Conclusion: The person is really the same as the essence, but differs only by reason. Of this matter we have treated at length in disputation 110.

670. Boethius, De Trinitate, near the end.

Articulus II - Whether it should be said that three persons are of one essence

It is objected:

1. It seems that it should not be said that three persons are of one essence. For Hilary says in the book On the Synods that the Father, and the Son, and the Holy Spirit are indeed three according to subsistence, but one according to consonance. But the substance of God is his essence. Therefore three persons are not of one essence.[671]
2. Moreover, one should not affirm anything concerning divine things which is not expressed by the authority of Sacred Scripture, as is clear from Dionysius, On the Divine Names, chapter 1. But nowhere is it found expressed in Sacred Scripture that the Father, and the Son, and the Holy Spirit are of one essence. Therefore this is not to be affirmed.[672]
3. Moreover, the divine nature (*natura*) is the same as the essence. It would therefore suffice to say that the three persons are of one nature.
4. Moreover, it is not customary to say that the person is "of" the essence, but rather that the essence is "of" the person. Therefore neither does it seem fittingly said that the three persons are of one essence.
5. Moreover, St. Augustine says that we should not say that three persons are "from" one essence, when in the divine things there is understood something other than essence and person. But as prepositions are transitive, so also are oblique [cases]. Therefore by equal reason it is not to be said that the three persons are "of" one essence.[673]
6. Moreover, what can be an occasion of error is not to be said concerning the divine things. But when it is said, "three persons of one essence," or "of one substance," an occasion of error is given. For, as Hilary says in the book On the Synods, if the common predications "one substance of the Father and the Son" be used, either one supposit which has two names is signified, subsistence, or one divided substance has made two imperfect substances; or a third prior substance, which to two has been usurped and assumed. Therefore it is not to be said that three persons are of one substance.[671]

But on the contrary: St. Augustine says in book 3 Contra Maximinum: "That which we, 'homoousion,' which in the Nicene Council against the Arians was established, signifies the same as that three persons are of one essence."[674]

I answer: As was said above, our intellect names divine things, not according to the mode of the things themselves, because thus it cannot know them, but according to the mode found in created things. And because, in sensible things from which our intellect takes knowledge, the nature of some species is individuated through matter; and thus nature has the ratio of form, but the

671. St. Hilary, De synodis.
672. Pseudo-Dionysius, De divinis nominibus I.
673. St. Augustine, De Trinitate VII, 6 (on modes of speaking about essence and person).
671. St. Hilary, De synodis.
674. St. Augustine, Contra Maximinum, III, c. 14 (and c. 28).

individual or supposit the ratio of a thing having form: for this reason also in the divine things, as to the mode of signifying, essence is signified as the form of three persons. But in created things we say that any form is "of" that of which it is the form, as the health or the beauty of some man. But we do not say that the thing having a form is the form, unless with the addition of some adjective that designates the form. Thus we say, "this woman is of excellent beauty," "this man is of perfect virtue." And likewise, because in the divine things, the persons being multiplied, the essence is not multiplied, we say one essence "of" the three persons, and the three persons "of" one essence; so that these genitives may be construed in the designation of form.

Reply to the first: "Substance" is there taken for hypostasis, and not for essence.

Reply to the second: Although "three persons of one essence" does not occur in Sacred Scripture in these words, nevertheless it is found as to this sense, as in John 10:30, "I and the Father are one," and John 14:10 - 11, "I am in the Father, and the Father in me." And by many other [places] the same can be had.

Reply to the third: Because "nature" designates a principle of act, but "essence" is so called from "to be," some things that are of one nature can be said which agree in some act, as all things that heat. But they cannot be said "of one essence" unless they are one in being. And therefore the divine unity is more expressed by this, that it is said that the three persons are of one essence, than if it were said that they are of one nature.

Reply to the fourth: A form taken absolutely is wont to be signified as that of which it is the form, as "the virtue of Peter." But conversely the thing having a form is not wont to be signified as that of which it is the form, unless when we wish to determine or designate the form. And then two genitives are required, one of which signifies the form, and the other the determination of the form; as if it be said, "Peter is of great virtue." Or also one genitive is required that has the force of two genitives; as when one says, "this man is blood-thirsty," that is, "a shedder of much blood." Because therefore the divine essence is signified as a form with respect to the person, it is fittingly said that the essence is "of" the person; but not conversely, unless something be added to the designation of the divine essence, as if it be said that the Father is a person "of" the divine essence, or that the three persons are "of" one essence.

Reply to the fifth: This preposition "ex," or "de," does not designate the relation of a formal cause, but rather the relation of an efficient or material cause. Now these causes are distinguished in all things from those of which they are causes. For nothing is its own matter, nor is anything its own active principle. But something is its own form, as is clear in all immaterial things. And therefore, by this that we say, "three persons of one essence," essence is signified under the ratio of form; it is not shown that essence is other than the person, which would be shown if we were to say, "three persons from the same essence."

Reply to the sixth: As Hilary says in the book On the Synods, the saints are not to be prejudged because of things not handled piously: for, because some things are not had piously, they ought not to be had. So, if "homoousion" is ill understood, what is that to me understanding it well? Thus therefore one substance "from one property of being begotten," not, however, from proportion, nor from unity, nor from communion.[671]

Conclusion: One essence is said to be "of" the three persons, and the three persons are said to be "of" one essence. Concerning the consubstantiality of the Son and the Holy Spirit with the Father we have already discussed in disputations 109 and 110. Now, however, only the mode of speaking is to be noted, which St. Thomas approves in this article. We say, therefore, that the three persons are of one essence, and conversely, that one essence is of three persons; in which mode of speaking the Sixth Synod uses, session 4, when it says, "The Trinity is of one will and of one operation."[675] Add also that it can rightly be said: "The three persons are of the Deity"; for thus we commonly say, "The Father, and the Son, and the Holy Spirit are three persons of the Deity."

Articulus III - Whether essential names are predicated singularly of the three persons

It is objected:

It seems that the essential names (as this name "God") are not predicated singularly of the three persons, but plurally. For just as "man" is signified as having humanity, so "God" is signified as having Deity.

It is objected: It seems that essential names (as this name "God") are not predicated singularly of the three persons, but plurally. For just as "man" is signified as having humanity, so "God" is signified as having Deity. But the three persons are three having Deity. Therefore the three persons are three gods.

1. Further, in Genesis 1, where it is said, "In the beginning God created heaven and earth," the Hebrew truth has Elohim, which can be interpreted "gods" or "judges." And this is said on account of the plurality of persons. Therefore the three persons are several gods and not one God.
2. Further, this name "thing" (if it be said absolutely) seems to pertain to substance. But this name is predicated plurally of the three persons. For St. Augustine says in the book On Christian Doctrine: "The things to be enjoyed are the Father and the Son and the Holy Spirit." Therefore other essential names also can be predicated plurally of the three persons.[676]
3. Further, just as this name "God" signifies one having Deity, so this name "person" signifies one subsisting in some intellectual nature. But we say three persons. Therefore by the same reasoning we can say three gods.

671. St. Hilary, De synodis.
675. Sixth Synod, session 4: "Trinitas est unius voluntatis, et unius operationis."
676. St. Augustine, De doctrina christiana I, 5 - 6.

But on the contrary: It is said in Deuteronomy 6: "Hear, O Israel, the Lord your God is one God."

I answer: It must be said that of essential names some signify the essence substantively, others adjectivally. Those which substantively signify the essence are predicated of the three persons only in the singular and not in the plural. But those which signify the essence adjectivally are predicated of the three persons in the plural. The reason for this is that substantive names signify something in the mode of substance, whereas adjectival names signify something in the mode of an accident which inheres in a subject. But substance, since it has existence through itself, has unity or multitude from itself; wherefore the singularity or plurality of a substantive name is attended according to the form signified by the name. An accident, however, since it has existence in a subject, receives unity or multitude from the subject; and thus singularity and plurality in adjectives are attended according to the supposits. Now in creatures one and the same form is not found in several supposits except by a unity of order, as the form of an ordered multitude. Hence names signifying such a form, if they are substantives, are predicated of many in the singular, but not so if they are adjectives. For we say that many men are a college, or an army, or a people; yet we say that several men are collegiate. But in divine things the divine essence is signified in the mode of a form, as was said above. And this is supremely simple and most one, as was shown above. Whence also names signifying the divine essence substantively are predicated singularly and not plurally of the three persons. Therefore this is the reason why we say that Socrates and Plato and Cicero are three men, but we do not say that the Father and the Son and the Holy Spirit are three Gods, but one God: because in three human supposits there are three humanities, but in the three persons there is one divine essence. But those which signify the essence adjectively are predicated plurally of the three, on account of the plurality of supposits. For we say three existing, or three wise, or three eternal and uncreated and immense ones, if they are taken adjectivally. If, however, they are taken substantively, we say one uncreated, immense, and eternal, as Athanasius says.[677]

Reply to the first: Although "God" signifies one having Deity, yet it is another mode of signifying. For "God" is said substantively, but "having Deity" is said adjectivally. Hence, although there are three having Deity, nevertheless it does not follow that there are three gods.

Reply to the second: Different languages have a different mode of speaking. Hence, just as because of the plurality of supposits the Greeks say "three hypostases," so also in Hebrew it is said plurally Elohim. But we do not say "gods" nor "substances" in the plural, lest plurality be referred to the substance.

Reply to the third: This name "thing" is among the transcendentals. Hence, insofar as it pertains to relation, it is predicated plurally in the divine; but insofar as it pertains to substance, it is predicated singularly. Whence Augustine says in the same place that the same Trinity is a certain supreme thing.[676]

677. Athanasius, Symbol of faith (Quicunque vult): "the uncreated is one, the immense is one, the eternal is one," etc.
676. St. Augustine, De doctrina christiana I, 5 - 6.

Reply to the fourth: The form signified by this name "person" is not essence or nature, but personality; whence, since there are three personalities, that is, three personal properties in the Father and the Son and the Holy Spirit, it is not predicated singularly, but plurally, of the three.

Notationes circa Articulum

There are two conclusions of the article. The first is: Essential concrete substantive names, as "God," etc., are said singularly of the three persons. The second is: Adjectival names, as "wise," are said plurally of the three persons. From which two rules are gathered universally, both in created things and in God. One is that concrete substantive names are said in the plural or the singular according to the unity or the number of forms, not of supposits. The other rule is that adjectives follow not the unity and number of forms, but of supposits.

Then, with Cajetan, it must be observed that in some codices there is added in the title of this article: "As this name God," whence he himself gathers that the question is about concrete names, not abstract. And indeed St. Thomas, who did not prefix titles to the articles, in the beginning of the argument, where he is wont to place the titles, thus says: "To the third it proceeds thus: It seems that essential names, as this name God, are not predicated singularly"; to which the doctrine of the whole article agrees. Now then let us treat, in our accustomed manner, the doctrine of this article itself.

Disputatio CLV - Whether concrete names are predicated in the singular and in the plural according to the singularity and plurality of forms

- The opinions of Richard and Durandus. Caput I.
- What Marsilius and Gabriel think. Caput II.
- The opinion of Cajetan and other Thomists. Caput III.
- That concrete substantive names are said in the singular or in the plural from the unity or the number of the form alone: the more probable opinion holds. Caput IV.
- Corollaries of the preceding opinion. Caput V.
- Arguments against the aforesaid opinion. Caput VI.
- Our adversaries object St. Thomas to us. Caput VII.
- Adjectival names ought to be predicated plurally of the three persons, but of the one God singularly. Caput VIII.

Caput I - The opinions of Richard and Durandus

There is no dissension among the Scholastics about names signifying abstractly, but all readily concede, both in God and in created things, that they are enunciated in the singular or in the plural according to the unity or plurality of the form. For since these names signify and connote nothing else than the form itself, of necessity, according to the number of that form, they must either be multiplied or receive unity.

But of concrete names a different judgment must be rendered; for since, besides the form, they either signify or connotate something else, it does not seem sufficient in all cases, for them to be said singularly or plurally, to have regard to the unity and plurality of the signified form. Moreover, since among concretes some are adjectival, as "wise," and some substantive, as "man," "God," and they do not signify the form in the same way, the ratio of the two is not equal. About adjectives the theologians readily agree, as we shall see in Caput VIII; but concerning substantives, if we speak universally, there is no slight controversy: for about concrete substantives which are attributed to God absolutely, all Catholics think in the same way; nevertheless, in order to assign the true rationale for these divine concretes, it is necessary to speak of all of them generically.

Therefore let the first opinion be that which Richard reports in the Third Book, distinction 1, article 1, question 5, of those who say that, if one divine person were to assume many humanities, neither one man nor many would be said simply. This opinion Richard does not disapprove; and Durandus plainly follows it in the Third Book, distinction 1, question 3, ad 3,[678] who, although along with St. Thomas in this article he taught that substantive concretes neither receive number nor unity according to number or the unity of persons, nevertheless asserts that in that case neither one nor many men are to be said simply; and hence that unity and plurality of names are not to be taken universally from the unity and plurality of forms. He renders the reason, because the name "man" is to be used according to common custom; but custom has obtained this, that, when "one man" or "many men" is said, not only the unity or plurality of forms, but also the unity or plurality of the supposit be considered: therefore in that case neither one man simply nor many would be said. And that substantive concrete names in God are regularly said according to the unity of form alone, even if there are many supposits, is not because universally these names by their nature follow only the unity or number of forms; but because usage has it that substantive names in God are neither numbered nor have unity according to supposits, but only according to forms. Durandus furthermore adds that, if we choose what is said with less impropriety, then, if one and the same person were to assume many human natures, they would have to be called many men; but if many persons were to assume the same nature, one man would be said.

Scotus rightly refutes this opinion first, in the Third Book, first question, q. 3, ad 1, with this argument: "One or many" are a property of being and divide its nature equally; wherefore, wherever the nature of being simply is found, it is necessary that unity or plurality simply be found. Therefore, if a name signifies the nature of something that simply is being - such as is a substantive concrete of the signified - which simply would be an ens, then either one or many would be said.[679]

678. Durandus, In III Sent., d. 1, q. 3, ad 3; cf. Richard, In III Sent., d. 1, art. 1, q. 5.

For another reason also this view does not please me: because Durandus seems to derive the unity of substantive names in God not so much from their native and primary imposition as from common usage, to which they are now applied for signifying. But this is altogether false: for, as we shall also say in the following chapter, divine substantive names do not signify in another way after the revelation of the mystery than before, but remain in their original signification; nevertheless, now too they are said singularly in God. Yet it is clear that, before the mystery of the Trinity was revealed, the word "God" was imposed in the same way to signify the divine nature in the concrete, as the word "man" to denote the nature of man; therefore, if in that case in which three divine persons were to assume one human nature, or one divine person were to assume three human natures, we, attending to the primary imposition of the name, would be unable to say either many men simply or one man simply, then, even after the revelation of the mystery of the Trinity, neither "many Gods" nor "one" is to be said simply - although now by ecclesiastical usage the word is so accommodated that we say "one God" simply in three persons. Wherefore the Gentiles, who have not hitherto changed this word, could, according to the propriety of each language, pronounce neither one God nor three Gods simply. Therefore our Christian religion would so confound words with significations that to the Gentiles it would leave intact neither the one nor the other signified. These things are assuredly most absurd; and this reasoning also tells against Durandus.

But in truth, since Durandus, as we reported in Disputation 125, chapter 1, asserts that in God there is only one common absolute subsistence, by which the divine nature is so signified in the concrete that it is said: "this God common to three persons," and affirms that to be proper to the divine nature subsisting in three persons; and hence that one human nature, if assumed by three divine persons, would not have that subsistence; he could indeed assert that the substantive concrete names of God signify the divine nature together with that absolute subsistence, both before the revelation of the mystery of the Trinity and after; and thus, remaining in their original signification, be predicated singularly of God simply, whatever revelation be made. However, because he plainly denies, as we shall see in Disputation 136, chapter 1, the understanding of an individual concrete of deity prior to the persons, even if he should concede that subsistence, he could not defend himself in this way, but would be forced to fall into the absurdity which we were inferring. But Richard, who, as we recalled in that Disputation 125, chapter 3, concedes in God no common subsistence, but only three relative ones, cannot defend himself in this way: wherefore, if he judges the opinion which we have reviewed in this article to be probable, he is compelled to fall into the absurdity which we were just now inferring.

Caput II - What Marsilius and Gabriel think

Marsilius, in the Third Book, question 2, article 3, dubium 2, holds that in created forms, even if many are assumed by one supposit, or one by many, unity and plurality are to be taken from supposits, not from natures. Wherefore, if many persons were to assume one humanity, many men would have to be said; but if one person many humanities, one man would have to be said. Gabriel

679. Scotus, In III Sent., q. 3, ad 1.

embraces the same opinion in the Third Book, first distinction, question 2, article 3, dubium 4, ad secundam rationem.[680] They prove the first point thus: if many men were to assume the same nature, each person would be a man, and there would be one man; but there would be no common man who in the concrete would be predicated of this and that person; therefore there would be many men. And they deny that in that case there would be a common "man" in the concrete, because they seem to think that concrete names are names of supposits, and that by them supposits are signified directly; and they teach the same about concrete substantives as about adjectives. Marsilius adds that the divine supposits are denominated from the human nature in the same way as a subject is denominated from an accidental form. Wherefore, just as the same air is said to be one luminous thing, even if it be illuminated by different lights; in the same way there will be one man, even if there are many humanities in the same supposit. Marsilius then proves his opinion further: because, if one humanity were assumed by one person, and afterwards were dismissed, he would begin to be another man for no other reason than because he was in another person; therefore, similarly, if it were assumed at once by many, there would be many men.

This opinion must be refuted in the same way as the preceding, and is to be driven to a like absurdity by the same argument. For if this rule were true, it would follow that substantive concrete names in God are multiplied according to the number of persons. For if the name "man" by its imposition signifies a supposit, and from that ought to be multiplied or to take unity, then, according to the primary imposition of this name "God," it will follow that many Gods are to be said, because there are many persons. For (as we were saying above) before the revelation of the mystery of the Trinity, the name "God" by itself signified in the same way as the name "man" and the other concrete substantives of created forms; after the revelation itself was made, the signification has not been changed; therefore, according to that primary imposition, even now many Gods could be said. Wherefore the same Marsilius, in the First Book, question 5, article 2, ad quintum, where he hands down the aforesaid opinion while he treats of the name "God," for this reason only asserts that many Gods cannot be said, because the usage of the Church is that the name "God" be taken not personally, but essentially, on account of the wiles of heretics, who strive to introduce many Gods according to essence.[681] By which words he plainly reduces this signification of the name "God," by which it is used essentially only, to the usage of the Church, not to the very primary imposition of the name; and hence, with the propriety of the word and its native signification preserved, the three divine persons, according to his opinion, could be called "many Gods"; wherefore the Church would have labored in vain in her mode of speaking against the Gentiles, by changing the ancient signification of the word.

But Marsilius's arguments are trifling. To the first I answer that concrete substantive names do not signify supposits directly, but natures, while connoting supposits, as we showed in chapter 4; but the number or unity of a name must be taken from the direct signified, not from what is connoted, as we shall say there. From which it will be clear that what Marsilius assumes is false, namely, that concrete substantive names are in the same case as adjectives: because a substantial

680. Marsilius, In III Sent., q. 2, art. 3, dub. 2; Gabriel, In III Sent., d. 1, q. 2, art. 3, dub. 4, ad 2.
681. Marsilius, In I Sent., q. 5, art. 2, ad 5.

form denominates the supposit in the same way as an accidental [form] denominates the subject. To the latter argument I say that, in the case in which an assumed humanity were dismissed, there would not be another man, as we shall see more fully below; and thus, when at once the same humanity is assumed by three, there are not three men, but one, as there is one God.

Caput III - The opinion of Cajetan and of other Thomists

Since St. Thomas spoke in various ways on this matter, his disciples too have been divided into various opinions. Cajetan, on this article, and in the Third Part, question 3, article 7, around the solution of the second objection, to whom the Canariensis adheres in the commentary on this article, and certain more recent men, teach first that the plurality of a substantive concrete name is not to be taken from the plurality of form alone, but that the plurality of supposits is also required. They gather this from St. Thomas above, question 36, last article, ad 2, where he says that for this reason the Father is not called "several principles," although in him there is a twofold form of principle, namely of generation and of spiration: because, if there were several principles, we would denote in him several supposits as well.[682] And in III, q. 3, a. 7, ad 2, he says: if the same person were to assume several humanities, several men would not be said; because the name of some form is never said in the plural except on account of a plurality of supposits.[683] With these agrees Ferrariense, IV Contra gentiles, cap. 11, q. 9, around these propositions, where he asserts that the condition required, for a substantive name to be said in the plural, is a multitude of supposits.[684]

Secondly, Cajetan and the others teach that, indeed, a plurality of supposits is required for the plurality of the name; and they interpret the Doctor in the cited places in this way, namely, that he did not exclude a plurality of forms, but thought that likewise necessary; assigning only this difference between concrete adjectives and substantives, that adjectives are said in the plural from the plurality of forms alone, but substantives from both.

Thirdly, Cajetan alone adds that even in that case in which several divine persons were to assume the same humanity, it would not be said "one man" simply, but "one" according to the nature. In this he plainly follows the opinion of Richard and Durandus set down in chapter 1: for thus neither would there be simply many men (since, in his view, for the plurality of the name a plurality of form and supposit is required), nor simply one man, but with that addition, "according to the nature." And whereas we can infer against Cajetan that absurdity which we were deducing there against Richard and Durandus - namely, that by the same reasoning the three divine persons could not be called "one God" except with the same addition - Cajetan could defend himself in the way in which, for Durandus's sake, we said above in that chapter, namely, that the notion of deity is different from that of a humanity assumed by three persons. For Cajetan, as we shall see in Disputation 156, chapter 1, affirms that there is a concrete of deity which he calls "semiperson," constituted in our understanding prior to the three persons by the common subsistence, of which

682. St. Thomas, I, q. 36, a. ult., ad 2.
683. St. Thomas, III, q. 3, a. 7, ad 2.
684. Ferrariense, IV Contra gentiles, cap. 11, q. 9.

all the things that are said of one God can be predicated; but that no such individual of a humanity assumed by three persons can be assigned; and thus he will readily answer that the three persons are simply one God, but that there will not be one man in the case in which one humanity has been assumed by them.

But that there is no such individual as Cajetan thinks, and that the concrete of humanity in our consideration precedes the persons in the same manner as the concrete of deity precedes them, we shall show there not obscurely. Wherefore, in this third point the Thomists do not agree with Cajetan, but commonly assert that more is required for the plurality of a concrete name than for unity: because for the latter they say the unity of form suffices, but for the former the plurality of both form and supposit is necessary. Moreover, in explaining the mind of St. Thomas and in reconciling what he asserts in this article and in the other places recently cited, they labor much, as we shall see in chapter 5. Further, the foundations of this opinion, besides the testimonies of St. Thomas which we have thus far recited, are the chief arguments which we shall bring against our opinion in chapter 6.

The more probable opinion will be set forth, that concrete substantive names are said singularly or plurally from the unity or number of form alone.

Caput IV - On the rule for concrete substantive names

St. Thomas assigns two rules in this article: one for concrete substantive names, the other for adjectives. In this chapter we shall assert and confirm that which he delivers concerning substantive names, for we judge it much more probable than the others; but the other, concerning adjectives, we shall set forth in chapter 8. The rule about substantives seems to have been followed by the author of Auxerre in book 3 of the Summa, first treatise, first chapter, question 5; by Scotus in III, distinction 1, question 3, and on I, distinction 12, question 1, n. 9; and to this same question St. Thomas also, in the third book on the Sentences, distinction 1, question 2, article 5, to the second and third responses, when they asserted that, in the case where one person would assume several humanities, there would be several men. The same is taught by Capreolus on I, distinction 4, question 1, article 1, to the first of Aureolus.[685]

Therefore the rule is of this sort: Concrete substantive names of natures are said in the singular or the plural solely from the unity or number of the form (*forma*) which they signify. The holy Doctor expressly delivered this in this article with these words: "In concrete substantive names, singularity or plurality is attended according to the form signified by the name." Yet some interpret his mind as wishing only to teach that the plurality of forms, or the unity thereof, must be attended to for the plurality or unity of the name, but that this does not suffice; for one thing is that it be required, as we said above from Cajetan, but another that it suffice. And they think St. Thomas said

685. Antisiodorensis, Summa, lib. 3, tract. 1, cap. 1, q. 5; Scotus, In III Sent., dist. 1, q. 3; In I Sent., dist. 12, q. 1, n. 9; St. Thomas, In III Sent., dist. 1, q. 2, a. 5, ad 2 et 3; Capreolus, In I Sent., dist. 4, q. 1, a. 1, ad 1 Aureoli.

this in order to constitute the difference between adjectival and substantive names, because for the unity or plurality of an adjectival name one considers only, and it suffices to have, the unity or plurality of the subject, not of the form.

However, this exposition is easily refuted both by the very words of the text and by the reason which he adduces. First, because St. Thomas did not say that, for the plurality or unity of the name, the unity or plurality of form is to be attended to and considered; for thus he would signify only (as those Doctors aforesaid affirm) that it is necessary, yet would not denote that it suffices. Rather, he said that the singularity or plurality of the name is attended according to the form signified; but to be attended according to the form is to be derived from that. For if it necessarily arose from elsewhere, it would not be said to be attended according to the form; for indeed, with several forms existing, it could happen that the name signify in the singular; and whenever we say that some property is attended according to the form, or according to the matter, we signify that it arises from that alone.

Then too, never in the whole article did he make mention of the unity and number of supposits (*supposita*), so as to show that this also is required for the unity and plurality of the name. Therefore, since he makes mention only of the form, and from that says the unity or plurality of the name is to be attended, it follows he judged that also alone to suffice; especially since he speaks of singularity in the same way as of plurality; and for singularity the unity of the form suffices, and he signifies this when he says that the singularity of the name is to be attended from the singularity of the form.

Moreover, the reason of St. Thomas and the whole discourse of the article plainly indicate that he gathered that aforesaid rule as necessary and sufficient for judging about the divine terms: otherwise he would have proved absolutely nothing at all. For, in order to prove that substantive names are predicated of God in the singular, but adjectives in the plural, he frames this argument: Substantive names signify something after the mode of substance; but adjectival names after the mode of an accident, which is in a subject. Now a substance, just as it has existence (*esse*) per se, so per se it has unity or multitude; whence the singularity or plurality of a substantive name is attended according to the form signified by the name. Therefore he infers that forms have from that whence they have existence, unity or plurality, not indeed merely as from a required principle, but also as from a sufficient and complete one: for just as they do not have existence from elsewhere, but per se; so perfectly they do not have unity and number from elsewhere. And since concrete names of forms follow the thing signified, as whatever else follows the thing which it signifies, St. Thomas rightly infers that from those alone the singularity and plurality of such names in signifying is to be taken.

Scotus, however, establishes the aforesaid position thus: everything that depends is necessarily terminated by something that does not depend; and it cannot depend upon another that itself depends. But an adjectival name, by its very imposition, depends, because it signifies an accidental form, or after the mode of an accident, which depends; on the contrary, a substantive name does not depend, because it signifies a form subsisting per se. Therefore it is necessary that an adjective depend upon a substantive. Whence it is that, if an adjectival name be added to an adjective, the

one cannot depend upon the other, but each must be terminated by another substantive. But when an adjective is added to a substantive, upon that it depends and by that it is terminated; therefore, since names of number are adjectives, when they are added to a substantive, they are terminated by it and take singularity or plurality, and hence follow the number or unity of the forms which they signify. But because, when they are added to adjectives, they depend and are determined not by the adjectives themselves but by the subject, it is necessary that from that they receive unity and number.

This reason does not sufficiently show that the signification of singular or plural number in substantives must be taken from forms, but in adjectives from the subject; rather, it shows that the forms themselves of accidents depend upon subjects, whereas substantial [forms] depend upon themselves. Therefore the aforesaid rule is better confirmed by the reason of St. Thomas which we a little above reported; and, that being passed over, it can also be shown by another no less easy and efficacious.

Now a certain doctrine is to be presupposed, sufficiently known, namely, that among concrete substantive names some are names of a person (*persona*), as hypostasis, person, supposit (*suppositum*), Peter and John, and (as the more common opinion holds) Christ; others are of a nature (*natura*), as God, man, a certain man, and the like. Next, what the holy Doctor teaches above in question 29, article 4, must be premised, to wit, that this is the difference among the names "person" and "a certain man," that "person" directly signifies subsistence (*subsistentia*), that is, the terminus of the nature by which a person is constituted, and it connotes the nature of that person; but "a certain man" directly signifies the nature of man, and it connotes the person in whom it subsists; which we also observed in disputation 130, chapter 3. From this the following reason is drawn. The signification of a name ought to be numbered according to its direct signification, for this is what it directly manifests and affects. But the direct signification of a concrete substantive name of a nature - "God" for example - is of a nature or form, not of a person; thus "God" does not signify a supposit, but a form. Therefore from that it must be numbered, and consequently it is to be said in the singular or plural according to the unity or number of the form, not of the supposit. Hence also it comes about that concrete names of a person are numbered, or said in the singular, not from the nature, but from personality, which is the direct signification.

Caput V - Corollaries of the preceding opinion

From the aforesaid rule it follows, first, that the three persons are one God, and that the name "God," in its primary signification, remained [singular] after the mystery of the Trinity was revealed; and by the same reason the three persons would be one man, if one humanity had been assumed by them together - not because there is some individual of the Deity constituted by that common subsistence which some contrive, but because the direct signification of a concrete substantive name is the form, while the persons are connoted in general. By the same reason the Father and the Son are said to be one principle, or one spirator, of which we also said something in disputation 180, because the direct signification is the will in the Father and the Son, which is one,

while the persons are connoted. And if St. Hilary in book 2 On the Trinity calls the Father and the Son the authors of the Holy Spirit, it matters little; for he uses that name as if it were an adjective, as St. Thomas taught above, question 36, last article, to the last objection; but adjectives are numbered according to their subjects.[686]

Secondly, it is gathered that, in the case where one person would assume many humanities, there would have to be said to be many men, as Capreolus openly acknowledges on I, distinction 4, question 1, article 1, ad primum Aureoli, following the opinion of the holy Doctor; and on III, distinction 1, question 2, article 5, ad secundam, because the direct significata of the name "man" would be several.[687]

Thirdly, it is inferred from the aforesaid rule that it would be the same man, if the same humanity were assumed by several persons and then dismissed by one, or even by all, so as to remain in its proper supposit. This opinion is also favored by the author of Auxerre, who in book 1 of the Summa, first treatise, first chapter, question 7, teaches that, if a humanity had first been assumed by three, then were dismissed by two and remained only in one, it would be the same man. The reason indeed is the same, because the same direct signification - namely, humanity - would remain, from which, as we said above, unity and plurality are to be taken.[688]

However, some contend that, in the case where the humanity were dismissed and remained in its own supposit, it would not be a different man; for, in order that it be another man, both would have to remain; yet they do not dare to say it would be the same, because, for it to be the same man, the humanity ought to remain in the persons at once. They are mistaken nevertheless, since, for it to be said that there are several men, or that one be called another man than another, it is not necessary that all be in act. For Peter is now said to be another man than John, though John is dead; and John, dead, and Peter, alive, are said to be two men. Likewise, in order that one be said to be the same man, it matters not whether the humanity be at once in three persons, or successively; for if unity is taken from the form signified, not from supposits, it will be the same man in whatsoever person. Otherwise one must say that, for the singularity of the name, not only the unity of the form is required, but also that of the supposit; which above was sufficiently impugned against Marsilius.

Finally, it follows that the Father cannot be called "several principles," for this mode of speaking denotes a real distinction, which in God is found only among the supposits. He can, however, be called several principles "according to reason." As for relations, there is a peculiar cause why, although they differ by reason alone, several things are said absolutely, as we said in disputation 138, chapter 2. Therefore, that the Father cannot absolutely be called "several principles," because that mode of speaking signifies a real distinction, is clear; nor should you think that in the abstract we can say "several principles," unless we add "according to reason." For abstract [terms] in God,

686. St. Hilary, De Trinitate 2; St. Thomas, I, q. 36, a. ult., ad ult.
687. Capreolus, In I Sent., dist. 4, q. 1, a. 1, ad 1 Aureoli; In III Sent., dist. 1, q. 2, a. 5, ad 2.
688. Antisiodorensis, Summa, lib. 1, tract. 1, cap. 1, q. 7.

unless they be pure relations, are not said to be several absolutely, as we noted in that place. Wherefore, if it is not said that the Father has several principles in the abstract - that is, several powers - what wonder if it cannot piously be said that there are several principles?

Caput VI - Arguments against the foregoing opinion

Against the position and the rule which we delivered in chapter 4 concerning substantive names, there are certain objections, by which those who follow the opinion mentioned by us in chapter 3 can contend. The first is this. If one person assumed several humanities, there would be two men; therefore there would necessarily be a distinction between them. For it is said that division includes the negation of one with respect to the other. Therefore one man could not be predicated of the other; but the consequent is absurd. For just as now "God" is predicated of "man" and "man" of "God," because each nature is in the same person, so then too one man would be predicated of the other, because each humanity would be in the same person

The argument is solved: I say that distinction and division of one from another necessarily include not just any negation between them, but not that which impedes predication in the concrete, rather the negation of those natures in the abstract. By that very fact that one humanity is not another, they are two men, even if one be said to be the other by the communication of idioms and the predication of the nature in the same supposit.

You will say: In the very way in which they are called "several men," one ought to be denied of the other; therefore, since in the concrete they are called "two men," in the concrete one ought to be denied of the other - which is false. I answer: It is not necessary that, in the very way in which they are called "several men," namely in the concrete, one be denied of the other. For not every plurality impedes the predication of one of the other, since even those which are distinguished - on account of various modes of affecting either the subject or the supposit - are not, in the concrete, denied one of the other. This we shall show when treating the third part of St. Thomas on question 15.

The posterior confirmation urges thus: from our position it would follow that it could be said that Christ is "two," because he has two natures. For if one having two humanities would be called two men, one having one divinity and one humanity would be called two - which is against the common opinion of the theologians and the Fathers, as we shall see on III, q. 17, a. 1. I reply in particular that "two" taken per se and substantially denotes a supposit, not natures; hence it cannot be said of Christ ... [continues in the next chapter].

Against the sentence and rule which we set down in chapter 4 on substantive names, there are certain oppositions by which those who follow the opinion recalled by us in chapter 3 can attack it. The first is this: if a divine person were to assume several humanities, there would be two men; a distinction between them would be necessary. But distinction, or division, includes the negation of the one from the other; therefore "one man" could not be predicated of the other. Yet the consequent is false; for just as now "God" is predicated of "today's God," because he is the person of both natures, so then too it would be said of the other, since the person would be the same for both

It is answered: the distinction and division of one thing from another do imply some negation, but not any and every negation whatsoever - namely, not a negation of predication in the concrete, but only in the abstract of natures. Thus "one humanity is not another humanity"; even if one be said to be many by the predication of properties and of natures in the same supposit. Nor does plurality ever impede predication, since even those things which are distinguished in their subject or supposit, on account of diverse modes, are mutually predicated, as we shall treat more fully in the Third Part of St. Thomas.

A second opposition is that, from our sentence it would follow that it can be said that Christ is two, since he has two natures. For if one having two humanities would be called two men, one who now has divinity and humanity would be called two; but this is against the common opinion of the theologians and of the Fathers, as we shall see in the Third Part, question 17, article 1.

I answer in particular that "two" taken per se can be taken in the masculine and in the neuter. If it be taken in the masculine, therefore Christ cannot be said to be "two," because the word "two" denotes supposits, not natures, as we proved from the Fathers and the Councils in Disputation 131, chapter 1. But if it be taken in the neuter, it denotes natures, as we said there. In such a signification you will not find among the Fathers that it has been handled in so many words; yet some have nonetheless said that in Christ there is "one thing and another," whom we mentioned in that place, and we shall bring them into the Third Part. There are also some who say that Christ is "one thing and another," or that he "is both." St. Cyril of Alexandria, in the Scholia on the Incarnation, chapter 26, says that different things are predicated of Christ according to one thing and another, and he adds: "And he himself is this and that," which is tantamount to saying "he is one thing and another." St. Augustine in the Enchiridion, chapter 35, says: "And by this [Christ] is made less (to wit, Christ) and remained equal, and truly one as was said; but he is one thing on account of the Word, another on account of the humanity: on account of the Word equal to the Father, on account of the man lesser"; where Augustine says that Christ "is both," that is, lesser and equal; and by the same reason he "is one thing and another," namely lesser and equal; which he demonstrates wholly from that chapter.[689]

Next, some of the Fathers grant that, in the identical sense (as they say), Christ is two natures at once: Augustine in the Enchiridion, chapter 38; St. John Damascene, On the Faith, book 3, chapter 19; Anselm, On the Incarnation of the Word, chapter 5; Bernard, Sermon on the Vigil of the Nativity.[690] Because of which things, a sentence might seem true to someone, which Durandus reports in the Third Book, distinction 6, question 1, number 10, namely that Christ can be said to be two in the neuter.[691]

However, the common School of Theologians together with St. Thomas in the Third Part, question 17, article 1 - whom it is not necessary to set out one by one - rightly deny that Christ can be called "two" either in the neuter or in the masculine. St. Thomas and certain others prove it

689. St. Augustine, Enchiridion, cap. 35.

690. St. Augustine, Enchiridion, cap. 38; St. John Damascene, De fide orthodoxa, 3, cap. 19; St. Anselm, De incarnatione Verbi, cap. 5; St. Bernard, Sermo in vigilia Nativitatis.

691. Durandus, In III Sent., dist. 6, q. 1, n. 10.

thus: if Christ were said to be "two" in the neuter, the reason would be that Christ is two natures; but Christ cannot be called "two" natures, because although he is his divinity, he is not his humanity. Yet this reason is difficult: first, because when, in the identical sense, some of the Fathers grant that Christ is two natures, they would also grant that he is "two" in the neuter, if no other obstacle stood in the way; next also, because, as we were saying a little before, St. Cyril grants that Christ "is this and that" (which also is true in the formal sense), just as Augustine says. For since Christ is lesser and equal in the formal sense, in the same we can say, "he is this and that," "one thing and another," namely equal and lesser. Why then could we not, on account of the diverse natures and their properties, say "he is two" in the neuter?

Therefore the most cogent reason why in no way can it be said that Christ is "two" without an addition is this: whenever many things are united in something, and one thing contains those many under some union and unity, they are not said to be many. Thus Peter, although he contains many things, is not said to be many, nor two; because those many, conjoined, are simply said to be one. Now "one" and "many" are simply opposed; therefore, since Christ is not only one, but also "one thing" simply on account of the union of all the things which he has, he cannot be said to be "many," nor "two." But with an addition it would rightly be said in this way: "Christ is several natures together"; it would also be said, "there are many things in Christ," and "there are two things in Christ," just as it is said that "one thing and another is in him"; because by this manner of speaking, along with the multitude of the things which are in Christ, there is signified the unity by which they cohere in him and are Christ. Nor is it only said that "one thing and another is in Christ"; rather, Christ himself is called "one thing and another" not only in the identical sense, but also in the formal. But to say that Christ is "one thing and another" does not dissolve the unity which he has in one person; rather, that manner of speaking denotes the union; whereas to say that "Christ is two" altogether takes away unity.

Finally, it is lawful to speak as Sophronius speaks in the letter received by the Sixth Synod, action 11, where a little before the middle he said that "Christ is one and two in this very respect knowable: one indeed according to subsistence and person, but two according to the natures themselves." For when he says "one and two," not "two" absolutely, he clearly indicates two natures, but under a unity, which he who would grant "two" absolutely would not signify, nay, would take away. Therefore, in the same way, if one person of the Word should assume two humanities, although it would not be permitted to say that there are "two" absolutely, yet it would be permitted to say that there are "two men," just as if we were to say that there are "two natures," it would also be permitted to say, "in the Word there are two men." For thus "two" would be signified, not absolutely, but in the human nature; which plurality can stand together with unity. Why indeed Christ is not called "several sons," we shall say in chapter 8, where we shall also show why one is called "an artisan" who has several arts; on which basis too our adversaries strive to weaken our sentence.

They oppose to us St. Thomas.

reply to the second, where he says that therefore the Father is not called several principles, namely of the Son and of the Holy Spirit, although he has the power of spirating and of begetting, because there would be implied (says he) a plurality of supposits: that is, by that manner of speaking we should denote that there are several supposits if there are several principles. Therefore he thinks that for the plurality of a substantive name, such as "principle" is, the plurality of form does not suffice, but there is also necessary a plurality of supposits.

Next, in the Third Part, question 3, article 7, reply to the second, in the case in which a divine person should assume two humanities, he affirms that they ought not to be called two men; because a name drawn from some implicit form is said in the plural on account of the supposits; and therefore in that case, he says, it ought to be said "one man." And whereas in this article he clearly said that the plurality and singularity of the name are to be considered only and to be taken from the unity or plurality of the form, as we plainly deduced from his very text above in chapter 4, he seems even to be at odds with himself. Wherefore also the Thomists try to reconcile his statements.

Concerning these propositions Ferrarensis, in book 4 on the Contra Gentiles, chapter 11, offers two solutions.[692] The first is that the rule of St. Thomas given in this article, when he says that the plurality or singularity of the name is to be looked at from the unity or plurality of the signified form, is to be understood of concrete substantives; but the rule handed down in the Third Part, where he says that for the plurality of a name the plurality of supposits is required, is to be understood of adjectives. This solution was Capreolus's in the First Book, distinction 4, question 1, article 1, to the first of Aureolus; but Ferrarensis easily refutes it, because St. Thomas in the Third Part was plainly speaking of substantives: for the question was about the name "man," which is a substantive - whether, without a plurality of supposit, several "men" ought to be said - and he answers, they ought not.

Then Ferrarensis answers from his own position: that the formal reason of plurality and singularity in substantives is the singularity or plurality of the form, and of this St. Thomas spoke in this article; but that the singularity and plurality of supposits is also a required condition; and thus it is to be understood in the Third Part in the cited place. However, this solution can be no less easily attacked than the preceding. First, because for the singularity of a substantive name in no way is the singularity of the supposit required; otherwise three persons would not be one God, nor one man if they assumed one humanity - which is absurd, as we proved in chapter 3. Next also, even if the plurality and singularity of the form were a required condition but not the formal reason, nonetheless St. Thomas ought not, in this article, to have said that the plurality and singularity of the name are taken from the unity and plurality of the form, but he ought to have added that they are also taken from elsewhere; for they are also to be attended to from the condition, just as from the formal cause, the condition is necessarily required.

692. Ferrarienfis, In IV contra gentes, cap. 11; Capreolus, In I Sent., dist. 4, q. 1, a. 1, ad 1 Aureoli. St. Thomas, I, q. 36, a. 4, ad 2; III, q. 3, a. 7, ad 2; III, q. 17, a. 1. Sophronius, Epistola recepta a VI Synodo, actio 11.

Thirdly, some more recent Thomists judge the rule assigned by St. Thomas in this article to be true about the substantial form which carries the supposit along with itself, so that then, in general, the singularity and plurality of the name are taken from the unity and multitude of the form alone. For just as then the form bestows existence upon the supposit, so too it bestows unity or plurality upon the name. And this has place only in substantives; for although adjectives signify a form which does not give existence to the supposit but comes to it already constituted - just as the form signified by an adjective does not bestow unity and plurality upon the supposit - so neither upon the name. Such also they think the name "principle" to be, which, although it is a substantive, nevertheless, because in the Father it comes to a supposit already constituted, therefore the Father is not called "two principles," even if he has two forms of principle.

But in this way it cannot at all be reconciled and defended, what the Angelic Doctor teaches in both places. For hence it would follow either that three persons assuming the same humanity are not one man, or that one person assuming several humanities is several men; which is against the doctrine of the same, in the Third Part, in that question, article 7, both in the body and in the second reply. Moreover, the humanity assumed by the divine persons is signified as carrying the supposit along with itself; and thus one man would indeed be said, even if one [humanity] were assumed by three; but if three humanities were sustained by the same person, three men would have to be said; which also manifestly is against the doctrine of the same St. Thomas in that place. Or else that form is not signified as carrying the supposit along with itself, but as coming to one already constituted; and thus no less does it follow against his doctrine. For although, if three humanities were assumed by one person, three men would not be said, because then the plurality would have to be taken only from the form when it carries the supposit; nevertheless, if one were assumed by three, by the same reason one man would not be said, because then the unity would not be taken from the form, inasmuch as it would not carry the supposit along with itself.

Others finally among the Thomists reconcile St. Thomas's statements in another way. For the sake of this matter they premise that it falls out differently in those cases in which there is unity of nature than in those in which, together with unity of supposit, there is also unity of nature.

There is a multiplicity of natures. For some substantial form, such as the divine, can by its own nature be found in many supposits; yet no accidental form can by its nature be in many subjects. Whence it follows that, if at some time the same humanity were found in three divine supposits, even if it arrived to supposits already constituted after the manner of an accidental form; because nevertheless after the manner of a substantial form it would be one found in many, as the divine nature is, a substantive name would from it take singularity, and the three persons would be said to be one man. But when many natures would be in the same person, because they would be after the manner of an accidental form, whose proper feature it is to be multiple in the same subject, singularity of the name would be taken from the supposit, as in adjectives, even if the name were substantive. For in the former case the name is not only substantive, but also signifies after the manner of a substantive, and remains under the imposition of a substance; in the latter case, even if the name be substantive, nevertheless it signifies after the manner of an adjective, and it does not remain in its imposition as a substantive, which always signifies either one nature in one supposit,

or one in many, but never many in one. From this doctrine they thus reconcile the statements of St. Thomas, that in this article he is speaking of substantives which follow the mode and norm of substantives, as has been explained; but truly in the Third Part he treats of substantives which do not follow the norm of substantives but of adjectives, by signifying many forms in the same supposit.

It is rejected. A keen speculation indeed, but one which, when the matter is attentively considered, can easily be refuted by the reasoning with which above we confirmed our opinion. For the direct signified of a substantive name is a substantial form, not a supposit; nor does a substantive name by its imposition signify a supposit; therefore from the form, not from the supposit, ought singularity and plurality of the name to be taken. And that a substantive signify one nature in many supposits, or many in the same, matters little for saying that the primary imposition and signification of the name vary: for substantive names were from the beginning imposed to signify a substantial form in such wise that, although at that time only one supposit under one form was known, nevertheless after the revelation of the mystery of the Trinity nothing is changed in the primary signification and imposition of the name. Therefore substantive names, which now signify one form in three persons and by reason of the form are said of them in the singular, were imposed before the revelation of the mystery to signify in the same way: nor were they imposed for this, to signify one form in three; therefore it comes to the same thing if, after the imposition of the name, one form be found in many, as if it be found in three by its nature, or many forms in the same person, not by their nature but supervening upon it, as from either case we assert that the name is said in the plural or in the singular according to the unity or multitude of the form, when in the primary imposition of the name no account was had of many supposits, just as no account was had of many forms in the same person. Therefore no such substantive has been imposed to signify after the fashion of an adjective, as the aforesaid doctors maintain. And this suffices concerning the first rule which St. Thomas sets forth in this article.

Adjectival names ought to be predicated in the plural of the three persons, but of the one God in the singular.

Caput VIII - The second rule, about adjectives

It remains that we explain the second rule which the Holy Doctor set down in the same article concerning adjectives. And it is this, that the plurality and singularity of names must be taken from the singularity or plurality of supposits, not of forms. Incidentally we shall also say by what reason the substantive names of accidental forms take singularity or plurality. Now the reason for this rule is that which St. Thomas assigns there, namely, because they signify a form after the manner of something adjoined, that is, as had from another; therefore they take singularity and plurality from the supposit or subject to which they signify the form to be adjoined. And from this a difference is constituted between substantive and adjective names: that substantives, in the opposite way, signify the form as subsisting through itself, and thus as having from itself unity or plurality, and accordingly from that is taken the singularity and plurality of the name; but contrariwise in

adjectives it is taken from the subject or supposit to which they signify the form to be adjoined. And therefore adjectives directly signify subjects under such and such a form, and the same thing is said to be white as to be "having whiteness," and "omnipotent" as "having omnipotence," and in general every adjective is defined by "having" such or such a form; but a substantive, as "man," "God," since it does not signify a form as adjoining to another, but as having to be through itself, ought not to be rendered by "having" such a nature, as "God" by "having deity," and "man" by "having humanity," as will be shown more fully in the following disputation, cap. 3.

What mode of speaking follows from the aforesaid rule. This being posited, it follows that one could say three persons of the Trinity are three omnipotents, three equals, three immensities. Thus speaks the Lateran Council under Innocent III, and it is reported in the chapter "Firmiter," De summa Trinitate et fide catholica, where it says thus: the Father generating, the Son being born, the Holy Spirit proceeding - consubstantial, coequal, and co-omnipotent, and coeternal.[693] But when Athanasius in the Symbol says, not three omnipotents, but one omnipotent; not three immensities, but one immense; either he takes the names substantively, as St. Thomas noted in this article;[694] just as conversely St. Hilary used the name "authors" adjectivally, when in book 2 De Trinitate he called the Father and the Son "authors" of the Holy Spirit (for it is by no means necessary that these names be taken as substantives, that is, in a substantive sense, which would require neutral usage); or certainly, since adjectival names take singularity and plurality from the bearer of the form, because they signify precisely what "having" such or such a form signifies; and in God not only the supposit but also the divine nature in the concrete has omnipotence, indeed "omnipotent God" is said proximately, as common to the three persons; therefore we can say "three omnipotents," if we refer to the persons who are said secondarily to have omnipotence; and "one omnipotent" only, if we refer to the nature itself which is said primarily to be omnipotent. Therefore, when Athanasius said "not three omnipotents but one omnipotent," he did not deny three omnipotents in respect of the persons, but in respect of the nature; and looking only to the concrete nature he denied three omnipotents, that is, "gods," and he said that one only is to be conceded. And in the same mode of speaking is St. Augustine in the book On the Trinity, cap. 8.[695]

It must, however, be noted that there are certain substantive names which signify an accidental form, or after the manner of an accident - such as "artisan," "maker," "philosopher," "creator," "governor" - which on the one hand do not seem to follow the nature of adjectives, because we do not say that the three persons are "three creators," "three makers," but "one"; in which they follow the rule of substantive names, which are numbered or receive unity according to the form. Conversely, the same man having many arts is called "one artisan," and having many philosophies - moral, natural, and political - is called "one philosopher": in which these names seem to follow the norm of adjectives, which are numbered from the subject, not from the form, or are said in the singular. And by this very argument some use themselves against the rule of substantives which we proved in cap. 4.

693. Lateran Council under Innocent III, cap. Firmiter, De summa Trinitate et fide catholica.
694. St. Thomas, in this article.
695. St. Augustine, De Trinitate, book, cap. 8.

I say, therefore, that these names, even if they signify an accidental form in us, and in God a form or relation arriving in time, as "creator," "governor," "maker," because nevertheless they signify substantively, do not so much signify the form itself as the subsisting nature of that quality. I do not say "what has that form," but that they signify the very subsisting nature to which such a form of art or of creating, etc., belongs. And since in a man there is one nature, therefore he is called one philosopher, one artisan; and since in God there is one substantial nature and one individual of the Godhead, to which that denominating form belongs, therefore he is called one artisan, one creator, and one governor - even though there are many supposits - because this denomination from a form, as it were accidental, after the manner of the substantive does not extend beyond the substance itself and the nature of the thing subsisting through itself.

Nay rather, note that the name "Son" takes singularity or plurality from the supposit, not from the nature: and therefore Christ cannot be called "several sons," even if he have several filiations, as under an anathema Gregory Nazianzen defines in Oration 51;[696] and for the same reason it cannot be said that there is one Son from the Virgin and a different Son from the eternal Father. Either because the name is as it were adjectival (for it means the same as "begotten"), or because it is a name of a supposit when it is said in the concrete - even if some filiation belong to Christ by reason of the human nature - especially since the divine person, constituted by filiation, is called Son. Therefore, one who would say "two sons, not one," even if he held a catholic meaning, would ...

Articulus IV - Whether the essential names in the concrete can stand for the person.

It is objected that the essential names in the concrete cannot stand for the person so that this be true, "God begot God." Because (as the logicians say) a singular term signifies and supposes for the same. But this name, "God," seems to be a singular term, since it cannot be predicated in the plural, as was said above. Therefore, since it signifies the essence, it seems that it supposes for the essence and not for the person.

1. Further. A term set in the subject is not restricted by the term placed in the predicate by reason of signification, but only by reason of the time connoted. But when I say, "God creates," this name "God" supposes for the essence. Therefore, when it is said, "God begot," this term "God" cannot by reason of the notional predicate suppose for the person.
2. Further. If this is true, "God begot," because the Father begets, for the same reason this will be true, "God does not beget," because the Son does not beget. Therefore there is "God begetting" and "God not begetting." And thus it seems to follow that there are two gods.
3. Further. If God begot God, either himself as God, or another God; but not himself as God, because, as St. Augustine says in On the Trinity, no thing begets itself.[697] Nor another God, because there is but one God. Therefore this is false, "God begot God."

696. St. Gregory Nazianzen, Oration 51.
697. St. Augustine, De Trinitate.

4. Further. If God begot God, either God who is God the Father, or God who is not God the Father. If God who is God the Father, then God the Father is begotten, which is false. If God who is not God the Father, then there is God who is not God the Father. Which is false. Therefore it cannot be said that God begot God.

But on the contrary: In the Creed it is said, "God of God."

I answer that some have said that this name "God" and similar names properly according to their nature suppose for the essence, but from an added notional [predicate] are drawn to suppose for the person. And this opinion seems to have proceeded from a consideration of the divine simplicity, which requires that in God the having and the thing had be the same. And thus the having of deity, which this name "God" signifies, is the same as deity.

But in the properties of locutions, not only the thing signified is to be attended to, but also the mode of signifying. And therefore, because this name "God" signifies the divine essence as in one having it - just as this name "man" signifies humanity in a supposit - others have spoken better, that this name "God," from its mode of signifying, has that it can properly suppose for a person, just as also this name "man." Therefore sometimes this name "God" supposes for the essence, as when it is said, "God creates," because this predicate belongs to the subject by reason of the form signified, which is deity. But sometimes it supposes for a person: either for one only, as when it is said, "God begets"; or for two, as when it is said, "God spirates"; or for three, as when it is said, "To the King of the ages, immortal, invisible, to the only God," etc. (1 Tim 1:17).

Reply to the first: This name "God," although it agrees with singular terms in this, that the form signified is not multiplied, nevertheless it agrees with common terms in this, that the form signified is found in several supposits. Hence it is not necessary that it always suppose for the essence which it signifies.

Reply to the second: The objection proceeds against those who were saying that this name "God" does not have a natural supposition for the person.

Reply to the third: This name "God" is related to supposing for a person otherwise than this name "man." For the form signified by this name "man," that is, humanity, is really divided into diverse supposits; it of itself supposes for a person even if nothing be added which determines it to the person, which is a distinct supposit. But the unity or community of human nature is not according to the thing, but only according to consideration. Whence this term "man" does not suppose for the common nature, unless on account of the exigency of some addition, as when it is said, "man is a species." But the form signified by this name "God," namely the divine essence, is one and common according to the thing. Whence of itself it supposes for the common nature; yet by something added its supposition is determined to the person. Hence, when it is said, "God begets," by reason of the notional act this name "God" supposes for the person of the Father. But when we say, "God does not beget," nothing is added which determines this name to the person of the Son. Whence it is given to understand that generation is repugnant to the divine nature. But if something be added pertaining to the person of the Son, the locution will be true; as if it be said, "God begotten does not beget." Hence also it does not follow, "there is God begetting and God not

begetting," unless something be posited pertaining to the persons, as, for instance, if we say, "the Father is God begetting, and the Son is God not begetting"; and thus it does not follow that there are several gods, because the Father and the Son are one God, as has been said.

Reply to the fourth: This is false, "the Father begot himself God," because "himself" (being reciprocal) refers to the same supposit to which also "the Father" refers. Therefore it would follow that the Father begot himself. Which is false. And the negation is true, "he begot God who is not God the Father." But if the construction be understood not to be appositive, but that something is interposed, then conversely the affirmation would be true and the negation false; so that the sense would be, "he begot God, who is God, who is the Father." But this is an extorted exposition. Hence it is better that simply the affirmation be denied and the negation conceded. A certain prepositor said that both the negation and the affirmation are false: because this relative "who," in the affirmative can refer to the supposit, but in the negative it refers both to the thing signified and to the supposit. Hence the sense of the affirmative is, that to be God the Father belongs to the person of the Son. But the sense of the negative is, that to be God the Father is not only removed from the person of the Son, but also from his divinity. But this seems unreasonable, since according to the Philosopher, of the same of which there is an affirmation, there can also be a negation.[698]

The conclusion is that sometimes the name "God" is supposed for the nature, sometimes for the person. We shall examine this conclusion and the doctrine of the article more deeply in the following disputations. For as regards the text of the article, there is nothing which needs special remark.

- Two scholastic opinions.
- It is to be conceded that there is a concrete of the Godhead, although in another way than Cajetan posited; the truer opinion.
- The arguments for the first opinion are solved.
- Why we cannot say, "This God is this God."

Caput I - Two scholastic opinions.

Before we come to the supposition of this name "God," it is necessary to dispute whether "this God," which is wont to be called the concrete individual of the Godhead, so precedes the persons in thought that, before we understand the Father, the Son, and the Holy Spirit, we conceive this God, and of him we enunciate something.

Henry and many more recent Thomists, to the best of their ability, deny that such an individual concrete can be understood before the persons, or before the personal properties.[699] They prove the first point thus: the name "God," by which we signify that concrete, is the name of a supposit; for the same thing is "God" as "one having deity," as is clear from St. Thomas in the reply to the first of the preceding article, and from St. John Damascene, book 3 On the Faith, chapter 11 in fine, and

698. Aristotle, Peri Hermeneias, last chapter.
699. Henry of Ghent, Quodlibet V, q. 8; on the Sentences I, dist. 26, q. 1, n. 6; Durandus.

Nicetas, The Treasury, book 3, chapter 33.[700] But there is no common supposit which in thought precedes the three persons; therefore no such thing is the individual concrete of the Godhead. Next, if there were an individual concrete of the Godhead common to the three persons, there would also be a common individual of humanity, if one humanity were assumed by three; for the same reason seems to apply. But this cannot be; for it would follow that a man is assumed by three persons, not humanity; since, before humanity is understood in the persons, he is a man. Wherefore the same also would have happened in the assumption of humanity by the Word; but a man cannot be assumed, because a supposit would be assumed, as St. Thomas teaches in the Third Part, question 4, article 3.[701] Therefore such an individual is not to be conceded. Finally, if this concrete were granted, there would likewise be granted a concrete "spirator" common to the two spirating persons; but no one, or very few, concede this. Why then ought we to assert the individual of the Godhead?

Cajetan, however, in this article, and in the Third Part, question 2, article 2, around the solution to the third, and question 3, articles 2 and 3, not only builds up such an individual and the concrete of the Godhead prior to the persons, but even calls it a semi-supposit or a semi-person, lest, if he should say person or supposit, he should seem to introduce a quaternity in God.[702] He proves it by a twofold reason. One is that we enunciate many things of "this God" which do not belong to him by reason of the persons, but by reason of the essence: as when we say, "one God creates," and other things of that sort. Therefore that individual concrete of the essence is understood before the persons. For which reason St. Thomas in this article expressly noted that the name "God," in this proposition "God creates," is supposed for the nature, not for the person; and the same was taught by St. John Damascene and Nicetas in the places a little above alleged. But since it is not supposed for the abstract nature, therefore for the concrete of that [nature], which we now endeavor to prove. On account of this concrete, too, Cajetan says that that saying of Athanasius in the Creed is true: "The Father is God, the Son is God, the Holy Spirit is God; not, however, three gods, but one is God." Who then would dare to deny that there is in this way one God who is predicated in common of the three persons? The other reason is taken from his doctrine, which, as we have recalled in Disputation 125, chapter 2, holds that there is given a certain absolute subsistence of the deity, common to the three persons, which in thought is prior to the three personal subsistences. Since, therefore, the concrete of a nature seems to be nothing else than the nature subsisting, and before the three persons are understood the subsisting deity is understood, therefore here too "this God" in the concrete is also understood numerically.

Caput II - On the individual concrete of the deity prior to the persons

Moreover, if there were granted an individual concrete of the deity common to the three persons, there would also be a common individual of the humanity, if one humanity were assumed by three; for the same reason seems to hold. But this cannot be; because it would follow that a man

700. St. John Damascene, De fide orthodoxa, book 3, cap. 11, in fine; Nicetas, Thesaurus, book 3, cap. 33.
701. St. Thomas, Summa theologiae, III, q. 4, a. 3.

would be assumed by three persons, not the human nature; for, before the humanity be understood in persons, there is already a man: wherefore the same would have happened now in the assumption of the humanity by the Word. But a man is not assumed, because a supposit (*suppositum*) would be assumed, as St. Thomas teaches in the Third Part, question 4, article 3; therefore such an individual is not to be conceded.[703]

Finally, if this concrete were granted, there would also be granted the concrete of the spirator common to the two spirating persons; but this none, or scarcely any, grant: why then ought we to assert also the individual of the deity?

Cajetan, however, in this article and in the Third, not only constructs such an individual, a concrete supposit of the deity prior to the persons; but further he calls it a semi-supposit (*semi-suppositum*), or semi-person, lest, if he said person or supposit, he might seem to introduce a quaternity in God. But he proves it by a twofold reason. The first is, that we enunciate many things of this God, which do not belong by reason of the persons, but by reason of the essence (*essentia*): as when we say, one is creator, and other things of that sort: therefore an individual as the concrete of the essence is understood prior to the persons. For which reason St. Thomas in this article expressly noted that the name "God," in that proposition, "God creates," stands for the nature, not for the person; the same is taught by St. John Damascene and by Nicetas in the places a little above alleged.[704] And yet it does not stand for an abstract nature; therefore it stands for the concrete of that nature, which we now are striving to prove. On account of this concrete Cajetan says that what Athanasius says in the Symbol is true, "the Father is God, the Son is God, the Spirit is God, not three gods, but one God." Who then will deny that there is now one God in the way that is predicated commonly of the three persons?

The other reason is taken from his doctrine, which, as we recalled above in Disputation 125, chapter 2, holds that there is given a certain absolute subsistence (*subsistentia*) of the deity common to the three persons, which in thought is prior to the personal subsistences. Since the concrete of a nature seems to be nothing else than the nature subsisting, and before the three persons are understood the subsisting deity is understood, therefore here too "God" in the concrete is understood numerically, and for that reason it is called a semi-person, because it is subsistent; but because it does not yet subsist incommunicably, it is not a perfect and complete person. Hence Cajetan further infers that this individual is peculiar to the divine nature and does not befit any created nature: wherefore, if the human nature were assumed by three (he himself says), it would not have such a concrete before it were understood in persons; because, since such an individual is constituted by nature and common subsistence, and this belongs only to the divine nature by reason of infinity (for other natures subsist only by the subsistence of a supposit), only in it, and not in another nature, can such a concrete be assigned.[705]

705. Cajetan, on this article; and on Summa theologiae, III, q. 2, a. 2 (solution to the third), and q. 3, a. 2 - 3.

However, before we set forth our own position, it pleases me incidentally to note something against Cajetan, either against the concrete of the deity, or at least against his reason for it, and to collect the same against any other nature. For if three persons were to assume one humanity, we would enunciate such propositions about that one man as we affirm about the one God who is in three: for we would say, "This one man sits, walks, eats," etc.; we would also say, "The Father is man, the Son is man, the Holy Spirit is man," and yet not three men, but one man. But as for the common subsistence, by reason of which Cajetan constitutes that concrete individual of the deity, we said quite sufficiently above in Disputation 125, chapter 3, where I proved, that there is no such common thing which deserves the name subsistence, nor is there anything of this sort by reason of which the concrete of the deity could be constituted; because there is only the common existence (*esse commune*), by which the deity and any nature is approved to exist.[706] Finally, Cajetan improperly calls that individual a semi-person, since no one until now has used this word: indeed, if he retained the mode of speaking which he usurped about the common subsistence, he ought to call it in full a supposit. For just as he called the act of existence (*esse*) of the divine nature itself "subsistence," not "semi-subsistence," so that which is constituted by it he ought not to call a semi-supposit, nor a semi-hypostasis, but absolutely a supposit and hypostasis (*hypostasis*), especially since it is the same as subsistence and that which hypostasis is, if you render the word by word.

That a concrete of the deity must be conceded, although in another way than Cajetan posited, is the truer opinion.

I for my part think it necessary to concede that the individual concrete of the deity, in our thought, is prior to the persons; although by a very different reason than that by which Cajetan asserted it; and in the same way, if one created nature were assumed by many persons; and in any nature with respect to its supposit. First, I think this kind of concrete must be conceded as necessary on account of those various enunciations which Cajetan mentioned, which are not only to be conceded in the divine nature, but also in the human, if one were assumed by three. There are also many others, even when we use notional terms and words, in which such a concrete must necessarily be understood, and the name must stand for it.

Second, that this concrete cannot in its concept include the persons in the singular is plain; because, if to the constitution of the concrete of the deity which we call "God" there belonged the three persons in the singular, even in the oblique case, neither would three be said to be one God, nor would God be common to the three persons. For that which in its own concept includes these three supposits in particular cannot be common to the three and befit each one; and so Thomists who concede this individual of the deity, and say that of its very ratio are the persons themselves, or include them in its concept, cannot but fall into those absurdities which we have mentioned.

Third, that this individual in our thought is prior to the persons can readily be proved and explained from the doctrine of the preceding disputation, chapter 4. For when we say that concrete names of natures, such as "man" and "God," directly signify the nature and connote the person in which the nature subsists, this must be understood so that it does not connote this or that person

706. Gabriel Vázquez, Disputation 125, c. 3.

in particular, that is, this or that singular supposit, but universally this or that person or supposit. For just as we said above that the concretes of natures are not counted by the connoted element, but by the directly signified, so also the demonstrative pronoun does not demonstrate the connoted, but the directly signified; and thus it is said "this man," not because he is in this supposit, but because this nature is in this or that supposit. And therefore we say "this God" numerically, demonstrating the nature, not the persons: for if we demonstrated them, it would not be said "this God" which was and was demonstrated before the revelation of the mystery, when it was not established concerning the three persons, which is absurd. Therefore, since the word "God" and "this God," which are concrete names of the deity, signify altogether the same thing after the revelation of the mystery of the three persons, it follows that before the revelation those concretes did not connote this or that person in particular, but the person universally; and the same reason will be of all the others: for when the connoted element is changed, the signification of the name is also changed; nor can it be said that what is signified by the name is the same when a change has been made in the connoted element. Whence it is that the concrete of the deity is prior in our thought to the persons, with that kind of priority with which the universal is prior to the particular; as "animal" is said to be prior to the particular, namely, to "man"; about which Aristotle in the Predicaments, in the chapter on the modes of prior, treats.[707] Therefore we rightly understand "this God" before we think this and that person of the Trinity. But that the connoted element is common does not hinder the name "God," or the name "this God" or "this man," from being singular. For a name is said to be singular from the directly signified, not from the connoted; although for forming an expository syllogism it is not a fit middle term, as we noted in Disputation 123, chapter 3. And from this it is evident that a concrete of the deity is assigned by us otherwise than by Cajetan and the other Thomists.[708]

Likewise the same must be said of human things and of creatures. Fourth, in the same way it follows that there is an individual of the humanity and of any nature, which in our thought is prior to the persons. Because the concretes of other natures are signified with the connotation of a supposit not in the singular, but universally, just as the concrete of the deity; for the same reason is of all: therefore the concrete, as something common on the part of the connoted, precedes in our consideration the persons. And thus, if one humanity were assumed by three persons, the concrete of the humanity would be demonstrated absolutely in the same way, and we would say "this man," not pointing out this or that person in particular; just as we have shown that the concrete of the deity is demonstrated without a singular person being demonstrated.

707. Aristotle, Categories, on the modes of the prior.
708. Gabriel Vázquez, Disputation 123, c. 3.

Caput III - The arguments for the first opinion are solved

Setting aside the reasons of Cajetan which, as we saw in the first and in the second chapter, only prove that there is given a concrete of the deity prior to the persons in our consideration, not in the same way in which he constitutes it; it remains to solve the arguments which are brought forward for the opinion of Durandus and Henry in chapter 1.

Reply to the first argument from the authority of St. Thomas, St. John Damascene, and Nicetas, who interpret the concrete name "God" or "man" by these names, "having deity," or "having humanity": I answer that these two are not of the same signification, "God" and "having deity," and I think the same of other concrete substantives. For, as we shall say in the following disputation, many absurdities would follow in the mode of speaking about the mystery of the Trinity. We would then say that there are three gods, because there are three "havings" of deity; and it would follow that God generates another God, because one "having deity" generates another "having deity": and since St. Thomas admits in the reply to the third of this question that we must not say "three gods," although we say "three having deity," because "having deity" signifies adjectivally, whereas "God" signifies substantively; he plainly grants that those two names do not signify the same in the same mode, just as an adjective and a substantive are never of the same signification. Therefore when those two Fathers said that "God" is "one having deity," they did not think the mode of signifying entirely equal on both sides; but they said this to show that it is not licit to use the word "deity" abstractly for a person, that is, to predicate of it what is said of a person, because the abstract is understood; but truly, because the name "God" is placed in any person, it is said of it what we enunciate of a person; because it signifies the nature conjoined with the person. Thus says St. John Damascene, from whom Nicetas took the same thing. But the word "God" signifies both the community of the nature and it is placed in each person, just as "man": for God is he who is endowed with the divine nature, and man he who is endowed with the human; and if he were to say that therefore the name "God" is placed in any person, this is, that it is said of it what we enunciate of any person, because he who is endowed with the divine nature is God. Wherefore he does not expound the concrete "God" by "having deity," nor does he predicate "God" of one having deity, so that again he might enunciate of God what befits the person. Therefore the proposition of St. John Damascene must be understood, as it were, by conversion. But when it is said in the argument that the name "God" is a name of the supposit, it must plainly be denied: but it must be said to be a name of the nature, connoting the supposit; nor do we only say that there is not given a common supposit, but also that common concrete cannot rightly be called a semi-supposit, or semi-person, as against Cajetan I noted in chapter 1.[704]

Reply to the second: we concede that there is also given an individual concrete of the humanity, just as of the deity: but from this it does not follow that "man" was assumed by God. For although "man" precedes in our thought this or that particular supposit, nevertheless it does not precede a supposit in general. Wherefore, if before the humanity were assumed by the Word, "man" were

704. St. Thomas, Summa theologiae, I, q. 39, a. 3 ad 1; St. John Damascene, De fide orthodoxa, III, c. 11; Nicetas, Thesaurus, III, c. 33.

already understood, the humanity would be understood to be in some supposit: but it cannot be understood to be in any other, for it was in none other, nor did it remain in any, except in the divine; therefore Christ did not assume "a man," since the nature alone did he assume, which previously could not be thought as suppositated in any manner. If he assumed a nature previously suppositated either by a proper supposit or by some other divine person, it would not be said that he assumed a man; because he would not terminate that nature inasmuch as it was suppositated in another supposit, but only inasmuch as the humanity was, as we shall show at length in the Third Part, q. 4, a. 3.[703]

Reply to the third: we gladly concede likewise that, in the same way, there is not the concrete of "spirator," just as of "God," constituted as Gabriel related in Disputation 149, chapter 4; for he asserts that it is constituted from the essence and active spiration, as from a property contracting; but by that very way by which we have conceded the individual of the deity, namely, that the spirator be the nature with the common property of spirating, connoting the supposit in the oblique case. And because the Spirit proceeds of himself from the Father and the Son as from two spirating, because he is their mutual love, therefore the concrete "spirator" will connote two supposits, not this or that particular one. Wherefore, if in other two persons there were the same in number nature and property, they would by the very same be "spirator": because this concrete, by the force of its signification, does not express this or that person; and yet it must be said that paternity and filiation belong of themselves to the production of the Holy Spirit, because they are the very objects of such love by which the Holy Spirit proceeds.[709]

By what reason we may say, "This God is this God."

Caput IV - On the sense of the proposition "This God is this God"

Canarensis, in the Third Part, on the commentary of the present article, does not well hold this proposition, "This God is this God," neither that it must be absolutely denied nor that it must be absolutely conceded; but that, a distinction being applied, it must both be denied and conceded. Lest, if we were to concede it absolutely, we should seem to prop up the error of the Gentiles asserting many gods; nor, if we were to deny it absolutely, should we seem, with Sabellius, to confound the persons. For some incautiously used to say that it must be conceded, others indeed that it must be denied, showing the Father on the part of the subject and the Son, or another person, on the part of the predicate. Either therefore the sense is (says Canus): "The Father, who is God, is the Son, who is God"; and in this way he thinks it must be denied: or the sense is, "The Father and the Son are the same God"; and thus he thinks it must be altogether conceded. He thinks the same of this proposition, "God generating is God generated." For if you render this sense, "The Father, who begets, is the Son, who is begotten," the proposition is false; but if the

703. St. Thomas, Summa theologiae, III, q. 4, a. 3.
709. Gabriel Vázquez, Disputation 149, c. 4.

sense be, "The Father begetting and the Son begotten are the same God," it is true; the same of this, "This spirator is this spirated," with respect to the Father and the Son; and of this, "This man is this man," if one humanity were in three persons.

But I for my part think that the sense of the aforesaid proposition is plain, if we rightly hold the signified of this concrete "God": for since "God" cannot directly signify the person, unless a notional term be added to it, the proposition, "This God is this God," will be true, if the name "God" be modified by the pronoun "this," and not set appositively, as grammarians speak. For, as we said above, just as numerical names follow the unity or multitude of form, because in these concretes of natures, substantive names signify only the form directly, and therefore, where there is one form and nature as in God, names of multitude cannot be conjoined, but singular ones; so also the demonstrative pronoun "this" cannot demonstrate the persons (for these are not signified by that name, but connoted), but demonstrates the nature and the concrete of the deity, which, since it is one, always, either on the part of the predicate or on the part of the subject, demonstrates the same God. Therefore the proposition, "This God is this God," will be true and not to be distinguished as Canarensis distinguishes; and it is not possible to demonstrate the Father on the part of the subject and the Son on the part of the predicate, or the contrary: for if this were truly possible, we could also say, "This God is not this God," and it would follow that there is a different and another God, and consequently two gods, of whom the one would not be the other. Then we would say, "These two are the Father and the Son," of whom to say -

on the contrary:

We would be saying, "This God is not God." These are plainly absurd, and against the legitimate signification of the word.

I answer:

Yet I said that this is to be understood when the pronoun "this" affects the noun "God." For if "God" is set appositively, so that the sense is, "This, who is God, is this, who is God," the proposition is to be denied, if on the part of the subject it demonstrates the Son, and on the part of the predicate it demonstrates the Father. For "this," absolutely placed, demonstrates the supposit according to the rules handed down in Disputation 145, chapter 6.[710] Then the name "God," appositively, signifies the same as if you were to say, "Who is God"; but in this way that sense is false, and the negative proposition is true; as if we were to say, "The Son, who is God, is not the Father, who is God." But this sense is not the common one, and it must be distinguished by the mode of utterance and the point of position. The very same judgment must be given about this proposition, "This spirator is not this spirator": for there is an individual of "spirator," as we said in the preceding chapter.

Finally, in the same proportion one must speak about that proposition, "God begotten is God begetting." For either the word "begotten" is placed appositively, and it is true; the sense is, "God, who is begotten, is God, who is begetting": for since there is one God who is at once begotten and

710. Gabriel Vázquez, Disputation 145, c. 6.

begetting, it is rightly said, "God, who is begotten, is God, who is begetting"; for there is not one God who is begotten, and another God who is begetting. But if that word "begotten" is not set appositively, and the word "begetting" likewise, the proposition is false; for in this way those words affect the term "God" so as to make it supposit for Father and Son: for notional terms added to essential ones sometimes make them supposit for a person, as will be clear in the following disputation. But one must not judge in the same way about this proposition, "Begetting God is begotten God," because whether the name "God" is set appositively, or is affected by other words, it is always false. For whether you say, "Begetting God is begotten God," that is, "the Father is the Son"; or, "the begetter, who is God, is the begotten, or the Son, who is God," it is always a false assertion.

It is objected:

But someone may object to us with Anselm, who in the tract On the Incarnation of the Word, chapter 6, teaches that when one says, "This man," or, "that man," now the person is shown; just as with a proper name one names "Christ," or "Peter": therefore likewise, when one says, "This God," the same person is shown, and so we could show various persons by this name, as by this name "This man," so that one might not be predicated of another: in the same way as if we were to say, "This man," with Peter pointed out, "is not this man," with John pointed out.

It is answered:

We reply that Anselm taught only this, to assign a discrimination between universal names, as the object "man," and singulars, as "this man": because universals can in no way be taken for a person; but singulars indeed, as "this man," since they demonstrate a contracted nature, demonstrate it in a supposit, not that they directly show the supposit.

Which of these propositions, "God generates," "God does not generate," is true, which is false. Disputation 157.

By what reason the more ancient Scholastics say the affirmative proposition is true. Chapter 1.

The negative proposition is held to be true by Durandus and the Nominalists. Chapter 2.

The truer opinion, which asserts that the aforesaid propositions are contradictory, and that the affirmative is true, the negative indeed false, is variously proved by the Scholastics. Chapter 3.

The same opinion is shown by the best reason. Chapter 4.

Certain objections against this supposition of the name "God" are dissolved. Chapter 5.

The name "God," unless something be added to it, is always used to supposit for the concrete individual of the Godhead. Chapter 6.

What must be thought about this proposition, "God begot another God." Chapter 7.

Disputatio CLVII - Which of the propositions "God generates" and "God does not generate" is true

Caput I - Why the ancients said the affirmative proposition is true

There is no one among the Scholastics who says that the affirmative proposition "God generates" is not true: about the supposition of the name "God" in that proposition they do not agree. For St. Thomas in this article and in I, dist. 4, q. 1, a. 2; St. Bonaventure, q. 4; Gabriel, q. 1, article 1, note 6; Gregory, in the single question; Capreolus, question 1, article 3, to the second and the third; and the last of Aureolus; and Aureolus in the first question; and Canariensis in part 2 of the commentary on this article, hold that the name "God," when it is placed absolutely without any additum, supposits for the essence of God, understood concretely: but when a notional term is added, it determines it so that it supposits for some person according to that which the term postulates.[711]

They think the same about other propositions in which some notional act is enunciated about God.

Nor indeed did St. Thomas in this article in the solution to the third think that the name "God" is always used to supposit for the person, at least confusedly, as Cajetan very well noted on this article in his reply to doubts about the third solution: for he merely asserts that sometimes it is used to supposit for the person, namely when a notional term is added. And in the reply to the second he answers that that argument has force only against those who assert that the name "God" cannot have natural supposition for the person, as if to say: we concede that sometimes it supposits for the person; yet for that reason he does not affirm that it always supposits for it. And in I, dist. 4, q. 1, a. 2, he says, "The name 'God' not only imports the nature, but the supposit indistinctly; and therefore of itself has it, that it can supposit properly for the person." He did not say that it actually always supposits for the person, but that it can, because it confusedly imports the supposit, as he says. For as we noted in the preceding disputation, since a concrete name of a nature connotes the supposit vaguely, it is rightly said that a name of nature imports a supposit, and accordingly St. Thomas judges that, not always, but sometimes, it is used to supposit for it. But Capreolus, who in the place cited thinks the aforesaid proposition to be true, also teaches that the name "God" not only distinctly supposits for the person when a notional term is added, as in that proposition, but also that it always, at least confusedly, supposits for the person, in whatever way it is placed.

Caput II - The opinion of Durandus and the Nominalists that the negative is true

About the other proposition, "God does not generate," there is greater dissension among the Scholastics. For Durandus in I, dist. 4, q. 2, n. 12 and following; Aureolus, question 1, as is reported by Capreolus in the place cited; Gabriel, question c., article 2, conclusion 2; Gregory, in the single

question, in the verse "But a doubt remains"; and Marsilius in I, question 8, article 3, to the second principal reason, affirm that, the propriety of the words being maintained, this proposition "God does not generate" is no less true than the affirmative; but that it should be denied on account of scandal, lest we seem to deny generation in God.

Gabr. proves the first point thus: since the subject of these propositions, which is "God," is not an entirely singular term, but in some way common, and therefore is not a fit middle in an expository syllogism, as was said in Disputation 123, chapter 3,[712] and is not distributed in any of the aforesaid propositions, the propositions will not be contradictory, nor contrary, but subcontrary, as the logicians say: as these, "A man runs," "A man does not run"; therefore it is not necessary, if the affirmative is true, that the negative be false: for both can be true at once according to the rules of the logicians: therefore just as this is true, "A man does not run," one man not running, even if others run; because the term "man" is common and signifies this man and that indistinctly: so also this will be true, "God does not generate"; because the term "God" is common, signifying this person and that not distinctly, and one of those persons does not generate.

From this community of the name Durandus gathers, number 10, that it is not the same thing to prepose the negation to the proposition or to postpose it. For if it be preposed in this way, "Not God generates," it is the contradictor of the affirmative, and hence false; just as if it were preposed to that proposition, "A man runs," it would be made the contradictor of the affirmative, and hence false, if the affirmative were true, or conversely; whereas with the negation postposed it is made only subcontrary, and can be true at the same time: for it makes very much difference whether the negation be preposed or postposed, whenever the subject of the proposition is not an entirely singular term: for if it is singular, it is all one. But if the term "God" is entirely singular, then whatever things are denied of God are also denied of every person; and on that account the proposition "God does not generate" is false: and by the same reasoning whatever is enunciated of this term will also be said of every supposit. Wherefore if this is true, "God generates," this also will be true, "The Son generates," which is absurd. But St. Thomas, in the place of the First Book of the Sentences cited, says that the name "God" is partly singular and partly common; and by reason of commonness it is enunciated essentially of the supposits, and whatever is said of the supposits is also affirmed of him, namely of God; by reason of singularity, however, it has it that the negation and the affirmation about him are set in contradictory opposition and not in subcontrary. Wherefore if this is true, "God generates," as all admit, this must be false, "God does not generate."

So teach St. Thomas in this article ad 3, and in I, dist. 4, q. 1, a. 2, ad 3; St. Bonaventure, question 1, ad 3; Capreolus, question 1, article 2; Cajetan, and more recent theologians on this article; and Canariensis in part 3 of the commentary, doubt 2.[713] Yet to render the proper reason of this seems difficult. First, St. Bonaventure says that the name "God" is singular; and therefore it

amounts to the same thing to prepose the negation by saying, "Not God generates," and already to postpose it by saying, "God does not generate": but that proposition, "Not God generates," is manifestly false; for it removes generation from God in any supposit, as if we could say, "No God generates": therefore that will also be false, "God does not generate." To this reason, however, the things that in the previous chapter were adduced from Durandus, to prove that the name "God" is not entirely singular, seem to stand in the way, to which we must give satisfaction.

St. Thomas in this article ad 3 assigns another reason. He says, therefore, that in that proposition "God generates" the name "God" is narrowed by reason of the notional term adjoined on the part of the predicate, so that it supposits for the person of the Father; but in that, "God does not generate," unless by an added reason a like restriction could be made, so that it would supposit for the person of the Son. Wherefore, in my judgment, that proposition of the divine nature confusedly - namely, for that nature in any supposit - repugns generation; this being posited, "God," no determination being made, is used to supposit for the nature. This reason, followed by Cajetan on this article around the solution to the third, replying to the first and second of Aureolus, teaches that the name "God" in the negative proposition is used to supposit for the undetermined concrete of the Godhead, in consequence of which there arises a dispute about the force of the expression, and thus that it is false, which signification St. Thomas wishes, not contending in any way to equal its force with generation. With whom Capreolus seems to agree in I, dist. 4, q. 1, a. 2; for he says that in the negative proposition the name "God" supposits "for the thing of nature confusedly," that is, for the supposit indistinctly.

But many follow Cajetan: Soto, book 5 of the Summulae, part ..., in the chapter "De electione," question, notation 3.[714] Canariensis rejects this reasoning in many ways, from which this argument seems effectual: If the name "God" in the affirmative proposition were used to supposit for the per -

Caput III - On the contradictory status of "God generates" and "God does not generate"

If the name "God" in the affirmative supposits for the person of the Father, and in the negative for the concrete individual of the Godhead, it would follow that the propositions "God generates" and "God does not generate" are not contradictories; because they are not about the same subject, which seems absurd. And indeed St. Thomas clearly asserted that they are contradictories, and St. Bonaventure agreed, when he said that it is the same thing to prepose the negation as to postpone it, because the term is altogether singular: with the negation prefixed, there is truly a contradiction; or at least, if a contradictory were to be assigned to this proposition "God generates," it ought to be this one, "the Father does not generate"; because in the affirmative "God" supposits for the Father. But who will say that we can assign a contradiction with the same terms? Or that the contradictory of this, "God generates," must necessarily be this, "the Father does not generate"? Or who will deny that it is altogether the same to prepose and to postpone the negation to this term "God"? For we signify the same thing when we say, "Not God generates," and "God does not generate."

714. Domingo de Soto, Summulae, book 5, part..., in cap. De electione, q., notation 3.

Next, Cajetan does not sufficiently prove why the name "God" in the affirmative proposition is determined by reason of that predicate, "generates," so as to supposit for the Father; and why in the negative it cannot be determined by that predicate, "does not generate," so as to supposit for the Son and the Holy Spirit. For it is no less proper to the Son and the Holy Spirit alone not to generate, than it is to the Father alone to generate.

But let us hear the reason of Cajetan: In the affirmative (he says) therefore the name "God" is restricted by reason of that predicate, so as to supposit for the Father alone; because to generate is proper to the Father alone. But "not to generate" is not proper to the Son and the Holy Spirit alone; it is also proper to the essence, and therefore the name "God" cannot be determined by such a predicate, so that it supposits for the Son and the Holy Spirit alone. But since "not to generate" belongs only to the essence as noted abstractly, whereas as signified concretely; for the divine essence is rather said concretely to generate, that is, "God," or the individual of the Godhead - as will be proved below from the same Cajetan - it follows that in that proposition, "God does not generate," that predicate "does not generate" can determine the subject "God," so that it supposits for the Son and the Holy Spirit, to whom alone it belongs not to generate. Then also, if that predicate "does not generate" belongs to the divine nature signified concretely, it follows that that proposition, "God does not generate," will be true, if the subject "God" supposits for the concrete individual of the Godhead; the opposite of which was taught by Cajetan. Or it must be said that the name "God" in that negative proposition supposits neither for the individual of the Godhead nor for the Son and the Holy Spirit, but for the person of the Father; because it cannot supposit for another: but why shall we say it supposits rather for the Father than for the Son and the Holy Spirit?

Moreover, since we truly say, "God is begotten," "God is unbegotten," if "unbegotten" is taken notionally for the property of the Father, a reason must still be given why it is not permitted to say, "God generates," "God does not generate," since "to generate" and "not to generate" seem to be the same as "begotten" and "unbegotten."

Finally, the Canariensis thus interprets the mind of the holy Doctor in both: that in each proposition the name "God" supposits for the person of the Father, and therefore there is truly a contradiction, "God generates," "God does not generate"; the former being true, the latter false. He infers this from the fact that in the text, in solution 3, he said that in the negative there is no term by reason of which the name "God" could be determined so as to supposit for the person of the Son. He did not say (says the Canariensis) "for the person of the Father," because he did not intend to exclude the name "God" from supposition for that, but only for the person of the Son. The Canariensis is further persuaded of this because we cannot deny that those two propositions are contradictories, as St. Thomas and the others cited above admit; but in the affirmative the name "God" supposits for the person of the Father: therefore it will be the same in the negative, because they are about the same subject.

Yet this reasoning and the doctrine of the Canariensis do not satisfy me: for although a common term in an affirmative and true proposition could be determined so as to supposit for some singular - for instance, if we were to say, "Some man runs," the subject "man" could be determined

for Peter running - nevertheless in the negative proposition, "Man does not run," it cannot happen that it is determined for the same singular for which it supposited in the affirmative: for he who says, "Man does not run," does not determine him who runs, but vaguely this one or another. Therefore similarly, although the term "God," in a certain manner common to the persons, would be determined in the affirmative by the addition of that predicate, for the Father who generates, nevertheless it cannot be that in the negative it is determined for the same; but of itself it is put indiscriminately for the Father or for another person. And truly, this interpretation which the Canariensis applies to the text of St. Thomas is not according to his mind, as will appear below.

Further defense of the same opinion

The same opinion is shown by the best reason.

Caput IV - The logical supposition of the name "God" in "God generates" and "God does not generate"

Further, in order to show as well the truth of that proposition "God generates" as the falsity of that one "God does not generate," first we must see for what the name "God" supposits in each proposition, and to that end a definition of supposition must be premised. Now supposition, as Peter of Spain teaches in the Summulae, is the acceptance of a term for something of which the proposition is true. Other logicians thus define it: for a term in a proposition to supposit for some thing is nothing else than that the term be placed in the proposition and the thing which it signifies exist, as the copula of the proposition denotes. For if the term is put for a thing which is not, they truly say it is not supposed; wherefore many logicians think that in this proposition, "Man is disputing," when Peter is disputing, the subject "man" supposits for Peter, by reason of whom the enunciation is true. And in this way they teach that the signification of the name extends more widely than supposition: because signification comprehends all the things which the word according to its imposition has been wont to denote; but supposition is a determinate signification for that thing alone by reason of which the enunciation is true.

But since such is the nature of words that they are substituted for concepts and things, I think that there is nothing else to the supposition of a name than the subrogation of it in the place of the thing: and this is the same as signification. For, in order to make present to the hearer the thing which we conceive in mind, we supposit by the voice. Which my view has this consequence, that the signification of the name extends as widely - in fact is entirely the same - as supposition. Whence it happens that, in the aforesaid proposition, "Man is disputing," if Peter alone is disputing, the term does not supposit for Peter, but for the concept of man vaguely and indefinitely. For although the proposition is true of Peter alone, nevertheless the word equally signifies him and another, and it is enunciated indiscriminately of this man or that one, although for the truth of the proposition it suffices that Peter dispute.

From this account it is easy to gather for what the name "God" supposits in those two propositions: it supposits for that which it signifies; and since the name "God" of itself signifies the concrete individual of the Godhead, as was explained in the preceding disputation, and that is the very divine nature directly signified with a connotation of person indistinctly and in general, it follows that in those two propositions the name "God" supposits for that individual directly, connoting a person confusedly. Wherefore to affirm generation of it will be true; but to deny it will be false; and in this affirmation and negation there will truly be a contradiction. It is not necessary, however, to assert that the name "God" in the affirmative proposition supposits for the person of the Father, but for the concrete, with some person vaguely connoted; although by reason of one determinate, namely the Father, the proposition is rendered true. Why, moreover, the negative is false, when that name "God" supposits for that concrete, we shall say a little below.

This is our view; it is that of Scotus in the first Book, distinction 7, question 1, s. quia autem, where he asserts that the name "God" in the affirmative proposition supposits for that concrete individual of the Godhead.[715] Cajetan also agrees in the following article around solution 3, when he says that the name "God" can be supposed in this way in the affirmative proposition; although he also says it can be supposed for the person of the Father. But in this latter way without doubt Cajetan does not take supposition for the whole signification of the name absolutely, but only for that part by which the proposition is rendered true; which we do not deny; nor does St. Thomas dissent in the places cited. For in this article in solution 3 he therefore asserts that this proposition "God does not generate" is false, because that negation removes generation from the divine nature in whatever person; which is true for no other reason, unless because "God" concretely connotes persons vaguely and directly signifies the nature. Wherefore he who denies generation of God, denies it of the divine nature, in whatever person he denies it. Nor does it stand in the way that he says of the same name "God," in the body of the article, that in the affirmative proposition it supposits for the Father: for he takes "supposition" in that place not for the whole signification of the name, but for that part by which the proposition is rendered true. But if the discourse were about signification, the holy Doctor would not deny that this name signifies the same in the affirmative as in the negative proposition - namely, the divine nature concretely, connoting persons indefinitely. For since he grants that those propositions are contradictories, he must admit that in each the name "God" signifies the same; otherwise there would not be an affirmation and negation about the same, and therefore neither would those propositions be able to have the relation of contradictories.

I answer: the direct signification of the name "God" is not persons, but the nature; but persons are by it indirectly and indistinctly connoted, as we said in the preceding chapter. Wherefore this name, by reason of its direct signification, is most singular, but by reason of its connotation it has a certain commonness. And since a universal and a particular sign, such as "every," "no," "some," affects the direct signification of a name, it follows that to this term "God" no sign of this sort can be adjoined: for these can only affect words that are common by reason of their direct signification; whereas, when it is added to a name, they modify its direct signification, as we noted in the

715. Scotus, In I Sent., d. 7, q. 1, s. "quia autem".

disputation of the preceding chapter, last section, about the demonstrative pronoun. And therefore we cannot say "no God," "every God," "some God"; for then we would denote that there are many gods directly signified by that name. Yet we can add to the connotata whatever signs you please; for we can say, God in some person begets, in every person he does not beget, etc., because on the side of the connotatum there is a certain community.

Hence it follows that, for the truth of that affirmative proposition, "God begets," it is enough if the divine nature begets in one person. For, that an affirmative proposition of some singular subject be true, it is enough that in some way the predicate belong to it; as when we say, "Peter disputes" or "walks": for the proposition to be true, it suffices that Peter dispute or walk in some place, since there is no sign distributing for every place. Yet for the truth of the negative, "God does not beget," it is necessary that God in no person beget; for the negative particle "not" has the force of distributing. And although, when "not" is placed after a common term, it does not affect that term nor distribute it, but only the words to which it is prefixed; when placed after, it distributes the connotata of that term and denies the predicate in every way and respect, because the term is singular and does not admit of any division as a common term does. Wherefore he who says, "God does not beget," denies generation of the whole God, so as to deny it to him absolutely, and therefore in every person. Just as he who says, "Peter does not walk" or "does not dispute," signifies that he neither disputes nor walks in any place or time: so then it affects the predicate, as altogether to remove it from the subject. For if it belongs to God in some person to beget, how will it be true "not to beget"?

Hence it follows that this syllogism is not legitimate: The Son is not the Father; the Son is God; therefore God is not the Father. For this conclusion, "God is not the Father," is universal on the side of the connotatum of this name "God," and the term "God," by reason of the connotatum, is in a certain way distributed; for it makes this sense, "God in no person is Father"; and yet that same term "God" was in no way distributed in the antecedent: for in the minor, "The Son is God," the term "God" is not distributed by reason of itself, as is clear, nor by reason of the connotatum; for the sense is not, "God is in every person," but "in some person." A similar syllogism is this: The Son does not beget; the Son is God; therefore God does not beget; and it has the same defect.

From what has been said the argument of Durandus is also easily dissolved. I answer, therefore, that these two propositions, "God begets," "God does not beget," are not subcontraries, as these are, "man disputes," "man does not dispute," but truly contradictories, because the term "God" is singular according to its direct signification, and the particle "not" denies the predicate absolutely and according to every connotatum; whereas the name "man" is common, and therefore those propositions of this word are subcontraries. And by the same reasoning, since the term "God" is singular by reason of the direct signification, it is the same (as Bonaventure noted, cap. 3, cited above) to prefix the negation to it or to postfix it: for in either way the predicate is denied of the subject in every way, because it is denied of the whole of that which is singular - contrary to what Durandus contended in his very first argument.[716]

716. St. Bonaventure, cap. 3 (as cited above).

This doctrine is rightly explained by the single example which Durandus uses against us, and is aptly retorted upon his very argument. For the name "Christ," which according to the sentence of Durandus and of the common run of theologians, as St. John Damascene seems to have taught (On the Orthodox Faith III, c. 3) and Nicetas (Thesaurus, III, c. 3), is the name of a person connoting two natures in him; and since with respect to one he dies, with respect to the other he does not die - just as God in one person begets, in another does not beget - we truly say, "Christ died," yet it is not true to assert, "Christ dead"; because he who of Christ absolutely denies death, denies it in whatever nature; since, he being a singular term, he who denies death of him denies it absolutely, although he who affirms death of him attributes it only to him in some nature. But if someone should wish that the name "Christ" is not the name of a supposit, but directly signifies the human nature united to the Godhead and connotes the Person of the Word (for "Christ" is the same as "anointed," and "anointed" signifies a sanctified and united nature - a view which is gathered from the Council of Frankfurt, in the Sacrosyllabus mid-book, and from St. Athanasius, Oration against the Arians after the fourth discourse, and from Fulgentius, Against Trasamund III, c. 6), let us take the name "Son of God," which without controversy is the name of the supposit: of this indeed we can truly say, "died"; but to deny that he died is not lawful for the reason stated. Therefore we can rightly lay Durandus low with his own sword.[717][718]

But in very truth, just as of Christ, so far as it is the name of the supposit, we truly enunciate contrary predicates - we say, he is passible and impassible; mortal and immortal; begotten and unbegotten; begotten and begetter; spirating and proceeding - so also of God we could assert, he is begotten and unbegotten; begetter and begotten; spirating and proceeding. For these contrary predicates rightly belong to the same singular supposit by reason of the diverse things which are connoted by the same name - by reason of the natures in Christ, or of the persons in God. But we take the name "unbegotten" for the notion of the Father in a contrary sense, not for the negation of generation contradictorily. In this way Fulgentius cited above (cap. 2, in the second argument) seems to have spoken, when of Christ he says, "suffering a passion without feeling it": for he took these two as contrary predicates, which belong to the same Christ, not as contradictories. And from here also the later argument of Durandus, which we brought in the second chapter, is dissolved.

It must be observed, however, that although these propositions are true, "The Father is unbegotten," and "not-begotten"; "the Son is nonbegetting"; "the Holy Spirit is nonspirating" - and although the notional terms which are said of the persons are also said of the concrete of the Godhead, as we shall immediately see - yet these propositions, "God is not-begotten," "God is nonbegetting," "God is nonspirating," are not to be conceded absolutely. For it seems to be equivalent to the negative propositions, and to render their sense, because that participle into which the adjective verb is resolved is negated; and it comes to the same as if the verb were negated. It therefore yields this sense: "God is not begotten," "God does not beget," "God does not spirate" - which is plainly false.

717. St. John Damascene, On the Orthodox Faith, III, c. 3; Nicetas, Thesaurus, III, c. 3.

718. Council of Frankfurt, Sacrosyllabus (mid-book); St. Athanasius, Oration against the Arians, after the fourth discourse; Fulgentius, Against Trasamund, III, c. 6.

First, because if in this proposition, "God begets God," the name "God" is supposed for the concrete individual of the Godhead, "God" has a principle from which he proceeds: therefore either this principle will be called the Father - and this cannot be, because the essence is prior to the notional terms, and therefore here "God" is prior to the Father; therefore the Father cannot be the principle of God; and the same reason proves it of the Son; or there is another principle of God besides the Father and the Son - and this is absurd, because in God, besides the Father and the Son, there is no other principle. Then, if God, as he is the individual of the Godhead, is from the Father or from the Son, he ought really to be distinguished from them; but if he is from God, he ought really to be distinguished from God; and therefore either "God" will be really distinct from the persons, or God from God. Which two are plainly absurd: the one, because it really distinguishes the persons from the essence, against the things we said in disputation 120, chapters 2 and 4; the other, because it posits two gods really distinct, of whom one is the principle of the other. Lastly, if God, as he is the concrete of the Godhead, is said to beget, every person will be said to beget; for every person is God.

Nevertheless all these things which the Canarian objects are much slighter than he supposed, by our consideration. For the solution of these, note first: when we say that the concrete individual of the Godhead, which is called "God," is abstracted from the personalities, we do not mean that it is abstracted in reality, but only by our consideration, just as "man" is separated by reason alone from this and that individuation of a man; because just as we understand man without understanding this one or that one, so also we understand God without understanding this or that person. Then observe that the things which in reality are done and belong to singulars, as to Peter and John, namely, to beget and to walk, are truly enunciated of the common term, as of man, whom we consider as abstracted from singulars. For if Peter walks, we truly say, "man walks," not because in reality the action proceeds from "man" in general - for actions and passions, as Aristotle said (Metaphysics I, c. 1), are conversant about singulars and proceed from singulars.

But because by our consideration we ascribe to those common concepts the things which in reality belong to singulars: so also to the individual of the deity abstracted from the persons by our consideration we ascribe the productions of generation and spiration, which in reality are only from the persons: and in order that by our consideration they may be rightly predicated of God so abstracted, it is enough that they be from the persons who truly are God, just as from the fact that Peter, who is a man, begets, we truly say, "man begets."

Respondetur to the objection of the Canarian. First, it follows that there is not another procession, when we say, "God is from God," besides that whereby the Son is from the Father and the Holy Spirit from both. Second, it follows that there is not in God another principle according to reality besides the Father and the Son: for God is not a distinct principle from those two, but the notion of principle, which really belongs to them, is by predication ascribed to God in the same way as we said; in the same manner as, when we say, "Peter walks," and "man walks," we signify not two principles but one, which we predicate both of the singular and of the common concept.

Third, it is gathered that, even if we say, "God begot God," there is no need to distinguish really God from God abstracted from personalities in the same way as abstracted; but it is enough that the persons be distinguished, namely the begetting person from the begotten. Thus, when we say, "man begot man," it is not necessary to distinguish man abstracted from man abstracted; but it is enough to distinguish Peter from John. Similarly, when we say "God begot the Son," or "the Father begot God," it is not necessary to distinguish God from the Son, or the Father from God: just as when we say, "Peter begot man," or, "man begot John," it is sufficient that the singular individuals or supposits, to which the action and passion belong, be really distinguished.

Fourth and finally, it does not follow, if God begets, that therefore any person whatsoever also begets, although any person whatsoever is God; because to begetting belongs to God by reason of one person to whom it is conjoined, not by reason of the bare essence. Wherefore it is rightly inferred, "the Father begets," and "the Father is God": therefore "God begets," just as, "John begets," and "John is man": therefore "man begets." By the same reasoning it does not follow, "God begets, therefore any person who is God begets": for, in order that we may truly say, "God begets," it suffices if one person who is God begets: because what belongs to God by reason of one connoted [notion] does not belong to the others connoted; and in general, what belongs to God by reason of a notional connotation does not belong to God by reason of the bare "existing-as-essence."

Hence the objection of the Canarian remains solved. But whether with the particle "insofar as," or "according as itself," it can be said, "God begets," we shall see in art. 6.

The third argument, which in cap. 2 was adduced on behalf of Durandus, is easily dissolved from what was said in cap. 4, where we proved that the name "God" does not signify the same as "one having deity."

The name "GOD," unless something be added to it, is always used to suppose for the individual concrete of the deity.

Caput VI - On how the name "God" supposes with and without notional terms

From the foregoing doctrine two points can be gathered, which must be treated in this chapter and the next. One is, that the name "God," whenever a notional term is not added to it, on the side on which it stands in the proposition, is always used to suppose for the individual concrete of the deity. I said, on the side on which it stands; for if the name "God" be placed on the side of the subject, and the notional term on the side of the predicate, as when we say, "God begets the Son"; or conversely, the name "God" on the side of the predicate and the notional term on the side of the subject, as when we say, "the Father begets God," it cannot happen that it be used to suppose for a person; but it remains in its whole signification of the individual concrete of the deity. And although in this proposition, "the Father begets God," on the side of the predicate there stands the term "begetting," according to the rules of the Logicians, who expound adjectival verbs by participles in this way, "the Father is begetting God," nevertheless, because the notional term "begetting" does not affect the name "God," but only regards the word "Father," therefore it does not determine the name "God," so that it be used to suppose for the Son: therefore it is necessary

that the notional particle which is posited on the same side as the name "God" affect it, and (as the Logicians say) be its syncategoreme, so that its supposition and signification can be restricted. Wherefore, when we say, "God-begetting has a Son," "God" is placed for the Father by reason of the syncategoreme "begetting": in like manner, in this proposition, "God-begetting is not God-begotten," for if it were used to suppose for the individual concrete of the deity, this proposition would be false: for the Father and the Son are one and the same God: yet such a proposition is true: therefore in it "God" is not used to suppose for that individual, but, in the same way as the common words "man," etc., when some particle expressing a property or office of some individual is added, it is determined to stand for some singular.

Yet a difference is to be noted between the name "God" and common names, such as "man." If to the latter a demonstrative pronoun be added, it does not determine a person, but it is the same as if it were not added: because, as we said in the preceding disputation cap. 4, a demonstrative pronoun only points out the direct signification of the name; and since the direct signification of the name "God" is utterly singular, it cannot be narrowed by that pronoun: whereas common words, like "man," since they signify a nature in common, when that pronoun is added are restricted, so that they suppose for some individual of the nature. But because the name "God" has a certain commonness on the side of the connoted, with respect to the personal properties, therefore by some notional term being added it can be determined so as to suppose for some person. Wherefore the Canarian was deceived in the fourth doubt of this article, when he asserted that the name "God" could be determined to stand for a person by the demonstrative pronoun being added, as when we say, "this God (pointing to the Father) begets this God" (pointing to the Son). For already in that cap. 4 it was proved that we cannot point out "this God" and "that God" as if other than the former, when "God" is used to suppose for the concrete individual of the deity: and it is used to suppose for the same in that proposition, "God begot God."

Then, according to the same doctrine, in this proposition, "God is from God," the name "God" is used to suppose for the same concrete of the deity: for, as we proved in the preceding chapter, in order that "God" be said to beget God, once the name "God" is posited for that concrete individual, it is not necessary to distinguish God from God, that is, one concrete individual from another concrete individual: but of the same we truly say, "he begets" and "he is begotten": wherefore of the same God it is permitted to say, "God from God," "light from light."

Certain persons, however, think that in the Creed it is said "God from God" by reason of the notional word which is added: for immediately there follows, "begotten, not made," as if the sense were, "God from God begotten, not made": whereas "God-begotten" is taken to suppose for the person, as we said just above. But in the Creed the word "begotten" seems to be set by itself, so that concerning the Son we confess these three distinct things: first, that he is "God from God"; second, that he is "begotten"; third, that he is "not made." For even without the word "begotten" the Church is accustomed to call the Son "God from God," and the like. Thus in the Roman Breviary on the feast of Saint Lawrence, in the first antiphon of the second nocturn at Matins it is said, "Blessed Lawrence was praying and saying, 'God from God, have mercy on me, your servant'"; and John Maxentius, in the confession of the Catholic faith about the middle, which is in the fifth volume of

the Bibliotheca sacra, as he proves that Christ can be called "one of the Trinity" without a division of the deity, thus says: "And if to say 'God from God' does not make a division of the divinity, especially since one is the divinity of the Trinity, much more does to say 'one of the Trinity' not make a division of the Trinity." He taught, therefore, that which we were just now saying, namely, that a division of the deity is not necessary in order that "God from God" be said, as though there were one "other" from whom, and another who is from the other: for of the same God we say, "God from God."[719][720]

Nay more, even with essential abstract names the Church is accustomed to express the origin of one person from another without any division of the deity or of the essential property, so that it may be manifest from this that not only by reason of an added notional term, but even absolutely one can say "God from God." For in the hymn at Matins for Tuesday the same Roman Breviary has thus, "Sharer of the Father's light, light himself, and light and day," where he calls the Son "light of light," that is, "light from light," as in the Creed "light from light." And again in the hymn at Lauds for Monday, "light of lights, and fount of light." There comes in St. Gregory of Nyssa, who in the little work On the difference of nature and hypostasis, not far from the end, thus writes: "It is not to be said that the glory of the Father is one, and that of the Son another, or that it is the same, since the Apostle did not say, 'who is glory from glory' (although this is the truth of the matter):" therefore he grants that the Son according to the truth is "glory from glory," although Paul did not say "glory from glory." And St. Augustine, On the Trinity 15, cap. 14, calls the Son "light from light," "wisdom from wisdom," "essence from essence," with no other notional term added: not because there are two wisdoms and essences and one is from another; but because there is one person who has essence and wisdom from another, and because each divine person is called "wisdom" and "essence," therefore the Son is called "wisdom from wisdom," and "essence from essence." Finally, since the Councils and Fathers commemorated in disputation 139, cap. 3, call the Father "fount of the deity," what wonder if "deity from deity" and "God from God" are said by them with no notional syncategoreme added? In the same sense the Council of Toledo XV spoke when it said that "according to the essence the divine will begot the will," as we shall show below in art. 5.[721][722]

Finally, when Paul said, in 1 Timothy 1, "To the King of ages, immortal and invisible, to the only God be honor and glory," the name "God" is much more used to suppose for the individual concrete of the deity, since no notional term is there added in any way. However, when St. Thomas in this article in the body says that there the name "God" is used to suppose for the three persons together, thus it must be understood: not because the name "God" in that place directly signifies the three persons, but because the concrete of the deity, for which it directly supposes, is common to the three persons, and whatever is predicated of that individual is truly said of them. But the

word "only" is added, not so that we signify that God is solitary or alone, but that we set apart the true and immortal God from other false and mortal [gods], and that to him, not to others, we attribute glory, according to what we noted in disputation 131, cap. 4.

I wonder, however, why St. Thomas said that in the proposition "God creates," the name "God" is used to suppose for the nature, that is, for the individual of the deity, and not for the persons: for the persons also are truly said to create; and the addition of the particle "alone," which does not exclude the divine persons, matters little. For in the same way the name "God" seems to be used to suppose in this proposition "only God creates," and in this, "God creates": and the word "only" does not exclude the persons. In that proposition also, "God breathes," "God" supposes for the concrete of the deity for the same reason. But because spiration of itself proceeds from two supposits, according to what was noted in disputation 150, cap. c, therefore St. Thomas said that the name "God" in that proposition is used to suppose for the persons. Which he could have said on a different ground than in that proposition, "to the only God be honor and glory": for he takes the "supposition" for that part of the signification by reason of which the proposition is rendered true; wherefore he says in treating that one, "God creates," that the name "God" is used to suppose for the person of the Father; but in that other, "to the only God be honor and glory," since glory is attributed to the three by reason of the universal essence, the reason of the supposition is different. Yet I would absolutely say that the name "God," for the concrete of the deity, is used to suppose in both; even if what is enunciated of God belong to the persons.

What we have said thus far about the name "God," namely, that it is used to suppose for the individual concrete of the deity even when a notional term which is not its syncategoreme is posited, must also be understood in other propositions in which predicates of the human nature are predicated of God by the communication of idioms. And the same too about the name "man," when we assert of it predicates of the divine nature; as will be more fully proved in the Third Part of St. Thomas, question 16, article 3. Now, however, by this single argument drawn from the foregoing it is shown.

If two divine persons were to assume two humanities, and were to suffer neither in the same place nor at the same time, it would not be permitted to say, "a different God suffers here than there," "one now, another before": but we ought to say, "the same God suffers now and before, here and elsewhere": therefore the name "God" is used to suppose for the individual concrete, not for the person having the deity. For thus we should have to say, "another God suffers here than there, now than before," which is absurd. On the contrary, also, if one humanity were assumed by three, we should not say "another man suffers," but "one and the same"; although nevertheless there would be a different person and another person having the humanity. But when St. Thomas and others affirm that these concrete names of the natures in those predications, when they are placed on the side of the predicate, are used to suppose for the nature, but on the side of the subject for the person, he seems to be employing the "supposition" of the name not for the totality of its signification, but only for that part by reason of which the proposition is rendered true, as we shall say more broadly in that place. And although of natures abstractly signified the words of those

natures are not mutually predicated, yet of the same concretely signified they are rightly predicated, as we shall say there also; because in concrete names the supposit is connoted in which the natures meet, as will there be explained.

But against this doctrine someone will object with St. John Damascene, book 3 On the Orthodox Faith, cap. 4, at the beginning, where he says thus: "This, then, is to be noted, that names taken from the humanity are referred to the true essence or nature; and that the common names of God and men are referred according to the natures, according to which we say, 'God is just'; and that 'subsistence' embraces every species, genus, orders, and even the diversity of persons. We name by that which is special, although Scripture is also wont to name by universals; wherefore, when Scripture says that for this reason he is called 'God,' 'one God' and 'essence,' therefore sometimes the name 'God' is used to suppose for the person..." And Nicetas also in the Thesaurus, cap. ...[723]

Caput VII - What is to be thought concerning the proposition, "God begot another God"

I answer: St. John Damascene and Nicetas only meant to teach that the name "God" is sometimes taken to stand for the person, not because its signification is thereby always narrowed, as when some notional syncategorem is added; but because, without any such addition, we sometimes predicate of God those things which befit Him by reason of some person. Thus in the same place he says that the name "a certain man in the land of Hus" is set down by Scripture for Job; not because, so set down without anything else, it signifies some determinate person, but because of a certain man of the land of Hus there are rightly said the things which we see to agree with Job.

Finally, from what has been said it follows that Capreolus slipped, in the First Book, distinction 4, question 1, article 3, in solution 2 and 3, and in the last argument of Aureolus, when he says that the name "God" always supposes for the nature distinctly and properly, and that it also always supposes for the person; sometimes indeed distinctly, when a notional term is added - as, "God begets"; sometimes indistinctly, when no notional term is added.[724] Cajetan attacks Capreolus in this article with three reasons, of which this one may suffice. In the proposition "God begets" either the name "God" is not the subject; or it supposes for some person distinctly; or it supposes for a person confusedly. If distinctly, it is either for the Father or for the Son. Not for the Father, as was proved in cap. 3 against the Canarians; not for the Son, because then the proposition would be true. Therefore it supposes for a person confusedly. But this, besides being false (for the proposition would then also be true for some person), is even against Capreolus himself, because in that proposition a notional term is added.

But on the contrary: although St. Thomas and Gabriel grant that the proposition can have a true sense, namely, if the name "God" be taken appositively, and the word "another" substantively; for thus the sense is, "God begot another who is God," we rightly say "another" because this adjective in the masculine denotes a person, as we noted in disputation 130, cap. 1; nevertheless that sense

723. St. John Damascene, De fide orthodoxa, III, c. 4; Nicetas, Thesaurus, cap....
724. Capreolus, In I Sent., dist. 4, q. 1, a. 3, sol. 2 - 3; Aureolus, ad ult. arg. Cajetan refutes Capreolus in this article.

and manner of speaking is not in use. Nor does it stand in the way that Christ said in John 14: "I will ask the Father, and He will give you another Paraclete," for the name "Paraclete" is an adjective, and therefore can be multiplied; indeed it can follow the number of the persons, as was said in disputation 155, cap. 8, according to which doctrine we say "three omnipotent," and we could say "three paracletes." It is therefore not surprising if Christ says, "He will give you another Paraclete." And from this with reason we deduced above, in cap. 4, that the name "God," in the proposition "God begets God," does not suppose for the possessor of godhead, nor is it altogether the same as that possessor.

Wherefore, second, we ought rather to say, "God begot the same God"; for thus identity is not denoted in person, but in nature, which the name "God" signifies. For, as Scotus teaches in that question 1, ad 1, from Aristotle, Metaphysics X, text 12, "the same" and "different," or "something other," are opposed without any middle; hence whatever is not other than something is the same with it. Therefore, if God begot God, and not another God, it follows that He begot the same God.[725]

Third, all the Doctors cited rightly note that this proposition is not true: "God begot Himself God"; because the reflexive pronoun "Himself/God Himself" denotes identity of the supposit of begetter and begotten, and so, removing every distinction both on the side of the nature and of the supposit, makes the proposition false. For that God may be said to beget God, a distinction of supposits is necessary. Wherefore neither among men nor among divine things is anyone said to beget himself. But from this it is not lawful to infer: therefore "God begot another God," on the ground that, if He did not beget Himself God, He ought to have begotten another God. For "the same" and "other" are opposed without a middle only if they are referred to the same, that is, either solely to the essence, or solely to the persons; but if to both together, they cannot be set without a middle, so as to divide being. Now in that proposition the name "God," both on the side of the subject and on the side of the predicate, supposes for person and essence together; and therefore (he says) we can neither say "God begot Himself God," because we remove the distinction of persons, nor "God begot another God," because we remove the unity of essence. From this he further infers that we can say neither "God begot another God," nor "the same God," because the same absurdity follows.

But certainly the reason of Durandus is trifling; for the name "God," as has been proved up to now, plainly supposes for the concrete individual of the nature. Therefore, just as it is not lawful to say "He begot another God," because by that we would signify a division of the nature, so too it is lawful to say "God begot the same God," because only the identity of the nature is signified. Indeed it is lawful to say "God begot the same God with Himself," wherein only the identity of nature is signified between the begotten and the begetter; and the particle "with Himself" does not confound the persons, but denotes the identity of deity in God-begotten with the generating person, with whom indeed the Son is the same God. But when we say, "God begot Himself God," we signify that

725. Scotus, In I Sent., dist. 4, q. 1; cf. Aristotle, Metaphysics X, text 12.

the same person begot Himself; for that is what the particle "Himself" denotes. And therefore Hugo of St. Victor, in the place cited, holds that one cannot say, "God begot another God," nor "God begot Himself."[726]

St. Thomas, in this article ad 4, explains in two ways Augustine in epistle 66, which is to Maximinus, when he asserts: "Of one the Father begot another Himself." He says, therefore: either the pronoun "Himself" is in the ablative of separation, and the sense is, "He begot another from Himself," whereby the distinction of persons is signified; or it is in the accusative, and then it establishes a simple relation: for it refers only to identity of nature, not of person; and he says the sense is: "He begot another most like to Himself," that is, of the same nature with Himself; as a friend is wont to say of a friend: "He is another I," on account of the highest union of wills. The latter sense appears to be according to the mind of Augustine, which is figurative and improper, as St. Thomas noted there. The Canarian, however, in the third part of his commentary, reports from Augustine, book 3 against Maximinus, chapter 14, these contrary words: "God begot what He Himself is, and not another Himself." But that book is not "to Maximinus," but "against Maximinus"; and the words cited by the Canarian I could not find in that chapter.[727]

Fourth, as the holy Doctor very well observed in the solution of the fifth argument, this proposition is false: "God begot God who is the Father," or "who is God the Father." For although the same God, who is the individual concrete of deity, is begetter and begotten, nevertheless in that proposition the name "God" is so restricted by reason of the adjunct that it is made to suppose for the person of the Father. Thus the proposition is false. For if we say, "God begot God the Father," and the word "Father" be appositive, the proposition will be false: because the name "God" is determined in such a way that it supposes for the Father; and yet that appears altogether to be the sense of both forms: therefore the first proposition also will be false. With St. Thomas agree Gregory, on I Sentences, dist. 4, q. 1, ad ultimum; and Durandus, q. 2, ad ultimum; but Durandus thinks that proposition is false for another reason, namely, because in that proposition the name "God," on the part of the predicate, supposes for the Son; thus, however, the proposition is false; for the sense is: "God begot a son who is the Father." But Durandus is mistaken; because in that proposition "God" is not set for the Father; but whereas otherwise it would be set for the individual of deity, if the apposition were not made, by reason of the apposition it is determined for the person of the Father alone. St. Thomas adds that, if something is interposed by reason of which that apposition of the notional term is not made, the proposition can be true: as if someone should say: "God begot God, who is God, who is the Father." Then indeed the word "God" seems to suppose for the individual of deity, because no notional term is apposed to it, and of that it is truly said, "who is God, who is the Father." Lastly, Marsilius, in I, q. 8, art. 3, ad ultimum, distinguishes the aforesaid proposition "God begot God who is the Father": either the sense of it is, "God begot the Son, who is not the Father, who nevertheless, as the Father, is God," and this sense is true; or

726. Hugo of St. Victor, Summa sententiarum, tract. 1, c. 11.
727. Augustine, Contra Maximinum, lib. 3, c. 14; St. Thomas, In I Sent., d. 4, q. 1, a. 4, ad 4.

the sense is, "God begot God, who is not God, who is the Father," and this is false. This distinction he took from the Master, in I, dist. 4. But these senses seem to have been applied only at will; therefore I approve what above I said from St. Thomas concerning the aforesaid proposition.[728]

Articulus V - Whether essential names signified in the abstract can suppose for the person

To the fifth we proceed thus. It seems that essential names signified in the abstract can suppose for the person, in such a way that this is true: "essence begets essence." For Augustine says in De Trinitate VII: "The Father and the Son are one wisdom, because they are one essence"; and explicitly, "wisdom from wisdom," as "essence from essence."[729]

Further: Generation among us either produces or corrupts, with respect to the things which are in us; but the Son is begotten; therefore, since the divine essence is in the Son, it seems that the divine essence is begotten.

Further: God is the same as the divine essence, as is clear from what was said above. But this is true: "God begets God"; therefore, "essence begets essence."

Further: Whatever is predicated of anything can stand for that thing. But "the Father" is "essence divine." Therefore "essence" can suppose for the person of the Father; and thus essence begets.

Further: Essence is a thing that generates, since the Father, who generates, is essence. If therefore essence is not that which generates, it will be essence both generating and not-generating, which is impossible.

Further: Augustine says in De Trinitate IV: "The Father is the principle of the whole Deity"; but He is not principle except by begetting or spirating. Therefore the Father begets or spirates the Deity.[730]

But on the contrary: Augustine says in De Trinitate: "In the Trinity no one begets himself." But if "essence begets essence," it does not beget anything other than itself, since there is nothing in God that is distinguished from the divine essence. Therefore essence does not beget essence.[731]

I answer: Concerning this the Abbot Joachim erred, asserting that just as it is said "God begot God," so it can be said that "essence begot essence," because it is said that God begot God, inasmuch as what is called "God" is the same as "essence"; considering essence precisely on account of the divine simplicity, as if "God" were nothing else than the divine essence. In this he was deceived, because for the truth of locutions one must consider not only the things signified, but also the mode of signifying, as has been said above. Now although according to the thing it is the same, "God" as "deity," nevertheless the mode of signifying is not the same in the two. For this

728. Gregory, In I Sent., d. 4, q. 1, ad ult.; Durandus, In I Sent., d. 4, q. 2, ad ult.; Marsilius, In I Sent., q. 8, a. 3, ad 4; the Master (Peter Lombard), In I Sent., d. 4.

729. St. Augustine, De Trinitate, VII, c. 1 - 2 (in princ.).

730. St. Augustine, De Trinitate, IV (cf. c. 20).

731. Cf. St. Augustine, De Trinitate, IV; and the common axiom that in the Trinity no one begets himself.

name "God" as it were signifies the divine essence as having in itself the notion of a subsistent, and thus naturally has what is able to suppose for the person; and so the things which are proper to the person can be predicated of this name "God," so that it be said that "God is begotten" or "generating," as has been said. But this name "deity" or "essence" does not have from its mode of signification that it should suppose for the person, because it signifies the essence as a form abstracted. And therefore the things which are proper to the persons, by which they are distinguished from one another, cannot be its attributes. For it would be signified that there is a distinction in the divine essence, as there is a distinction in the supposits.

Reply to the first: We must say that, for expressing the unity of essence and person, the holy Doctors have sometimes spoken more expressly than the propriety of speech allows. Hence such locutions are not to be extended, but to be expounded; namely, that abstract names be explained by concretes, or even by personal names; so that, when it is said "essence of essence," or "wisdom of wisdom," the sense is: "the Son, who is essence and wisdom, is of the Father, who is essence and wisdom." Yet in these abstract names a certain order must be observed: because those which pertain to nature are more closely related to the persons, since acts belong to supposits. Hence these locutions are less improper: "nature of nature," or "wisdom of wisdom," than "essence of essence."

Reply to the second: In creatures, generation takes nature according to number, which begins to be by generation anew, and ceases by corruption; and therefore what is generated receives another nature in number than that whereby the generator subsists. But in God, what is generated does not receive another nature in number, but the very same nature is communicated without any division or change; wherefore it is not the essence that is generated, but the person, to whom the numerically same essence is communicated, without increase of number or any corruption. Therefore the argument fails.

Objicitur 1. It seems that the essence generates the essence. For Augustine says in the seventh book On the Trinity, chapter 1 - 2 at the beginning: the Father and the Son are one wisdom and one essence; and taken singly, wisdom is from wisdom, as essence is from essence. Therefore essence generates essence.

1. Further, when we are generated or corrupted, those things which are in us are generated or corrupted. But the Son is generated. Therefore, since the divine essence is in the Son, it seems that the divine essence is generated.
2. Further, God and the divine essence are the same, as is evident from what was said above. But this is true: God generates God, as was said. Therefore this is true: essence generates essence.
3. Further, of whatever a thing is predicated, it can stand for that thing. But the Father is the divine essence. Therefore essence can stand for the person of the Father; and thus essence generates, because it is the Father who is the generator. If therefore the essence is not the generator, the essence will be a generating thing and not generating; which is impossible.

4. Further, essence is a generating thing, because it is the Father who is the generator. If therefore the essence is not a generator, it will be that the essence is a generating thing and not generating; which is impossible.
5. Further, Augustine says in the fourth book On the Trinity that the Father is the principle of the whole Deity. But He is not a principle except by generating or spirating. Therefore the Father generates or spirates the Deity.

But on the contrary: Augustine says in On the Trinity that no thing generates itself. But if the essence generates the essence, it generates only itself, since in God there is nothing which is distinguished from the divine essence. Therefore the essence does not generate the essence.

I answer: Concerning this the Abbot Joachim erred, asserting that just as it is said, God begot God, so it can be said that essence begot essence, considering that on account of the divine simplicity God is not other than the divine essence. But in this he was deceived, because for the truth of locutions one must consider not only the things signified, but also the mode of signifying. Now this name "God," because it signifies the divine essence as in the possessor, from its mode of signifying naturally has that it can supposit for a person. And therefore those things which are proper to the persons can be predicated of this name "God," so that it be said that God is begotten or is begetting, as was said. But this name "essence" does not have from its mode of signifying that it supposits for a person, because it signifies the essence as an abstract form. And therefore those things which are proper to the persons, by which they are mutually distinguished, cannot be attributed to the essence. For it would be signified that there is a distinction in the divine essence, as there is a distinction in the persons.

Reply to the first: To express the unity of essence and person, the holy doctors have sometimes spoken more expressly than propriety of speech allows. Whence such locutions are not to be extended, but to be weighed; that is, abstract names are to be expounded by concretes, or even by personal names; so that when it is said, essence from essence, or wisdom from wisdom, the sense may be: the Son, who is essence and wisdom, is from the Father, who is essence and wisdom. Yet among these abstract names a certain order is to be observed: because those which pertain to act are more closely related to the persons, because acts belong to supposits. Hence this is less improper, nature from nature, or wisdom from wisdom, than essence from essence.

Reply to the second: In creatures, the generated does not receive the numerically same nature as the generator has, but another numerically distinct one, which begins to be in it anew through generation, and definitively ceases through corruption. And therefore it is generated and is corrupted per accidens. But the begotten God receives the numerically same nature as the generator has. And therefore the divine nature in the Son is not generated, neither per se nor per accidens.

Reply to the third: Although God and the divine essence are the same according to reality, nevertheless, on account of a different mode of signifying, it is necessary to speak in a different way about each.

Reply to the fourth: The divine essence is predicated of the Father by way of identity, on account of the divine simplicity; yet it does not follow that it can supposit for the Father, because of the different mode of signifying. The reasoning would proceed in those cases in which one is predicated of the other as a universal of a particular.

Reply to the fifth: This is the difference between substantive and adjective names: because substantive names carry with them their supposit; but adjectives do not, rather they place the thing signified in a substantive. Whence the sophists say that substantive names supposit, but adjective names do not supposit but copulate. Therefore personal substantive names can be predicated of the essence on account of identity of the thing. Nor does it follow that personal property determines a distinct essence. But something is posited about the supposit imported by a substantive name. Yet notional and personal adjectives cannot be predicated of the essence unless with some substantive added. Hence we cannot say that the essence is generating; we can, however, say that the essence is a generating thing, or God generating, if "thing" and "God" supposit for the person, but not if they supposit for the essence. Whence there is no contradiction if it is said that the essence is a generating thing and a thing not generating: because first "thing" is taken for the person, secondly for the essence.

Reply to the sixth: Deity, insofar as it is one in several supposits, has a certain agreement with the nature of a collective name. Whence, when it is said "the Father is the principle of the whole Deity," it can be taken for the universality of the persons, inasmuch namely as in all the divine persons He is the principle. Nor is it necessary that He be the principle of Himself, just as someone from the people is called the ruler of the whole people, not however of himself. Or it can be said that He is the principle of the whole Deity, not because He generates and spirates the Deity, but because by generating and spirating He communicates it.

Notationes circa articulum. - In this question St. Thomas proposed to examine whether this proposition is true, "the essence generates," as is gathered from the first argument. Now the conclusion is negative, and of faith: concerning which there was the error of the Abbot Joachim, condemned in the Lateran Council under Innocent III, and it is reported in the chapter Damnamus, on the supreme Trinity and the Catholic faith. He asserted that the divine essence generates and is generated; which also seems to have been earlier condemned in the first Council of Toledo in the profession of faith, where it is said: "If anyone shall say that the Deity is passible of birth, let him be anathema"; but it is the same to say that the Deity is passible of birth and that it is generated. The Bishop of the Canary Islands also reproves Holcot, for having said in his determinations, I q. 10, dub. 4, that there is no reason for this truth other than that the Council defined it against Joachim. For how could the Church decree that without a great reason? Yet that author only denied that there is a natural reason for this truth; which ought not to be a wonder, since the mysteries of the Trinity surpass all natural reason. Nevertheless, St. Thomas in this article, St. Bonaventure in I, dist. 1, art. 1, q.; Scotus q. 1; Durandus, the single question; Gabriel q. 1; Gregory q. 1; and Marsilius in I, q. 9, art. 1; and Durandus, art. 2, assign certain reasons.[732] The most forceful, however, is that between the begotten and the begetter there must be a real

distinction: for since they are opposed relatively, they cannot fail to be really distinct; but the divine essence signified abstractly cannot be distinguished from any generating or generated person; therefore neither can it generate, nor be generated; for nothing generates itself. Which reason stands even by the light of nature alone: for the real distinction between begetter and begotten is most well known to all. By natural reason too it can be proved that the essence of God cannot differ really within itself from anything. First, not from another essence, because there is only one in God; then, not from any person, as has been proved, disp. 120, cap. 4; therefore neither can the essence be generated, nor generate. For that actions be attributed to the essences of things signified abstractly, but to supposits alone, is certain, as we shall show in III, q. 1, art. ... Therefore, if it did not repel reason that the divine essence be generated and generate for the reasons set down, even if it were signified abstractly, it could be said to generate and be generated.

Second, note that it is said rightly: the essence is communicated, although it cannot be said: the essence is generated. For, as Scotus says in the place cited, in replying to the arguments, at the phrase, "to the reason about 'to communicate,'" to communicate and to produce or to generate differ widely. For to produce and to generate denotes a real relation between producer and produced, between begetter and begotten only; and therefore it demands a distinction between producer and produced, between begetter and begotten, which cannot exist between the essence and anything else which is in God. And so we shall not say, the essence generates, the essence is generated. But to communicate, even when it is by real production, besides the real relation which it signifies to the thing produced, denotes also a relation of reason to that to which something is communicated, and in like manner to that which is communicated to the produced. Now this relation between that which is communicated and that which communicates does not require a real distinction, since it is itself a relation of reason. Wherefore it is rightly said, the essence is communicated, for in this way of speaking there is signified only a relation of reason between the person who communicates and the communicated essence, although we do not say, the essence generates, because thus we denote a real distinction between the essence and something else which generates.

Indeed, Marsilius rightly taught, in that question 9, art. 2, almost the same reason; following Scotus, he rightly says that something can communicate itself, because in this way of speaking there is denoted only a relation of reason between him who communicates and him who is communicated. For this reason, although the person is not distinguished from the essence, nor is said to produce it, nevertheless it is said to communicate it, solely because it produces another person in the same essence. However, the essence is not said to communicate itself, because that which communicates itself must produce something else to which it may communicate itself; but the essence does not produce something to which it can communicate itself.

---

732. Lateran IV under Innocent III (c. Damnamus, De summa Trinitate et fide catholica) condemns Joachim's error; cf. Toledo I, profession of faith ("Si quis dixerit deitatem nativam esse, anathema sit"); the Bishop of the Canary Islands against Holcot, In I Sent., q. 10, dub. 4; St. Thomas, In I Sent., dist. 1, art. 1, q.; St. Bonaventure, ibid.; Scotus, q. 1; Durandus, q. unica; "Gabriel," q. 1; Gregory, q. 1; Marsilius, In I, q. 9, art. 1; Durandus, art. 2.

Third, it is to be observed with Scotus in the same question that words which signify notional acts, such as to generate, to be generated, cannot be predicated of the essence signified abstractly in the "identical" sense (as they say), as when we say, the essence is the person. For notional verbs signify those acts after the manner of an adjoined form, and therefore they are always taken formally, just like any adjective names. Therefore let them always be predicated by force of their signification in the formal sense, and never in the identical sense. For that sense can be expressed only by a substantive verb - sum, es - which things were all noted in disp. 119, cap. 2, and 137, cap. 3, where we said many other things about the various predications in the mystery of the Trinity.

St. Thomas adds in this article that a notional act is truly predicated of the essence signified abstractly, some substantive name being added on the part of the subject, as if we were to say, the essence is a thing which generates, or, the essence is God who generates. For in these propositions each sense is included, both the identical in the prior part of them, and the formal in the latter. For it is the same as if we say, the essence is the same according to reality with the person, or with God, who generates: but St. Thomas understands this if, according to those things which he handed down above, "thing," or "God," supposits for the person. Nevertheless, in the same way it could be said if it supposit for the concrete of Deity; because of that too the notional acts are truly predicated, as we showed in the previous disputation. Whether indeed the essence be the formal principle of generation and the formal terminus of that, we shall say in disputation 166, cap. 3.

Lastly, note that the Fathers, and even Councils, sometimes use abstract names, so as to denote the origin of one from another, as we saw in the previous disputation, cap. 6, when they say, "light from light," "brightness from light," "wisdom from wisdom," "essence from essence," etc. Yet St. Thomas rightly warns in the reply to the first that these locutions are to be explained in this sense, that abstract names be set forth for concretes, or by personal names in this way: "the Son, who is wisdom, is from the Father, who is wisdom," etc. You have the testimonies of the Fathers in that cap. 6.

Moreover, the Fathers of the fifteenth Council of Toledo under King Flavius Egica and Archbishop Julian also taught, among other things, this proposition, "according to essence, will begot will," in a certain book on three substances, which by Peter the Regionary of the Roman Church...

Articulus VI - Whether the persons can be predicated of essential names

Moreover, the Fathers of the Council of Toledo XV, under King Flavius Egica and Archbishop Julian, also taught, among other things, this proposition, according to essence, will begot will, in a certain book on three substances, which they sent to Pope Benedict II through Peter the Regionary of the Roman Church. The Pope had noted this proposition not indeed in writing, but only by word some two years earlier; and that the Fathers of the Council should be made aware of this his notation, he also enjoined it by word. But the Fathers replied to the Pope with a certain little book; whose reply we have in the Council of Toledo XV, in the new compilation of the Councils of Spain. Now the words of the notation are these: By a natural order we know that the word draws its origin

from the mind, as do reason and will; and they cannot be inverted, so that it be said that, just as the word and will proceed from the mind, so the mind is from the word or from the will; and from this comparison it seemed to the Roman Pontiff that "will from will" cannot be said. Where it must be very much observed that this proposition, "will from will," was not noted by the Pontiff because those Fathers used abstract for concrete names, nor because they said "will begotten"; but because they said "begotten by will from will." For if they had said "wisdom begotten from mind," he would not have noted it; because wisdom has its origin from the mind, and will also from the mind; but will is not from will, nor mind from mind.

But the Fathers of the Council excused their proposition acutely, as is reported more fully in that Council, not meanwhile caring about abstract and concrete terms. They excuse it on this ground, that they did not state that proposition with the addition, according to the comparison of the human mind, or according to relation, but according to essence; they do say, however, according to the comparison of the human mind, that is, according to appropriation. For this sense is plainly gathered from the words of the Council, so that mind is appropriated to the Father, but will to the Holy Spirit. For the Council says among other names otherwise common and essential: "But here, according to the comparison of the human mind, the several things agree in each one in such wise that from them the one is said of the one, the other is not said at all; just as also the one named by the relative word 'Father' is not the very one who is Son." Therefore the Fathers excuse themselves that they did not say "will begot will" according to the comparison of the human mind, that is, according to appropriation. For thus the sense would be, that the Holy Spirit begot the Holy Spirit, which is absurd; and in this way the Pontiff understood the proposition; because he thought it absurd that will should be from will, whereas rather will is from mind. For the Fathers of Toledo were taking "by will" for an act, not for the faculty itself, as is evident there. Wherefore the Pontiff would not condemn this proposition, Will is from mind, or wisdom is from mind. Then the Fathers of Toledo add that they had said "by will from will according to essence," according to the doctrine of St. Augustine in On the Trinity XV, c. 2,[733] where he calls the Son "wisdom from wisdom," "counsel from counsel," "essence from essence," because in God essence, counsel, and wisdom are the same according to essence, and the Son has all these from the Father. The history of this matter was written by Roderic, Archbishop of Toledo, bk. 3, ch. 13, of the History of Spain,[734] where he relates that the Pope was satisfied when a book was written on this matter.

Objicitur 1. - It seems that the persons cannot be predicated of essential concrete names, so that it be said, "God is three persons," or "is the Trinity." For this is false, "Man is every man," because it cannot be verified of any supposits. For neither Socrates is every man, nor Plato, nor anyone else. But similarly this, "God is the Trinity," cannot be verified of any of the supposits of the divine nature. For neither the Father is the Trinity, nor the Son, nor the Holy Spirit. Therefore this is false, "God is the Trinity."

733. St. Augustine, De Trinitate XV, c. 2.
734. Roderic (Rodericus) Toletanus, Historia Hispaniae, lib. 3, c. 13.

Objicitur 2. - Further, inferiors are not predicated of their superiors, except by accidental predication; as when I say "animal is man." For to be man befalls animal by accident. But this name "God" stands to the three persons as a common to inferiors, as St. John Damascene says. Therefore it seems that the names of the persons cannot be predicated of this name "God" except accidentally.

Sed contra: St. Augustine says in the book On the Faith to Peter: "We believe one God to be the Trinity of the divine name."[735]

Respondetur: I answer that (as has already been said), although personal or notional adjectives cannot be predicated of the essence, nevertheless substantives can, on account of the real identity of essence and person. But the divine essence is not only really the same as one person, but as three. Wherefore both one person and two and three can be predicated of the essence; as if we say, "The essence is the Father and the Son and the Holy Spirit." And because this name "God" of itself has that it supposes for the essence (as was said), therefore, just as this is true, "the essence is three persons," so this is true, "God is three persons."

Reply to the first: As was said above, this name "man" of itself has to suppose for a person, but from an adjunct it has that it stands for the common nature. And therefore this is false, "man is every man," because it cannot be verified of any supposit. But this name "God" of itself has that it stands for the essence. Wherefore although for none of the supposits of the divine nature is this true, "God is the Trinity," nevertheless it is true for the essence. Not attending to this, the Porretan denied it.[736]

Reply to the second: When it is said, "God or the divine essence is Father," it is a predication by identity, not however as of an inferior of a superior; because in the divine there is not universal and singular. Wherefore just as this is per se, "the Father is God," so also this, "God is the Father"; and in no way per accidens.

Notationes circa articulum.

The conclusion of the article is affirmative. But concerning the doctrine of the whole article there are certain points worthy of observation.

1) First, the Bishop of the Canary Islands notes that the question of the article was proposed against Gilbert, who asserted this proposition to be false, "God is three persons"; because "God" supposes for any person whatsoever; but it is false to say "any person whatsoever is three persons." The same thing seems to be proposed by the Holy Doctor in the first argument. In truth, as we have reported,[737] Gilbert only taught that "God" is sometimes taken for the essence, and then one must simply concede, "God is his deitas (deity)," because thus he did not distinguish God from essence by nature of the thing; but sometimes it supposes for a person, and then it cannot be said, "God is his deitas," because he distinguished the person from the deitas by nature of the thing. Wherefore

735. St. Augustine, De fide ad Petrum (Pseudo-Augustine), "Credimus unum Deum, unam esse divini nominis Trinitatem."

736. Gilbert of Poitiers (Porretanus).

737. See Vazquez, disp. 120, cap. 1.

by the same rule he would deny this proposition, "God is three persons," if "God" were to suppose for the essence; but if it were to suppose for the persons, he would concede it in some sense, namely when it were set collectively for all; for if for some only, he would without doubt deny it, as also the Thomists do.

2) Secondly, note, concerning the solution of the second objection, that this proposition "God is Father" is per se in the way assigned by Aristotle in Posterior Analytics I, c. 4,[738] as St. Thomas teaches in that solution. For, as he taught above,[739] in the perfection of the divine existence (*esse*) it is contained that he is Word. Now the Holy Doctor speaks of the proposition as it is in our intellect; for the proposition is not outside the intellect. Wherefore the Thomists are mistaken who say that that "per se" is found only in the thing itself in God, not in the proposition as it is in the intellect.

Moreover, one must see in what way this proposition is per se. The Bishop of the Canary Islands, in this article, in a single disputation in the second part, judges that no predication about God is per accidens; yet he holds the aforesaid proposition to be per se, but in the identical sense: which St. Thomas seems to indicate in the second reply. Then the Bishop of the Canary Islands adds that that predication is not properly of an inferior of a superior, as Blessed Thomas also said: for then it would be per accidens, as this, "animal is man": for it is accidental for the superior, namely "animal," to be found in the inferior; in divine things, however, there is neither inferior nor superior, because there is not universal and particular, although there is what is common according to the thing, and incommunicable.

However, it seems to me we must distinguish. For if we speak of the essence abstractly, as St. Thomas seems to have spoken in the reply, then the proposition cannot be per se in any sense other than the identical sense; as if we say, "the divinity is Father": for to be the same as the Father also in that way belongs to it per se; yet it is not predicated formally of that, according to what was noted elsewhere.[740] But in truth, if the discourse is of the essence signified concretely by this name "God," the proposition is per se in the formal sense; and accordingly a particle must be added, "inasmuch as," and "according as": namely thus, "God inasmuch as God," or "according as God is Father." For, as Durandus rightly noted,[741] since the properties which in the first way belong per se are signified according to a mode of signifying, they are signified of the proposition in the same mode; wherefore it is not only to be said that when something is predicated of something from what belongs per se according to the formal notion of the subject, where it agrees adequately to it, as "rational" of "man"; but also when something is said of another which regards per se in some way the being of it; either as from its essence, and thus it is predicated in the first mode, as when we say "man, as man, is animal"; or rationally in the second mode, from the property of the subject it is said, or subjectively it is predicated of the essence, "man, as man, is capable of laughter." And in this way I think the aforesaid proposition pertains: "God, inasmuch as God, is Father"; that is, "God is Father," because thus it is predicated of the essence; not conversely. For "Father," in the

738. Aristotle, Posterior Analytics I, c. 4.
739. See St. Thomas, q. 27, art. 3, ad 2.
740. See Vazquez, disp. 136, cap. 3.
741. Durandus, In I Sent., d. 12, q. 1, n. 6; cf. Aristotle, Posterior Analytics I, c. 4.

concrete, is referred to God or to his essence according to the person that belongs to it per se, and necessarily coheres to it; but "God" is of the essence of the Father; wherefore this proposition, "the Father is God," is in the first mode of saying "per se": for there is, as it were, a certain difference of notedness between these propositions; that this, "the Father is God," is a direct proposition, because on the part of the predicate a quidditative term is placed, and it has the notion of form with respect to the subject; but that other, "God is Father," seems to have a type of indirectness, because that which is on the part of the subject has rather the notion of form than that which is placed on the part of the predicate.

Nevertheless, as far as we can add the notes "inasmuch as" and "according as" to propositions to perfect them, one must not say per se in this manner, "the Father is, per se and inasmuch as, God," or "God, inasmuch as, Father," and similarly with the other persons. For in this mode of speaking, as St. Augustine asserts,[742] we signify not only that the predicate belongs per se to the subject, but that by the same formal notion the subject and predicate are constituted, which is false. Hence Augustine said that "Word" is not that by which it is "Word," because the formal notion of "wisdom" is one, and that of "word" is another; "word" is said of the Son, not of the Father. Yet certain persons unskilfully suppose that the particle "inasmuch as" can be so applied; but Augustine, when he used that way of speaking, chiefly intended to show that it is false in the case in question; from this it is manifest that it is false likewise in other cases.

Hence also is understood that which St. Thomas taught in De potentia, q. 8, art. 2, ad 6,[743] when such a mode of speaking is used, that it is to be taken with caution, lest by adding "inasmuch as" we confound diverse formal notions in God.

3) Thirdly, the Bishop of the Canary Islands notes in this article that the proposition "God creates" is not per se in the fourth mode, as if it designated something accidental befalling God. He proves this first from St. Augustine, On the Trinity IX, where he says that in God there is nothing accidental, because he is immutable; and second, because the name "Creator" is imposed from a relation of reason which regards creatures, and therefore is not an accident in God, but only according to our mode of understanding. Therefore, although we say "God is Creator," this does not introduce an accident into God; rather, it signifies by extrinsic denomination, from the effect; and thus it is not properly per se in the fourth mode, which requires an intrinsic effect from a proper cause. Consequently I distinguish: when we use the expression "accidentally predicated," if we mean a predicate which does not adhere to the subject by an intrinsic nature and substance of the subject, in this way it is accidental to say "God creates"; because God can be Creator and not creating now. But if we speak of an "accident" predicable strictly so called, it ought not to be attributed to God; and thus the argument is solved according to the latter understanding.

Reply to the third: We say that it is not a proposition per se, even if an effect is predicated of its proper cause. For, in order that it be per se in the fourth mode, it must be necessary: for that which is per se, even in that mode, is distinguished from what is predicated accidentally, as Aristotle says

742. St. Augustine, De Trinitate VII (cf. c. 1 - 2), on the improper use of "inquantum" in divine predications.
743. St. Thomas, De potentia, q. 8, a. 2, ad 6.

in Posterior Analytics I, c. 4. Moreover, there can be science of propositions in the fourth mode of per se, as Aristotle teaches in the same place; but of contingent and non - necessary things there cannot be science. Therefore, in the fourth mode of saying per se is that proposition which he himself affirms, that an eclipse is in the moon; and similarly this one, "Whatever is created is from God": for these are necessary, and so also others in like manner.

Articulus VII - Whether the essential names ought to be appropriated to the persons

It seems that the essential names are not to be appropriated to the persons.

- For that which can verge toward an error in the faith ought to be avoided by individuals; for, as St. Jerome says, from words inordinately uttered heresy is incurred. But to appropriate what are common to the three persons to one person can verge toward error: because it can be understood either that they belong only to that person to whom they are appropriated, or that they belong to that one more than to the others. Therefore the essential attributes ought not to be appropriated to the persons. And one finds this in the Master, I Sentences, d. 19, in the lines.[745]
- Further, essential attributes, when signified in the abstract, signify after the manner of a form (*forma*). But one person does not stand to another as form: since from one and the same form there is constituted only one supposit (*suppositum*), not distinguished from itself. Therefore essential attributes, especially when signified in the abstract, ought not to be appropriated to the persons.
- Further, the proper is prior to the appropriated. But essential attributes, according to the mode of understanding, are prior to the persons, as the common is prior to the proper. Therefore essential attributes ought not to be appropriated to the persons.

But on the contrary: The Apostle says: "Christ the power of God and the wisdom of God" (1 Cor 1:24).[746]

I answer: For the manifestation of the faith it was fitting that the essential attributes be appropriated to the persons. For although a demonstration concerning the Trinity of persons cannot be established (as was said above), nevertheless it is fitting that it be declared through things more manifest. Now essential attributes are more manifest to us according to reason than are personal properties: because from creatures, from which we receive our cognition, we can, with certitude, arrive at knowledge of the essential attributes, but not at knowledge of the personal properties, as was said above. Therefore, just as we use the likeness of a vestige or image found in creatures for the manifestation of the divine persons, so too do we use the essential attributes. And this manifestation of the persons through essential attributes is called appropriation. But the divine persons can be manifested through essential attributes in a twofold way: in one way by way of likeness, as those things which pertain to the intellect are appropriated to the Son, who proceeds

745. Peter Lombard, Sentences I, dist. 19 (in the lines).
746. 1 Corinthians 1:24; Luke 6:19.

by way of intellect, as the Word; in another way by way of unlikeness: as power is appropriated to the Father (as St. Augustine says), because among us fathers are wont, on account of old age, to be weak, lest we suspect anything of that sort in God.[747]

Reply to the first: Essential attributes are not appropriated to the persons in such a way that they be made to be proper to them, but for manifesting the persons by way of likeness or unlikeness, as has been said. Whence no error of the faith follows, but rather a clearer manifestation of the truth.

Reply to the second: If the essential attributes were appropriated to the persons so as to be made proper to them, it would follow that one person would have to another the relation of form: which St. Augustine excludes in the sixth book On the Trinity, showing that it is not to be added to paternity that it "begot wisdom," as if the Son alone were wisdom, so that the Father and the Son together could be called wisdom; but the Father is not called "wise by the wisdom begotten." Rather, the Son is called the wisdom of the Father, because he is wisdom from the Father who is wisdom.[748]

Reply to the third: Although an essential attribute, according to its proper ratio, is prior to the person according to the mode of understanding, nevertheless, insofar as it has the ratio of something appropriated, nothing prevents the proper of the person from being prior to that which is appropriated. Thus color is posterior to body insofar as it is a body; yet color is naturally prior to a body insofar as it is white.

Conclusion: Although the essential things are themselves common to the three persons, nevertheless by us some are accommodated to one person, others to another, that we may know them better; and this accommodation is called appropriation.

Articulus VIII - Whether the essential attributes have been suitably assigned to the persons by the holy Doctors

It seems that the essential attributes have been assigned to the persons incongruously by the holy Doctors.

- For St. Hilary in book II On the Trinity says: "Eternity is in the Father, form in the Image, use in the Gift." In which words he posits three names proper to the persons, namely, the name of Father; the name of Image, which is proper to the Son (as was said above); and the name of Gift or of Donum, which is proper to the Holy Spirit (as was said above). He also posits three appropriated things. For he appropriates eternity to the Father, "form" to the Son, "use" to the Holy Spirit. And it seems that this is irrational. For eternity imports the ratio of essence; "form" is the principle of essence; but "use" seems to pertain to operation. Yet essence and operation are not found appropriated to any person. Therefore these appropriations seem incongruous.[749]

747. St. Augustine, De Trinitate (cf. the appropriation of power to the Father).
748. St. Augustine, De Trinitate VI.

- Further, St. Augustine in the fourth book On Christian Doctrine says thus: "In the Father is unity, in the Son equality, in the Holy Spirit the concord of equality and unity." And this seems incongruous: because one person is not denominated formally by that which is appropriated to another. For the Father is not "wise by the wisdom begotten," as was said. But, as he subjoins in the same place: "These three - one, all things are on account of the Father; equal, all things on account of the Son; connected, all things on account of the Holy Spirit." Therefore they are not inappropriately appropriated to the persons.[750] Likewise, according to Augustine, power is attributed to the Father, wisdom to the Son, goodness to the Holy Spirit. And this seems incongruous. For "virtue" belongs to power. But "virtue" is found appropriated to the Son, according to that of 1 Corinthians: "Christ the power of God." And also to the Holy Spirit according to that of Luke: "Power went forth from him and healed all." Therefore power ought not to be appropriated to the Father.
- Likewise Augustine, in the book On the Trinity, says: "We must not take confusedly what the Apostle says, 'From him, and through him, and in him' (Rom 11:36): 'from him' he says on account of the Father, 'through him' on account of the Son, 'in him' on account of the Holy Spirit." But this seems incongruous: because by this which he says "in him" there seems to be imported the relation of final cause, which is the first of causes; therefore this causal relation ought to be appropriated to the Father, who is principle not from a principle. Likewise, the truth is found appropriated to the Son, according to that of John 14: "I am the way, the truth, and the life." Similarly "the book of life": according to that of the Psalm, "In the head of the book it is written of me"; the Gloss adds, "with the Father who is my head." And similarly that which I say, which is this: "Because over the breadth of the earth..." and "Behold I..." - the Gloss says, the Son speaks what he said to Moses, "I am who am." But it seems that these are proper to the Son, and not appropriated. For the truth, according to Augustine, is proper to the Son; just as only the Son is the Word, so only the Son is Truth; yet the Father and the Son together can be said Wisdom; but the Father is not Wisdom from the Son, whereas the Son is Wisdom from the Father who is Wisdom.[751]

For he appropriates eternity to the Father, beauty (species) to the Son, and use to the Holy Spirit. And it seems that this is unreasonable. For eternity imports a duration of being; but beauty is a principle of the essence; and use seems to pertain to operation. Yet neither essence nor operation is found appropriated to any person. Therefore these appropriations seem unfitting.

Likewise Augustine says: In the Father there is unity, in the Son equality, in the Holy Spirit unanimity or connexion. And it seems this should be otherwise: because one person is not formally perfected through what is appropriated to another. For neither is wisdom begotten, as is said thereupon in the same place; but these three are said on account of the Father, equality on account

749. St. Hilary, De Trinitate II (shortly after the beginning).
750. St. Augustine, De doctrina christiana, at the end of c. 3.
751. John 14:6; Psalm 39:8 (Vulgate; 40:7); Gloss (ordinary) ad loc.

of the Son, connexion on account of the Holy Spirit. Therefore they are not appropriated to the persons according to Augustine, the Father by unity, the Son by wisdom, the Holy Spirit by charity, but rather unity to the Father, equality to the Son, connexion to the Holy Spirit.[752]

Likewise, virtue is referred to power; yet we find it appropriated to the Son and also to the Holy Spirit, according to 1 Cor. 1:24, and also according to that of Luke 6:19: "Power went out from him, and healed all." Therefore it ought not to be appropriated to the Father.

Again, in the book On the Trinity Augustine says that in the doxology "of him, and through him, and in him are all things" God is named on account of the Father, through the Son, in the Holy Spirit.[753] But it seems this is unfitting: because by that which he says "of whom" (ex quo) there is imported the notion of final cause, which is the first of causes; therefore "of whom" ought to be appropriated to the Father, who is principle not from a principle; yet "of whom" is not appropriated to the Father, but to the Son. Likewise, truth is appropriated to the Son, according to "I am the way, and the truth, and the life" (John 14:6); and likewise "In the head of the book it is written of me" (Ps. 39:8 Vg. [40:7]); and on that place the Gloss says: "With the Father is the book, in which..." And likewise what the Gloss says there, that the Son speaks what he said to Moses, "I am who am." But it seems that these are proper to the Son, and not appropriated. For the truth, according to Augustine, is proper to the Son; just as only the Son is the Word, so only the Son is Truth; yet the Father and the Son together can be called Wisdom; but the Father is not Wisdom from the Son, whereas the Son is Wisdom from the Father who is Wisdom.

Again, a "book of life" seems to be something proper: because it signifies a being from another; for every book is written by someone. Likewise, this very name "who is" seems to be proper to the Son. For if, when it is said to Moses, "I am who am," the Trinity spoke, then Moses could have said: "He who is, the Father and the Son and the Holy Spirit, has sent me to you." Therefore, and further, he could have said: "He who is, the Father and the Son and the Holy Spirit, has sent me to you," thereby manifestly designating a certain person. But this is false. For no person is "the Father and the Son and the Holy Spirit." Therefore "who is" cannot be common to the Trinity, but is proper to the Son.

I answer that our intellect, which is led by the hand from creatures into the knowledge of God, must consider God according to the mode which it takes from creatures. Now, in the consideration of any creature there occur to us four orders. For first, the thing itself is considered absolutely, inasmuch as it is some being. Secondly, the consideration of the thing is inasmuch as it is one. Thirdly, the consideration of the thing is according to what there is in it of virtue for operating and causing. Fourthly, the consideration of the thing is according to the habitude which it has to things caused. And thus also around God there occurs to us a fourfold consideration.

Accordingly, according to the first consideration, by which God is considered absolutely according to his existence (*esse*), that appropriation is taken which is from St. Hilary, according to which eternity is appropriated to the Father, beauty (species) to the Son, and use to the Holy Spirit.

752. St. Augustine, De doctrina christiana I, c. 5 (at the end): "The three are one on account of the Father; equal on account of the Son; connected on account of the Holy Spirit."

753. St. Augustine, De Trinitate VI, c. 10.

For paternity, inasmuch as it signifies an existence not begotten of a principle, has a likeness with the Father's proper feature, who is a principle not from a principle. But species, or beauty, has a likeness with the Son's proper features. Now three things are required for beauty: first, a certain mode, that is, wholeness or perfection; for the diminished are on that account ugly; and secondly due proportion or consonance; and thirdly, clarity. Hence things that have a shining color are said to be beautiful. Therefore, as to the first, there is a likeness with the Son's proper feature, inasmuch as he is Son, having in severe and perfect manner the nature of the Father. Hence, to intimate this, Augustine in his exposition says that in the Son there is the summit and perfection of life, etc.[754] As to the second, it agrees with the Son's proper feature, inasmuch as he is the express image of the Father. Hence we see that some image is called beautiful, if it represents a thing perfectly, even though the thing itself is ugly. And Augustine touched on this when he said: "Where is there so great a conveniency and the first equality, etc."[754] As to the third, it agrees with the Son's proper feature, inasmuch as he is the Word, which indeed is light and the splendor of the intellect, as Damascene says; and Augustine touches this too, when he says: "As a perfect Word to which nothing is lacking, and a certain art of the omnipotent God," etc.[755][756]

But use has a likeness with the Holy Spirit's proper features, if we take "use" in a broad way, insofar as use includes under itself also enjoyment (fruition): inasmuch as to use is to take something into the faculty of the will; and to enjoy is to use with gladness, as Augustine says in De Trinitate. Therefore the use whereby the Father and the Son enjoy one another agrees with the Holy Spirit's proper feature, inasmuch as he is Love. And this is what Augustine says: that affection, delight, felicity, or beatitude - "use" has been called by him.[757] The use, however, whereby we enjoy, has a likeness with the Holy Spirit's proper feature, inasmuch as he is Gift. And Augustine shows this when he says that in the Trinity the Holy Spirit is the sweetness of the Begetter and the Begotten, by a generous lavishness and abundance pouring upon us, or upon creatures.[754] And thus it is clear that it is fittingly that eternity, species, and use are attributed or appropriated to the persons. But not essence or operation: because in the notion of these, on account of their commonness, nothing is found to have a likeness with the persons' proper features.

The second consideration of God is insofar as he is considered as one. And thus Augustine appropriates unity to the Father, equality to the Son, and unanimity or connexion to the Holy Spirit. That these three import unity is manifest, but differently. For unity is said absolutely, not presupposing something else. And therefore it is appropriated to the Father, who does not presuppose some person, since he is a principle not from a principle. But equality imports unity in respect to another; for that is equal which has one and the same quantity together with another. And therefore equality is appropriated to the Son, who is a principle from a principle. But

754. St. Augustine, De Trinitate VI, c. 10.
754. St. Augustine, De Trinitate VI, c. 10.
755. St. John Damascene, De fide orthodoxa I, c. 8 (shortly before the middle).
756. St. Augustine, De Trinitate VI, c. 10.

754. St. Augustine, De Trinitate VI, c. 10.

connexion imports the unity of two things; hence it is appropriated to the Holy Spirit inasmuch as he is from two. In this sense too that can be understood which Augustine says, that "the three are one on account of the Father; equal on account of the Son; connected on account of the Holy Spirit."[752] For it is manifest that each thing is attributed to that in which it is first found; just as all lower things are said to live on account of the vegetative soul, in which the notion of life is first found in these lower things. Now unity is first found in the person of the Father, even with the others, per impossibile, set aside. And therefore the other persons have unity from the Father. But if the other persons are removed, equality is not found in the Father; rather, as soon as the Son is posited, equality is found. And therefore all things are said to be equal on account of the Son: not because the Son is the principle of equality to the Father, but because, unless the Son were equal to the Father, the Father could not be said equal: for the Father's equality is first considered in reference to the Son. For this very fact, that the Holy Spirit is equal to the Father, he has from the Son. Likewise, if the Spirit be excluded, who is the nexus of the two, the unity of connexion between the Father and the Son cannot be understood; and therefore all are said to be connected on account of the Holy Spirit. For, the Holy Spirit being posited, there is found the notion of connexion in the divine persons; whence the Father and the Son can be said to be connected.

But according to the third consideration, by which in God there is considered sufficient virtue for causing, a third appropriation is said to be taken, namely, of power, wisdom, and goodness. And this appropriation is both according to a notion of likeness, if one consider what is in the divine persons; and according to a notion of unlikeness, if one consider what is in creatures. For power has the notion of a principle; hence it has a likeness with the heavenly Father who is the principle of the whole divinity. A father on earth, however, sometimes fails on account of old age. Wisdom has a likeness with the heavenly Son, inasmuch as he is the Word, which is nothing else than the concept of wisdom. A son on earth, however, sometimes fails on account of the scantiness of time. Goodness, however, since it is the reason and object of love, has a likeness with the divine Spirit who is love; but it seems to have a repugnance to an earthly "spirit," insofar as that imports a certain violence and impulse; as is said in Isa. 26: "A strong wind, like a whirlwind driving a wall." But "virtue" is appropriated to the Son and to the Holy Spirit, not inasmuch as "virtue" is said to be the very power of a thing, but inasmuch as sometimes "virtue" is said of that which precedes the power of a thing; as when we say some work has been accomplished by virtue of some agent.

But according to the fourth consideration, inasmuch as God is considered in relation to his effects, that appropriation is taken, "of whom, through whom, and in whom." For this preposition "of whom" (ex quo) sometimes imports the habitude of a material cause, which has no place in the divinity; and sometimes the habitude of an efficient cause, which indeed befits God by reason of his active power. And hence it is appropriated to the Father, as also is power. But the preposition "through" (per) sometimes designates a medial cause; as we say that a smith works through a hammer. And yet "through" is sometimes not appropriated but proper to the Son, according to John 1: "All things were made through him:" not because the Son is an instrument, but because he

752. St. Augustine, De doctrina christiana I, c. 5 (at the end): "The three are one on account of the Father; equal on account of the Son; connected on account of the Holy Spirit."

is a principle from a principle. Sometimes, however, it designates the habitude of a form through which an agent acts; as we say that the craftsman works through art. Hence, just as wisdom and art are appropriated to the Son, so too "through whom." But the preposition "in" properly denotes the habitude of a container. Now God contains things in a twofold way. In one way, according to their likenesses; as things are said to be, namely, insofar as they are in his knowledge. And thus what I say "in him" would be appropriated to the Son. In another way, things are contained by God, insofar as by his goodness he preserves and governs them, leading them to a fitting end. And thus "in whom" is appropriated to the Holy Spirit, as is goodness. Nor is it required that the habitude of final cause (although it be the first of causes) be appropriated to the Father, who is principle not from a principle; because the divine persons, of whom the Father is the principle, do not proceed as to an end (since each of them, being God, is the ultimate end), but by a natural procession, which seems rather to pertain to the notion of natural power.

To the other things asked it must be said that, since truth pertains to the intellect (as was said above), it is appropriated to the Son, yet it is not proper to him. For truth, as was said above, can be considered as it is in the intellect, or as it is in the thing: just as, therefore, the intellect and the thing taken essentially are essential and not personal, so too truth. The definition of Augustine adduced is given of truth according to the mode in which it is appropriated to the Son.

But "the book of life," strictly taken, imports knowledge, yet obliquely life. For it is, as was said above, the knowledge of God concerning those who are to have eternal life. Wherefore it is appropriated to the Son, although life is appropriated to the Holy Spirit, insofar as it imports a certain interior motion, and thus agrees with the Holy Spirit's proper feature inasmuch as he is love. Now, "to be written by another" is not of the notion of a book insofar as it is a book, but insofar as it is a certain artifact. Hence it does not import origin, nor is it personal, but it is appropriated to a person.

Likewise, the very name "who is" would be appropriated to the person of the Son, not according to its own proper notion, but by reason of its adjunct: inasmuch as, namely, in the speech of God to Moses the liberation of the human race was prefigured, which was brought about through the Son. Yet, insofar as "who" is taken relatively, it could sometimes be referred to the person of the Son; and thus it would be taken personally, for instance if one says: "The Son is begotten, who is," just as also "the begotten God" is personal. But taken infinitely it is essential.

And although this pronoun "this" (iste), grammatically speaking, seems to pertain to some determinate person, nevertheless any demonstrable thing, grammatically speaking, can be called a "person," although according to the nature of the thing it is not a person. For we say "this stone" and "this donkey." Hence also, grammatically speaking, the divine essence, according as it is signified and supposes under the name "God," can be demonstrated by this pronoun "this," according to that Exodus 15: "This is my God, and I will glorify him."

Quaestio XL - On the persons in comparison to relations or properties

Then there is asked concerning the persons in comparison to relations, or proper properties. And four things are asked.

Articulus I - Whether relation is the same as person

It is objected that, in the divine, relation is not the same as person. For whatever things are the same, when one of them is multiplied, the other is multiplied. But it happens that in one person there are many relations, as in the person of the Father there are paternity and common spiration. And again one relation is in two persons, as common spiration is in the Father and the Son. Therefore relation is not the same as person.

1. Further, nothing is in itself, according to the Philosopher in Physics IV. But relation is in a person. Nor can it be said that it is by reason of identity; for thus it would also be in the essence. Therefore relation, or property, and person are not the same in the divine.
2. Further, whatever are the same are so disposed that whatever is predicated of the one is predicated of the other. But not whatever is predicated of person is predicated of property. For we say that the Father generates, but we do not say that paternity is generating. Therefore property is not the same as person in the divine.

But on the contrary: In the divine there do not differ "that which is what it is" and "that by which it is," as is had from Boethius in the book On the Hebdomads.[758] But the Father is Father by paternity. Therefore the Father is the same as paternity. And by the same reasoning the other properties are the same with the persons.

I answer that concerning this some have been of different opinions. For some said that the properties are neither persons, nor in persons. They were moved by the mode of signifying of relations, which indeed do not signify as in something, but rather as to something. Hence they said that relations are assistent beings, as was explained above. But, since relation, insofar as it is a certain thing in the divine, is the essence itself; and the essence is the same as person (as is evident from what has been said), it is necessary that then relation be the same as person. Therefore, others, considering this identity, said that the properties are indeed persons, but not in persons: because they did not posit properties in the divine except according to the mode of speaking, as was said above. Yet it is necessary to posit properties in the divine, as we have shown above. And these indeed are signified in the abstract, as certain forms of the persons. Wherefore, since it belongs to the notion of a form that it be in that of which it is the form, one must say that the properties are in the persons, and yet that they are persons, just as we say that the essence is in God, which nevertheless is God.

Reply to the first: Person and property are the same in reality, yet differ according to reason. Hence it is not necessary that, when the one is multiplied, the other be multiplied. Yet it must be considered that, on account of the divine simplicity, there is considered a twofold real identity in the divine of those things which differ in created things. For because the divine simplicity excludes the composition of form and matter, it follows that in the divine the abstract and the concrete are the same, as deity and God. But because the divine simplicity excludes the composition of subject and accident, it follows that whatever is attributed to God is his essence; and on account of this, wisdom and power are the same in God, because both are in the divine essence. And according to this twofold ratio of identity, a property in the divine is the same as a person. For personal properties are the same as the persons in that respect in which the abstract is the same as the concrete. For they are the subsisting persons themselves, as paternity is the Father himself, and filiation the Son, and procession the Holy Spirit. But the non-personal properties are the same as the persons according to that ratio of identity, according to which that which is attributed to God is his essence. Thus therefore the common spiration is the same with the person of the Father and with the person of the Son; not because it is one person subsisting of itself, but just as one essence is in two persons, so too one property, as was said above.

Reply to the second: The properties are said to be in the essence by a mode of identity only; but in the persons they are said to be by a mode of identity, not indeed according to the thing only, but as to the mode of signifying, as a form is in a supposit. And therefore the properties determine and distinguish the persons, but not the essence.

Reply to the third: Participles and notional verbs signify notional acts. But acts are of supposits. The properties, however, do not signify as supposits, but as forms of supposits. And therefore the mode of signifying is repugnant to participles and notional verbs being predicated of properties.

Conclusion: Relation, according to the thing, is the same as person; it is said to be in a person. Certain points are wont to be disputed in this article, about which enough and more than enough has been said by us. First, whether relation is distinguished from person by nature of the thing, or by reason alone: about which we treated in Disputation 121, and it is gathered from what was said in Disputation 20. Second, whether notional acts are predicated of personal properties or not: about this, however, we treat differently in Disputation 136, chapter 3. Third, whether a property is said to be in a person, as paternity in the Father: and this too we treated there, chapter 2.

758. Boethius, De hebdomadibus.

Articulus II - Whether the persons are distinguished by relations

To the second we proceed thus. It seems that the persons are not distinguished by relations. For simples are distinguished by themselves; but the persons are most simple. Therefore they are distinguished by themselves, and not by relations.

1. Further, no form is distinguished except according to its genus. For white is not distinguished from black except according to quality. But hypostasis signifies an individual in the genus of substance. Therefore hypostases cannot be distinguished by relations.
2. Further, the absolute is prior to the relative; but the first distinction is the distinction of the divine persons. Therefore the divine persons are not distinguished by relations.
3. Further, that which presupposes a distinction cannot be the first principle of distinction. But relation presupposes distinction, since in its definition it is posited; for the being of the relative is to be disposed toward another. Therefore the first distinctive principle in the divine cannot be relation.

But on the contrary is what Boethius says in the book On the Trinity, that only relation multiplies the Trinity of the divine persons.[759]

I answer that, in whatever many there is found something common, one ought to seek a distinctive something. Wherefore, since the three persons agree according to unity of essence, it is necessary to seek something by which they may be distinguished, to this end that they be several. Now there are found in the divine persons two things, according to those which differ, namely origin and relation: which, although they do not differ in reality, do differ nevertheless according to the mode of signifying. For origin is signified by the mode of an act, as generation; but relation by the mode of a form, as paternity. Certain men, therefore, attending to the fact that relation follows upon the act, said that the hypostases in the divine are distinguished by origin, so that we might say that the Father is distinguished from the Son inasmuch as the former generates and the latter is begotten. But the relations, or properties, manifest consequently the distinctions of hypostases or of persons: just as also in creatures the properties manifest the distinctions of individuals, which are constituted by material principles. But this cannot stand for two reasons.

First, because in order that certain two things be understood as distinct, it is necessary that their distinction be understood through something intrinsic to each: as in created things, either through matter or through form. But the origin of a certain thing is not signified as something intrinsic, but as a kind of way either from the thing or to the thing; as generation is signified as a kind of way toward the generated thing, and as proceeding from the generator. Whence it cannot be that the generated thing and the generator be distinguished solely by generation; but one must understand both in the generator and in the generated those things by which they are

759. Boethius, De Trinitate.

distinguished from each other. But in the divine person there is nothing else to understand except the essence and relation or property. Wherefore, since they agree in the essence, it remains that the persons be distinguished from each other by relations.

Second, because the distinction of the divine persons is not thus to be understood as though something common were divided; for the common essence remains undivided; but the very distinguishing things must constitute distinct realities. Now relations or properties thus distinguish or constitute hypostases or persons, inasmuch as they are themselves subsisting persons, just as paternity is Father, and filiation is Son, since in the divine the abstract and the concrete do not differ. But it is against the notion of origin that it constitute a hypostasis or a person. For origin signified actively is signified as proceeding from a subsisting person, and so presupposes it; but origin signified passively (as nativity) is signified as a way to the subsisting person, and not yet as constituting it. Wherefore it is better said that persons or hypostases are distinguished by relations than by origin. For although they are distinguished in both ways, yet first and more principally by relations according to the mode of understanding. Wherefore this name "Father" signifies not only a property, but also a hypostasis. But this name "begetter" or "generating" signifies property only. For the name "Father" signifies a relation which is distinctive and constitutive of the hypostasis; but the name "generating" or "begotten" signifies an origin which is not distinctive and constitutive of the hypostasis.

Reply to the first: The persons are subsisting relations. Wherefore it does not repugn the simplicity of the divine persons that they be distinguished by relations.

Reply to the second: The divine persons are not distinguished in the essence in which they subsist, nor in anything absolute, but only according to that which is said to another. Wherefore for their distinction relation suffices.

Reply to the third: The more prior the distinction is, the nearer it is to unity. And therefore it ought to be least. And so the distinction of persons ought to be only by that which distinguishes least, namely by relation.

Reply to the fourth: Relation presupposes the distinction of supposits when it is an accident; but if relation be subsisting, it does not presuppose, but it itself brings the distinction. For when it is said that the being of the relative is to be disposed toward another, by the "other" is understood the correlate, which is not prior, but is simultaneous by nature.

Conclusion: The divine person is constituted and distinguished by relations.

Whether the divine person is constituted and distinguished by relations, or by absolute properties. Disputation 158.

Disputatio CLVIII - Whether the divine person is constituted and distinguished by relations, or by absolute properties

Caput I - That in the persons there are not properties by which they are distinguished and constituted; taught by Praepositinus and Gregory

This is the chief difficulty in this whole question, which so greatly wrung the wits of the Scholastics that they diverged into various opinions, which it will be necessary for us to recount. The first opinion was that of Praepositinus, which, as St. Thomas notes, certain Scholastics held,[760] who asserted in sum that in the persons there are no properties, neither absolute nor relative; that in the divine the persons are neither constituted nor distinguished by properties, but are distinguished by themselves, and are in no way constituted by something other than themselves. This opinion Gregory followed and set forth at length,[761] explaining it thus: that properties can be taken in two ways - first, for the very persons themselves; in which sense St. Jerome seems to have used the term in the exposition of faith to Damasus, where he says: Thus, shunning the impiety of Sabellius, we distinguish three persons expressed under "property"; and a little later: For we confess not only names, but also names as properties, that is, as persons; or, as the Greeks say, hypostases, that is, substances.[762] In this way Gregory agrees in the Decretal: the properties that are in God are the persons; and the persons are distinguished by properties, because by themselves they are distinguished; but they are not constituted by them, because nothing is constituted by itself. But if a property were to effect something other than the person, it would follow that the person would not be altogether simple and without composition, since in it there would be something that was not itself.

He proves, secondly, that the divine person is constituted by nothing. First, because the divine person is altogether simple, without any composition; therefore it can be constituted by nothing. For if it were constituted by something, either that something would be the person itself, or something other: if it were the person itself, the person could not be constituted by it, because nothing is constituted by itself; but if it were something other than the person, it would follow that the person is not altogether simple and without composition, since in it there would be something that was not itself. He proves, secondly, that the person is not the essence itself; the essence is simple and is constituted by nothing else; therefore neither is the person. Thirdly, he argues in I, q. 4, the single article, after the conclusion, from the chapter Firmiter "On the supreme Trinity and the catholic faith," where it is said that the Father gave his whole substance to the Son: if there is some property in the Father that is not in the Son, since that ought to be of the substance of the Father, it follows that the Father did not give his whole substance to the Son, but retained some part to himself.[763]

760. St. Thomas, Summa theologiae I, q. 32, a. 2.
761. Gregory (as cited) on I Sentences, dist. 26 and 27, q. 1.
762. St. Jerome, Expositio fidei ad Damasum.
763. The decree Firmiter "De summa Trinitate et fide catholica" (Decretum).

Caput II - The foregoing opinion is refuted

The other Scholastics, however, in opposition to Gregory, agree that in the persons there are properties by which they are both distinguished and constituted; although they also concede "notions," as we have seen elsewhere, yet they do not assign them in the same way, as we shall immediately report. All, moreover, impugn the opinion of Praepositinus and of Gregory; among whom the Master in I, dist. 33, affirms that no one ever dared to deny properties in the persons.[764] The canonists indeed, in their commentaries preceding this article, for the first part of Gregory's sentence, charge him with errors; for, if it were true that the properties by which the persons are distinguished were not constitutive, a person could not be constituted by anything; for nothing constitutes itself; but if it were constituted by something other than the person, it would follow that the person is not simple, and without composition; since there would be something in it which was not itself. And thus the divine persons would by no means be constituted; for Gregory's first proof, namely that the divine person is altogether simple without any composition, does not take this away. For if it be altogether simple, as the essence is; but the essence, which is simple, is constituted by nothing else, neither will the person be so constituted. Thirdly he argues, from the aforesaid chapter Firmiter of the Summa of the Trinity and the catholic faith, where it is said that the Father gave his whole substance to the Son; if there be any property in the Father that is not in the Son, since that ought to be of the substance of the Father, it will follow that the Father did not give his whole substance to the Son, but retained some part to himself.

It is noted that he asserts there are no properties in the persons, contrary to what the Church sings in the Preface of the Trinity: "Unity in essence, property in persons," etc. Add Sophronius, who, in the letter received and approved in the Sixth Synod, action 11, far from the beginning, shows the identity and distinction of the persons by these words: "This indeed on account of nature, the identity; that, however, on account of the alterities of the properties of these three (namely of the Father, and the Son, and the Holy Spirit), and on account of the dissimilarity of the properties, which without confusion figure each person." Where he concedes properties in the persons, and that the persons themselves are figured by properties, that is, are thereby distinguished from others.

Gregory nevertheless answers either that the Church's wording is not "according to property," or that it is to be understood in the sense (as they say) of an intransitive form of speech, as if it had said, "the properties are adored in the persons," that is, the very persons. But this solution he could not adapt to the testimony of Sophronius, to which Gregory himself does not refer. For when Sophronius says that by these properties the persons are figured, he speaks not intransitively but transitively; for it would be absurd to say that a person is figured by itself. Wherefore, not without a note of rashness, these authors deny properties and notions in the persons, which the whole school admits, not only as signified complexly, but even incomplexly, as we noted against them in that disputation 136, chapter 2; and the cited testimonies sufficiently prove it. For who would deny this manner of speaking: "The Father is Father by paternity"? For although paternity, apprehended as a

764. The Master (Peter Lombard), I Sentences, dist. 33.

certain simple form - as even the attributes are apprehended in God - is distinguished by reason alone from the Father, nevertheless we can absolutely and without any additament say, "paternity is in the Father." For the words imposed by us signify the thing to us as it is conceived by us; and since the intellect distinguishes in the persons the properties from the essence (*essentia*), and in each of them apprehends something common to the three and something peculiar to each, it cannot but conceive properties after the mode of a form, which it signifies by simple and incomplex names. Wherefore we would not rightly say that the divine persons differ "by their wholes"; for surely they agree among themselves and also differ from one another; but the things which agree and differ are conceived by us in such a way that in them we distinguish something by which they agree and something by which they differ. Thirdly, just as deity is said to be in the three persons signified as a form, why will not paternity be said to be in the Father, and any other property in its own person? And Sophronius often says in that epistle that the divinity is in the three persons.

As to the latter part, namely, where that opinion says that the divine persons are constituted by nothing else, this is pleasing to Canariensis in the third part of the commentary on this article and in the second part of the commentary on article 4, if it be understood thus: he thinks the divine persons are not constituted in reality, but only by the intellect, just as a species is said to be constituted of genus and difference, and is constituted by them. This view was handed down by St. Thomas on the First Book, distinction 26, question 2, article 1; by Cajetan on this article, around the answer to the first; and by Ferrariensis on Contra gentiles IV, chapter 26, "Ad evidentiam;" and it is also most highly approved by me for this reason. A constitution from the nature of the thing requires a distinction from the nature of the thing between that which constitutes and that which is constituted; for the same thing does not constitute itself. But the person, the essence, and the property are entirely the same from the nature of the thing; therefore from the nature of the thing the person can be constituted neither by the essence nor by the property. But that it be constituted by the intellect, it is enough that by the intellect also the relation (*relatio*) be distinguished from the person.

Scotus, however, in the places to be cited in the next disputation, chapter 4, therefore says that the persons are constituted from the nature of the thing, because he thinks the properties or relations are from the nature of the thing, or really distinguished from the essence, as we saw in disputation 120, chapter 3; which posited, it follows that the person is really constituted by relation, as by a proper constituting principle, and by essence as by a common one. The same must be asserted by Durandus and Gabriel, whom we alleged in that same chapter; because they hold concerning the distinction of the relation from the essence in the same way, as we saw in that chapter 3: but we showed their foundation to be false in that disputation: therefore it follows that the person is constituted by the intellect alone by relation and essence.

But some say that this constitution, according to the mode in which it is conceived by us, is not in reality in the persons: because we think this constitution along with some distinction of a constituting principle and a constituted thing; but in the divine person that distinction which we apprehend is not in reality: therefore neither is the constitution according to the mode in which it is conceived by us. Nevertheless, on the side of the thing there is that which we wish to signify by

the name "constitution," and for that cause it can rightly be called a real constitution. For when we say that the divine person is constituted by relation, we mean only to signify that in the divine person there is something common, by which he agrees with the others, and something by which he differs; and this is present in reality, even without a real distinction of the one from the other. They say, moreover, that this constitution is deservedly called real, because absolutely the Scholastics, in the Council of Florence, say that the persons are constituted by relations; but they admit that the metaphysical constitution in man from genus and specific difference is wholly of reason and in no way real. You might be moved [by an objection], because in man nothing common according to the thing is found with such [constitutive notes], but only by reason: wherefore neither according to the thing signified, nor according to the mode, ought the constitution of man to be called real.

A groundless middle. Yet this middle view, lacking foundation, was devised; and all the other Scholastics rightly said that, once a constitution is posited, it is either real or of reason, from the fact that either the constituting principle is distinguished from the constituted person by the nature of the thing, or it is not distinguished, as we saw above; for between these there is no middle. For when by the name "constitution" we signify not only a thing agreeing with others and distinct from them, but also a certain act and order of the constituting principle about the thing constituted, if this act is only by reason, the constitution must be called not real but of reason. Now this act in the divine person is an act of reason, if the constituting principle is not distinguished by the nature of the thing from the constituted thing, as the more probable opinion holds; there is no one who does not know this. For what act or real order can that have which is the same in itself? Therefore, if we attribute a real constitution, it ought to be distinguished really, or by the nature of the thing, from that which is constituted. Why, however, it is said that the person in the divinity is absolutely constituted, we shall say a little later.

The opinion of Gregory and of Praepositivus therefore is acceptable as to the latter part, wherein they assert that the person is constituted by no principle from the nature of the thing. Yet on that account they ought not to have asserted that the person is in no way constituted; since all the other Scholastics plainly admit that the persons are constituted and distinguished by something; and John the Theologian, a man of the Latin Church most learned in divine letters, in the Council of Florence, session 19, at the end, asserts this same thing in these words: "Although there are three hypostases, and persons different among themselves, nevertheless we confess one God, ...; but that a person consists of diverse substances and of property." We speak, however, without additament when we say that the persons are constituted by relations; but we do not absolutely assert that the persons are composed or are composite - even though both composition and constitution are by reason, as we said in disputation 121, chapter 3. For when we speak of constitution, we commonly understand that one also which is by reason; since about many other things also which, even in themselves potentially, our adversaries hold to be constituted by reason alone, we absolutely assert a constitution. For we say that man is constituted by the rational [difference]; that man is constituted by the animal and the rational; yet this constitution is by reason. Nevertheless, with the

name "composition" we seem more expressly to denote something which is opposed to the simplicity of God; and therefore we abstain from it, and we attribute it to God only with an additament.

From what has been said the foundations of Gregory easily fall. Reply to the first argument: we say that the divine person is in reality most simple; nevertheless by reason it can be constituted by some principle; for this constitution in no way impedes the simplicity of the thing.

Reply to the second: I answer that in reality the person is no less simple than the essence; yet in our intellect there is a greater foundation to constitute the person than the essence: because in the person we apprehend something common and something peculiar; but in the essence, not so. And just as in a constitution which is according to the thing we at length come to the constituting principles which no longer constitute, so also in a constitution by the intellect, the intellect at length comes to principles which can no longer constitute: such are relation and essence.

Reply to the third, from the chapter Firmiter, I say that the Father communicates to the Son his whole essence, which is distinguished in reason from relation and property; and this the Council signified when it asserted that he communicated his whole substance. It did not say "his whole reality under every aspect"; for thus also under the aspect of property the Father would communicate [it to the Son], which is false.[765][766][767][768][769][770][771][772]

... would communicate it under the aspect of paternity; wherefore it would be necessary to say that he communicated his whole reality to the Son, because since his reality is also paternity, it would then be said that he communicated it. Yet this is not so in such wise that he retains some part in himself and gives some part to the Son, but only thus: that in the very essence remaining, which is really the same as paternity, under the formal aspect of paternity - under which he did not communicate it to the Son - he did not communicate it. Of which we shall also speak below in disputation 163.[773]

The divine persons to be constituted and distinguished by absolute properties was the view of Ioannes de Ripis and of Scotus.

Caput III - On the opinion that the divine persons are constituted and distinguished by absolute properties (Ioannes de Ripis and Scotus)

The second opinion was that of Ioannes de Ripis, which Scotus reports and, as probable, embraces in the First Book, distinction 26, question 1, n. 9.[774] A third opinion, namely, that the divine persons are constituted and distinguished by absolute properties. In this position they first

engage with Gregory and Praepositivus, and agree with the other Scholastics in admitting in God a constitution from something common and from a peculiar property; yet they dissent from them, because they think that the proper principle constituting and determining the essence to be the being of a person is some absolute property. They prove this, moreover, by many arguments, which we shall report in the last chapter.

This opinion is branded as erroneous by the Canarien. in this article, part 2 of his commentary, and by other more recent writers; and from the doctrine of the Fathers it can plainly be refuted. First, St. Augustine, passim; in book 3 On the Trinity, c. 2, concerning the Father and the Son, he speaks thus: "Whatever therefore are said 'with respect to self' (ad se) are not said of the one without the other." If, then, the Son were such a person by an absolute property, already the Son would be said to have something absolute "with respect to self," which would not be said of the Father; and of the Father in like manner: wherefore already the one without the other would be said to be something that is absolute. And in book 7 On the Trinity, last chapter, he explains that saying of John 10, "I and the Father are one," in such a way that "one" refers to the essence, "are" to the relations. And in book 9, c. 1: "Let us believe," he says, "that the Father, the Son, and the Holy Spirit are one God, the creator and ruler of the whole creation; and that neither the Father is the Son, nor the Holy Spirit is either the Father or the Son; but that there is a Trinity of persons related to one another, and a unity of equal essence."

The same says St. Ambrose, book 1 On the Faith to Gratian, c. 1,[775] and St. Jerome, in the exposition of the creed to Damasus,[776] where he says that the three persons are distinguished by properties; but from the preceding and the following it is clear that by "properties" Jerome means relations. Boethius, in the book On the Trinity, towards the end, says that by relation the Trinity is multiplied.[777] St. Anselm expressed the same in nearly the same words in De Incarnatione Verbi c. 3. Certainly, on the procession of the Holy Spirit, he writes thus: the only cause of plurality in God being presupposed, the Father, the Son, and the Holy Spirit are said, not "with respect to self," but "to one another"; because besides these modes there is "God from God" (namely generation and procession), all of which can be called relation.[778] Therefore, according to his mind, relation alone is the cause of plurality - and therefore of distinction - in God. St. John Damascene, De fide orthodoxa 1, c. 10, on the Holy Spirit, says: "Having all things that the Father and the Son have, except the property of being unbegotten and of being begotten." And c. 11: "We recognize God indeed ... but as to the properties, namely of paternity, filiation, and procession, we note distinctly what belongs to each person according to cause and what proceeds from cause; and this he calls the perfection of the person and the mode of existing of that person." Therefore Damascene judges that the distinction in God is from relations alone and from the sole order of cause and caused; and this he calls the perfection of the person and the mode of existing of the same.[779] Finally, in the

Eleventh Council of Toledo, in the confession of faith, it is said thus: "Therefore this holy Trinity, which is one God, which neither receives number nor is contained under number: for the number of persons is discerned in relation," etc.[780] And the Latin Theologian John, in the Council of Florence, session 19, somewhat before the middle, speaks thus of the divine substance: that it differs in many other things - except that the Father is Father and the Son is Son. And at the end of the session, when he had said that hypostases consist of essence and property, so that "person" is nothing other than "substance and property," he adds thereafter: "Which substance and property, although they be united in themselves and by their properties be really distinguished among themselves (namely, the hypostases), since they are 'toward another' (ad aliquid), yet we confess God to be chiefly according to substance." Where he therefore says that persons differ precisely in that they are "toward another": he recognizes no absolute properties as real.[781]

From all these things at least this, in my judgment, can be gathered: that Ioannes de Ripis and Scotus have manifestly slipped, in that they assert that the distinction among the divine persons arises from absolute properties, whereas the holy Fathers with one voice profess that it is taken from relation alone. But as to constitution, that aforesaid opinion cannot so plainly be condemned: about this the Fathers do not speak; although the Theologian John in the Council of Florence, session 19, not only said that persons are distinguished by properties which are "toward another," but also that by these same properties and by the essence they consist, which amounts to their being constituted.

Those who come somewhat nearer to the truth said that the divine persons are constituted by relative properties, not insofar as they only contain the order of one to another, but insofar as they are origins: for both are included in the concept of property, Bonaventure thought, in the First Book, distinction 26, question 2.[782] For this reason they teach that the Father is constituted by active generation, not by paternity; the Son by passive generation, not by filiation; and the Holy Spirit by procession, as it is an emanation. They think the same about distinction: for if origins sufficiently constitute the person, the same will sufficiently also distinguish; those which are opposed, according to what was noted in disputation 147, chapters 4 and 6. This opinion is attributed to St. Bonaventure in that distinction 27, question 2; yet there he seems to have spoken only of distinction.

The aforesaid opinion can be proved in this way. First: whenever in any thing two things occur, one prior, the other posterior, by the latter that thing cannot be constituted and distinguished substantially, but by the former. Now in any divine person origin is prior to relation: therefore a person cannot be constituted and distinguished substantially by relation, but by origin. Moreover, when there is origin, a person is understood; for if it be active, of the producing person; if passive, not without the produced person. But when there is origin, relation is not understood at once, but afterwards: therefore it accrues to a person constituted and produced; but what accrues to a thing constituted cannot constitute it substantially; therefore neither can relation constitute the person.

780. Council of Toledo XI, in the confession of faith.
781. Council of Florence, session 19 (cited by "Ioannes Theologus... in Concilio Florentino sessione 19").
782. St. Bonaventure, In I Sent., d. 26, q. 2.

St. Thomas and Cajetan refute this opinion in this article; the Canarien., in part 3 of his commentary on this article; and more recent Thomists; and Durandus In I Sent., dist. 26, q. 1, nn. 13 - 14.[783][784][785] The Canarien. first lays down that in the divine realities relation and origin are absolutely the same in reality, and are distinguished only by our thought: for the very same relation, conceived as a way and production of a person, whether actively or passively, is called origin and has the concept and ratio of a second act; the same, however, considered as the form of the person (as they say) in actual being, is relation: therefore the same thing is considered as generation, and thus it is origin, and as the ratio of the begotten, and thus it is relation, and so of the others. This posited, it must be proved that origin is not a principle constituting or distinguishing under the proper aspect of origin, in our way of understanding: for this constitution is of concepts in our thought, and therefore we only seek the ratio of the constituting principle as it is apprehended by us: for in reality origin and relation are entirely the same; nay more, these two are entirely the same as the person. Therefore, in our way of understanding, origin is not a constituting and distinguishing principle, as St. Thomas and Durandus prove in this way. Every principle or form constituting and distinguishing some thing ought to be conceived by us after the mode of a form inhering in the thing in actual being, which it constitutes and distinguishes: for since it is a question of the being of a thing, it ought to be considered after the mode of some form, not after the mode of a way and production of the thing. For it is one thing for a thing to be, another to be produced. Now a thing is said to be when it is already constituted and distinguished; but origin is not formally conceived as a form inhering in actual being, but as a way and production: therefore, in our concept, it cannot be the principle constituting and distinguishing the person.

This argument rightly proves about passive origin, because passive origin is as it were the way and becoming of the produced person: wherefore it cannot be the form in actual being that constitutes it, and distinguishes it from others. For when we understand that a person or some thing is being made or produced, we do not yet understand that it is; for formally it is one thing to be produced, whereby it comes to be a person, another whereby it is formally constituted by some principle by which it is, not by which it is produced; but by the name of origin we do not understand - nor did the aforesaid authors understand - relation in actual being signified by the name of origin, such as is the relation of the begotten: for this is entirely the same as the relation of the Son; for "Son" and "begotten" are synonyms, as "gladius" and "ensis": but we understand relation after the mode of a way, which we signify by the name "generation" and "to be generated." And about this we rightly said that it is not the form constituting and distinguishing the person.

But some say that relations and origins are not distinguished, not even by a distinction of reason, but only by a mode of signifying. This is by no means true: first, because nothing can differ from another by mode of signifying unless it also differ by reason and concept. For since signification is that which makes something to be known, the signification will be the same which

783. Cajetan, on this article.
784. The "Canarien." cited here, part 3 (and earlier part 2) of his commentary on this article.
785. Durandus, In I Sent., d. 26, q. 1, nn. 13 - 14 (and n. 14 cited again below).

makes the very same thing to be known, and it will then be different when it effects different concepts in the mind. This I also noted above in disputation 136; otherwise relations and origins will be synonyms - unless someone were to say that they differ as the definition differs from the defined and the explicit from the implicit: which has no place here.

Besides, "to be generated" and "to be begotten" are conceived by us in a different way, just as "to be moved" and "to be in motion"; therefore the concept of origin, which is "to be generated," is not the same as the concept of relation, which is "to be begotten." Otherwise, just as we say "the Son proceeds by generation," we would also say "he proceeds by filiation," which is absurd. Therefore, just as we say that the person proceeds by generation, and not by the relative property; so conversely we shall say that the Son is constituted by filiation, not by passive generation. About active origin the same can be proved no less easily, because the principle constituting the person that produces ought to be understood after the mode of a first act, not after the mode of a second act; but origin is understood after the mode of a second act: therefore it cannot be the principle of the producing person.

Reply to a ready question. If you say that origins, both active and passive, conceived according to the mode of origin only in general, are merely a way, but conceived particularly, are a form per se subsisting: this is manifestly blocked by reason. For a way, however much it be understood as toward something determinate, is always in our concept "as a way" and "as a second act," not as a first act: but that which constitutes after the mode of a first act ought to be conceived after the mode of a first act.

The argument of St. Bonaventure will be solved in the following disputation together with the arguments of Scotus. For the present it only remains to observe that the Fathers sometimes without distinction assign the distinction of the persons by origins and by relations. For they say that the Father is distinguished from the Son because he is Father, or also because he begot; and of the Son similarly - that by either way the difference is rightly inferred. For we do not deny that from origin the difference of the produced person and of the producer is gathered; for from opposed origins there result opposed relations. But we only assert that origin itself, under the formal concept of origin, is not conceived as a principle constituting and distinguishing after the mode of an inhering form, which seems to be proper to such a principle; nevertheless we do not deny that origin is a way to constitution. And therefore St. Ambrose, book 1 On the Faith to Gratian, c. 2; Fulgentius, book 1 On the Faith to Peter, c. 1; Athanasius, in Dialogue 1 On the Trinity against the Anomoeans; Richard of St. Victor, book 4 On the Trinity, c. 1, gather the distinction and plurality of persons from origins; with whom Bessarion agrees in his Oration for the Union of the Greeks and Latins, c. 6, after the middle, which is had after the Council of Florence. But indeed no one said that origin is the formal principle of distinction: in these modes of speaking the controversy about this matter is solved among scholastic theologians. Much less do the Fathers assert that the principle constituting the person is origin; about this they do not speak. But what some assert, that the constituting and the distinguishing principle are the same, is false, as is gathered from disputation 147, c. 7.

The divine persons to be constituted and distinguished by relations alone is the truer view.

Caput V - That the divine persons are constituted and distinguished by relations alone: the truer view

With the other opinions set aside, the one truer seems alone to remain, which St. Thomas and Cajetan hand down; Ferrariensis on this article; Ferrariensis also in Contra Gentiles IV, c. 26; Durandus in I, d. 26, q. 1, n. 14; Gabriel; Capreolus, q. 1, and others.[783][786][785][787]

But indeed we have clearly shown above, in chapter 2, from the doctrine of the Fathers, that the principle of distinction ought to be relation (*relatio*). And since, as we have said against St. Bonaventure, this ought not to be understood of relations under the mode of way and origin, it follows that the persons are distinguished by relations, and that relations are the principle of distinction.

Some Thomists moreover also gather from this that the constituting principle ought to be relation, because the same thing ought to be the principle of constitution and of distinction. Yet they are deceived; for, as we have shown elsewhere, in the divine persons the constituting principle and the distinguishing principle are not the same according to the doctrine especially of St. Thomas, who teaches that the Holy Spirit would not be distinguished from the Son unless He proceeded from Him: whence it follows that the formal principle of distinction in the Son is not filiation, but spiration, as we have proved in the place cited; although nevertheless filiation is the constituting principle.[788]

Therefore this position, which we have followed as truer, merely asserts that the constituting and the distinguishing principle - whether the same or diverse - cannot be something absolute, nor an origin, but must be a relation in actual being. Concerning origin we have now sufficiently shown this against St. Bonaventure; but concerning the absolute it is proved likewise from the doctrine of the Fathers whom in chapter 2 we have recalled, namely, that in the divine persons all things are common except relations: therefore every absolute is common; but by what is common to all, neither can one person be distinguished from two, nor two from one; therefore by something absolute persons cannot in any manner be distinguished. Wherefore the principle of distinction ought to be relation; for, as we said, origin cannot be so in any other way.

Concerning the constituting principle: from the same doctrine of the Fathers, this sentence of St. Thomas is thus deduced. A proper principle, which constitutes something, cannot be that which is common to others, but that which is proper to itself; for this determines that which is common to have this, and thus in the notion of this it is said to constitute. But whatever is absolute is common to all the persons, as we have from the Fathers; and if anything is peculiar to any person, it is relation: therefore relation, not the absolute, ought to be the constituting principle. From which it follows, that therefore the constituting principle of the Son is filiation, not spiration, as we said

783. Cajetan, on this article.
786. Ferrariensis, In Contra Gentiles IV, c. 26.

787. Capreolus, q. 1.
788. Vazquez, Disputatio 147, cap. 7.

elsewhere, because that is proper to the Son; but filiation does not distinguish the Son from the other persons, but only from the Father; because it is not opposed to the Holy Spirit, but only to the Father: it does, however, entail opposition, as we noted in the same place: therefore of the ratio of the constituting principle it is to be proper to the constituted person; but of the ratio of the distinguishing principle it is not to be proper, but it is opposition; for a distinguishing principle can be common to two persons.

It only remains to advert concerning the text of St. Thomas, that for this reason he said that the persons are distinguished by relations and by origins, yet more principally by relations - not because both are formal principles of distinction, and relation is more principal - but because origins also, as ways, pertain to the distinction of a person, inasmuch as by such and such an origin, as production, a distinct person proceeds, not because origin distinguishes as a form; and about this formal principle of distinction there is now controversy. And therefore in De potentia q. 8, a. 5 he said that a thing may be distinguished by something as form, and by something as way; and constituted similarly; and that that which distinguishes as form distinguishes more principally than that which distinguishes as way and production: therefore he said that the persons are distinguished more principally by relations than by origins.[789]

Scotus argues against the aforesaid opinion from the comparison of the related to the relation.

It is asked whether Scotus impugns the sentence of St. Thomas by four heads, and at the same time confirms his own. The first is from the comparison of the related to the relation. The second is from the comparison of origins with relations. The third is from the ratio of the constituting principle. The fourth, from authority. In this chapter we shall adduce the arguments from the first means; in the following, from the third means; for those which he takes from the second means are more difficult and demand a special discussion; therefore in the following disputation we shall institute a discussion concerning those.

But before we come to the first, among the others which he takes in the fourth place from authority, because they are lighter, let us only answer that one which he adduces from Proverbs 30, where Solomon, speaking of God, asks: "What is his name, and what is the name of his son, if thou knowest?" He infers from this that if the second person were constituted only by the property of filiation, he would not have asked, "What is the name of his Son?" For that was well known. Some of the Hebrews strive here to interpret so that he not speak of the Son of God, who is the second person in the Trinity; whom Jansenius rightly refutes in the same place. Granted, therefore, that the speech there is about the second person, Scotus's objection is easily met: for there Solomon does not ask about some more proper name of the second person, but about a name which adequately and exactly explains the nature and property of the Son of God; and because it is ineffable to men, whatever it be, whether relative or absolute, therefore he says, "if thou knowest," as if to say, you will not find such a name, because the Son of God surpasses every name, according to what we handed down about the names of God.[790] But that this is what Scripture wished to

789. St. Thomas, De potentia q. 8, a. 5.
790. See above, Disputatio 57, cap. 3, on the names of God.

signify is clear, because he not only asks there about the name of the Son, but also about the name of God himself, when he says, "What is his name?" Now many proper names of God existed among the Hebrews, and among others that Tetragrammaton, more accommodated than the others; nevertheless he rightly asks about a name which may be able to express his essence to us: because there is none such, so as to exhibit God and his name above every name.

First argument of Scotus. He argues thus in the first chapter: That which is referred is prior to the relation; for the thing is prior to being referred: but in God not the essence is referred, but the person: therefore the person is prior to the relation. In what way, then, can the person be substantially constituted by relation? For if he is not constituted by relation, he exists as before absolutely and in himself.

I answer: In created relations it is true, what Scotus assumes in the major; but in the divine there is another reason. For since they are substantial and subsistent, by them in such wise the essence is substantially completed and determined to the notion of person, that by it the person is substantially constituted, and at the same time substantially referred to another; therefore while it is constituted, by that very fact it is formally referred, and conversely.

Second, Scotus argues thus. Every composite supposes its component parts, and also the union of the same, even if it be a per accidens composite: for man supposes body and soul and, together with them, the union as something prior; and white supposes body and whiteness, and likewise the union of them: therefore the related supposes the thing which is referred and the relation and the union of both. But that which is referred in the divine is the person: therefore the person is prior to that by which it is referred.

It is solved. I answer: This only proves that the essence and relation are in a certain way supposed as something prior; not, however, prior to the person as person related. For the related person does not result from the person and the relation - something which Scotus ought to prove and ought not to assume gratis - but from the essence and the relation; because by that very fact the person is constituted as person and as related, as we were just saying. Moreover, although the essence be supposed as prior, nevertheless the relation itself cannot be supposed; because since a relation is not understood to be unless in something, and as soon as it is understood to be in the essence, a person is understood, the relation cannot be understood first inhering where a person is not understood. And thence also it is so in composites from substance and accidental forms, which are always understood to inhere and whose being is to be in, that the form inhering is not first understood than is understood the composite from the subject and that accidental form, as is manifest.

Third, Scotus argues: because a relative, formally, is referred to the absolute; therefore the Father in the divine is referred to the Son according to the Son's absolute; therefore the person is first by an absolute property than he is Son. But about this argument more fully will be treated in the following disputation.

Fourth, he argues. Every real relation supposes its extremes really distinct and constituted: therefore the divine relation of paternity supposes extremes constituted: and hence it itself neither constitutes nor distinguishes a person. But in the same way it is replied that this is true of accidental relations; but a substantial relation, which establishes a supposit, can also distinguish and constitute the extremes. Then Scotus urges us in this way: Relation, as relation, is to another; therefore either paternity is to another distinct by filiation, or to something else; if to something else, it is distinct only by filiation: therefore if someone wished to prove that in God there is not a real relation, he ought to prove in this way: This relation is not to another real; therefore it is not real. But this would be an evident begging of the question, because it would be just the same to say, "it is not to another real," as to say, "this relation is not real" - namely, either because it supposes no real opposite relation, or because it in no other way has a real other to which it is opposed. From this, however, one could not rightly infer, "Therefore it is not real," because in his argument he would seem to beg the question. But Scotus's objection is vain; for when someone would thus assume, "this relation is not to another," he would not beg the principle, because he would only say that that relation is not to another distinct really, whether by an opposite relation, or in some other way. And although he would say, "distinct really by an opposite relation," he would not beg the question, but would argue rightly, as is plain.

Arguments of Scotus taken from the ratio of the constituting principle.

Caput VII - Arguments of Scotus from the ratio of the constituting principle

From the third means, which precedes the proposed head, first Scotus argues thus. A constituting principle renders that which it constitutes entirely incommunicable, in the very mode in which it constitutes it: therefore by the constituting principle a person repugns being communicated to many; for it makes the whole incommunicable. But paternity, and any relation whatsoever in the divine, is communicable by nature; for a relation is a certain quiddity, and every quiddity is communicable: therefore this is not the constituting principle of a person. Someone will say that relation indeed is communicable of itself, yet that from the essence it has incommunicability. But this is manifestly false; for spiration, which of itself can be communicated, is not made incommunicable by the essence: therefore the same reason will hold of the other relations, especially of the opposite relation, which is spiration. Further, when two things together constitute something, neither of them receives from the other the mode which it has in the constitution; for man is matter and potency, and form and act; yet neither does the form receive potency from matter, nor matter the ratio of act from the form, but the form itself is by act constitutive. Moreover, because the rational faculty of man terminates in the simplest concepts, and the last term of it is such by nature that, whatever impossibility might be in the hypothesis, nevertheless the entire concept always remains indifferent if the whole of that concept remains - just as, if it be supposed that what is rational could create something or be of a different color, the nature "rational" would remain incommunicable in those species; so, according to the first procession in God taken from the word itself, there must be perfect simplicity remaining in the

entire concept of paternity: thus paternity, if it were received in two supposits, in the Father and in the Holy Spirit (which is false), would still, under the sign of paternity as paternity, not be incommunicable.

I answer: Paternity, universally and of itself, is named from something common, namely, from a certain quiddity by which it can be communicated through likeness to many effects, as a created nature can be communicated: but the increase of created effects does not communicate that by which a person is constituted as divine; for it is conceived as that which is to be communicated, or what the uncreated relationship signifies; and because it is conceived as something that is to be communicated by its proper notion, it does not have incommunicability from the essence, except insofar as it is in that very fact subsistent relation. And thus, according to this very fact, it is the same in species; yet it is altogether dissimilar: for the very nature which is common in itself, from the fact that it is terminated to a supposit, has incommunicability; just as the same specific nature in created things, although it is the same in species, nevertheless has incommunicability from its subsistence. Therefore, in the divine, relation as subsistent constitutes the person, and by that very fact it is incommunicable.

Further, Scotus argues from the same means in this way. From paternity, filiation, and procession there is abstracted a common concept, not only according to the intention of reason, such as some think the scholastic concept to be, but also according to the thing there are real concepts and quidditative concepts of those intentions; so that a certain common reason of relation of origin truly is conceived and abstracted from the concrete relations: therefore, since what constitutes is altogether simple and last in the order of constitution, and not a common concept and particular but a simple, that which is altogether simple is the last in the order of constituting; but the person is constituted, not by an animating form which does not consist in a relation, but by a relation which consists in a terminus to another: therefore the constituting principle, according to that common concept, will not be simple, but common.

To this we say that the common concept which reason abstracts from paternity, filiation, and procession, according to the aspect of a common reason, does not exist in reality, but in the intellect; wherefore, as neither does "animal" really constitute Socrates, but the specific difference does, so here neither does the abstract common notion of "relation of origin" constitute, but the determinate relation - paternity, or filiation, or procession - according as it is really incommunicable, constitutes the person.

veluti if a person were constituted by whiteness and blackness, we could indeed from each of the constituents abstract the notion of color; but nothing hinders this, because for something to be the last constituting principle in the same genus, it is necessary that it no longer be able to be constituted by the same genus of constitution; just as the indivisible difference, which ultimately constitutes the species man, namely "rational," cannot further be constituted by genus and difference, because then it would not itself be the ultimate constituting principle in that genus; yet that very same "rational" can really be constituted out of matter and form: for it embraces both, since in the genus of real physical constitution it is not the ultimate constituting principle; rather, the form, which in that same genus is not further constituted, is the ultimate physical constituting

principle: therefore, in the same way a relation can ultimately constitute the person, by determining the essential existence (esse) to personal existence, provided only that it is not further determined by us by another personality, and is constituted; even if it be constituted by a twofold concept, namely of genus and difference, and be constituted by both.

I add third against Cajetan that we cannot abstract from the divine relations a common univocal concept, because, as I said in Disputation 114, chapter 3, in a relation there is a twofold concept, of in and of toward, which are compared to one another in such a way that the concept of in is transcendent and is necessarily included in the concept of toward; for the toward cannot be conceived without the in. Wherefore a divine relation has both: yet because it is substantial, it is conceived by us not as subsisting of itself, but as a substantial mode of the nature itself; nor can the concept of the in of a divine relation be explained in any other way: but this concept is denominative of either a hypostatic form, or of a mode of subsisting, and is as it were of second intention, as we shall show in the following disputation: therefore nothing else can be abstracted commonly and quiditatively from the divine relations, but only denominatively. Scotus himself agrees with us in 1, Dist. 23, question 1, at the end, when he asserts that nothing common quiditatively can be abstracted from the three persons, but only something common as it were proper; but a "proper" is predicated denominatively, about which we have already spoken in Disputation 130.[791][792]

Disputatio CLIX - How relation constitutes the divine person

Nodus difficultatis in praesenti controversia.

Caput I - Statement of the difficulty in the present controversy

On account of the arguments which Scotus draws from the second medium, which we recalled in chapter 6 of the preceding disputation, it was necessary to institute the present question. For those arguments so exercised the ingenuity of the Thomists that they divided them into various opinions. But Scotus's arguments are taken from the comparison of the producer with the produced, and of the relation with the origins

- First, comparing the producer with the produced, he argues thus in the first place: Everything is prior to the produced, not insofar as it is a producing act primarily - thus it is referred to the product, and therefore is together with it - but insofar as it is of such a nature or property as to produce: therefore the producing person in the divinity is prior to the produced, not insofar as it is an act producing, but according to such a nature and property as to produce: wherefore, before it is understood as actually producing, it is already a person: but then it cannot be constituted by the relation, for this arises from production: therefore it is constituted by something absolute.

791. Scotus, In I Sent. d. 23, q. 1, at the end.
792. Vazquez, Disputatio 130.

- Second, if persons are, according to the notion of person, relative, it will be nothing else for the Father to produce than to have a Son; for the Father is Father by the fact that he has a Son: therefore, from itself, by reason of its own person alone, with no origin understood, he has a Son: in vain, therefore, do we posit origins.
- Third, the absolute is produced before that from which relation arises; for to relation there is not of itself motion, from the Physics V, text 10: therefore the person which is produced is prior as absolute than as relative: then therefore it will already be constituted by something absolute.

Then, comparing relations with origins, he also argues in a twofold way. - First, every supposit (suppositum) which is the principle of operation or of production is understood before the operation; because it befits a thing first to be than to act: therefore before it is understood under the relation of the producer, it is understood as constituted: wherefore it cannot be constituted by that relation, but by something absolute; because there is no other relation by which it can be constituted. - Further, relation is as it were the form (forma) of the divine person insofar as it is a person; but every form is understood prior to that which is, of which it is the form, and which it constitutes: therefore paternity is understood prior to the person of the Father; and yet paternity cannot be understood without filiation, because they are simultaneously known: therefore filiation is understood before the person of the Father; since filiation results from generation, which proceeds from the Father, it follows that before the person of the Father is understood.

All these arguments seem to look to the same point, and they have difficulty around the person of the Father alone; namely, how it can be that the person of the Father, which ought first to be understood as constituted before he generates, can be constituted by paternity, which results from generation: but in the other persons there is no difficulty at all; for passive generation precedes the person of the Son, and filiation is in fact; likewise, active spiration already presupposes the Father and the Son constituted by other relations; for they are not constituted by the relation of "spirator": finally, passive procession precedes the person of the Holy Spirit and the relation in him, as we said of passive generation. We must therefore strive to untie the knot of this difficulty, after first recounting the opinions of others, who, while they tried to explain this matter, I do not know whether they made it more difficult. But for the explication of this question, the Schoolmen who say that the persons are constituted by relations dispute that which we set forth in the title, In what way relation constitutes the person.

Caput II - Opinion of Cajetan and of the Canariensis

Cajetan, with his accustomed subtlety, seems to have labored more than the rest in solving this question, I know not whether so fruitfully. He teaches in article 4 of this question, to the second doubt, that paternity is taken in a twofold way - for upon this the whole difficulty seems to turn - one way as conceived under the express concept of paternity, not as it exercises the office of relation: and in this way, he says, it constitutes the person (persona) of the Father in God, before he is understood to generate and to have a Son: for relation as conceived, according to Cajetan's

view, does not require a terminus; in another way it is considered as exercised, he says, that is, as it exercises the office of referring: thus, however, it requires a terminus in act, and in the terminus, filiation: in this way it cannot constitute the person of the Father, as Scotus's arguments clearly convince, especially that one, because paternity and filiation are in this way together after the origin; but the person of the Father ought to precede the origin. Thus he interprets St. Thomas, article 4 of this question, when he says that relation, as it is the hypostatic form, constitutes the person, and is to be considered prior to origin and to the person produced; not, however, according to the proper notion of relation, because according to the proper notion of relation it cannot be understood prior to origin: though by this it distinguishes a person from another. Nor did St. Thomas teach the opposite in I q. 42, a. 3 (says Cajetan), when he said that there is not priority, even of reason, among the persons: for he is speaking of them as they are actually now referred under the proper concept of relation as exercised. Wherefore some wrongly charge the holy Doctor with contradiction.[793]

The Canariensis, moreover, is not far from Cajetan's sense, although he professes the sentence of Durandus in an equal degree: for he says that two things belong to the notion and essence (*essentia*) of relation: one is to be the form and property of the relative, as whiteness is the form of the white - behold for you Cajetan's "relation as conceived"; the other is to refer one to another - behold relation exercising the office of relation. He therefore asserts that the divine person is constituted by relation insofar as it is the form of the relative: not, however, insofar as it refers to another: and in this sense the Canariensis understands St. Thomas, in exactly the same proportion as Cajetan understood him. Hence he infers that it is truly said that the divine persons are constituted by relations: for since they are constituted by relations considered first in that way which pertains to the essence of relation itself, it comes about that they are truly constituted by relations: indeed that that little particle can be added, "insofar as," or "according to the notion of relation," if it denotes relation as understood in the former mode. For if someone takes relation in the latter mode, and adds the particle "insofar as," he ought to use it as a mark which they call of specification: and the sense will be, "relation insofar as relation constitutes," that is, "what is truly relation constitutes."

Ferrariensis makes mention of this opinion of Cajetan in book 4 Contra Gentiles, chapter 26, at the verse, but with this interpretation: which, though he says it is subtle, he nevertheless affirms is neither true, nor according to the mind of St. Thomas. We will therefore attack these together with the opinion of the Canariensis by the same reasons.[794]

The first reason of Ferrariensis is: That which befits something according to a formal notion befits it according as it is such: but according to Cajetan's view, to constitute a hypostasis befits relation according to the express and formal notion of relation: therefore it befits it, insofar as it is relation: but St. Thomas says the opposite in article 4 of this question, namely, that relation does not constitute the person according as it is relation: therefore Cajetan is at variance with the holy Doctor whom he thinks he follows.

793. St. Thomas, Summa theologiae I, q. 42, a. 3.
794. Sylvester Ferrariensis, In IV Contra Gentiles c. 26.

You will say for Cajetan: relation constitutes according to the notion of relation considered in the former mode; not, however, in the latter mode, as it exercises the office of relation. But against this ...[795]

This is what Cajetan himself concedes: that relation, in that prior mode, carries the express and formal notion of relation.

Second, Ferrariensis argues in this way. For a form to exercise its act is nothing other than to give being to the subject in which it is, under the aspect of formal cause; for what else can a form exercise? Thus whiteness exercises the act of a form when it makes the subject white. Therefore relation is then understood to exercise its act when it bestows upon the subject the being of one-related-to-another and now refers the subject to another; for it has no other act. Wherefore, if some relation is conceived in a subject under the express concept of relation, it is understood then as referring the subject to another, that is, as exercising the office of relation. In vain, therefore, do Cajetan and the Canariensis distinguish two acceptions of relation, since it is entirely the same thing to be the form of the relative inhering in the subject and to refer the subject to another - just as it is the same thing to be the form of the white and to give the being of white.

Third, the opinion of Cajetan and the Canariensis can be impugned in this way. Either relation, taken in that prior mode, is to itself, or to another. If to itself, it takes on an absolute mode, and so it lacks the express and formal notion of relation, which is to be-to-another - the very opposite of what they teach; and they must needs assert, in order to defend their position, that those are true acceptions of relation, and that persons are constituted formally by relation. Or else relation, in that mode, is to another, and then it must have the term which it regards; therefore, inhering in the subject, it refers that subject to another. Wherefore the difficulty returns which at the outset we proposed from Scotus. Moreover it is necessary that relation, even as conceived, have a term - this being the express and formal notion of relation under which it is conceived; for it cannot be understood or defined except as to another. Therefore the distinction of Cajetan and the Canariensis is fabricated.

Caput III - What Capreolus and Ferrariensis have thought

Capreolus, on I Sentences, dist. 26, q. 1, art. 2, to the first of Scotus, from those things which were alleged in the third place; and Ferrariensis, on IV Contra Gentiles, chap. 26; most plainly, following the sentence of St. Thomas in article 4 of this question, say that relation can be considered in a twofold manner: both as a hypostatic form and as a property of the person - and in this mode it constitutes the person, yet does not distinguish, so that the Father can be understood as constituted by relation under the concept of hypostatic form before he is understood to generate; and also as it is relation - and in this way it does not constitute the person, but distinguishes by it. For in the former mode it is not to another, nor is it formally relation, and therefore it can be understood before origin; but in the latter mode it is now formally relation, and thus it can only distinguish, because all distinction in the divine is by relative opposition. In

795. Aristotle, Physics V, text 10.

keeping with this, Capreolus notes that, since the very same reality is essence, hypostatic form, and relation, nevertheless they are formally diverse in the same reality and are distinguished by our consideration: first, the essence, which is called deity, by which the person is constituted in the notion of God; second, the property or hypostatic form, by which it is constituted in the notion of person; third, the relation, by which one person is distinguished from another.[796][797]

Likewise, on behalf of this sentence the Canariensis reports Marsilius in I, q. 29, a. 1, dub. 1, conclusions 1 through 3, where in truth he uses that same distinction in the same words and teaches exactly the same.[798] Elsewhere, in q. 30, a. 3, to the first argument adduced to the contrary, he says that relations are not constituted by notional acts - that is, that notional acts are not the foundations of relations. For, although in human affairs the relation of paternity follows upon generation, it is plain that relation does not constitute the generator substantially; yet in the divine the relation of paternity is before generation, because the person substantially constituted is prior to generating. But it is constituted by relation. Nay more, he concedes that the eternal Father is constituted by paternity before he have a Son than that he generate - which Scotus urged as absurd, as we saw above - and I do not see by what reason it can be defended. And certainly, if that were true, there had been no need for Marsilius to distinguish relation in those two modes, so that in one he would constitute and in the other distinguish. But now it is necessary to refute the opinion of Capreolus and Ferrariensis. Scotus attacks it in I, dist. 28, the last question. In common with him does Durandus in I, dist. 26, q. 1, num. 16.[799][800]

The first argument is as follows. That relation - under the notion of property or hypostatic form - which, as such, is formally something, is either absolute or relative. If absolute, then the person is constituted formally by an absolute form, which Scotus concedes. If relative, then in vain is relation distinguished into the notion of hypostatic form and relation, since even under the notion of hypostatic form it is formally to another; and once this is admitted, the very same absurdities seem to follow which Scotus infers against those who say that persons are constituted formally by relations, which we recalled in the first chapter. However, some reply that relation, under the concept of hypostatic form, is formally absolute, and nevertheless persons are constituted by relations inasmuch as they are relations - the particle "inasmuch as" being taken as a note of specification, not as denoting duplication; that is, that persons are constituted by that which is relation, not under the notion of relation, but of the absolute.

But this is frivolous. Those who assert that persons are constituted formally by absolute properties do not deny that they are constituted by that which in reality is relation, because in the judgment of all the properties are the same in reality with the relations. Now, however, the controversy is by what formally persons are constituted: whether by relation, or by the absolute. But those aforesaid theologians, as also the Canariensis in the cited chapter 2, misuse the particle "inasmuch as," so that it be a note of specification in the sense which they themselves want. For, as

796. Capreolus, In I Sent. d. 26, q. 1, a. 2, ad 1.
797. Sylvester Ferrariensis, In IV Contra Gentiles c. 26.
798. Canariensis reporting Marsilius, In I Sent. q. 29, a. 1, dub. 1, conclus. 1 - 3; and cf. the same, q. 30, a. 3, ad 1.
799. Scotus, In I Sent. d. 28, q. ultima.
800. Durandus, In I Sent. d. 26, q. 1, n. 16.

we shall say in I - II, dist. 73, c. 9, and in III, q. 16, a. 10, that particle is then called a note of specification when it determines and designates a part or peculiar nature of the subject, by reason of which the predicate belongs to it, even if it belong by accident and not per se. Thus when we say, "Christ, inasmuch as he is man, is white, or walks," or "The bishop, inasmuch as he has teeth, is white." In these cases the said particle cannot be a note of perfection, as is evident, because the predicate is not predicated per se of the subject. But ineptly is that particle said to be a note of specification in this proposition, "Relation, inasmuch as relation, constitutes," so that the sense would be, "that which is relation constitutes." For this is the sense which they call identical, not formal, which cannot be denoted by that particle alone. Add that the particle "inasmuch as," as I shall also say there, when it replicates and repeats the subject, as in the aforesaid proposition, is called reduplicative and is always a note of perfectness.[801]

The second argument of Durandus is of this sort. Either hypostatic form and relation are distinguished by opposition (certain codices read "according to supposit"), or they are distinguished as superior and inferior. If by opposition - that is, as opposites - then it follows that persons are constituted formally by the absolute; for that which is distinguished by opposition from relation is the absolute. But if as inferior and superior, so that the notion of property be superior to relation, it follows likewise that persons are constituted formally by the absolute. For if that personal property, which is superior, constitutes the person with relation excluded, it must necessarily include the opposite, namely the absolute. For superiority never excludes the inferior unless it includes another opposite; just as "animal" never excludes "rational" unless it includes "irrational." Therefore, either we must say that the person is constituted by the property inasmuch as it is also relation, or we must affirm that persons are constituted by absolutes.

The third argument of Scotus and Durandus is this. The notion of hypostatic form, or personal property, is not compared with relation quidditatively, but denominatively. For it seems to be a denomination of second (as they say) intention, such as the denomination of the individual, the denomination of person, and of the constituting principle. Or, if it is a real denomination, it does not seem to be quidditative, as we noted in disp. 130, cap. 2. But the present question is about that which constitutes the person: we do not inquire about the denominative notion of what constitutes, but about the essential and quidditative; just as when we inquire by what Peter is constituted in the notion of person, we demand the quidditative concept of that by which he is constituted, not how that is denominated - whether it be called the principle of the individual, or the notion of person.

Lastly, as to that which we were reporting from Marsilius in the later place - namely, that relations are prior to origins, of which St. Bonaventure makes mention in I, dist. 27, part 1, dub. q. 2 - it is absurd. For if he admits that which Scotus was inferring, namely, that the Father has a Son before he is understood to have generated, why shall we say that he has begotten? Or to what end do we concede generation to him who already has a Son? Then too, if we speak of passive generation, it cannot be posterior to relation; for "to be generated" is prior for him who is begotten

801. Vazquez, Disputatio 130, cap. 2.

- therefore, than "to be a son." But if passive generation does not come to the Son constituted in the notion of son, neither will active [generation], which corresponds to the passive, be able to come to the Father, who is together with the Son.

Caput IV - The opinion of Durandus and Gabriel

Durandus, in I, dist. 26, q. 1, num. 18, and dist. 27, q. 1, openly teaches that persons are constituted by relations, and are distinguished under the express and formal notion of relation, and that the person of the Father cannot be understood by us as first constituted and then as generating and having a Son, but as both at once. Gabriel teaches the same in I, dist. 26, q. 1, art. 3, dub. 4; and it seems to have been the opinion of Scotus, in I, dist. 23, the last question; to questions 4 and 5; to the principal argument; and in Quodlibet 4, at the end, to the principal argument - although in dist. 26 he defends as probable the opinion of Ioannes de Ripa, as we reported in the preceding disputation, cap. 3. They philosophize as follows. First, lest they be compelled to say that persons are constituted by an absolute form under the absolute concept...

They affirm that, taken absolutely, the persons are constituted formally by relations, as relations. For in whatever other way they might be constituted, apart from by relation under the formal and proper account of relation, one would have to say that they are constituted by something absolute, as up to now has been proved against Cajetan, the Canary Islander, and others.

Moreover, they say that the person of the Father is together with the generation and the Son; and that generation is not prior to paternity; nor are they forced to assert that in some way the person is conceived as constituted before the relation is understood; for so it would come about that the person would not be constituted formally by relation, but by something absolute. And indeed, if the constitution of the person were from the nature of the thing, we could easily defend the aforesaid opinion on both sides: for then by nature at once paternity would constitute the person of the Father and would beget the Son, even if the Father were prior in origin to the Son; for this priority among the persons, even as formally related, is found, as we said in Disputation 168, cap. 2. But in truth we could not first by reason understand the first person before the generation; because that very person, generation being, as it were, completed, cannot be considered as constituted by the relation of paternity, since paternity cannot be understood before generation, as even the adversaries against Marsilius admit, and as we proved in the preceding chapter.

Some, however, who embrace this opinion of Durandus in that in which he asserts that generation is not understood before paternity, nor conversely; nor is the supposit considered prior to being constituted than to generating; for the foundation of paternity and of the other personal relations in God they say is not generation - indeed, origins seem to be distinguished from relations only by name. They assert rather that the foundation of relations is the essence of God understanding itself with the rest of all things; and in this way an origin, as it were, inchoate is understood prior to the relation itself. For an origin, compared with the relation of production, is

not prior nor posterior to the producing person; but this, they say, is the difference between a created relation, which comes to an already constituted supposit, and the divine, which constitutes the supposit - something which above Durandus assigned.[802]

But their opinion, in part, has already been impugned in the preceding disputation, cap. 4, where we showed that to beget and paternity, to be begotten and filiation, are not synonymous, and therefore differ not only in name but also in concept. For who would deny that the respect which we conceive in origin, and that which we apprehend in relation, are not thought by us in the same way? The respect of origin is of production and of way; the respect of relation is as of father and son, and as of producer and produced. Whence the first argument against this manner of speaking is gathered, and it is manifest, namely, that between these concepts of origin and relation there is an order - not real by nature or origin, but by our reason and consideration; because one is as way, the other as form in the thing as constituted: therefore one ought to be thought prior to the other - not relation, therefore origin. For it is not therefore that we understand the Father to beget because he is Father; but rather from this we understand him to be Father, after the manner of those who are created, who have begotten; and similarly concerning the Son.

Secondly, this opinion is impugned, because they do not rightly say that the foundation of the relation of paternity is the essence alone understanding itself, and so forth: for since this is in the Son, in the Son too we would understand the foundation of paternity, which is absurd. But when we speak of the foundation of a divine relation, we do not contend to assert something distinct from the nature of the thing from the relation itself; but that which is conceived in our manner as the proximate cause of a relation: but the essence is not the proximate cause, even as understanding; because so it is found in the Son: therefore it is by reason of a notional intellection, which is production: and this we call origin. And since the foundation ought to be conceived prior to the relation, origin will be prior in our consideration than relation.

Thirdly, since the principle of origin, namely of generation, is not the essence alone, but the person - for the essence does not produce, but the person - and in our manner of understanding we first conceive that whence there is generation, than generation itself: for the principle is not through generation, but on the contrary, in our manner of understanding: it is necessary that the first person be conceived as existing in itself before producing: then, however, it cannot be considered as constituted by the relation of paternity, because paternity cannot be understood before generation, as even the adversaries against Marsilius admit, and as we proved in the preceding chapter.

Caput V - The truer account is set forth

The one difficulty of the present disputation seems to be reduced to the person of the Father, namely, by what rationale he is understood to be constituted by relation before he actually generates; for concerning the other persons there is absolutely no difficulty, even if we speak with the common opinion - which in the preceding disputation we established - namely, that the

802. Durandus, In I Sent. d. 26, q. 1, n. 18.

persons are constituted by relations. For if we speak of the person of the Son, we easily understand that origin is prior, than that the person herself be understood as produced: for we first consider a thing to be produced, than to be; and since that person is constituted by the relation of filiation, which follows upon passive generation, all is consistent. Concerning the Holy Spirit, in the same way. Wherefore, if in these two persons we rightly understand the foundations of the relations to be origins (for this reason the second person is Son, because he is begotten, and the third [is] Spirit, because he proceeds, not the other way around), why shall we not say the same also concerning the person of the Father?

However, for the explication of the proposed difficulty, it must be observed that this constitution of the persons by properties is only per reason, as was proved in the prior disputation, cap. 2. Wherefore, when it is asked concerning the person of the Father, how he is understood to be constituted before he generates, we are not inquiring about a constitution from the nature of the thing, according to which he would precede generation in real order; but about the constitution in our intellect, according to which alone he precedes generation in our consideration; that is, how the Father is thought by us before he is understood to generate - whether under the concept of paternity, or in some other way. For it cannot be denied that something is understood by us which is able to generate, before it is understood actually to generate. But that which is conceived as a principle for generating ought to be a person, and not the essence alone. All the Scholastics cited admit this with St. Thomas in art. 4 of this question; indeed St. Thomas, and St. Bonaventure in I, dist. 27, first part, question 1, who said that the persons are distinguished by origins, not relations. To these also Henry of Ghent accedes, as is reported by Scotus in I, dist. 28, the last question; and likewise in Quodlibet 4, question 5.[803][804][805][806]

Another way: It is answered that no one up to now has denied this, except the recent authors alleged, who think it sufficient that the essence be first conceived under its essential act of intellection.

Under what concept, however, the person is then understood as constituted, not all think in the same way: nevertheless, against Marsilius, according to their various opinions they agree that the person cannot be considered under the concept of the relation of paternity, as actually referred to the Son; concerning which enough has been said above. For together with St. Thomas in that art. 4, it is taught that any origin whatever is prior in our consideration than the relation of the person (as he himself says): of the originating, that is, than the relation which responds to origin. Thus generation is prior to paternity in the view of St. Thomas and of others; but because the difficulties proposed do not satisfy their sentence, therefore one must philosophize otherwise.

First indeed, if the persons are conceived by us in a distinct and express concept, they are rightly understood to be constituted by relative properties under the expressed and formal account of relation: for thus the three persons are conceived as mutually distinct by their relations.

803. St. Thomas, in this question, art. 4.
804. St. Bonaventure, In I Sent., d. 27, prima pars, q. 1.
805. Henry of Ghent, as reported by Scotus, In I Sent., d. 28, q. ultima.
806. Scotus, Quodlibet 4, q. 5.

Concerning the Son and the Holy Spirit, as I noted a little above, that does not seem difficult: concerning the Father the same can be said, if he is conceived not before the generation, but already as having the Son, and as distinct from him by paternity.

But because in our consideration the Father can precede generation, it is necessary that he also be conceived by us to be in some other way, before he generates. Therefore, secondly, it must be said that the first person of the Father can be conceived, before he is understood actually to generate, not indeed under the concept of Father - for paternity is founded on generation, as was proved in the preceding chapter - but under the concept of the unbegotten (innascible), and of fecundity for producing. In the former way he is considered by St. Bonaventure in I, dist. 27, first part, question 1; in the latter way by Henry of Ghent, as is reported by Scotus. Add that, when I say that the first person is conceived by us in that way in which he is before he is understood to generate, I do not assert that he is then necessarily understood to be constituted; but that by a simple concept he can be apprehended. For since this constitution is only per reason, as was said above, it is not necessary that the person always be apprehended as constituted. If, however, it were a real constitution, in whatever way he were understood, he ought to be constituted; just as, if we apprehend animal before man, it is not necessary to apprehend it as constituted of living and sensible; for that constitution is by reason, which, although at length it may be known, still the thing can be apprehended in one way or another. But a real constitution of animal from body and soul cannot fail to be in the very animal; wherefore this in animals does not depend upon our consideration. Therefore, if the Father were constituted in reality, in whatever way he were first understood by us as being, than as generating, by that very fact at least he ought to be held to be constituted with a real property.

Thirdly, nothing hinders the person of the Father from being apprehended as constituted, before he generates, from the essence and from that property, or notion, of innascible and fecund for producing, which elsewhere St. Bonaventure calls the fontal plenitude, as we saw in Disputation 127, cap. 5. For we can apprehend the essence as fecund from itself, and the fecundity as, so to say, ordered toward the being of a person that can produce; and yet we do not as yet understand the express notional paternity. Afterwards, however, in this way apprehending the first person - what stands in the way? For if we add that expressed notional relation afterward, we conceive the same first person as Father.

St. Thomas and St. Bonaventure indeed teach the same. For St. Thomas in art. 4 of this question contends that the person of the Father cannot be conceived under the account of paternity before he is understood to have begotten; because paternity is founded upon generation: therefore the first person is not conceived under the notion of Father, since paternity is not yet understood; but under the account of a certain quidditative denomination, namely of the unbegotten, or of the fecund as to producing - not a denomination which is the hypostatic form properly expressing. And later, in I, q. 42, art. 3, he teaches that among the persons there is no priority of nature, since they are together, according to the superior doctrine we have set down: nevertheless the person can in our manner be considered as first, if in that way it be understood; namely, that the first person be

first according to our consideration, before he generates; otherwise the person of the Son could not in any way be considered to be subsequent in our consideration, unless we had already considered that same person under the expressed account of relation.

St. Bonaventure, moreover, in I, dist. 27, first part, q. 1, ad secundum, clearly defends that the person of the Father can be well understood, not indeed as Father before he begets in our consideration, since the notion of paternity is founded on generation; but he can be understood under another notion, namely that of innascible, and again as fecund for producing; then at length is referred to that relation of paternity and of generation.

Satisfaction of the arguments of Scotus alleged in the first chapter.

Caput VI - The arguments of Scotus adduced in the first chapter are satisfied

It remains that, if there are any arguments against our position proposed, we should resolve them. First we must satisfy the argument of Scotus advanced in that place, on the occasion of which this present controversy among us is disputed; and certain objections which they propose to us must be solved. We give warning about one argument of Scotus, who contends that first one understands the person...

But because in our consideration the Father can precede generation, it is necessary that in another way also he be conceived by us to exist before generating.

Second assertion. Therefore, second, it must be said that the first person of the Father can be conceived before he is understood actually to generate, not indeed under the concept of father, for that is repugnant - because paternity is founded upon generation, as was proved above in chapter 3 - but under the concept of being unbegotten and fecund for producing. In the former way he is considered by St. Bonaventure in I, distinction 27, first part, question 1; in the latter way by Henry, as is reported by Scotus.[807] [808] Add that, when I say that the first person is conceived by us in that way before he is understood to generate, I do not assert that he is then necessarily understood to be constituted; but that he can be apprehended by a simple concept. For since this constitution is only by reason, as was said above, it is not necessary that the person always be apprehended as constituted. If, however, it were a real constitution, in whatever way it were understood, it would have to be constituted: just as, when we apprehend animal before man, it is not necessary to apprehend it as constituted of the living and the sentient; for this constitution is by reason, which lasts as long as it is thought; but the thing can be apprehended in one way and in another. But the real constitution of animal from body and soul cannot fail to be in the animal itself whenever animal is thought by us; for this does not depend on our consideration. Wherefore, if the Father were constituted really, in whatever way he were first understood by us to exist before generating, he would have to be conceived at least confusedly as constituted by a proper real property.

Third assertion. Third, nothing hinders that the person of the Father be apprehended as constituted, before he generates, from the essence and that property, or notion, of being unbegotten and fecund for producing, which elsewhere the same St. Bonaventure calls the fontal

plenitude, as we saw in disputation 137, chapter 3; for we can apprehend the essence as of itself fecund, and, as it were, by fecundity contracted unto the being of a person, so that it can produce; and yet we do not as yet understand the expressed notion of father. But that the first person can be apprehended in this way, what hinders? For he can be thought, as fecund and unbegotten, before he generates and before he is father.

Now these two modes of the constitution of the persons were not obscurely handed down by St. Thomas and St. Bonaventure; for St. Thomas, in article 4 of this question, contends that one cannot conceive the person of the Father under the aspect of father before he is understood to have begotten, because paternity is founded in generation; therefore then he conceives the first person, not expressly under the aspect of father - because paternity is not yet understood - but under the aspect of a certain hypostatic form, which we express more by some quidditative, non-denominative name, such as unbegotten or fecund-for-producing, than by a denominative like paternity, while the hypostatic form is more expressed thereby.[809] Afterwards indeed, in q. 42, art. 3, he teaches that among the persons there is no priority of reason, because they are relatives; which would not stand with the foregoing doctrine, unless he had considered the person in another way. For if the first person is understood to be before he generates, he will be substantially prior, according to the notion by which the person of the Son is; how then would he afterwards deny that one person is prior to another in our consideration, unless he had considered him in another way, under the expressed notion of relation?

But St. Bonaventure, in I, distinction 27, first part, question 1, to the second, admits that no one can fully and distinctly understand the person of the Father unless paternity be understood, although he plainly admits in the body that the person of the Father can be understood to be before he generates, and then not be conceived under the aspect of father, but of unbegotten. In two ways therefore St. Bonaventure considers the first person; what wonder, then, if likewise in two ways he is constituted by our consideration, as has been explained? Add that the things we have said are to be understood only of the constitution of the first person. And it must be said by way of distinction that the Father is understood distinctly under the expressed and formal concept of paternity and relation to the Son; for he is not understood distinctly, until another is understood from whom he can be distinguished: then, however, he is now actually referred to that other by the relation of paternity and of generation.

Third. Third, nothing hinders that the person of the Father be apprehended as constituted, before he generates, from the essence and from that property, or notion, of being unbegotten and fecund for producing, which elsewhere the same St. Bonaventure calls the fontal plenitude, as we saw in disputation 137, chapter 3; for we can apprehend the essence as of itself fecund, and by fecundity, as it were, contracted unto the being of a person, so that it may be able to produce; and

807. St. Bonaventure, In I Sent., d. 27, prima pars, q. 1.
808. Henry of Ghent, as reported by Scotus, In I Sent., d. 28, q. ultima.
809. St. Thomas, in this question, art. 4; and cf. I, q. 42, a. 3.

yet we do not as yet understand the expressed notion of father. But that the first person can be apprehended in this way, what hinders? Since, as fecund and unbegotten, he can be thought before he generates and before he is father.

These two modes of the constitution of the persons were not obscurely handed down by St. Thomas and St. Bonaventure; for St. Thomas, in article 4 of this question, contends that one cannot conceive the person of the Father under the aspect of father before he is understood to have begotten, because paternity is founded in generation; therefore then he conceives the first person, not expressly under the aspect of father - because paternity is not yet understood - but under the aspect of a certain hypostatic form, which we express more by some quidditative, non-denominative name, such as unbegotten or fecund-for-producing, than by a denominative like paternity, while the hypostatic form is more expressed thereby.[809] Afterwards indeed, in q. 42, art. 3, he teaches that among the persons there is no priority of reason, because they are relatives; which would not stand with the foregoing doctrine, unless he had considered the person in another way. For if the first person is understood to be before he generates, he will be substantially prior, according to the notion by which the person of the Son is; how then would he afterwards deny that one person is prior to another in our consideration, unless he had considered him in another way, under the expressed notion of relation? But St. Bonaventure, in I, distinction 27, first part, question 1, to the second, admits that no one can fully and distinctly understand the person of the Father unless paternity be understood, although he plainly admits in the body that the person of the Father can be understood to be before he generates, and then not be conceived under the aspect of father, but of unbegotten. In two ways therefore St. Bonaventure considers the first person; what wonder, then, if likewise in two ways he is constituted by our consideration, as has been explained? Add that the things we have said are to be understood only of the constitution of the first person. And it must be said by way of distinction that the Father is understood distinctly under the expressed and formal concept of paternity and relation to the Son; for he is not understood distinctly, until another is understood from whom he can be distinguished: then, however, he is now actually referred to that other by the relation of paternity and of generation.

Satisfaction is given to the arguments of Scotus adduced in the first chapter.

The arguments of Scotus adduced in the first chapter are satisfied

It remains that, if there are any arguments opposed to this our opinion, we should refute them. First, however, satisfaction must be given to the arguments of Scotus adduced in the first chapter, on the occasion of which the present controversy has been disputed by us; then certain objections which can be proposed to us must be solved.

But to all the arguments of Scotus which contend that the person is understood to be before he generates, it is answered that it is so, provided that then he not be considered under the expressed concept of paternity; for thus they would plainly prove that origin is not necessary, nor that the person of the Father is the principle of generation. Nonetheless, it is not considered then that the

809. St. Thomas, in this question, art. 4; and cf. I, q. 42, a. 3.

person is constituted by something altogether absolute; for fecund-from-itself unto producing is conceived relatively. How, however, it be no hindrance that that relation be of reason and not real, will be explained below. Wherefore, of the arguments of Scotus there remains only the third, set in the former order, which has a special difficulty. By it indeed Scotus strives to prove that generation is terminated first to the absolute, and then to relation, because there is no motion toward relation: which is most strongly confirmed by this, that a relative cannot be terminated formally to another relative, but to the absolute: wherefore the Father regards the Son as first constituted by an absolute property before he is understood to be another.

I for my part admit that a relative in creatures is not referred formally to another relative, but to the absolute; in the divine, however, it must necessarily be referred to the relative. Concerning creatures, this I persuade myself from Aristotle: first, because in book 5 of the Metaphysics, chapter 15, he plainly teaches that sight is therefore not referred to the visible, nor intellect to the intelligible, because in their definition there would be a useless circle, as we have set forth at length above in disputation 104, chapter 2; with which doctrine St. Thomas agrees, above, q. 25, art. 3, he teaches that no power of God is rightly defined through the possible, for absolutely the same reason, because there would be a useless circle in the definition, and the very same thing in the very same way would be, if the father were referred to the son and were defined through him. Therefore, if in sight and intellect - which some say are relatives of a third genus, not mutual - Aristotle judged that inconvenience to be present, he ought to have thought the same in other relatives; or, if in others it is never present, it cannot be present in intellect and sense.

Third. Next, Aristotle in the Predicaments, in the chapter on relation, never said that it is proper to relatives that one cannot be known unless the other be known under the formal notion of relative; but that the relative cannot be known unless that to which it is referred be known - which is most true - concerning even the absolute terminus; so that the relative cannot be known unless the terminus to which it is related be known. For the same reason Aristotle, defining the relative, which is not only said, but is another, did not say that a relative is that which is another relative, but that whose whole being is being to another.[810]

Wherefore the opinion of Scotus pleases me in I Sentences, distinction 30, question 1, who asserts that relatives universally are terminated formally to the absolute, provided he understands that only in created relatives; for with regard to the divine persons there is another account, as we shall say in due course. From this it follows that relatives are much better defined through the absolute terminus; for if they are defined through the relative terminus, a useless circle is committed, while the one is defined through the other and conversely, and we would fall into a nugatory repetition by repeating the defined in the definition, placing the definition of the name set in the definition in the place of the very name itself in this way: sight is that of which there is sight, or sight through the visible; a nugation which Aristotle strives to avoid in that cited chapter 15. And although we truly say that one relative is of another relative, as half is the half of the double, and a father is the father of a son, and an intellect is the intellect of an intelligible - for this is what

810. Aristotle, Categories (Praedicamenta), ch. on Relation.

Aristotle signified in that chapter 15, when by a parenthesis he said, "even if it is true to say this," as I explained in disputation 104, in that chapter - nonetheless the nature of the relative does not become rightly known to us when it is defined formally through the other relative; and thus the mathematicians do not define the half in this way, that it is the half of the double; but thus, that taken twice it renders the whole, and so with other things. Aristotle also, in book 5 of the Metaphysics, chapter 12, defines active power not through passive power, which is the correlate, but thus, as a principle of transmutation in another, insofar as it is another. He did not say, to be the transmutative principle of the transmutable as the transmutable is; but, in another insofar as it is another. So also a father is not rightly defined as "one who has a son," because in turn we would have to say, "a son is one who has a father"; and thus one and the other would remain equally unknown after the definition. Rather we must say: a father is a living being that has produced another living being into the likeness of nature from a conjoined principle: thus too we employ the definition of generation, which is not delivered through an order to the begotten, but to the absolute substance produced in such a mode. But if the definition were given in the order to the begotten in this way, "It is the production of the begotten," it would be ridiculous, nor would it explain its nature: and since generation and father are referred in the same way, if generation is referred to the absolute and is defined through that, the same must be said of father.[811] [812]

Objection from Aristotle. But against the things we have said concerning nugation, Aristotle in book 2 of the Elenchi, chapter 6, seems to be opposed; for in the first book, chapter 3, he proposed a difficulty in this way: If it makes no difference to put a discourse in place of a name, that is, the explanation of it, men will easily be compelled to trifle, that is, to repeat the same thing twice in vain. For since "double," when explained by a discourse, is the same as "simply double," if someone says "of a simple [unit], double," it will be the same as if he were to say "of a simple [unit], of a simple [unit], double," taking, in place of that word "double" which was in the former discourse, its definition, namely, "of a simple [unit], double"; and if again, in place of "double" which was in that latter discourse "of a simple [unit], double," you put its definition, you will be able to say "of a simple [unit], of a simple [unit], of a simple [unit], double." He answers, however, in that second book, chapter 6, with words quite obscure, which give this sense: namely, that names relative to something do not signify the same when conjoined as when they are taken separately and are explained by a discourse in which the related terminus is set; as when we say, "A double is the double of a simple [unit]": but when they are set in a discourse together with the related terminus, they do not signify - that is, they must not be explained - in the same way, by adding again the related terminus; wherefore "double," put in a discourse with "simple," as when we say "the double of a simple [unit]," must not again be explained through "simple," by saying "it is the double of a simple [unit], of a simple [unit]"; therefore in the same way we can say that, even if one relative is defined by another relative, as the father by the son, it is not lawful to put, in place of the relative set in the definition, its definition, on which being put we would fall into nugation; because although that relative, taken by itself, is explained through another relative, yet, once set in the

811. Aristotle, Metaphysics V, c. 15.
812. Aristotle, Metaphysics V, c. 12.

definition and conjoined with others, it cannot be explained through another relative; since from Aristotle it is clear that one relative is not to be explained in the same way when taken by itself and when it is conjoined with others.

Reply. I reply that Aristotle did not say that whenever a name - even a relative - set in a definition or in a discourse has not yet been explained, it cannot be explained as if it were taken by itself; since he taught the opposite openly in Metaphysics V, chapter 15, as we recalled above in disputation 104, chapter 2; but he only taught this: that the relative, which is explained by a repetition of itself with its own related terminus, and thus set in a discourse is said to be of another relative, as we say "a double is the double of a simple [unit]" (for this is truly said, as in that first chapter from Aristotle I noted), cannot be expounded by repeating again the relative terminus through which it is explained; and thus, in place of what is said "a double is the double of a simple [unit]," it is not lawful - retaining that "simple" - to explain again the word "double," and to say "a double is of a simple [unit], of a simple [unit], the double." Therefore, in that place Aristotle is not disputing whether it is lawful that a relative terminus, through the order to which another relative is defined, when set in the definition may be explained - about which he had treated in that Metaphysics V, chapter 15, and had said that it can be done; and thus sight is not rightly defined by the visible, because that nugatory repetition would follow, but sight is better defined through something prior to the visible. The reason for the difference is this: because when a relative is explained through another relative by a repetition of it, together with the other relative in a discourse - as when we say "a double is the double of a simple [unit]" - we there take that [relative] as already explained by the "simple," and thus it is no longer to be explained by a new repetition of "simple," which truly would be of no moment, nor would it contribute anything to the explication of that; whereas when some relative terminus not yet defined or explained is put in a definition, reason itself seems to demand that it be explained and defined for the perspicuity of the definition itself. For if someone should ask what that terminus is which is put in the definition, its definition is not to be denied him. Wherefore, if the prior definition were of one relative through another relative, we would fall into a circle, as has been said. Therefore we rightly said that relatives must be defined through an absolute terminus. Hence you will understand that saying of Porphyry, in the chapter on species, that genus ought to be defined through species and conversely: for he does not understand (as the logicians think) that genus is to be defined through species, insofar as a species is correlated to a genus, that is, insofar as it is subjected to it - for thus a useless circle would be committed - but through species, insofar as a species also is predicated of several things differing in number. Thus it becomes known to us how a genus is predicated of those which differ by species, namely by that species which is such as to contain under itself several individuals at least. But enough on these things.[813]

Now indeed, as regards our undertaking, I say that the eternal Father is referred, not to the absolute, but to the Son under the aspect of filiation as the related; although in created things the account is different, because in created things substantial generation is terminated at the substance, not at the relation.

813. Porphyry, Isagoge, cap. de specie.

The relation, however, in no way, because that tends to the substance and to the person or begotten nature to which generation is terminated; but in the divine persons otherwise, because since the relation is subsisting, indeed the very hypostatic form according to the foregoing opinion, generation is terminated substantially at it as constituting the person. For that which is generated in God is a person, not a nature: therefore in the divinity the begetter, that is, the Father, is referred in the same way to the Son as the generation is to the Son, inasmuch as he is Son, as to its proper and per se terminus. And one who wished to define him as he is in himself, ought in this way to define him, and would in this way clearly behold the related as related. But we wayfarers, who understand divine things after the manner of created things, although we truly say that the Father in God is the Father of the Son, and conversely; nevertheless we better explain to ourselves the nature of the Father by an absolute term, as in human affairs, in this way: the eternal Father is he who from a beginning conjoined to himself produced a living person in the likeness of his nature. Thus also we defined the divine generation above, in disputation 113; nor would we so well define it by the correlated term in this way, "it is the procreative production of a Son."

In the same way it must be said concerning the notion (ratio) of the Holy Spirit, that it is terminated at the Son as spirator formally, yet in another respect, namely because by this sole respect the Son is distinguished from him, as was said in disputation 147; but a relation ought to be distinguished from its term. Of the Father, however, there is another account. For since he is distinguished from the Holy Spirit solely by paternity, and is constituted in the notion of a person by that, not by spiration, that [paternity] also can be the term of the Holy Spirit, not by reason of spiration. And thus the reasons of Scotus adduced in the first argument are satisfied.

Diluuntur alia argumenta, quae nobis opponi possunt.

Objections against our explanation that the eternal Father is conceived by us as existing before we conceive Him as generating

Moreover, some things can be objected against what we said in chapter 5, explaining, according to our own view, in what way the eternal Father is understood by us to be prior to our understanding him to generate. These, therefore, in this chapter it is necessary to resolve.

First, Scotus argues in Quodlibet 4, q. 9, against that way as follows: Innascibility is a mere negation; therefore the first person cannot be understood as constituted before he is understood to generate. But if someone should say, with the Antissiodorensis and St. Bonaventure, that it is something positive even if it is signified by a negation - namely, "to be from himself" - Scotus presses: either that phrase "from himself" denotes the ratio of a principle, and thus the Father is not from himself, because, as St. Augustine says, De Trinitate I, chapter 1, the same cannot be the principle of itself; or that phrase denotes "not to be from another," and so it signifies a mere negation. I answer in various ways: either by the negation of procession which "innascibility" denotes, or that by the phrase "from himself" there is signified the notion of first principle, which also by the name "fountain" of plenitude is denoted, not, however, by the name of paternity; and it is better expressed by a negation than by a positive, although the notion of this positive is constituted not by negation alone, as was noted in disputation 137, chapter 1.[814][815][816]

Next, the same Scotus argues thus. Either innascibility signifies a relation, or an absolute property, or the essence; if the essence, it cannot constitute a person, nor can it contract it; but it cannot signify a relation, because no other relation seems to exist except paternity, which belongs to the person alone, or else there will be more personal relations in God than four, which is absurd; therefore it remains that it signifies an absolute property, and consequently that a person is constituted in that prior, that is, in something absolute.

I answer that what we conceive by innascibility is a property conceived relatively; for by that word we signify a fontal plenitude, or the first principle of producing, which relation in God is certainly not real, because in him "to be able to generate" cannot be distinguished from "to generate actually"; and this suffices that it be understood as the property of the Father, the foundation of this first and fontal fecundity. Nor is it a wonder (since that comes from a different mode of conceiving) that that which actually generates "from itself," like a fountain, which is the Father innascible, is conceived by us after the mode of "being able to generate" before it is understood to generate. In this we do not multiply relations, but conceive the same one in a different way after the manner of created things: therefore Henry says that the first person is considered first as able to generate, rather than as actually generating. On that account, however, we do not constitute a different notion in God of innascibility, inasmuch as it signifies the first fountain and as actually emanating and as able to emanate; because it denotes the same dignity of fountain and of first origin. Nor does it hinder, if we say that that property of "innascible and fountain" is expressed by us by a relation of reason, from our conceiving the person under this concept as constituted. For since that constitution is by reason, it is not a wonder if, the same fecundity being conceived by us in a different way, the same person is apprehended as constituted in a different way.

Articulus III - Whether, the relations or properties being abstracted by the intellect from the persons, the hypostases still remain

Nevertheless, although Scotus in the place cited and Henry teach that the first person is conceived by us earlier as able to generate than as actually generating - for they think with all the other doctors that the person is understood before origin - Scotus nonetheless argues in the place cited, to prove that the first person cannot be constituted by that relation of "able to generate": both because the other persons are constituted by relations founded not in potency but in act; and also because, since it is a relation of reason, it cannot constitute a real person. It is answered, however, that the other persons cannot be conceived before the act of passive origin, and so they cannot be constituted by a relation founded in potency; but the first person can be conceived by us "to be" before he generates, and therefore then he can by our intellect be constituted by that relation of "able to generate," because by no other relation can he be constituted. That this relation is of reason does not hinder, as was said just before. Wherefore, since Scotus concedes that the first

814. Scotus, Quodlibet 4, q. 9.
815. The Antissiodorensis (William of Auxerre) and St. Bonaventure are here adduced.
816. St. Augustine, De Trinitate I, c. 1.

person can be thought "able to generate" before he actually generates, yet says that then he is not constituted by that relation or property of "able to generate," we shall speak to this in the annotations of the following article.

And from this there is also defended the common doctrine which affirms that the absolutes in the divinity are common to the persons. For innascibility, in the mode conceived before the actual generation, is not altogether absolute in our concept. And although relations of reason which are founded in the naked essence are common to all the persons, as the essence, nevertheless relations founded upon a personal property and upon our mode of conceiving are not common. For by the name "Word" a respect of reason is denoted, and by the name "Gift" likewise, as we saw in disputation 144, chapter 2, and disputation 154, chapter 2; and yet they are not common to the persons. Therefore, since here this respect of first fecundity and of the fountain able to flow is founded upon the first person according to our way of conceiving, it ought not to be common to all the persons. If you ask what is the foundation of this relation, I answer: the very person conceived under the mode of being fecund, which fecundity is indeed the same in reality with the relation of paternity, but according to our way of conceiving it is then considered under the respect of "able" and as not yet actually generating.

It is asked:

Third, one proceeds as follows.[817] It seems that, when the properties or relations are abstracted by the intellect from the persons, nevertheless the hypostases remain. For that to which something stands related by way of an addition, can be understood with that which is added removed. Thus "man" stands to "animal" by an addition, and "animal" can be understood with "rational" removed. But "person" stands by an addition to "hypostasis." For person is a hypostasis distinct by a property that pertains to dignity. Therefore, the personal property being removed by the intellect from the person, the hypostasis is understood.

1. Further. The Father does not have from the same [thing] that he is Father and that he is "someone." For by paternity he is Father; if by paternity he were "someone," it would follow that the Son, in whom there is not paternity, would not be "someone." Therefore, with paternity removed by the intellect from the Father, there still remains that he is "someone," which is to be a hypostasis. Therefore, the property removed from the person, the hypostasis remains.
2. Further. St. Augustine says in De Trinitate V, chapter 6, at the beginning: "This is not to say 'unbegotten' which is to say 'Father'." For if he had not begotten the Son, nothing would prevent his being called "unbegotten"; but if he had not begotten the Son, there would not be in him paternity. Therefore, paternity being removed, there still remains the hypostasis of the Father as unbegotten.[818]

817. The article proceeds in the manner of St. Thomas: cf. I Sent., dist. 26, q. 4, art. 2; Quodlibetal q. 5, art. 4; Opusculum 3, cap. 61, etc.

818. St. Augustine, De Trinitate V, c. 6, in the beginning.

But on the contrary: St. Hilary says in De Trinitate IV: "The Son has nothing except to be begotten; by nativity, however, he is Son." Therefore, filiation being removed, the hypostasis of the Son does not remain. And the same reason holds of the other persons.[819]

I answer that a twofold abstraction by the intellect is to be set down. One, according to which the universal is abstracted from the particular, as "animal" from "man." Another, according to which the form is abstracted from matter; as the form of a circle is abstracted by the intellect from all sensible matter. Between these abstractions this is the difference: that in the abstraction which is made according to universal and particular, that from which the abstraction is made does not remain. For with the rational difference removed from man, there does not remain in the intellect "man" but only "animal." But in the abstraction which is considered according to form from matter, each remains in the intellect. For when the form of a circle is abstracted from bronze, there remain separately in our intellect both the intellect of a circle and the intellect of bronze. Although, however, in the divinity there is neither universal nor particular, nor form and matter according to the thing, nevertheless according to the mode of signifying there is found some likeness of these in the divinity, according to which mode St. John Damascene says that the "common" is substance, but the "particular" is hypostasis. If, therefore, we speak of an abstraction which is made according to universal and particular, with the properties removed, there remains in the intellect the common essence, but not the hypostasis of the Father, which is as it were the particular.[820]

But if we speak according to the mode of abstraction of form from matter, the non-personal properties being removed, there remains in the intellect the notion of hypostasis and of persons. Thus, with it being removed by the intellect from the Father that he is "unbegotten" or "spirating," there remains the hypostasis or person of the Father. But with the personal property removed by the intellect, the notion of hypostasis is taken away. For the personal properties are not understood to accrue to the divine hypostases like a form to a pre-existing subject; rather, they carry along with themselves their supposits, inasmuch as they themselves are the subsisting persons. Thus paternity is the Father himself. For hypostasis signifies something distinct in the divinity, since hypostasis is an individual substance. Therefore, since the relation is that which distinguishes and constitutes the hypostases (as was said), it follows that, the personal relations being removed by the intellect, the hypostases do not remain.

But (as was said) some say that the hypostases in the divinity are not distinguished by relations, but by origin alone, so that the Father be understood to be a certain hypostasis by this, that he is not "from another"; but the Son, by this, that he is "from another" by generation. But the relations, coming as it were as properties pertaining to dignity, constitute the notion of person; whence also they are called "personal." Hence, the relations of this sort being removed by the intellect, there remain indeed hypostases, but not persons. But this cannot be, for two reasons. First, because the relations distinguish and constitute the hypostases, as has been shown. Second, because every hypostasis of a rational nature is a person, as is plain from the definition of Boethius, saying that a

819. St. Hilary, De Trinitate IV.
820. St. John Damascene, De fide orthodoxa, III, c. 6, in the beginning.

person is an individual substance of a rational nature. Hence, in order that there be a hypostasis and not a person, it would be necessary that rationality be abstracted on the side of the nature, not, however, that the property be abstracted on the side of the person.[821]

to the first: Person does not add above hypostasis a property distinguishing absolutely, but a property distinguishing and pertaining to dignity. For all this is to be received in the place of one difference. And the property which distinguishes pertains to dignity, according as it is understood to signify one subsisting in a rational nature. Hence, when the distinguishing property is removed, there does not remain a person, nor does there remain a hypostasis; but it would remain if rationality on the part of the nature were taken away. For person, as hypostasis, is an individual substance. Wherefore, in the divine, on account of both, there is a relation (*relatio*) distinguishing.

Reply to the second: By paternity, the Father is not only father, but he is a person, and is a "who," that is, a hypostasis. Nor, however, does it follow that the Son is not a "who," or hypostasis, just as it does not follow that he is not a person.

Reply to the third: The intention of St. Augustine was not to say that the hypostasis of the Father remains ingenerate when paternity is removed, as though unbegottenness constituted and distinguished the hypostasis of the Father. For this cannot be; since "ingenerate" posits nothing, but is said negatively, as he himself says. Rather, he speaks in a common way: because not every ingenerate is a father. Therefore, with paternity removed, there does not remain in the divine the hypostasis of the Father as distinguished from the other persons, but as distinguished from creatures, as the learned understand.

Conclusion: With the personal relations removed by the intellect, neither do the hypostases remain nor the persons; yet with active spiration removed, the persons of the Father and the Son remain.

Notations concerning the article.

St. Bonaventure in I Sentences, dist. 6, q. 3 seems to approve the opinion of those who assert that, the relations abstracted, hypostases remain in God on account of origins alone: for there would be in God "one who is from another" and "one from whom another is." For relations are posterior to origins. Yet this opinion is easily refuted from disputation 138, where it was proved that persons are not constituted by origins, nor distinguished formally.

Scotus adds in Quodlibet 4, q. 5, that from these two, with the personal relations removed, at least one person would still remain, namely that of the Father; because the first person is understood by us as fecund and able to beget, as Henry says, whom he himself there reports, before he is understood actually to beget.[822] Nor indeed does Scotus attack Henry as though he had said that the first person could be understood in this mode before the generation; but that he had affirmed that the person is constituted by that relation of "able to beget," before he is understood to beget. But Scotus refutes that, in harmony with his doctrine: for since he himself thinks that the

821. Boethius, De duabus naturis, c. 3, in the beginning.

822. Scotus, Quodlibet 4, q. 5; he also reports Henry (of Ghent) on conceiving the first person as fecund and able to beget before actual generation.

persons are constituted from the nature of the thing, as I recalled in chapter 4 of the preceding disputation, and that that relation in God is only of reason - because in God there is no other relation in reality than the act of producing and the act of the produced - it was rightly inferred by Scotus that a person cannot be constituted by that relation; yet he could not deny that it can be conceived under the merely conceptual idea of being fecund and able to beget. But we, who in disputation 158, chapter 2, proved that the constitution of the divine persons is only through our intellect, have rightly inferred already in the preceding disputation, chapter 5, that not only can the first person be conceived by us as fecund and able to beget, before he is understood to begetting, but also that by that property conceived in the mode of relation - even if it be a relation of reason - the first person can rightly be constituted by us.

Wherefore, if St. Thomas were speaking of the person of the Father as it is conceived by us before he begets, he would not doubt to affirm that he can indeed be conceived as a person without the relation of father, as relation, being understood, since he himself openly admits this in the following article. Therefore, when he asserts in this article that with the relations removed the persons do not remain, he is speaking of the relations, that is, of the personal properties, whatever they may be, and in whatever way they are conceived.[823]

Articulus IV - Whether the notional acts are understood prior to the properties

It seems that the notional acts are understood prior to the properties.

1. For the Master says in I Sentences, dist. 27, that the Father always is, because he begot the Son. And it is further granted that generation, according to the intellect, precedes paternity.[824]
2. Moreover, every relation presupposes in the intellect that upon which it is founded: as equality presupposes quantity. But paternity is a relation founded upon an action, which is generation. Therefore paternity presupposes generation.
3. Moreover, as active generation is related to paternity, so is birth to filiation. But filiation presupposes birth; for the Son is such because he has been born. Therefore paternity presupposes generation.

But on the contrary: Generation is an operation of the person of the Father. But paternity constitutes the person of the Father. Therefore, according to the intellect, paternity is prior to generation.

I answer: According to those who say that properties do not distinguish and constitute hypostases, but manifest hypostases already distinct and constituted, it is to be said absolutely that relations, according to the mode of understanding, follow upon notional acts, so that one may say

823. St. Bonaventure, In I Sent., dist. 6, q. 3.
824. The Master (Peter Lombard), I Sentences, dist. 27: "The Father always is, because he begot the Son."

simply: because he generates, he is Father. But, supposing that relations distinguish and constitute hypostases in the divine, it is necessary to make a distinction. For origin is signified in the divine actively and passively: actively indeed, as when generation is attributed to the Father, and spiration, taken for the notional act, is attributed to the Father and the Son; passively, as when nativity is attributed to the Son, and procession to the Holy Spirit. Now the origins signified passively, simply speaking, precede according to the intellect the properties of the proceeding persons, even the personal ones. For a passively signified origin signifies, as it were, the way to the person constituted by the property. Likewise, the origin signified actively is prior, according to the intellect, to the relation of the originating person, which is not personal. Just as the notional act of spiration, according to the intellect, precedes the unnamed relative property common to the Father and the Son. But the personal property of the Father can be considered in a twofold way. In one way, as it is a relation, and thus again, according to the intellect, it presupposes the notional act: because relation as such is founded upon an act. In another way, according to that whereby it is constitutive of the person. And thus it ought to be that the relation to the notional act is understood as presupposed, just as the acting person is understood as prior to the action.

Reply to the first: When the Master says that because he generates, he is Father, the name "Father" is taken according to that which designates the relation alone, and not according to that which signifies the subsisting person. For in that converse way it ought to be said that, because he is Father, he generates.

Reply to the second: That objection proceeds regarding paternity according to that which it is a relation, and not according to that which it is constitutive of the person.

Reply to the third: Birth is the way to the person of the Son. And therefore, according to the intellect, it precedes filiation also according to that which it is constitutive of the person of the Son. But active generation is signified as proceeding from the person of the Father; and therefore it presupposes the personal property of the Father.

Conclusion: Origin, understood passively, is prior, according to the intellect, to the property and relation which follow upon the origin; and, considered actively, it is prior, according to the intellect, to the relation of the producing person.

Concerning the doctrine of this article enough has been said by us in the preceding disputation, chapter 5; and also how the person of the Father is understood by us before he generates, and in what respect St. Thomas here also differs, has been sufficiently explained there.[825]

Quaestio XLI - On the persons in comparison to the notional acts

Therefore there is to be considered concerning the persons in comparison to the notional acts. And concerning this six things are asked.

825. Cf. the author's disputation 158, cap. 2; and the preceding disputation, cap. 5; see also St. Thomas's way of proceeding in similar places (e.g., Opusculum 3, cap. 63 - 64).

Articulus I - Whether the notional acts are to be attributed to the persons

It seems that the notional acts are not to be attributed to the persons.

1. For Boethius says in the book On the Trinity that when anyone turns the predication to the individual in any of the genera, in the divine they change the substance, except for relatives. But action is one of the ten genera. If therefore some action is attributed to God, it will pertain to his essence, and not to a notion.[826]
2. Moreover, St. Augustine says in De Trinitate that whatever is said of God is said either according to substance, or according to relation. But those things which pertain to substance are signified by the essential attributes; whereas those which pertain to relation, by the names of the persons and by the names of the properties. Therefore, beyond these, notional acts are not to be attributed to the persons.[827]
3. Moreover, it is proper to action to infer from itself a passion. But in the divine we do not posit passions. Therefore neither ought notional acts to be posited there.

But on the contrary is what Augustine says at the beginning of the book De fide ad Petrum: It is proper indeed to the Father that he begot the Son. But generation is a certain act. Therefore notional acts are to be posited in the divine.[828]

I answer: In the divine persons there is observed distinction according to origin. But origin cannot be suitably designated except by certain acts. Therefore, in order to signify the order of origin in the divine persons, it was necessary to attribute to the persons notional acts. To the first, therefore, it must be said that every origin is designated by some act. But a twofold order of origin can be attributed to God. One indeed, according as the creature proceeds from him; and this is common to the three persons. And therefore the actions which are attributed to God to designate the procession of creatures from him, pertain to the essence. Another order of origin, however, is observed in the divine according to the procession of person from person. Wherefore the acts that designate the order of this origin are called notional, because the notions of the persons are the persons' mutual relations.

And concerning this six things are asked.

Whether the notional acts are to be attributed to the persons

In the first we proceed thus. It seems that the notional acts are not to be attributed to the persons.

826. Boethius, De Trinitate.
827. St. Augustine, De Trinitate V, c. 6.
828. [Pseudo-]Augustine, De fide ad Petrum, in the beginning.

For Boethius says in the book On the Trinity that all the genera of the divine when one turns them into individual predication change the substance, except the relatives. But action is one of the ten genera. Therefore, if some action is attributed to the persons, it pertains to their essence and not to the notion.[829]

Further, St. Augustine says in De Trinitate that everything which is said of God is said either according to the substance, or according to the relation.[830] But the things which pertain to the substance are signified by the essential attributes; while those which pertain to the relation are signified by the names of the persons and by the names of the properties. Therefore there are not, besides these, any notional acts to be attributed to the persons.[831]

Further, it is proper to action to infer from itself a passion. But in the divine we do not posit passions. Therefore neither ought the notional acts to be posited there.

But on the contrary: [Pseudo-]Augustine says at the beginning of De fide ad Petrum: "It is proper indeed to the Father that he begot the Son." But begetting is a certain act. Therefore notional acts ought to be posited in the divine.[832]

I answer that in the divine persons there is observed a distinction according to origin. Now origin cannot suitably be designated except by certain acts. Therefore, to signify the order of origin in the divine persons it was necessary to attribute notional acts to the persons.

Accordingly, first it must be said that every origin is designated by some act. Now a twofold order of origin can be attributed to God. One indeed according to which the creature proceeds from him; and this is common to the three persons. And therefore the actions which are attributed to God to designate the procession of creatures from him pertain to the essence. But another order of origin is observed in the divine, namely the procession of a person from a person. Wherefore the acts that designate the order of this origin are called notional, because the notions of the persons are the persons' relations to one another, as is clear from what has been said.

Reply to the second: Notional acts differ from the relations of the persons only according to the mode of signifying, but in reality they are altogether the same. Whence the Master says in I Sentences, distinction 26, around the beginning, that generation and nativity are called by other names paternity and filiation.[833]

For the understanding of which it must be noted that first we come to know the origin of something from another by motion. For when some thing was observed to be removed by a change from its own disposition, it was clear that this happened from some cause; and therefore, according to the first imposition of the name, origin imports motion. For just as motion, insofar as it is in the thing moved by another, is called passion; so origin itself, insofar as it begins from another and terminates in that which is moved, is called action. Motion therefore being removed, action imports nothing other than the order of origin according as it proceeds from some cause or

829. Boethius, De Trinitate.
830. St. Augustine, De Trinitate V, c. 4 - 5.
831. Cf. St. Thomas, Summa theologiae I, q. 33, a. 2.
832. [Pseudo-]Augustine, De fide ad Petrum, in the beginning.
833. The Master (Peter Lombard), I Sentences, dist. 26.

principle into that which is from the principle. Wherefore, since in the divine there is no motion, personal action producing the person is nothing other than the relation of a principle to the person which is from the principle. Now these relations are themselves the relations or notions. However, because we are not able to speak of divine and intelligible things except according to the mode of sensible things, from which we receive knowledge, and in which actions and passions insofar as they imply motion are something other than the relations which follow upon actions and passions: it was fitting that the persons' relations be signified apart under the mode of act, and apart under the mode of relation. And thus it is clear that they are the same according to reality, but differ only according to the mode of signifying.

Reply to the third: Since action, insofar as it imports origin with motion, entails from itself passion, no action is posited in the divine persons in that way. Hence no passions are posited there, except in a grammatical way of speaking, as to mode of signifying: thus we attribute "to beget" to the Father, and "to be begotten" to the Son.

Conclusion of the article: To signify the order of origin it was necessary to attribute notional acts to the persons.

Notes around the article.

- That we may better understand all the things which are handed down in this article and in the whole question, certain things are to be noted. First, that origin, or the notional act, is the same. Origin is called the very way and act whereby a person produces, and whereby it proceeds: as generation, spiration, procession. Just as also in any agent, between it and the effect, we assign a certain middle act of production, as will be explained below. Now in the divine this origin is called "notional act"; for as "notions" are certain forms conceived by us by which the persons are known - about which in disputation 137 and the following it was said - so also these origins are called notional acts, because they conduce to recognizing the persons. And indeed the Fathers use indiscriminately them and the relations as the notions of the persons.
- Second, it must be observed that the notional act is not the relation of production alone, but also includes the operations of understanding and of loving. For, as was proved in disputation 112, generation in God is essentially intellection, and spiration is essentially love; but upon the nature of these operations there is added the relation of production. Wherefore he who would assert that origin is something absolute according to reality would err gravely: he would take away the real order of production to the thing produced. On that account, however, we ought not to add more real relations in God beyond the four which all the Scholastics grant: for active generation, since it is nothing other than paternity as it were in the way, and passive generation nothing other than filiation also "in becoming" and in the way, there ought not to be constituted distinct relations; but relative origins are constituted: for by the name of relation absolutely we understand that which is in the thing as a form in "fact of being."[834]

- Third, note that origin is the same according to reality with the essence and the person, not adequately with the essence but with the person. For we say that something is adequately the same with another which is also the same with the rest with which that thing has identity; and because origin thus is the same with the essence as not being with all the persons with whom the essence is the same, therefore we say that origin is not adequately the same with the essence. But it is adequately the same with the person, because whatever origin is the same with its own person - active with the producing, and passive with the produced - is not the same with another.
- Fourth, note the doctrine of St. Thomas in the solution to the second, where he says that origin is the same according to reality with the relation, and differs only according to mode of signifying. When he says "according to mode of signifying," it ought not to be understood as a merely nominal difference: for thus it would have to be said that "to beget" and "paternity," "to be begotten" and "filiation," are synonymous - which is absurd. They therefore differ in concept and in our ration if they differ in signification, as we said in disputation 159, cap. 4, because diverse signification is taken from our mode of conceiving. Add, from the mind of the holy Doctor in that solution, that active origin is the same with the relation of the producing person, and passive with the relation of the produced person - "to beget" with paternity, and "to be begotten" with filiation; and thus active and passive origin do not exist in the same person. Whereas in human things action and passion are in the same subject: active indeed is in the producer, passive in the produced, and thus they are really distinguished, just as the very persons and relations themselves. So think with the Master in the first of distinction 26, whom St. Thomas cites; Gabriel, Capreolus, and the other Scholastics; Durandus in that distinction, question 1; Scotus, distinction 28, question 3; the Ferrariensis, 4, against the adversaries, cap. 26; Cajetan, the Canarian, and the recent Thomists on this article. And it is gathered from the Fathers, who assign distinction among the persons from the distinction of the origins, namely "to beget" and "to be begotten," whom we have enumerated in disputation 158, cap. 4; whereas in the other created actions there is altogether the same, according to reality, action and passion in the same subject, as Aristotle teaches, Physics 3, chap. 3, text 18 and the following; because action in human things, which is production, is in the subject which is moved; and therefore it is received there, and is called "action" insofar as it is understood as an act between agent and produced term; but "passion" insofar as it is conceived as the middle act between the receiving subject and the received form, and it is called "reception." But in God there is only "to beget" and "to be begotten," which are called active generation and passive, and each is conceived as a middle act between one person and another - one, as of the producer into the produced, the other, as of the produced from the producer. In creation it would be in the same way: that is, in God there would be active creation, that is, to create; in the creature there would be passive, that is, to be created, if creation began in time. Yet because creation begins in time,

834. On the four real relations customarily admitted by the Scholastics, see the common doctrine; for the identification of action and passion in the same subject in created agents, see Aristotle, Physics III, c. 3, text 18 and following.

and nothing intrinsic is in God's will either from time or from eternity by his free will, as was shown in disputation 80, chapter 7, therefore God is said "to create" by an extrinsic denomination from the relation existing in the creature, not from the active origin existing in him. For the very act of his will and of his intellect is not itself creation and active origin, but the principle thereof. It must, however, be added against Cajetan and the Canarian on this article, that creation conceived as an action is the middle act and the way between the creator and the creature, just as in the divine it is origin. And although it is a pure relation, yet it is considered as in fieri and as a way, and not as in "fact of being": and therefore it ought to be constituted as a kind of middle act. Nor did St. Thomas teach the opposite, when he said that in the divine, the notion of way, which is wont to be in motion, being taken away, nothing remains except relation. For he understands that origin is altogether the same in reality with relation; yet it is signified and conceived under the mode of act, and therefore under the mode of way. For act, in its concept, is a way, although in motion one thing is the "way" according to reality, and another the relation thence arising: for relation remains when the motion ceases. And indeed St. Thomas in article 2 and article 4 of the preceding question therefore said that the persons cannot be constituted by origins, because they have the notion of a way as if tending, and not the notion of a form inhering. Therefore, since he grants that the way is to the thing produced according to its own rationale, he ought also to say that it is a middle act between the producing and the produced person.[835]

Articulus II - Whether the notional acts are voluntary

In the second we proceed thus. It seems that the notional acts are voluntary.

1. For Hilary says, book 1 On the Synod: "Not by a necessity of nature was the Father led to beget the Son." Therefore the Son was begotten by the Father's will.[836]
2. Further, the Apostle says, Col. 1: "He translated us into the kingdom of the Son of his love." But love belongs to the will. Therefore the Son is begotten of the Father willing.
3. Further, nothing is more voluntary than love. But the Holy Spirit proceeds from the Father and the Son as love. Therefore he proceeds voluntarily.
4. Further, the Son proceeds according to the mode of intellect as Word. But every word proceeds from the one speaking by will. Therefore the Son proceeds from the Father by will, and not by nature.
5. Further, that which is not voluntary is necessary. If therefore the Father did not beget the Son by will, it seems to follow that he begot him by necessity - which is against Augustine in the book to Orosius.[837]

835. Cf. St. Thomas as cited on I Sent. d. 26; and see his handling in Summa theologiae I, q. 33, a. 2, and the author's disputations 137, 158 (cap. 4), and 159 (cap. 4). On creation and extrinsic denomination see also disputation 80, cap. 7; against Cajetan and the Canarian on this article the author adds the point about creation conceived as a middle "way."

836. St. Hilary, De Synodis, lib. 1.

837. St. Augustine, Contra Maximinum vel ad Orosium (as cited by the author).

But on the contrary is what Augustine says in the same book: that the Father begot the Son neither by will nor by necessity.[837]

I answer that, when it is said that something is or is done "by will," this can be understood in a twofold way. In one way, so that "by will" designates only concomitance: as I can say that I am a man "by my will," because namely I will that I be a man. And in this way it can be said that the Father begot the Son "by will," just as one says "by will God is": because he wills to be God, and he wills to beget the Son.

In another way something is said to be "by will" so as to import the habitude of a principle. Thus it is said that the craftsman works "by will," because will is the principle of the work. And according to this mode it must be said that God the Father did not beget the Son by will, but by will he produced the creature. Whence in the book On the Synod it is said that if anyone says that by the will of God as though one of the creatures the Son was made, let him be anathema. And the reason of this is: because will and nature differ in causing in this respect, that nature is determined to one, but will is not determined to one. The reason of which is that an effect is assimilated to the form of the agent by which it acts. But it is clear that of one thing there is only one natural form by which the thing has being: whence, such as the thing is, such it will make. But the form by which the will acts is not one only, but are many, according as there are many rationes understood. Whence that which is done by will is not such as the agent is, but such as the agent wills and understands to be. Of those things therefore the will is the principle which can be thus or otherwise; but of those which cannot be except thus, the principle is nature. Now that which can be thus or otherwise is far from the divine nature; but this pertains to the ratio of the creature, because God is of himself necessary to be, whereas the creature is made from nothing. And therefore the Arians, willing to bring it about that the Son be a creature, said that the Father begot the Son "by will": according as for every creature the will of God brought in the substance of God, but gave to the Son nature from impassibility; and as not born, a perfect nativity. For all such things were created such as God willed them to be; but the Son was begotten to God; he subsists such as God is.

It is objected that the notional acts are voluntary. For Hilary says in the first book On the Synods: Not led by natural necessity did the Father beget the Son.[838]

Further, the Apostle, Col. 1: He has transferred us into the kingdom of the Son of his love. But love belongs to the will. Therefore the Son is begotten by the Father willing.

Further, nothing is more voluntary than love; but the Holy Spirit proceeds from the Father and the Son as love. Therefore He proceeds voluntarily.

Further, the Son proceeds by way of the intellect as Word; but every word proceeds from the one speaking by will. Therefore the Son proceeds from the Father by will, and not by nature.

Further, what is not of the will is necessary; if, then, the Father begot the Son not by will, it seems to follow that He begot by necessity. But this is against Augustine in the book to Orosius.[839]

837. St. Augustine, Contra Maximinum vel ad Orosium (as cited by the author).
838. St. Hilary, De Synodis, lib. 1.
839. St. Augustine, Contra Maximinum vel ad Orosium (as cited by the author).

But on the contrary: Augustine says in the same book that the Father begot the Son neither by will nor by necessity.[839]

I answer: When something is said to be or to be made "by will," this can be understood in two ways. In one way, so that the ablative designates merely concomitance: thus I can say that I am a man "by my will," inasmuch as I will to be a man. And in this way it can be said that the Father begot the Son "by will," just as He is "by will" God; for He wills Himself to be God, and He wills Himself to beget the Son.

In another way, so that the ablative imports a principle, as when one is said to work "by will," because will is the principle of the work. And in this way it is to be said that God the Father did not beget the Son by will, but by will He produced the creature. Hence in the book On the Synods it is said that if anyone says by the will of God, as by a kind of mean, that of the creatures the Son was made, let him be anathema.[838] And the reason for this is: will and nature differ thus in causing, because nature, determined by natural necessity, has begotten the Son, but will is not determined to one. The reason of this is that the effect is likened to the form of the agent by which it acts. Now it is manifest that of one thing there is only one natural form, through which the thing has existence; hence, such as the thing itself is, such it makes. But the form by which the will acts is not only one, but many, according as there are many rational accounts understood. Whence what is done by will is not such as the agent is, but such as he wills, and he understands that it is from the agent. Therefore will is the principle of those things which can be thus or otherwise; but of those things which cannot be except thus, the principle is nature. Now what can be thus or otherwise is far from the divine nature; but this pertains to the notion of a creature, because God is of Himself necessary to be, whereas the creature is made from nothing. And therefore the Arians, wishing to deduce from this that the Son is a creature, said that the Father begot the Son "by will," inasmuch as will designates a principle. But we must say that the Father begot the Son not by will but by nature. Whence Hilary says in the book On the Synods: To all creatures the will of God brought being, but to the Son the nativity, from impassible and unborn substance, gave nature perfect. For all created things are such as God willed them to be; but the Son, born of God, subsists such as God Himself is.[838]

Reply to the first: That authority is brought against those who even removed the concomitance of the paternal will from the generation of the Son, saying that the Father so begot the Son "by nature" that nevertheless there was not present to Him the will of begetting, just as we suffer many things by natural necessity against our will, as death, old age, and defects of this sort. And this is clear from the preceding and following in that place; for thus it is said there: "Not with the Father unwilling, nor compelled, nor led by natural necessity, did the Father beget the Son."

Reply to the second: The Apostle names Christ "the Son of the love of God," inasmuch as He is superabundantly loved by God, not because love is the principle of the generation of the Son.

---

839. St. Augustine, Contra Maximinum vel ad Orosium (as cited by the author).
838. St. Hilary, De Synodis, lib. 1.
838. St. Hilary, De Synodis, lib. 1.

Reply to the third: Even the will, inasmuch as it is a kind of nature, wills something naturally, as the will of man naturally tends to beatitude. And similarly God naturally wills and loves Himself. But concerning other things than Himself the will of God is disposed indifferently to either, as was said. Now the Holy Spirit proceeds as love, inasmuch as God loves Himself; whence He proceeds naturally, although He proceeds according to the mode of will.

Reply to the fourth: Even in intellectual conceptions there is a reduction to first principles which are understood naturally. But God naturally understands Himself; and according to this the conception of the divine Word is natural.

Reply to the fifth: Something is said to be necessary per se and per aliud. Per aliud in two ways. In one way, as by an agent and compelling cause; and thus what is violent is said to be necessary. In another way, as by a final cause: thus something is said to be necessary in those things which are to an end, inasmuch as without this the end cannot be had. And in neither of these ways is the divine generation necessary. For God is not for the sake of an end, nor does coercion fall upon Him. But per se something is said to be necessary which cannot not be. And thus for God to be is necessary; and in this way for the Father to beget the Son is necessary.

From this article there are elicited conclusions. The first is: The notional acts are voluntary with concomitant will. The second: The notional acts are not voluntary by will as principle. And both are understood of each notional act, of generation as well as of spiration; for although in the body of the article St. Thomas makes mention only of the act of generation, in the reply to the third he also makes mention of spiration. The reason, moreover, of the second conclusion in St. Thomas is that those things which are voluntary by will as principle can be thus or otherwise; but generation and spiration cannot be thus or otherwise; therefore they are not voluntary by will as principle. Which reason plainly proves concerning each notional act.

Prior dubitatio circa textum. Furthermore, for a fuller explication of each conclusion and of the doctrine of the article, it must be explained what St. Thomas understands by the name "will." Now the reason for doubting, which Cajetan asserts, is this: either by "will" is understood that which He necessarily and naturally wills - and in this way the act of spiration is voluntary by will as principle, and thus the second conclusion would be false, and the reason which we have adduced from St. Thomas would not fit - or "will" is understood as free and indifferent, and thus, although the second conclusion be true, because no notional act is from free will as principle, nevertheless the first conclusion cannot be true, because no notional act is voluntary by free will, even as accompanying.

Cajetan answers that "will" is taken univocally in each conclusion, either for the very power of willing, or for the act of will, not determined in this or that way, but indiscriminately. Accordingly, in the first conclusion, when it is said, "The Father begets the Son with concomitant will," St. Thomas shows that the act of generation is referred to the act of will as to its object, not determined in this or that way, that is, not as free or as necessary, but confusedly to the act of will, of whatever sort it be. But when, in the second conclusion, he says that a notional act is not referred to will as to a principle, he signifies that the act of will, which is to will, abstracting from

free and necessary, is not the principle of any notional act. For that ablative, "by will," when it is joined to verbs signifying an act, denotes the notion of a principle of liberty; as if you were to say, "by will the Father begets or spirates."

Yet according to this exposition of Cajetan, we can hardly avoid the equivocation and variety of the same name. Wherefore St. Thomas can be more easily explained, if in each conclusion "will" is taken for act, not for power. For, as is clear from the same First Part of the Second, question 8, article 1, "will" can be taken in a twofold way: first, for the faculty itself of willing; next, for its act, which is the prosecution of the good, or complacency - for the flight of evil is not called "will." But if "will" be taken in the latter way, namely for the act of willing, the truth of each conclusion rightly stands. The first, indeed, is true, because every notional act pleases God and, therefore, He is said to will it; but in this way the act of will is not the principle of the notional act, but accompanies it. The second conclusion also is true in the same way, because both the act of spiration and of generation is not from the act of will as from a principle; for, therefore, the Father does not generate or spirate because He wills to spirate and to generate; therefore the act of willing is not the principle, although spiration is from will as it is a faculty.

Moreover, St. Thomas proves that the notional acts are not voluntary by will as principle by the same foundation and reason by which above, question 19, article 4, he showed that creatures are produced by God by will as principle; which is of this sort. That which acts by will as principle, that is, because it wills, and that which acts by nature as principle, that is, inasmuch as it is, differ in this, that the agent by will acts freely and indifferently to either; but the agent by nature acts necessarily and as determined to one part. But God necessarily generates and spirates; therefore not by will as principle.

Posterior Dubitatio. Hence Cajetan further doubts whether the reason of St. Thomas has place only in products outside God, or also in products within Him. The reason of doubting is that, if it has place in products within God, nothing will be produced within Him voluntarily, unless by a reflex will; for something in God is produced voluntarily only insofar as it is willed; but if it be understood only of products outside God, the labor of St. Thomas is idle, because the difficulty of the present article was only about notional acts.

Cajetan answers that the reason of St. Thomas is to be understood also of any product within God, such as the act of free will itself, which, although it is not a product in reality, is nevertheless conceived under the mode of a product. He therefore says that these acts too are voluntary and free, because in a certain way they are willed, not by another distinct and reflex act, but by the same. For every act of will, he says, is willed, by the reason of the object of willing. I do not know, however, who has brought Cajetan into these straits: for the reason of St. Thomas plainly proves that everything which is produced voluntarily, that is, freely and indifferently, is from will, that is, from the act of will, as from a principle, whether the product be within God or outside. From this, moreover, he concludes that there is nothing within God produced in this way, because no notional act is produced in this way. But concerning other free operations, which truly are not produced, but are conceived as operations, such as the free volitions of God, this reason of St. Thomas does not prove them to be free; but this can be proved by another reason. For now St. Thomas only strives to

show that no notional act is free; which he excellently concludes by the foregoing reason. Further, the acts of willing creatures, even if they be conceived as elicited by the faculty of will as by a proximate principle, and not by another distinct act of willing...

That the acts of willing are free by another easy argument has been shown above by St. Thomas in question 19, article 3, as we too have explained in disputation 79.

Disputatio CLX - Whether the act of will precedes, accompanies, or follows the notional acts

- The opinion of Gregory, Capreolus, and others. cap. 1.
- What Scotus and Cajetan thought. cap. 2.
- That whatever act of God's will concerns the notional acts is in no way prior to them, but posterior to them, is the truer view. cap. 3.
- How the Fathers spoke about this matter. cap. 4.

There was the opinion of Gregory in the First Book, distinction 6, question 1, article 3, where he attacks the opinion of Scotus; and of Capreolus in the same distinction, question 1, article 1, conclusion 6, and article 2 against the arguments for the same conclusion; of the Ferrarensis on Contra Gentiles IV, chapter 11, § virum autem; and of the Canariensis in the third part of his commentary on this article, that the voluntary notional acts cannot precede them, but necessarily accompany them. These seem to be the express view of St. Thomas in De potentia, question 2, article 3, to the second.[840] But Cajetan replies that St. Thomas only denied that the will precedes as a principle, and not in any other way. This interpretation, however, is excellently refuted by the Ferrarensis from the words of the holy Doctor, as anyone can see.

Moreover, the Ferrarensis's view is proved by reason.

First, before the individual act that proceeds necessarily from a supposit is in act, another act of the same supposit cannot be understood as prior according to the true order of intellect, because there cannot be any middle act between the supposit and the act that proceeds necessarily from the supposit; yet several acts can well be understood as proceeding at once and necessarily from the same supposit. But the notional acts proceed necessarily from the supposit: therefore the act of will cannot be understood to precede them; for here it would be a middle act between the supposit and the notional act, which is impossible.

Second, it is proved by the reasoning of the Canariensis. Even if there were no act of will concerning the notional acts, nonetheless the notional acts would exist: therefore the act of will concerning the notional acts does not precede them; for if it preceded, upon its removal the notional act would also be removed, because upon the removal of what is prior it is necessary to remove what is posterior.

He also confirms this from St. Thomas in this article, who only grants a concomitant will.

840. St. Thomas, De potentia, q. 2, a. 3, ad 2.

Third, it is proved by Gregory's reasoning. The Father's knowledge cannot be perfect before He generates: therefore neither can the Father understand before He generates; nor can He will to generate, because to will cannot exist without intellection. Or if it was first to will to generate, before actually generating, it follows that the Son had being after not-being.

Finally, it can be confirmed thus: if an act of will precedes generation, it cannot precede otherwise than by origin; but in this way it would follow that the notional acts are voluntary by a will as principle: therefore in no way does it precede.

Caput II - What Scotus and Cajetan thought

Scotus in the First Book, distinction 6, question 1 - if I may trust my memory - holds that there is some act of will prior according to reason to the origins, or notional acts. Cajetan embraces this opinion in commenting on this article; and in its confirmation Scotus notes that a twofold act of intellect and of will can be distinguished: one, an essential intellection, which is common to the three persons; another, a notional intellection, which is proper to the Father. In the will likewise there is one act of all the persons, and another of the Father alone and of the Son producing the Holy Spirit.[841][842]

Hence he proves that some act of intellect and will, namely the essential act, is prior to the origins and notional acts: for the person is understood at some instant of origin to be able to generate before he generates, as was proved in the preceding disputation; and at that instant the person of the Father stands to the person of the Son and of the Holy Spirit as to a person to be produced and possible. And since at that instant the Father is perfectly God and perfectly blessed, He understands by an essential intellection, which is not a production, and He wills by an essential will - both of which He communicates to the Son by generation - therefore by that intellection He understands the notional acts as future or possible, and by the essential will He wills them to be future or possible, that is, it pleases Him that they be future or possible.

And from this it is clear how that act of will is not the principle of the notional acts, nor is God said thereby to produce because He wills; for it is only a certain simple complacency concerning a possible or future notional act that befits the Father in that instant of origin, before He generates. And in the same way all the arguments that have been brought for the first opinion could be solved by this. For they only prove that an act of will as the principle of the notional acts cannot be prior, not however in the other way explained. Wherefore Capreolus in the place cited, to the arguments against the sixth conclusion, finally concedes that from the imperfection of our intellect it comes about that the will of generating in God is considered prior to the very act of generation, although in reality it is not prior - this alone being what Scotus contends.

841. Scotus, In I Sent., dist. 6, q. 1.
842. Cajetan, on this article.

In another way this opinion can be explained, so that that will is prior in the sense in which the essential attributes are said to be prior to the notional, namely because they are more common, and the common is prior to the particular according to the rules of Aristotle in the Categories, in the chapter on the modes of the prior.

The Canariensis, however, replies that to will to generate is not essential, but notional and proper to the Father: for He alone wills to generate, just as He alone generates. He errs nonetheless: for although the Father alone wills to generate the Son, yet the other persons also will that the Son be generated by the Father, and thus this pleases them as it does the Father.

Moreover, the Ferrarensis answers otherwise, namely that only those essential attributes are prior to the notional which signify the essence itself, and not those which signify an operation, such as the will. Yet this is no less false, because just as deity is prior to filiation, so also by the same reasoning knowledge and will are prior in the way in which animal is prior to man. For just as without animal there could not be man, and rightly there can be animal without man: so the persons could not be understood without deity, knowledge, and will; whereas rightly the essence, knowledge, and will are understood without the three persons. But this mode of priority is different from the preceding one, which Scotus strives to prove.

Caput III - That whatever act of God's will concerns the notional acts is in no way prior to them, but posterior to them, is the truer view

This opinion is proved by the authority of Henry in the Summa, article 58, question 2, and in Quodlibet 5, question 4; and of Godefrid in Quodlibet 5, question 5; whom Scotus reports in the place cited. These authors in general maintain that every act of God's will which is conversant about the notional acts as about its object is posterior to the notional acts themselves according to reason.[843] From which two things follow against the two preceding opinions: one is that no such act of will is prior to the notional acts - in which we agree with the first opinion, and oppose the second. The other is that no such act of will accompanies the notional acts and is simultaneous with them, but is posterior to them in the intellect according to reason; for in reason they are not simultaneous. This is the opposite of the first opinion, unless its authors understand "accompaniment" to mean duration. We, however, since we deny priority, speak of every kind of it, such that neither by origin, nor by reason, nor in any other way is an act of will prior, but rather according to reason it is posterior.

Henry indeed proves this by the same reasoning by which Gregory also proved that the act of will is not prior: the notional intellection, insofar as it is the Father's, is an intellection; but in the Father intellection is prior to an act of will: therefore the notional act of generation is prior to the will concerning it.

843. Henry of Ghent, Summa, art. 58, q. 2; Quodlibet V, q. 4; Godefrid (Godfrey of Fontaines), Quodlibet V, q. 5; cited by Scotus in the place mentioned.

Yet to this argument, which in my judgment is weak, adversaries could easily reply: because in the Father there is not only notional intellection, which is generation, but before He generates He is conceived by us with the sole essential intellection which He has insofar as He is God; therefore from that He can also have an act of will before He is understood to have the notional act of intellect. Another way therefore must this opinion be proved.

In its confirmation, however, note first that the present question is about action and about acts that are truly in God. Among these we try to investigate an order of prior and posterior, either by priority according to reason or according to origin; for another kind of priority, such as by duration and by nature, is not found in God. By the name of priority according to reason I also understand that which is found between the essential and the notional, such as is found in creatures between universals, or common things, and particulars, which is called by Aristotle priority "a quo" - of which we shall speak in disputation 167, chapter 2.[844]

Second, it must be observed that only that is assigned as prior or posterior which has some order with that to which it is compared. For if it has no order with it, it is neither prior nor posterior; for these two are not without order. Wherefore that is prior by origin to another in the divine which has an order of origin with it. But an order of origin is had only by that which produces and is produced, and by those things which are per se required on the part of the producer or of what is produced; and conversely, what per se requires the product, or is a product, has an order with the producer and with production itself, inasmuch as such things are per se required. But those things which are in the product or in the producer per accidens have no order among themselves, nor with producer and product. In natural causes and effects this can be seen. For if a man is the cause of a man, and in the generating man there is whiteness, that whiteness is not prior as a cause to what the man producing effects, because it contributes nothing to the production of that; yet it is prior by duration, because it exists together with the generating man, who in time precedes the product.

Third, note that we ought not here to feign new acts in God, and new objects known and willed, which in reality are not, so that we may call those prior to others; but only among those things that are truly in God must an order be assigned either according to origin or according to our reason.

These foundations laid, the first part of the aforesaid opinion - namely, that an act of will is not prior to the notional acts - can rightly be proved, because an act of will, even of simple complacency concerning the act of generation or spiration as future or only possible, is not in God: therefore such an act cannot be prior either by origin, or even according to reason, to the notional act; and by the same reasoning neither will it be posterior nor simultaneous. For, as we have said, these orders are to be assigned only among those things that are truly in God. That there is no such act of will in God is clear, because God never considers His generation as future or only possible, as if by an abstraction of the intellect; indeed, neither can He consider those in that way. For this reason, in disputation 142, chapter 2, against Cajetan we said that the Word is not produced with cognition suspended, so as to be possible or future, because no such cognition is in God.[845] For God cannot

844. Below in this work, disputation 167, cap. 2.

abstract His intellection from His object so as to consider the Son or the Holy Spirit as future and only possible, in the way our mode of understanding does with things that are in the present to our intellect. We indeed, in our present state, understand first an essence as possible, before actual existence; or in another, we apprehend the very thing. But we must not consider Him as one who first, as an intelligent, has His own Son as merely possible before actually existing; for to ascribe such a sign to God in God Himself is only to make a mark remaining in our own intellect. Therefore God does not first understand His Son, or the Holy Spirit, as possible, than as actually existing; nor does He first have an act of will concerning them as possible than as existing, in our mode of understanding. Therefore the act of will is not prior by origin to the notional acts in God, nor prior by reason; since what is prior and posterior in God ought to be assigned, even according to our reason, only among those things which truly are in Him.

Tertio nota, we ought not here to feign new acts in God, and new objects known and willed, which in truth are not, so as to say that those are prior to others; rather, only among those things which truly are in God is an order to be assigned either according to origin (*origo*), or according to our reason.

With these foundations laid, the first part of the aforesaid opinion, namely that the act of will (*voluntas*) is not prior to the notional acts (*actus notionales*), can rightly be proved; because an act of will - of simple complacency also - about the act of generation or spiration as future or merely possible is not in God: therefore such an act cannot be prior either by origin, or even according to reason, to the notional act, and for the same reason it will be neither posterior nor simultaneous; for, as we have said, these orders are to be assigned only among those things which truly are in God. But that such an act of will is not in God is clear, because God never considers His generation as future or merely possible, as if by an abstraction of the intellect; indeed neither can He in that way consider it. For this cause, in disputation 142, chapter 2, against Cajetan, we said that the Word is not produced by a cognition of Himself under the aspect of possible or future existence, because there is no such cognition in God. For since God cannot, by an abstraction of the intellect, consider one of the things which are in Himself without another, nor can He understand that under any other state than under the present, in which necessarily He has always been, it is not to be said that God knows Himself or anything of Himself first as possible or as future than as present, even in our mode of understanding. We indeed understand in Him that the Son was first possible than actual; because we apprehend Him after the manner of other things: but we ought not to consider Him as one understanding His Son first according to possible existence than as actually existing; for to attribute this to God is to place a figment in God Himself: whereas for us to consider Him in various ways is a figment remaining only in our intellect. Therefore, if God does not first understand His Son, or the Holy Spirit, as possible than as actually existing, neither will He first have an act of will concerning them as possible than as existing and according to our mode of understanding: therefore the act of will is not prior by origin to the notional acts than the acts

845. Above in this work, disputation 142, cap. 2, against Cajetan.

themselves are in God, nor prior by reason; since what is prior and posterior in God ought to be assigned, even according to our reason, only among those things which truly are in God, as was said in the first and third notations.

But it is objected: since we apprehend God and the first person before He generates, and under the concept of being able to generate, do we not consider Him as understanding Himself first as powerful than as generating? I answer: by no means. We grant indeed that we understand God first as powerful than as actually generating: for this is natural to our intellect, which knows God after the manner of other things; yet we deny that we consider God in such a way that He understands Himself first as powerful than as actually generating, or that He first understands anything in Himself as future than as present: for this is absurd, and least of all befitting the divine intellection. And if God truly understands Himself as powerful, nevertheless He does not understand power unless as conjoined to act and as operating, not as about to operate afterwards in the future, or as powerful to operate in the future: therefore we do not think of Him in such a way that He first understands Himself as powerful alone, but we do consider Him first as present than as actually generating: which two are far different.

However, let us concede that God is by us considered as first thinking Himself as powerful than as actually producing the Son and the Holy Spirit; nonetheless it cannot be said that that will which would be about the notional acts as future or possible would be prior according to origin, but only in our mode of understanding. For priority according to origin is real, as we shall show below in disputation 187, chapter 1;[846] but that [priority] would not be real, but only through our intellect. Then too, priority according to origin is between producer and product, and between those things which of themselves pertain to producer and product: but those things which stand to either extrinsically have no order among themselves according to origin, as was proved in the second notation: but that will of generating or of spirating would not of itself pertain to the principle of such origin, because it could exist without that principle: therefore it would not be prior according to origin; it would, however, be prior in our mode of understanding, inasmuch as it would be conceived by us before the acts themselves: for when we conceive the notional acts as future or possible, they would not be future or possible unless there were an act of will about them as such; and the possible or future is conceived as prior to what is present in our mode of conceiving: therefore in the intellect that will is prior to the notional act as present. And these points concern the first part of that opinion.

The other part, which affirms that that will is posterior to the notional acts, and is not simultaneous with them nor accompanies them, except in duration, is easily proved from what has been said. For that will is about the acts as now present: but every act of simple will presupposes its object under that mode about which it is conversant, whether as possible, future, or present, otherwise than an efficacious act, which is the cause of its object. For example, if it pleases someone that rain be possible, rain is first as possible; if it pleases that it be future, it is first future; if it pleases that it be present, it is first present: therefore, since the origins please God as actually

846. Below in this work, disputation 187, cap. 1.

existing and present, they are first present than there is a will about them: for the reason they please, and by this simple complacency of will they are willed, is that they are present, not the other way around. And this our opinion agrees with St. Thomas in the places cited: he denied that an act of will as efficient is prior to the notional acts; but when he conceded a concomitant will, he did not deny the order which we have posited between origin, and will, and the act of that will, for this cannot be denied: he did not, however, wish to grant that priority of a principle which the Arians posited. For he adduces an example of a concomitant will: when I will to be a man, it is evident that it is first that I am a man, even in the order of nature, than that I will to be a man.[847]

What we have said is to be understood not only concerning priority according to origin, but also concerning that priority by which we said that the essential precede and are prior to the notional: for only those are prior to the notional which are not referred to the notional themselves as objects. For if in this manner they are referred to the notional, as the act of intellect and of will is referred, which reflect upon the notional acts, without doubt they are posterior to the notional.

From what has been said, the argument of Scotus for his opinion also remains solved. As to the arguments for the first opinion there is no need to respond; for they prove what we willingly admit, namely that the act of will by which it pleases to will to generate and to spirate is not prior to generation and spiration themselves. There remains, however, some sayings of the Saints to be interpreted, which seem to grant not only will as prior to the notional acts, but even as their principle.

Caput IV - How the Fathers spoke on this matter

Among the Fathers, however, Hilary seems to teach that there is in God a will of generating as the principle of generation: for in the book De synodis, in the defences of Catholic professions against Photinus, definition 25, he says: "If anyone says that the Son was born of an unwilling Father, let him be anathema: for the Father was not compelled, nor led by natural necessity, to beget the Son, but as soon as He willed." But this definition has no weight. For it is of the Council of Sirmium, which was Arian; and in it, as in many things, it expressed the very error of Arius. But further down the same Hilary reports from the Catholic Synod of Sardica these words: "But that neither by counsel, nor by will did the Father beget the Son, let him be anathema": and the holy and Catholic Church, that is, affirms this. Of which synod Hilary there testifies that it used brief, yet most absolute, definitions.[848][849][850]

But St. Jerome on that passage to the Ephesians, chapter one, "He predestined us," says: Of the Son indeed, that is, of our Lord Jesus Christ, it is written elsewhere that He was always with the Father, and that the paternal will never preceded Him so that He might be. Therefore that definition is to be understood thus: that the Father begot the Son with counsel and with will, not as a principle, but as accompanying according to duration, and as following according to reason:

847. St. Thomas, on this article.
848. St. Hilary, De synodis, in the defences of Catholic professions against Photinus, defin. 25.
849. The Council of Sirmium, which was Arian.
850. The Synod of Sardica; cited by Hilary in the same place.

because, to wit, seeing Himself generating by the force of nature and necessarily, He judged that to be supremely good and perfect, and it pleased Him. For although it was by the necessity of nature, nevertheless He begot, the will not resisting. And when Jerome denies a preceding will, he clearly speaks not as the Scholastics about a precedence only according to reason, but about time and duration.[851]

St. Augustine also, book 65, question 7, to Orosius asking whether the Father begot by will, answers: neither by will nor by necessity - this is, neither by will as a principle (he understands, indeed, not the faculty, but the act of will), nor by coercion. And in De Trinitate 15, chapter 20, he asserts: just as God is not God by will, nor by necessity, nor is God willing, nor not willing; so also neither by will, nor by necessity, neither willing, nor not willing did He beget. Which in the same manner, as above, is to be explained.[852][853]

Moreover, let us see whether that mode of speaking of the Council of Sardica, "God begot by will," is to be conceded. Marsilius, in the First Book, question 10, article 3, and Gabriel, distinction 6, question 1, said that that part, "by will," can be taken in two ways: either as an adverb, so that it is the same as "willingly," and thus the proposition is true; or in an effective sense, and thus it is false, because it seems to signify a principle as it were efficient. But St. Thomas in this article, and Scotus in the First Book, distinction 6, question 1, article 2, concede this proposition, "God begot the Son by will," with only this distinction made concerning a concomitant will, or a preceding one as a principle; in the former way they concede it, in the latter they deny it; and because it can bear the aforesaid true sense, they absolutely concede it with the Council of Sardica. And in what sense the Fifteenth Council of Toledo said, "According to the essence the divine will begot will," we have explained above, question 39, article 5.[854][855][847][856][857][858]

Disputatio CLXI - Whether the Holy Spirit is produced necessarily, or freely

- Henry judges that the Holy Spirit proceeds in a certain manner freely, and in a certain manner naturally. Caput I.
- Scotus holds that the procession of the Spirit is necessary, yet not free. Caput II.
- That the spiration of the Holy Spirit is not only necessary, but also natural and not free, and that "not free" is the truer opinion. Caput III.
- The arguments of Scotus are resolved. Caput IV.

- The controversy in this matter, at least with Scotus, is one of words rather than of things. Caput V.

Caput I - Henry's opinion: the Holy Spirit proceeds in one way freely, and in another naturally

... whether namely His production ought to be called free, since it is through will, not by compulsion; or to say the same in another way, as others do: yet with Henry there seems to be even a disagreement about the thing itself; for in sum, as Scotus reports in the First Book, distinction 6, question ... and as to the second ... or to say that nature itself, by means of will as a middle, always operates; or to say ...

Caput II - On whether the procession of the Holy Spirit is necessary, natural, and free

It is to be asked whether its production ought to be called free, since it is by the will; not all feel the same way, as also others: and even with Henry there seems to be disagreement about the matter itself. For he, in sum (as Scotus reports), in the first distinction 10, question 1, §§ as to the first, and as to the second, and in Quodlibet 16, art. 3, asserts that the Holy Spirit proceeds indeed naturally, with naturalness (as he himself says) only accompanying, and at the same time proceeds freely.[859] And that he may set forth this his opinion for us, he notes that a threefold act of will can be posited. The first is of will, as free choice is, tending to some good that is not the highest, and this act is altogether free. Of this sort is every act of will, even the divine, about any created object whatsoever. The second act is from the will toward God clearly seen, and it is said to be altogether natural, because it is from nature as principle, unchangeable and necessary. A third act can be called natural with nature only accompanying: for the will is a certain faculty existing in some nature, and from that has some natural mode accompanying in its operations. In this way he thinks the procession of the Holy Spirit is natural. For in the procession of the Holy Spirit this author considers a twofold respect of operation, one toward God clearly seen and beloved, the other toward the Holy Spirit as produced love. For the procession of the Holy Spirit is not only the production of love, but also the love of the highest good, that is, of the goodness of God. According to the former respect he says it is an act natural from nature as principle; according to the latter he says it is free, but accompanying-natural, on account of the accompaniment, so far as liberty of will has with nature. From which he gathers that God lives naturally by a necessity of nature, and understands naturally by a necessity also arising from the object, but breathes naturally on account of the accompaniment of nature, because nature is annexed to the principle of breathing.

It is refuted: Scotus refutes this opinion of Henry in two arguments of less moment, which therefore I deliberately pass over; for it can be attacked by this one easy argument. For Henry thinks that naturalness (as he speaks) is annexed to the procession of the Holy Spirit, because the will is in the divine nature itself as in a subject, and this does not hinder that act from being natural

859. Scotus, In I Sent., dist. 10, q. 1, §§ ad primum et ad secundum; Quodlibet 16, art. 3.

as from a principle, because nature itself by means of will as a middle always operates; or he says that naturalness is annexed only to the act of breathing, because, so far as it is love, it is necessary, but so far as it is the production of Spirit, it is not necessary - which Henry himself seems to indicate; and by this reasoning it would follow that in fact the Holy Spirit is produced in such a way that he could not be produced: for that act which is the love of God could be borne toward God in such a way as not to be production, if, so far as it is production, it proceeds from no necessary principle. Thus the Father and Son, while necessarily loving themselves, could cease from production; nor would the necessity of love, as it is terminated to God loved, suffice, so that the same, so far as it is production referred to the Holy Spirit, should proceed necessarily unless from the force of its principle, even as it is production, it proceeded necessarily.

Moreover, with Scotus the contention is only about words. For he himself, in the first, distinction 10, question 1, at the second doubt, and in Quodlibet 6, art. 1, affirms that the procession of the Holy Spirit is necessary also on the part of the principle, so that the Holy Spirit cannot not be produced, yet that it ought to be called free and not natural: that it is necessary, he briefly proves; both because God necessarily loves himself, and by loving produces love; and also because the Holy Spirit is necessarily God, so that he cannot not be: for the things that are within God are supremely necessary.[860]

Furthermore, that it ought to be called free, Scotus first proves in that Quodlibet 1, art. 2, and in that question 1, § against the same, near the end of it, from the sentence of St. Augustine in the Enchiridion, ch. 105, where he says: "It was fitting that man should first be so made as to be able to will good and able to will evil; afterwards, indeed, he will be so as to be unable to will evil; nor therefore will he be without free will: much more free indeed will be the will which will be altogether unable to serve sin," - he understands, in beatitude, where he will not be able to sin. He adds: "For neither is the will to be blamed, nor is it not a will, if that by which we will to be blessed is not to be called free, since we so will to be blessed that we not only do not will, but in no wise are able to will, to be miserable."[861] Therefore, according to the sentence of Augustine, the will is then also free when it operates necessarily. The same is taught by Anselm, On Free Choice of the Will, ch. 7.[862]

Secondly: because the will infinite, such as God's is, about the infinite object, such as is love produced, conducts itself in the most perfect mode: but the most perfect mode is of operating freely and necessarily, because liberty is the perfection of will: therefore the Holy Spirit, who is produced love, proceeds freely and necessarily.

Thirdly, it can be proved from Scotus himself in this way: In the most perfect operation, such as is the will of the highest good, that which is of perfection can be together with the necessity of that same; but liberty is the perfection of operation; therefore it can be together with the necessity of that same in the same way in the spiration of the Holy Spirit.

860. Scotus, In I Sent., dist. 10, q. 1, ad secundum dubium; Quodlibet 6, art. 1.
861. St. Augustine, Enchiridion, ch. 105.
862. St. Anselm, De libero arbitrio, ch. 7.

Moreover, in Quodlibet 16, art. 2, to the one asking in what name of free that which can be together with the necessary should be understood, he answers that there is no reason to be given of the first principles; yet nevertheless he tries to explain this kind of liberty, and for its sake notes in the article that every sufficiently complete agent is divided into a natural agent and a free agent: because every agent either acts by nature, inasmuch as it is, or acts by purpose through an apprehended form, that is, through the intellect. Thus Aristotle seems to teach in the second of the Physics, text 48, and in the ninth of the Metaphysics, ch. 4, where he divides the power of acting into rational and irrational power, as if he were saying, into natural and free. St. Augustine agrees, City of God 5, ch. 9, after the middle, where he says that one cause is fortuitous, another natural, another voluntary. But the natural agent differs from the free (says Scotus) in that the natural is always first, or at least is moved by some prior agent, and does not move itself. Thus indeed all created agents, when they tend into their determined ends, are said to be moved by some rational cause; but the voluntary agent moves itself, only the form proposed being apprehended by reason; and therefore its mode of operating is called free, and not natural. And liberty is placed in this, that it operates delectably and electively (he says), even if necessarily: which he also affirms about the spiration of the Holy Spirit, and for that reason calls it free. However, he says that the reason of the necessary in the spiration of the Holy Spirit arises from a twofold head: first on the part of the object, which is the highest good and necessarily moves to love of itself; then on the part of the efficient principle: and thus, he says, there is no necessity which precedes spiration on the part of the principle, but one which only accompanies spiration. In which he seems in part to agree with Henry, because if some necessity on the part of the principle were to precede, the will in spiration would not act, but would be acted upon.

Nevertheless, in order that what Scotus teaches in his opinion about the liberty of the act of spiration we may leave to be impugned in the following chapter, that which he asserts about the necessity of the act of breathing must be refuted in passing by this reasoning. Just as the object itself so determines the will to breathe that it cannot not breathe, because it is the highest good, which cannot not move to love of itself, so also the very faculty of the will, so far as it is such, by its native power is of itself so determined to love the highest good clearly seen that it cannot not love; and since in the Father and the Son, by loving, he breathes, he cannot not breathe: therefore the necessity of operating on the part of the principle is not concomitant, but antecedent and direct to spiration; nor from this does it follow, which Scotus inferred, that the will is not moved by itself, because, since this necessity is nothing else than the very virtue of the will, even if it is moved necessarily, it will be moved by itself.

The procession of the Holy Spirit is necessary, but also natural and not free, is to be said, according to the truer opinion.

Caput III - The common sentence: the Holy Spirit's spiration is necessary, natural, and not free

The common and truer sentence of the Scholastics is that the spiration of the Holy Spirit is not only necessary by a necessity concurring on the part of the principle, but also that it is to be called natural and not free. Thus taught St. Thomas in this article, to the third, when he says that the Holy Spirit proceeds through the will, not as will, but as nature is; and with him Cajetan, and the more recent writers on this article, the Canarian in the second part of his Commentary, Gregory in the first, dist. 10, q. 1, art. 2, Capreolus, dist. 6, q. 1, art. 1, conclusion 5, and in art. 2, in the solutions of the arguments against the same, and dist. 10, q. 1, art. 1, conclusions 2 and 3, although he concedes that the procession of the Holy Spirit can in a certain way be called free with freedom from coercion, which we do not deny, just as St. Thomas also said in De potentia, q. 10, art. c., to the fifth; yet nevertheless absolutely it is not to be called free: for commonly free is said of that which is indifferent to either. And indeed, although the procession of the Holy Spirit can be called free, because it is free from coercion, in no way can it be denied to be natural: for natural and free from coercion are not repugnant, nay rather they agree, as will be evident from what is to be said below. [863][864]

This sentence is confirmed first by a refutation of the preceding opinion; then it is further explained. Cajetan uses this reasoning: Free and natural are not differences of powers, but can befit the same faculty; for differences of faculties are not taken from the various mode of their operating about the same object, but from the diversity of the primary object: for in the intellect there is found a twofold mode of operating, namely without discourse and with it; likewise in the will there is a twofold mode, one with choice and consultation, the other without that: therefore in the same power there can be a mode of operating naturally and freely, so that that is natural which is necessary in some way, but that free which is with indifference.

But Scotus does not deny that a diverse mode of operating can befit the same power: for he himself concedes in the will a necessary mode and an indifferent mode, especially in the divine; but he asserts that the necessary mode of operating is also called free and is not to be called natural; not because it is not necessary, but because it is from a principle of cognition. Wherefore in another way it must be proved against him that the spiration of the Holy Spirit cannot be said free, if it is necessary, as he admits: which can be deduced by this reasoning.

Either spiration is called free because it is without coercion and with delight; and in this way the actions also of natural agents, because they are without coercion, would have to be called free, or at least the operations of brute animals and of animal appetite, because they too are with delight - which is absurd. Or it is called free because it is indifferent to either part of contradiction, so that it can be and not be; or of contrariety, so that it can will this and its opposite: and in this way it cannot be called free, because this mode of liberty is the same as the mode of contingency, which is

863. St. Thomas, De potentia, q. 10, ad 5.

864. Cajetan; the Canarian, Commentaries, part 2; Gregory, In I, dist. 10, q. 1, art. 2; Capreolus, In I, dist. 6, q. 1, art. 1, concl. 5; and in art. 2, solutions against the same; and dist. 10, q. 1, art. 1, concl. 2 - 3.

opposed to the necessary. Or finally, thirdly, the will is to be called free in all its operation, as in truth Scotus contends, because it is determined by its own internal principle to act from cognition and an apprehended form: but this, besides being said without any foundation, is plainly false; for brutes also act through an apprehended form, and yet are not said to operate freely, because they act necessarily.

Moreover, when Aristotle in the second of the Physics, text 48, divides the agent, one according to nature, another by purpose, he judges that to be by purpose which from consultation operates indifferently to either part; and when in Metaphysics, book 4, ch. 4, he defined the irrational power, which he had distinguished from the rational, thus he says: It is necessary, when action is now approached, this indeed to act, that indeed to be acted upon; therefore if by the name of irrational power he understands the natural, sometimes it will also befit the will, because sometimes, an object being applied, it cannot not operate, which Scotus at least concedes in the divine will. And Aristotle defined irrational powers thus because he knew of no act in the will necessary as to exercise; for he did not know the love of the highest good clearly seen in the fatherland, toward which alone the will in this way tends necessarily; and thus he thought the rational faculty to be that which can operate to either by election. Finally, Augustine, in that same book of the City of God, ch. 9, distinguishes a natural cause from a voluntary one for this reason, that the natural has only the mode of operating of nature with determination and necessity to one part; but the voluntary, even if it sometimes operates naturally, yet can operate indifferently, which is commonly called to operate voluntarily.[865][866]

Then the sentence of St. Thomas is explained from an analogy to agents by nature, which are called natural because they operate in only one natural mode: for the proper mode of acting of nature is necessary and, as it were, bound to one part: therefore, when the will operates in this way, with some determination, it is rightly said to operate naturally, or to operate as nature: but on the contrary, since it is proper to a rational agent to operate indifferently to this or that part because of the indifference of reason, then it operates as will, when it operates to either: and since free is opposed to bound, and nature is as it were bound to operation, because it is determined of necessity to one part, therefore free is rightly and commonly said; which ...

What is indifferent is also then said to be free; and then the will is said to act freely, when it acts indifferently as will; but then naturally, when it acts as nature. Thus do St. Jerome, in his Epistle to Damasus on the Prodigal Son, which is 146; St. Augustine, De libero arbitrio, book 3, chapter 3; St. John Damascene, book 1 On the Faith, chapter 28; and St. Thomas, De veritate, question 22, article 6, and question 24, article 1, define liberty.[867]

Hence the holy Doctor rightly inferred in the Prima Secundae, question 10, article 1, that those things are desired naturally by the will, which are desired of necessity. Wherefore, when the will so necessarily desires certain things that it cannot hate them, although it may be unable to love them

865. Aristotle, Physics II, text 48; Metaphysics IV, ch. 4.

866. St. Augustine, De civitate Dei, V, ch. 9.

867. St. Jerome, Epistle to Damasus on the Prodigal Son (Ep. 146); St. Augustine, De libero arbitrio, III, ch. 3; St. John Damascene, De fide orthodoxa, I, ch. 28; St. Thomas, De veritate, q. 22, a. 6; q. 24, a. 1.

(which is called necessity as to specification), this is also said to love naturally. Such are life, sense, and knowledge. For this reason Aristotle seems to have said in Metaphysics I, chapter 1: "All men by nature desire to know"; of which, and of the desire of seeing God, which for this reason is called natural, we shall say more in question 12, article 8. Much more fittingly will the will be said to act naturally, when it acts so necessarily that it cannot but act, which necessity is called as to the exercise: and since the Holy Spirit is breathed in this way, His spiration must in every respect be called natural, because it is from the will as nature.

That there is to be posited a certain natural will, and another free, Nicetas taught in book 3 of the Thesaurus of the Faith, chapter 19, in these words: "The natural will of man - or, as St. Basil and St. Cyril are its authors - is life-love; for to every man life and the enjoyment of light are dear. Behold, this is the common will. The gnomic, or knowing wills in our nature, are many: for one man wishes to transact private business with himself, another to build," etc. There, by natural will, which is in all with respect to life, he understands what is necessary at least as to specification; otherwise it would not be in all. By gnomic will (*voluntas gnomica*), however, he understands that which is born of gnome, that is, of decision and consultation, concerning other things which of themselves can be loved and can be held in hatred; and therefore about those things consultation is exercised, and thus he himself calls this gnomic will spontaneous, or spontaneous free will in the same chapter.[868]

Furthermore, when St. Thomas and Capreolus in the places cited say that the Holy Spirit proceeds naturally, not by the mode of nature, but by the mode of will, by the mode of nature they understand that which belongs to the notion of generation, in likeness, namely, to nature - as was said in Disputation 113 - and not the mode of determination to one part; while by the mode of will they do not understand what is free and indifferent, which is wont to be said proper to the will; but a mode which is not in the likeness of nature, on account of which a procession by will is not generation; otherwise, in a few words he would contradict himself. Finally, when the same holy Doctor said above, question 27, last article, that the procession is not from nature but from will, he did not exclude a mode of acting naturally; but only wished to say that it is not proximately from the substance and nature of God, but from the intermediate faculty of the will: which is to be understood as it is conceived by us; for in reality, since the will and the nature of God are the same, it proceeds proximately from the very nature.[869]

Caput IV - The arguments of Scotus are dissolved

Again, all can be resolved. To the first, which we adduced in favor of Scotus's opinion - namely, from St. Augustine in the Enchiridion, chapter 105 - I answer: It is for this reason that Augustine says our free choice will then be freer when it cannot sin, because, beyond the liberty of indifference which it will have with respect to a particular good, it will be free from the servitude of sin. Therefore he calls it freer, not because it is more indifferent, but because it is freer from sin.

868. Nicetas, Thesaurus fidei, lib. 3, cap. 19; citing St. Basil and St. Cyril.
869. St. Thomas, I, q. 27, last article.

Now we have already warned, near the beginning of chapter 3, that an operation is not called free absolutely because it is free from coaction, add also, or from the servitude of sin; but because it is indifferent. Here, however, Augustine says that choice is freer when it cannot sin, because now he himself seems to explain of what kind of liberty he speaks. Moreover, although we might call this mode of acting free, and thus we could call the spiration of the Holy Spirit free, nevertheless it ought to be called natural; for natural is always said from that necessary mode of acting which is proper to nature. Nay rather, Augustine immediately subjoins: "Either there is no will, or that will is not to be called free, by which we so will to be blessed, that we not only do not will to be miserable, but can in no way will it at all." Therefore he concedes that that will is not free; and by liberty he understands indifference, even if only as to specification, according to what we said in the preceding chapter.[870]

Reply to the second: The most perfect mode of acting is indeed both natural and free at once in the same potency; not in the same operation, for thus they are repugnant, as is clear from what has been said: but to be in the same agent is most perfect.

To the third I say in the same way: that perfection of liberty cannot be in just any operation, nor with respect to just any object; for we take liberty for indifference. In which sense even Scotus himself would say that it cannot be found in the same act. Nay rather, if it were found in this way in the procession of the Holy Spirit, there would be the greatest imperfection, because the Holy Spirit would be a creature. But in another way it could not be said to be free in the will, unless for such an explanation, or at least that it could at the same time be said to be natural, which has already been proved above. Thus therefore we ought to speak of spiration, that at least we in no way deny it to be natural.

Articulus III - Whether the notional acts are from something

The third proceeds thus. It seems that the notional acts are not from something. For if the Father generates the Son from something, either from Himself, or from something else. If from something else, since that from which something is generated is in that which is generated, it follows that something alien to the Father is in the Son. Which is against Hilary in book 7 On the Trinity, where he says: "There is nothing diverse or alien among these."[871] But if the Father generates the Son from Himself, that from which something is generated, if it be something permanent, receives the predication of that which is generated: as we say that "man is white," because man remains when newly white becomes white. It follows, therefore, that either the Father does not remain when the Son is begotten, or that the Father is the Son - which is false. Therefore the Father does not generate the Son from something, but from nothing.

1. Further, that from which something is generated is the principle of that which is generated: if, therefore, the Father generates the Son from His essence or nature, it follows that the essence or nature of the Father is the principle of the Son: but not a material

870. St. Augustine, Enchiridion, ch. 105.
871. St. Hilary, De Trinitate, VII: "Nihil in his diversum est vel alienum."

principle, because matter has no place in the divine. Therefore it is a kind of active principle, as the begetter is the principle of the begotten. And thus it follows that the essence generates. Which in some manner has been disproved above.

2. Further, Augustine says that the three persons are not from the same essence, because essence and person are not different things. But the person of the Son is not other than the essence. Therefore the Son is not from the essence of the Father.

3. Further, every creature is from nothing: but in the Scriptures the Son is called a creature. For it is said in Ecclesiasticus 24: "From the mouth of Wisdom I was begotten. I came forth from the mouth of the Most High, the first-born before every creature." And afterwards from the mouth of the same Wisdom it is said: "From the beginning and before the ages I was created." Therefore the Son is not begotten from something, but from nothing. And similarly it can be objected about the Holy Spirit because of that which is said in Zechariah 12: "Thus says the Lord, stretching out heaven, and founding the earth, and creating the spirit of man within him." And Amos 4, according to another reading: "I form the mountains and create the spirit."

But on the contrary is what Augustine says in the book On the Faith to Peter, chapter 1: "God the Father alone, from His own nature, without beginning begot a Son equal to Himself."[872]

I answer that the Son is not begotten from nothing, but from the substance (*substantia*) of the Father. For it has been shown above that paternity and filiation and nativity are truly and properly in the divine. Now this is the difference between true generation, by which someone proceeds as a son, and making: that the maker makes something from exterior matter, as the craftsman makes a bench from wood; but a man generates a son from himself. And as the craftsman makes something from matter, so God makes from nothing (as will be shown below), not that nothingness passes into the substance of the thing, but -

But because by him the whole substance of the thing is produced, with no other presupposed. Therefore, if the Son were to proceed from the Father as existing from nothing, he would stand to the Father as an artifact to the craftsman; which manifestly cannot bear the proper name of sonship, but only according to some likeness. Whence it is left that, if the Son of God were to proceed from the Father as though existing from nothing, he would not be a true and proper son. The contrary of this is said in 1 John: "That we may be in his true Son, Jesus Christ." Therefore the Son of God is true not from nothing, nor made, but only begotten. If, however, those who are made by God from nothing are called sons of God, this will be metaphorically, according to a certain assimilation to him who is truly Son. Hence, inasmuch as he alone is the true and natural Son of God, he is called the Only-Begotten, according to that in John 1: "The Only-Begotten who is in the bosom of the Father, he has declared him." But inasmuch as by assimilation to him others are called adopted sons, he is, as it were metaphorically, called First-Begotten, according to Romans 8: "Whom he foreknew and predestined to be made conformable to the image of his Son, that he might be the firstborn among many brethren." It is therefore left that the Son of God is begotten of

872. St. Augustine (attributed), De fide ad Petrum, cap. 1 (t. 3).

the substance (*substantia*) of the Father, yet otherwise than a son of man. For a part of the substance of the begetting man passes into the substance of the begotten. But the divine nature (*natura*) is impartible. Whence it is necessary that the Father, begetting the Son, did not pour a part of the nature into him, but communicated to him the whole nature, the distinction remaining only according to origin, as is clear from what has been said.

Reply to the first: When the Son is said to be born of the Father, this preposition "of" (de) signifies a generating consubstantial principle, not a material principle. For what is produced from matter is by a transmutation of that of which it is produced into some form (*forma*).

The divine essence (*essentia*), however, is neither transferable, nor receptive of another form.

Reply to the second: When it is said that the Son is begotten of the essence of the Father, according to the exposition of the Master, 1 Sentences, it designates the habitude of a principle as it were active. Where he thus expounds: The Son is begotten of the essence of the Father, that is, of the Father's essence; on account of what St. Augustine says in the fifteenth book on the Trinity: "Such is what I say 'of the Father's essence,' as if I were more expressly to say 'of the Father's essence'."[873] But this does not seem to suffice for the sense of a locution of this kind. For we can say that a creature is from God essentially; yet not that it is from the essence of God. Hence it can be said otherwise that this preposition "of" (de) always denotes consubstantiality. Hence we do not say that a house is "of" the builder, since he is not a consubstantial cause. Yet we can say that something is "of" something whenever that signifies a consubstantial principle, whether it be an active principle, as a son is said to be "of" the father; or a material principle, as a knife is said to be "of" iron; or a formal principle, in those cases only in which the forms themselves are subsistent and not adventitious to another: for we can say that some Angel is "of" an intellectual nature. And in this way we say that the Son is begotten "of" the essence of the Father, inasmuch as the Father's essence, communicated to the Son by generation, subsists in him.

Reply to the third: When it is said, "the Son is begotten of the essence of the Father," something is added, with respect to which distinction can be saved. But when it is said that the three persons are "of" the divine essence, nothing is posited with respect to which distinction can be imported by the preposition so signifying. And therefore it is not similar.

Reply to the fourth: When it is said, "wisdom is created," it can be understood not of that Wisdom who is the Son of God, but of created wisdom which God has put into creatures. For it is said in Ecclesiasticus: "He himself created her, namely wisdom, in the Holy Spirit, and poured her out upon all his works." Nor is it unsuitable that in one context of speech Scripture should speak of wisdom as begotten and as created, since created wisdom is a certain participation of uncreated wisdom. Or it can be referred to the created nature assumed by the Son, so that the sense be: "From the beginning and before the ages I was created," that is, I was foreseen to be united to a creature. Or by the fact that wisdom is named both created and begotten, the mode of the divine generation is insinuated to us. For in generation, that which is generated receives the nature of the generator, which belongs to perfection. But in creation, the creating agent is not changed, and the

873. St. Augustine, De Trinitate, XV, ch. 13.

created does not receive the nature of the creator. Therefore the Son is said to be at once created and begotten, so that from creation the immutability of the Father may be apprehended, and from generation the unity of nature in the Father and the Son. And thus the understanding of this Scripture is expounded by St. Hilary in the book On the Synods.[874] But the authorities brought forward do not speak of the Holy Spirit, but of a created spirit: which sometimes is called wind, sometimes air, sometimes the breath of man, sometimes also soul, or any invisible substance.

Conclusion of the Article. It is defined in the Council of Toledo that the Son is "of" the substance of the Father, namely in the Third and Fourth Councils, and in the Eleventh, in the confession of faith. The same is handed on by St. Augustine, book 13 on the Trinity, chapter 19, and in book 3 against Maximinus, chapter 14; and by Fulgentius, book On the Faith to Peter, chapter 2; and by the Master in the First Book, distinction 5; and all the Scholastics there. How, however, the particle "of" (de) is to be understood is not altogether certain among them; of which the following disputation will treat.[875][876][877][878]

Disputatio CLXII - What the particle "of" (de) signifies, when it is said that the Son is "of" the substance of the Father

Part 1: That the particle "of" does not signify a material principle, against Henry and Durandus, is proved. cap. 1.

Part 2: The particle "of" in the aforesaid locution signifies a consubstantial principle. cap. 2.

Part 3: The formal terminus of procession is the divine essence, but the total terminus is the person. cap. 3.

Caput I - That the particle "of" does not signify a material principle, against Henry and Durandus, is proved

Henry in his Summa, article 5, question 3, as is reported by Scotus and by Capreolus in the places to be cited below, thinks that the particle "of," when we say "the Son is of the substance of the Father," signifies a principle as it were material, with every imperfection of matter excluded; just as we say "a knife is of iron." Durandus agrees in the First Book, distinction 5, question 2; indeed, Durandus seems in the same distinction, question 2, article 1, as Capreolus admits, and Cajetan interprets the Doctor there otherwise, because he only said that in the divine essence there is some property of matter, which will be examined in chapter 3; but he did not say that the particle "of" signifies a material principle.[879]

878. Peter Lombard, Sentences, I, dist. 5.
879. Henry of Ghent, Summa, art. 5, q. 3, as reported by Scotus and Capreolus; Durandus, In I Sent., dist. 5, q. 2; Capreolus and Cajetan on I, dist. 5.

Durandus proves, first, that what in some way precedes the generation of something, and remains in the generated, if the thing is said to be of it or to be made of it, stands as the matter of that thing; but the divine essence precedes the generation of the Son according to reason, and remains in the Son, and of it the Son is said to be: therefore it stands as a material principle.

Second, whenever something is constituted from two things, one stands as matter, the other as form, because the one is determined by the other: but determination is proper to matter, as determining is proper to form. Now the person of the Son is constituted from two, namely from essence and relation: therefore, since the divine essence is, as it were, the subject of the relation, and is determined by it, it will rather stand as matter.

Third, that stands as matter in generation which receives the form of the begotten, namely relation, which is the form of the begotten: therefore, since the divine essence receives relation, it stands as matter. There are, however, conditions of matter (says Durandus) which do not befit the divine essence: namely, to be pure potency reduced into act by form; to be dissoluble; to be able to lose one form in order to acquire another. For he thinks that in the heavens there is no matter, but that the heavens are most simple bodies; because, since in them there is not that which can lose one form and receive another, he judges that there is in them no matter.

However, much truer is the common opinion of the Scholastics, which affirms that the particle "of" does not denote a principle as it were material, nor that the divine essence has any notion of matter on account of which the Son is said to be "of" the substance of the Father. Thus taught St. Thomas in this article, reply to the second; Cajetan, and the Canarian and more recent authors there; Capreolus in the First Book, distinction 5, question 1, article, conclusion 4; Scotus, question 2; St. Bonaventure, article 1, question 2; Gabriel, question 2, article 2; Gregory, question 9, article 2, to the eighth argument.[880]

Cajetan proves it by a reason taken from Scotus: for it is common both to form and to matter to be that of which something is said to be, or to be made, if the form precedes generation. Therefore in the resurrection a man will be said to be made "of" the soul, and that will suffice lest he be said to be made from nothing. Therefore, from the fact that the Son is said to be, or to be generated "of" the essence of the Father, a material principle is not necessarily denoted.

Then Scotus proves, because the formal terminus of the generation of the Son is the essence of the Father: therefore, if the Son is not said to be and to be generated "of" the essence of the Father as of matter; yet that the essence is the formal terminus must be proved in chapter 3. From these, the first argument of Durandus will easily be solved; the second and the third will be resolved in chapter 3.

Caput II - The particle "of" in the aforesaid locution signifies a consubstantial principle

St. Augustine, in the book On the Nature of the Good against the Manichee, chapter 26, notes that by the particles "from" (ex) and "of" (de) there is signified a reason of principle, but in a different way: for "of" signifies a consubstantial principle of the same nature, whereas "from"

denotes a principle of whatever kind. Wherefore all creatures are said to be "from" God, but not "of" God. The Scholastic theologians have followed this doctrine of Augustine in the authorities alleged. However, Driedo, book 3 On the Rules and Dogmas of Sacred Scripture, near the end, in the verse beginning "But this doctrine," does not approve this doctrine, this rule of Augustine: for he gathers the opposite from Scripture. For in Matthew 1 it is said, "that which is born in her is of the Holy Spirit," and in the Symbol Christ is said to be born "of" the Holy Spirit. Yet in both places Christ is understood according to the human nature: wherefore creatures too will be said to be "of" God, just as "from" God. Nevertheless, although what Driedo asserts concerning the particles "from" and "of" cannot be denied, yet because of that word "Father," in the way of speaking "the Son is of the substance of the Father," or "is begotten of the substance of the Father," is openly denoted consubstantiality with his principle and with his Father, as will be explained shortly.[881][882]

The Scholastics variously expound the aforesaid proposition, even if they concede that by it the origin of one from another is denoted. St. Thomas, in the solution to the second, interprets thus: that the particle "of" signifies a principle as it were formal; because the Son has the substance of the Father, which is as it were the formal principle of the Son. Against this, however, St. Bonaventure objects that by the same reason it could be said that the Father is "of" the substance of the Son, because in each the same essence is as it were the formal principle of each. But the Master, in the First Book in that same distinction, thus explains: "The Son is of the substance of the Father," that is, "of the Father, who is essence." But by the same reason, says St. Thomas, we could say that creatures are "of" the essence of God, because they are of God, who is essence.[883]

It pleases me to follow the interpretation of St. Bonaventure, Scotus, Gabriel, and Marsilius in the places cited, and from which St. Thomas does not dissent, namely that the particle "of" denotes a formal principle or consubstantial, which is the same thing, if it is referred to the essence; but if it is referred to the name "Father," it denotes at the same time a principle of origin; so that by both words there is signified a principle of the same nature. St. Thomas did not deny this; and for that reason we cannot say "the Father is of the substance of the Son," even if we say "the Father is of the same substance with the Son." From which it may also be gathered that the particle "of," referred to substance, does not denote only something common to both, whether that be material or formal, as some recent authors falsely suppose; but a formal principle only: both because the name substance and nature signifies this; and also because no ...

...nor can it be said that creatures are "of the substance" of the eternal Father; for in that way we should signify that creatures are begotten by the eternal Father consubstantial with him, even if we can say, according to the rule of Driedo, that creatures are "of God".[884]

St. Thomas moreover adds in the third reply that the three persons cannot be said to be "of the divine nature," because the particle "of" (de) indicates origin, which does not befit the three persons. But this seems difficult to the Canarian: for if we say, "Michael is of the angelic nature,"

880. St. Thomas, here ad 2; Cajetan; the Canarian; Capreolus, In I Sent., d. 5, q. 1, art., concl. 4; Scotus, q. 2; St. Bonaventure, art. 1, q. 2; Gabriel, q. 2, a. 2; Gregory of Rimini, q. 9, a. 2, ad 8.

881. St. Augustine, De natura boni, c. 26.

882. John Driedo, De regulis et dogmatibus Scripturae sacrae, book 3, near the end.

why will not the Father be said to be of the divine nature, and the three persons similarly? For a supposit is wont to be said to be "of" such-and-such a nature, of which it is the supposit. And indeed, if it is true what we said, that the particle "of," referred solely to nature absolutely, does not signify origin, but only from that which is added - "of the Father," or of another person as it were producing - nothing seems to stand in the way why one may say "the Father is of the divine substance," and similarly all the persons; since by that manner of speaking only consubstantiality is signified, and a quasi-formal principle.

The begotten is said to be "of the substance" of the begetter not merely on account of the matter which it receives from him, but especially on account of the form which the begetter infuses into the begotten. Therefore, on this account one cannot say, "Creatures are of the substance of the eternal Father"; for thus we should signify that creatures are begotten by the eternal Father consubstantial with him - even if we can say, according to Driedo's rule, that creatures are "of God."

St. Thomas adds in the third solution: the three persons cannot be said to be of the divine nature, because the particle "of" indicates origin, which does not befit the three persons. But this seems difficult to the Canarian: for if we say, "Michael is of the angelic nature," why will not the Father be said to be of the divine nature, and the three persons similarly? For a supposit is wont to be said to be "of" such-and-such a nature, of which it is the supposit. And indeed, if it is true what we said, that the particle "of," referred solely to nature absolutely, does not signify origin, but only from that which is added - "of the Father," or of another person as it were producing - nothing seems to stand in the way why one may say "the Father is of the divine substance," and similarly all the persons; since by that manner of speaking only consubstantiality is signified, and a quasi-formal principle.

Caput III - The formal terminus of procession is the divine essence; but the whole terminus is the person

A first opinion of Aureolus, namely that the essence is not the formal terminus of generation or production, and a second that it is a property, is controverted also among the Scholastics. Aureolus, as Capreolus reports in the First Book, distinction 5, question 1, article 2, in the arguments for the contrary to the first conclusion, teaches that the essence is not the formal terminus of production.[885] He proves the first point thus: the formal terminus of some production has being through that production; but the divine essence does not have being through the production of any person: therefore it is not the formal terminus of such a production. He proves the major: because if the whole terminus produced receives being through the production, much more does the formal terminus of that production, by which a thing receives being. Whence he concludes that the soul in the resurrection is not the formal terminus, nor whiteness in whitening, if it had first been

883. St. Thomas, ad 2 of this article; St. Bonaventure's objection there; Peter Lombard, Sentences I in that distinction.
884. John Driedo, De regulis et dogmatibus Scripturae sacrae, book 3, near the end.
885. Capreolus, In I Sent., d. 5, q. 1, art. 2, in the arguments for the contrary to the first conclusion.

separated and afterwards were joined to the wall; but he thinks that the formal terminus of some production is that which receives being according to itself as a whole through that production; and since such a thing would seem to be the relation, or property, in the person produced, this he says is the formal terminus.

With Aureolus agrees Durandus in the place cited in the first chapter, saying that the essence is as it were the matter, the relation as it were the form, in the person produced, as we reported in that chapter; and therefore that the formal terminus is the relation, but the essence is as it were the matter: he proves this moreover by the reasons adduced there.[886] Gabriel agrees in the First Book, distinction 5, question 3, article 1, note 4, and article 2, in that he says that the essence is the formal terminus by the same reasoning; he adds, however, that in the production of a divine person there is no formal terminus, but a terminus which he calls "total." For this reason he does not assert that the relation is the formal terminus, because he thinks it is not distinct from the origin itself.[887]

Gregory, however, in the same distinction, question 1, article 2, although he refutes this opinion of Aureolus by the best arguments, nevertheless himself teaches that the formal terminus of generation is not the essence. He proves this by the following reason: the formal and total terminus of a production is found only in those things which are constituted of several realities; but the divine persons are not constituted in that way: therefore in their production there is no total and formal terminus, since the one is not as form and the other as matter.[888]

But the common opinion is to be embraced, which affirms that the integral terminus of the production, which they call "total," is the person; but the formal terminus is the essence. Thus taught Scotus in the First Book, distinction 5, question 2; and Capreolus in question 1, article 1, conclusion 1; Caietan in this article; and the more recent authors commonly. The same distinction is gathered from St. Thomas in the same distinction, question 3, article 1.[889][890]

This opinion must first be confirmed by refuting the others, then by the arguments of Cajetan. First indeed, what Aureolus and Gabriel said - that the formal terminus cannot be prior in being to the generation - is rightly impugned by Gregory, because, he says, in the resurrection the formal terminus is the soul, by which the product, namely the man, is formally constituted; otherwise one would have to say that that production lacks a formal terminus. Nay more, if this were true in generation, then when first the rational soul begins to be, it would not be the formal terminus of the generation of man - which seems more absurd; because even then the soul does not have being through generation, but through creation, which at least in nature precedes: for by generation the soul is only joined to matter.

Secondly, it is proved thus. The notion of the formal terminus of production seems to be nothing else than to be the form of the thing produced, by which the thing itself, as by a form, in generation or production receives being, as will be more fully explained at the end of the chapter.

886. Durandus, In I Sent., dist. 5, q. 2.
887. Gabriel, In I Sent., d. 5, q. 3, art. 1, nota 4; and art. 2.
888. Gregory of Rimini, In I Sent., d. 5, q. 1, art. 2.
889. Scotus, In I Sent., d. 5, q. 2; Capreolus, In I Sent., d. 5, q. 1, art., concl. 1; Cajetan on this article.

For just as every agent works through its form, so also through the form of the thing produced it communicates and bestows upon it being, which is to produce it; and yet this can occur even if the formal terminus precedes generation and production, and does not come to be through them, as is evident: therefore, from this side it is not repugnant that the divine essence be the terminus of the production of a person; from any other side it is not repugnant, as is clear: therefore it will be the formal terminus.

Thirdly, add against Gregory that, when we speak of the formal terminus of the production of a person, we do not understand a terminus, really distinct by the nature of the thing, from the person produced, but only according to our mode of understanding: therefore, although there is not granted a formal terminus by the nature of the thing in the person produced, because that is not constituted out of several realities by the nature of the thing; nevertheless, since it can be said to be constituted according to our reason, as we showed against that same Gregory in Disputation 158, chapter 2, what hinders us from being able to say that something is the formal terminus of the production of a person according to our mode of knowing? Thus the present question is to be understood. But it is not surprising that Gregory taught thus about the formal terminus, when, as we saw in chapter 1 of that disputation, he denies any constitution of the person.

Fourthly, Cajetan moreover proves this opinion by many arguments, of which this alone will suffice for us. In the production of a created person the formal terminus is the nature, not the personality: for in the second book of the Physics, text 14, it is said that generation is the way to nature, that is, to the form: therefore the form is the formal terminus, not the personality. For although the form of man is then produced when the human person is generated; and although the divine nature is not generated when the person is produced; nevertheless the form of man is not produced by generation itself, as we said above, but is created by God. Then also, from the notion of the formal terminus, as has been proved, it is not required that it be produced by that action of which it is said to be the formal terminus, but that it be communicated by that action: therefore, if the rational soul is the terminus of the production of a human person, the divine nature will be the formal terminus of the production of a divine person.

Objection. But you will say, the formal terminus of the production of a human person is not the nature, that is, the form or soul, but the humanity, which consists of soul and body, and is that by which the thing is produced, not that which is produced: but the whole supposit is the total terminus of generation, because it is that which is generated: for actions and passions belong to supposits, as Aristotle witnesses in Metaphysics, chapter 1.

Reply. But against this there is a manifest reason: because the whole nature composed of soul and body is not the formal terminus, which is called the terminus whereby of generation, but a total terminus, and what is called the terminus which: for in the assumption of the humanity there was truly a generation prior in nature to the assumption; but that was terminated not to the supposit but to the nature. As to what is adduced from that proposition, "Actions and passions belong to supposits," it is not rightly understood. For Aristotle did not say "of supposits," but

890. St. Thomas, In I Sent., d. 5, q. 3, art. 1.

"about the singular": which if we follow the rather common interpretation of those who think that Aristotle is speaking about the principle of actions and about the subject about which they are concerned, one must say that he distinguished not nature from supposit, but only singulars from universals: because neither are actions from universals, nor can they be concerned with universals: for he gives the example of curing, because the physician does not cure "man" in general, but "this man."

But some answer that Aristotle did not distinguish singular nature from supposit, because he did not know such a distinction, since he had not yet seen nature separated from its own supposit. I indeed grant that he did not know this distinction of supposit from nature; nevertheless, if he had known it, he would still have spoken only of singulars as they are distinguished from universals, not of natures as they differ from supposit. For he would rightly have known that curing is concerned not only, as about the subject which, with the supposit, but also with the nature: for the humanity of Christ, as it was a certain singular nature, could be the subject as which of curing: therefore in the same way Aristotle would have attributed to it to be the integral terminus as which, and the principle of operating: and about actions and passions he seems to have spoken in the same way as about curing; and to whom he attributes curing, he also concedes action.

Moreover, since Aristotle did not say that actions and passions are "of singulars," but that they are "about singulars," this should not be understood of the principle of action, but only of the subject and the matter about which, which must be singular: and this as much can be about a singular nature as about a supposit. But of this matter more fully in the Third Part, question 2, article 11.

Others say that the formal terminus of resurrection and of generation is union: but they are mistaken. For if union is taken for the relation of the union, or of the united, which has its foundation in the very unity of the composite, it cannot be the formal terminus; for it is posterior to generation. If, however, it is taken for some mode in the produced matter and form, similarly it cannot be: for that is not the form of the thing produced: therefore it is not the formal account of terminus, insofar as it is terminus: for the terminus of the generation or resurrection of man is man under the notion of man: therefore the formal terminus is that by which man comes to be and is formally constituted by generation; but this is the soul; for which reason Aristotle said that generation is terminated to nature; but by nature he understands not matter, but form, as we have explained above. Moreover, it can be proved by the reasons of Scotus, that from the opposite opinion it would follow that the production of a divine person is, as they say, univocal: for the univocity of generation with the begotten is taken from the formal terminus of that generation.[891]

To the reasons of Durandus, which remain from the first chapter, it is answered as follows. In what way the divine nature determines to the being of a person, and how it is received there as a mode in that of which it is the mode, and thus in a certain way they assign to the nature, to the essence of the divine Word, a desire for union: the formal terminus of generation is the nature, not

891. Scotus, ibid., arguing that univocity of generation is taken from its formal terminus.

relation; because nature is the form of the begotten person, not relation. As for the notion of the terminus of generation, it is to be the form of the thing begotten; and thus those two reasons of Durandus, which they require, can be dissolved.

But others object in this way: The formal terminus of generation ought to be that mode by which the whole terminus determines the action which the production is. But it cannot be such a terminus of action as produced, unless that also be produced which is the terminus: therefore a form also preceding generation cannot be the formal terminus. I answer: the thing which is the total terminus of an action does not terminate the action under the notion or relation of expressed product, but according to the absolute notion of such an entity; as generation is terminated by "man" under the absolute notion of man, or "horse," or some other thing: not, however, under the notion and denomination of what is produced. Therefore that which is the form of this thing will be the formal terminus of this action, because generation, by means of that form, not as by a producing principle, nor as by a nature to be produced, gives to it the being of such a thing, by communicating to it that same form: although the relation of the product is founded upon that union which these men say is the formal terminus.

Articulus IV - Whether in God there is potency with respect to notional acts

To the fourth we proceed thus. It seems that in the divine there is not potency with respect to notional acts. For every potency is either active or passive. But neither can befit here. For passive potency is not in God, as was shown above. Active potency, however, does not befit one person with respect to another, since the divine persons are not made, as was shown. Therefore in the divine there is no potency for notional acts.

Further: Potency is said with respect to the possible. But the divine persons are not among the number of possibles, but among necessary beings: therefore with respect to the notional acts by which the divine persons are produced, no potency ought to be posited in the divine.

Further: The Son proceeds as Word, which is the concept of the intellect; the Holy Spirit proceeds as Love, which pertains to the will. But potency in God is said by comparison to effects, not, however, by comparison to those things which are understood and willed, as was had above. Therefore...

Objicitur: 1) It seems that in God there is not potency with respect to notional acts. For every potency is either active or passive. But neither can belong here. Passive potency is not in God, as was shown above. But active potency does not befit one person with respect to another, since the divine persons are not made, as has been shown. Therefore in God there is no potency to notional acts.

2) Further, potency is said with respect to the possible. But the divine persons are not in the number of possibles, but of necessaries; therefore with respect to the notional acts by which the divine persons proceed, potency ought not to be posited in God.

3) Further, the Son proceeds as Word, which is a conception of the intellect; but the Holy Spirit proceeds as Love, which pertains to the will. Now potency in God is said by comparison to effects, not, however, by comparison to understanding and willing, as was had above. Therefore in God potency ought not to be said by comparison to notional acts.

Sed contra: St. Augustine says against Maximinus the heretic: "If God the Father could not beget a Son equal to Himself, where is the omnipotence of God the Father?" Therefore in God there is potency with respect to notional acts.[892]

Respondetur: It must be said that, just as notional acts are posited in God, so too it is necessary to posit there a potency with respect to such acts, since potency signifies nothing else than a principle of some act. Hence, since we understand the Father as the principle of generation, and the Father and the Son as the principle of spiration, it is necessary that we attribute to the Father the potency of begetting, and to the Father and the Son the potency of spirating. For the potency of begetting signifies that by which the begetter begets; but every begetter begets by something. Hence in every begetter one must posit a potency of begetting, and in the spirator a potency of spirating.

Reply to the first: Just as, according to the notional acts, no person proceeds as made, so neither is potency to notional acts said in God by respect to some person made, but only by respect to the person proceeding.

Reply to the second: The possible, as it is opposed to the necessary, follows upon passive potency, which is not in God. Hence, in God there is nothing possible in that mode, but only in the mode in which the possible is contained under the necessary. In this way, however, it can be said that, just as it is possible that God be, so too it is possible that the Son be begotten.

Reply to the third: Potency signifies a principle. But principle imports a distinction from that of which it is the principle. Now a twofold distinction is considered in those things that are said of God: one according to the thing, the other according to reason alone. According to the thing, indeed, God is distinguished by essence from those things of which He is by creation the principle; just as one person is distinguished from another of which it is the principle according to a notional act. But action is not distinguished from the agent in God save according to reason only, otherwise action would be an accident in God. And therefore, with respect to those actions according to which things proceed distinct from God, either essentially or personally, potency can be attributed to God according to the proper notion of principle. And thus, just as we posit in God the potency of creating, so we must posit the potency of begetting or of spirating. But to understand and to will are not such acts as designate a procession of some thing from God distinct either essentially or personally. Hence, with respect to these acts, the notion of potency in God cannot be preserved, except according to the mode of understanding and of signifying only, inasmuch as intellect and understanding are signified in diverse modes in God, although the very understanding of God is His essence not having a principle.

892. St. Augustine, Contra Maximinum, near the end; cf. tom. 6, where he argues: "If God the Father could not beget a Son equal to Himself, where is the omnipotence of God the Father?"

Conclusio: The conclusion is affirmative. In this article nothing further peculiar occurs to be noted beyond what needs to be examined in the Disputation which follows, namely, whether in God there is a true notion of productive potency within Himself.

An in Deo sit vera ratio potentiae producentis intra ipsum. Disputatio 163.

Disputatio CLXIII - On whether in God there is a real productive potency with respect to the notional acts

Dua opiniones Aureoli, Gregorii, & aliorum.

First Book, distinction 7, question 1, article 2, as is reported by Capreolus in the place cited in the preceding Disputation, the last chapter, namely, that in God there is truly no productive potency, neither with respect to the notional acts, nor with respect to the person produced; but that the potency of God to beget or to spirate is nothing other than a non-repugnance of terms, in precisely the same way in which we are wont to say, "God has the potency to be God." He proves the first point thus: where there is not truly an elicited production, there is not truly a productive potency; for this potency is with respect to the product by means of an action or elicited production. But in God there is not an elicited production within Himself, since generation is altogether the same as the producer; whereas elicited production really differs from the eliciting agent, for "to elicit" denotes a real distinction. Therefore in God there is not a productive potency within Himself. Then he adds: for the Father to be in God is not of some productive potency, but of non-repugnance of terms; and so God can be Father, not indeed by a productive potency, but by non-repugnance of terms; to be Son is not of a productive potency, but of non-repugnance. These are his chief reasons.[893]

Convinced, however, by the first reason, Gregory [of Rimini] judged that in God there is not a real potency with respect to the notional acts, but only with respect to the person produced. Thus he taught in the First Book, distinction 7, question 1, article 1, to the first of Aureolus; to whom Capreolus consents in the same distinction, question 1, article 2, to the second of Aureolus against the first conclusion; and Caietan and the Canarian in this article.[894] The same they teach of the potency of creating, namely, that between God the creator and the creature there is not a middle elicited action; similarly, neither between the Father begetting and the Son begotten. For there is only a relation either of producer or of product, after the mode of action; and therefore real potency is to be granted only with respect to the person produced, not, however, with respect to the production, which truly is not elicited, since it is nothing other than the thing produced. For just as, in order that there be a real potency with respect to the thing produced, the thing produced must be really distinguished from the producer; so, in order that there be a real potency with respect to the production, there must be an action truly and really intermediary between producer and

893. Aureolus, In I Sent., d. 7, q. 1, a. 2; as reported by Capreolus in the place cited in the preceding disputation.

894. Gregory of Rimini, In I Sent., d. 7, q. 1, a. 1; Capreolus, In I Sent., d. 7, q. 1, a. 2, against Aureolus' first conclusion; Cajetan on the present article; the Canarian likewise.

product, so that the action also be elicited by the producer. This opinion St. Thomas seems to indicate above, question 25, article 1, to the third, where he grants in God a potency truly compared with the effect, yet not with the operation; for, he says, the operation of God is not distinguished from the very potency of God; and in this article, to the third; and in the Disputed Questions On Power, question 2, article 1, at the end, he seems to teach the same.[895][896]

Caput II - In God there is a true real productive potency, not only with respect to the person produced, but also with respect to the notional act; this is the more probable view.

I, however, judge it to be much more probable, and more according to the mind of the holy Doctor, that one ought to posit in God a true productive potency, real, not only with respect to the person produced, but also with respect to the production and to the notional act. This, in the first place, I seem to gather from St. Thomas in this article: for, since in the title he asked whether there were potency with respect to the notional acts, answering in the body he expressly grants it; and to the third he replies that there is in God such a potency with respect to those actions according to which certain things proceed from God distinct either essentially or personally; although in the same solution he says that there is not such potency with respect to the immanent essential operation, which is understanding and loving. Nor did he wish to say anything else in question 25, article 1, which Caietan and others report for their own opinion, as we noted in Disputation 101, chapter 1. For he says only this there: that in God there is not potency according to the thing with respect to the immanent operations of intellect and will; he understands, however, the essential operations.[897]

By reason it is proved thus. For to the notion of real potency it is not necessary that the action or production be distinguished from the thing produced and from the producer; because the action itself is not that which is produced, but is, as it were, the medium of the act by which the producer brings forth the product into effect; which, for our consideration, stands as a kind of middle, and differs only according to reason from the relation which is founded on the term produced. It is enough, then, that there be a real distinction between the producer and the product, so that the notion of a real productive principle be saved; while the production itself, according to the reality, can be identified either with the producer as an issuing forth on the part of the principle producing, or with the product as an issuing forth received on the part of the thing produced, and with both is really the same, though it import in reason a different relation - on the one side of the producer as origin, and on the side of the product as terminus of origin. Thus, in created productions indeed, an action distinct according to reality is sometimes posited, as when a quality is educed, or a movement proceeds from a moved mover; yet often it is not necessary to posit, beyond the agent and the effect, anything distinct according to reality, but only a relation considered under the mode of origin, or a certain mode inherent in the effect while it is being produced; and nevertheless we truly say there was in the agent an active potency with respect to such production. Therefore

895. St. Thomas, Summa theologiae I, q. 25, a. 1, ad 3.
896. St. Thomas, Quaestiones disputatae De potentia, q. 2, a. 1, at the end.
897. St. Thomas, Summa theologiae I, q. 25, a. 1.

neither does it hinder, if in the divine productions the production be not really other than the person produced or than the producer, that there be in God a real potency with respect to the notional act, inasmuch as He is the principle producing a person who is really distinct.

Now then, from what has been said, the arguments of Aureolus are solved.

To the first: We have already said that there is in God a true productive potency, even if there is not a production really distinct from the produced; nay rather, this notwithstanding, there is potency with respect to the notional acts, because for this it suffices that there be a distinction between the person produced and the producer, as has been explained.

To the second: It was said above in the preceding chapter that to be Father in God is indeed something positive, namely, a real principle with respect to the Son, although it include no composition nor imperfection; and that it is not merely a non-repugnance of terms. Moreover, when Aristotle in Metaphysics XII, text 30, teaches that there is no potency in God, he understands that potency which is sometimes in act and sometimes not in act; such a potency indeed is not in God with respect to the things which are within the divine Trinity. But the argument from "potency is said with respect to the possible" is resolved in the manner of St. Thomas in this article: that in God "possible" can be said as contained under the necessary; hence, just as it is possible that God be, so it is possible that the Son be begotten; and thus the notion of potency is saved without positing in God any passive potency.

In the foregoing, before the treatment of notional potency, note also the following:

Respondeo to the earlier doubt: The thing which is the total terminus of an action does not terminate the action itself under the notion or expressed relation of the product, but according to the absolute notion of such an entity; as generation is terminated by man under the absolute notion of man, or by horse, or by some other thing - not, however, under the notion and denomination of what is produced. Therefore that which is the form of this thing is the formal terminus of this action; because generation, by means of that form - not as by a producing principle, nor as by a thing produced, but as by the nature of the product - gives to it the being of such a thing by communicating to it that form; although the relation of the product is founded upon that union which those men say is the formal terminus.

Articulus V - Whether the power of begetting signifies relation, and not essence

It is answered to the arguments of Aureolus and of others, that there is no need that action itself be distinguished in reality from the thing produced and from the producer, because the action itself is not that which is produced, but is as it were a middle act by which the thing itself and the effect are produced; which is a middle only in our consideration, and differs from the relation of the product only by reason. Yet it seems sufficient to distinguish the product from the producer; for this very thing is truly elicited and proceeds from the agent, and its procession is a middle action between it and the producing principle. But in the divine, a twofold act of this procession is

understood: one, which is called the active origin, and is really the same as the relation of the producing person; the other, which is called the passive origin, and is really the same as the relation of the product. In the productions of created things this may indeed be contemplated; for the coming-to-be of a thing by a created agent seems, as to the thing, to be nothing other in reality than the relation of the product considered under the mode of a way, or, if one were to speak, some mode of that thing thus considered, which in things that do not depend upon an agent ceases at once to be as soon as they are once produced; whereas in other cases, as in light, and in an intellect eliciting an act of understanding, some seem not to distinguish it from the thing produced itself, just as creation itself is the creature created. Since therefore we say that in our intellect there is a real potency (*potentia realis*), not only toward the thing produced but toward its production, in the same way toward the light produced and toward the illumination, it follows that it is not necessary that there be a real distinction between the origin and the person produced, so that in God there be said to be a potency according to reality not only toward the person produced, but also toward the origin itself and the notional act.

Nor does anything stand in the way, so as to prevent this potency in God from being the same by nature with the divine essence and with the person producing; for in order that it be called a real potency toward some operation or toward some product, there is no need that it be really distinguished from that in which it inheres, but it suffices that it be really distinguished from the thing itself that is produced, as I noted above in disputation 120, cap. 1. Wherefore I judge that Aureolus plainly erred, when he asserted that the potency in God, that He be Son, is not other than that He be Father; for since the Son is truly produced in reality, but the Father is not, the potency that He be Son and be produced is real; but that He be Father, who is not produced, is not real.

But if Durandus had attended to the solution of St. Thomas, he would have found it altogether the same as his own: for he says that the possible in God is not the contingent, which Durandus also admits; he adds as well, that it is the necessary, just as it is necessary to be able to be God; nor does Durandus dissent in this: for he says, "The possible in God does not exclude the necessary." Hence however the holy Doctor rightly infers that there is in God a producing potency; for although from the fact that it is possible that God be God there follows a potency which is a mere nonrepugnance of terms, it does not follow that God, as God, can be produced; yet from the fact that it is not repugnant that there be a Son in God, even if this be necessary, it rightly follows that He can be begotten, and consequently that there be a producing potency toward Him who, by the very notion of Son, is to be produced and begotten; but by the notion of God, as He is God, He is not to be produced, but to be from Himself. The same that is said of the Son ought to be said of the Holy Spirit.

It must be observed, however, that there is a difference between the omnipotence of God, which regards creatures, and the producing potency, which regards the person produced within God Himself; for omnipotence is referred to creatures not under the notion and denomination of the "possible-to-be-produced" - for thus there would be a useless circle, as we showed in disputation 104, cap. 4 - but under an absolute notion, inasmuch as of themselves they do not imply a contradiction, that they be; from which it rightly follows that there is in God an omnipotence

related to creatures; and from omnipotence related there follows in turn that creatures are possible. In the same way, omnipotence as act producing is not referred to creatures under the relation of the product, but under the proper absolute notion of the creature existing; but the true producing potency within God, even if it be considered before it produces, under the notion only of being able to produce, is nevertheless referred to a person under the notion of relation, because a person is constituted as to subsistence relationally, and thus we said in disputation 199, cap. 6, that it is peculiar to the divine relations not to be referred to absolutes but to relatives. Wherefore it is rightly inferred that there is in God a producing potency, from this, that it is not repugnant that there be a Son and the Holy Spirit in God; for in these is included origin.

But to the fifth, the procedure is as follows. It seems that the power of begetting or of spirating signifies relation, and not essence. For potency signifies a principle, as is clear from its definition. For active potency is said to be a principle of acting, as is clear in Metaphysics V. But principle in the divine, with respect to a person, is said notionally.[898] Therefore potency in the divine does not signify essence but relation.

1. Further. In the divine, "to be" and "to act" do not differ; but generation in the divine signifies relation. Therefore so too does the power of begetting.
2. Further. Those things which signify essence in the divine are common to the three persons; but the power of begetting is not common to the three persons, but is proper to the Father. Therefore it does not signify essence.

But on the contrary: Just as God can beget a Son, so too He wills. But the will of begetting signifies essence. Therefore so too the power of begetting.

I answer that certain men have said that the power of begetting signifies relation in the divine. But this cannot be. For that is properly called potency in any agent by which the agent acts. But every producer by its action produces something like itself with respect to the form by which it acts. Thus a man who begets is like the generator in human nature, by virtue of which the father can beget a man. Therefore that is the generative potency in a generator, in which the begotten is made like the generator. But the Son of God is made like the begetting Father in the divine nature. Whence the divine nature in the Father is the power of begetting in him. Hence St. Hilary says in book 2 On the Trinity: "The nativity of God cannot fail to retain that nature from which it is perfect; for nothing subsists other than God, which does not subsist from God alone." Thus therefore it must be said that the power of begetting principally signifies the divine essence, as the Master says in I Sentences, dist. 7, not however relation alone; nor even essence insofar as it is the same as relation, so as to signify each equally. Although indeed paternity, as the form of the Father, is signified, it is nevertheless a personal property having itself to the person of the Father as an individual form to some individual created thing. But an individual form in created things constitutes the generating person, yet it is not that by which the generator generates; otherwise Socrates would generate Socrates. Wherefore neither can paternity be understood as that by which

898. "Potentia enim significat principium... in 5. Metaph."; cf. also "Lib. 1. Metaph. text. 17. tom. 3."

the Father begets, but as that which constitutes the person begetting; otherwise the Father would beget the Father. But that by which the Father begets is the divine nature, in which the Son is made like to Him. And according to this St. John Damascene says that generation is a work of nature, not as of the one begetting, but as of that by which the one begetting begets. And therefore the power of begetting signifies in the direct case the divine nature, but in the oblique case relation.[899][900]

Reply to the first: Potency does not signify relation itself of principle, although indeed it is in the genus of relation; but it signifies that which is the principle: not indeed as the agent is called a principle, but as that by which an agent acts is called a principle. Now the agent is distinguished from the thing made, and the generator from the generated. But that by which the generator begets is common to the begotten and to the generator, and the more perfect the generation will have been, the more perfect it is. Whence, since the divine generation is most perfect, that by which the generator begets is common to the begotten and to the generator, and the same in number, not only in species as in created things. By this therefore, that we say that the divine essence is the principle by which the generator begets, it does not follow that the divine essence is distinguished; just as it would follow if it were said that the divine essence generates.

Reply to the second: Just as in the divine the power of begetting is the same as generation, so the divine essence is the same thing as generation and paternity in reality, but not by reason.

Reply to the third: When I say "potency," the power of begetting is signified in the direct case, and generation in the oblique case; as if I were to say "the essence of the Father." Whence, as to the essence which is signified, the power of begetting is common to the three persons. But as to the notion which is connoted, it is proper to the person of the Father.

Conclusion: The power of begetting signifies in the direct case essence (*essentia*), but in the oblique case relation (*relatio*).

Disputatio CLXIV - What the producing power is formally within God

Opinion of St. Bonaventure. Caput I.

Before we set forth the various opinions of the Scholastics, it must be premised that, in our way of understanding, a twofold producing principle must be assigned in God, after the manner of other things; for there is a principle by which the agent produces, and this is wont to be called the "principle by which" (principium quo), and there is a principle which produces, and this is called the "principle which" (principium quod). The "principle by which" is the same as the potency (*potentia*) about which we are now inquiring. It is a certain power by which some agent furnished with it operates as with an instrument; but the "principle which" is said to be the whole selfsame thing that, endowed with this power, produces another. In the divine, however, the "principle which" is called a person, but the "principle by which" is called the potency, about which there is now controversy among us as to what it is.

Opinio Bonaventurae. Caput 1.

Five other opinions of the Scholastics are set forth. Caput 2.

That the potency which produces a divine person is the divine essence connoting a property is the truer opinion. Caput 3.

Corollaries of the foregoing opinion, and solution of the arguments of the other opinions. Caput 4.

Caput I - The opinion of St. Bonaventure

Further, this twofold principle does not clash with God's simplicity, as Gregory falsely taught in the First Book, distinction 7, question 2, article 2, who for the same reason denies in God those forms which the theologians call notions, as we recalled in Disputation 136, chapter 2.[901][902] For since by our consideration alone these things are distinguished in God, even if in him something be conceived as form and something in the manner of matter, we detract nothing from his perfection, but as we are able, we understand him. For this reason, since we have shown against Gregory and others in that chapter that there is for us only a distinction of reason by abstract and concrete names, and that the notions are to be established in God after the mode of forms, now the question is, what formally is the potency, in our mode of understanding - that is, the principle by which - in God with respect to the productions of the persons.

With this notation premised, the first opinion is that of St. Bonaventure in the First Book, distinction 7, question 1, and of Durandus in the same question, number 29, who assert that the principle by which, or the potency, is formally a relation, that is, a property. Indeed, when speaking of the person of the Father, St. Bonaventure, who thinks that what is first understood by reason is a power to beget which, when he speaks of the generating act, he calls a property, not under the notion of the relation of paternity, but under the notion of the unbegotten; but Durandus, who held that the first person cannot be conceived except with an act of begetting, said that the potency is the very property under the notion of relation. Therefore both agree in this, that the potency is formally a personal property; yet they differ in the mode of expounding it, according to the various opinions which they followed about the principle constituting the person, as we saw in Disputation 119, chapters 4 and 5.[903][904]

This opinion is proved first as follows. Whenever some production or operation belongs to one supposit which does not belong to another - indeed even repugns it - the principle and potency of that operation ought to be something proper to that supposit; for if by reason of something common the potency were suitable, that operation would be attributed to both supposits. But

901. Gregory (of Rimini), In I Sent., dist. 7, q. 2, art. 2.
902. Vázquez, Disputatio 136, cap. 2.
903. St. Bonaventure, In I Sent., dist. 7, q. 1; Durandus, In I Sent., dist. 7, q. 1, n. 29.
904. Vázquez, Disputatio 119, cap. 4 - 5.

generation, for the reason set out, belongs to the Father and to no other person. Therefore the principle of that is something proper to him, and this is nothing else than a property, considered in this or that way.

From the same principle it follows that the potency of breathing is not the essence, but a common property in the Father and the Son, since spiration proceeds from both.

Second, to attribute being to something and not to act is imperfection; but paternity attributes some being to the first person: therefore, unless it also attributed acting, it would be imperfect - which is absurd.

Third, finally, since the essence cannot be potency, as will be proved below, nothing else remains except a property which can be potency.

St. Thomas in this article impugns this opinion; and Scotus in the First Book, distinction 7, question 1, speaking first from Anselm in the Monologion, chapter 54, where about the Holy Spirit he says thus: "He does not proceed from that in which the Father and the Son are many, but from that in which they are one." And lest anyone think that he proceeds from the relation of spiration, he immediately adds: "For not from their relations - which are many, for the relation of the Father is one, that of the Son another - but from their very essence, which does not admit plurality, do the Father and the Son emit the one good." And in the book On the Procession of the Holy Spirit, chapter 25, he says that the Holy Spirit proceeds from the divinity of the Father, not from paternity. He repeats the same in chapter 30. St. Thomas also proves it from St. John Damascene, De fide orthodoxa I, chapter 8, a little after the middle, where he speaks thus: "Generation is indeed a principle unknown and sempiternal, which ought to be a work of nature, and from its very essence it produces"; and a little before: "Generation indeed consists in this, that from the begetter's essence there be produced an offspring of the same substance with the begetter." And a little earlier, defining fecundity itself, which seems to be nothing other than the power of generating, he writes thus: "Fecundity, moreover, is placed in this, that one from himself, that is, from his own essence, bring forth an offspring like in nature." Since they say that that from which something is produced or proceeds in the divine persons is the essence; and fecundity is placed in this, that from it the product comes forth, they plainly think that the potency is the very essence, not a relation.[905][906][907][908][909]

Wherefore those more recent writers are worthy of reproof who, striving to undermine these testimonies of the Fathers, assert that they are not speaking about the principle of producing, but only wished to show against Arius that the divine persons were not produced from nothing; for this indeed is excluded only if a material, or quasi-material, or a formal principle of production be supposed: but the Fathers cited clearly indicate the principle of producing, as has been proved.

905. St. Anselm, Monologion, cap. 54.
906. St. Anselm, De processione Spiritus Sancti, cap. 25.
907. St. Anselm, De processione Spiritus Sancti, cap. 30.
908. St. John Damascene, De fide orthodoxa I, cap. 8.
909. St. Thomas, in this article, adducing the places of St. Anselm and St. John Damascene.

By reason, moreover, Gregory argues thus in the place cited: because if the principle by which, or the potency, were a property, the production of the person would be equivocal; for the effect is said to be equivocal when it is not made like to the principle of producing. For, as St. Thomas says, it is proper to the agent (he understands a univocal agent) to make the product like to itself in the principle of producing. Other reasons of Scotus being omitted, this very point can afterward be proved in this way: The procession of the Word is properly speaking a diction and an intellection, as was proved in Disputation 112, chapter 3; but relation is not a formal principle, and the potency of understanding, as is clear, therefore neither is the potency of generating.[910][911]

Caput II - Five other opinions of the Scholastics are set forth

The second opinion is that which Durandus reports in the First Book, distinction 7, question 1, number 18, of certain men who said that the essence and the property are equally the principle by which, or the potency, yet with respect to different things. For in the divine production there are two things, the communication of the essence and generation: with respect to the former, the essence is the potency; with respect to the latter, the property, or relation. They prove it thus: the principle of communication ought not to be distinguished from that which is communicated, because the same can communicate itself; yet the principle of production ought to be distinguished from the thing produced, because nothing produces itself: therefore rightly is the essence posited as the principle, or potency, of communication, but the property as the [principle] of production.[912]

Durandus impugns this opinion with this reason: In the divine there is not one action of communicating and another of generating; add also, in our mode of understanding, because the same action - processio verbi, properly speaking, is a diction and an intellection; relation, however, is not a formal principle, and the potency of understanding, as is evident - therefore neither [is it] of generating.

The third opinion is that which Scotus in the place cited thought to be St. Thomas's in this article, and some judge that it was the Master's in the First Book, distinction 7: namely, that the potency of generating, or of spirating in God, is only the essence, without any property in any way. Gabriel also follows this in the First Book, distinction 7, questions 1, 2, and 3.[913][914][915]

For the explanation of which he notes in that first question, article 1, notation 2, that the eliciting principle of some operation is that which is of itself necessarily required for the production, and it is not the production itself formally, nor is it constituted by it: therefore, since paternity and the other property cannot be the eliciting principle, because it is the production

910. Gregory (of Rimini), loc. cit., arguing from the univocity of the effect to the nature of the principle.
911. Vázquez, Disputatio 112, cap. 3.
912. Durandus, In I Sent., dist. 7, q. 1, n. 18.
913. Scotus, In I Sent., dist. 7, q. 1.
914. The Master (Peter Lombard), In I Sent., dist. 7.
915. Gabriel (Biel), In I Sent., dist. 7, qq. 1 - 3.

itself, it follows that the essence is such a principle. Yet, he says, the producing principle is the person, because she is the one who produces, not the essence: therefore he distinguishes between the eliciting principle and the producing [principle], as is clear from what has been said.

However, this opinion can be no less easily impugned than the preceding. First, because from it there follows that in the Son there is a potency of generating, because in him there is the essence, and this is the potency of generating. And if you say that some condition requisite is lacking, this will shortly be impugned against Scotus. Second, Gabriel vainly distinguishes the eliciting principle from the producing principle. For if the eliciting principle, as he himself admits, is the principle of the action, it will also be the principle of the thing produced by means of the action; for action is the middle way to the thing produced. Third, because nothing seems to prevent relation, or property, from being the eliciting principle and a potency. For, although relation and active origin are the same in reality, yet because they differ by reason, it seems sufficient that relation can be a potency and the principle of origin; otherwise it would be necessary that the essence could be [that principle], which according to the truer opinion is distinguished from origin by reason alone. Add, that since the producing person is not really distinguished from the active origin, she could not be the principle of it, if relation cannot be [that principle] for this reason - that it differs from it by reason alone.

The fourth opinion is Scotus's in the First Book, distinction 7, question 1, in the reply to the question: and in the section "But who adduces other arguments," namely, that the potency in God is only the divine essence in itself absolute, while the necessary condition in order that it produce is the property of this or that person. Nor does it stand in the way, he says, that the name "potency" is relative, but the divine essence absolute: for we use this relative name when in no other way can we explain this perfection; but we wish to signify its foundation, which is absolute. And this occurs in many other names of God.[916]

Scotus proves that the essence is the potency in this way, namely, that that which is of the greatest perfection in a principle or potency does not impede the notion of principle or potency; but under the common acceptance the identity of nature is of the greatest perfection: therefore it does not impede the notion of principle and potency. If God were to produce another God and communicate to him another nature, his essence would be a producing principle and potency; therefore now it will be the same; for although he does not produce another God, he does produce a person in the same nature, and to communicate himself in the same nature does not impede the notion of potency and principle, as has been proved. Then he confirms the same thing, because the testimonies which earlier we cited show formally that the principle is the essence; therefore the principle, or potency, is the essence: for the one is found together with the other according to the same testimonies. Moreover, relation or property he was forced to call a condition requisite by necessity, lest he be compelled to assert that the essence, in whatever person it be, generates and breathes.

916. Scotus, In I Sent., dist. 7, q. 1, ad quaest.; and in the section "Quis autem alia argumenta" on the same question.

Yet by vicissitude he also refutes the reasons of the previously stated opinion, because from that opinion it would follow that the very divine essence in any person whatsoever would generate and breathe. For where there is a principle of actions or productions, to that there does not belong an impediment; therefore the action or production follows. But the essence is in any person whatsoever, and there is in it no impediment; therefore in any [person] it generates and breathes. Scotus will say that there is an impediment in some, because to them the necessary condition is lacking, which is such a relation, or personal property. But he does not say this rightly: for, as is correctly said, any potency which by its nature posits an act cannot have a perpetual impediment from the nature of the thing, unless perhaps from accident; and the divine essence by its nature posits being in three persons: therefore in none of them can it have an impediment from the nature of the thing; and an accidental impediment, and one arising from without, it cannot have: therefore in every person there cannot be lacking to it any condition whatsoever required for acting; otherwise it would naturally demand to be in that same person who naturally would have an impediment to his act - which is absurd.

Fifth, finally, Henry in Quodlibet 3, question 3, teaches that both the essence and the relation are per se and directly required for the notion of potency, so that each pertains directly to the thing; yet more principally the property. Scotus reports this same opinion from Henry in the Summa, article 57, whose reason is this: because in every generation there are two [aspects], one is to produce the like, the other to produce the distinct; more principal, however, in generation is that it be terminated to something distinct so that it be like, than that it be terminated to something like so that it be distinct. Therefore in the potency of generating the principal thing is the property, by reason of which the distinction between the begotten and the begetter is attended to; but the essence is the principal with respect to likeness by reason of which there is a likeness in nature.[917][918]

However, if this opinion were true, no distinction, not even according to reason, between the person and the potency could be assigned. For since the person includes nothing other than the essence and relation, and likewise the potency; they will be entirely the same, and there will be only a difference of name. But if someone should say that there can be a distinction, not of reason, but only from the mode of signifying, against this was said in Disputation 159, chapter 4: we say that the mode of signifying is nothing unless in the thing there be some distinction signified, at least of reason.[919]

Caput III - That the potency which produces a divine person is the divine essence connoting a property is the truer opinion

A more probable and more true opinion in the schools is that which asserts that the potency producing within God a person is the essence connoting a property.

918. Henry of Ghent, Summa, art. 57.
919. Vázquez, Disputatio 159, cap. 4.

Probabilior, and, in the schools, the truer opinion is that which asserts that the power (*potentia*) producing a person within God is the divine essence (*essentia*) connoting a property which itself modifies the essence so that it be a power. Cajetan and the Canarian teach this in this article; Capreolus in the First Book, distinction 7, question 1, article 1, conclusions 2 and 3; Marsilius in the First, question 11, article 2, conclusions 3 and 4; and Ferrarensis, IV Contra gentes, cap. 13, § Considerandum etiam.[920] [921] [922]

Wherefore the personal property will not only be a condition required for the power, that it may produce and pass into act, but also that it be a power formally; although, to be sure, it does not pertain in the thing to the concept of that power, nevertheless it is connoted essentially in an oblique case by the name of power, and is included per se in its concept. But for the explication of this opinion it must be noted with Cajetan first, that by the name of power the proximate principle of generation is not understood: for this is the Father's intellect, as the will of the Father and the Son is the proximate principle of spiration; rather, what is understood is the first and remote principle. Yet one must philosophize in the same proportion about each: so that the essence, signified in the direct case, with the personal property connoted in an oblique case, is the first principle; the proximate principle, however, is the intellect or will signified in the direct case, with the personal property connoted in an oblique case. Moreover, everyone concedes that, at least in intellection and volition, both this proximate and first principle concur, because not only the intellect or will concurs in these operations, but also the divine nature itself, as happens in created things.

Then observe that, since the person of the Father is understood by us as prior with the power of generating than as having generated, and "Father" is a connotatum which of itself pertains to the power of generating, therefore the condition connoted is not paternity under the express concept of paternity, but the property of the first person, as it is conceived by us before generation, according to those things which we said in Disputation 159, cap. 5.[923]

However, it could seem to someone that it is easier to assign the condition of the power of spiring also as considered before the act of spiration: on the ground that the condition connoted by this power is not the relation of spirator, but paternity and filiation under the express concept of these relations. For when we conceive the Father and the Son before they spirate, we can rightly understand the divine essence or the will determined by these relations in such a way that it is able to spirate, so that this determination not be had merely nominally by the person. Yet I for my part judge that the condition of the power of spiring, which is connoted by the name of such a power, is not paternity and filiation, but the relation of spirator. For since the power of spiring is one and integrally common to the Father and the Son, it is necessary that in each of them there be the integral connotatum which is required in order that it be a power; but if the connotatum were paternity and filiation, or both together, it would be one integral connotatum, and thus such a

920. Cajetan and the Canarian, on this article; Capreolus, In I, dist. 7, q. 1, a. 1, concl. 2 - 3.
921. Marsilius, In I, q. 11, a. 2, concl. 3 - 4.
922. Ferrarensis, IV Contra gentes, cap. 13, § Considerandum etiam.
923. Vázquez, Disputatio 159, cap. 5.

power would not be integrally in each person, because in each there would not be the integral connotatum - as is clear. Or else any relation whatsoever would be a sufficient connoted condition for such a power; and thus the same power of spiring would not be in the Father as is in the Son, because the same connoted condition would not be in each.

Wherefore it must be said that the condition connoted by this power is the common relation of spirator, which is whole in the Father, whole in the Son. If, however, we speak of the power as it is conceived by us before the act of spiring, the same must be said of it as of the power of generating, which demands that the condition be connoted by paternity, so that the relation of spirator is not then conceived under the express concept of spirator, but confusedly, as we said of paternity when it is conceived as the condition connoted by the power of generating before the act of generation.

From this doctrine about the power of generating and spiring we shall at once very well infer how in one person there may be a power producing a person which is not in another.

But indeed, since the concrete names of nature, such as "God," signify the nature directly, but connote the supposit, and this very thing has been said of the generating power, a difference must be assigned between these two, lest they be easily confused. Therefore the first difference is that the concrete name "God" connotes a supposit vaguely, not this or that one; whereas the name "power" connotes the property of this singular supposit, as we have explained. Further, the name "God" connotes the supposit in which the nature subsists; the name "power" signifies the property such that the essence is modified and determined by it to produce what in another person it would not be determined to produce.

Corollaries in favor of the foregoing opinion, and a solution of the arguments of the other opinions.

Caput IV - That the power of generating or of spiring is not in all the persons

From this doctrine it is rightly inferred that the power of generating or of spiring is not in all the persons, but in those whose properties are connoted. In this opinion those agree with us who assert that the power is either the property of the person or the essence, or not the essence alone; which manifestly follows from what has been said. Hence Gabriel erred in the First Book, distinction 7, question 3, when he asserted that the Father communicates to the Son that by which he generates; he understands, however, the power of generating; but, he says, in the Son it does not generate because it is perpetually impeded. Nor is it a wonder, because this author, as we related in cap. 2, thought that the power of generating or the principle, which he calls elicitive, is the essence alone. It must be wondered, however, why Marsilius, in the First, question 11, articles 3 and 4, said that the power of generating is in all the persons, just as the essence is - although he himself teaches, as we saw in cap. 3, that the power is not the essence alone, but that to its ratio there pertains a property, as something connoted; yet he adds that this power does not generate in every person, not on account of Gabriel's reason, but for a different cause: for as, in a certain way, if the same color were in fire and in water, fire would heat by it, not however water; likewise, if the same

faculty of seeing were in the eye and in the bone, the eye would see, not the bone; so also the same essence existing in the Father and the Son, in the Father it generates, in the Son it does not generate.

However, the opinion of these men is easily refuted from what has been said: for since the bare essence is not the power, as has been proved, but the person determined by a property, the same cannot be in all the persons. Moreover, the reasons by which the aforesaid authors teach that a power does not generate in every person in which it is, are trifling. The first, which Gabriel asserts, has already been sufficiently impugned in cap. 2. But the second can be impugned more easily, first, because the example about heat is altogether inept: for heat in water is in a subject contrary to nature, and therefore the action of heat in water cannot be derived from it; but the divine essence is per se in any person: therefore, if the essence is in one person a natural power of generating, in another it can also be. Then, if the faculty of seeing were naturally in the bone, the bone would see, because it would be in a natural subject - namely, in the soul - and just as by its own nature it could be in that, so it could cooperate in the act. For it is impossible that a faculty by its own nature reside in some part in which it would have a perpetual and natural impediment, as we said in cap. 2. But if, besides nature, a seeing faculty were in the bone, it would not see on account of the impediment which it would have besides nature; but the divine essence is not besides nature in the Son, but equally natural as in the Father; therefore, if that alone is the faculty of generating, and in the Father it generates, in the Son likewise it will generate.

Of the arguments, however, which were adduced in caps. 1 and 2, two only remain: one of Durandus in I, cap. 15, and another of Scotus in cap. 2, to which it is necessary to respond.[924] [925]

Reply to the first, of Durandus. We say that the Father generates according to that which is proper to him; but what is proper is not only the relation or personal property, but also the essence determined by such a property; and this we said is the power of generating.

As to the second, it is of no moment, nor does it prove anything against the mystery of our faith. For if for that reason paternity should be called imperfect, because it gives being and does not operate, and therefore we ought to assign to it generation as to a generating faculty, it would follow that procession, which is posited as the property of the Holy Spirit, is an imperfect form, because in no way does it ascribe any operation to the Holy Spirit, since it is not a principle of producing anything either outside or within God. We answer, therefore, that even if a property does not ascribe an operation to the person, it is nonetheless a perfection of that person, because it pertains to the complement of the person according to our mode of understanding; for not every perfection of something ought to bestow upon it the power of producing.

As to the third argument of Durandus, from what has been said the solution is clear.

But to the argument of Scotus adduced in that cap. we say: if God were to produce another God, then indeed the essence of God would have to be assigned as the faculty of generating, because producing another God he would produce another essence of which it could be the principle. For

924. Durandus, In I, cap. 15.
925. Scotus, In I Sent., dist. 7, q. 1, ad quaest.; and in the section "Quis autem alia argumenta" on the same question.

the principle must be distinguished from the thing produced: for the same thing cannot produce itself. Now, however, because God produces God in the same nature, the nature itself, in itself, cannot be the principle, because it is not distinguished from the thing produced. We add, therefore, that by that determination of the personal property, according to which the person is distinguished from the person produced, it can be a principle.

But that the three persons are equal in all power, see Disputation 166.

-

Earlier opinions and their impugnation

Fourth opinion. The fourth opinion is Scotus's, in the First Book, distinction 7, question 1, ad quaestionem "Quis autem alia argumenta," namely, that the principial power in God is the divine essence alone, the whole essence, absolute; but that the necessary condition, in order that it produce, is the property (relation) of such or such a person. Nor does it stand in the way, he says, that formally a power is relative, but the divine essence is absolute: for we use this relative name when we cannot explain this perfection in another way; but we mean to signify the foundation of that perfection, which is absolute - something which happens in many other names of God.

Scotus proves in truth that the essence is a power in this way: that which is of the greatest perfection in a principle or power does not impede the notion of principle or power; but to communicate oneself in identity of nature is of the greatest perfection; therefore it does not impede the notion of principle and power. Moreover, if God were to produce another God and communicate to him another nature, his essence would be the producing principle and power; therefore, now too it will be, even though he does not produce another God, but another person in the same nature; since to communicate oneself in the same nature does not impede the notion of power and principle, as has been proved. Then he confirms the same, because the essence is the least formal; therefore both the principle and the power are the essence: for the one seems to correspond to the other. Furthermore, he had to say that relation or property is a condition required necessarily, lest he be compelled to assert that the essence, in any person whatsoever, would generate and spirate.

But the aforesaid opinion is refuted by one reason only, because from it there would follow that the divine essence, in any person whatsoever, would generate and spirate. For where there is a principle of action or production, unless an impediment be present, action or production follows; but the essence is in any person, and there is no impediment at all; therefore, in any person it generates and spirates. Scotus would say that in some there is an impediment because they lack the necessary condition, which is such a relation or personal property. But this is not rightly said, because wherever some power by its own nature demands to be, it cannot have a perpetual impediment from the nature of the thing, unless perhaps by accident; but the divine essence by its own nature demands to be in three persons; therefore none of them can have an impediment from the nature of the thing; nor can it have accidental and extrinsic impediments; for a person cannot lack anything required for acting; otherwise it would naturally demand to be in that person in such wise that it would naturally have an impediment of its act, which is absurd.

Fifth opinion. Finally, Henry in Quodlibet 3, q. 3 teaches that both the essence and the relation are per se and directly required for the notion of power, so that each pertains in recto to it; yet more principally the property.[926] He reports the same in the Summa, art. 57.[927]

The reason is, because in every generation there are two things: one is to produce something similar; the other is to produce something distinct; but the more principal thing in generation is that it be terminated to the distinct as it is similar, rather than to the similar as it is distinct; therefore in the power of generating the principal thing is the property, by reason of which the distinction between the begotten and the begetter is intended. That this be principal, by reason of which the distinction follows, he proves, because Peter does not on that account generate this man because he generates man; but, on the contrary, he generates man because he generates this man.

But if this opinion were true, no distinction, even according to reason, could be assigned between person and power. For since the person includes nothing other than essence and relation, and power likewise, they will be absolutely the same, and there will be only a difference of names. But if someone should say that there is a distinction not of reason but only of mode of signifying, against this is what was said in Disputation 159, cap. 4: a diverse mode of signifying is not had unless in the thing signified there is some distinction, at least of reason.[923]

Disputatio CLXVI - On whether omnipotence is equally in the three divine persons and whether it includes the potencies of generation and spiration

Caput I - Various opinions of the Scholastics

This controversy, from the foregoing and from what we said in Disputation 104, could easily have been dispatched; but because the Scholastics, perhaps differing only about a word, have been of various opinions, it was necessary in this chapter to enumerate their positions and in the following to say something briefly by way of a true explanation.

First opinion. Marsilius, on I, q. 23, a. 2, part 2, holds that under omnipotence is contained the potency of generating and spiring; and since he says that the potency of generating and spiring is in all the persons, as we reported in the last chapter of the preceding disputation, he further asserts that omnipotence, insofar as in this way it includes under itself the potency of generating and spiring, is in all the persons, although in all it is not possible to generate and to spirate. With Marsilius agrees the Canarian, in his commentary on article 6 of the following question. When he asserts that the same omnipotence which the Father has is in the Son, although the Son cannot by those means generate as the Father. And, in order to explain this, he uses the examples employed by Marsilius in the last chapter of the preceding disputation, to explain how there could be in the Son the potency of generating and yet he could not generate; and he adds another of this sort: if the

926. Henry of Ghent, Quodlibet 3, q. 3.
927. Henry of Ghent, Summa, art. 57.
923. Vázquez, Disputatio 159, cap. 5.

same heat were in a man and a woman, in the woman it would generate milk, in the man it would not; nonetheless, he says, the potency for generating, which they call generative, ought not to be granted to the Son.[928]

However, since it was already proved above in that chapter that the generating potency is not in the Son, nor the spirating in the Holy Spirit, if omnipotence were to comprehend under itself every potency, even that which produces within God, it would follow that omnipotence is not in each person, because some potency is not in some person. Moreover, those examples which Marsilius used in that same chapter have been sufficiently impugned, and in the same way there can be refuted that to which the Canarian has recourse. For the same heat in a man and in a woman would not have the same power of operating, because it would not be conjoined to the same substance of which it is the instrument; for heat is not the entire cause of producing milk, but because it is conjoined to such a form, or at least to such a temperament, which is also required as a per se cause. But the divine essence differs only in that it is in diverse supposits (*supposita*); wherefore, if it were the whole rationale of the generating potency, it would follow that wherever it were, there also generation would take place. I am surprised, however, that the Canarian should say that omnipotence, even if under itself it comprehends the potency that produces within God, is in each person, although he does not grant the generating and the spirating potency in each.[929]

Second opinion. St. Thomas, on q. 42, a. 6, ad 3, and Ferrarensis, IV Contra gentes, c. 13, in order to defend that the three persons are equal in potency, concede that the potency which is in the Father is in the Son, but under a different respect: for in the Father it is so as to generate, in the Son however so as to be generated; and that this suffices so that they may be said to be of equal potency.[930][931] But since the difficulty proposed concerns only the potency for acting or producing, which is called active, not the passive, so that something be produced, it does not seem that a sufficiently fitting answer is being given. For if some active potency is not in the Son, it follows that all the persons are not equal in potency to act; and indeed every potency about which we ask whether it is equally in all the persons is not for suffering (being acted upon), but for acting, as the same St. Thomas admits above, q. 25, a. 3, ad 1. Convinced by this reasoning, Durandus thinks that the proposed difficulty must be satisfied in another way.

Third opinion. Thomas of Argentina and Aegidius of Rome, as Scotus relates in the place to be cited below, assert that omnipotence is in the Son just as in the Father and in the Holy Spirit, even if the Son cannot generate, nor the Holy Spirit spirate; not because omnipotence has regard only to those things which can be outside of God, but even if it be with respect to those which can be produced within God, since omnipotence universally extends only to those things which do not imply a contradiction. Nor is omnipotence at all derogated from or its power diminished if it cannot produce those things which imply a contradiction; therefore, since it implies a contradiction that another divine Son be generated by the Son, and that another Holy Spirit be produced by the

928. Marsilius, In I, q. 23, a. 2, pars 2.
929. The Canarian (Canariensis), commentary on article 6 of the following question.
930. St. Thomas, I, q. 42, a. 6, ad 3.
931. Ferrarensis, IV Contra gentes, cap. 13.

Holy Spirit, nothing will stand in the way, considering their omnipotence universally, that they cannot generate or spirate; because omnipotence has respect to those things which do not imply a contradiction.

He assigns, moreover, a distinction between a transient act (*actus transiens*) and an immanent act (*actus immanens*): because every transient act, or its effect, which considered in itself absolutely, not with respect to the agent, does not imply a contradiction, falls under omnipotence; yet, in order that an immanent act be said to fall under omnipotence, it is not enough that, considered in itself, it does not imply a contradiction and can be done by another, but its possibility, in order that it fall under omnipotence, must be considered with respect to the agent. Therefore, since the generation of the Son is an immanent act and is possible only with respect to the Father generating, it ought to fall only under the omnipotence of the Father, not under omnipotence insofar as it is the Son's. By this reasoning, then, from the Son's omnipotence it does not follow that he can generate another Son - nothing stands in the way of his being omnipotent nonetheless. Furthermore, that alone is called impotent, or is said to lack some potency (*potentia*) for operating, which, although it have from itself a form fitting for operating, is nevertheless unable to operate; but that which cannot operate because it does not have a form from itself fitting, is not called impotent. Wherefore that the Son cannot generate another Son is not a mark of impotence, because he cannot generate for the reason that he does not have a form from himself fitting; therefore this will derogate nothing from his omnipotence.

This opinion is refuted by Durandus, on I Sent., dist. 10, q. 1, n. 6: because omnipotence is said with respect to those things which do not imply a contradiction absolutely in themselves, not with respect to the efficient cause; as St. Thomas most excellently noted above, q. 25, a. 3. For if it were referred to that which does not imply a contradiction with respect to the potency and to the efficient, there would result a certain useless circle, as St. Thomas noted there, and we also explained in Disputation 104, c. 4. Moreover, if the aforesaid opinion were true, any man, indeed any animal whatsoever, would truly be said omnipotent, at least with respect to immanent actions; because he can do any action possible to be done by himself. Then Scotus impugns the same opinion, on I Sent., distinction 20, question 1, by this reasoning: If we do not compare the Son and the act of generation to some supposit in particular, but in common, generation is possible, and likewise a Son; therefore with respect to that there is some potency; wherefore, if that potency is not in the Son, it follows that in the Son there is not every potency, and hence that he is not omnipotent.[932][933]

But someone will object against Scotus: bodily vision is a certain act which in itself does not imply a contradiction - for instance, that it exist; yet only God can bring it about, and nonetheless he is called omnipotent; therefore omnipotence ought not to be compared to all those things which in themselves do not imply a contradiction absolutely, but also with respect to omnipotence itself. Scotus most fittingly responds that omnipotence is said with respect to all those things which absolutely in themselves do not imply a contradiction, yet in such a way that that be produced by

932. Durandus, In I Sent., dist. 10, q. 1, n. 6.
933. Scotus, In I Sent., dist. 20, q. 1.

omnipotence as its nature requires to be produced. For if it is a substance, as it is by nature apt to subsist of itself, so it must be produced, not in another; but if it is an accident necessarily depending on a subject, insofar as it is a vital act, so by God it must be produced together with the subject also concurring; and thus God reaches by his power the existence of that thing.

Finally Scotus argues: although that which has a limited form cannot be called impotent, just as fire is not called impotent because it does not produce cold, nevertheless it will not for that reason be called omnipotent, because it can do all those things for which it has a form; therefore the aforesaid Doctors do not argue rightly.

Caput II - The true opinion

Much easier and more probable is the opinion of Scotus and of Durandus in the places cited, and of Gab. on I, that distinction 20, q. 1; of Gregory, quaest. 1, art. 2; of Cajetan above, q. 23, art. 3; of Major on I, dist. 42, quaest. 1, proposition 4; namely, that the three persons are equally omnipotent. For they take the attribute of omnipotence not for any and every potency which even within God can produce, but with respect to creatures outside God, as Fulgentius took it, in the book On the faith to Peter, c. 7, where he says thus: "In this God's omnipotence is understood, that he made every visible creature out of nothing." Durandus proves this by the following reason: omnipotence is the same as a potency to act, not however that something be; wherefore God is not called omnipotent because he can be, but because he can operate; therefore with respect to that operation there is not the potency which is the being (*esse*) of the operator; but generation is God's being; therefore with respect to that there is not omnipotence. But this reason destroys what we set down in Disputation 163, namely that in God there truly is a potency with respect to notional acts.

Scotus, however, proves it thus: the correlative of omnipotence is the possible; but the possible is that which can be and not be; therefore, since within God there is no person who is possible, there is not omnipotence with respect to that. Yet, although in common it is said that that is possible which can be and not be, nonetheless that is also called possible which is in act, and the necessary is called possible which is in act; and with respect to notional acts there truly is potency; therefore nothing stands in the way why there should not also be omnipotence.

The true reason, therefore, of the aforesaid opinion - indicated by St. Thomas, q. 25, a. 3, and in the following question, a. 6 - is this: that omnipotence is said only with respect to creatures, and that this is commonly used for that which can be given in this way. In the same fashion God is said to be omnipotent as he was said to be before the mystery of the Trinity was revealed; before this revelation, omnipotent fell only with respect to creatures, and no potency with respect to notional acts was known; therefore now it is so said in the same way. But if one were to take omnipotence for the potency of producing absolutely everything, both within God and outside, I do not see by what reasoning we could say that omnipotence is in the three persons, as the arguments made in the preceding chapter show. Wherefore I would not use "omnipotence" for just any potency, but for the potency of all things which can be produced outside God, just as the ancients accepted it before the mystery of the Trinity was revealed.[934][935][936][937]

Objection from St. Augustine. Yet there is an argument taken from the words of Augustine, book 3 against Maximinus, c. 14: "If the Father," he says, "begot a lesser Son, either he could not or he did not wish to beget an equal. But if it is said that he did not wish, as though envious, he destroys himself; but if he could not, where is the omnipotence of the Father?" And a little later: "If he could not, he was inhuman." In order, however, that Augustine's argument have any force, the potency of generating must be contained under omnipotence; for if it is not contained, one could easily answer Augustine's question in his argument - "But if he could not, where is the omnipotence of the Father?" - that the Father's omnipotence is about creatures, not about producing persons equal to himself.[938]

To this argument Scotus replies in the cited place and in the third doubt, 9: to the first argument, that Augustine is arguing ad hominem from Maximinus's concessions, not absolutely from the nature of the thing; because he conceded to the Son deity, yet lesser than he himself had. From this, therefore, he infers that the Father would not be omnipotent, because it would follow that the deity is not infinite, since some deity would be greater, some lesser; but the infinite is not greater and lesser. If, however, the deity is not infinite, neither will he be omnipotent, because omnipotence is born of the infinity of the nature. But Scotus clearly twists the force of Augustine's argument another way; for Augustine does not infer, as Scotus thought, in that way, but rather thus: "But he could not beget an equal; therefore there failed him some potency; therefore he is not omnipotent."

Gregory, moreover, on I Sent., dist. 20, art. ..., expounds the force of this argument against Maximinus to the same effect. He says, therefore: Maximinus asserts - as is clear from that same chapter - both that the Son is a creature and yet is truly of a like nature with the Father. On these positions Augustine (Gregory says) argues that he breaks the Father's omnipotence: as if those who are by their nature equals to the fathers of whom they are begotten; whose God - the Son - was not equal to the Father; either because the Father did not wish, and thus the begetter was envious; or

934. Gregory, Quaestio prima, art. 2; and In primum Sent., dist. 20, art. ...
935. Cajetan, on I, q. 23, a. 3.
936. Major, In I Sent., dist. 42, quaestio 1, propositio 4.
937. Fulgentius, De fide ad Petrum, cap. 7.
938. St. Augustine, Contra Maximinum, lib. 3, cap. 14.

because he could not, and thus not omnipotent. But Augustine (Gregory says) took "omnipotence" with respect to creatures; for Maximinus was saying that the Son of God is a creature. And yet Maximinus could easily have replied that God could not beget a Son equal to himself if he were a creature; for no creature can be equal to God; and so nothing would have been derogated from his omnipotence.

For my part I think Augustine did not use "omnipotence" for the attribute of the divine essence, which we admit to be common to the three persons - for then the argument would be of scarcely any moment - but that by the name "omnipotence" he understood the full and second potency (*potentia secunda*) for generating and acting, in this way: if by his nature the Son could be equal and consubstantial to the Father - as we see in created things, where, when we ascribe second potency for generating, it follows that one begets a like and equal son - then, if he did not beget when he could, he was envious; or he was not fully in second act for generating, as a father created for generating is, which is absurd. Hence, therefore, he urges, when he says: "But if he could not, where is omnipotence?" - that is, where is the Father's full fecundity? I pass over what St. Thomas replies in the following question, article 6, ad 3; for the proposed difficulty does not seem thereby to be satisfied.

Articulus VI - Whether a notional act can terminate in several persons

To the sixth, one proceeds thus. It seems that a notional act can terminate in several persons, such that there are several persons begotten or spirated in the divine. For whatever has the power of begetting can beget; but the Son has the power of begetting. Therefore he can beget - not, however, himself. Therefore another Son. Therefore there can be several sons in the divine.

1. Further, St. Augustine says against Maximinus: The Son did not beget the Creator; not because he could not, but because it was not fitting.[939]
2. Further, God the Father is more powerful to beget than a created father. But one man can beget several sons. Therefore so can God - especially since the Father's power is not diminished by one Son having been begotten.

But on the contrary: In the divine there is no difference between to be and to be able. If, therefore, in the divine it could be that there are several sons, there would be several sons; and thus there would be more than three persons in the divine. Which is heretical, as is clear from the symbol of faith.

I answer: As Athanasius says, in the divine there is only one Father, one Son, one Holy Spirit. The reason for which can be assigned in four ways. First, on the part of the relations, by which alone the persons are distinguished. For since the divine persons are the subsistent relations themselves, there could not be several fathers or several sons in the divine, unless there were several paternities and several filiations; which could not be, unless according to a material

939. St. Augustine, Contra Maximinum, lib. 3, cap. 14.

distinction of them. For forms of one species are not multiplied except according to matter; which is not in the divine. Hence in the divine there can be only one subsistent filiation, just as a subsistent whiteness could be only one.

Second, from the mode of the processions: because God understands and wills by one simple act. Whence there can be only one person proceeding by way of word, which is the Son, and only one by way of love, which is the Holy Spirit.

Third, from the mode of proceeding, because the persons themselves proceed naturally, as has been said; but nature is determined to one.

Fourth, from the perfection of the divine persons. For the Son is perfect from this, that the whole divine filiation is contained in him, and that there is only one Son; and similarly must it be said of the other persons.

Reply to the first: Although it must be conceded without qualification that the Son has the power which the Father has, nevertheless it must not be conceded that the Son has the power "of begetting," if "of begetting" is taken as the gerund of an active verb, so that the sense would be that the Son has a power to beget - just as, although the being is the same of the Father and of the Son, nevertheless it does not befit the Son to be Father on account of the notional adjunct. If, however, "of begetting" is taken as the gerund of a passive verb, the power "of being begotten" is in the Son, that is, that he be begotten; and similarly, if it is the gerund of an impersonal verb, the sense is "a power of being begotten," that is, by which some person is begotten.

Reply to the second: Augustine in those words does not intend to say that the Son could beget a Son, but that this, that he does not beget, is not from an impotence of the Son, as will be made clear below.

Reply to the third: The immateriality and divine perfection require that there cannot be several sons in the divine, as has been said. Hence that there are not several sons is not from an impotence of the Father to beget.

Conclusion of the article denies it, and it is expressed as of faith in the Athanasian symbol: "One Son, not three sons; one Holy Spirit, not three Holy Spirits." St. Thomas proves this by four fitting reasons; Scotus at Quodlibet 2 and Aureolus on the First Book, distinction 7, question 2, attack them at length; as is reported by Capreolus on the first article, Cajetan and the Canarian, Ferrarensis, Henry, and other more recent authors defend them in this article.[940][941][942][943][944][945][946] On occasion of one of those reasons Cajetan disputes more fully about the principle of individuation. Henry in Quodlibet 6, question 1, and Scotus in the place cited, adduce other reasons; yet none of

them concludes demonstratively, but all only congruently prove this truth. For it has a supernatural reason, and can be established only by faith, just as the very mystery of three persons in one nature.

Quaestio XLII - On the equality and likeness of the divine persons among themselves

Then there must be considered the comparison of the persons among themselves. And first as to equality and likeness; second as to mission. Concerning the first, six things are asked. On this matter the Doctors treat in the First Book, distinction 19.

Articulus I - Whether equality has a place in the divine

Objicitur 1. It seems that equality does not befit the divine persons. For equality is considered according to one thing in quantity, as is clear from the Philosopher, Metaphysics V. But in the divine persons there is found neither an intrinsic continuous quantity, which is called magnitude; nor an extrinsic continuous quantity, which is called place and time; nor, according to discrete quantity, is equality found in them, because two persons are more than one. Therefore equality does not befit the divine persons.

Objicitur 2. Further, the divine persons are of one essence (*essentia*), as was said above. But essence is signified after the mode of a form (*forma*); now agreement in form does not make equality, but likeness. Therefore in the divine persons there should be said likeness, not equality.[947]

Objicitur 3. Further, in whatever equality is found, those things are equal to one another; for the equal is said equal to the equal. But the divine persons cannot be said equal to one another. For, as St. Augustine says, in the sixth book On the Trinity, if an image perfectly fulfills that of which it is the image, it is itself coequal to it; not that which is the original to its image. But the Son is the image of the Father. And thus the Father is not equal to the Son. Therefore equality is not found in the divine persons.[948]

Objicitur 4. Further, equality is a certain relation (*relatio*). But no relation is common to all the persons, since according to relations the persons are distinguished from one another. Therefore equality does not befit the divine persons.

But on the contrary: Athanasius says that the three persons are coeternal and coequal to one another.[949]

I answer: It is necessary to posit equality in the divine persons. For according to the Philosopher in Metaphysics X, the equal is so called as by negation of the less and the greater. But we cannot posit in the divine persons anything greater and less. For, as Boethius says in the book On the

947. St. Thomas, I, q. 39, a. 2.
948. St. Augustine, De Trinitate, lib. 6, cap. 10 (at the beginning).
949. Athanasian Creed: "coeternal and coequal."

Trinity, the difference of deity accompanies those who either increase or diminish it, as the Arians, who by grades of numbers distort the Trinity and lead it into plurality. The reason for which is that one quantity in number cannot be of unequals. But in the divine, quantity is nothing other than its essence. Whence it follows that, if there were any inequality in the divine persons, there would not be one essence in them; and thus the three persons would not be one God. Which is impossible. Therefore it is necessary to posit equality in the divine persons.[950][951]

Reply to the first: Quantity is twofold. One is what is called bulk-quantity, or the quantity of dimensions, which is only in corporeal things. Whence there is no place for it in the divine persons. But there is another, the quantity of power or virtue, which is considered according to the perfection of some nature or form. And this quantity is designated inasmuch as something is said to be more or less hot, inasmuch as it is more or less perfect in such heat. Now such a quantity of virtue is considered, first, in the root, that is, in the very perfection of the form or of the nature; and thus we speak of a spiritual magnitude; we say that heat is great on account of its intensity and perfection. And thus says Augustine in the sixth book On the Trinity, that in God those things which are not great by mass are greater by being, namely that it is better-being; for we say that what is better is more perfect. Second, the virtual quantity is considered in the effects of the form. Now the first effect of the form is existence (*esse*). For every thing has existence according to its form. The second effect is operation. For every agent acts through its form. Therefore the virtual quantity is considered both according to existence and according to operation: according to existence, inasmuch as those things which are of a more perfect nature are of longer duration; according to operation, inasmuch as those which are of a more perfect nature have greater power to act. Thus therefore, as Augustine says in the book On the Faith to Peter, equality is understood in the Father and the Son and the Holy Spirit, inasmuch as none of these either precedes in eternity, or exceeds in magnitude, or surpasses in power.[952][953]

Reply to the second: Where equality is considered according to virtual quantity, equality includes likeness in itself, and something more; for it excludes excess. For whatever communicate in one form can be called like, even if they participate that form unequally, as when air is called like to fire in heat; but they cannot be called equal if one participates the formal perfection more than the other. And because not only is there one nature of the Father and of the Son, but it is also equally perfect in each, therefore we not only say that the Son is like to the Father, so as to exclude the error of Eunomius, but also that he is equal, so as to exclude the error of Arius.

Reply to the third: Equality or likeness can be signified in the divine in a twofold way, namely by nouns and by verbs. According to that which is signified by nouns, mutual equality is said in the divine persons, and likeness: for the Son is equal and like to the Father, and conversely. And this for this reason, that the divine essence is no more the Father's than the Son's. Whence it is said that the Son has greatness from the Father, which is to be with an equal to the Father; and likewise the

950. Aristotle, Metaphysics X, texts 15 - 17.
951. Boethius, De Trinitate.
952. St. Augustine, De Trinitate, lib. 6.
953. Fulgentius (under Augustine's name), De fide ad Petrum, cap. 7.

Father has greatness of the Son, which is to be with an equal to the Son. But with respect to creatures (as Dionysius says in On the Divine Names, chapter 9) the conversion of equality and likeness is not admitted: for effects are said to be like their causes, inasmuch as they have a form from their causes; but not conversely, because the form is primarily in the cause and secondarily in the caused. But the verb signifies equality with motion. And although motion is not in the divine, nevertheless there it is received in its proper sense, because the Son receives from the Father, whence he is equal to him; and not conversely.[954]

Reply to the fourth: In the divine persons there is to be considered nothing except the essence, in which they communicate, and the relations, in which they are distinguished. But equality imports both: namely the distinction according to supposits, and the unity according to the essence. Therefore equality befits the divine persons.

It is answered: Among things unequal there cannot be one quantity numerically. But quantity in the divine is nothing other than its essence (*essentia*). Whence it follows that, if there were any inequality among the divine persons, there would not be one essence in them. And thus the three persons would not be one God. Which is impossible. It is therefore necessary to posit equality in the divine persons.

Reply to the first: Quantity is twofold. One, namely, which is called quantity of bulk, or dimensional quantity, which exists only in bodily things. Hence it has no place in the divine persons. But there is another, the quantity of power, which is attended to according to the perfection of some nature (*natura*) or form (*forma*). And this quantity is designated according to the fact that something is said to be more or less hot, insofar as it is more or less perfect in such heat. Now this virtual quantity is attended to, first, at the root, that is, in the very perfection of the form or nature: and thus there is said to be spiritual magnitude, just as there is said to be great heat on account of its intensity and perfection. And therefore St. Augustine says in De Trinitate 6 that in those things which are not great by bulk, to be greater is to be better; for the better is said of what is more perfect.[955] Secondly, virtual quantity is attended to in the effects of the form. Now the first effect of a form is existence (*esse*). For every thing has existence according to its form. The second effect is operation. For every agent acts through its form. Therefore virtual quantity is attended to both according to existence and according to operation. According to existence indeed, insofar as those which are of a more perfect nature are of greater duration. According to operation, insofar as those which are of a more perfect nature are more powerful for acting. Thus, as Augustine says in the book De fide ad Petrum, equality (*aequalitas*) is understood in the Father and the Son and the Holy Spirit, inasmuch as none of these either precedes in eternity, or exceeds in magnitude, or surpasses in power.[956]

Reply to the second: Where equality is attended to according to virtual quantity, equality includes within itself likeness (*similitudo*) and something more: because it excludes excess. For whatever things communicate in one form can be called like, even if they participate in that form

954. Pseudo-Dionysius, De divinis nominibus, cap. 9.
955. St. Augustine, De Trinitate, lib. 6, cap. 8.

unequally, as if air is said to be like fire in heat; but they cannot be called equal if the one participates in that form more perfectly than the other. And because not only is there one nature of the Father and the Son, but it is also equally perfectly in each: therefore we not only say that the Son is like the Father, to exclude the error of Eunomius, but also that he is equal, to exclude the error of Arius.

Reply to the third: Equality or likeness can be signified in the divine in a twofold way, namely, by nouns and by verbs. According to what is signified by nouns, mutual equality and likeness is said of the divine persons. For the Son is equal and like to the Father, and conversely. And this for the reason that the divine essence is not more the Father's than the Son's. Hence just as the Son has the Father's magnitude, which is to be equal with the Father, so the Father has the Son's magnitude, which is to be equal with the Son. But as to creatures (as Pseudo-Dionysius says in De divinis nominibus, ch. 9), there is no conversion of equality and likeness received. For effects are said to be like their causes insofar as they have the forms of their causes, but not conversely, because the form is principally in the cause and secondarily in the effect. But verbs signify equality with motion. And although motion is not in the divine, there is nevertheless there, to receive. For the Son receives from the Father, whence he is equal to him; and not conversely.[957]

Reply to the fourth: In the divine persons nothing is to be considered except the essence, in which they communicate, and the relations (*relationes*) in which they are distinguished. Now equality imports both, namely, the distinction of the persons, because nothing is said to be equal to itself; and the unity of essence, because from this the persons are equal to one another, since they are of one magnitude and essence. But it is manifest that the same is not referred to itself by any real relation. Nor again is one relation referred to others by means of some other relation. For when we say that paternity is opposed to filiation, the opposition is not a relation midway between paternity and filiation. For in either way relation would be multiplied to infinity. And therefore equality and likeness among the divine persons is not some real relation distinct from the personal relations, but in its own concept it includes both the relations that distinguish the persons and the unity of essence. And on this account the Master says in I, dist. 31, that in these cases the appellation is only relative.[958]

The conclusion is affirmative, expressed in the Athanasian Creed, that the three persons are coeternal and coequal. Still, certain points concerning a fuller explanation of this and of the whole doctrine of the article must be noted in the following disputation.[959]

Whether the relations of equality, likeness, and identity among the persons are real

Scotus thinks that these relations are real. cap. 1.

These relations are only of reason; the more probable opinion says so, though it is proved in various ways. cap. 2.

958. The Master (Peter Lombard), Sentences, I, dist. 31.
959. Athanasian Creed: "coeternal and coequal."

The preceding opinion is confirmed by the best reason. cap. 3.

An opposition against the foregoing reason. cap. 4.

Corollaries of this controversy. cap. 5.

Caput I - Scotus holds that these relations are real

Before we come to the disputation, it must be premised, from the doctrine of Durandus in I, dist. 19, q. 1, and from Scotus in the first question, that three relations of the first genus, which in creatures arise as distinct from various foundations, are found to be conjoined in God. For in creatures the first is the relation of equality, founded upon the unity of quantity; the second the relation of likeness in the unity of quality; the third the relation of identity, founded upon the unity of nature and substance. All of which are enumerated in the first genus by Aristotle, Metaphysics, book 5, chapter 15. But according to our way of understanding, we consider first in the divine essence the notion of substance, namely, that it is; and thence arises the relation of identity and consubstantiality; then we consider the same as under the mode of quality, namely, under the mode of truth and wisdom; and thence arises the relation of likeness; lastly, we consider in the divine essence a certain notion of quantity, insofar as we say that God is great; and upon this is founded the relation of equality. About these relations the question is, whether they are real in God, or only of reason.[960]

In this controversy the opinion of Scotus was, who in Quodlibet 6, art. 2, and on I Sent., dist. 31, in the first opinion of the first article, affirms that the relations are real. His sole reason is that in these relations there are found all the things that are required for real relations; therefore they are real. First, it is required that the extremes of the relation be real; but here they are real, namely, the persons. Second, it is necessary that the foundation be real, and the term of the relation likewise; but here each is found: for the foundation is the unity of the essence considered under that various mode, and the term is the other person. Third, it is necessary that from the nature of the foundation and of the extremes the relation arise to this extent, that it be real: and this suits these relations, as is manifest: it remains, therefore, that they are real, and so it is said.

Moreover, Scotus persisting in his opinion, namely, that the attributes are distinguished among themselves and from the essence by the nature of the thing and not only by our consideration, teaches in the cited Quodlibet that, as has been said, the foundation of these relations is real, not only insofar as it founds the relation of identity, but also of likeness and equality, because in it there is the notion of an attribute under the mode of quality, although it is not really a quality - for wisdom and goodness are of this sort - and of a certain quantity, as magnitude, which can found relations distinct by the nature of the thing from the relation of identity. He calls these relations "of the same account" in each extreme, which the Logicians call equiparantiae (equivalent relations); otherwise than the relations of origin: for these are of a different account in each extreme, and are called by the Logicians relations of disquiparation (disparity).

960. Aristotle, Metaphysics, lib. 5, cap. 15.

Finally, he notes in the cited Quodlibet, article 2, section "Secondly it is objected," and says therefore, that these relations are posterior to the relations of origin, so that the extremes, namely the persons, are first distinct; for the persons are first distinguished by origins, or by opposed relations.

Caput II - These relations are only of reason; the more probable opinion, proved in various ways

The common and much more probable view is to be embraced, which affirms that these relations in God are only of reason. Thus affirm, with St. Thomas in this article, Cajetan, Canariensis, and more recent Thomists, Durandus in I, dist. 31, question 1, Capreolus, question 1, on the first conclusion 3; Marsilius on I, dist. 33, art. 1, conclusion 1 and notation 8; I omit Gabriel in the same distinction, question 1, who seems to incline to this view. The Nominalists indeed scarcely seem to admit relations of reason, just as neither distinctions of reason: but they think that all relations and distinctions of this sort are located in names. Add that, although one of these relations were real in God, nevertheless there would not be so many relations to be distinguished among themselves by the nature of the thing in the same way as was said about the attributes and the essence in Disputation 116: because only the relation of identity founded on the unity of substance would seem to be posited in God; but the relation of likeness and of equality would not be distinguished from this.

Yet this view is wont to be confirmed in various ways by the Doctors, and so in this chapter we shall survey the reasons of others, so that at length in the following we may bring our own reason, and also set forth some other noteworthy points. Therefore Durandus, in the cited question, num. 4, relates the reasoning of certain persons in this way: The relation of identity, which is founded on the unity of substance, is in creatures only of reason; although the relation of equality and of quantity is real: but all these relations, translated to God, are relations of identity, since in God there is no quality nor quantity: therefore in God these relations are of reason. Yet I for my part do not know why the relation of identity in creatures is of reason, whereas the relations of equality and likeness are real. For if identity is a relation of reason because unity in substance is by reason, so also unity in quality and quantity is by reason: for two qualities and quantities, really diverse in themselves, are united by reason, and are said to be one quality so as to make a like, and one quantity so as to make an equal.

The second reason is that of Henry in Quodlibet 5, q. 1, which Scotus reports in the place cited; it only proves that equality and likeness in God are not real relations, because in God there is not quality according to the thing, but only according to our mode of understanding: this reason, however, does not prove about the relation of identity, since this is founded upon substance, which according to the thing is in God.

The third reason is that of Durandus in the cited question, num. 9, which is as follows: These relations in God are founded upon substance: but the substance of God does not require plurality insofar as it is substance, but according to the origins in the persons: therefore, according to itself,

it cannot be the foundation of a real relation, which requires a plurality of correlatives. This reason, however, does not sufficiently prove why the plurality of persons in the same nature does not sufficiently constitute the extremes of a real relation: for certainly there are persons who are said to be equal and like.

Fourth, some prove thus, because they think that not only must the extremes be distinguished in a real relation, but also the foundations of the relations; here, however, although the extremes are distinguished, the foundations nevertheless are not distinguished. However, although some foundations of relations ought to be distinguished, this is not necessary universally. For the relations of the second genus, which are said to be founded upon an action present, past, or future, do not have distinct foundations, but paternity and filiation in human beings are founded in the same generation: for in that generation I think these relations are founded, not in potency reduced to act; and this is more consonant with the doctrine of Aristotle, Metaphysics 5, ch. 15. I grant that in the relations which he calls of the first genus, namely, equality, likeness, and identity, the foundations are always distinguished: yet that happens for another reason, not because they are foundations, as we shall see in the following chapter.

The fifth and last reason is that of Canariensis, who asserts that these relations in God cannot be real by reason of the essence, because it is one, and excludes a real relation toward itself; nor by reason of the relations...

By reason of the persons, because the persons are really distinguished by the relations of origin, and one relation cannot be the foundation and cause of another real relation. Wherefore this author would concede that these relations in God would be real, if the persons were not distinguished by relations, but by absolute properties. For thus they could found real relations of equality and similarity, because then that obstacle which he alleged would not stand. Accordingly he concedes that, if in diverse men there were the same whiteness, there would also be a real relation of similarity; because the persons who would be referred would not be constituted and distinguished by relations, as the divine persons are.

The foregoing opinion is confirmed by a most apt reason.

But the extremes, according to the opinion of all, ought to differ really; whereas the foundations of the relations which are called of the first genus, namely of equality, similarity, identity, are first referred; for quantity is first said to be equal to another, quality similar to another, substance the same as another: therefore these foundations themselves likewise ought to be distinguished, in order that the relation be real. And since the divine persons are said to be equal, similar, and, in the account of that which they have in common, of the same number of nature, it follows that the aforesaid relations are not real but of reason.

And from this foundation the chief arguments for the first opinion of Scotus which were adduced are solved; indeed also the various reasons which the Doctors who favored our opinion brought forward can be refuted, especially that of Canariensis lately mentioned. For although the divine persons be constituted by absolute properties, nevertheless the aforesaid relations would not be real, because the foundations which are first referred would not be really distinguished, since

the divine nature would be one. Likewise, if in two created subjects there were one and the same whiteness, the relation of similarity would not be real, because there would be a single foundation, and hence the primary extremes of the relation would not be distinguished. Therefore it matters little that the persons in the divinity are constituted by relations, so that we should say that they cannot be referred by a real relation of similarity, quality, and identity.[961]

But in very truth, if Scotus's opinion concerning the distinction of the divine attributes among themselves and from the essence were true, it would follow that there are in God more real relations than are commonly enumerated. For in God there would be as many relations of equality as there are distinct magnitudes; but as many magnitudes would by nature be distinct as there are attributes. This he himself freely admits on I Sentences, dist. 31, question 1, as to the third, in the solution of the second. Wherefore he would not refuse to concede more than twenty real relations, which Canariensis in the fourth part of his commentary on this article strives to elicit against him. Yet all these things are frivolous and against the common doctrine of the Scholastics, who concede only four real relations in God.[962][961]

Opposition against the foregoing reason.

It is answered from the doctrine of St. Thomas in this article in the solution to the fourth, that no relation can be the foundation of another relation, especially of that which is first referred: otherwise there would be a process to infinity, which can be proved in this way. Just as there cannot be another action of one action, because an action is not that which is made, but an act and a way by which something is made: and just as there is not another habit of one having or habit, because a habit is, as it were, an act and a way between the haves and the thing had, and therefore the very habit by which we have a garment is not itself had: so also there cannot be another relation of one relation, because a relation is, as it were, an act and a way by which one relative is referred to another - something which I judge to be so true, that neither by the intellect can there be distinguished an action of an action, a habit of another habit, and a relation of another relation; for the intellect, standing between the act and the thing of which it is the act, cannot conceive another act.

But someone will still object: just as the persons of the Father and the Son, once constituted by their relative properties, yet receive another relation of spirator, why can they not receive another relation of diversity and distinction?

I answer that the case is different. For the persons of the Father and the Son receive the relation of spiration, not by the mediation of another constituting relation, nor are the constituting relations referred by that relation of spirator, nor are they the foundations of it; rather, the foundation and, as it were, the cause of that relation is origin. Now that which is first referred by that relation is a person, not a personal relation: but a person, even constituted by relation, can be referred first by another relation, because it can have two active origins. But if the relation of diversity were so founded first on a personal relation, that the personal relation itself were first

961. Canariensis, on I, q. 42, a. 1.
962. Scotus, Quodlibet VI, art. 2; and on I Sent., dist. 31, prima opinio prima.
961. Canariensis, on I, q. 42, a. 1.

referred, this is impossible; because the foundations of these relations are first referred, as by the reasoning of Cajetan has been shown. It would also follow, as St. Thomas said, a regress to infinity, because a relation of another relation would be required.[963][963]

But again someone may say that a regress to infinity does not follow; because, although the relation of paternity and filiation be referred by another relation of diversity, which is of another genus, nevertheless the relation of diversity could not be referred by another relation, because it would be of the same species and in the same subject, and thus the same in number. Yet altogether the same would follow concerning this relation of diversity as concerning the others. For although it would be in the same subject, nevertheless, because it would not have the same foundation nor the same terminus, but a different one, as is clear; nor the same proximate subject, because it would proximally refer that relation which previously referred the substance, at least this relation would be posterior in number, different from the prior; and so of the others.

Finally, from the same principle of the holy Doctor there is gathered an excellent reason why there is no motion to relation, just as there is to action and to habit; because relation has itself after the manner of a certain middle act between the relative and the terminus, as having is between the haver and the thing had, informing between form and matter; and since action too is a middle act between the agent and the effect, it follows that one cannot conceive as the terminus of the agent's act another act, which is relation, but rather that the terminus be conceived as a certain thing which does not have the character of act. Therefore neither in the predicament of habit can there be motion, nor in the predicament of posture (situs), because this too is signified after the mode of act, as to lie, to sit.

Corollaries of this controversy.

The doctrine is that of Dionysius, De divinis nominibus, cap. 9, which St. Thomas followed above, I, q. 4, art. 3, ad 4, and in the Contra Gentiles I, cap. 29, and Ferrarensis in the same place.[964][963] For, as St. Thomas noted in the aforesaid places, likeness is found in one way in those things which are of another order, and in another way in those which are of the same. For those things which are of the same order, as two white things, are said to be mutually similar; because this kind of likeness is nothing other than equality or unity in quality; and therefore the Father and the Son are said to be mutually similar, because they are of the same nature of the same order; cause also and effect, which are univocal, are said to be mutually similar. But among those things which are of another order, as between effects and causes of a different account, and equivocal things, since there is not a nature of the same account, for that reason they are not said to be mutually similar; but effects are said to be similar to causes, although they are of an inferior nature. For effects in a certain way imitate the cause and strive to be made like to it. By the same reason the image of Caesar is said to be similar to Caesar, not conversely: therefore in like manner a creature, which is an effect of God of an inferior order, is said to be similar to God, because in some way it imitates

963. Cajetan, on I, q. 42, a. 1.
963. Cajetan, on I, q. 42, a. 1.
964. Pseudo-Dionysius, De divinis nominibus, cap. 9.
963. Cajetan, on I, q. 42, a. 1.

His perfections, but God is not said to be similar to a creature. The Son indeed among created things is said to be similar to the father in two ways: by reason of nature, because he has the same nature with him according to species; and by reason of the individual properties by which he imitates the father, by reason of which he is said to have been made to his image.

However, although these things are so, sometimes Scripture says that none is like to God: for it speaks of the likeness which is between those which share the same nature and quality.

Another thing to be noted concerning the same solution to the third is that St. Thomas teaches that the Son is said to be equalled and assimilated to the Father, but not the Father to the Son; and, finally, that every person proceeding is said to be assimilated to Him from whom he proceeds, not conversely. In this sense St. John Chrysostom seems to have spoken on that text in Hebrews 1: "Who being the brightness..." where he asserts that the Son is equal to the Father, yet not the Father to the Son; and St. Augustine, De doctrina Christiana I, cap. 2, when he says: in the Father unity, and in the Son equality; for thus he ascribes equality to the Son alone; Chrysostom also understands the Son after the manner of a way.[965][966]

St. Thomas gives the reason, because these words seem to signify motion: for one is said to be assimilated or equalled to another whenever he becomes like by the very production received in himself, which, as it were, tends to the likeness of the producer; and since the Son by His production, as it were, tends to the likeness of the Father, He is said to be assimilated; but the Father, because He does not tend, nor is, as it were, on the way, since He is not produced, is not said to be equalled to, or assimilated by, the Son. Scotus agrees on I Sentences, dist. 19, q. 1, ad tertium, and gives the same reason: because to equal and to assimilate signifies the action of the one assimilating and equalling; but to be assimilated and to be equalled signifies a passion. And since the Son is produced, not producing, while the Father produces, not being produced, therefore it is said that the Father equals and assimilates the Son to Himself, but the Son is equalled and is assimilated to the Father. Capreolus, however, in I Sentences, dist. 19, question 2, in the last article against Aureolus's argument, judges these two reasons wholly different; yet he concludes with St. Thomas, that these words do not so much signify an action as a certain tendency or way toward likeness, which befits the person who is produced; while the other expressions befit the producer. Bonaventure likewise proves the same in I, dist. 19, part 2.

Articulus II - Whether a person proceeding is coeternal with His principle, as the Son with the Father

To the second we proceed thus. It seems that a person proceeding is not coeternal with His principle, as the Son with the Father. Arius assigns twelve modes of generation. The first mode is according to an efflux, where the equality of simplicity is lacking. The second mode is according to the emission of rays from the sun, where equality of nature is lacking. The third mode is according to a character or impression from a seal, where consubstantiality and the power of efficiency are

965. St. John Chrysostom, Homilies on Hebrews 1.
966. St. Augustine, De doctrina Christiana, lib. 1, cap. 2.

lacking. The fourth mode is according to an infusion of good will from God, where too consubstantiality is lacking. The fifth mode is, according to the going forth of an accident from a substance; but to an accident subsistence is lacking. The sixth mode is, according to the abstraction of a species from matter; although sense receives a species from a sensible thing, nevertheless here equality of spiritual simplicity is lacking. The seventh mode is, according to the excitation of will by thought, which excitation is temporal. The eighth mode is...

It is objected that a person proceeding is not coeternal with his principle, as the Son with the Father. Arius assigns modes of generation. The first mode is according to the flux of a line from a point, where equality of simplicity is lacking. The second mode is according to the emission of rays from the sun, where equality of nature is lacking. The third mode is according to a character or impression from a seal, where consubstantiality and sufficiency of power are lacking. The fourth mode is according to the emission of good will from God, where likewise consubstantiality is lacking. The fifth mode is according to the going forth of an accident from a substance; but an accident lacks subsistence. The sixth mode is according to the abstraction of a species from matter: just as sense receives a species from the sensible thing; where equality of spiritual simplicity is lacking. The seventh mode is according to the excitation of will by thought, and this excitation is temporal. The eighth mode is according to transfiguration, as an image is made out of bronze; which is material. The ninth mode is motion from a mover, and here too effect and cause are posited. The tenth mode is according to the eduction of species from a genus. This does not befit the divine things, because father is not predicated of the son as genus of species. The eleventh mode is according to ideation: as an external ark from that which is in the mind. The twelfth mode is according to being born: as a man is from a father. Where there is a before and an after according to time. Therefore it is clear that in every mode according to which something is from another, either equality of nature, or equality of duration, is lacking. If therefore the Son is from the Father, one must say either that he is lesser than the Father, or posterior, or both.

1. Moreover, whatever is from another has a beginning; but nothing eternal has a beginning. Therefore the Son is not eternal, nor the Holy Spirit.
2. Moreover, whatever is corrupted definitively ceases to be; therefore whatever is generated begins to be. For this it is generated, that it may be. But the Son is begotten of the Father. Therefore he begins to be and is not coeternal with the Father.
3. Moreover, if the Son is begotten of the Father, either he is always being begotten, or some instant of his generation must be given. If he is always being begotten (but while something is in generation, it is imperfect; for it is in successions, which are always in a state of becoming, as time and motion are), it follows that the Son is always imperfect. Which is altogether unfitting. Therefore some instant of the Son's generation must be given. Before that instant, the Son was not; therefore he is not coeternal.

But on the contrary: Athanasius says that all three persons are coeternal with one another, "not made, nor created, but begotten."[967]

I answer: It must be said that the Son is coeternal with the Father. For the understanding of which one must consider that something exists from its principle posterior to its principle in two ways: in one way on the part of the agent; in another way on the part of the action.

On the part of the agent indeed, one way in voluntary agents, another in natural agents. In voluntary agents, because of the choice of time. For just as it is in the power of a voluntary agent to choose the form that it will confer upon the effect, as was said above, so too it is in his power to choose the time in which he produces the effect. But in natural agents this happens because some agent does not from the beginning have the perfection of natural power for acting, but it comes to it after some time; as a man cannot generate from the beginning

On the part of the action however there is an impediment for that which is from a principle to be simultaneous with its principle, because the action is successive. Hence, granted that some agent begins to act with such an action as soon as it exists, nevertheless the effect would not exist at once in the same instant, but in the instant to which the action is terminated

But it is manifest according to the foregoing that the Father does not beget the Son by will, but by nature; and again that the nature of the Father was perfect from eternity; and again that the action by which the Father produces the Son is not successive: because thus the Son of God would be generated successively, and his generation would be material and with motion, which is impossible. It remains therefore that the Son existed whenever the Father existed. And thus the Son is coeternal with the Father, and similarly the Holy Spirit with both.

Reply to the first: As Augustine says in the book On the Words of the Lord, Sermon 38, no mode of procession of any creature perfectly represents the divine generation. Hence it is necessary to collect a likeness from many modes: so that what is lacking in one may in some manner be supplied from another. And on this account it is said in the Synod of Ephesus: "Let the coexisting, ever-coeternal Son to the Father be declared to you by 'splendor'; let 'Word' show the impassibility of the nativity; let the name 'Son' insinuate the consubstantiality of the Son."[969][970] Among all, however, the procession of the word from the intellect represents most expressly. Yet this is not posterior to that from which it proceeds, unless there be such an intellect as goes out from potency into act; which cannot be said in God.

Reply to the second: Eternity excludes a beginning of duration, but not a beginning of origin.

Reply to the third: Every corruption is a certain change. And therefore everything that is corrupted begins not to be and ceases to be. But the divine generation is not a transmutation, as was said above. Hence the Son is always being begotten, and the Father always begets.

Reply to the fourth: In time, one thing is indivisible, namely the instant, and another is that which is duration, namely time. But in eternity the "now" itself is indivisible and ever-standing, as was said above.[971] But the generation of the Son is not in a now of time or in time, but in eternity.

967. Athanasius, in his symbol of faith.

969. St. Augustine, De verbis Domini, serm. 38.

970. Synod of Ephesus: "Coexistere semper coeternum patri filium, splendor tibi denuntiet; impassibilitatem nativitatis ostendat verbum; consubstantialitatem filii, nomen insinuet."

971. St. Thomas, I, q. 10, a. 4.

And therefore, to signify the presence and permanence of eternity, it can be said, as Origen said, that he is "ever being born"; but (as Gregory and Augustine say) it is better that it be said "ever born": that "ever" may designate the permanence of eternity, and "born" the perfection of the begotten. Thus therefore the Son is not imperfect, nor was there a time when he was not, as Arius said.[972]

Conclusion affirming, and without controversy among Catholics, defined by the Church in the very same places in which against Arius the consubstantiality of the Son was defined, about which we spoke at greater length in Disputation 109.

Articulus III - Whether in the divine persons there is an order of nature

Third, it is proceeded thus. It seems that in the divine persons there is not an order of nature. For whatever is in the divine things is either essence, or person, or notion. But order of nature does not signify the essence, nor is it any one of the persons or of the notions. Therefore order of nature is not in the divine things.

1. Moreover, in whatever things there is an order of nature, one is prior to another, at least according to nature and intellect: but in the divine persons there is nothing prior and posterior, as Athanasius says. Therefore in the divine persons there is not an order of nature.[973]
2. Moreover, whatever is ordered is distinguished; but nature in the divine things is not distinguished. Therefore it is not ordered; therefore there is no order of nature there.
3. Moreover, the divine nature is the same as the essence. But in the divine things an order of essence is not said. Therefore neither an order of nature.

But on the contrary: Wherever there is a plurality without order, there is confusion; but in the divine persons there is not confusion, as Athanasius says. Therefore there is order there.

I answer: Order is always said through a comparison to some principle. Hence just as "principle" is said in many ways, namely, according to position, as a point; according to intellect, as the principle of demonstration; and according to the individual causes; so too is "order" said. But in the divine things "principle" is said according to origin without priority, as was said above. Hence there must be there an order according to origin without priority. And this is called "order of nature" according to Augustine: not that the one be prior to the other, but that the one be from the other.[974][975][976]

Reply to the first: The order of nature signifies the notion of origin in common, not however in particular.

975. Ex l. 4 super Gen., c. 34 et 35, 10, 3 (as cited).
976. Ex oratio de quinque haeresibus, a med., tom. 7 (as cited).

Reply to the second: In created things also, when that which is from a principle is coeval with its principle according to duration, nevertheless the principle is prior according to nature and intellect, if one considers that which is the principle. But if the relations themselves of cause and caused, and of principle and principiate, are considered, it is manifest that relatives are simultaneous by nature and intellect, insofar as the one is in the definition of the other. But in the divine things the relations themselves are subsistent persons in one nature. Whence neither on the part of the nature, nor on the part of the relations, can one person be prior to another, not even according to nature and intellect.

Reply to the third: It is called order of nature, not because the nature itself is ordered, but because order in the divine persons is attended according to natural origin.

Reply to the fourth: "Nature" in a certain manner imports the notion of a principle, but "essence" does not. And therefore the order of origin is better named "order of nature" than "order of essence."

Conclusion of the article, and explanation: The conclusion of the article is: in the divine things there is an order of nature without priority. For whose explanation it is to be noted from St. Thomas in the solution to the third and from Cajetan on this article, that the question is not whether among the divine persons there is an order of nature, as if the divine nature itself were that which is ordered; but whether there is an order of nature, that is, a natural order, or not. It is called rather an order of nature than of essence; as St. Thomas in the reply to the fourth teaches, because "nature" in a certain way denotes origin, not however "essence": but order in the divine things is according to origin. I, however, understand here the order of nature, that is, real and from the nature of the thing, which St. Thomas calls "natural," which is not fittingly explained by the efficient notion: for "natura" among the Latins rather means "birth" than "essence." But concerning this order and priority we shall speak in the following disputation.

Disputatio CLXVII - Whether among the divine persons there is an order of prior and posterior according to reality

What the Scholastics hold. Caput I. That among the divine persons there is not only order, but that one is prior according to reality by origin to another, the more probable opinion teaches. Caput 2.

Caput I - What the Scholastics hold

The present controversy is not whether the essential predicates in God are prior to the notional ones; for of these it has been said often that they are indeed prior in our consideration, just as the common are prior to the particular, as animal to man; for that is prior which can be understood without another. Nor is the question whether some person, at least not expressly related to others, can be thought by us prior in reason to the others; of this indeed we spoke in Disputation 159, especially in chapter 5. St. Thomas plainly admits in q. 40, a. 4 that something can indeed be

understood first, although in this article he says that there is order among the persons without priority. But the difficulty is about the persons mutually related in act; whether among them there is some order natural and real with priority. I will therefore in this chapter report the opinions of the Scholastics; and in the next I will set forth my own judgment.

All indeed the Scholastics admit that among the persons mutually and their relations there is a natural and real order. For, as Durandus says in I, dist. 20, q. 1, order is the habitude of many to one first; with whom St. Bonaventure agrees in I, dist. 2, and in the First Question, and so too in the Third. But in the divine persons, even mutually related in act, there is a real habitude to one first; and a real habitude to one first, or to one principle; for one is said to be relatively to another; therefore among the others there is a natural and real order. Cameracensis (Augustine of Ancona) defines order in this way... (text to be continued).

Caput II - Whether among the divine persons there is not only order, but that one is prior in reality according to origin

St. Thomas in this article and St. Bonaventure in the places cited, especially in Question 1 and 2, in the body and to the first, do indeed concede a real order, which they call according to nature, but without a before and after. To these Durandus agrees in the place cited, adding that this order is between first, second, and third (for by his very definition first and second in an order cannot be denied), yet that this order is not between prior and posterior. He therefore concedes what others would not deny, namely a first, a second, and a third person; but not a prior and a posterior; because in the divine things there is nothing before or after, according to Athanasius in the Creed. [977]

Second opinion, that there is priority of origin according to the thing. Scotus, in II, distinction 1, question 1, everywhere calls the Father prior in origin to the Son, and both prior to the Holy Spirit. And in I, distinction 10, question 1, toward the end, he grants a priority of origin among the persons, and that one can be understood before another in origin. But in those places he is speaking of a prior according to our intellect by reason of origin; because the person from whom another proceeds can be conceived before the one proceeding, not conversely. Now, however, the question is not about prior and posterior in our consideration, even by reason of origin; but about prior and posterior according to the thing among the persons, even as mutually related in act. Our consideration indeed merely conceives one person before another, before it understands it as related; for it could not conceive one as related before another, as we shall see in the next chapter.

Moreover, the same Scotus in I, distinction 28, question 3, § Ad quaestionem istam, and in Quodlibet 4, article 1 and 9, maintains, against arguments to the contrary, that the Father and the Son, even as they are mutually referred in act, have between them an order of prior and posterior according to origin. Which kind of prior and posterior, he says, is real, not according to reason, nor according to nature; because relatives are together by nature and by intellect. As to intellect, this is quite manifest; as to nature, it is clear from Aristotle, Metaphysics VI, text 16 and chapter 11, where

977. Durandus, In I Sent., dist. 20, q. 2; St. Bonaventure, In I Sent., dist. 2, art. 2, q. 1 - 2; Athanasian Creed.

he says that is prior by nature which can be without the posterior; as, in creatures, the cause is prior to the effect. He proves, moreover, that among relatives there is not a prior by nature nor by intellect. First, by reason that Aristotle, Metaphysics VI, chapter 7, text 15, says that the more perfect are prior, and thus he establishes a certain genus of prior according to perfection; and one correlate can be more perfect than another, even under the ratio of a correlate; therefore also prior. But this can happen only in relatives that are of diverse ratio, such as in the divine the Father and the Son, which logicians call non-equiparant correlatives (relata disquiparantiae). Yet this reason does not prove that among the divine persons there can be this kind of prior, since one cannot be said more perfect than another, even as correlatives. It does prove, however, that there is no repugnance for there to be among relatives in general something prior and posterior in reality. Wherefore it is not surprising if in the divine also, under another ratio, a prior and a posterior be assigned.

Next, he confirms the same, because, as he himself says, simultaneity, which is opposed to one kind of priority, can co-exist with another to which it is not opposed: now to be together in intellect and in nature is not opposed to what is prior according to origin; therefore one person can be together in intellect and in nature with another, and prior in origin to it. The opinion of Scotus pleases the Canarian in this article, although he says it is against St. Thomas, or at least that it differs from him only in name. Cajetan also admits that Scotus in reality agrees with St. Thomas; but, he says, let him hold the opinion and restrain his tongue: because, when he concedes prior and posterior in the divine according to the thing, he seems to assert that one is older than another.[978]

Inter divinas personas non solum esse ordinem, sed unam priorem secundum rem origine, quam aliam, probabilior sententia docet.

Although the present controversy is not of things but of words, and concerns the mode of speaking that St. Thomas and others have followed, which is not without great probability; nevertheless, the way of speaking and the sentence of Scotus seem to me to be asserted and proved in this chapter, in so far as he affirms that among the divine persons one is, according to the thing, prior in origin to another; which I think I can gather both from the ratio of prior and posterior, and from the manner of speaking of the holy Fathers.

It is proved first from the Fathers. Epiphanius, whom St. Thomas cites at length in the Opuscule Contra errores Graecorum, cap. 2, and Gregory Nazianzen, whom he adduces in cap. 9, assert that the Son is a mean between the Father and the Holy Spirit; which mode of speaking Basil also preserved. Basil, Against Eunomius, book 3, at the beginning, concedes a first, second, and third person in the Trinity in dignity and in origin; and from him John the Theologian took it up in the Council of Florence, session 20, past the middle.[979] But someone will say that Durandus does not deny first, second, and third in the divine persons according to a natural and real order; but only a

978. John Duns Scotus, In II Sent., d. 1, q. 1; In I Sent., d. 10, q. 1; In I Sent., d. 28, q. 3, § Ad quaestionem istam; Quodlibet IV, a. 1, 9; Cajetan, In S. Thomae I, q. 42, a. 3 - 4, ad loc.

979. Epiphanius, as cited by St. Thomas, Opusc. Contra errores Graecorum, c. 2; Gregory Nazianzen, Or. 9; Basil, Contra Eunomium, lib. 3 (init.); idem, Contra Eunomium, lib. 1 (fine); Council of Florence, sess. 20; Author of De triplici habitaculo apud Augustine, c. 6; St. Augustine, Contra Maximinum, lib. 3, c. 14. Aristotle, Metaphysics VI, c. 7, text 15; VI, text 16; XI.

prior and posterior according to that same order. Yet from this we shall at once, by an easy reason, collect that there is a prior and a posterior; it must be observed, however, in the meantime, that when Basil calls the Father first in dignity, he does not so name him because he is more perfect and of greater dignity, but because he has the authority of the first principle.

More clearly, however, the same Basil establishes our sentence in book 1 against Eunomius, far toward the end, where, treating of the order of origin between the cause and that which is from the cause, he says thus: "For in these things we say the cause is prior, and posterior that which is from it, not by interval but" - not as if they were mutually separated by intervals of duration, but in our thought, when we first understand the cause of causes. Since therefore such a position obtains, to deny order in those things wherein there is a before and after is not to deny our positing, but a certain natural consequence. And after many things he explains that statement, John 10: "The Father is greater than I," of the prior according to origin, so that he is called greater because he is prior, inasmuch as he is cause, as the Greeks speak: for thus some of the Fathers, even the Latins, by the name of greater and less, understand in the divine a prior and posterior according to origin; whom we reported in Disputation 122, cap. 3. Basil therefore affirms that among the divine persons there is a before and after, not by our positing, but by a natural consequence; which is tantamount to a natural and real order: for if it were only an order of reason, it would indeed be by our positing. Nor does it stand in the way that he a little before said, "but in our thought, when we first understand the cause of causes": for he said this only to show that the cause and the caused are not separated by any interval of duration, but by our thought; this, however, does not hinder that there be also a prior not only by thought, but also by a natural and real order.

In the same way Gregory Nazianzen is to be understood, in the Oration on the Dogma and Constitution of Bishops, which is Oration 9, at number 13, where he says: "Thus the Father's essence concurs with the generation of the Only-begotten, who indeed is from him, yet not after him, or at least only by the ratio of principle:" for he does not mean that the Son is after the Father by our consideration alone, but by the consideration of principle alone; that is, not posterior in duration (about which he had spoken much earlier there), but by the ratio of principle, namely in that way by which what is from a principle is said to be posterior to the principle itself. The author also of the book De triplici habitaculo, apud Augustine, cap. 6, near the end of the book, says: "The Father does not precede the Son in time, but in origin." Therefore, since Augustine himself, Contra Maximinum, book 3, cap. 14, thus writes: "For it was fitting that the Begotten be sent by the Begetter, not the Begetter by him whom he begot; but this is not an inequality of substance, but an order of nature, not whereby one would be prior to the other, but whereby one would be from the other"; and Athanasius in the Creed, when he says, "In this Trinity nothing is before or after," plainly speak of a prior and posterior according to duration. For these are what are commonly signified when one says absolutely "before" and "after"; but when we add "according to origin" or "according to the natural order and consequence," as Basil said, it is not necessary to understand this priority of duration.

Second, I prove this sentence by reason; for in the Trinity it cannot be denied that there is a first, a second, and a third person, not only by the numbering of our intellect, but from the nature of the thing, according to a real order. For the first is in such wise the Father, and the second the Son, and the third the Holy Spirit, that it cannot be otherwise: but if it were only by the numbering of the intellect, the Holy Spirit could be called first, the Father second, and the Son third; for the one who counts can as well begin from this unity as from that, and can end in this as in that. From this very order of first, second, and third - besides the testimonies of the saints alleged - the very definition of order shows it. For order is the habitude of many to one first, as Durandus says; or to one principle, as St. Thomas said: but "one principle" and "one first" seem to be the same; for every principle is first in some order, from which the rest [are]; but in the divine there is a real and natural order, as all the Schoolmen admit, and that John the Theologian above mentioned; therefore from the nature of the thing there is a first, second, and third person. For if "first," "second," and "third" were only by the numbering intellect, there would not be order among them according to nature, but according to our intellect.

Add also that up to now no one has denied that in the Trinity there is a first, a second, and a third person: indeed we commonly speak thus. And we always call the Father the first, the Son the second, and the Holy Spirit the third, and not otherwise. But if first, second, and third among the persons were only according to number, this one would not be more first than that one, as we just said; rather, in every order every first is prior to the second, and the second posterior to the first, and so with the rest. Therefore, in the real order of the Trinity the first person will be prior to the second, and the second will be posterior according to reality; for whatever is first in its order is prior to the second.

Moreover, that this kind of prior and posterior may be better understood, first the doctrine of Aristotle must be recalled to mind, in Metaphysics V, chapter 11, where he assigns several modes of the prior: the first is according to nearness of place; the second is according to time; the third is according to motion, according to which those things are called prior which are nearer to the mover, as the boy to the man; the fourth is according to potency, for that which surpasses others in potency and is stronger is said to be prior to the rest; the fifth is according to order of place. From these things it is evident - especially that third mode - that the Son seems, as it were, nearer to the Father as mover than the Holy Spirit, because he proceeds from him first, which seems to be a mode of the prior according to origin. But because Aristotle seems to have understood nearness according to the duration of the moving principle, this mode of the prior does not square with the divine persons unless that imperfection of nearness according to duration is removed. For if nearness of origin alone be considered, the Son seems nearer to the Father, because from him he emanates in origin sooner than the Holy Spirit, who by the nature of his own origin presupposes the Son as already produced, that he may proceed from both. The sixth mode of the prior is according to reason, and these are the universals, and the singulars according to sense, and those which according to their nature can exist without others. From these it follows, in my judgment, that things which are really distinguished must not only be said to have an order of prior and posterior according to reason, but also according to reality and nature, as cause and effect: for

things that differ only by reason cannot have an order except that of reason, just as they do not have plurality except by reason, as are animal and man; for animal is prior to man, because it can exist without man; and, in general, that from which the consequence of reciprocation does not hold, as the same Aristotle noted in the Categories, the chapter On the Modes of the Prior.[980] But this order and mode of the prior according to reason is assigned among the common predicates in divine matters, both essential and personal; among the persons, however, as related, it cannot be, because relata are known together. It remains, therefore, that in another mode - which Aristotle did not know nor number - the prior and the posterior among related persons must be assigned, namely according to origin, which can be among those things which are together in nature and in cognition, although not all relata are together in nature. Moreover, this order can be reduced to the fifth which we numbered from Aristotle, with the imperfections removed, as was explained, so that he is called prior by origin - even under the relative concept - who is from no other, and posterior, who is from another. And from these points any arguments that can be brought to the contrary are solved.

Then it must be noted that, even if there be among the persons an order of prior and posterior according to reality, as was explained, still it is not lawful absolutely to call one person prior to another, unless with the addition, "according to origin." For when we do not add "according to origin," but speak absolutely, in that we say one person is absolutely prior according to reality than another, we seem to signify some priority of duration, which cannot agree to the divine persons; but with that addition we do not signify that. And indeed with that addition St. Thomas would not deny this mode of speaking.

Disputatio CLXVIII - Whether opposed origins, distinct according to reality, have among themselves an order of prior and posterior

Caput I - The opinions of St. Bonaventure and Durandus

It seemed that concerning the origins there remained difficulty in excess; for from the things said about the order of the persons one could easily judge what should be said about the order of the origins. But because some have thought variously, a special disputation had to be instituted.

First opinion. St. Bonaventure therefore, on the First Book, distinction 12, question 4, teaches that the procession of the Word is prior according to the intellect to the procession of the Holy Spirit; whence also it follows that one origin is prior to another according to the intellect.[981] For where there is order, there is a before and an after, as we said in the preceding disputation, chapter 2. Yet in question 2 he denies that one origin is by nature prior to another; and whether there be an

980. Aristotle, Categories, ch. On the Modes of the Prior; Metaphysics V, c. 11.
981. St. Bonaventure, In I Sent., d. 12, q. 4; cf. Durandus, In I Sent., d. 12, q. 1; Aristotle, Posterior Analytics I, c. 4.

order according to nature he does not determine. Perhaps he would also grant this order without a "prior" and a "posterior," just as among the persons he granted it in the preceding disputation, chapter 1.

Second opinion. Durandus indeed, on the First Book, distinction 12, question 1, mentions this opinion of Bonaventure, which posits order among the origins, and he confirms it in this way: the Holy Spirit proceeds per se from the Son; therefore the procession per se presupposes the generation of the Son, from whom he proceeds; and so the procession per se presupposes generation. But he disapproves this mode. For Aristotle, in the First Analytics, the Posterior Analytics, chapter 4, teaches that the same thing does not belong per se and according to what the thing is in a different way; but to "breathe forth" (spirare) does not belong to the Son according to that he is Son; therefore to breathe forth does not belong per se to the begotten, and consequently the procession of the Holy Spirit does not per se presuppose generation. Wherefore, in number 8 of that question, he himself asserts that between generation and procession there is indeed an order of origin natural, that is, according to reality, as among the persons; yet that it is not per se, but per accidens.

For the explanation of which, it must first be noted that no action depends upon another action or has an order per se with it, unless because the terminus of the preceding is per se the principle of the subsequent. Now the preceding action can be compared to the subsequent in a twofold way. In one way, so that it produces a terminus which is per se the principle of the following, as the prior calefaction produces heat which is per se the principle of the following calefaction. In another way, so that the preceding action produces a terminus which is per accidens conjoined to the principle of the following action, as refrigerating and the disgregation of sight stand; for refrigerating per se tends to cold, which is per accidens conjoined to whiteness, which disgregates sight. Next he notes that the preceding action remains conjoined to the terminus whenever the terminus depends upon the agent both for its coming-to-be and for its conservation.

From these two notes Durandus gathers this reasoning: whenever the preceding action produces such a terminus as, precisely as it is such, and per se, is the principle of the following, those two actions have a per se order, such as can be among actions; for one action has no order with another, just as neither does one depend upon another, except by reason of the terminus produced. But when the preceding action only produces a terminus that is per accidens conjoined to the principle of the following, and the preceding action does not remain with the following, for a twofold reason they have among themselves an order per accidens, both because the terminus is per accidens conjoined to the principle, and because the preceding action does not remain. Now, however, in the divine things the origins have among themselves only in one respect an order per accidens, because the first produces a terminus to which it happens to be the principle of the following, since to the Son, precisely as he is Son, it does not belong to breathe forth, although, precisely as he is Son, he is the terminus of generation.

Not less per se is there a real order of prior and posterior among the origins than among the persons: this is the truer opinion.

Caput II - The author's thesis

The position to be embraced is the one which affirms that among the passive origins there is a real order of prior and posterior, no less per se than among the persons. For the reasoning of Durandus is frivolous, as will presently be clear. The Schoolmen do not expressly hand down this opinion; yet in my judgment they presuppose it as a known point - not, indeed, as regards the notion of the prior and the posterior (for about this the controversy is the same concerning the origins as it was concerning the persons), but as regards the natural and real order per se. About "prior" and "posterior" nothing need be said now; but this thesis ought to be proved in the same way as in the preceding disputation that about the persons was proved. About the order itself per se, what we said above can easily be confirmed in this way.

It is proved. A per se order between two actions can be considered in a twofold way. In one way, because the preceding action produces a terminus according to that notion to which it belongs per se to be the principle of the subsequent: and thus the preceding calefaction and the subsequent are per se ordered, because the preceding produces heat which is per se the cause of the subsequent calefaction; and the generation of a son among men and of a grandson who is generated by the son have a per se order: indeed, even refrigerating and the disgregation of sight are ordered in the same way at least remotely, because refrigerating tends to cold, which is per se the cause of whiteness, which then disgregates sight. In another way, when the prior action is terminated at a cause to which the following action is essentially subjected; for which reason philosophers call the causes essentially subordinated to the generation of a man universal causes, and the man (namely, the generator); but the other men who have preceded the generator - grandfather, great-grandfather, and the rest - are called causes per accidens of the subsequent generation. Now the procession of the Holy Spirit in the divine things has a per se order with generation in both ways: both because generation is terminated in the Son, to whom it belongs per se to breathe forth; and also because these processions are essentially ordered among themselves, that is, in the way in which philosophers call causes subordinate, one procession following upon the other. But that the Son per se breathes forth is manifest; for although to filiation - which Durandus falsely thought to be the formal terminus of generation - it does not belong to breathe forth, yet to the person of the Son, who is per se the terminus produced, it does belong to breathe forth, and he is truly said to breathe forth "insofar as he is Son," not because filiation breathes forth - that the particle "insofar as" (inquantum), or "according to that" (secundum quod ipsum), or "per se," does not signify - but because such a characteristic property is produced that he has the fecundity of breathing forth. For he has this by the force of his origin, which takes the nature that is the formal terminus of generation, as was said in disputation 162, chapter 3, thus determined by a property that by its very nature he breathes forth. Therefore, although it cannot be said, "the Son breathes forth by that by which he is Son," we nevertheless say, "he breathes forth according as he is Son," or "insofar as he is Son," which is the same as if we should say, "the Son per se breathes forth, not per accidens." The

difference between the particles "insofar as" (inquantum), "in a certain respect" (secundum quid), and "per se," and the particle "by that by which" (eo) we assigned above in the annotations to article 6, question 39.

Lastly, it must be observed that although among persons actually related there is a real and natural order and a priority according to origin, nevertheless one is not prior to another according to reason, as was noted above; among the passive origins, however, not only is one prior to another by a real and natural order, but also by reason, as St. Bonaventure taught, because the passive origins are not mutually related, namely, to be generated and to be spirated; and thus also by the intellect we conceive prior "to be generated" than "to be spirated," although we do not understand the Father as related prior to our understanding the Son.

Articulus IV - Whether the Son is equal to the Father according to magnitude

To the fourth we proceed thus. It seems that the Son is not equal to the Father in magnitude.

For he himself says in John 14: "The Father is greater than I." And the Apostle, 1 Corinthians 15: "The Son himself will be subject to him who put all things under him."

Further, paternity pertains to the dignity of the Father; but paternity does not belong to the Son; therefore not whatever dignity the Father has does the Son have. Therefore he is not equal to the Father in magnitude.

Further, wherever there is a whole and a part, several parts are something greater than only one or fewer, as three men are something greater than two or than one. But in the divine things there seems to be a universal whole and a part. For under relation or notion several notions are contained; therefore, since in the Father there are three notions, but in the Son only two, it seems that the Son is not equal to the Father.

But on the contrary:

But on the contrary: It is said Philippians 2: "He did not deem it plunder to be equal to God."[982]

I answer that it is necessary to say that the Son is equal to the Father in magnitude. For the magnitude of God is nothing other than the perfection of His nature. Now it belongs to the very notion of paternity and filiation that the son, by generation, arrive at having the perfection of the nature that is in the father, just as the father has it. But because in men generation is a certain transmutation of what goes forth from potency into act, a man who is a son is not from the beginning equal to the begetting father, but is led to equality by due increase - unless it happen otherwise on account of a defect of the principle of generation. It is, however, manifest from the things said that in the divine there is properly and truly paternity and filiation. Nor can it be said that the power of God the Father was defective in begetting, nor that the Son of God came to perfection successively and by transmutation. Hence it is necessary to say that from eternity He was equal to the Father in magnitude. Whence also St. Hilary says in the book De Synodis: "Take

982. Philippians 2.

away the infirmities of bodies, take away the beginning of conceptions, take away sorrows and every human necessity: every son, according to the nature of his nativity, is the equality of the father; for he is also the likeness of nature."[983]

Reply to the first: Those words are understood to be said of Christ according to the human nature, in which He is less than the Father and subject to Him. But according to the divinity He is equal to the Father; and this is what St. Athanasius says: "He is equal to the Father according to the divinity, less than the Father according to the humanity."[984] But according to St. Hilary, in the ninth book On the Trinity, "by the authority of the giver the Father is greater, yet He is not less to whom it is given to be." And in the book De Synodis he says that "the subjection of the Son is a natural piety, that is, a recognition of the paternal authority." The subjection, however, of the rest is a weakness of creatureliness.[985]

Reply to the second: Equality is considered according to magnitude. But magnitude in the divine signifies the perfection of nature (as has been said), and pertains to the essence. And therefore in the divine equality and likeness are considered according to what is essential; nor can inequality or dissimilarity be asserted according to the distinction of relations. Whence St. Augustine says against Maximinus: "The question of origin is, of what is from what; but the question of equality is, of what sort or how great it is."[986] Therefore paternity is the Father's dignity, just as is the Father's essence. For dignity is absolute and pertains to the essence. Accordingly, as the same essence which in the Father is paternity, in the Son is filiation, so it is truly said that whatever dignity the Father has, the Son has. Nor does it follow, "the Father has paternity, therefore the Son has paternity." For something is changed into the mode of "toward another." For the essence and dignity of the Father and of the Son are the same; but in the Father they are according to the relation of giving, in the Son according to the relation of receiving.

Reply to the third: Relation in the divine is not a universal whole, although it is predicated of like relations; because all the relations are one according to essence and existence, which is repugnant to the notion of a universal, whose parts are distinguished according to existence. And similarly the person (as was said above) is not a universal in the divine. Whence neither are all the relations something greater than only one, nor are all the persons something greater than only one; because the whole perfection of the divine nature is in each of the persons.

Conclusion: The conclusion is affirmative, concerning which nothing need be noted besides those things which we have said about the relations of equality and likeness among the persons in Disputation 169.

Articulus V - Whether the Son is in the Father, and conversely

It is objected first that the Son is not in the Father, and conversely. For the Philosopher in Physics IV sets down eight modes of something's being in something; and according to none of these is the Son in the Father, or conversely, as is clear to one running through the several modes. Therefore the Son is not in the Father, nor conversely.[987]

1. Further, nothing which has gone forth from another is in it; but the Son from eternity went forth from the Father, according to Micah 5: "His going forth is from the beginning, from the days of eternity." Therefore the Son is not in the Father.
2. Further, one of opposites is not in the other. But the Son and the Father are opposed relatively. Therefore the one cannot be in the other.

But on the contrary: It is said in John 14: "I am in the Father, and the Father is in me."

I answer that in the Father and the Son there are three things to consider, namely the essence, relation, and origin; and according to each of these the Son is in the Father, and conversely. For according to the essence the Father is in the Son, because the Father is His essence, and communicates His essence to the Son not by any transmutation of Himself. Whence it follows that, since the essence of the Father is in the Son, the Father is in the Son. And likewise, since the Son is His essence, it follows that He is in the Father, in whom His essence is. And this is what St. Hilary says in the fifth book On the Trinity: "His nature (so to speak) the immutable God, begetting the immutable God subsistent, follows. Therefore we understand the nature of God to be in Him, since in God God is within."[988] Likewise, according to the relations, it is manifest that one of relatives is in the other according to the intellect. Also according to origin it is manifest that the procession of the intelligible word is not something outside, but remains in the one speaking. That also which is said by the word is contained in the word. And the same reason holds of the Holy Spirit.

Reply to the first: The things that are in creatures do not sufficiently represent the things that are of God. And therefore according to none of those modes which the Philosopher enumerates is the Son in the Father, or conversely. Yet that mode according to which something is said to be in its originating principle comes nearer to this - except that in created things there is lacking the unity of essence between the principle and that which is from the principle.

Reply to the second: The going forth of the Son from the Father is according to the mode of an interior procession, as a word goes forth from the heart and remains in it. Hence this going forth in the divine is according to the mere distinction of relations, not according to any essential distance.

Reply to the third: The Father and the Son are opposed according to relations, not however according to essence; and yet one of relatives is in the other, as has been said.

Conclusion: The conclusion is affirmative, and of faith. John 14: "I am in the Father, and the Father is in me."

988. St. Hilary, De Trinitate V.

By what ratio one person is said to be in another. Disputation 169.

One person is not in another according to the whole, holds Henricus. Caput I.

One person is wholly in another, and conversely, is a probable opinion. Caput II.

Disputatio CLXIX - By what ratio one person is said to be in another

Caput I - The sense of the doubt; Henricus; the first opinion

No Scholastic denies that the Son is in the Father, and the Father in the Son, and in the same way that one person is in another, since in John 14 it is said, "I am in the Father, and the Father is in me." But whether truly one person is in another according to the whole self, or according to some part of itself, is a matter of controversy among the Scholastics. Henricus in his Summa, as is reported by Scotus on the First Book, distinction 19, question 4, article 2, and question 5, on the first point, judges that one person is not in another according to the whole self, but according to something of itself, that is, according to the essence; to which Durandus seems to consent on the First Book, distinction 19, question 3.[989] For the explanation of whose opinion Henricus notes that something is in another in two ways: first, according to the whole self, as wine is in a jar; then according to a part which is not common to both, as a bird is said to be in a snare according to its feet, which are parts of that bird; in another way, according to something which is common to both, as if there were a monster (he says) having two heads, and two bodies to which only two feet served, one of these animals would be in the other according to a part common to both. Thus therefore he says that one divine person is in another not according to the whole self; for then it would be according to essence and according to relation; and thus not only would the essence be in the Son but also paternity, which seems absurd, because thus the Son would be Father and the Father Son; but according to something of itself, namely according to the essence which is common to both. He then confirms this by the following reason: it is impossible that one, according to the whole self, seem to be contained in another, and then, in turn, that that should be shown to be also according to the whole self; therefore neither can one divine person be in another according to the whole self, and conversely, but only according to something of itself. This opinion Scotus refutes in that question.[990]

Then he (Scotus) attacks Henricus better in this way. When something is in another by reason of a part, it is not in it in any other way than by reason of that part; for example, if a part of one thing is in another as in a place, the whole will be said to be in it by the same reason. If therefore one person is said to be in another by reason of essence only, that is, because only the essence of that person is in the other, one person will not be in another in any other way than essence itself;

989. Henricus of Ghent, Summa; Scotus, In I Sent., d. 19, q. 4, art. 2; q. 5; Durandus, In I Sent., d. 19, q. 3.
990. Scotus, loc. cit.

but essence is said to be in the person as that person's nature, and not by circumincession (as it is wont to be said); therefore one person will not be in another by circumincession. Then also the same person would be said to be in itself.

One person wholly to be in another, and conversely, is a probable opinion.

We prove the opinion of Scotus, which Cajetan and the Canarian without doubt follow in this article, and St. Bonaventure seems to consent on the First Book, distinction 19, question 4, and Gabriel, question 2, article 1, and Capreolus, question 1; and others of the third (order), and the Ferrariense; and the Fourth book Contra Gentes, chapter 9, at the beginning; and also the Master on the First, question 2, article 2, seem to say that one whole person is in another by circumincession, so that not only the one essence be in the other - although the essence be in the other thus as common essence - but that also one person be said to be in the other person.[991] It is proved first from St. Hilary, who in the seventh book On the Trinity, near the end, thus speaks: "To be in Himself before He is in another, as body in body - not so, but to be as subsisting, as a subsistent in a subsistent, as living as it is, as He Himself subsists." In which words, while explaining the mode in which one person is said to be in another, he has expressed our very sentences. For since persons primarily contain their being, and are in another person as a subsistent in a subsistent, it follows that they are in it according to the whole self. Then the series of praises given by the Church in the hymn of St. Ambrose declares this: "In the Father the Son is whole, and whole everywhere the Father." For he who is in another according to something is not said to be whole in another. In this sense Scotus notes the ordering of the sentence, that something of them agrees in one of two ways: either according to the whole self, or according to a part; according to a part, as for example when the eye is healed, the man is said to be healed by that part first, since the part ...[992]

Durandus rightly meets this reason in the place cited; for he says that the relation which Scotus alleges is not of the same notion in either extreme: in one person there is a relation as of the contained, in the other a relation as of the containing, although each relation be found in one person with respect to the other. Yet from the relation of container and contained, on which Scotus seems to argue, he does not rightly infer what he contends.

Then he attacks Henricus better in this way. When something is in another by reason of a part, it is not in it otherwise than that part is: for instance, if a part of one thing is in another as in a place, the whole will for the same reason be said to be in it. If therefore one person is said to be in another by reason of the essence only, that is, because the essence alone of that person is in the other, one person will be in the other in no other way than the essence itself is: but the essence is said to be in the person as its nature, and not by circumincession, as it is said; therefore one person will not be in another by circumincession. Then too the same person would be said to be in itself.

That one whole person is in another, and conversely, is the more probable opinion.

991. Cajetan and the Canarian (on this article); St. Bonaventure, In I Sent., d. 19, q. 4; Gabriel, q. 2, art. 1; Capreolus, q. 1; Ferrariense; St. Thomas, Summa contra Gentiles IV, c. 9 (at the beginning); the Master, In I, q. 2, art. 2.

992. St. Hilary, De Trinitate VII; Ambrose (Ambrosian hymn): "In Patre totus Filius, et totus ubique Pater."

The opinion of Scotus is proved by many, and without doubt it is followed by Cajetan and the Canarian in this article, and St. Bonaventure seems to consent in I Sent., d. 19, q. 4, as do Gabriel in q. 2, art. 1, and Capreolus in q. 1.[993] Ferrariense also on Contra Gentiles IV, c. 9 at the beginning, and Marsilius on I, q. 22, art. 2, hold that the whole one person is in another by circumincession, so that not only is the essence of one said to be in another, although the mode of existing be only the common essence, but also that one person is said to be in another.[994]

It is proved first from St. Hilary, who in De Trinitate VII near the end speaks thus: "To be in another is not as a body is in a body, but to be and to subsist so that, subsisting, it be in the subsisting; for to be in the 'to be' is that it itself subsist." In these words, by explaining the mode in which one person is said to be in another, he expressed our very opinion. For since it belongs first to the person to subsist, and it is in another person as subsisting in the subsisting, it follows that it is there according to itself wholly.[995]

Then the Church sings in the Ambrosian hymn at Lauds on Monday: "In the Father the whole Son, and the whole Father in the Word." But one who is in another according to something is not said to be wholly in another.[996]

In confirmation of this opinion Scotus notes that something agrees to a whole in one of two ways: either according to the whole self, or according to a part. According to a part, as when the eye is healed, the man is also said to be healed; yet in the first instance this agrees to the part, and by reason of it to the whole. Aristotle mentions this in Physics, book I, chapter 1. But that agrees to something according to the whole self which does not agree first to a part, as it agrees to a triangle, according to the whole self, first to have three angles equal to two right angles. In the same way, to be in something agrees to something in these two modes: either according to the whole self, because the whole is in another; or according to a part, or according to something of itself, because something of itself is in another; and so it agrees first to the part to be in another. But the whole Father is in the Son, and conversely, and each person whole is in the other; therefore this mode of existing does not agree to the persons according to something of themselves. That the whole Father is in the Son, besides the sayings of the Saints which we have alleged, is confirmed by the common way of speaking; for the person as subsisting exists in another as subsisting; but to subsist belongs first to the whole; therefore also to exist in this mode.

Yet Scotus, Cajetan, and the others who follow the latter opinion concede the reason and foundation on account of which one person exists in another to be the common essence, the three persons, however, being connoted; so that this mode of existing does not agree first to the essence (as in Henricus's example, to be caught in a snare agrees first to the feet of the animal, and by reason of them to the whole), but so that it agrees first to the whole supposit, while the foundation is the common essence. By which Henricus seems to have been deceived so as to follow the earlier

993. Cajetan and the Canarian (on this article); St. Bonaventure, In I Sent., d. 19, q. 4; Gabriel, q. 2, art. 1; Capreolus, q. 1.

994. Ferrariense, on Contra Gentiles IV, c. 9 (at the beginning); Marsilius, on I, q. 22, art. 2.

995. St. Hilary, De Trinitate VII (near the end).

996. Ambrosian hymn: "In Patre totus Filius, et totus in verbo Pater."

opinion. Rightly therefore did St. Bonaventure say in the place cited, that to exist in this way by circumincession is thus denoted by unity with distinction, that the unity is undivided and the distinction without confusion. When therefore Henricus argues against this opinion that the relation of the Father is in the Son, if the Father is, according to the whole self, in the Son, it must be conceded in such wise that the mode of existing of paternity in the Son is not as of an inhering form, but as of one subsisting with the Father in the subsisting Son, which is called the mode of circumincession.

Nor is it against this that St. Thomas taught in this article, when he said that one person is in another also by reason of relation. For, as Cajetan very well noted, the holy Doctor did not wish to say that one person is in another by reason of relation in that mode of circumincession; for the sole reason of this is the essence, as we have explained; but as one correlate is in another, to wit, in concept and intellection. Wherefore Durandus and Scotus labor in vain when they try to impugn this doctrine. And what St. Thomas also said, namely that one person is in another by reason of an immanent operation, is excellently defended by Cajetan against the Author's arguments, which are of no moment.

But someone will ask whether there is a different foundation for the relation by which one person is said to be in another and to be contained by it, and for the relation of that person who is said to contain and in whom the other is. Durandus judges that the reason and foundation on account of which one person is said to contain another is the person according to the whole that is in it, that is, according to property and essence together; but that the foundation on account of which one person is said to be in another is the essence alone: because that which contains is compared to that which is contained as exceeding it. Nor is this surprising in Durandus's opinion, who with Henricus thinks that one person is in another according to something of itself, but is contained by the other as a whole. However, I deem it truer that the very same thing is the foundation, namely the common essence, with the persons connoted; and that it is at once the foundation of a diverse relation in distinct persons, namely of the containing and of that which is contained; which respects nevertheless agree first to the whole person, not to the essence. This foundation of circumincession Hilary seems to have explained in De Trinitate II near the end, with these words: "For the Father to remain in the Son is not [the property] of one who is solitary or unique," as if to say, this mode of existing denotes plurality.[997]

Finally note that this relation is not real, but by everyone's judgment of reason. First indeed, if it agreed first to the essence, as the prior opinion seems to assert, it would not be real, just as neither is the relation of similarity and equality real; then also even if it agrees first to the persons, because still it agrees to them insofar as they are distinct and are distinguished by real relations, and one real relation cannot be referred to another real relation, as was said in Disputation 166, chapter 4, it cannot be real, but only of reason; by which we wish to signify nothing else according to the thing than one absolute essence in three persons. We use, however, names of relation, because it is proper to us in this life almost to know all things relatively.

997. St. Hilary, De Trinitate II (near the end): "Manere in Filio Patrem non est singularis aut unici," etc.

Articulus VI - Whether the Son is equal to the Father according to power

The text proceeds thus. It seems that the Son is not equal to the Father according to power. For it is said in John 5: "The Son cannot do anything of himself, but what he sees the Father doing." But the Father can do of himself. Therefore the Father is greater than the Son according to power.

1. Moreover, greater is the power of him who commands and teaches than of him who obeys and hears. But the Father commands the Son, according to John 14: "As the Father has given me commandment, so do I." The Father also teaches the Son, according to John 5: "The Father loves the Son, and shows him all things that he himself does." Likewise the Son hears, according to John 5: "As I hear, so I judge." Therefore the Father is of greater power than the Son.
2. Moreover, it pertains to the omnipotence of the Father that he can beget a Son equal to himself. For St. Augustine says in Contra Maximinum: "If he could not beget an equal to himself, where is the omnipotence of God the Father?" But the Son cannot beget a Son, as was shown above. Therefore not everything that pertains to the omnipotence of the Father can the Son do; and thus he is not equal to him in power.[998]

But on the contrary is what is said in John 5: "What things soever the Father does, these the Son also does in like manner."

I answer that it is necessary to say that the Son is equal to the Father in power. For the power of acting follows upon the perfection of nature. We see indeed in creatures that the more someone has a more perfect nature, the greater is his strength in acting. Now it has been shown above that the very notion of the divine paternity and filiation requires that the Son be equal to the Father in greatness, that is, in the perfection of nature. Whence it remains that the Son is equal to the Father in power. And the same reason holds of the Holy Spirit with respect to each.

To the first, therefore, it must be said that in this which is said, "The Son cannot do anything of himself," there is not taken away from the Son any power which the Father has, since there is immediately subjoined, "What things soever the Father does, these the Son also does in like manner"; but it is shown that the Son has power from the Father, from whom he has nature. Whence St. Hilary says in De Trinitate IX: "Such is the unity of the divine nature, that the Son so perfectly acts what he does not act from himself."[999]

To the second it must be said that in the showing of the Father and the hearing of the Son nothing is understood unless that the Father communicates knowledge to the Son, as also essence. And to the same can the command of the Father be referred, in that from eternity he gave to him knowledge and will of the things to be done in generating. Or rather it is to be referred to Christ according to the human nature.

998. St. Augustine, Contra Maximinum, lib. 3, cap. 7.
999. St. Hilary, De Trinitate IX.

To the third it must be said that just as the same essence which in the Father is paternity is in the Son filiation, so the same is the power by which the Father begets and by which the Son is begotten. Whence it is manifest that whatever the Father can, the Son can; yet it does not follow that he can beget, but the quid is changed into an ad aliquid. For generation signifies a relation in the divine things. The Son therefore has the same power as the Father, but with another relation: because the Father has it as giving. And this is signified when it is said that he can generate. But the Son has it as receiving. And this is signified when it is said that he can be generated.

The conclusion is affirmative, about which we have already disputed sufficiently above in Disputation 169 on this article.

Quaestio XLIII - On the Mission of the divine persons

Then it must be considered about the mission of the divine persons. Concerning this eight things are asked.

Articulus I - Whether it befits any divine person to be sent

First, it seems that it does not befit the divine persons to be sent.

1. One who is sent is less than the sender. But one divine person is not less than another. Therefore one person is not sent by another.[1000]
2. Further, whatever is sent is separated from the sender. Hence St. Jerome says on Ezekiel that what is conjoined and coupled in one body cannot be sent; but in the divine persons nothing is separable, as St. Hilary says; therefore one person is not sent by another.[1001]
3. Further, whoever is sent departs from one place and goes anew to another place. But this does not befit a divine person, since a divine person is everywhere. Therefore it does not befit a divine person to be sent.

But on the contrary: It is said in John 8: "I am not alone, but I and the Father who sent me."

I answer: In the notion of mission two things are imported. One is the relation of the one sent to the one by whom he is sent. Another is the relation of the one sent to the term to which he is sent. By the fact that someone is sent there is shown a certain procession of the one sent from the sender: either according to command, as a lord sends a servant; or according to counsel, as a counselor may be said to send a king to wage war; or according to origin, as when it is said that a flower is emitted by a tree. There is also shown a relation to the term to which he is sent, so that he begins in some way to be there: either because previously he was in no way there to which he is sent; or because he begins there to be in some way in which previously he was not. Therefore the mission of a divine person can befit, insofar as on the one hand it imports a procession of origin

1000. The objection presupposes the common axiom that the one sent is subject to or less than the sender; cf. the scholastic loci ad 1 q. 15, art. 1, and related places.

1001. St. Jerome, Commentarius in Ezechielem; St. Hilary, De Trinitate VII.

from the sender; and insofar as on the other hand it imports a new mode of existing in another. Thus the Son is said to be sent by the Father into the world, inasmuch as he began to be in the world by the assumed flesh; and yet beforehand he was in the world, as is said in John 1.

Reply to the first: Mission does import a kind of diminution in the one who is sent, insofar as it imports a procession from a principle that sends, whether according to command or according to counsel; for one who commands is greater, and one who counsels is wiser. But in divine things it imports only a procession of origin, which is according to equality, as was said above.

Reply to the second: That which is sent in such a way as to begin to be where previously it in no way was, is by its mission moved locally. Whence it must be that it is separated by place from the sender. But this does not happen in the mission of a divine person, because the divine person sent, just as he does not begin to be where previously he was not, so neither does he cease to be where he was. Whence such a mission is without separation, but has only a distinction of origin.

Reply to the third: That objection proceeds from a mission which is according to local motion, which has no place in divine things.

Conclusion: Mission can befit some divine person, insofar as on the one hand it denotes a procession of origin from the sender; and on the other hand a new mode of existing somewhere, which is called being sent. From this conclusion we shall easily gather the mind of the holy Doctor, which, together with others, we shall examine at length in the following disputation.

What the mission of a divine person is.

Disputatio CLXX - Various opinions of the Scholastics

Caput I - Various opinions of the Scholastics

Once the nature and definition of mission has been unfolded, the remaining points which St. Thomas disputes in this question will be easily illustrated; for when the true definition of the thing is unknown, the other things which follow from it must needs be unknown. But concerning the nature of mission the Scholastics are of various opinions.

First opinion. The Master (in I Sent., dist. 15), when speaking of the donation by which the Holy Spirit is given, says it is nothing other than an operation of God outside himself concerning the creatures; and he seems to feel the same about mission; for since he teaches that any person can be given by any other, thus also he thinks that any person can be sent by any other and by himself. Yet he adds, on the authority of St. Augustine, that nowhere is it read that the Father was sent by another person or by himself; but he assigns no reason for this. Indeed Augustine himself, who in De Trinitate II, c. 5 teaches that the Son is given by himself and is sent by the Holy Spirit, never renders a reason why the Holy Spirit is not said to send the Father, or why the Father does not send himself. However, in De Trinitate IV, c. 20 he contends to adduce some reason, as we shall say below. For my part I do not doubt that, according to this opinion of the Master, it follows plainly

that the Father is sent by himself: for if mission is nothing other than an operation outside God, according to which a person begins in a new way to be, or to appear, in the creature, then indeed, if the Son is sent by the Holy Spirit, I do not see why also the Father could not be sent by him.

Second opinion. St. Bonaventure (in I Sent., distinct., part I, questions 3 and 4), while in that place defending the opinion of the Master, affirms that for mission it is not necessary that there be authority in the sender with respect to the one sent, but only the procession of the person sent, and the manifestation of him in time. He says moreover that procession absolutely is necessary - not indeed a procession from the person who sends, but from whatever other. Wherefore, he says, a person proceeding can be sent by himself or by any other, if he is manifested by himself or by any other; and since the Father proceeds from none, even if he be manifested by himself or by another person, he is neither sent by himself nor by another person. He proves this from Augustine, De Trinitate IV, c. 20, about the middle, where he speaks thus: just as "to be begotten" is to the Son "to be from the Father," so "to be sent" is to the Son "to be known to be from him"; and he subjoins almost the same words about the Holy Spirit. Now the principle of this, namely that the Son be known to be begotten of the Father, is whatever person of the Trinity; therefore whatever person has the character of sender, and consequently, according to Augustine's opinion, mission will be a temporal manifestation by which one person is known to proceed from another. According to which doctrine he says in De Trinitate II, c. 15 that the Son was sent into the world by the Holy Spirit when he assumed flesh. He proves it from that of Matthew 1: "She was found to be with child of the Holy Spirit."

To this opinion St. Thomas seems to give assent in article eight of this question, when he concedes that one person can in some manner be sent by whatever other, when mission is taken only for the temporal effect, not for the eternal procession of one from another. But he embraces it in express words himself in I Sent., dist. 15, q. 3, a. 1. Scotus does so in I Sent., dist. 14, questions 1 and 4; Gabriel in question 1; and Marsilius in I, question 18, articles 1, 2, 3, and 4.[1002] The reason, moreover, can be proved thus: A person is said to be sent only in time, not from eternity; therefore mission is only temporal, not the eternal procession. But the whole Trinity is the cause of any temporal effect whatsoever; therefore also of the mission of each person.

Third opinion. That of Cajetan on this article, and of the Ferrarian on Contra Gentiles IV, c. 23, who teach that "mission" can be used in a twofold way: strictly and properly for the eternal procession connoting a new mode of existing in creatures; and also in a broader signification for mere temporal manifestation. In the former way only the person proceeding can be sent by that one from whom he eternally proceeds; in the latter way anyone can be sent by anyone else, as the Canarian admits in his commentary on article 8 of this question: thus they think that the Son, when he assumed flesh, was sent by the Holy Spirit. He proves this moreover from the Council of Toledo I, in the confession of faith, where it is said: "Nevertheless the Son is to be believed to be sent not only by the Father, but also by the Holy Spirit," in that which is said by the prophet, "And now the Lord has sent me, and his Spirit."[1003]

1002. St. Thomas, In I Sent., dist. 15, q. 3, a. 1; Scotus, In I Sent., dist. 14, qq. 1, 4; Gabriel Biel, In I Sent., q. 1; Marsilius of Inghen, In I, q. 18, arts. 1 - 4.

Caput II - That mission is only the eternal procession connoting a temporal effect; this is the truer opinion

So that all the things handed down in Scripture and the Fathers about the mission of the divine persons may more easily stand together, if we say that mission is taken only in that first way which Cajetan posited - though if it were nothing other than that, this would suffice for us to judge that opinion to be much more probable than the rest - indeed not only does this confirm it, but also the manifest reason which we shall set forth in this chapter. Therefore the truer opinion is that mission is the eternal procession of a person, with the connotation of some temporal effect by reason of which the person who is sent is said to appear. This is the opinion of St. Thomas in this article, who in this way alone defines mission, declaring that its ratio is a procession from the sender, and that there is no other in divine things than the eternal one.[1004] It is also that of Durandus in I, dist. 15, q. 3. Now the first point is proved by the testimonies of the Fathers, then by reason.

From the Fathers: first, St. Hilary, De Trinitate, col. 13 near the end, explaining that of John 16, "Because I went forth from God; I went forth from the Father; I came into the world," speaks thus: "For he had come into this world from the Father, because he had gone forth from God. For that he might be understood in his going forth to have signified his nativity, he subjoined that he had come from the Father; and since by that he came from the Father, because he had gone forth from God, his going forth is an absolute nativity from God, which paternity in no way less confers upon him on his own behalf." Surely nothing clearer could be said for our opinion.

Second, Pope St. Gregory the Great said the same thing no less clearly in Homily 26 on the Gospels, on those words, "As the living Father has sent me." For there, after he shows that those words can be understood of Christ according to his humanity, so that according to it he would be said to be sent by the Father, he adds: "Although 'to be sent' can also be understood according to the nature of the divinity: for the Son is said to be sent by the Father precisely in that he is begotten by the Father; and likewise the Holy Spirit also - for although he is equal to the Father and the Son, yet he was not incarnate - the Son declares that he himself sends the same, saying, 'When the Paraclete comes, whom I will send to you from the Father.'" For if "to be sent" ought to be understood only of being incarnate, surely the Holy Spirit would by no means be said to be sent, who in no way was incarnate; but his mission is his very procession, by which he proceeds from the Father and the Son.[1005]

Third, Bede, in book 2 of the Homilies, homily 2 (for the first Sunday after the Ascension), used almost the same words: "When the grace of the Holy Spirit is given to men, then assuredly the Holy Spirit is sent by the Father and by the Son - by the Son, because he proceeds from the Son, and by the Father, because his mission is his very procession."

1003. Cajetan, on this article; Ferrariense, on Contra Gentiles IV, c. 23; the Canarian, on article 8 of this question; Council of Toledo I, in the confession of faith: "Missus tamen filius non solum a patre, sed ab Spiritu sancto esse credendus est," adducing Isaiah 48:16: "Et nunc Dominus misit me, et spiritus eius."

1004. St. Thomas, in this article, defining mission solely as a procession from the sender, and acknowledging no other in God than the eternal procession.

1005. St. Gregory the Great, Homiliae in Evangelia, Hom. 26; cf. John 16:28; John 15:26.

Finally, we proved from this in Disputation 147, chapter 2, against the Greeks, that the Holy Spirit proceeds from the Son, because he is sent by the Son: which, if the very procession were not of the notion of mission, even if only the person proceeding were said to be sent, would not rightly be proved from thence; for a person proceeding could be sent by one other than the one from whom he proceeds. From these testimonies of the Fathers this is certain, that mission is the very eternal procession of the person; but because mission is eternal, yet is in time, St. Thomas, Durandus, and those who follow this opinion rightly added, beyond procession according to nature, some temporal effect connoted by the very name of mission, by which the person begins to appear, and to be in some new manner in the things to which he is said to be sent - which will at once be made clearer.

Moreover, by reason also this foregoing opinion can easily be confirmed, in this way.

First, the notion of mission does not require that he who is sent proceed substantially from someone. Although this is found in all who are sent, nevertheless it is not necessary to the notion of mission: for even if some man were understood to proceed substantially from no one, he could nonetheless be understood to be sent by another by command, and there would be a true mission of him. Therefore, to mission considered universally, it is accidental that the thing sent proceed from someone according to substance.

Second, neither is it of the notion of mission in general that the procession according to substance be from the sender: for there is some mission by one from whom the thing sent does not proceed, as in a mission according to command. Wherefore, when they say that it is of the notion of mission that the thing sent proceed from someone according to substance, as they thus defend that the Father cannot be sent, they assert it without foundation.

Third, it is of the notion of the mission of a divine person that the one who is sent proceed substantially from the sender; nor is it sufficient that he be said to be sent if he proceed from another person rather than from the one by whom he is said to be sent.

Caput III - Corollaries of the preceding opinion

From this opinion, as from a most certain first principle, many points worthy of note, consonant with Scripture and the Fathers, can be deduced.

First, although all the persons are said to come to the creature by reason of a new effect produced in it, according to that of John 14: "We will come to him," nevertheless only the person who proceeds is said to be sent, because only that person is said to go forth. Now going forth is of the essence of mission; and hence it is clear why, as St. Thomas says in article four, the Father is never said to be sent, neither in Scripture nor in the holy Fathers, because he does not proceed.[1006]

Second, it is gathered why mission is said simply to be temporal, as the holy Doctor rightly taught in article two. For although procession is of its nature eternal, nevertheless by this alone the idea of mission is not completed; a temporal effect must also be added on the part of the terminus

1006. St. Thomas, Summa theologiae I, q. 43, a. 4.

to which. But that something be called temporal, it is enough that something of it be temporal, as Durandus rightly noted on the First Book, distinction 14, question 1, number 7: by contrast, for something to be called eternal, every part of it must be eternal. For if the soul were eternal, and in time were united to the body, the man would be temporal.[1007]

Third, it follows that temporal procession and eternal procession are not two processions, but one and the same, constituted only by a diversity with respect to the effect that the temporal connotes: for the eternal procession is of the essence of the temporal. Thus taught Durandus on that distinction 14, question 2; and, what is marvelous, St. Bonaventure in the same distinction, article 1, question 2, likewise judges that there are not two processions, eternal and temporal, although he himself defines the temporal otherwise than Durandus, lest he seem to teach that something eternal belongs to the essence of the temporal.[1008]

Fourth, from what has been said it follows that one person can be sent without another. For when one proceeding person alone begins to be manifested without the other, that one alone is said to be sent, as the Son in his Incarnation, the Holy Spirit in the dove, and in the figure of tongues, and the like; because in a peculiar manner then one person begins to be in the creature in which the other is not - either by terminating, as in the humanity; or by appearing, as in the dove and other cases. But by the effects of grace, by which the Trinity begins to be in a new mode in the creature, one person is not sent without another; for one without the other does not begin to be in it in a new mode, even as to manifestation. Nevertheless, by the whole Trinity, then at once the Son and the Holy Spirit are said to be sent, because, since they are the proceeding persons, and begin in a new mode to be in the creature, nothing is lacking to them whereby they be sent: the Father, however, is not sent, because he goes forth from no one; but together with the Son and the Holy Spirit he is said "to come," according to that of John 14: "We will come to him, and will make our abode with him."

Fifth, it is gathered that the person sent is always distinguished from the sender: for mission ought to be some going forth; but this properly is not except between persons really distinct: therefore the person sent must be distinct from the sender. By the same reasoning one ought to philosophize concerning gift and giving in the Godhead, of which we spoke in disputation 113, on the gift, namely, that what is by its nature a gift (*donum*), that indeed, by its origin, by which it proceeds, ought to be given by another, as we explained there; and therefore, when a person is said to have given himself, about the gift an accidental understanding must be had. Hence, when St. Augustine - adduced by us in the first chapter - said that the Son is given by himself, it must be understood about the gift which is accidentally a gift; but when he says that the Son is sent by the Holy Spirit, either he speaks of mission not properly, but in a broader signification; or he speaks of the Son according to the humanity. But if there is not speech of mission strictly taken for that which truly is an exit (*exitus*) from someone, I do not see why the Father would not be sent by any person whatsoever, just as the Son is said to be sent by the Holy Spirit. Therefore, when Augustine - cited in the same place - says that there is nothing else for a person to be sent than to be known to

1007. Durandus of St. Pourçain, In I Sent., dist. 14, q. 1, n. 7.
1008. Durandus, In I Sent., dist. 14, q. 2; St. Bonaventure, In I Sent., dist. 14, a. 1, q. 2.

proceed from another, he must be understood in such a way that, together with this temporal effect on the part of the terminus to which, there is also included in the very mission the exit according to origin.

Finally, it is inferred, speaking absolutely, that mission (*missio*) is something notional, just as also giving (*donatio*) and gift (*donum*), which by their nature are gifts, not only divine but also passive. For although mission itself and giving include a temporal effect, which is common to the whole Trinity; nevertheless, insofar as it is conjoined to the eternal origin, and with it constitutes the idea of mission, it is so determined by what is notional that it belongs only to one or the other person, not to the whole Trinity: for mission is the very eternal procession, with a temporal effect connoted; but this, even with the connotation, is not attributed to just any person, as those things which are essential are. Wherefore Durandus, on the First Book, distinction 15, question 2, ought not to have said that in mission there are both an essential and a notional element: for although each taken separately is as he said, nevertheless, taken together they constitute one notional predicate; in which Durandus also rightly said in the same place that the principal element is the temporal effect, not because it directly pertains to the idea of mission, but because the temporal modifies that which is notional, namely origin (*origo*), so that it may have the complete idea of mission; and thus it stands as a difference with respect to a genus.[1009]

Moreover, lest anyone object against the foregoing doctrine: "The person who is sent does not begin to be in a new mode in the creature by the force of his procession, but by reason of the effect which the whole Trinity works; therefore procession according to origin cannot be of the idea of mission," - I answer: the temporal effect is not joined wholly per accidens, nor as it were merely accompanies the origin itself. For just as the person who proceeds from another receives from that person the nature, so also from that person he receives the power according to which he outwardly produces the effect, and by reason of which he begins to be in a new mode in the creature: therefore, since he goes forth from the producing person, and has from that person the operation in the creature, deservedly his origin, with that temporal effect connoted, is called mission.

Again, the foregoing sentence can easily be confirmed also by reason, in this way.

First indeed, the notion of mission (*missio*) does not require that the one who is sent proceed substantially from someone. This, although it be found in all who are sent, nevertheless is not necessary to the notion of mission: for even if a certain man were understood to proceed substantially from no one, he could nonetheless be understood to be sent by another by command, and that would be a true mission of his. It follows, therefore, that to mission, considered universally, it is accidental that the thing sent proceed substantially from someone.

Second, it is not of the general notion of mission that there be a procession according to substance from the sender. For there is a mission from one by whom the thing sent does not proceed, as in mission according to command. Wherefore, when they say that it is of the notion of mission that the thing sent proceed from someone according to substance, so that thus they may defend that the Father cannot be sent, they assert it without foundation.

1009. Durandus, In I Sent., dist. 15, q. 2.

Third, it is of the notion of the mission of a divine person that that which is sent proceed substantially from the sender; nor is it sufficient, in order that it be said to be sent, if it proceed from another person than from that by whom it is sent. But procession according to substance is for this sole reason of the notion of mission in the divine, in order that mission be a certain going forth (*exitus*), or issuing forth, as Hilary said; for by no other mode can there be an exit or procession, and consequently no mission. For every mission is an exit and a certain procession of the one who is sent from the sender; and the exit ought to be, as St. Thomas said in the first article, either according to place (as when someone is sent by the sender's command or counsel only), or it ought to be in some other way; and the former kind of exit cannot be in the divine, because no person exits from another according to place, or counsel, or the command of the sender. It remains, therefore, that in another way the person who is sent go forth from the sender; otherwise its mission will not be an exit. But no other mode of going forth can there be than according to origin: therefore it is necessary that the mission of a divine person be an exit from the sender according to origin. Nor is it enough if it go forth substantially from another; for mission is the exit of the sent from the sender, not from another; indeed, an origin from another in no way is essentially included in its notion, as above has been proved. Therefore rightly did Christ in John 16, when he wished to show his mission from the Father, say: "I went forth from the Father, and came into the world: again, I leave the world, and go to the Father." By "I went forth," he denoted the exit and procession which are of the notion of mission; by "I came," he signified the terminus to which mission is made, which, as I said above, ought to be an effect connoted, by which the eternal origin is completed in order that it be mission, and from which also it has that it be temporal: for a bare exit without a terminus to which would not be mission.

- Moreover, the testimonies of the Fathers confirm the same. First, St. Hilary, On the Trinity, column 13, explaining that of John 16, "Because I went forth from God; I went forth from the Father and came into the world," thus speaks: for he declared that he went from the Father into this world, what had gone forth from God. For he signified his birth in the going forth; and he subjoined that he had come from the Father; and since he had come from the Father, because he had gone forth from God, that birth from God is absolute, which afterwards was followed by profession among men. This could be said more surely for our opinion. Second, St. Gregory the Great very clearly said the same in Homily 26 on the Gospels, on those words, "As the Father sent me." There, after he shows that it can be understood of Christ according to the humanity, so that according to that he be said to be sent, he subjoins: "Yet 'to be sent' can also be understood of the nature of divinity; for the Son himself is said to be sent by the Father, in that he is begotten by him; likewise the Holy Spirit, who, although he is equal to the Father and the Son, was not incarnate - himself the Son promised that he would send, saying, 'When the Paraclete shall have come, whom I will send to you from the Father.' For if 'to be sent' ought to be understood only of being made incarnate, in no way would the Holy Spirit be said to be sent; but his sending is the very procession whereby he proceeds from the Father and the Son." Third, the Venerable Bede, Book 2 of Homilies, homily 2, which is for the First Sunday after the Ascension, used almost the same words: "When the

grace of the Holy Spirit is given to men, assuredly the Holy Spirit is sent by the Father and by the Son; from the Son he proceeds, and from the Father, because his sending is his very procession." Lastly, from this we proved in disputation 147, chapter 2, against the Greeks, that the Holy Spirit proceeds from the Son, because he is sent by the Son; which, if procession itself were not of the notion of mission, even though to be sent were proper to a proceeding person, would not rightly be proved from thence: for it could be that a person proceeding from one be sent by another.[1010]

Antonius de Corduba, Book 1, question 41, at the beginning, teaches that the Holy Spirit is never sent without the Son, except by appropriation. He proves it thus: to be sent without the Son cannot belong to the possession of any real relation (as is clear, because relation is not the cause of mission), nor by reason of any peculiar effect (because every effect ad extra is of the whole Trinity); therefore it is said to belong to him only by appropriation, according to which certain effects which are really common are attributed to him, such as the effects of grace. However, this author is mistaken: for although every effect outside God be common to the Trinity, nevertheless the whole Trinity is not said to be sent by reason of that effect, as was said a little above. Moreover, although, by reason of each effect outside God, the whole Trinity be, by essence, presence, and power, in the thing in which it operates, if the opinion is true which asserts that by reason of operation God is intimately present to things; nevertheless, by reason of some effect one person is said to be in a special mode without the other, as the Word in the assumed humanity and the Holy Spirit in the dove; because in these he so appeared and was manifested that the other person was not manifested: therefore for this reason one person is said to be sent without the other.

Articulus II - Whether mission (*missio*) is eternal, or only temporal

To the second it is proceeded thus.

Objection 1. It seems that mission can be eternal. For Gregory says that the Son is sent in that he is begotten; but the generation of the Son is eternal; therefore mission is eternal.

Objection 2. Further, whatever a temporal property befits is changed; but a divine person is not changed. Therefore mission, if it befits the divine person, is not temporal, but eternal.

Objection 3. Further, mission implies procession. But the procession of the divine persons is eternal. Therefore also mission.

But on the contrary: Galatians 4 says: "When the fullness of time came, God sent his Son."

I answer: In those things which import the origin of the divine persons, a certain difference must be observed. For some, in their signification, import only a relation to a principle, as procession and exit (*exitus*). Others, together with the relation to the principle, determine the terminus of the procession. Of these, some determine an eternal terminus, namely generation and spiration. For generation is the procession of a divine person into the divine nature; and spiration,

1010. St. Gregory the Great, Homiliae in Evangelia, hom. 26; Bede, Homiliae, lib. 2, hom. 2; see also Vazquez, Disputatio 147, c. 2, contra Graecos.

taken passively, imports the procession of love in subsisting. But others, together with the relation to a principle, import a temporal terminus, as mission and giving (*dation*). For something is sent in order that it may be in something; and it is given in order that it may be had. Now for a divine person to be had by some creature, or to be in it by some mode of existing, is something temporal. Whence mission and giving in God are said to be only temporal. But generation and spiration only from eternity. However, procession and exit are said in the divine both eternally and temporally: for the Son proceeded from eternity in order that he might be God; temporally, however, in order that - if man by a visible mission - or likewise in order that he might be in man by an invisible mission.

Reply to the first: Gregory speaks of the temporal generation of the Son, not from the Father, but from the Mother; or because from this very fact the Son has that he can be sent, namely that he is begotten from eternity.

Reply to the second: That a divine person be had in some way in, or by, another temporally is not on account of a change in the divine person, but on account of a change in the creature; just as God is said to be Lord temporally on account of a change in the creature.

Reply to the third: Mission does not only import a procession from a principle, but determines a temporal terminus of the procession. Whence mission is only temporal; or, if "mission" include the eternal procession, it adds something, namely a temporal effect. For the relation of a divine person to his principle is only from eternity; whence a twofold procession is spoken of, eternal namely, and temporal: not because the relation to the principle is thereby duplicated, but the duplication is on the part of the terminus, temporal and eternal.

Conclusion: Mission is said to be only temporal; about which enough has been said above in this disputation.

Articulus III - Whether the invisible mission of a divine person is only according to the gift of sanctifying grace (*gratia gratum faciens*)

It is objected: 1. A divine person to be sent is for that very person to be given. If, therefore, a divine person is sent only according to the gifts of sanctifying grace, the divine person himself will not be given, but only his gifts. But this is the error of those who say that the Holy Spirit is not given, but his gifts are.

1. Further, this preposition "according to" denotes the habitude of some cause; but the divine person is the cause that the gift of sanctifying grace is had, and not conversely, according to that saying of Romans 5: "The charity of God is poured forth in our hearts by the Holy Spirit who is given to us." Therefore it is incongruous to say that a divine person is sent according to the gifts of sanctifying grace.

2. Further, St. Augustine says in the fourth book On the Trinity, chapter 10, in the middle, that the Son, when he is perceived in the mind as something temporal, is said to be sent.[1011] But the Son is known not only through sanctifying grace, but also through grace freely given, as through faith and through knowledge. Therefore a divine person is not sent only according to sanctifying grace.

3. Further, Rabanus says that the Holy Spirit was given to the Apostles for the working of miracles. But this is not a gift of sanctifying grace, but of grace freely given. Therefore a divine person is not given only according to sanctifying grace.

But on the contrary: St. Augustine says in the third book On the Trinity, chapter 4, near the end, that the Holy Spirit proceeds temporally to sanctify the creature; but mission is a temporal procession. Since, therefore, the sanctification of the creature is brought about only through sanctifying grace, it follows that the mission of a divine person is only through sanctifying grace.[1012]

I answer: It befits a divine person to be sent, in that he exists in something in a new mode; and to be given, in that he is had by someone; but neither of these takes place except according to sanctifying grace (gratia gratum faciens). For there is a common mode by which God is in all things by essence (*essentia*), power, and presence, as a cause in effects participating its goodness. Over and above this common mode there is a special one, which befits a rational nature: in which God is said to be as the known in the knower, and the beloved in the lover. And because by knowing and loving the rational creature by its own operation attains to God himself, according to this special mode God is said not only to be in the rational creature, but also to dwell in it as in his temple. Thus, therefore, no other effect can be the reason why a divine person is in a new mode in a rational creature, except sanctifying grace. Hence it is only according to sanctifying grace that a divine person is sent and proceeds temporally. Likewise, we are said to have only that which we can freely use or enjoy. Now to have the power of enjoying the divine person is only according to sanctifying grace. Yet in the very gift of sanctifying grace the Holy Spirit is had and indwells man. Wherefore the Holy Spirit himself is given and sent.

Reply to the first: By the gift of sanctifying grace the rational creature is perfected to this end, that it freely use not only the created gift itself, but that it enjoy the divine person himself. And therefore the invisible mission takes place according to the gift of sanctifying grace, and yet the divine person himself is given.

Reply to the second: Sanctifying grace disposes the soul to have the divine person. And this is signified when it is said that the Holy Spirit is given according to the gift of grace. Yet the very gift of grace is from the Holy Spirit. And this is signified when it is said that the charity of God is poured forth in our hearts by the Holy Spirit.

Reply to the third: Although through certain effects the Son can be known by us, nevertheless through no effects does he dwell in us, or is he had by us.

1011. St. Augustine, De Trinitate, lib. 4, c. 10, in medio.
1012. St. Augustine, De Trinitate, lib. 3, c. 4, circa finem.

Reply to the fourth: The working of miracles manifests sanctifying grace, as also does the gift of prophecy and any grace freely given (gratia gratis data). Hence 1 Cor. 12: "To each is given the manifestation of the Spirit for the common good." Thus the Holy Spirit is said to have been given to the Apostles for the working of miracles, because sanctifying grace was given to them with a manifesting sign. But if only the sign of sanctifying grace were given without the grace, the Holy Spirit would not be said to be given simply, unless perhaps with some determination, as when it is said that the spirit of prophecy or of miracles is given to someone, inasmuch as from the Holy Spirit he has the power of prophesying or of working miracles.

Dubitatio concerning the doctrine of the Article.

The conclusion is affirmative. For the explanation of which Cajetan notes that, besides the eternal origin, a necessary effect or sign belongs to the ratio of mission: to visible mission, indeed, a visible effect or sign; but to invisible mission, an invisible effect or sign.[1013]

He nonetheless doubts whether an invisible mission is brought about solely through the gift of sanctifying grace; and he answers that it is also brought about through the gift of unformed faith, indeed through any thought and love of God whatsoever, on the ground that by these effects in some manner God comes to be in the rational creature. Then he adds that St. Thomas did not deny this: for he only said that God's existence in the rational creature through sanctifying grace pertains to the fourth mode among those by which God is said to be in things; for besides that he is in all things by essence, presence, and power, he is said to be in a fourth mode in the rational creature as in the knower, because he is, as it were, in the temple where he is worshiped: under this mode there is one way through sanctifying grace, another through faith alone.

Durandus favors this opinion in the first book of the Sentences, distinction 14, question, when he says that the Holy Spirit is given with the gifts of grace perfectly; with the gifts of nature, imperfectly; with the gifts of glory, most perfectly.[1014] St. Bonaventure also agrees, Distinction 15, article 2, question 1: for he asserts that the Holy Spirit and the Son are given either simply through the gift of sanctifying grace alone, or in a qualified way through other gifts, because they are given for some use or help.[1015] However, St. Thomas in this article clearly teaches that an invisible mission into the soul is brought about only through sanctifying grace; more clearly above, question 8, article 3, in the body and to the fourth, where he says: "To the fourth it must be said that no perfection superadded to substance makes God to be in something, as an object known and loved, unless grace; therefore it is grace alone that makes a singular mode of God's being in things." He also adds a peculiar other mode not contained under this fourth, namely through the hypostatic union.[1016]

For my part, with St. Thomas it seems one should hold, if we speak absolutely and simply: for it is not customary to say in general that God is, or that he dwells, in the hearts of men, beyond those three modes of existing in things, until a man is just with God; for of the just alone is God said to

1013. Cajetan, on the ratio of mission (ad rationem missionis), ad loc.
1014. Durandus, In I Sent., dist. 14, quaest.
1015. St. Bonaventure, In II Sent., dist. 15, art. 2, quaest. 1.
1016. St. Thomas, in this article; and above, q. 8, a. 3, in corp. and ad 4.

dwell in them. Yet in a qualified sense Cajetan's opinion can be conceded, as St. Bonaventure and Durandus also seem to concede: because in some manner God is in man through faith. And so much on the invisible mission.

Articulus IV - Whether it befits the Father to be sent

It is objected: 1. It seems that it also befits the Father to be sent. For to send a divine person is to give him; but the Father gives himself (since he cannot be had unless he give himself), therefore it can be said that the Father sends himself.

1. Further, a divine person is sent according to the indwelling of grace. But by grace the whole Trinity dwells in us, according to John 14: "To him we will come, and we will make our abode with him." Therefore each of the divine persons is sent.
2. Further, whatever befits one person befits all, except the notions and the persons. But mission does not signify any person, nor any notion either, since there are only five notions, as was said above. Therefore it befits each divine person to be sent.

But on the contrary: St. Augustine says in the second book On the Trinity that the Father alone is never read as sent.[1017]

I answer: Mission in its very notion imports procession from another; and in divine things according to origin, as was said above. Wherefore, since the Father is not from another, in no way does it befit him to be sent, but only the Son and the Holy Spirit, to whom it befits to be from another.

The conclusion is negative, about which we have discoursed in the foregoing disputation.

Articulus V - Whether it befits the Son to be sent invisibly

To the fifth it proceeds thus. It seems that it does not befit the Son to be sent invisibly. For the invisible mission of a divine person is considered according to the gifts of grace; but all the gifts of grace pertain to the Holy Spirit, according to 1 Cor. 12: "All these are the work of one and the same Spirit." Therefore invisibly only the Holy Spirit is sent.

1. Further, the mission of a divine person takes place according to sanctifying grace. But the gifts that pertain to perfections of the intellect are not gifts of sanctifying grace, since they can be had without charity, according to 1 Cor. 13: "If I should have prophecy, and know all mysteries and all knowledge, and should have all faith, so as to move mountains, but have not charity, I am nothing." Since therefore the Son proceeds as the word of the intellect, ...

I answer: Therefore, according to the mode of charity the mission of the Holy Spirit is attended to. But the Son is the word, not just any sort, but breathing forth love. Hence St. Augustine says in De Trinitate, book 9: "But the word which we intend to intimate is knowledge with love."[1018]

1017. St. Augustine, De Trinitate, lib. 2.

Therefore the Son is not sent according to just any perfection of the intellect, but according to such an institution or instruction of the intellect as bursts forth into an affection of love, as it is said in John 6: "Everyone who has heard and learned from the Father comes to me"; and in the Psalm: "In my meditation a fire shall burn." And therefore Augustine says pointedly that the Son is sent when he is known and perceived by someone. Now "perception" signifies a certain experiential knowing; and this is properly called wisdom, as it were a "savory" knowledge, according to Ecclesiasticus 6: "The wisdom of doctrine is according to its name."

Reply to the third: Since mission imports the origin of the person sent, and indwelling through grace (as was said above), if we speak of mission with respect to origin, thus the mission of the Son is distinguished from the mission of the Holy Spirit, just as generation is distinguished from procession. But if we speak with respect to the effect of grace, thus the two missions share in the root of grace; yet they are distinguished in the effects of grace, which are the illumination of the intellect and the inflaming of the affection. And thus it is manifest that one cannot be without the other, because neither exists without sanctifying grace, nor is one person separated from the other.

Conclusion: It is affirmative, about which matter dispute has been held in the same place.

Articulus VI - Whether the invisible mission is made to all who are participants in grace

Objicitur 1. It seems that the invisible mission is not made to all who are participants in grace. For the fathers of the Old Testament were participants in grace. But to them the invisible mission does not seem to have been made. For it is said in John 7: "The Spirit had not yet been given, because Jesus was not yet glorified." Therefore the invisible mission is not made to all who are participants in grace.

Objicitur 2. Further, progress in virtue is only through grace. But the invisible mission does not seem to be attended to according to progress in virtue, because progress in virtue seems continuous, since charity always either advances or declines. And thus mission would be continuous. Therefore the invisible mission is not made to all participants in grace.

Objicitur 3. Further, Christ and the blessed have grace most fully. But to them mission does not seem to be made, because mission is to something distant. But Christ, inasmuch as he is man, and all the blessed, are perfectly united to God. Therefore the invisible mission is not made to all participants in grace.

Objicitur 4. Further, the sacraments of the New Law contain grace, and yet the invisible mission is not said to be made to them. Therefore the invisible mission is not made to all things that have grace.

But on the contrary: according to St. Augustine, an invisible mission is made for the sanctification of the creature.[1019] But every creature having grace is sanctified. Therefore to every creature of this sort an invisible mission is made.

1018. St. Augustine, De Trinitate, lib. 9, in medio.
1019. St. Augustine, De Trinitate, lib. 4 (as cited in the article).

I answer: As was said above, mission by its notion imports that the one who is sent either begins to be where previously he was not (as happens in created things), or begins to be where he was before, but in a certain new mode, insofar as mission is attributed to the divine persons. Thus, therefore, in that to which mission is made, two things must be considered, namely the indwelling of grace and a certain renovation through grace. Therefore an invisible mission is made to all in whom these two are found.

Reply to the first: An invisible mission was made to the fathers of the Old Testament. Hence Augustine says in De Trinitate, book 4, that, insofar as the Son is sent invisibly, he is "in men, or with men." But this had been done before in the fathers and prophets. Therefore when it is said, "the Spirit had not yet been given," we understand this of that giving with a visible sign, which was done on the day of Pentecost.[1020]

Reply to the second: Also according to progress in virtue, or increase of grace, an invisible mission is made. Hence Augustine says in De Trinitate, book 4, that then the Son is sent to someone "when he is known and perceived by someone, as much as he can be known and perceived according to the capacity either of a soul advancing toward God or of a rational soul having advanced in God." Yet, nevertheless, the invisible mission is especially attended to according to that increase of grace when someone advances into some new state of grace: for instance, when someone advances into the grace of miracles or of prophecy, or into this, that out of the fervor of charity he exposes himself to martyrdom, or renounces the things he possesses, or undertakes any arduous work.[1020]

Reply to the third: To the blessed an invisible mission was made in the very beginning of beatitude. Afterwards, however, an invisible mission is made to them, not according to an intensifying of grace, but according to the fact that some mysteries are newly revealed to them - and this will be even to the day of judgment. And this increase is attended to according to the extension of grace as it extends itself to more things. But to Christ an invisible mission was made in the beginning of his conception; not, however, afterwards, since from the beginning of his conception he was full of all wisdom and grace.

Reply to the fourth: Grace is in the sacraments of the New Law instrumentally, just as the form of an artifact is in the instruments of an art, according to a certain transitus from the agent into the patient. But mission is not said to be made except with respect to the terminus. Hence the mission of a divine person is not made to the sacraments, but to those who through the sacraments receive grace.

Conclusion: To all who are renewed by sanctifying grace, an invisible mission is made.

Doubt concerning the doctrine of the article.

Concerning the conclusion and the doctrine of the article, there is a difficulty, whether the Holy Spirit is sent invisibly to the just when their grace and justice are increased. St. Thomas, on the second objection, teaches that then the Holy Spirit is not sent, nor when some gift is intensified.

1020. St. Augustine, De Trinitate, lib. 4.
1020. St. Augustine, De Trinitate, lib. 4.

And it is gathered likewise from the article, where he teaches that mission is then only made when there is a renovation through grace.[1021] Durandus seems to agree in I Sent., dist. 15, q. 4, num. 12: because, in order that some person be sent to someone, he ought to begin to be in him when previously he was not; but when the gifts of grace are increased, a person does not begin to be in a just man, because previously he was in him: therefore then he is not sent to the just man.[1022]

To me the opinion of St. Bonaventure is proved in I Sent., dist. 15, art. 2, q. 3, who asserts that then a person is sent invisibly as often as he begins to be in a creature in a new mode; but he is not sent by reason of an intensification of the habits of grace alone, because then he does not begin to be in a creature in a new mode - just as neither by an intensification of natural endowments is he sent or does he begin to be in a creature in a new mode. But by other gifts of grace, which are conferred for various effects, a person is said to be sent, as to the Apostles on the day of Pentecost, not by reason of an increase of the habit of grace, but by reason of other gifts. Both opinions Corduba judges probable, lib. 1, q. 41, at the end.[1023] I add that even then a person is in a special manner sent to the rational creature when, by the power of the sacrament, grace is intensified in him, in which grace is perfected - for that would not be sufficient, as we were saying - but because the same grace is given for a special effect, by reason of which it is called "sacramental," although here this is a certain respect of reason.

Articulus VII - Whether it belongs to the Holy Spirit to be sent visibly

Objicitur 1. It seems that it does not belong to the Holy Spirit to be sent visibly. For the Son, insofar as he is sent visibly into the world, is said to be less than the Father. But the Holy Spirit is never read to be less than the Father. Therefore it does not belong to the Holy Spirit to be sent visibly.

Objicitur 2. Further, a visible mission is attested according to some assumed visible creature, as the mission of the Son according to the flesh. But the Holy Spirit did not assume any visible creature. Hence it cannot be said that in some visible creatures he is otherwise than in others, unless perhaps as in a sign, as he is also in the sacraments and in all the legal figures. Therefore the Holy Spirit is not sent visibly; or one would have to say that according to all such things his visible mission is attended to.

Objicitur 3. Further, any visible creature and effect manifests the whole Trinity. Therefore through other visible creatures the Holy Spirit is not more sent than any other person.

Objicitur 4. Further, the Son was sent visibly according to the dignity of a visible creature, namely according to the human nature. If, therefore, the Holy Spirit is sent visibly, he ought to have been sent according to some rational creatures.

1021. St. Thomas, in this article, ad 2.
1022. Durandus, In I Sent., dist. 15, q. 4, n. 12.
1023. Corduba (González de Alcañiz), Lib. 1, q. 41, in fine.

Objicitur 5. Further, the things that are visibly from God are dispensed by the ministry of angels, as Augustine says in De Trinitate, book 3. If, therefore, certain visible species appeared, this was done through the angels. And thus the angels themselves are sent, and not the Holy Spirit.

Objicitur 6. Further, if the Holy Spirit is sent visibly, this is only to manifest the invisible mission, because invisible things are manifested through visible things. Therefore to those to whom the invisible mission was not made, neither should the visible mission have been made; to all, therefore, to whom the invisible mission, whether in the New or in the Old Testament, was made, the visible mission ought to be made. Which is evidently false. Therefore the Holy Spirit is not sent visibly.

But on the contrary: it is said in Matthew 3 that the Holy Spirit descended upon the Lord when he was baptized in the form of a dove.

I answer by saying that God provides for all things according to the mode of his universe. But the mode connatural to man is that through visible things he be led by the hand to invisible things, as is clear from the foregoing. And therefore the invisible things of God had to be manifested to man through visible things. Therefore, just as God showed, as it were, to men himself and the eternal processions of the persons through visible creatures according to certain indicators, so it was fitting that even the invisible missions of the divine persons be manifested according to certain visible creatures; yet differently for the Son and for the Holy Spirit. For the Holy Spirit, insofar as he proceeds as love, began to be the gift of sanctification; but the Son, insofar as he is the principle of the Holy Spirit, began to be the author of this sanctification. And therefore the Son was sent visibly as the author of sanctification, but the Holy Spirit as a sign of sanctification.

Reply to the first: The Son assumed, in the unity of person, the visible creature in which he appeared, so that what is said of that creature can be said of the Son of God. And for this reason, by reason of the assumed nature, the Son is said to be less than the Father. But the Holy Spirit did not assume a visible creature in which he appeared in the unity of person, so that what belongs to that would be predicated of him. Hence he cannot be said to be less than the Father on account of a visible creature.

Reply to the second: The visible mission of the Holy Spirit is not attended to according to a vision of the imagination, which is a prophetic vision. For, as Augustine says in De Trinitate, book 2, a prophetic vision is not an exhibition to the bodily eyes through bodily forms, but in the spirit through spiritual images and the images of bodies. But that dove and the fire were seen by the eyes of all who saw. Nor again did the Holy Spirit stand in such a relation to those species as the Son to the rock of which it is said, "The rock was Christ."

The seventh proceeds as follows. It seems that it does not befit the Holy Spirit to be sent visibly. For the Son, inasmuch as he was sent visibly into the world, is said to be less than the Father. But it is never read that the Holy Spirit was less than the Father. Therefore it does not befit the Holy Spirit to be sent visibly.

1. Further. A visible mission is attended to according to some assumed visible creature, as the mission of the Son is according to the flesh. But the Holy Spirit did not assume any visible creature. Hence it cannot be said that he is in some visible creatures otherwise than in others, unless perhaps as in wood, as he is also in the sacraments and in all the legal figures. Therefore the Holy Spirit is not sent visibly; or it must be said that according to all such things his visible mission is attended to.
2. Further. Every visible creature is an effect that manifests the whole Trinity. Therefore, through those visible creatures, the Holy Spirit is not sent more than any other person.
3. Further. The Son was sent visibly according to the most dignified of visible creatures, namely according to human nature. If, therefore, the Holy Spirit is sent visibly, he ought to have been sent according to some rational creatures.
4. Further. The things that are done visibly by divine power are dispensed by the ministry of angels, as St. Augustine says in De Trinitate, book 3. If, therefore, certain visible species appeared, this was done through the angels. And thus the angels themselves are sent, and not the Holy Spirit.[1024]
5. Further. If the Holy Spirit is sent visibly, this is only in order to manifest an invisible mission, since invisible things are manifested through visible. Therefore, for all to whom an invisible mission was not made, neither ought a visible mission to have been made; and for all to whom there was an invisible mission, whether in the New or in the Old Testament, a visible mission ought to be made. But this is clearly false. Therefore the Holy Spirit is not sent visibly.

But on the contrary: it is said in Matthew 3 that the Holy Spirit descended upon the Lord when he was baptized in the form of a dove.

I answer that, God provides for all things according to the mode of each. And the connatural mode of man is that he be led by visible things to invisible things (as is clear from what was said above). And therefore the invisible things of God ought to be manifested to man through visible things. Accordingly, just as God himself and the eternal processions of the persons have been in some way shown to men through visible creatures according to certain judgments: so it was fitting that the invisible missions of the divine persons also be manifested through certain visible creatures. Yet the Son and the Holy Spirit were manifested differently. For to the Holy Spirit, inasmuch as he proceeds as love, it befits to be the gift of sanctification; but to the Son, inasmuch

1024. St. Augustine, De Trinitate 3.

as he is the principle of the Holy Spirit, it befits to be the author of this sanctification. And therefore the Son was sent visibly as the author of sanctification, but the Holy Spirit as the indication of sanctification.

Reply to the first: The Son assumed into the unity of person the visible creature in which he appeared, so that what is said of that creature could be said of the Son of God. And thus, by reason of the assumed nature, the Son is said to be less than the Father. But the Holy Spirit did not assume a visible creature in which he appeared in the unity of person, so that what belongs to that would be predicated of him. Hence he cannot be said to be less than the Father on account of a visible creature.

Reply to the second: The visible mission of the Holy Spirit is not attended to according to a vision of the imagination, which is a prophetic vision. For, as St. Augustine says in De Trinitate, book 2, a prophetic vision is not an exhibition to the bodily eyes through bodily forms, but in the spirit through spiritual images and the images of bodies. But that dove and the fire were seen by the eyes of all who saw. Nor again did the Holy Spirit stand in such a relation to those species as the Son to the rock, of which it is said, "The rock was Christ." For that rock already was a creature, and by way of action it was called by the name of Christ whom it signified. But that dove and that fire suddenly came to be only for signifying these things. They seem, however, to be like the flame that appeared in the bush to Moses, and like the pillar which the people followed in the desert, and like the lightnings and thunders which took place when the law was given on the mountain. For the bodily species of those things existed to signify and to foreshow something. Thus, then, it is clear that visible mission is attended to neither according to prophetic visions, which were imaginary and not bodily, nor according to the sacramental signs of the Old and New Testament, in which certain pre-existing things are assumed for signifying something. But the Holy Spirit is said to be sent visibly inasmuch as he was shown in certain creatures as in signs made specially for this.

Reply to the third: Although the whole Trinity produced those visible creatures, nevertheless they were made to show forth this or that person specially. For, as the Father and the Son and the Holy Spirit are signified by diverse names, so too they could be signified by diverse things; although among them there is no separation or diversity.

Reply to the fourth: It had to be shown through the person of the Son - as was said - that he is the author of sanctification. And therefore it was necessary that the visible mission of the Son be made according to a rational nature, whose office it is to act and to which it can befit to be sanctified. But an indication of sanctification could be made through any other creature. Nor was it necessary that the visible creature formed for this be assumed by the Holy Spirit into the unity of person, since it was not assumed for doing something, but only for indicating. And for this reason neither was it necessary that it should last, except so long as it fulfilled its office.

Reply to the fifth: Those visible creatures were formed by the ministry of angels, not however to signify the person of an angel, but to signify the person of the Holy Spirit. And therefore, because the Holy Spirit was in those visible creatures as the thing signified in a sign, for this reason according to them the Holy Spirit is said to be sent visibly, and not an angel.

Reply to the sixth: It is not of the necessity of invisible mission that it always be manifested by some outward visible sign; but, as is said in 1 Corinthians 12, "The manifestation of the Spirit is given to someone unto the utility" of holy Church. And this utility is that by such visible signs faith may be confirmed and propagated. This indeed was done principally through Christ and through the Apostles, according to that of Hebrews 2: "When it had begun to be announced by the Lord and was confirmed to us by those who heard." And therefore a visible mission of the Holy Spirit ought specially to have been made to Christ, to the Apostles, and to certain other first-fruits of the saints, in whom in a way the Church was being founded; yet in such wise that the visible mission made to Christ should show the invisible mission - not then, but made to him at the beginning of his conception. Now a visible mission was made to Christ: in his baptism under the appearance of a dove, which is an animal, to show in Christ the authority of giving grace through spiritual regeneration (whence the voice of the Father thundered, "This is my beloved Son"), that others might be regenerated to the likeness of the Only-begotten. In the Transfiguration, however, under the appearance of a bright cloud, to show the abundance of doctrine. Whence it was said, "Hear him." But to the Apostles, under the appearance of breath, to show the power of the ministry in the dispensation of the sacraments. Whence it was said to them: "Whose sins you shall forgive, they are forgiven them." But under fiery tongues, to show the office of teaching. Whence it is said that they began to speak with various tongues. But to the fathers of the Old Testament a visible mission of the Holy Spirit ought not to have been made, because first the visible mission of the Son ought to have been perfected rather than that of the Holy Spirit, since the Holy Spirit manifests the Son as the Son the Father. There were, however, visible apparitions of the divine persons made to the fathers of the Old Testament. These missions cannot be called visible missions, because they were not made (according to Augustine) to designate the indwelling of a divine person by grace, but to manifest something else.[1025]

Conclusion. Concerning that dove in which the Holy Spirit was seen, St. Thomas disputes in the Third Part, question 39, article 7, and Canariensis in the commentary on this article, and Durandus in the First Book, distinction 16, question 3, and others; but let us reserve his treatment for that place of the Third Part. This, however, must be certain for all, that a true dove, or a visible effigy of a dove, appeared outwardly; nor did this happen by an imaginary vision alone. The other things which Canariensis notes in this article are very easy.[1026]

Articulus VIII - Whether any divine person is sent except by that from whom he proceeds eternally

The eighth proceeds as follows. It seems that no divine person is sent except by that one from whom he proceeds eternally. For as Augustine says in De Trinitate, book 4, the Father is sent by no one because he is from no one. If, therefore, some divine person is sent by another, it must be that he is from that one.[1027]

1025. Augustine, De Trinitate 2. See also 1 Cor. 12; Heb. 2.

1026. St. Thomas Aquinas, Summa theologiae III, q.39, a.7; Melchior Canus (Canariensis), commentary on this article; Durandus, In Sent. I, dist. 16, q.3.

Further. The sender has authority with respect to the one sent; but with respect to a divine person authority cannot be had except according to origin. Therefore it is necessary that the divine person who is sent be from the person sending.

1. Further. If a divine person can be sent by one from whom he is not, nothing will prevent our saying that the Holy Spirit is given by a man, although he is not from him. But this is against Augustine in De Trinitate. Therefore a divine person is not sent except by the one from whom he is.[1028]

But on the contrary is that the Son is sent by the Holy Spirit, according to Isaiah 48: "Now the Lord God has sent me, and his Spirit." But the Son is not from the Holy Spirit. Therefore a divine person is sent by one from whom he is not.[1029]

I answer that, concerning this some are found to speak in different ways. For according to some, a divine person is not sent except by him from whom he is eternally. And according to this, when the Son of God is said to be sent by the Holy Spirit, this must be referred to the human nature, according to which he was sent to preach by the Holy Spirit. But Augustine says in De Trinitate, book 2, that the Son is sent and also by himself and by the Holy Spirit, and that the Holy Spirit too is sent both by himself and by the Son; so that in things divine it does not befit just any person to be sent, but only a person existing from another; yet to send befits any person. Each view has truth in some way: because when a divine person is said to be sent, both the person existing from another is designated and the visible or invisible effect, according to which the mission of the divine person is attended to. If, therefore, the sender is designated as the principle of the person who is sent, then not just any person sends, but only that one to whom it befits to be the principle of that person. And thus the Son is sent only by the Father, and the Holy Spirit by the Father and the Son. But if the sending person be understood to be the principle of the effect according to which the mission is attended to, then the whole Trinity sends the person sent. Yet not on this account does a man give the Holy Spirit, because he cannot cause even the effect of grace. And by this the solution to the objections is evident.

Quaestio XLIV - On the procession of creatures from God, and on the first cause of all beings

The whole Trinity sends the person sent. Yet not on this account does a man give the Holy Spirit, because he cannot cause even the effect of grace. And by this the solution to the objections is evident.

1027. Augustine, De Trinitate 4.
1028. Augustine, De Trinitate 15.
1029. Isa. 48:16.

Concerning the conclusion and the doctrine of this article, we shall treat in the following disputation. Therefore here nothing else is to be noted, except about the title prefixed to the article: it is not to be read, "Some person," but "No person," as is gathered from the words of the first argument; and the particle "unless" clearly indicates it. Thus far St. Thomas has treated of God in himself, according to the division set forth by us above into questions.

Articulus I - Whether it is necessary that every being be created by God

But on the contrary: It is said in Romans 11: "From him and through him and in him are all things."

I answer that it is necessary to say that every being, which in whatsoever way is, is from God. For if something is found in another by participation, it must be caused in that thing by that to which it belongs essentially; as iron is made fiery by fire. But it was shown above, when divine simplicity was treated, that God is his very existence (esse) subsisting through himself; and again it was shown that subsisting existence could not be more than one, just as if whiteness were subsisting, it could be only one, since whitenesses are multiplied according to recipients. It remains therefore that all other things besides God are not their existence, but participate in existence. Therefore it is necessary that all things which are diversified according to a diverse participation of existing - so as to be more perfect or less perfect - be caused by one first being which most perfectly is. Hence also Plato said that it is necessary, before every multitude, to posit unity; and Aristotle says in the second book of the Metaphysics that that which is most being and most true is the cause of every being and of every truth, as that which is most hot is the cause of all heat.[1030]

Reply to the first: Although the relation to a cause does not enter into the definition of a being which is caused, nevertheless it follows upon those things which are of its notion; because from this, that something is a being by participation, it follows that it is caused by another. Wherefore such a being cannot be without being caused, just as a man cannot be without being capable of laughter. But because to be caused is not of the notion of being simply, on that account there is found some being that is not caused.

Reply to the second: From this reason certain men were moved to posit that that which is necessary does not have a cause, as is said in the eighth book of the Physics. But this appears manifestly false in demonstrative sciences, in which necessary principles are the causes of necessary conclusions. And therefore Aristotle says in the sixth book of the Metaphysics that there are certain necessary things which have a cause of their necessity. Therefore it is not only for this reason that an efficient cause is required, because the effect can fail to be; but because the effect would not be if the cause were not. For this conditional is true, whether the antecedent and consequent are possible or impossible.

1030. Romans 11:36. Aristotle, Metaphysics II, text 4; VI, 3.

Reply to the third: Mathematical things are taken as abstract according to existence. But to each thing it belongs to have an efficient cause according as it has existence. Therefore although things which are mathematical have an efficient cause, nevertheless, according to the relation which they have to an efficient cause, they do not fall under the consideration of the mathematician. And therefore in the mathematical sciences nothing is demonstrated through an efficient cause.

Notes concerning the Article.

The conclusion is: Every being, in whatsoever way it is, is from God. The reason and doctrine of this whole article we shall examine in the disputation. Concerning the article itself, however, first it must be noted with Cajetan in his commentaries, that here there is not the question whether God is the cause of all things by creation: for from those things which will be said in the following question, on the nature of creation, one can easily gather which beings were produced by God through creation; but it is asked universally whether every other thing, besides God, is from God, as from an efficient cause. This is clear from the very text, where no mention of creation is made; and more clearly from the conclusion with which St. Thomas answers to the title of the article. Wherefore that word "Created" (says Cajetan), which St. Thomas uses in the title of the article, does not signify that which is produced by true creation, but that which, in whatsoever way, has been effected. And for this reason, in the distinction of the titles of this question, St. Thomas sets it under this form: Whether God is the efficient cause of all things.[1031]

Yet I for my part think that the participle "created" in the title prefixed to this article signifies that which is produced through creation. For the question is not whether it is necessary that a created being be from God, but whether it is necessary that every being be created by God, or not; as appears from the beginning of the first argument, from which the title is taken. Nevertheless St. Thomas does not respond that every being is created by God, but that every being, in whatsoever way it is, that is, in whatsoever way it is produced, is from God: and he understands this as from an efficient cause; for about the exemplar and final cause, which can befit God with respect to creatures, he disputes afterward in articles 3 and 4; now therefore he responds in general that every being is from God, as efficient cause, in whatsoever way it comes to be.[1032]

Next it must be observed that St. Thomas is not here disputing about the operation of God with all causes, that is, whether God works all things through himself, or with second causes. For this he disputes in questions 104 and 105; and especially, concerning created substances, he teaches in question 104, article 1, that all are preserved by God proximately: but concerning all the operations of creatures he says that they are not only from second created causes, but also from God, the first of all causes: not only remotely, that is, by preserving the created causes; but also proximately, by working with them the very same effect altogether individual. About this we should not dispute

1031. Cajetan, Commentary on this article: he notes that the question is not "whether God is the cause of all things by creation," but "whether God is the efficient cause of all things," and that "created" in the title is taken broadly.

1032. See below, articles 3 - 4, on exemplar and final causality; and compare what was said above on divine simplicity and unity: q. 3, a. 4; q. 11, a. 3 - 4.

here, but in 1 - 2, question 79, articles 1 and 2. Now therefore it is to be inquired only whether one true God is the cause of all things, whether by creation, or by some other mode; whether proximately, or remotely.

Disputatio CLXXI - Whether one God is the author of all things

Various errors of the heretics, cap. 1. The Catholic doctrine is set against the heretics, cap. 2.

Caput I - Various errors of the heretics

Before we bring forward and confirm the Catholic doctrine, it will be worthwhile to recount various errors. The first heresy, then, was that of Simon Magus, who, as Tertullian is the author in the place cited below, was the first heretic out of the Gospel. He said that this visible world and men were not made by God, but by Angels; and that the Angels had been generated from himself and from a certain strumpet woman, whom he called Helena. For he boasted that he was the Holy Spirit and God. Thus write St. Irenaeus in the first book Against Heresies, chapters 20 and 21; St. Epiphanius, Heresy 21; Theodoret, in the first book of the Fabulous Histories of the Heretics, chapter 3; and Tertullian in the book On Prescriptions, chapter 46, who adds that this Simon called himself infinite wisdom, and that he appeared to the Jews as the Son; but to the Samaritans as the Father he had descended; and to other nations he had approached as the Holy Spirit, as he boasted.[1033]

The second heresy was that of the Saturnilians, who are so called from Saturnilus. These said that God was the author of all the Angels; yet that by seven of them, without the consent of God himself, this visible world had been formed, and that in the production of man they had used those words of Genesis 1: "Let us make man to our image and likeness." Thus report, among the Greeks, St. Epiphanius, Heresy 23, and Theodoret, book 1 of the Fabulous Histories of the Heretics, chapter on Saturnilus; St. Irenaeus likewise, book 1, chapter 22: among the Latins, Tertullian, On Prescriptions, chapter 46, and St. Augustine, On Heresies, chapter 3, who call this heretic Saturninus.[1034]

The third heresy is that of Basilides, who, according to the witness of St. Epiphanius, Heresy 24, and of Theodoret, book 1 of the Fabulous Histories of the Heretics, chapter on Basilides, and of Tertullian in the cited book, the same chapter 46, and of St. Irenaeus, book 1, chapter 23, and of St. Augustine in the same book, chapter 4, when he asserted that there are 365 heavens and a multitude of Angels, said that all were produced in this way: that from God, whom he called Abraxas, mind was created; from mind, word; from that, providence; from providence, power and wisdom; from these in turn, principalities and powers and Angels. By these Angels, he affirmed, the heavens were procreated in this order: that the first heaven was founded by Virtues and Powers

1033. St. Irenaeus, Adversus haereses I, 20 - 21; St. Epiphanius, Panarion, haer. 21; Theodoret, Haereticarum fabularum compendium I, 3; Tertullian, De praescriptione haereticorum 46.

1034. Genesis 1. St. Epiphanius, Panarion, haer. 23; Theodoret, Haereticarum fabularum compendium I, De Saturnilo; St. Irenaeus, Adversus haereses I, 22; Tertullian, De praescriptione haereticorum 46; St. Augustine, De haeresibus 3.

and Angels, and with it other Angels were created, who in turn produced the second heaven and other Angels with it; who then made the third heaven with other Angels; and so up to the last; and finally that the lower world and man flowed forth from the makers of the last heaven.[1035]

The fourth heresy, that of Carpocrates and Cerinthus and of their disciples, who were called Gnostics, that is, "knowing ones," agrees with the foregoing. For it asserts that Angels, produced by the supreme virtue, fell away and founded the visible world, as St. Epiphanius writes, Heresies 27 and 28, Theodoret in the cited book, chapter on Carpocrates, St. Irenaeus, book 1, chapters 24 and 26. These are not only manifest heresies, but also fables or dreams full of figments, which anyone can easily refute by Scripture and by reason. However, these dreamers did not entirely deny that God is the author of all things, whether proximately and through himself, or remotely and by the secondary causes established by him. In this, nevertheless, they raved manifestly: that they asserted the world to have been effected by God without God's own beck and will, as Cerinthus and those who followed him said. For since all things subsist and are preserved by his nod, as we shall show below in Disputation 174, it cannot be that any cause operates without his concurrence: for although sin, insofar as it is evil, is done without his beck and consent, nevertheless the substance of the act cannot be produced without him, as we shall see in 1 - 2, question 79, articles 1 and 2.[1036]

Moreover the Gnostics, who sprang either from Nicolaus or from Carpocrates, asserting that there are two Gods, one good, the other evil, seem, just as Manichaeus, to have taught that this visible world was produced by the evil God. Recent theologians attribute this error in this way to these heretics, because St. Augustine, in the book On Heresies addressed to Quodvultdeus, chapter 6, says these words about them: "They say also that a good God and an evil God are contained in their dogmas." But in St. Epiphanius, Heresies 26 and 27, where about these ...[1037]

Caput II - Catholic doctrine is established against the heretics

When he treats of the Gnostics, he could find nothing of the sort; rather, in heresy 27 concerning Carpocrates, from whom he also said the Gnostics flowed, he recounts only that heresy lately mentioned about the production of the world by Angels; nor does St. Augustine report from Epiphanius that the Gnostics said this visible world was created by an evil God.[1038]

Accordingly, the first who posited two principles, the one a good God, the other an evil, was Apelles, as Epiphanius in heresy 44 and Augustine in heresy 23 testify, from whom those called Apelleians took their name; he said that the visible world was made by an evil God, so that the good God took no care of it. Yet since Apelles said, as Epiphanius and Augustine likewise report, that the evil God was made by the good God, and did not posit two equally first principles; at least remotely he referred this world to the good God as to its author. Wherefore he is not so directly opposed to the doctrine of this article.[1039]

1035. St. Epiphanius, Panarion, haer. 24; Theodoret, Haereticarum fabularum compendium I, De Basilide; Tertullian, De praescriptione haereticorum 46; St. Irenaeus, Adversus haereses I, 23; St. Augustine, De haeresibus 4.

1036. See Disputatio 174; and 1 - 2, q. 79, a. 1 - 2 of St. Thomas, on God's concurrence with second causes.

1037. St. Augustine, De haeresibus ad Quodvultdeum 6; St. Epiphanius, Panarion, haer. 26 - 27.

1038. St. Epiphanius, Panarion, haer. 27 (on Carpocrates); St. Augustine, De haeresibus 27.

At length Manichaeus, as Epiphanius in heresy 66 and Theodoret in book 1, last chapter, of the Compendium of Heretical Fables, writes, not only posited two principles or two Gods, the one good, the other evil; but also affirmed them to be unbegotten, coeternal, and mutually opposed. Therefore, when he said that this visible world, in so far as it pertains to evil natures, was created by the evil God, and that the good God was not the author of all things, neither proximately nor remotely, he fought directly against the Catholic doctrine which St. Thomas holds in this article; and what natures were good and evil Augustine relates in the place cited.[1040]

Moreover, before Manichaeus, Cerdon, in the time of Pope Hyginus, as Epiphanius in heresy 41 and Augustine, chapter 21, Irenaeus book 1 against heresies chapter 28 and Tertullian in the book On the Prescription of Heretics chapter 51 bear witness, introduced also two Gods, one unknown to the world, whom they said to be the Father of Christ; this one he called good: but the other, the maker of the whole creation, fierce and cruel, and well enough known to men. Thus must Irenaeus be understood, whose words are obscure, when he says: one indeed just, the other good, according to the opinion of Cerdon; for by the name of just he means fierce and cruel. Clearer are the words of Irenaeus in Eusebius, book 4 of the History, chapter 10. He therefore agreed with Manichaeus by positing two principles, one good, the other evil: except that he attributed all creatures to the evil God as their author, whereas Manichaeus reserved some good ones to the good God. The Priscillianists in Spain agreed with Manichaeus, who drew their origin from Priscillian of Avila, as Pope Leo I writes in Epistle 91, which is to Turibius, chapter 14, where he condemns their error: then the Albigenses, the new Manichaeans in Gaul in the time of Innocent III, as Antoninus is authority, part 3 of the History, title 19, chapter 1.[1041]

Catholic doctrine is that one God, supremely good, in the beginning of time created from nothing both the corporeal and the spiritual creature; namely the angelic spirits, the heavenly bodies, and the elements. For fishes, birds, trees, brute animals, and man he produced from the matter of these elements, as is clear from the first chapter of Genesis: then in this way all things also that were afterwards generated must be referred back to God as author: so that at least God produced them by means of created causes. Whether, however, he actually concurs and operates with them, or only preserves them, is not to be disputed now, but in 1 - 2, question 79, articles 1 and 2; nor indeed does St. Thomas discuss this matter here, as I said in the notations on the article.

This truth is so manifest from Scripture, Councils, and the Fathers, that it would be superfluous to recount their testimonies one by one. It remains, therefore, that we confirm it by philosophical reason. Among others the best is that which St. Thomas asserts in this article in this manner. Whatever is such by participation must be from that to which it belongs to be such essentially: as heated iron, because it is hot by participation, has this from fire, which is such by essence: but all things other than God are not their own existence (*esse*), but participate in it: therefore they must

1039. St. Epiphanius, Panarion, haer. 44; St. Augustine, De haeresibus 23.

1040. St. Epiphanius, Panarion, haer. 66; Theodoret, Haereticarum fabularum compendium I, cap. ult.; St. Augustine, De haeresibus ad Quodvultdeum, locus citatus.

1041. St. Epiphanius, Panarion, haer. 41; St. Augustine, De haeresibus 21; St. Irenaeus, Adversus haereses I, 28; Tertullian, De praescriptione haereticorum 51; Eusebius, Historia ecclesiastica IV, 10; St. Leo the Great, Ep. 91 ad Turibium, cap. 14; St. Antoninus, Chronicon, pars 3, tit. 19, cap. 1.

have existence from him who has existence by his essence: that is, to whom it is essential to be and to exist; such an entity is God: therefore all things have existence from God. This reasoning plainly demonstrates that all things are from God, at least remotely: for here we do not contend to prove that God operates proximately in all things: for St. Thomas treats that matter elsewhere and we also will prove it elsewhere, as we promised.[1042]

On the first cause of all beings

Omitting, however, many things which must be noted in the explication of this reasoning, this alone is to be observed with Cajetan, that St. Thomas thence gathers that to exist is of the essence (*essentia*) of God, and that God is his own existing; because in him essence and existence (*esse*) are entirely the same. Thus he proved in question 3, article 4; and hence also he deduced in question 7, article 1, that God is infinite by essence, for the reason that he does not have existence received in essence, but his essence is his existence; whereas in article 2 he shows that every being, other than God, is not infinite according to essence, because it is not its own existence, but has existence received, either as a form received in matter, or as an existence and to-be in an essence. But because it cannot so easily be proved that in created things existence is distinguished from essence and is received in it; indeed the opposite is not less probable, as we shall show in the Third Part, question 17, article 2: therefore this reasoning can be framed by an easier route, in this way. That which is so actually that it cannot not be, exists by essence; that is, to be is essential to it as any other predicate: and hence it is from itself, needing no other: and this we said is to be infinite by essence, which is proper to God himself: for that which is thus of itself that it cannot not be, and needs no other, is the supreme being, which we call God: but there cannot be unless one God, as is shown in question 11: therefore all other things, besides this being, will not be beings actually existing by essence, but such as can of themselves be and not be: but that which is of this sort is from another: for of itself nothing can be, being indifferent to be and not be: nor can there be a process to infinity: therefore at length we must come to that one being which is by essence, from which we must admit that all other things are either remotely or proximately; and this St. Thomas in this article strives to demonstrate. What indeed Aristotle holds on this matter I have briefly said in Disputation 81, chapter 1.

Articulus II - Whether prime matter is created by God

Objection 1. It seems that prime matter is not created by God. For everything that comes to be is composed out of a subject and something else, as is said in Physics 1; but there is no subject of prime matter. Therefore prime matter cannot be made by God.

Objection 2. Further, action and passion are divided against one another. But as the first active principle is God, so the first passive principle is matter. Therefore God and prime matter are two principles divided against one another, of which neither is from another.

1042. See 1 - 2, q. 79, a. 1 - 2 of St. Thomas, on God's concurrence with second causes.

Objection 3. Further, every agent acts something like itself. And so, since every agent acts inasmuch as it is in act, it follows that everything made is in some way in act. But prime matter is only in potency as such. Therefore it is contrary to the notion of prime matter that it be made.

But on the contrary is what St. Augustine says: "Thou hast made two things, Lord: one nigh unto thee, namely the angel; another nigh to nothing, namely prime matter."[1043]

I answer that it must be said that the ancient Philosophers entered little by little, as it were step by step, into the knowledge of truth. At the beginning, as it were being cruder, they did not think there were beings except sensible bodies. Of these, those who posited motion in them did not consider motion except according to certain accidents, for instance according to rarity and density, by aggregation and segregation. And supposing the very substance of bodies to be uncreated, they assigned certain causes of such accidental transmutations, for instance friendship, strife, intellect, or something of this sort. Advancing further, they distinguished by the intellect between substantial form and matter, which they posited uncreated; and they perceived transmutation to be made in bodies according to essential forms. Of which transmutations they posited certain universal causes, for instance the oblique circle, according to Aristotle,[1044] or, according to Plato, the ideas.

But one must consider that matter is contracted by form to a determinate species, just as the substance of some species is contracted by an accident supervening to a determinate mode of being, as man is contracted by white. Therefore they considered being as particular under a certain consideration: either inasmuch as it is this being, or inasmuch as it is such a being; and thus they assigned such particular agent causes. And further some recurred to consider being inasmuch as it is being; and they considered the cause of things not only according as they are these or such, but according as they are beings. Therefore that which is the cause of things inasmuch as they are beings must be the cause of things not only according as they are such by accidental forms, nor according as they are these by substantial forms, but also according to whatever pertains to the being of them in any way. And thus one must also posit prime matter created by the universal cause of beings.

Reply to the first: The Philosopher in Physics 1 speaks of becoming in particular, which is from form to form, whether accidental or substantial; but he is not speaking of things according to their emanation from the universal principle of being; from which emanation matter is not excluded, although it is excluded from the first mode of making.

Reply to the second: Passion is the effect of action. Hence it is reasonable that the first passive principle be the effect of the first active principle. For every imperfect thing is caused by the perfect. For the first principle must be most perfect, as Aristotle says in Metaphysics 12.

1043. St. Augustine, Confessiones XII, 7 (in fine): "Duo fecisti, Domine, unum prope te, scilicet angelum; aliud prope nihil, scilicet materiam primam."

1044. Aristotle, De generatione et corruptione II, text. 16; Plato, on the ideas.

Reply to the third: The argument proves not that matter is not created, but that it is not created without form. For although every created thing is in act, it is not, however, pure act. Hence it is necessary that even that which has itself on the side of potency be created, if everything that pertains to its being is created.

Notations concerning the doctrine of the article. The conclusion is affirmative, and no less of faith than the preceding. This is clear from all that we said in the preceding disputation. And indeed when in the preceding article the Doctor had proved this very point, that God is the efficient cause of all the rest of things which are besides himself, this same point had already been sufficiently proved concerning prime matter. But because there have not been lacking heretics who have erred specifically about prime matter, therefore it was fitting first to institute a new article concerning it. There were indeed at the beginning philosophers, who, although they clearly felt that the world was made in the beginning of time, nevertheless asserted that prime matter was unbegotten and coeternal with God. Thus Plato held, as Plutarch writes in book 1 On the Opinions of the Philosophers, and most others, and St. Ambrose in book 1 of the Hexaemeron. So too the Stoics taught, as we shall immediately report from Tertullian. And the philosopher Zeno, Tertullian himself attests in the book On the Prescription of Heretics, chapter 7. Among the heretics, however, the first who followed this error was Hermogenes, as Tertullian is authority in the book Against Him, chapter 1, following (as he himself says) the Stoa, that is, the school of the Stoics. The same error Tertullian attributes to the same Hermogenes in the On the Prescription of Heretics, chapter 33, and to Marcion in book 5 Against Him, penultimate chapter. Theodoret likewise charges the same error in book 1 of the Compendium of Heretical Fables, in the chapter On Hermogenes and in the chapter On Marcion. Isidore also makes mention of Hermogenes in book 8 of the Etymologies, chapter 5, and Rabanus in book 3 On the Instruction of Clerics, chapter 8. St. Gratian likewise takes certain things concerning this in the Decretum, cause 19, question 4, canon Quare fallitur. Gabriel Prateolus is mistaken in the Elenchus of Heresies, when he makes Hermogenes a follower of Sabellius in the time of the Emperor Gallienus; for he was much earlier. Whether indeed Sabellius, concerning the Trinity, later followed this error is another matter; as I said elsewhere, in Disputation 109, chapter 1. In the same error Sabellius himself wavered, as is clear from Eusebius, book 7 of the Preparation for the Gospel, chapter 8. Then the Seleucians and Hermians, as St. Augustine writes, De Haeresibus 59; and Hermias; and indeed St. John Chrysostom believed that even Valentinus and the Manichaeans taught the same, Homily 21 on Genesis, halfway through. Thus he says.[1045]

Reply to the first: The Philosopher in Physics I speaks of a particular coming-to-be, which is a transition from form to form, whether accidental or even substantial; but here we are speaking of things according to their emanation from the universal principle of being, from which emanation matter is not excluded, although it is excluded from the first mode of making.

1045. Plutarch, De placitis philosophorum I; St. Ambrose, Hexaemeron I; Tertullian, De praescriptione haereticorum 7, 33; Tertullian, Adversus Hermogenem 1; Tertullian, Adversus Marcionem V, penult.; Theodoret, Haereticarum fabularum compendium I, De Hermogene; ibid., De Marcionis; Isidore of Seville, Etymologiae VIII, 5; Rabanus Maurus, De institutione clericorum III, 8; Gratian, Decretum, causa 19, q. 4, can. Quare fallitur; Eusebius, Praeparatio evangelica VII, 8; St. Augustine, De haeresibus 59; St. John Chrysostom, Hom. 21 in Genesim.

Reply to the second: Passion is the effect of action. Hence it is reasonable that the first passive principle be the effect of the first active principle. For every imperfect thing is caused by a perfect one; for the first principle must be most perfect, as Aristotle says in Metaphysics XII.[1046]

Reply to the third: That reasoning does not show that matter is not created, but that it is not created without form. For although everything created is in act, it is not, however, pure act. Hence it is necessary that even that which stands on the side of potency be created, if everything that pertains to its existence is created. For matter is contracted by form to a determinate species, just as a substance of some species is contracted by an accident supervening to it to a determinate mode of being - thus a man is contracted by whiteness. Accordingly, both parties considered being with a certain particular consideration: either insofar as it is this being, or insofar as it is such a being; and thus they assigned to things particular efficient causes. And further, some rose up to consider being insofar as it is being, and they considered the cause of things, not only according to the fact that they are these or such, but according to the fact that they are beings. Therefore, that which is the cause of things insofar as they are beings must be the cause of things, not only according to the fact that they are such by accidental forms, nor according to the fact that they are these by substantial forms, but also according to everything that pertains to their existence in any way whatsoever. And thus it is necessary to posit that even prime matter is created by the universal cause of beings.

A few notes around the doctrine of this article. The conclusion is affirmative, and no less of faith than the preceding. It is clear from all that we said in the preceding disputation. And indeed, since in the foregoing article St. Thomas had already proved that God is the efficient cause of all the others which are apart from Himself, the very same had already been sufficiently proved regarding prime matter. But because heretics have not been lacking, who have erred especially about prime matter, it was therefore worth the effort to institute a fresh article on it. There were, to begin with, philosophers who, although they clearly held that the world was created in the beginning of time, nevertheless asserted that prime matter was unbegotten and coeternal with God. Thus thought Plato, as Plutarch writes in book I On the Opinions of the Philosophers, and very many others, and St. Ambrose in Hexaemeron I. So too the Stoics taught, as we shall immediately report from Tertullian; and Zeno the philosopher, as Tertullian himself attests in the book On the Prescriptions against Heretics, chapter 7. Among the heretics, the first to follow this error was Hermogenes, as Tertullian testifies in the book Against him, chapter 1, who (as he himself says) followed the portico, or school, of the Stoics. The same error Tertullian ascribes to this same Hermogenes in the book On the Prescriptions against Heretics, chapter 33, and to Marcion in book V against him, the second-to-last chapter. Theodoret likewise imputes this error to them in book I of the Compendium of Heretical Fables, in the chapters On Hermogenes and On Marcion. Mention of this same error of Hermogenes is made by Isidore, Etymologies VIII, by Rabanus, On the Institution of the Clergy III, 18, and by Gratian in the Decree, cause 24, question 3, the canon "Quare fallitur." Gabriel Prateolus, in the Elenchus of Heresies, makes Hermogenes a partisan of Sabellius under the Emperor Gallienus, although he was much earlier. Whether indeed he followed

1046. Aristotle, Metaphysics XII.

the error of Sabellius against the Trinity of persons was discussed in Disputation 109, chapter 1. In this same error Sabellius is found, as is clear from Eusebius, Preparation for the Gospel VII, 8 and following; then Seleucus, from whom the Seleucians, and Hermias, from whom the Hermians, as St. Augustine writes, De haeresibus 59. Nay rather, if we believe St. John Chrysostom, Homily 2 on Genesis, after the middle, Valentinus and the Manichees taught the same. For thus he says: If a Manichaean approach you saying that matter pre-existed - or Marcion, or Valentinus, or a Gentile - say to him: "In the beginning God made heaven and earth" (Gen. 1:1). And for this reason the Albanians, or Albigensians, the new Manichees in Gaul, thought the same, as Alphonsus de Castro reports against the heresies under the word "mundus."[1047]

Against this error there is the manifest definition of the Church in the Lateran Council, reported in the chapter Firmiter, On the Most Holy Trinity and the Catholic Faith, where it is defined that God created from nothing both kinds of creatures. Many Fathers also have written the same: Lactantius, Divine Institutes II, 9; Tertullian in the place cited; St. Ambrose, Hexaemeron I; St. Augustine, De Genesi contra Manichaeos I, 1 and 5; the same, Literal Commentary on Genesis I, 14; and De vera religione 18; and Contra Faustum X, 14; and Confessiones XII, 4; Origen too has a fragment on this in Eusebius, Preparation for the Gospel VII, 8 - 9, where Eusebius himself also discusses it; Epiphanius, Haeresis 66, where he attributes this error to the Manichees; St. Gregory of Nyssa, On Man; St. Athanasius, On the Incarnation of the Word. From Scripture too it can be refuted: for in Genesis 1 it is said that God in the beginning made all things, nor is it expressed from what He produced them, although it is said when He produced man from the slime of the earth, that He made the fishes from the water, and so on; then also because in Psalm 145 it is said that He made "heaven, earth, the sea, and all things that are in them" (Ps. 145[146]:6); Isaiah 41: "Behold, you are of nothing, and your work is of that which hath no being" (Isa. 41:24); and 2 Maccabees 7: "I beseech you, look upon heaven, and earth, and all that is in them, and consider that God made them out of nothing, and men also" (2 Macc. 7:28); and Romans 11: "For of him, and by him, and in him are all things" (Rom. 11:36)

Moreover, by natural reason the same is most excellently proved. For that which is from itself, and needs nothing outside itself in order to be, is so perfect as to be God, and is infinite according to essence - for we said this is the ratio of the infinite according to essence in Disputation 25. If therefore matter were not from another, it would not only not be the most imperfect being, but indeed it would be God. Or by what reason could it come about that prime matter, which is the most imperfect being of all, should not need a cause in order to be produced, while the rest are produced? Will it be that from a second cause, by means of a form which they efficaciously induce, it proceeds, but is conserved by God? We shall speak of this below in Disputation 147. For now, regarding matter, let these points suffice.

1047. Eusebius, Praeparatio evangelica VII, 8 - 9; St. Augustine, De haeresibus 59; St. John Chrysostom, Homilia 2 in Genesim (post medium); Alphonsus de Castro, Adversus haereses, s.v. "mundus"; Tertullian, De praescriptione haereticorum 7, 33; Adversus Hermogenem 1; Adversus Marcionem V (penult.); Theodoret, Haereticarum fabularum compendium I, De Hermogene; ibid., De Marcionis; Isidore of Seville, Etymologiae VIII; Rabanus Maurus, De institutione clericorum III, 18; Gratian, Decretum, causa 24, q. 3, can. Quare fallitur; Plutarch, De placitis philosophorum I; St. Ambrose, Hexaemeron I.

Articulus III - Whether God is the exemplar cause

It is asked thus for the third. It seems that the exemplar cause is something other than God. For the exemplified thing has a likeness of the exemplar; but creatures are far from a divine likeness. Therefore God is not their exemplar cause.

1. Moreover, everything that is by participation is reduced to something existing per se, as what is ignited is reduced to fire, as has already been said. But whatever things are in sensible realities are only by participation in some species. This is clear from the fact that in none of sensibles is found only that which pertains to the notion of the species; rather, to the principles of the species there are adjoined individuating principles. It is therefore necessary to posit the species themselves as existing per se, as a man existing per se, and a horse existing per se, and so forth. And these are called exemplars. Therefore there are certain exemplars outside God.
2. Moreover, sciences and definitions are about the species themselves, not according to the way in which they are in particulars, because there is neither science nor definition of particulars. Therefore there are certain entities which are species not in singulars. And these are called exemplars. Therefore as before.
3. Moreover, the same seems to follow from Pseudo-Dionysius, who says in Divine Names V that being itself, considered according to itself, is prior to that which is life itself and to that which is wisdom itself.

But on the contrary: An exemplar is an idea. But the ideas, according to what St. Augustine says in the book of Eighty-Three Questions, are principal forms which are contained in the divine intelligence. Therefore the exemplars of things are not outside God.[1049]

I answer that God is the first exemplar cause of all things. For the understanding of which, it must be considered that to the production of any thing it is necessary to have an exemplar, so that the effect may follow with a determinate form. For the craftsman produces a determinate form in matter on account of the exemplar to which he looks, whether it be an exemplar which he contemplates outside, or an exemplar conceived interiorly in the mind. But it is manifest that the things which come to be naturally obtain determinate forms. Now, this determination of forms must be reduced, as to the first principle, to the divine wisdom, which devised the order of the universe, an order which consists in the distinction of things. And therefore it is necessary to say that in the divine wisdom are the reasons, that is, the rationes, of all things: which we have already called ideas, that is, exemplar forms existing in the divine mind. These indeed, although they are multiplied according to their relation to things, are nevertheless not really other than the divine essence, insofar as its likeness can be participated in different ways by diverse things. Thus, then,

1049. St. Augustine, De diversis quaestionibus octoginta tribus, q. 46 (and cf. q. 28): "Ideae... sunt formae principales, quae continentur in divina intelligentia."

God Himself is the first exemplar of all. Yet in created things certain ones can be called exemplars of others, inasmuch as some are to the likeness of others - either according to the same species, or according to an analogy of some imitation.

Reply to the first: Although creatures do not attain to this - that they be like God according to His nature by a likeness of species, as a homogeneous thing to the human generator - yet they do attain to His likeness according to a representation of the pattern of reason conceived by God; as the house which is in matter is to the house which is in the mind of the craftsman.

Reply to the second: Of the notion of man it is that he be in matter, and thus a man cannot be found without matter. Therefore although this particular man is by participation in the species, nevertheless he cannot be reduced to some thing existing per se in the same species, but to a species exceeding it, as are the separated substances.

Reply to the third: Although any science and definition is solely about beings, it is not necessary that the thing have in existing the same mode which the intellect has in understanding. For by the power of the agent intellect we abstract universal species from particular conditions; yet it does not follow that universals subsist apart as exemplars of particulars.

Reply to the fourth: As Pseudo-Dionysius says in Divine Names XI, "life itself" and "wisdom itself" sometimes name God Himself, and sometimes the perfections given to things; but not certain subsisting things, as the ancients posited.

Conclusion: God, by reason of the ideas which He has in Himself, is the exemplar cause of all things. About the ideas enough, and more than enough, has been said by us throughout Question 15.

Articulus IV - That God is the final cause of all things

To the fourth we proceed thus. It seems that God is not the final cause of all things. For to act for an end seems to belong to one who is in need of an end. But God is in need of nothing. Therefore it does not befit Him to act for an end.

1. Moreover, the end of generation is the form of the generated; and the end and the agent do not fall under the same in number, as is said in Physics II. But God is the first agent of all. Therefore He is not the final cause of all.
2. Moreover, all things desire an end. But not all things desire God, because not all know Him. Therefore God is not the end of all.
3. Moreover, the final cause is the first of causes. If therefore God be both efficient cause and final cause, it follows that in Him there is a prior and a posterior. But that is impossible.

But on the contrary: It is said in Proverbs 16: "The Lord has wrought all things for himself."

I answer: Every agent acts for an end. Otherwise, from the consideration of the agent it would not follow this rather than that, unless by reason of a cause. Now the end of the agent and of the patient, as such, is the same, but in different ways. For one and the same thing is what the agent

intends to impress, and what the patient intends to receive. There are, however, certain things which act and suffer at the same time, which are imperfect agents; and to these it belongs that even in acting they intend to acquire something. But to the first agent, which is agent only, it does not belong to act for the acquisition of the end of another, but it intends only to communicate its own perfection, which is its goodness. And each creature intends to attain its perfection, which is a likeness of the divine perfection and goodness. Thus the divine goodness is the end of all things.

Reply to the first: To act on account of indigence belongs only to an imperfect agent, which is of a nature to act and to suffer. But this does not befit God. And therefore He alone is supremely liberal, because He does not act for His own utility, but only for His own goodness.

Reply to the second: The form of the generated is not the end of generation, except inasmuch as it is a likeness of the form of the generator, who intends to communicate its likeness. Otherwise the form of the generated would be nobler than the generator, since the end is nobler than the things that are for the sake of the end.

Reply to the third: All things desire God as an end by desiring whatever good, whether by an intelligible appetite, or by a sensible appetite, or by a natural appetite which is without cognition. For nothing has the character of good and of the appetible except according as it partakes of the likeness of God.

Reply to the fourth: Since the final cause is the first of causes, if therefore God were both the efficient and the final cause, it would follow that there is a prior and a posterior in Him. Which is impossible.

Notationes circa articulum. - The conclusion is affirmative and of faith, as appears from that, "The Lord has wrought all things for himself," Proverbs 16. Here first observe that St. Thomas does not inquire in this whole question whether God is the formal cause of things; but he inquires only about the other genera of causes: because already in question 3, article 8, he had proved that God cannot enter into the composition of anything; but the formal cause always composes that of which it is the cause. Next note that God is not the end "for whose sake" (finis cuius gratia); for this end is obtained by operation, and God is not obtained; but He is the end "to whom" (finis cui), because all things issue in the praise and glory of Him which are done in this world. We spoke of the distinction between the end "for whose sake" and the end "to whom" in book 3 On the Cult of Adoration, disputation 1, chapter 6; and we shall speak in disputation 2, chapter 3. But how God is happy, and regards Himself as the end; and whether anything created can be compared to Him as end or not, we said above in disputation 82.

Quaestio XLV - On the mode of the emanation of things from the first principle

Next, there is inquiry about the mode of the emanation of things from the first principle, which is called creation.

Of which eight things are asked.

Articulus I - Whether to create is to make something from nothing

Objection 1. It seems that to create is not to make something from nothing. For Augustine says against the adversary of the Law and the Prophets: "To make is to cause what before was not at all; but to create is to establish something by drawing it out from that which already was."[1050]

Objection 2. Further, the nobility of an action and of motion is considered from the termini. Therefore a more noble action is that which is from good into good, and from being into being, than that which is from nothing into something. But creation seems to be the most noble action, and the first among all actions. Therefore it is not from nothing into something, but rather from being into being.

Objection 3. Further, this preposition "from" (ex) imports the relation of some cause, and chiefly of the material cause; as when we say that a statue is from bronze. But "nothing" cannot be the matter of a being, nor in any way its cause. Therefore to create is not to make something "from nothing."

But on the contrary is what is said upon that text of Genesis 1:1, "In the beginning God created heaven and earth": the Gloss says that "to create is to make something from nothing."[1051]

I answer: As was said above, one must consider not only the emanation of some particular being from some particular agent, but also the emanation of the whole being from the universal cause, which is God; and this emanation we designate by the name of creation (*creatio*). But what proceeds according to particular emanation does not presuppose emanation. Thus, if a man is generated, there was not previously a man, but a man is from a non-man, and something white from a non-white. Hence, if there be considered the emanation of the whole universal being from the first principle, it is impossible that any being be presupposed to this emanation. But the same is "nothing" as "no being." Thus, as the generation of a man is from a non-being which is a non-man, so creation, which is the emanation of the whole existence (*esse*), is from non-being simply, which is nothing.

Reply to the first: Augustine uses the name "creation" according to that usage by which those things are said to be created which are reformed unto the better, as when someone is said to be "created" into a bishop. But we are not speaking here thus of creation, but as has been said.

Reply to the second: Changes receive their species and dignity not from the terminus from which, but from the terminus to which. Therefore the more perfect and prior some change is, the more the terminus to which of that change is nobler and prior, even if the terminus from which, which is opposed to the terminus to which, be more imperfect. Thus generation simply is nobler and prior than alteration, because the substantial form is nobler than the accidental form: yet the privation of substantial form, which is the terminus from which in generation, is more imperfect than the contrary, which is the terminus from which in alteration. And similarly, creation is more

1050. St. Augustine, Contra adversarium legis et prophetarum I: "Facere est quod omnino non erat; creare vero est ex eo quod iam erat educendo aliquid constituere."

1051. Gloss (ascribed to Bede) on Genesis 1:1: "Creare est aliquid ex nihilo facere."

perfect and prior than generation and alteration, because its terminus to which is the whole substance of the thing. But that which is understood as the terminus from which is simply non-being.

Reply to the third: When it is said that something is made "from nothing," the preposition "from" does not designate a material cause, but only order, as when it is said, "from morning it becomes midday," i.e., after morning it becomes midday. But one must understand that this proposition "from" can include the negation that is conveyed in what I call "nothing," or it can include it from itself. If in the first way, then the order remains affirmed, and it shows the order of that which is to non-being preceding. If, however, the negation include the preposition, then the order is denied, and the sense is: "It is made from nothing," that is, it is not made from anything; just as if it be said, "this man speaks," one can say "from nothing" because he does not speak from anything. And in both ways it is verified when it is said that something is made from nothing. But in the first way this preposition "from" imports order, as has been said. In the second way it imports a relation to the material cause, which is denied.

Conclusion: Creation, which is the emanation of the whole being, is from non-being, which is nothing. In the text of St. Thomas nothing else occurs to be noted, beyond the explication of this definition, upon which many things that are to be said about creation depend; and this will be handed on in the following disputation.

Disputatio CLXXII - Whether creation is a production from nothing

Caput I - The opinion of Wyclif

The verb "to create" (creare), and the noun "creation" (creatio), are wont to be used both in the broader signification for that which is "to make something"; and properly for that which is "to produce something from nothing." For although sometimes in Scripture and the holy Fathers creation is taken for renovation and spiritual regeneration, as St. Basil noted on Psalm 32 in the words "He spoke and they were made; he commanded and they were created," and in the homily, "That God is not the author of evils," column 3;[1052] yet that occurs because the renovation of the interior man is, in that genus, a certain production from nothing, that is, from the mercy of God, with no proper works of ours preceding from us; whence we are said by the Apostle to the Ephesians to be "created in Christ in good works"; and in chapter 4, "the new man according to God is said to be created"; and to the Galatians, "neither circumcision avails anything, nor uncircumcision, but a new creature."[1053] For this reason our justification could be called a certain moral, not physical and natural, creation. But whether the infusion of grace itself, or of other supernatural gifts, be creation, we shall say below in disputation 174, chapter 2.

1052. St. Basil, In psalmum 32 (33): "Ipse mandavit, et creata sunt"; and Homilia: Quod Deus non est auctor malorum, col. 3.

1053. Eph. 2:10; 4:24; Gal. 6:15.

But concerning physical and natural creation, all the Scholastics affirm that it is the production of something from nothing, although in explaining this definition they vary among themselves. Therefore, first, Scotus, in the second book, distinction 1, question 9, article 2, so far as concerns this article, explaining this definition, asserts that creation is the production of something from nothing, that is, not from anything according to the existence of existence (esse existentiae), and therefore not from anything according to the existence of essence (esse essentiae): because, as he says, proved in distinction 36 of the first book, the existence of essence is never separated from the existence of existence. For Scotus thinks existence to be altogether the same according to reality, as we more fully showed in the third part of St. Thomas, question 17, articles 1 and 2. He adds then that no thing is created from nothing, that is, from no mode of being, neither simply nor in a qualified way: because all things that are created previously have an intelligible being in the mind of God, and a willed being, which is the possible being of things, and elsewhere Scotus himself calls it the diminished being, and the objective being, of creatures. A similar opinion is that of Wyclif, which Walden reports in the first tome of the Doctrinale fidei antiquae, book 1, chapter 17; for thus (he says) Wyclif defined creation: it is a production from pure intelligible being to essential being outside God. The same Walden also reports in the same book, chapter 20, that Wyclif in the aforesaid definition explained the terminus a quo of creation, so that it would not be altogether nothing, but the ideal being of the thing; because, as that man used to say, God cannot tend unto that which is pure nothing. In this opinion Walden cites the man's words in Trialogus I: "If you ask why God did not forbid man to sin thus, it is easy for me to answer that for this reason, because this was not forbiddable, since it was not; nor does the power of God extend to nothing and the void"; in which words Wyclif seems to assert that which Scotus taught, namely, that no thing is created from nothing, that is, from no mode of being, neither simply nor in a qualified way.

Caput II - The foregoing opinion is refuted

Walden keenly pursues both positions of Wyclif in the places cited; but for us to impugn them, it is necessary first to explain what each intended; for Wyclif did not err in all the things which Walden thought. One must first set down this, which we reported from the same Wyclif in disputation 70, chapters 1 and 2: namely, that according to his opinion this proposition is true, "the creature is God," even without that addition "according to intelligible being"; whereas according to the rules of truer logic it is altogether false, as we proved there more closely. Secondly, since this proposition, "Man, and any creature whatsoever, according to intelligible or ideal being, is God Himself," in some sen -

Now, what in Wyclif's opinion is worthy of reproof, and what censure it deserves, can easily be shown; for it is not fitting that truth be confused with falsehood, nor that it be attacked indiscriminately, as Valdensis attacks it. First, then, when Wyclif asserts that the "term a quo" is not "absolutely nothing," he has for companion in his doctrine Scotus, as is clear from what has been said; yet I do not see on what ground this can be blamed. For by "absolutely nothing" each understands - just as Scotus explained - that which the Ferrariensis called "non-being essentially," and which St. Thomas above, question 45, article 3, called "the non-being opposed to the notion of

being," which is the object of the divine omnipotence: and this is most true.[1054] For God does not so create something from nothing that He makes something out of that which involves a contradiction and is impossible, and is called "absolutely non-being," or "non-being essentially": who does not see this? In this doctrine St. Thomas also agrees in that article, as we noted in the place cited. For he asserts that about non-being in this way omnipotence is not conversant. Henry likewise asserts this in his Summa, article secundo, questions 23 and 24.[1055] Therefore, when Wyclif - as cited by Valdensis in that chapter 20 - said, "The divine power does not extend to nothing and to the vacuum," he is not denying that God can fill a vacuum, that is, a place not filled - who would deny this? - but he only says that God cannot make that what implies a contradiction and is non-being essentially should be something; and that a vacuum, which is nothing, should also be something - which is most true. Wherefore the testimonies of the Saints which Valdensis there piles up, by which he proves that God made all things from nothing, are not against Wyclif: for by "nothing" the Fathers understand that which actually is not, but can be and exist.

Next, whether the intelligible being (*esse intelligibile*) of creatures, which some call "ideal," is the very essence (*essentia*) of God - what theologians call the ideas of things, as we saw in disputation 71 - or rather is the very formal being (*esse formale*) of creatures according to their proper determinations, existing objectively in the intellect, is not sufficiently clear in Wyclif, as we proved in that same disputation. Moreover, if by that "intelligible being" he himself understands the essence of God, inasmuch as it has the nature of an idea, he plainly errs in faith, when he asserts that God produced all things out of that intelligible being, as Valdensis very well refutes in the cited chapter 17.[1056] For just as it is against the doctrine of the Fathers and against reason that God made any creature out of His own substance, since He produced only the Son and the Holy Spirit out of His substance; so likewise he plainly errs when he asserts that a creature was produced by God out of that intelligible or ideal being, which is God Himself. For thus every creature would be produced out of the nature of God and out of His substance. And since Wyclif concedes this proposition, "The creature is God according to intelligible or ideal being," as we reported there, he seems to have taken in this former way the intelligible being of creatures, out of which he said creatures were produced. For only in this way can it be said with that addition, "According to intelligible being, the creature is God," as we noted in that place. But it is the same manifest error to assert that God created something "out of His substance" or "out of His own substance": because the particles "out of" (de) and "from" (ex) do not denote an efficient principle only, but at the same time a principle that pertains to the constitution of the produced thing, when something is said to be produced "from" something; although the efficient cause without a preposition denotes only the principle of causing. And what the particle "out of" (de) signifies, when it is joined to the verb "is" (sum), as when we say, "The Son is out of the substance of the Father," we discussed in disputation 163.[1057]

1054. St. Thomas Aquinas, Summa theologiae I, q. 45, a. 3.

1055. Henry of Ghent, Summa, article secundo, questions 23 - 24.

1056. Valdensis' refutation of Wyclif on production "out of intelligible being," cited at cap. 17.

1057. On the sense of "out of the substance" in the formula "the Son is out of the substance of the Father," see Vazquez, disputation 163.

In this sense, however, it is certain that Scotus was not speaking, when he said that "things were produced by God not from nothing, that is, from no mode of being, neither simply nor in a qualified sense, since previously things had had some being understood and willed in God." For Scotus did not think that this intelligible being was the very essence of God, but the essence of the creature, possible and objectively present to the divine intellect. Wherefore, even if he says that things were made "out of that intelligible being," he does not on that account hold that they were made out of the very substance of God, as Valdensis was inferring against Wyclif.

But if Wyclif understands by "intelligible being" that objective being of creatures according to their proper determinations, as Scotus understands it, and as Valdensis himself does, who also grants that this is the diminished being of things, as we said in that disputation 70; and in this sense says that all things were produced by God, not out of "nothing at all," but out of "non-being existing," and out of that intelligible and diminished being; he does not err in faith. Yet from the principles of philosophy he can easily be refuted. For either a thing is said to be made "out of that possible being" as out of some constituent, and this cannot be said; because the possible being of a thing does not constitute the thing actually existing, but is altogether the same as that which is possible and that which actually exists. For "possible being" is nothing other than "not implying a contradiction that it be"; but this is not something out of which the thing itself that is actually produced is constituted, nor is it any principle of it.

If he should say that a thing is made "out of that possible and intelligible being" as out of a term a quo (terminus a quo), it can be more easily attacked: and in this sense Valdensis attacks him in that chapter 17. For just as Aristotle in Physics I, chapter 5, text 43, ridicules the philosophers, whose opinion he had reported in chapter 4, text 34, asserting that "out of sweetness comes whiteness" and "out of brightness comes magnitude": because although what is not white may have been sweet, and out of non-white white may come, nevertheless this is per accidens, and therefore only per accidens does white come from sweet; so also the per se term a quo of creation will be the non-being of the thing; but "possible" and "intelligible" being will be a per accidens term, just as "sweet" is the term of white, of which it is not to be said absolutely that out of it white comes.[1058]

Yet this argument of Valdensis is weak. For although from a positive which is joined per accidens to the negation that is the term a quo of production, nothing is said to be made except per accidens; nevertheless, out of a positive which is joined per se to the negation that is the term a quo, something also is said to be made: for example, a tree is made out of seed, and a man out of an embryo, and white out of black, and so of others. Thus Wyclif could say that that intelligible being is not per accidens conjoined to non-being, as sweet is conjoined accidentally to non-white, and therefore that it is not the same case.

However, by this argument Wyclif can be refuted. For that diminished or possible being is nothing other than a thing's not implying a contradiction that it be: but this remains even when the thing itself is produced, nor is it in any way distinguished from it. Wherefore we do not rightly say, "out of that which does not imply 'man' comes a man," as we say that a tree comes from seed;

1058. Aristotle, Physics I, c. 4, text 34; c. 5, text 43.

rather, this is brought about when the man is produced, namely, that man, who does not imply being, actually be. Therefore "possible being" cannot have the character of a term a quo; and thus, although it be conjoined per se with the negation out of which a man comes, nevertheless he is not said to come out of it, nor any other thing; because that out of which a thing comes, as out of a term a quo, does not remain with the thing itself which is made. And just as in disputation 71, chapter 2, we said that the idea is not the objective concept of a possible thing, because it is altogether the same thing that is made; so, with much less reason, can it be the term a quo of the same production, because it is the same thing that was objectively present and that actually is made. Therefore Anselm rightly, in the Monologion, chapter 8, near the end, after he had said that creation is a production from nothing, that is, not from something, explains what that "nothing" was, and says: "All created things existed indeed in the uncreated mind of God, but they were not what they now are, that is, they did not have the existence which they now have. They were, however, something, with respect to the account of making, by which, and according to which they would be made." He did not say "out of which" they would be made, but "by which" and "according to which," which is proper to the idea and to the efficient cause. Therefore Wyclif did not rave at that point, as Valdensis thought.[1059]

In this part also Scotus seems to have taught the same as Wyclif: for he says that nothing can be created "from nothing," that is, from no mode of being, neither simply nor in a qualified sense, because nothing is created which did not first have being understood. By which words, if Scotus wishes to teach that creation is "from some intelligible being," he is mistaken, as has been proved. But if he only says that the term a quo is not "non-being," that is, what is impossible, and non-being essentially, this is most true. Yet in what he immediately adds, he clearly slips: for he says that something can be produced, though not created, "from non-being simply," that is, "from not-something according to essence and existence": he does not speak of "the impossible," but of "the not-possible" - that it can, I say, be produced, not according to the being of existence, but according to possible being: for he thinks - just as we reported in disputation 104, chapter 2 - that all things are produced by the divine intellect according to the notion of the possible; which we sufficiently impugned in that place. But if by the divine intellect things were possible, the doctrine of Scotus would be true.

Exposition is given of the aforesaid definition of creation.

Caput III - Exposition of the definition of creation

It remains that, from the foregoing, we gather in general the true exposition of the definition which above we handed on concerning creation; for to which productions the notion of creation pertains peculiarly, will be said in the following disputations. Creation, therefore, is the production of something out of nothing, not because "nothing" is as it were matter, or anything pertaining to the constitution of the thing produced; but because it is the term a quo (*terminus a quo*) of the production. And it comes to the same, that a thing be produced out of nothing as out of a term a

1059. St. Anselm, Monologion, c. 8.

quo, and that nothing pre-exist before the production which in some way pertains to the constitution of that thing; or, which is the same, that the thing be made according to its whole self. For when something in the thing has preceded, and by that production is not made, it is not creation; because that thing is made, not out of nothing, but out of something - whether that be a form or matter; for a thing is said to be made out of everything by which it is constituted. Wherefore, if the form of the thing has preceded, it is said to be made out of it, not out of nothing. Hence creation is wont to be called the production of being, as being (*ens qua ens*), that is, according to the whole notion of that which is produced; and St. Thomas, in the first article of this question, called it the "emanation of the whole universal being": and therefore he argues rightly as follows. Just as the emanation of man, according to the notion of man, ought to be "from non-man," so also the emanation of the whole of being ought to be "from non-being," which is "nothing," not from such a non-being as "from non-man," which is something. Thus do the Scholastics, to be cited below, understand the aforesaid definition, and they gather it from Anselm in that chapter 8 of the Monologion, where he thus explains "from nothing": that is, "not from something."[1059]

But indeed, concerning the particle "from" (ex), some vary in their understanding. Marsilius, in the Second Book, the first question, article 2, in the fourth part of the article, at the words "Whence it follows that the eternal emanation," and a little below, thinks it necessary for the notion of creation that that "nothing" should precede in duration: whence he infers that a simple eternal emanation cannot be creation, and therefore that nothing can be created by God from eternity.[1060] The reason for this opinion, by which also Marsilius is led to say that nothing can be created from eternity, we shall adduce in disputation 179, chapter 3. The same seems to be the opinion of St. Bonaventure, in the Second Book, distinction 1, article 3, question 1; and from this he also taught, in article (or question) 2, that no thing could have been created from eternity.[1061]

Much more probably, however, the particle "from" (ex) signifies not a priority of duration, but a priority of nature, as Scotus plainly teaches in the Second Book, distinction 1, question 2, in the respondeo; and all who assert that some creature could have been created by God from eternity ought to admit this: for then the non-being would precede, not in duration, but only in nature. For, besides the fact that the opinion that some creature could be created from eternity is much more probable, even if that should be repugnant for some other reason, nevertheless, so far as pertains to the notion of creation, it could well be understood "from eternity," although "nothing" itself had not previously in duration preceded. For just as we now understand the continual conservation of things by God to be a true creation out of nothing - not because previously in duration nothing had preceded, but because in this way, as to their whole being (*esse*), things depend upon God, so that of themselves they would be absolutely nothing if they were left by God - so in the same way a creation from eternity could rightly be understood, which would be a production out of nothing.

1059. St. Anselm, Monologion, c. 8.
1060. Marsilius (of Inghen), In II Sent., q. 1, a. 2, pars 4 (versus "Ex quo sequitur quod aeterna emanatio ...").
1061. St. Bonaventure, In II Sent., dist. 1, art. 3, q. 1; and q. 2.

Moreover, Durandus - who teaches that something could have been created from eternity, as we shall see in disputation 179 - nevertheless affirms that creation is not a production out of nothing as out of a term a quo: thus he asserts in the Second Book, distinction 1, article 1, numbers 5 and 6. He gives the reason: because there cannot be two terms in one action, which ...[1062]

... unless both terms have a common subject. He said this on account of transubstantiation, which is the conversion into the Body of Christ, in which there is no subject common to both terms. And he proves it thus: Whenever an action has two terms, one a quo and the other ad quem, they must be so opposed that the term a quo precede the term ad quem either by nature or by duration; but the nothing which is said to be the term a quo of creation cannot precede the being of the created thing either by duration or by nature: not by duration, because a negation has no duration; not by nature, because a negation is not some nature, except by reason of the subject in which it is, and by reason of that subject it can precede by duration, as the subject in which it is: but this only happens when the subject is common to both terms. Therefore the term a quo of creation cannot be that negation of all being, or nothing. Wherefore Durandus understands that phrase, out of nothing, set in the definition, negatively, so that to be made out of nothing is the same as not to be made out of anything.

But although the definition can be understood in one way or another (for it is the same that what is made out of nothing, as out of a term a quo, is not made out of anything), nevertheless there is no reason why we should not say that very nothing is the term a quo of creation, either preceding by duration, or only by nature: for in either way creation can be. First indeed by duration: for although the negation of being has no duration, nevertheless, compared with being, it is said to precede or to follow not only by reason but also by duration. For we say that first the angel was nothing, or did not exist, before he was; and of the universe likewise: for there was a time or duration when it was not. Moreover, if the universe or an angel were annihilated, it would be said that in reality it was first before it ceased to be; and yet there would be no common term. Therefore, just as annihilation is from being to non-being, although there is no common term, so also creation could be from non-being to being. We say, moreover, that one thing precedes another by duration, not because a negation has duration in itself, but because there can be some real duration by which we measure the negation and the very being of the thing; and thus we say that the non-being of the thing has preceded from eternity, and afterwards in time it began to be after non-being. For who would dare to deny that all things produced by God had being after non-being? The priority of time, however, we said is entirely accidental and extraneous to the notion of creation, and that a priority by nature alone suffices. This Scotus rightly noted in the place cited, in such a way that the nothing of the thing is said to be prior by nature to the thing itself, not positively, but privatively; and this suffices for it to be the term a quo of creation. For we say to be prior by nature not only of that which primarily befits something by its own nature, but also of that which befits a thing of itself unless it be impeded, it is said to belong to it prior by nature; just as to prime matter privation befits prior by nature than form, not because they are together, or because it truly always has privation, but because of itself, unless it were impeded from elsewhere, it would

1062. Durandus of St.-Pourçain, In II Sent., dist. 1, art. 1, nn. 5 - 6.

be deprived. In the same way, since anything whatsoever, if it were left by God, of itself alone would not be, we say that non-being befits it prior by nature than being, because being befits it from an efficient cause; of itself, however, it would not be unless it were produced by an efficient cause. And this would be enough even if the thing had existed from eternity, for it to be said to have been brought forth out of nothing into being; that is, produced from eternity so that it might exist, which of itself alone from eternity would not exist. Why transubstantiation is not creation - whether because it is from a positive term a quo, that is from the substance of bread or wine, or for another reason - we shall say below in disputation 177, at the last chapter; but concerning annihilation it must be said that it is the deletion of some thing into nothing, so that the term ad quem is nothing: and by nothing I mean the non-being of the thing, which by its nature is not conjoined, by force of the deletion, with any entity; for if it were conjoined, the thing would not be said to cease into nothing, but into something. Whether this so happens in transubstantiation will be said in its proper place.

Articulus II - Whether God can create something

It proceeds thus. It seems that God cannot create anything.

1. For according to the Philosopher, in the first book of the Physics, the ancient philosophers received as a common conception of the mind that out of nothing nothing is made. But the power of God does not extend to things contrary to first principles; for instance, that God make that the whole not be greater than its part, or that an affirmation and a negation be true at the same time. Therefore God cannot make or create anything out of nothing.
2. Moreover, if to create is to make something out of nothing, then to be created is for something to be made; but every being-made is a being-changed: therefore creation is a change. But every change is from some subject, as is clear from the definition of motion. For motion is the act of a being existing in potency: therefore it is impossible that something be made by God out of nothing.
3. Moreover, what has been made, it is necessary that it at some time be made. But one cannot say that that which is created is at once being made and has been made: for in permanents, what is being made, is not; but what has been made, already is: therefore at once something would be and not be. Therefore, if something is being made, its being-made precedes its having-been-made. But this cannot be unless there pre-exist a subject in which the very being-made be sustained. Therefore it is impossible that something be made out of nothing.
4. Moreover, it is not permitted to traverse an infinite distance. But there is an infinite distance between being and nothing. Therefore it does not happen that something be made out of nothing.

But on the contrary is what is said in Genesis 1: In the beginning God created heaven and earth, where the gloss says that to create is to make something out of nothing.

I answer that not only is it not impossible that something be created by God, but it is necessary to posit that all things have been created by God, as is had from the foregoing. For whoever makes something out of something presupposes in his action that out of which he makes, and it is not produced through the same action. Thus the craftsman works from natural things, as from wood and bronze, which are not caused by the action of art, but are caused by the action of nature. And nature itself too causes natural things as to the form, but presupposes matter. Therefore, if God acted only from something presupposed, it would follow that that presupposed thing were not caused by Him. But it has been shown above that nothing can be in beings which is not from God, who is the universal cause of the whole of existence (*esse*). Hence it is necessary to say that God produces things into existence out of nothing.

Reply to the first: The ancient philosophers, as was said above, considered only the emanation of particular effects from particular causes, which must presuppose something in their action. And according to this, their common opinion was that out of nothing nothing is made. Yet this has no place in the first emanation from the universal principle of things.

Reply to the second: Creation is not a change except according to the mode of understanding alone. For it belongs to the notion of change that the same thing be otherwise now than before. Sometimes indeed it is the same actual being that is so disposed now and before, as in motions according to quantity and quality. Sometimes, however, it is the same being only in potency, as in change according to substance, of which the subject is matter; but in creation, by which the whole substance of things is produced, one cannot take anything the same as otherwise disposed now than before, except according to the intellect alone; as when one understands that some thing before was not at all, and afterwards is. But since action and passion agree in the substance of motion, and differ only according to diverse relations, as is said in the third book of the Physics, it must be that when motion is removed there remain only diverse relations in the creator and the created.[1063] But because the mode of signifying follows the mode of understanding, as has been said, creation is signified under the mode of change. And for this reason it is said that to create is to make something out of nothing; for to make and to be made agree more in this than to change and to be changed: because to make and to be made import the relation of cause to effect and of effect to cause; but change does so only consequently.

Reply to the third: In those things which are done without motion, to be being-made and to have been made are simultaneous, whether such a making be the terminus of a motion, as illumination - for at once something is illuminated and is illuminated - or whether it be not the terminus of a motion, as at once a word is formed in the heart and is formed. And in these, what is being made, is, while it is said to be being made. But its being and that it was not before are signified by different aspects. Hence, since creation is without motion, at once something is created and has been created.

1063. Aristotle, Physics, book 3, text 10.

Reply to the fourth: That objection proceeds from a false imagination, as if there were some infinite medium between nothing and being. This is plainly false. But this false imagination arises from the fact that creation is signified as a kind of change existing between two terms.

The conclusion of the article is affirmative, and it clearly follows from the doctrine set forth above, as the Holy Doctor most aptly deduces it by this reasoning: if God could not create, this would be because something would be presupposed to the operation of God which would not be made by God Himself; but this cannot be, because then there would already be something which would be coeternal with God, or would not be made by Him, which is contrary to the doctrine delivered above: therefore God can so produce something that He brings it about according to the whole of its entity, which is to create.

Articulus III - Whether creation is something in the creature

It proceeds in order. It seems that creation (*creatio*) is not something in the creature.

1. For just as creation taken passively is attributed to the creature, so creation taken actively is attributed to the creator; but creation taken actively is not something in the creator. For if it were so, it would follow that there were something temporal in God. Therefore creation taken passively is not something in the creature.
2. Moreover, there is nothing intermediate between creator and creature. But creation is signified as something intermediate between the two. For it is not the creator, since it is not eternal; nor the creature, because then by the same reasoning one would have to posit another creation by which that very creation were created, and so on to infinity. Therefore creation is not something.
3. Moreover, if creation is something besides the substance created, it must be an accident of it. But every accident is in a subject. Therefore the created thing would be the subject of creation, and thus the same would be the subject of creation and the terminus. But this is impossible. For the subject is prior to the accident, and conserves the accident. The terminus, however, is posterior to the action and passion of which it is the terminus; and, when that action and passion cease, it ceases to exist: therefore creation itself is not some thing.

But on the contrary, it is a greater thing for something to come to be according to the whole substance than according to a substantial or accidental form. But generation simply, or in a qualified sense, by which something comes to be according to a substantial or accidental form, is something in the generated. Therefore, much more is creation, by which something comes to be according to the whole substance, something in the created.

I answer that creation posits something in the created only according to a relation (*relatio*). For what is created does not come to be by motion or change. What comes to be by motion or change comes to be out of something pre-existing; which indeed happens in the productions of particular beings; but it cannot so happen in the production of the whole of existence by the universal cause

of all beings, which is God. Hence God creates, that is, He produces things without motion, with motion subtracted both from action and from passion; nothing remains but a relation, as has been said.

Reply to the third: In things which are made without motion, the coming-to-be and the having-been-made are simultaneous, whether such a making be the terminus of motion, as illumination is (for at once something is illuminated and has been illuminated), or whether it be not the terminus of motion, as when a word is at once formed in the heart and has been formed. And in those things which are made, the thing is, when it is said to be made. But it is signified by something else to have been from another and previously not to have been. Hence, since creation takes place without motion, at once something is created and has been created.

Reply to the fourth: That objection proceeds from a false imagination, as if there were some infinite medium between nothing and being, which is clearly false. And this false imagination proceeds from the fact that creation is signified as a certain change existing between two termini.

Conclusion: Creation in the creature is nothing other than a certain relation of the creature to God, upon whom it depends; just as in passion, which is a motion, there is a certain relation to the principle of the motion. The points in the doctrine of this article that are worthy of special notation we shall set forth in the following disputation.

Disputatio CLXXIII - Whether creation is a pure relation, or something absolute

- Creation to be a real and absolute influx of God into creatures, is the view of some recent writers. Caput I.
- Creation to be only the relation of the creature to the creator, is the true and common opinion. Caput II.
- The relation of creation is distinguished from the thing created by reason alone. Caput III.
- The arguments of the former opinion are dissolved. Caput IV.

Caput I - The recent opinion: creation as a real and absolute influx

Concerning the nature of creation there still remains to be investigated whether the ratio of production which is in creation be nothing else than a certain relation, or whether besides relation it contains something absolute. Some more recent theologians have said that creation is not a change, properly speaking - in which all the Scholastics agree, because a change ought to have a common subject to both termini, which passes from the one terminus into the other. They add, however, first, that something absolute belongs to the ratio of creation, namely a real influx, by which creatures are said to emanate in time from God. Secondly, that in the creature there is the action and passion of creation in the same way as in a patient there are said to be an action and a passion; and that by it not only is the thing denominated created, but also God denominated

creator and creating, just as from the motion existing in the mobile the agent is said to move and to act, and the mobile to be moved and to suffer. Thirdly, finally, that creation truly belongs to the predicament of action by name, as heating does, and any action which is a motion.

That there is something absolute of the ratio of this production, on which the rest follow, they prove first thus: either creation is the divine willing and understanding, by which God is said to create; or it is a certain respect of reason; or it is a real influx into the creature, by which God is also denominated creating, and which has the ratio of action. Not the first: for to will and to understand in God are the principles of creation; for by them, as by form and power, God creates; therefore they are not the very action of creating. As when an angel by his will moves a stone, the will of that angel is not the motion and action, but the principle of acting; whereas the motion and action are in the thing which is moved. Nor can it be the second: for who would say that action in God is a respect of reason? It will therefore be the third, namely a real influx in the creature.

They prove, moreover, that this is not the very relation of the creature, but something absolute and prior to the relation, in a second way: because the relation of the produced thing in the creature, which is the relation of the creature, is posterior to the creature; but the action which is creation is prior to the creature, because it is the way to it; therefore, besides the relation, there is something else which is rightly called influx, and is something absolute. This they more strongly confirm in a third way: the relation of the creature to God as cause is real, as all grant; therefore it has some real foundation among those which Aristotle assigns in Metaphysics V, chapter 15. And this can be nothing else than an influx and action having an absolute character; both because the relation of the creature is of the second genus, and also because one relation cannot be the foundation of another real relation; therefore there must be a real absolute influx. Fourthly, action and passion, since they constitute a peculiar predicament, are not relations according to being, nor are they essentially completed by relations according to being; otherwise they would not be in another predicament than that of relation; but creation is in the predicament of action; therefore it is neither relation according to being nor completed by relation.

They confirm this, because if the character of motion and transmutation be withdrawn from action, nothing else seems to remain than pure relation; nor can it be explicated by us otherwise, or even understood, than by the concept of relation alone. What the adversaries assert, namely that there is a certain real influx or production which is as it were a way to being, we do not deny. But that this be something absolute they cannot prove; nay rather, against them we have an efficacious argument drawn from the divine processions. For, as I said in the annotations on the first article of question 41, the productions of the divine persons are nothing else than the relations themselves of the persons - active indeed in the producing persons, passive however in the produced persons - so that to generate is nothing else than paternity conceived in one way; and to be generated is nothing but filiation under a different concept; nevertheless they are truly productions, and have the true character of active and passive influx, the imperfections of created things being set aside. Therefore in the same way in creatures one can understand a true ratio of action and passion and of influx, even if the thing itself be nothing but relation.

Whether this kind of action and passion be in the predicament of action and passion, we shall say shortly. For the present I do not dispute whether there be something absolute besides relation and terminus; for this does not pertain to our present purpose.

There is, moreover, a difference between the action and passion which are motions by their genus, on the one hand, and the action and passion which by their genus are not motions, on the other. For action and passion which are motions are in the patient; but an action which is not a motion is in the agent, and the passion, however, is in the patient. Wherefore the action which is creation would indeed be in God the creator, just as also the relation of the creator, unless He Himself were capable of some relation in time. But because He cannot receive that relation, He is denominated creating and creator from the creation existing in the creature; whereas the begetter and the father are denominated the first person from the relation existing in Himself. All these matters have been more at length explained in the place cited.

Caput II - The true and common opinion: creation is only the creature's relation to the creator

Now I add first, that the action of creation is not in the predicament, not because it does not have the true character of a production, or because it is not a motion, but because an action of the predicament ought to be not only by our consideration but in reality an accident. But in order to be an accident it must really be something that happens to a substance; and to this it is necessary that it be distinguished from the substance itself by the nature of the thing. For if it be the same as that substance, it does not really happen to it, even if it be conceived by us after the manner of an accident. Since therefore creation is not distinguished by the nature of the thing from the thing created, as we shall presently say, it will not be a true accident, nor in the predicament of action. By the same reason neither will a relation, which is the same as the substance, whatever that substance be, be in the predicament of relation; not because all the predicaments ought to be distinguished at least formally by the nature of the thing (for a distinction of reason suffices), but because the predicaments of accidents ought to be distinguished from substance by the nature of the thing, in order that they be truly accidents. Moreover, if there were some action and passion which were not a motion nor a transmutation, and yet were not the same in reality with the substance - as is the illumination of the air together with the body of the illuminating source - it would be in the predicament of action. For nothing seems to be lacking for its placement in that predicament, since it is the act of agent and patient; whence it is also gathered that the character of motion does not pertain to the predicament, nor is there something common to action and passion - not because it is (as Logicians say) an incomplete being and a way (for both action and passion are also a way), but because there can be an action and a passion which are not motions nor a transmutation, as in the example given. Wherefore, since motion is not something common to these predicaments, nor is it contained under any of them, it will not be in any predicament.

Next, notice that since every action is a certain medium between the thing produced and the producer, because it is the act by which the producer produces, creation likewise is a medium between God and the creature produced. I have of set purpose added "produced": because, since creation is the end in respect of essence and nature, it is contained under the universality of creatures which are distinguished from God. But if one speak of creatures which have the ratio of a produced terminus, creation is rightly compared to the author's medium by which creatures are produced; yet it is not itself to be called a production, because a production is not produced. For that reason, however, it does not have the character of God.

Caput III - More probable: the relation of creation is not really distinct from the substance of the creature

The more probable opinion is that the relation of creation is not really distinguished from the substance of the creature, as Scotus most aptly proves in that question: as often as relation and substance or the absolute stand in such a way that the one, even by the absolute power of God, cannot be without the other, they cannot be really distinguished; or at least we have no argument to prove a real distinction between them. But so it is with creation and the creature; therefore we cannot assert that they are distinguished by the nature of the thing. And universally, a real distinction cannot be gathered between those things which are in the same subject and cannot be separated even by absolute power.

Wherefore it is false what Cajetan in this article, Ferrariensis and Capreolus in the places alleged, teach, namely that creation is distinguished according to the thing from the thing created.[1064] From which Cajetan, above on question 27, article 2, and Ferrariensis, Contra gentiles IV, against chapter 14, in the little verse "Ad alias rationes," hold that every real relation is distinguished from the absolute and from the subject in which it is.[1065] But their common reason is this: because every kind of accident is of itself distinguished from substance; and also because the genus of relation has a different being from the other genera of accidents.

Further, we say: Creation is a real and absolute influx of God into creatures, according to the sense of some recent writers; they confirm their view by authorities who suppose that if the character of motion and transmutation be lacking to action, nothing remains but pure relation - Richard, In I Sent., dist. 1, q. 2, art. 1; and again, Durandus, In I Sent., q. 2, n. 19; as also is supposed by Scotus, In I Sent., q. 5; Gregory of Rimini, In the same distinction, q. 6, concl. 2 and 3, when he asserts that creation and conservation are not distinguished from the thing created and conserved.[1066] But, as noted above, the relation of the creature to God is real and has a foundation; yet from this it does not follow that there is some absolute action in addition to the relation, as has been shown.

1064. Cajetan, on ST I, q. 45, a. 3; Ferrariensis, secundo Contra gentiles, cap. 16 and 18; Capreolus, In II Sent., distinctions as cited in the text.

1065. Cajetan, on ST I, q. 27, a. 2; Ferrariensis, In IV Contra gentiles, cap. 14, ad alias rationes.

1066. Richard of Middleton, In I Sent., dist. 1, q. 2, art. 1, and elsewhere; Durandus of St.-Pourçain, In I Sent., q. 2, n. 19; Scotus, In I Sent., q. 5; Gregory of Rimini, In I Sent., the same distinction, q. 6, concl. 2 - 3.

Note also: when it was said above, while treating of the divine names, that the relation of the creature to God is real, this was distinguished from the relation in God to the creature, which is not real but according to reason only.[1067] And this very point shows how creation, in the creature, is nothing other than a relation to the Creator as the principle of its existence.

Finally, that the relation of the creature to God has a real foundation, Aristotle teaches by enumerating in Metaphysics V, chapter 15, the ways in which relations are founded in realities; from which it follows, however, not that there is some absolute action distinct from the creature itself, but rather that the relation has its foundation in that which is identical with the creature's substance.[1068]

Creation is not in a category, not because it does not have the true notion of production, or because it is not motion; but because the action of a category ought to be not only by our consideration, but in reality an accident (*accidens*). Now, in order for it to be an accident it must in reality befall some substance (*substantia*); and for this it is necessary that it be distinguished from the substance itself by nature of the thing. For if it be the same as that, it does not really befall it, even if by us it be conceived after the mode of an accident. Therefore, since creation is not distinguished by nature of the thing from the created thing, as we shall presently say; it will not be a true accident, nor in the category (*praedicamentum*) of action (*actio*). For the same reason, neither will a relation (*relatio*), which is the same as the substance, whatever that substance be, be in the category of relation; not because all the categories ought to be distinguished at least formally by nature of the thing (for a distinction of reason suffices); but because the categories of accidents ought to be distinguished from substance by nature of the thing, in order truly to be accidents.

However, if there were some action and passion which would not be motion (*motus*) nor change, and yet would not be the same in reality as the substance - such as the illumination of the air beginning at the same time with the very body of the air - it would be in the category of action. For nothing seems lacking, by which it should not be placed in that category, since it is the act of an agent and of a patient: whence it is also gathered that the notion of motion does not pertain to a category, nor is it something common to action and passion; not because it is, as the Logicians say, an incomplete being and a way; for action also and passion are a way: but because there can be action and passion which are not motion nor change, as in the example proposed. Wherefore, since motion is not something common to these categories, nor is it contained under any of them, it will not be in any category.

Next, note that every action is a certain medium between the thing produced and the producer, because it is the act by which the producer produces; so creation too is a medium between God and the creature produced. I have expressly added "produced," because, since creation belongs to a finite essence (*essentia*) and nature (*natura*), it is contained under the universality of creatures, which is distinguished from God. But if we speak of creatures which have the notion of a produced terminus, as that about which we speak; creation is rightly compared as the middle act, by which

1067. St. Thomas, Summa Theologiae I, q. 13, a. 7.
1068. Aristotle, Metaphysics, V, c. 15.

the creature is produced: the production itself, however, is not said to be produced; because production is not produced. For this reason it does not have the notion of God. Disputation 116, chapter 5. And since thus creation and the created thing stand, the same must be said of them. Moreover, as for the relation of creation, it is distinguished from the created thing only by reason.

It cannot be "multiplied" in beings that perfectly subsist by their nature, as is manifest in spirits and in matter; or at least we do not have a foundation for devising various modes of creation, each of which could be separated from the created thing, that is, that the created thing could be created in one or another mode: and since such things cannot by God be put forth otherwise than by creation, it is rather to be said that there is one creation of these things, without which they themselves cannot exist. A difficulty could arise in those forms which can be produced in a subject and outside a subject; of these, however, we shall speak at the end of the following chapter.

But when Cajetan says that creation is therefore distinguished from substance, because creation is an accident, since it is a relation; and that an accident ought to be distinguished from substance; he supposes that which in truth had to be proved. For this relation in reality is not an accident of substance, since it implies a contradiction that the substance be without it; but it is apprehended as an accident only by our mode of conceiving, whereas in truth it is substance.

Moreover, Scotus, on the First Book, distinction 1, that question, section 5, Second member, according to the common doctrine of his school, added that creation and the created thing are distinguished by nature of the thing formally, just as he philosophizes concerning the attributes of God and many other things; he himself gathers this distinction in the present matter, as among many others, from various enunciations. For we enunciate many things of creation which cannot be predicated of the thing itself created. However, we have shown sufficiently that this reason is frivolous, disputation 120, chapter 6, where we have shown that, by reason alone, which is contained in the various names imposed by us, contrary things can be enunciated of the same thing, named and conceived in a diverse mode.

Finally, from what has been said it is gathered that creation is not an influx really distinct from the created thing after the mode of a way in the category of action: for thus it would be an accident distinct by nature of the thing from the very thing produced: and since it would previously be outside causes in the real order of the nature by which the thing is produced, by it it would have to have a subject previously; since its existence by its very nature is to be in another. Some reply that creation indeed has for its subject the created thing itself, not that in which it inheres, but that to which it adheres; and although the subject of the inhesion of some accident ought to be considered together with the accident, nevertheless they say the subject of adhesion can be subsequent. Further, they collect a difference between the subject of adhesion and of inhesion, because in a different mode the point is in the line, and the part in the whole, and the substantial mode (*modus substantialis*) in the thing, of which it is the mode; than an accident is in a subject. But this response seems frivolous: and first, that distinction seems to have been fabricated only in words, to elude, unless we attend to the force of the word; for no less properly can it be said that whiteness adheres to the wall than that it inheres; and conversely, no less properly can it be said that a point inheres than that it adheres. But if in the thing itself there is some difference, it is only this, that a

point in a line is not as an accident in a substance, but as a mode in a thing, and a substantial mode in a substance. Therefore, in the same way, since creation, in the adversaries' view, is truly an accident, it will, no less than other accidents, require for itself a subject of inhesion. Therefore, since the existence of an accident by its very nature is in another; in that which is prior by nature, in which creation precedes the created thing, it ought to have some subject: for this reason we proved in the following disputation that accidents are not created; because they cannot fail to be made in a subject, unless when by God they are produced really separate. But creation, in that prior, cannot have a subject, as is evident; therefore it is not a real accident. Moreover, since an accident depends on matter as on a cause, it cannot be in anything real prior, even by nature, without a subject.

Caput IV - The arguments of the prior opinion are resolved

The arguments of the prior opinion are most easily resolved from what has been said thus far. To the first, we say that creation is not an action of the will of God, nor understanding; for these are the principles of creating, not creation itself: and the action of creation is no other than the relation in the created thing; otherwise, it would have to be in the created as an active origin is in the producing person; and from it God would be denominated in the creature by an extrinsic denomination real: but which be the cause of this we have shown above. Moreover, it is not difficult, without any mutation in God himself, nor of a real relation, that now by creation something should flow from him which previously did not emanate, solely by the mutation of the thing produced.

Reply to the second: one must philosophize in the same way, by our mere mode of understanding, about creation as action and passion, and about the relation of the creature compared with the creature produced, as about passive origin and relation compared with the person produced. For just as, by our mode of understanding alone, active and passive origin is pre-understood as a way before the person, and then relation and the person which is constituted by relation, although in reality relation and origin are the same; so too we first understand, after the manner of other things which come to be little by little, the creature as it were on the way and in becoming; and this is creation with respect to God, and passion with respect to the creature produced: then we understand the thing itself produced, and finally the relation of the produced and the creature as in actual being, because we do not understand it as a property constituting, as we do the divine relation with respect to the person. But this order is not real, nor in duration, nor in nature; but by reason alone: because all these things which we have said are distinguished by our mode of conceiving and naming alone.

Reply to the third: a real relation is not real because it really differs from its foundation; but because by nature of the thing it is referred to another: which is apparent in the divine relations, which are truly real, and yet are distinguished neither from that in which they are, nor from the foundation by reason of which they are said to arise: nor indeed is there any need that these two be distinguished from the relation: nor did Aristotle teach this, but in Metaphysics, chapter 15, when

enumerating the kinds of relations, he assigned various accounts which philosophers have been wont to call foundations, although Aristotle never used this name.[1069] He took the first kind according to number, that is, according to unity or plurality in substance, quality, or quantity: and sometimes a relation is not really distinguished from the substance, quality, and quantity in which it is founded. I said sometimes, namely when it cannot be separated from them, nor quality and quantity from relation. For when these foundations can remain without the relation, it must be certain that the relation is distinguished in reality from its foundation, as a mode is distinguished from the thing of which it is the mode, as is established from what was said above, disputation 116, chapter 5. He took the second kind according to powers and their actions: and yet the relation of a power, which is founded in a power, is not really distinguished from it. The third kind is of those related things which by name alone are referred to others, because others are really referred to them; which does not pertain to our present purpose. Incidentally, however, it is worth noting that these are called "related according to saying" (*secundum dici*), because by name alone they are referred, although in reality they are absolute things, says Henry; and he says that these and other similar things, which are referred by name alone, are nevertheless in reality absolute; and he says that they were defined by Aristotle in the Categories, in the chapter on relation, by the prior definition, which is at the beginning of the chapter in this way: "Those are said to be relative which are what they are of others, or are said to be to something in some other way"; where he only defines the relative by this, that it is said "to another": for afterwards, in the same chapter, because Aristotle saw that this definition was not rightly given of relatives which are placed in the category, but also suited others, he adduced another of those which are not only said, but really are, "to another." Which is this: "Those are relative whose being is the same as having their being disposed to another in some way."[1070]

I observe well that not a few Thomists call that relation "according to saying" which is of the essence of some absolute thing; such as, in their opinion, is the relation of a power: even if such a relation be truly real. They distinguish, moreover, a real relation into a relation "according to saying" and a relation "according to being." I for my part consider this division inept. For a real relation cannot fail to be a relation according to being and according to nature. Moreover, a relation which is real is not only a relation according to saying, which is not merely according to name. Nor indeed has the aforesaid opinion and division a foundation in the holy Doctor: for he, in Prima Pars, question 13, article 7, to the first, only said that some relative names were imposed to signify the very relative habits: as lord, father, etc.; and these, he says, are relative according to being, that is, the thing signified by this name, namely lord, father, etc., is a relative according to being. But he says that some were imposed to signify the things which relations and habits follow: as mover, moved, head, "headedness," and others of this sort, which are said to be relative according to saying; where St. Thomas does not call the relations themselves "according to saying," but the absolute things themselves, which habits follow, he calls "relatives according to saying,"

1069. Aristotle, Metaphysics V, c. 15.

1070. Aristotle, Categories, ch. 7 (On Relation). See also Henry of Ghent, Quodlibet II, q. 4. On St. Thomas, see Summa Theologiae I, q. 13, a. 7, ad 1.

because of themselves they are not referred really "to another," although they have the name; and perhaps that and other things of this sort, which are said to be relative according to saying, does not refer to all those which he had said, namely to mover and to moved, but to head and "headedness." The aforesaid Thomists, however, call a relation "according to saying," even if by nature of the thing, and not by name alone, it exists and befits things, that relation which does not require that its terminus exist at the same time with it; but is referred to a non-existent thing, in the way that knowledge is referred to the knowable which is not yet. For Aristotle, in the Categories, in the chapter on relation...

Among the properties of the relative of that predicamental order he set down this, that the things related are simultaneous by nature. Yet this foundation is slight, so that we should call those relatives, which are referred to a thing not yet existing, relatives according to saying; although they could be called relatives which do not pertain to the real predicamental order: because, although they are referred to a non-existent terminus, nevertheless in reality they are referred, and are not said to be "to another" by name alone. Why, then, are they to be called relatives according to saying, if indeed they are not said to be predicamental, but relatives, and truly are relatives?

Add that Aristotle both constitutes and numbers relation to a non-existent terminus among the relatives of the category "to something" in Metaphysics V, chapter 15, namely the efficient to that which is makeable or to be made; and in the same chapter he says that the knowable is said to be relative to another from this, that another thing, namely knowledge, is referred, that is, in reality, to it. Finally, in the Categories, in the chapter on relation, when he had adduced as a property of relatives that they are simultaneous by nature, at length, because he saw that many things related are referred to a non-existent terminus, as knowledge to the knowable, he does not admit this condition as a true property of the relatives of this category; and he assigns only one true property of this category in the last place, namely that one cannot know the relative determinately unless one also knows that to which it is referred - a property which also befits those relatives that are referred to a non-existent terminus. And therefore these relatives ought to be placed in this category: because to that to which the passion in the fourth mode of some category befits, the essence of that category also befits. We have therefore the foundation, which is the reason out of which relation arises, that by the nature of the thing it is not always distinguished from relation itself.[1071][1072]

To the fourth I answer first, that creation is not in the category of action, as I noted in chapter 2; and therefore it matters little if it be entirely the same in reality as the relation of the creature. Then I say that, in order that some things be in diverse categories, it is enough if by our reason they are distinguished; nor is a distinction by the nature of the thing between them necessary for this: wherefore, if other things necessary were present, that creation be an action, it would be in a category, and nothing would hinder its real identity with the relation.

1071. Aristotle, Metaphysics V, ch. 15.
1072. Aristotle, Categories, ch. 7 (On Relation).

Nevertheless, certain more recent authors, in order to prove that creation is really distinguished from the created thing, argue from separation, from which this real distinction is rightly gathered, in this way: Although the created thing cannot be without some creation, just as quantity cannot be without "where," which is one of the ten categories; nevertheless it can be without this determinate creation, with another; just as quantity can be without this "where," with another. Which is quite enough, they say, for us to say that it is distinguished as a mode is distinguished from the thing, and "where" from the body in which it inheres. That the creature can be without this creation, but with another, and thus that creation can vary, they indeed cannot gather from all the forms that are created; for in simple things and in matter itself this variation of creation does not appear, as they themselves frankly admit; but in forms which, if they were produced by God outside a subject, would be said to be created, but if produced in a subject, would not be created, but would be produced by generation.

Some, overwhelmed by this argument, said that these forms are always created, whether in a subject or outside a subject. But in the following disputation we shall show amply enough that forms which by their nature cannot of themselves subsist, when they are produced in a subject, cannot be created. I answer, therefore, that although in forms which by their nature require to be in matter and cannot subsist of themselves, the production is not the same when they are produced of themselves and when they are generated in a subject; nonetheless it is not permitted from this to infer that any form which subsists of itself, as an angel and the soul, can be created by various creations. For in other forms it has not yet been proved, nor can it be proved, that they can be created by one and by another creation, but only that they can be produced by various productions: because the thing itself can be in various ways, both by itself and in another. But when it is produced by itself, since it always is in the same way, there is no basis from which we can gather that it can be produced by various creations: for if the thing produced itself is varied neither as to substance nor as to mode, by no reason can we gather that it can be created by diverse creations. But that the same form, being in a different way, namely either by itself or in another, is produced by diverse productions, of which one is creation, the other generation, the very different mode of the form's existing seems to demand. Wherefore it does not follow from this that, in forms which always are in the same way, creation is distinguished from the created thing: for the inference, that it could be produced now by this, now by that creation, does not hold.

Nor does it follow in forms which, being in a different way, are produced in a different way. For when they are created, they always are in the same way. Wherefore the creation of them does not seem able to be separated from those things, as they are in that way.

But if it is separated from them and is really distinguished, it is by reason of a real mode which is varied in them; by reason of which variation the same thing can be really distinguished from itself, as we showed above in the disputation, chapter on modes.

Nay, from what has been said, against the opposite opinion such a line of reasoning can be formed. When an accidental form is produced outside a subject, that creation cannot be separated from the terminus, nor the terminus from that creation: therefore there is no cause why we should say that it is really distinguished. Further, that the terminus cannot be separated from that

creation, or conversely, is proved thus: An accidental form existing of itself cannot be separated from the creation by which it is then created; but the terminus of creation is an accidental form existing of itself: therefore the terminus of creation cannot be separated from that creation by which it is then created. This form of arguing is syllogistic; the premises indeed are most well known; and if any of them need confirmation, it is the minor: but that is proved thus. That creation cannot be terminated at an accidental form considered as separated, insofar as it is form only, not considered with separation and existence of itself - whether that mode of existing of itself be a negation or be positive - otherwise any accidental form, when it is in a subject, could by a prior nature be conceived as produced by God by creation, before being conjoined to a subject and made by the generation of a created agent. This, however, besides the fact - which we shall demonstrate in the following disputation - that it is false, would altogether remove the difficulty of the argument proposed against our opinion, by which our adversaries strove to prove that the creation of forms which by their nature depend on a subject is really distinguished from them, from the fact that creation could be separated from them when by a creation outside a subject they can be created and without creation be produced in a subject: but this would by no means follow, if creation were terminated at this form according to substance, before it were considered in a subject or outside; and thus it would always depend on God in the same way whether in a subject or outside.

Add that, since St. Thomas says that creation is of subsistents, as will be proved in the following disputation, a separated accidental form cannot be the terminus of creation, unless with the mode of per se subsistence; but creation cannot be separated from a form with this mode; and thus in no way ought it be distinguished from it: for that it would be separated from it when the mode of per se subsistence were separated, does not argue a distinction from the terminus.

Here it is also to be observed that this mode of per se, in an accidental form, is not produced by a production distinct from the production of the form. For although some mode is produced by a different production than the production of the thing of which it is the mode, as where; nevertheless the mode of existing, since it does not have any existence other than the thing of which it is the mode, as we showed in Disputation 126, chapter 3, is not therefore produced by a different production; otherwise, when an accidental form is produced in a subject with the mode of inherence, the form itself ought to be produced according to itself by one production, and the very mode whereby it inheres by another distinct production: which is false. But the mode of a thing then does not have a different existence and production, when it is a mode of the very existence; but if it be another mode, as where, it has a different existence.

You will say that the terminus of creation is the form, not with the positive mode of per se subsistence, but with the negation of being in another; and thus, if it were the same as the substance negated, it could not be separated from it, even if later it were to have a positive mode in another. But this solution is weak, first because when an accident is per se, it has no less a positive mode than when a substantial nature is per se: but that the mode of the substantial nature's existing per se is something positive, we shall prove in the prologue to part 3, question 4, article 2; and the Thomist school readily admits it. And otherwise, when God were preserving accidents outside a subject, he would effect nothing new or more in them, but would only remove the prior

mode of preserving them in a subject. Then also, even if that mode of per se were a negation, nonetheless it would not follow that creation is distinguished from the created thing: because when that accidental form produced per se were conjoined to a subject, creation would then no longer remain; for this would happen because to the production of that form there would be added a new mode of inhering and depending on a subject, which all concede to be positive. Wherefore from the created thing, without some additional real mode being added, it would not be distinguished; but from the created thing with the addition of a new mode it would be distinguished; because by reason of the mode the same thing is really distinguished from itself.

Articulus IV - Whether to be created is proper to composites and subsistents

Fourthly one proceeds thus. It seems that to be created is not proper to composites and subsistents. For it is said in the book On Causes: The first of created things is existence. But the existence of a created thing is not subsistent and composite. Therefore creation is not properly of what is subsistent and composite.[1073]

1. Further: What is created is from nothing. But composites are not from nothing, but from their components. Therefore it does not befit composites to be created.
2. Further: That is properly produced by the first emanation which is presupposed in the second. Thus natural things are by natural generation, which presupposes the operation of art. But that which is presupposed in natural generation is matter. Therefore matter is what is properly created, and not the composite.

But on the contrary is what is said in Genesis 1: In the beginning God created heaven and earth. But heaven and earth are composite, subsistent things. Therefore creation is proper to these.

I answer that to be created is a certain becoming, as has been said; but becoming is ordered to the existence of the thing. Whence to those things it properly befits to become and to be created, to which it befits to be. But this properly belongs to subsistents, whether they are simple, as separated substances, or composite, as material substances. For to these it properly befits "to be," which have existence and which are subsistent in their own existence. But forms and accidents, and other things of this sort, are not called beings as if they themselves were something, but because something has them: thus white is said to be a being because the subject is white; whence, according to the Philosopher, an accident is more properly said to be a being by co-existence than to be a being. Therefore, just as accidental forms and the like which do not subsist are more co-existences than beings, so they ought rather to be called co-created than created. But subsistents are properly created.

Reply to the first: When it is said that the first of created things is existence, the term "existence" does not import a created substance, but it imports the proper notion of the object of creation. For from this a thing is said to be created, that it is an ens, not from this that it is this ens;

1073. ps.-Aristotle, Liber de Causis, prop. 1 (as commonly cited).

since creation is the emanation of the whole existence from the universal being, as has been said. And the mode of speaking is similar to this: if it were said that the first visible is color, although that which is properly seen is the colored thing.

Reply to the second: Creation does not signify the constitution of a composite thing from pre-existing principles; but a composite is said to be created, which is produced into existence together with all its principles.

Reply to the third: That line of reasoning does not prove that matter alone is created, but that matter is not except from creation. For creation is the production of the whole existence, and not of matter alone.

The conclusion is: Creation is properly of subsistents; but forms which by their natural necessity are in another are not properly created, but co-created. The truth of this conclusion and the whole matter of this article the following disputation will examine.

Disputatio CLXXIV - On whether grace and the supernatural gifts are created or co - created in us

Caput I - Many Scholastics judged that grace and the supernatural gifts in us are created

Although it is certain among the Scholastics that no natural form, whether accidental or substantial, which by its very nature depends, in order to be, upon matter (*materia*), is produced by a creation (*creatio*) proper to it; nevertheless, concerning grace and all the supernatural gifts, all the ancient Scholastics who made mention of this matter think that they are produced by no production proper to them other than creation. Thus expressly taught Alexander,[1074] St. Bonaventure,[1075] Richard,[1076] and Scotus.[1077]

Against that opinion Gabriel, Capreolus, Peter Ailly, Major, and Conrad, in the places noted, set themselves. Likewise Dominicus Soto, Vega, Ledesma, and the Ferrariense, in part agree with Paludanus and Cajetan when they assert that grace is not created, but co - created, that is, that it cannot be produced by any production other than creation, or co - produced along with it; for the others affirm absolutely that it is created

The foundation of this position, in so far as it asserts that grace is created, is this: because it is produced by God alone, like the rational soul, and from nothing; and because in man there do not precede merits, nor is there any natural potency toward such a form, of which it might be said that it is educed; for the opposite seemed to them to agree with the error of Pelagius. Wherefore, for the same reason, they reckon grace to be a quality infused by God alone and created by Him. Add the places of Scripture in which man is said to be created in grace, which we reported in Disputation

1074. Alexand., c. p. q. 9, m. 8.
1075. Bonavent., II Sent., dist. 26, art. 1, q. 4; et in IV Sent., dist. ...
1076. Ricard., in II Sent., dist. 26, art. 1, q. 2; et in IV Sent., d. 1, q. 5.
1077. Scotus, in IV Sent., d. 1, q. 5.

173, chapter 1.[1089] But Cajetan and Paludanus, since they saw, according to the opinion of St. Thomas in this article 4, that creation is only of subsistents (*subsistentia*), said that grace is not created, but co-created, while the man who is in grace is created; and from this it is thought probable in this matter: although something is supposed in the production of grace - namely, the soul and the man who is made gracious - yet that which precedes grace itself and is compared to it as subject (*subiectum*), is continually conserved by God as a whole, which is to be created; for the continual conservation of the whole existence is a certain production from nothing and, therefore, is creation. Hence the whole man in grace is created, and grace with him, which Cajetan and Paludanus call grace's being co-created; just as if a horse were created, its soul would be co-created, not, however, said to be created. And likewise, when an Angel in the first instant was produced as to substance, and in grace, his grace was co-created together with his nature. As, however, it is now also said that grace is co-created in the soul, nothing seems to stand in the way because the soul temporally preceded; since it is continually produced by God from nothing in the same way as in the first instant. If, therefore, in that first instant grace would be created, now too at whatever time it would be said to be created.

Caput II - That neither grace nor any accidental or substantial form that by its nature depends on a subject or on matter is created or co - created is proved by authority

If we rightly inspect the definition of creation, explained by us in Disputation 173, it will be easy to conjecture that the opposite opinion, which we set down in the previous chapter, is much more probable - namely, that neither grace nor any accidental or substantial form, which by its nature depends upon a subject (*subiectum*) or upon matter, is created or co-created, but is produced by a peculiar action of eduction from the potency of matter. This I deem altogether true, not only when grace begins later in time than the subject, but also when it begins together with something else.

As to other forms besides grace, I find no mention among the Scholastics; but from the very nature and definition of creation, what I have said I will confirm in the following chapter. But with respect to grace and the supernatural gifts, it is proved by the authority of St. Thomas that they are not created.

First, because in 1-2, question 110, article 2, to the third, he teaches that no accident (*accidens*) is properly corrupted or made, but is made or corrupted according as the subject begins, or ceases, to be actually through it; and for this reason St. Thomas says that grace is not created because it is an accidental form, unless from this, that men are said to be created according to it, that is, to be established in a new existence from nothing, that is, not from merits.[1090] By these words, first, he plainly denies that grace is created, because its being is an in-being, as is that of other forms; and he openly indicates that it is educed from the innate potency of the soul itself, as other accidents are from the potency of the subject. Then he also denies that grace is co-created, against Cajetan and Paludanus, because he explains that phrase, from nothing, in such a way that it does not

1089. Vázquez, Disputatio 173, cap. 1.
1090. St. Thomas, I-II, q. 110, a. 2, ad 3.

exclude any kind of being from which grace is said to be made, but [excludes] merits. But whether merits precede or do not precede is of no moment to the notion of natural creation, but only of moral creation, about which we spoke in Disputation 173, chapter 1. He therefore holds that grace is not co-created. For since in the definition of creation it is said, from nothing, merits - one's own or another's - are not excluded, but something pertaining to the constitution and natural being of the thing to be produced. For who does not see that moral merits are only compared to the thing produced naturally, or contribute nothing? Whence it also is clear that the testimonies of Scripture which we alleged in that first chapter do not prove the opinion of Cajetan and the others mentioned above, as we shall explain there.

Moreover, from the doctrine of the same St. Thomas, according to the understanding of many Thomists, the same thing is gathered: for St. Thomas himself thinks, in the following article, that no instrument (he understands a physical instrument) can be assumed for creating; and yet he himself, in the Third Part, question 62, article 1, as many Thomists think, asserts that the sacraments of the New Law are physical instruments of grace.[1091] Therefore he could not have thought that grace in the soul is created or co-created; for thus already an instrument would be assumed for creating. For even if grace itself were co-created, and the sacraments worked to co-produce it, they would also have to concur to the creation of the whole, in which at the same time grace itself is created.

But Dominicus Soto, Paludanus, and Capreolus, in order to defend their opinion and at the same time to uphold with St. Thomas that the sacraments of the New Law are God's instruments in the production of grace, have contrived certain evasions. First, Dominicus Soto, in the place cited and in IV, distinction 1, question 3, article 1, asserts that grace is indeed by one action created by God alone without any instrument; but by another action, through the sacraments as instruments, it is united to the soul; and this union is not creation: just as the rational soul, according to itself, is produced by creation, but by another action, which is generation, it is infused into, and conjoined to, the body. This evasion Andreas de Vega endeavors to bar, in the place cited, by this reasoning: It cannot be that some agent, or instrument, can join together two things, unless it has power and potency over both; but the humanity of Christ and the sacraments have no power over the very substance of grace, since, according to Soto's opinion, they do not touch its production; therefore neither will they be able to unite grace with the subject. However, by this reasoning Andreas de Vega strikes down Dominicus Soto rather than shuts him off. For just as a man by generative power joins the soul to the body, although he has no power concerning the production of the substance of the soul, so also it could happen that the sacraments would join grace to the soul, even if they had no power concerning the production of the substance of grace, if nothing else stood in the way.

Therefore, by another reasoning, which the same Vega hints at briefly, Dominicus Soto can be refuted more easily: because the production of grace is the production of an accident; but every production bestows being on the thing produced; therefore, since the being of grace is an in-being

1091. St. Thomas, III, q. 62, a. 1.

in a nature as subject, it will be the same thing that grace be produced and be conjoined to the subject. Wherefore, if the sacraments attain by their instrumental efficacy to the being of grace, they pertain also to the conjunction of it with the soul. Paludanus and Capreolus, however, to defend their opinion, say that the sacraments do not produce grace, but a certain previous quality, which they call the adornment of the soul. But besides the fact that this quality seems without any foundation and fabricated merely to evade, the opinion of these men is easily refuted by Scotus and Gabriel. For if that adornment is the ultimate disposition which grace most nearly follows, it ought to be of the same supernatural order with it; wherefore there will be the same account of it as of grace, and its production will be creation in the same way as the production of grace; or neither will be, but each will be educed from the potency of the subject.

Finally, Cajetan and Conrad take refuge in saying that grace is not created, but co-created; for they do not think it absurd, or contrary to the mind of the holy Doctor, that the sacraments be assumed as instruments for co-creating, although they cannot be assumed for creating. Yet, against each of these there are not less effective considerations available.

Caput III - The preceding opinion is confirmed by reason

A single line of reasoning, drawn from the very definition of creation, by which the opinion set forth in the preceding chapter can be proved universally, is this. Creation is the production of a being as being, that is, of the whole of a thing's existence (*esse*), not of this or that sort of being. Therefore, whether a thing is made by God alone or with [another], if nevertheless that [which is made] is not according to the whole existence, but is made according to such-and-such an existence, it will not be creation. For this reason the conjunction only of soul and body - although it can be brought about by God alone - is not creation; because that conjunction is not according to the whole existence of the being, but, which is something else, [is according to] its being such-and-such an entity, namely, a human. Whence the restoration is not from non-being, but from non-man; and, finally, the production of such an entity, as such an entity, is not from non-being, but from a non-such entity, which is always something. This is clearly the definition of creation handed down by St. Thomas in article 1 of this question,[1092] and explained by us in Disputation 173. Therefore, wherever some form (*forma*) comes to be in a subject or in matter, which by its nature depends upon a subject or upon matter, since as to its being it is not produced as a substance, but [produces] such-and-such an entity whose natural being of that form is to be in another, or to inform another, not to be through itself; therefore when such a form is produced, it is not created, nor co-created, but is generated together with the whole which it composes, or is produced according to some other common account. Of this sort are all substantial forms, except the rational soul, and all accidents, even the supernatural ones; because by their very nature they require to be in a subject, since by their very nature they depend upon that by which and in which they establish such-and-such an existence of such-and-such [a thing]. Hence, it is not from non-being, but from a non-such being, which is some [being].

1092. St. Thomas, I, q. 45, a. 1.

This is clearly shown by that opinion which Scotus sets down in IV, distinction 1, question 1: for this reason, he says in conclusion 3, that no material form can be created, because, in order that it be created, it must first in nature be before it is an in-being in a subject; but since its being is an in-being depending on a subject, it does not exist first before it is in a subject.[1093] And Durandus, in the second book, against Scotus teaches that by nature the natural forms are in the thing before they are in matter; for indeed their being is an in-being, depending on a subject or on matter.[1094]

In its own kind, this must be understood so that, before the whole composite is considered of which it is the form, the form itself is conceived as a ratio, not, however, as something existing and produced in itself; the same is to be said, for example, of accidental forms. Wherefore it must also be said that they are educed from the native potency of the subject (*subiectum*), because their being depends on the subject as on a proper cause.

But if the discourse be about grace (*gratia*), and other supernatural accidental forms, the same must be said; and it has nothing in common with Pelagians or Semipelagians. For they never contended with Catholics about this, but about other diverse heads which we have rehearsed in Disputation 89, chapters 4 and 5; and thus St. Augustine, although he strongly opposes both, especially in the books On the Predestination of the Saints and On the Good of Perseverance, nevertheless in the first book, chapter 5, toward the end, says thus: "To be able to have faith, as to be able to have charity, is of the nature of men (and in this he acknowledges no grace); but to have faith, in the way that to have charity, is of the grace of the faithful." He therefore grants a native potency in man so that he may be able to have faith and charity, not only by the operation and infusion of God alone, but also by his own cooperation; for he speaks of the acts of these virtues, which are vital operations. Wherefore there is in the soul also a native potency of receiving from God alone the habits of these virtues. And although this potency cannot be called natural, but obediential (for these appellations are taken from the order to the form which the potency receives), nevertheless it can be called native or inborn, because it follows upon nativity itself and the natural constitution of man; for thus it is referred only to the nature which it follows, not to the form which it receives. Therefore the ancient Scholastics feared in vain to concede that grace and other supernatural gifts are educed from the potency of the soul, thinking that, if they asserted this, they would be agreeing with Pelagius, since indeed against Pelagius the Church teaches only that by the proper powers of our will, without the help of grace, a man cannot observe the law, overcome temptations, be justified, persevere, and merit the kingdom of heaven; but against the Semipelagians, that we cannot by our own powers, without the help of grace, offer some beginnings to God of our justification, as was explained in the place cited.[1095]

1093. Scotus, in IV Sent., d. 1, q. 1 (conclusio 3).

1094. Durandus, in II Sent., d. ..., q. 4, n. 39, contra Scotum.

1095. Vázquez, Disputatio 89, cap. 4 - 5; cf. St. Augustine, De praedestinatione sanctorum; De bono perseverantiae, lib. 1, cap. 5.

And so in Disputation 173, chapter 1, we called our justification a certain moral creation, because in injustice we are created from nothing, that is, from no proper work. For this reason also it is said, Psalm 55: "For nothing will he save them," as I explained according to the mind of St. Augustine and Prosper, Disputation 91, chapter 14, at the end.[1096]

On the contrary, among the remaining substantial forms, the rational soul alone is by a certain peculiar reason created as its own and produced from nothing. For although it confers upon the matter to which it is conjoined the being of man, which is such a being; yet because it is by itself by nature apt to subsist and to be per se without matter, therefore it is produced by creation, and cannot be educed from the potency of matter, because its being is absolute being (*esse absolute*), nor does it depend on another. Whence it is also clear that Soto does not argue rightly from the rational soul to grace, in order to prove that by nature grace is created by God alone before it comes to the subject; for the difference is manifest: that the rational soul in its production does not depend upon matter, and so its being is simply being; but grace, since it is an accident (*accidens*), depends no less upon the subject in order that it may be, than any other accidental form, because its being is the being of another; and hence its being is not simply being, but such a being, as was explained above by us. But if substantial and accidental forms were produced without a subject, they would indeed be created, because then simply being would come to be according to the whole in a way other than when they are produced in a subject or in matter; for thus their being is to be in another or to inhere; and so the being which results from them is made not from nothing but from matter. Wherefore, since it is commonly said that forms are not produced as what, but are co - produced by the same production with the whole, it follows that forms inhering in a subject or in matter are neither created nor produced, but are co - generated, if the whole which coalesces from them and the subject or matter is said to be generated; which will be more fully explained in the following chapter

Some, however, assert that every accidental form, even if it is produced in a subject, essentially depends upon God, and that this reason of dependence on God cannot be separated from it, because it is essential to every creature to depend on God; and therefore by this reason it proceeds by nature from God before it is produced in a subject by a second cause. They say moreover that this which they call dependence on God always remains in the form itself, whether it is produced in a subject or outside a subject; but that it has the notion of creation only when it is outside a subject, not, however, when it is produced in a subject, because to be created is not only to depend on God in that way, but also not to be produced at the same time in a subject by another action.

Yet it is not to be wondered at that in theological and philosophical matters new and unheard-of opinions are devised daily, if once the very definition of the thing is not rightly held. The falsity of this opinion is clear first from what has been said: because, since the being of an accidental form is to inhere (*inesse*), it cannot, as we were inferring above, be produced in the order of nature in any way prior to being in a subject, unless when in reality it remains without a subject. But if it were first produced in reality, like the rational soul, in that earlier instant it would be produced from

1096. Vázquez, Disputatio 173, cap. 1; Disputatio 91, cap. 14; cf. Psalm 55: "Pro nihilo salvos faciet eos"; St. Augustine; Prosper.

nothing, and its being would be simply being; and hence it would be created, as is clear from what has been said. Next, if by nature that form were first produced by God, it could not then be produced by a second cause, but only be conjoined to a subject, as the rational soul is: because it was previously produced, and then in the following instant of nature it cannot be understood to be produced by a second cause, but to be united to matter by generation; whereas an accidental form not only is united to a subject by the second cause, but is also by it produced according to its essence: for fire not only unites heat to wood, but in the wood produces the heat itself. Moreover, from this opinion it would follow that the actions of our will, because they are creatures, are first produced by God alone than by us; from which it would follow that no liberty would remain in us, as is clear from those things which we said above in Disputation 92. But what the adversaries were saying, that every thing, besides God, depends essentially on God, must be understood thus, that it cannot be, unless from God in some way, either by creation, as if the form be outside a subject; or, if by its nature it does not depend on the subject, at least by generation, by which it is produced in the subject upon which by its own nature it depends: whether in this way it be produced by God alone, as grace, or together with a second cause, as other natural accidental forms.

From what has been said in this chapter it follows that the destruction of an accidental form in a subject is not annihilation, but corruption; even if something can be done by God alone, such as is the destruction of grace. The reason is indeed that, just as the production of it is not creation, because it is not the production of being absolutely, but of such a being, so also the destruction of it is not annihilation, because such a form does not fail into nothing simply, but into such a non-being; for indeed the subject remains under such a non-being. Wherefore the sentence of St. Bonaventure in 4, distinction 26, article unico, question 4, of Richard in the same article unico, question 3, of Scotus in 4, distinction 16, question 2, number 9, and of Gabriel in 1, distinction 17, question 4, article 3, doubt 3, proposition 3, who teach that the destruction of grace is annihilation, does not please me.[1097] The sentence of these can also be impugned thus, because, as we shall prove in I-II, question 71, article 4, by mortal sin a man attains as a physical efficient cause to the destruction of grace; but no created cause can in this manner attain to the annihilation of any form.[1098]

Caput IV - Corollaries of the foregoing doctrine

By what reason creation (*creatio*) is said to be only of subsistent things, as the Holy Doctor affirms in the conclusion of this article, can be gathered from what has been said. First indeed, this must not be understood in that sense in which it is commonly said that actions and passions are of supposits; for already above, in Disputation 163, chapter 3, we showed that this is not true, nor according to the mind of the Philosopher; but that actions and passions are also of natures, so that they are said both to come to be and to operate, as it is commonly said, "that which." Secondly, not only of composites, but also of simples, there can be creation, as St. Thomas expressly noted: for

1097. St. Bonaventure, In IV Sent., d. 26, ar. unico, q. 4; Richard, artic. unico, q. 3; Scotus, In IV Sent., d. 16, q. 2, n. 9; Gabriel, In I Sent., d. 17, q. 4, ar. 3, dub. 3, prop. 3.

1098. St. Thomas, I-II, q. 71, a. 4; see also Vázquez, Disputatio 92.

the rational soul and the Angel are created, and yet they are not composites; nevertheless creation is proper to subsistent things, whether substances or forms. I say forms subsisting (*subsistentes*), not because they are actually per se and subsist (for the rational soul in the body is not per se, but in the whole; and thus it does not subsist: for to be in another and to subsist, or to be per se, are mutually repugnant), but I say subsisting which are by nature apt to be per se. For what some say, that the rational soul subsists per se in the body, because it has a proper existence distinct from the whole, but other forms do not subsist in matter because they do not have a proper being, but exist by the existence of the whole - this is false. For every form, since it has a proper entity in act, has...

It has also its own proper existence; for this is nothing other than entity in act (entity: entitas): therefore the rational soul, of itself apt by nature to subsist, even if in act it is in matter, suffices to be said to be created: because its being is simply being, in that it can exist of itself without another; and so it is not made from matter; for according to its own proper substance it does not depend on that, nor is it educed from its potency. It is only educed from the potency of matter (potency: potentia), and on it depends the being of the man, which proceeds from the soul conjoined to matter.

There is added that the humanity of Christ does not subsist per se, but in the Word; nevertheless it could first then have been created whole out of nothing, that it might be assumed, when it was generated from the womb of the Virgin; indeed, and in a certain respect, as referred to God, it is said to be created, as below will be explained of all other things. Therefore creation is not only the act of subsisting things per se, but also of those which by their own nature can subsist without another: because the being of such things is to be simply, not to be an inherence, or another's being.

Third, in any thing of the world composed of matter and form (form: forma), we can consider the composition, and the being which results from the parts, and the whole composite according to each part: but there are singular productions of the individual parts, and another of the whole; because it consists from the composition. Now we say of the composite, according to that notion of the composite by which it is distinguished from its parts, that no composite can be created. I explain this doctrine from the nature and definition of creation: for it is the production of something out of nothing. Then, as was set out in Disputation 173, chapter 3, we expounded that it matters little whether that "nothing" preceded in duration, or were first only in the order of nature; for this reason, the conservation of a thing according to itself as a whole is true creation and production out of nothing, not because what preceded in duration is nothing, but because it would be of itself, if the thing were not conserved. In the same way, the eternal emanation of a creature would be creation and production from nothing; because, since it would be made according to itself as a whole, it would be from nothing, or not from anything. Again, in order that something be said to be made from something, it is not required that that, from which it is made, precede in time, as Gabriel very well noted in the second book, distinction 1, question 4, article 1.[1099][1100]

1099. Vázquez, Disputatio 173, cap. 3.
1100. Gabriel, In II Sent., d. 1, q. 4, art. 1.

From this I gather that the composite, according to the notion of the composite and of the union, is never created, even if according to itself as a whole it should wholly begin. And concerning conservation one must philosophize in the same manner: so that the conservation of that union and of the composite, as it is a composite, inasmuch as it is something distinct from the parts, is not a continued creation. The reason is, because every being which is from something and is constituted, is also said to be made from something: but whatever is made from something, either as from a subject, or as from a constitutive principle which is only by nature prior, is not said to be created: because creation is from nothing: and nothing excludes every subject, or even a constitutive principle which is at least by nature prior: therefore neither that composition, nor the composite as composite, is said to be created; but to be produced from something. For which reason also, when God concurs with man in generating a man, He is said to generate him; not because God supposes matter and form, as the man who generates truly supposes, since God from nothing conserves matter, and the soul He makes from nothing; but because that union, which is by generation, is from something; just as also it is constituted from something. And this is not only true in that moment of time in which the man begins, but also in the whole time in which he is conserved by God. Therefore that conservation by which that union is continuously sustained by God is not true creation: which must be said likewise of the conservation of any other composite. And for the same reason, if a man were produced by God alone, no matter and form having been previously supposed in duration, the composite, as it is a composite, would not be created, nor according to that union of the parts which we have mentioned: the same must be said in the same way, and for the same reason, of all composites.

Fourth, if we speak of the component parts, we must philosophize otherwise. Of the rational soul we have already proved in the preceding chapter that it is always created: but other substantial forms and accidental forms are not created unless when, separated from the subject or from matter, they are produced, because the subject or matter is the cause of their substance. For since all forms are substantially, through the mediation of matter as a sustaining subject, already they are from something, and what is from something must also be made from something: and hence we say that all forms, except the rational [soul], are educed from the potency of matter, or of the subject; because from that they are produced: from which also they are effected. For to be educed from the potency of that is nothing other than, from it as it is potency, to be made and to be.

But of matter one must judge in a certainly opposite way. For that, according to its own natural and partial entity which it has, cannot be produced otherwise than by creation: for although naturally it never exists without some form, nevertheless it depends on no form according to its own entity. First, because it would be impossible to depend on a form, and with the form substantially changed, itself not to be changed: for a different form effects a different formal effect. Then also, whatever natural agent introducing a form would reach even to the conservation, or substantial production, of matter itself: for that which produces some form, causes not only that it be, but also that which is through it; for the same cause produces the form and the formal effect of it: whether this be the primary or secondary effect matters little: for all the effects which the form attains in the genus of formal cause must also be attained, in its own genus, by the efficient cause of

that form. Moreover, if God conserves matter by means of the form as a principle, and matter is from it: it will not be created by God as often as, conjoined to some form, it is produced: and thus no composite except man will be said to be created. First, not according to the notion of the composite, nor according to the form, as was proved above. Then not according to matter: because it would be made from the form, as we were just saying: therefore in no way would it be created. For neither according to itself as a whole would that be said to be created which would be created neither according to any part of itself, nor according to the notion of composition: since in one composite there is no other production than of the singular parts per se, which by their nature precede the union, and of the union itself, or composition. Now I suppose that matter has some existence which they call entitative, and that it is not pure potency in the genus of being; which now seems more probable to not a few. And with this hypothesis premised, the things we have just said must be understood.

Fifth, hence it is clear why the rational soul and matter are by God alone, but substantial and accidental forms, and any composite in the notion of a composite, can be produced also by created causes. For since matter is produced only by creation according to its own proper entity, and the rational soul likewise, as it remains proved, they can be made by no creature: for it belongs to God alone to create, as will be shown in the following disputation: but the composite from matter and any form, according to the substance (substance: substantia) of the composite, is produced by a created cause, because according to those it is not created. I said according to the substance, because in one or another manner it cannot also be made by a created cause, namely, once the soul has been separated from matter, it cannot be united again: but that we may say that the composite, in the notion of a composite, is not created by God, is sufficiently proved from this, that that composite, in the notion of a composite, can be made by a creature, I except accidental forms, namely supernatural habits, which, even if they are not created in the soul, but are educed from its native potency, nonetheless cannot be produced by a created cause: because they are of a higher order. Nor do we contend that all things which are not created can be made by a created cause; but on the contrary, that all things which according to substance are produced by a created cause, according to substance are not created by God.

Sixth, from what has been said it follows in what sense St. Thomas said that creation is only of subsisting things. For either it is of those forms which by their own nature demand to subsist per se, as is the rational soul, or of simple forms, which by nature always subsist, or of composites from matter and form: nor does anything hinder, if by reason of the hypostatic union with a foreign person it does not subsist per se, from their being said to be created by God according to the whole being, as was explained above. But in composites from matter and form it must be observed that creation befits them not according to the notion of a composite, nor according to the notion of the form (unless it be the rational soul), but according to matter, which, since it is the first foundation and as it were a hypostasis, and therefore is from nothing, as we were saying a little before, is created by God alone and is conserved by a certain continued creation: and by reason of that, it is also of subsisting things to be created. It also befits man to be created by reason of the rational

soul. Wherefore, if we speak of composites collectively, comprehending their individual parts, all things are in fact created by God, by a continued creation whereby in the beginning He created common matter.

Finally, it is to be added that in precisely the same way prime matter was created by God in the beginning, and is now conserved by a continued creation out of nothing, and not from something, as the soul: yet so that although it needs nothing as a formal or material cause of its entity, but only the efficient power of God, as the rational soul, nevertheless there is a difference between it and the rational soul, namely, that this latter, the order of natural causes being preserved, cannot be produced unless conjoined to a body: for since by its nature it is a part of man, by its nature it can be produced only for the constitution of that.

Articulus V - Whether it belongs to God alone to create

To the fifth, we proceed thus. It seems that it does not belong to God alone to create. Because according to the Philosopher, it is proper to what is perfect that it can make something like itself. But immaterial creatures are more perfect than material creatures, which make something like themselves: for fire generates fire, and man generates man. Therefore an immaterial substance can make a substance like itself. But an immaterial substance cannot be brought to be except by creation, since it has not matter from which it may be made. Therefore some creature can create.

Further, the greater a thing that is made is on the part of the maker, the greater a power is required in the maker. But a contrary cuts more than nothing. Therefore it is of a greater power to make something from a contrary (which nevertheless a creature does) than to make something from nothing. Much more, then, could a creature do this.

Further. The power of the maker is considered according to the measure of that which it is. But a created being is infinite, as was proved above when there was discussion of the infinity of God. Therefore, in order to produce by creation some created thing, nothing more is required than a finite power. But to have finite power is not against the notion of a creature. Therefore it is not impossible for a creature to create.

But on the contrary: St. Augustine says in the third book On the Trinity, that neither good nor evil Angels can be creators of any thing. Much less, then, can other creatures.[1101]

I answer that it is God's alone to create; and this appears partly, at first view, from what has been premised, since to create cannot be the proper act [of any cause other than God].

Objicitur primo: Because, according to the Philosopher, that is perfect which can make its like. But immaterial creatures are more perfect than material creatures, which make their like: for fire generates fire, and man generates man. Therefore an immaterial substance can make a substance like itself. But an immaterial substance cannot come to be except by creation, since it does not have matter out of which it may be made. Therefore some creature can create.

1101. St. Augustine, De Trinitate, lib. 3.

Objicitur secundo: Further, the greater the resistance on the side of the thing made, the greater the power required in the maker. But a contrary resists more than nothing. Therefore it belongs to a greater power to make something from a contrary (which nevertheless a creature does) than to make something from nothing. Much more, then, can a creature do this.

Objicitur tertio: Further, the power of the maker is considered according to the measure of that which is made. But a created being is finite, as was proved above when there was discussion of the infinity of God. Therefore, in order to produce by creation some created thing, nothing more is required than a finite power. But to have finite power is not against the notion of a creature. Therefore it is not impossible for a creature to create.

Sed contra est, quod St. Augustine says in book 3 On the Trinity, that neither good nor evil Angels can be creators of any thing. Much less, then, can other creatures.[1102]

Respondeo dicendum, quod it sufficiently appears at first view, according to what has been premised, that to create cannot be the proper action except of God alone. For it is necessary to reduce the more universal effects to more universal and prior causes. But among all the most universal effects, the most universal is existence (*esse*) itself. Hence it must be that this is the proper effect of the first and most universal cause, which is God. Wherefore it is also said in the Book of Causes, that neither an intelligence nor a noble soul gives existence, except inasmuch as it operates by a divine operation.[1103] Now to produce existence absolutely, not inasmuch as it is this or such, pertains to the notion of creation. Hence it is manifest that creation is the proper action of God Himself.

However, it happens that something may share in another's proper action, not by its own power, but instrumentally (*instrumentaliter*), inasmuch as it acts in the power of another: as air, by the power of fire, has the ability to heat and set on fire. And according to this, some have thought that, although creation is the proper action of the universal cause, nevertheless some of the inferior causes, inasmuch as they act in the power of the first cause, can create. And thus Avicenna held that the first separated substance created by God creates other things after itself, and the substance of the heaven and its soul, and that the substance of the heaven creates the matter of the lower bodies. And according to this same mode the Master also says in book IV of the Sentences, distinction 5, paragraph 3, that God can communicate to a creature the power of creating, so that it may create by ministry, not by its own authority.[1104]

But this cannot be. For a secondary instrumental cause does not share in the action of the higher cause, except inasmuch as, by something proper to itself, it operates dispositively (*dispositive*) to the effect of the principal agent. If, therefore, it were doing nothing there according to what is proper to itself, it would be employed to act to no purpose. Nor would it be necessary for instruments to be determinate to determinate actions. For thus we see that an axe, by splitting the wood - which it does by the property of its own form - produces the form of a bench, which is the proper effect of the principal agent. But that which is the proper effect of God creating is that which

1102. St. Augustine, De Trinitate, lib. 3.
1103. Liber de causis.
1104. The Master (Peter Lombard), Sentences, book IV, dist. 5, par. 3.

is presupposed to all other things, namely existence absolutely. Hence nothing can operate dispositively and instrumentally to this effect, since creation is not out of anything presupposed that could be disposed by the action of an instrumental agent. Thus, then, it is impossible that creating should belong to any creature, neither by its own power, nor instrumentally, that is, by ministry. And it is especially incongruous to say this of any body, that it creates, since no body acts except by touching or moving. And thus its action requires something pre-existing which can be touched and moved. Which is against the notion of creation.

Ad primum dicendum, that something perfect, sharing in some nature, makes its like, not indeed by producing that nature absolutely, but by applying it to something. For this man cannot be the cause of human nature absolutely, because thus he would be the cause of himself; but he is the cause that human nature is in this man generated. And thus he presupposes in his action determinate matter, through which this man is this man. But as this man shares in human nature, so every created being shares, so to speak, in the nature of existing; because God alone is His existence, as was said above. No created being, therefore, can produce some being absolutely, except inasmuch as it causes existence in this thing. And thus it must be pre - understood, to the action by which it makes its like, that by which something is this; but in an immaterial substance nothing can be pre - understood by which it becomes this, because it is this by its own form, by which it has existence, since they are subsisting forms. Therefore an immaterial substance cannot produce another immaterial substance like itself, as to its existence, but as to some perfection superadded: as when we say that a higher angel illumines a lower, as Dionysius says. According to which mode, too, in the heavens there is paternity, as is clear from the Apostle's words, Eph. 3: "from whom every paternity in heaven and on earth is named." And from this it also clearly appears that no created being can cause anything unless something is presupposed. Which is repugnant to the notion of creation

Ad secundum dicendum, that from contraries something is made per accidens, as is said in Physics I. But per se something is made from a subject that is in potency (*potentia*). Therefore the contrary resists the agent, inasmuch as it hinders the potency from being reduced to the act (*actus*) to which the agent intends to reduce the matter. Thus fire intends to reduce water to an act like itself, but it is hindered by the contrary form and dispositions, by which the potency is, as it were, bound lest it be reduced to act. And the more the potency is bound, the greater power is required in the agent to reduce the matter to act. Whence a much greater power is required in the agent if no potency pre - exists. Thus it is evident that it belongs to a much greater power to make something from nothing than from a contrary

Ad tertium dicendum, that the power of the maker is considered not only from the substance of the thing made, but also from the mode of making. For a greater heat not only heats more, but also heats more quickly. Although, therefore, to create some finite effect does not show an infinite power, nevertheless to create it from nothing shows an infinite power. Which is clear from what has been said. For if so much the greater power is required in the agent, by how much the potency is more remote from act, it follows that the power of an agent which acts with no presupposed potency - such as an agent creating - must be infinite: because there is no proportion of no potency

to any potency, such as the natural agent's power presupposes, just as there is none of non - being to being. And because no creature has simply an infinite power, just as neither an infinite existence, as was proved above, it follows that no creature can create

Conclusio articuli est: Thus it is proper to God to create; it can belong to no creature, neither as to a principal cause, nor as to an instrument. Each part of the conclusion will be elucidated in the two following disputations.

Disputatio CLXXV - Whether a native power of creating can belong to a creature

"By absolute power this can be done," holds Durandus.

Caput I - Durandus asserts that by absolute power this can be done

There is no Catholic who asserts that there actually has been created by God some nature to which, as to a principal cause, it belongs by proper and native power to create; for the testimonies of the Fathers and of Scripture, which we shall cite below, at the least denote that it is now God's alone to create. But whether some creature is possible which, as a principal cause, would have in itself the power of creating, there is disagreement among the Schoolmen. Of these, Durandus, in his Second Book on the Sentences, question 4, affirms that there can be produced by God some creature to which it would belong by native virtue to create. And Durandus is led to this opinion because the reasons which are wont to be adduced to prove that this is repugnant can easily be solved. From which it appears...

But on the contrary: It is likewise in the heavenly orders as Pseudo-Dionysius says: a superior angel illumines an inferior; and in this manner there is even in the heavens a paternity, as is clear from the Apostle's words, Ephesians 3: "From whom all paternity in heaven and on earth is named." From which it is also clearly evident that no created being can cause anything unless something is presupposed. Which is repugnant to the notion of creation.

It appears, then, that there is no contradiction implied in this, that a creature as principal cause could create, just as also it could generate. I will, however, in this chapter set down two reasons to which Durandus, at number 23 and the following, reduces the whole contradiction; for another reason of Scotus, which we approve exceedingly, we shall adduce in the following chapter, and we shall refute Durandus's solutions.

The first reason, then, is Albert's, in the Second Book of the Sentences, distinction 1, article 7, which St. Thomas used in solution 3, and Henry in his Summa, article 25, question 6. It is of this sort. The power of one producing is to be considered not only from the substance (essence) of the thing made, but also from the mode of making it: for the greater the cause is, it not only works better, but also more swiftly. Although, therefore, to create a finite effect is not an indication sufficient for an infinite power (potency), nevertheless to create itself from nothing is a manifest

argument of infinite power. For if the potency of the subject is more remote from act, a greater power of the agent and of one that educed an act from such a potency ought to be; and consequently it is necessary that the faculty which produces a form or an effect from no potency of a subject be infinite, because there is no proportion of no potency to some act, just as there is none between being and not-being.

However, this reason does not seem to convince those asserting the contradictory. For first Scotus, in the Fourth Book, distinction 1, question 1, § The second reason, and Durandus at number 24, respond that between non-being and finite being there is not an infinite distance, because finite being cannot exceed non-being except by the whole of its latitude of being, which, since it is finite, the distance and excess will only be finite - especially since creation (says Durandus) does not proceed from nothing as from a terminus; rather, it is said to be "from nothing" because "not from something." Thus, from the sole perfection of the thing produced, without any comparison with a terminus a quo, the power of the agent ought to be weighed; and since the perfection of the thing produced is finite, from it the infinite power of the agent cannot be inferred. Yet since we have already conceded, in Disputation 173, chapter 3, that the terminus a quo of creation is nothing itself, the first part of Durandus's reasoning satisfies us; for, this supposed, it also has force: because since an infinite distance between non-being and being is not proved, I do not see how from creation, which is a production from nothing, one may infer infinite power for creating. However, Cajetan, in this article, around solution 3, tries to weaken the reasoning of Scotus and Durandus, and to strengthen the reasoning of St. Thomas. He notes, therefore, that the aforesaid reasoning rests on a common Peripatetic principle, which is of this sort: whenever two extremes are so related to each other that as much as the one is diminished the other increases, if the one is diminished down to the "non-" grade of itself, that is, down to nothing, the opposite grows beyond every grade, that is, to infinity. An example of this seems to be brought by Cajetan from Aristotle, Physics IV, text 7: thus motion and a plenum of space are compared, that the more the resistance of the space decreases, the swifter the motion is. Therefore, if there be no resistance, because there is a vacuum, it follows that the motion is in non-time, which is in an instant; and so the velocity of motion increases to infinity.

Yet, besides the fact that Aristotle's doctrine proceeds only by supposing the opinion of certain philosophers who said that the whole succession of motion, its speed and slowness, should be taken from the greater or lesser resistance of the space - which, however, is false, as will be explained in Disputation 197, chapter 2 - the aforesaid example, even if it contained true doctrine, would prove nothing. We concede indeed that motion would be in an instant, if the resistance of the medium were to vanish altogether. Nevertheless, between motion in an instant and motion in any determinate time there would not be an infinite distance nor an infinite excess. They could differ only, at most, as one species differs from another. Hence, therefore, one would not argue an infinitely powerful potency for moving in non-time; since the distance is not infinite - unless from elsewhere motion in non-time were repugnant. For although motion, as philosophers say, can become faster to infinity, that, however, is understood according to proportional and

communicating parts; for according to non-communicating parts, the speed could finally increase so much as to be in non-time, if from elsewhere it were not repugnant, as in truth it is repugnant, as we shall say in that disputation.

Cajetan, in the same place, tries to confirm in another way this reasoning of St. Thomas, namely because it would follow that the power able to produce from nothing and the power able to make from some potency could be equal; which is absurd. For let the finite power producing from nothing be A, for example; and let the power producing from some potency be B; and let the power A, working from nothing, exceed the power B, producing from some potency, which we call C, in a tenfold proportion. Then some potency of a subject is taken which is itself tenfold less than C; then it plainly follows that the power which would educe an effect from that potency lesser by a tenfold proportion than C, is ten times greater than the power B, because it educes an effect from a potency ten times less. It will therefore be equal to the power which produces from nothing, since we said that this is only ten times greater than the power B.

By this reasoning Cajetan seems to himself to gain praise against his adversaries, which, in my judgment, is no less weak than the preceding. For, that it may prove anything, he must necessarily suppose that this increase and decrease of power, from the increase or decrease of the potency of the subject, happens according to the grades of the same form by intensification or remission, in which way that tenfold proportion of one to the other could be assigned, and the argument would have force. But this is not to be granted to him. For we can say that the power which educes an effect from no potency is finite and greater than any other which produces an effect from some potency; yet it exceeds it neither in a tenfold proportion nor in any other geometrical way, but after a manner "infinitely," as one species exceeds another, because that power is of a distinct species from any other virtue that educes an effect from some potency; just as the power of the intellect differs from the power of sense, and yet does not exceed it in a tenfold or greater proportion, but by such a specific grade that, however much sense may grow to infinity, it never attains to the perfection of the intellect. The same is to be said, in like manner, of all species. How, therefore, does Cajetan infer that the power educing its effect from some potency of a subject would be equal to the power producing from nothing, if this latter were finite?

Some other more recent authors, who confirm St. Thomas's reasoning, frame it in this way. A greater power is required to produce an effect from nothing than to produce from some potency, however much that potency may be distant from the effect; but if a potency be infinitely distant - either on account of impediments or some other cause - an infinite power is required: therefore, to produce an effect from nothing, an infinite power will be necessary. But besides the fact that this is not to confirm St. Thomas's reasoning but to form a new one, the aforesaid line of argument has no strength. First, St. Thomas never spoke of an infinite effect, but of a finite one. For he holds in question 7 that an infinite effect cannot be made, even by God, neither in multitude nor in magnitude. Wherefore, from the mode of making, not from the thing made, ceteris paribus, he wished to collect the infinity of the power - namely by this, that the same thing is brought about either from nothing or from something. For he said that the power of the agent is considered not only from the substance of the thing made, but also from the mode of making. But if some potency

of a subject were infinitely distant from the effect to be produced from it, by reason of extrinsic impediments, the infinity of the agent's power would have to be considered only from the substance of the thing done, that is, from the removing of impediments which would be infinite. And if the effect were infinitely distant by its own nature, the infinity of the power would have to be considered from the substance of the fact. And if all these things were done from nothing, the power also would be infinite - not from the mode of making (because, to wit, it made from nothing) but from the substance of the thing made.

Accordingly, when more recent authors assume in their argument, "A greater power is required to produce an effect from nothing than to produce from some potency, however much that be distant from the effect," if they mean a finite effect from nothing and an infinite from some potency, it must be denied, because the other circumstances are not equal. But if they mean a finite effect, so that the only difference be in the mode of making, it can be conceded; yet nothing follows from this, as has been sufficiently proved up to now.

The subsequent reason by which it is wont to be proved that to create belongs to God alone is St. Thomas's, in the body of this article, and in the second book Contra Gentiles, chapter 21, in this way.[1107] More universal effects require more universal causes; but among all effects the most universal is being (existence) itself: therefore it requires the most universal of all causes, which is God. Now "to produce being," not insofar as it is this or that being but insofar as it is being, is "to create": therefore it belongs to God alone to create; to whom alone also it belongs to produce being, insofar as it is being.

Scotus, in the Fourth Book, distinction 1, question 1, § But these reasons, disproves this argument in this way: whatever agent generates a composite, the being of the composite is also made; but a composite is made by a created agent; therefore, so too its being: yet not by creation; therefore being is not the proper terminus of creation.

However, Cajetan in this article, at Ad evidentiam horum, and Ferrariensis, in the second book Contra Gentiles, chapter noted there, deride Scotus as not having understood the mind of the holy Doctor. They assert, therefore, that St. Thomas did not ascribe to God "being" merely as any effect whatsoever, but as proper and per se first; whereby it is denoted that God is the cause of whatever pertains to "being," and that being itself, simply insofar as it is being, is referred to God as to the object adequate to His power. Since, then, "being as being" is the ratio according to which something is created, and according to which it is referred to God as to the universal cause, it follows that creation can belong to God alone. Very well, they say, do they infer this, says Cajetan, from the identity of the terminus on the part of creation, that it belongs to God alone.

Yet to me, although Scotus's argument is not proved, nevertheless the defense of Cajetan and Ferrariensis does not please. First, Scotus does not argue rightly; for St. Thomas does not deny that the being of the composite is made by the efficient cause of the composite itself; for the very composition, which terminates in the unity of that, is the terminus of generation. I say, however, that the "being of the composite" is not taken according to any and every conjunction of its parts,

1107. St. Thomas, Summa contra Gentiles, II, c. 21.

but according to that whereby it is a third thing resulting from the parts; for this is what is generated. Hence neither is "being" referred, in that sense, to the universal cause as if the particular being of this composite were universal; rather, as the blessed Thomas says, "being" is attributed to God according to its common notion, as to the proper and universal cause; but, in creatures, being is received under determinate thisness and contracted to particular natures, and thus its production belongs to secondary causes in their own order - not, however, as creating, but as educing or composing under presupposed principles.

Again, the defense of Cajetan and Ferrariensis does not seem sufficient. For to say that "being" according to the common and universal notion which it has with respect to things can be attributed as an object to God alone as to the proper cause, and that no created cause can be conversant about that, would on the opposite supposition plainly follow that some created cause could create itself; for what would hinder, if under the common ratio of "being" an effect falls as object, that a created power, acting within the compass of that same ratio, should cause itself? Yet although a color, because it falls under the common notion of the visible, is seen, it does not therefore follow that color, as such, sees; but sight sees. I reply in like manner: even a thing colored can see itself, if either by reflection in a mirror, or by receiving a species of itself, or in some other way it be made a knower; but a bare color never sees. So too a creature, although it be under the common ratio of "being," does not therefore create; to create belongs to that power to which "being as being" is the adequate object as caused. Wherefore, although every created cause produces some being, it produces it only under a contracted mode and with presupposed principles; to produce being as such, without any presupposition, is proper to the first universal cause alone.

Concerning this proposition, they deride Scotus as one who did not understand the mind of the holy Doctor. For they assert that St. Thomas did not merely attribute to God "being" as an effect in any manner whatever, but as something proper, of itself, and first; in which it is noted that God is the cause of whatever pertains to being; and that being itself simply, insofar as it is being, is referred to God as the adequate object of His power. Therefore, since being as being is the ratio according to which something is created, and according to which it is referred to God as to the universal cause, it follows that creation can belong to God alone. For, says Cajetan, from the identity of the term per se primo of creation, it is most rightly inferred that creation belongs to God alone.[1108]

For my part, however much Scotus's argument does not persuade, nevertheless the defense of Cajetan and Ferrarensis does not please. First, to be sure, Scotus does not argue rightly. For St. Thomas did not deny that the being of a composite is made by an efficient cause of the composite itself: for both the composite, and its being, is the terminus of generation. Now I say "the being of the composite" not according to any constituent part of it, but according to that which is a third thing resulting from the parts; for this is what is generated. Wherefore this being is not to be reduced to a universal cause; since it is not a universal, but a particular. Blessed Thomas only said that being according to the common ratio is attributed to God as to its proper and universal cause.

1108. St. Thomas, Summa contra Gentiles, II, c. 21.

Next, the defense of Cajetan and Ferrarensis seems less sufficient: for we concede that being, according to the common and universal ratio which it has with respect to all things, is attributed to God alone as to its proper cause; nor can any created cause be conversant about that. For from the contrary it would plainly follow that some created cause could create itself. For just as, because color universally is the proper and adequate object of sight, any color can be seen, inasmuch as it is contained under that common ratio; so also that creature, whose power would be conversant about being according to the whole community thereof, could create itself, because it would be contained under it; or if it could not produce itself, its power could not embrace being according to the whole latitude.

But if you object that the eye is conversant universally about the ray of light and the colored, and yet cannot see itself; although it is both lighted and colored: I answer, that even the eye can see itself, if either by reflection in a mirror it receives the species of itself, or in some other way. Wherefore it too is contained under the ratio of the object, except that it is not always in a due position so as to emit a species; but a creature can in no way be understood to produce itself.

This being supposed, which we readily grant to Cajetan and Ferrarensis, it is not rightly inferred that creation is to be attributed to God alone. For when they subsume thus: The cause, in order that something be created and be referred to God as to the universal cause, is being according to the ratio of being simply and universal; it follows that creation can belong to God alone: either they subsume falsely, or they can infer nothing therefrom. For if they speak thus, that the formal ratio of the term of creation is being according to the common ratio, that is, as it embraces under itself all beings, they assert manifest falsehood. For the one who creates does not, when he creates, produce every being, but a particular being. But if they speak thus, that the formal ratio of the term of creation is universal, and is the whole entity of the thing produced, that is, the thing itself according to its every part, this is most true; yet it does not follow therefrom that the terminus of creation is universal by the ratio of being, or of being insofar as it is being; nor does it follow that, if some creature were to produce an Angel from nothing, or some composite out of matter and form according to the whole of it, it could by the same power make every creature. For one might say that the power of that cause would embrace the whole being of this thing, but not the whole being of another thing according to its every part: whence it would follow that it could create this thing, not that. But God can so create the whole entity of a thing that He can do so not only in this thing, but in any other whatsoever; and thus, with respect to the creating power in Him, the adequate object is being according to its whole community; not, however, with respect to a created power in some creature. These are especially the reasons which seem to prove that the universal power of creating cannot befit a creature. Many others, which Durandus also solves because they are easier, I pass over.[1109]

Thus teach, together with St. Thomas in this article, Cajetan and the more recent Thomists; likewise in the second book of the Contra Gentiles, chapter 21, and Ferrarensis there; Aegidius in Quodlibet 5, question 1; Henry in Quodlibet 4, the last question; Scotus on the fourth book,

1109. Durandus, in the place cited on this article, solves many others; the present reasons are his chief ones.

distinction t., question 1; to the question therefore and the following, Ockham in Quodlibet 2, question 9, and on the second book, first distinction, question 7; Gabriel, question 4, article 2. It is also reported by Scotus that Varro in the second book, first distinction, question 6, asserts that this cannot be proved by any natural reason; yet from the testimonies of Scripture and of the Saints it is rightly deduced; with whom some more recent authors agree, to whom it is difficult to find a contradiction in things, but they judge that all can easily be composed together. In which matter this is first to be observed, that when we assert something to be able to be done by God, it is not always sufficient that no contradiction appear to us; for in reality a contradiction may be present, even if it does not appear to us.

From Scripture indeed I do not see how this sentence can be gathered; for the testimonies all only indicate that it is proper to God to have created all things. Which does not hinder that some creature could be, which would be able to create something. But from the holy Fathers it seems much more to be gathered. For Athanasius, in Sermon 3 against the Arians, says: "To administer belongs to creatures and to servants; but to found and to create belongs to God alone, and to His Word and Wisdom: but any creature whatsoever which would be produced would be a servant; therefore it would not befit it to create." Cyril, book 2 against Julian, says: "Those things which are properly of the one and supremely highest substance alone, which we say is one, are inaccessible to nature, namely, to be able to act efficaciously as creator, and to produce things which at some time were not." He understands those things which, according to no part of them, were before: for in another way things which were not can be produced by a creature, as is plain; the rest are manifest for our sentence. Next, this is reported by Augustine, On the Trinity III, chapters 8 and 9; upon the Literal Meaning of Genesis, chapter 15; and City of God XII, chapter 24; and by Prosper in the Book of Sentences of Augustine, sentence 146; and by Cyril in the place cited; and by Damasus, book 3 On the Faith, chapter 1, at the end, who think it heretical to assert that anything was created by angels. But they seem to deduce this, because by their nature they are creatures, not creator. For He alone is God who, being uncreated, is the creator of all.[1110] Moreover Basil, book 4 against Eunomius, from this proves that the Son is true God, because He can create.[1111]

Further, by reason we confirm this sentence. Among the rest, the reasons of Scotus persuade me; for the other two by which the Thomists more frequently use do not seem effective, as is clear from the preceding chapter. Yet I have decided to reduce them all to this one.

If some creature could create, it ought to be the most noble of all, because creation is the most perfect transient action which can be attributed to any nature; but no nature can be more perfect than a spiritual one: therefore, if any nature could create, it would be spiritual. But this would not create proximately by its nature, insofar as it is; for thus it would create necessarily. Now the most perfect transient production, which is attributed to the most perfect nature, ought to befit it not

1110. Athanasius, Sermon 3 against the Arians; St. Cyril, Contra Julianum, lib. 2; St. Augustine, De Trinitate, III, cc. 8 - 9; De Genesi ad litteram, c. 15; De Civitate Dei, XII, c. 24; Prosper, in the Book of Sentences of St. Augustine, sent. 146; St. Cyril, loc. cit.; Damasus, De fide, lib. 3, c. 1 (at the end).

1111. St. Basil, Contra Eunomium, lib. 4.

necessarily, but freely, and to proceed from it not insofar as it is, but insofar as it understands and wills. But by a created intellection and will nothing can create. Therefore in no way can a creature create.

But Scotus proves that no created nature can create by a mediate intellection and volition: because intellection and volition are an accident; therefore they cannot be the principle of creating a substance. Nor can they be an instrument: for this ought to be natural; but a natural instrument ought to have some prior operation, as is made clear by induction. I speak of a natural instrument; for of one voluntarily assumed the case is different, as we shall say presently. Wherefore, if an Angel were to create by a mediate volition and intellection, and, these posited, the effect would follow, and, these removed, it would be taken away, nor would it have any prior disposition, they would be principal causes of creation.

To this reason Durandus replies at numbers 35 and following. First, that intellection and volition are not the formal principle of creating, but only directing to creation: as in an artist with respect to the work of art. But this is trifling: for in an artist, since there is an executing potency distinct from the intellect and will, intellection and volition are posited in order to direct to operation; but a spiritual substance has no such executing faculty, besides the intellect and will themselves, as we shall say in Disputation 105, chapter 3: therefore intellection and volition would be the principles of creation. Next, at number 37 Durandus says that it is not rightly proved that intellection and volition in an Angel are an accident.

Passing over Scotus's proof, this can easily be shown in this way. That intellection and will of an angel, by which he would create a creature, would be conversant about the creature itself as about its object, not naturally, but freely; for there would be no cause why we should say that an Angel is necessarily conversant about creatures and by his substance; therefore from that operation he could cease: therefore it would be an accident of him, as in us any intellection and volition is.

1. Moreover, if no creature could create any substance which by its nature is per se, neither could it create an accidental form: because, in order that such a form be created, it must have existence per se; which for it is beyond nature. But if no creature can create a thing according to nature, much less ought we to attribute to it a creation beyond the nature of the thing created.

Finally, since no created intellection and will seems possible other than that which in fact is in Angels; and these are not principles of creating; in vain shall we suspect that there can be created by God some things which would have such a power.

Disputatio CLXXVI - On whether a creature can be assumed by God as an instrument for creating

Caput I - The opinion that a creature can be assumed as an instrument for creating

That a creature can be assumed as an instrument of creation, some have held together with the Master. For the Master in IV, distinction 5, last chapter, seems to assert that this can most fittingly be done; whose sentence St. Thomas followed in IV, dist. 5, q. 1, art. 3, quaestiuncula 3, ad 4, and in II, dist. 1, q. 1, art. 3; and not a few recent writers in our time in the schools defend this.[1112][1113]

It can be proved, first, because a greater power is necessary for effecting the Incarnation than for creating; but for the Incarnation something can be assumed as an instrument: therefore for creation also. Second, the priest by the words of consecration efficiently attains the transubstantiation of bread into the body of Christ: therefore he efficiently attains the whole substance of the body of Christ, as if he were creating it: why then could he not concur to its creation? Third, the fire of hell produces a quality in spirits as an instrument of the divine power: therefore it could also be an instrument of creation. Finally, it can be confirmed, because no reason appears which would draw those who assert this sentence to a manifest contradiction: therefore we shall say in vain that it so repugns the divine power and omnipotence that it cannot be done by God.

Caput II - The opposite, truer opinion

The opposite opinion is truer, yet it is wont to be proved in various ways. The more probable and more common conclusion is the opposite opinion, which affirms that no creature can be assumed by God as an instrument of creation. This sentence was followed by St. Thomas, Cajetan, and the more recent Thomists in this article and in Contra Gentiles II, chapter 21; and by Ferrarensis there; by Albert in II, dist. 1, art. 7; by Scotus in IV, dist. 1, q. 1 ("Ideo dico potest," not far from the end); by Richard in IV, dist. 5, q. 1, art. 2; by Herveus in the same distinction, q. 2.[1108][1113][1114][1115] Yet many reasons are commonly brought forward in confirmation of this sentence, which, in my judgment, have little weight. We shall therefore set forth some of them in this chapter, so that in the following we may assert what we hold.

The first reason is of Richard, in this way. Creation requires an infinite power: therefore no creature can cooperate to it. But this reason either proves that instruments cannot be assumed by God for the production of grace, or proves nothing in the present question: not because the

1115. Richard of St. Victor, IV Sent., dist. 5, q. 1, art. 2; Herveus, eadem dist., q. 2.

production of grace is creation, as Richard there falsely thinks, but because, since it belongs to God alone to infuse grace and to remit sins, this effect by its nature no less requires an infinite power than creation. Which, although it is true, the reasoning

Caput III - The preceding opinion is shown by the best reason, with no innate virtue posited in the instrument

But the reason proposed proves neither side. For though the effect be of such a nature that in the principal cause it requires an infinite virtue, it does not seem to follow that in the instrument it likewise requires the same. Since an instrument does not act by its own virtue, but by the virtue of the principal agent, and (as they say) being elevated by it, it operates. It must therefore rather be proved that a creature cannot be elevated by the power of God, nor can a creature so obey God as to cooperate with him to creation.

Second. The second reason of St. Thomas in this matter is of this sort. Every instrument, in order to operate with the principal cause to the effect, ought of itself to have some prior operation. This proposition is established by induction in the saw and other instruments of art, and in the natural heat of the animal for generating flesh, and in the heat of fire for producing another fire. But no creature can have a prior operation unto creating anything, because since nothing precedes that which is created, there is no subject about which by its prior operation an instrument might operate: therefore it cannot concur to creation.

However, this reason of the holy Doctor is not without difficulty, both in his own doctrine and absolutely. First indeed, in his own doctrine. For it cannot be denied that the intellect can see without the habit of the light of glory being acquired with God's help, as with a principal cause, just as an instrument with the principal cause; and yet it does not have a prior operation. Then he also affirms that the phantasm is an instrument of the agent intellect for impressing the intelligible species on the possible intellect, and yet it has no prior operation upon the intellect itself. But come, let us see what prior operation St. Thomas attributes to all instruments, that from this it may be inferred whether it is necessary. First indeed, he asserts, with the opinion of many, that the sacraments are physical instruments of grace, in III, q. 62, a. 1,[1116] and yet he attributes to them no other prior operation than a natural one, namely the washing of baptism by water, the sounding also by words, and so of the others. But these operations are of no other virtue and moment for producing grace; and the infinite power of God could no less assume water at rest as an instrument of grace than water washing by its motion; since that motion, and speech itself, and touch, have of themselves no virtue ordered to such an effect. This he teaches in III, q. 13, a. 2,[1117] about the power of working miracles in Christ: but the prior operation here, such as was speech or touch, contributed nothing of itself to the effect and the miracle; therefore St. Thomas vainly requires it as something necessary to the notion of an instrument. For the other natural instruments there is a different account: for the prior operation which their nature has serves as a disposition to the effect

1116. St. Thomas, Summa Theologiae, III, q. 62, a. 1.
1117. St. Thomas, Summa Theologiae, III, q. 13, a. 2.

of the principal cause, as is clear in the instruments of the arts, however those be said to concur and operate (in this I do not linger), and in the natural heat for generating flesh, and in the heat of fire for producing fire.

Wherefore Andreas de Vega, book 7 upon the Council, cap. 13, teaches that a prior operation is not necessary in an instrument in order that it be assumed: he understands freely, in which sentence he adduces Scotus, whose mind he does not seem sufficiently to have understood. For that man in IV, distinct. 1, q. 1, to the first question then around the middle, and in distinct. 6, question 5, § Circa tertium principale, at the little verse ad primum dico solvi, affirms that certain things are called instruments which do not act; and he thinks all the instruments of the arts are of this sort, because of themselves they have no efficacy - which he there more fully proves. But of instruments which he calls living, he thought it necessary that they have prior operations to the principal effect, in order that they be called instruments; indeed he thinks they are not therefore called instruments because they are elevated to the principal effect, as the heat of fire to fire, the heat of animals to flesh, but he thinks they are called instruments only by that reason because by their own virtue they effect something prior, which posited, the effect follows without their concurrence. Wherefore in IV, distinct. 1, q. 1, therefore it can be said, near the end, he concludes that for this reason he thinks no creature is assumed as an instrument, because it does not have the virtue of effecting something prior; which reason, in my judgment, is effective, as we shall see in the following chapter.

However, if we wish to interpret St. Thomas thus, that he is not speaking of an instrument physically operating to the effect, but only of an instrument operating morally, his reasoning will not be difficult. It must therefore be said that the holy Doctor is not here inquiring whether there can be an instrument physically concurring to creation - for this could by no reason be defended, as we shall see below - but whether there can be a moral instrument; and he answered rightly, that nothing can be assumed as an instrument of that sort: he understands however a moral one, because there is nothing that would have any prior operation around the thing to be created, or around anything of it. For God's moral instrument is not called that which only obtains something from God by praying; but that which obtains by doing something around the thing in which the effect is derived from God: as when someone touches a sick man and by his touch obtains from God health, etc. For since that which obtains something from God is called an instrument only inasmuch as it is likened to a natural separate instrument, or an instrument of art, which of itself has some prior operation around the subject, therefore not every moral cause which obtains something from God is called God's instrument, but only that which by first doing something around the subject, obtains from God the principal effect about the same thing, as in the example set and in the sacraments. And because no created cause can operate anything prior around the thing which is created, nor around anything of it, therefore no created cause can be called even a moral instrument of creation; although there can be some impetratory cause. Wherefore when Christ's humanity and holy men first did something around the thing, and by their deed obtained a

miracle from God about the same thing, they were rightly called God's instruments, even if they were only moral and impetratory. Nor indeed do I see it necessary to assert that they were physical instruments, as I shall show in its place.

But when in that place, q. 13, a. 2, St. Thomas teaches that Christ's soul cannot be assumed by God as an instrument to annihilate, this too must be understood about a moral instrument. For although it could be an impetratory cause of annihilation, nevertheless it cannot be called God's instrument, even moral. Because annihilation consists only, as the Doctor says there, in this, that God denies the influx by which he was conserving the thing. But to this nothing seems to concur by any prior operation by way of an instrument, although one could obtain this from God; because along with this there would not be to effect something in the thing itself, but for God to deny it conservation. For whatever takes place in the thing before it is annihilated, does not have the status of a prior operation in order to deny conservation. For that it be in the manner of an instrument, rather this prior operation ought to be in the very one who denies conservation. Wherefore we do not say that God in any way uses an instrument to deny the conservation of a thing, just as we say that in a certain way he uses a moral instrument to effect something, if there could be an impetratory cause of annihilation.

Third. The third reason that is wont to be brought is of this sort. Creation is the production of being as being; but that which produces being as being can produce every being: therefore it can produce itself; just as a finite and limited being. But every created instrument is of that sort: therefore if God were to assume it to create something, it could also serve to create itself; which is absurd.

But this reason proves little. For as we said in the superior disputation, c. 1, in order that some creature have the power of creating, it would not be necessary that it be able to deal with every being universally; but it would suffice that in some particular thing it produce the whole entity of that thing, namely matter and form; from which it would not follow that it could create itself: which follows far less in an instrument. Since it would not operate by native virtue, but only by the will of God who assumes it, from the fact that it would produce the whole entity of this being there would not follow that it could effect itself, even as an instrument.

Here indeed there seems to be one single, and better, reason which not only in the present difficulty, but also universally, convinces that no thing can be assumed by God at his will as a physical instrument to whatever effect; but that the instrument must be of such a nature and virtue that it have of itself a prior operation, not just any, but one required by its very nature to the effect, or at least that by its native virtue it do something in that effect: that is, that the effect according to some formal account answer to the instrument as to a proper cause operating by native virtue. By this line of reasoning Scotus seems to have been moved in IV, distinct. 1, q. 1, in that place Therefore it can be said, near the end, where he demands universally a prior operation in an instrument.[1118] He differs however from the Thomists, because Scotus requires a prior operation naturally requisite to the effect; the Thomists, however, think it suffices to have any prior

1118. Scotus, IV Sent., dist. 1, q. 1, near the end ("Ideo dici potest"); see also dist. 6, q. 5.

operation, even if of itself it contributes nothing to the effect, as we saw above: which we said in the preceding chapter is not necessary; but if by that a thing could be freely assumed as an instrument, in the same way it could also be assumed while at rest and without that prior operation. From which principle indeed it has come about that Scotus and some Thomists judged differently about the sacraments. For the Thomists, III, q. 62, art. 1, teach that the sacraments are physical instruments, because they have a prior operation,[1116] even if of themselves they do not fit nor are required to such an effect; but Scotus in the places cited said that they are not physical instruments, because they do not have a prior operation. There is, therefore, no force in such a reason.

- If some thing is assumed as an instrument in order to effect something, there is not only an order of efficient and effected between the effect and the principal cause, but also between the effect and the instrument itself. For the effect does not proceed wholly from the principal cause alone; rather in part it proceeds from the cause through the instrument; and the instrument in very fact does what before it did not do. Wherefore that a thing which by God is referred to the effect by means of an instrument, be referred also as an effect to the instrument itself, it is necessary either that by its very nature it be referred to it, or that by some equal change it be rendered such as to be referred to it, either in itself or in the instrument, as is wont to happen when the very substance is changed, which either becomes fire or becomes flesh. But if we suppose that by the very use of the instrument no change at all is wrought either in the instrument or in the effect, I do not see by what reason, or in what way, the effect will be referred to the instrument as to its proper cause.

Therefore, if anyone says that God uses a creature as an instrument for creation or for any effect without any real change either in the instrument or in the effect, nothing will be assigned whereby the effect be referred to that instrument. And if some change be feigned, it must be placed either in the instrument or in the effect.

In the instrument. For whether it be said that in it there is some quality permanent, or transient and impressed by God after the manner of a motion, as some imagine; however that be, either that is a proper virtue for producing such an effect, and thus the thing is not constituted an instrument but its own proper and principal cause - which, as was proved in the superior disputation, cannot ever be posited in order to create, and we may boldly assert it - or that virtue is of a much inferior sort than that it be able of itself to produce the effect; and therefore it needs a new elevation; it will not be able from itself to produce such an effect; accordingly, neither from that will the effect be referred to it; therefore that change will not be sufficient for the instrument to be referred to the effect. From which kind of argument it is proved that it is superfluous to posit in the instrument this elevating quality from the efficient cause in order that it exercise a virtue beyond its proper and native status to the effect: since beyond this quality there would be required another new elevation, as has been proved.

1116. St. Thomas, Summa Theologiae, III, q. 62, a. 1.

Or let the whole change be in the thing produced: and even on this ground it cannot be that the effect be by a motion referred to the instrument. First, because it is not evident what change could be introduced into the same substance which God alone conserved; for he could conserve it with no instrument intervening that has any virtue or influence at all. For when the same thing is conserved successively by other and diverse causes, or the same light by diverse lamps, the mode of that production does not vary from the fact that it is referred now to this, now to that as an instrument; rather it is always referred to God alone as the principal conserver. Second, because if some quality be posited in that thing produced, which is not from the nature of the instrument, nor is referred to the instrument by any intrinsic reason, it will be referred to the producer alone, who nevertheless by will alone has given it. Something also accrues from this, that such referring would be accidental and extrinsic, and from its own nature it would not be referred, just as the whiteness of a dove is not referred to the water which cleanses it, because God willed that the water be an instrument when he gives to it some quality of the same nature. Wherefore to refer the change to some accident impressed in the water by a divine act is one thing; but to refer it to the instrument as to an intrinsic principle from which it proceeds is another: which nevertheless this change does not have unless by the will of God. It follows also that sometimes the same thing is referred to diverse instruments, sometimes to none at all; which is alien to the mode of production of any change.

One might say: it does not seem necessary to place such a change either in the effect or in the mode of producing; but that the Lord can proceed in diverse functions in the same way; and in the same way, as the light proceeds from diverse lamps, so God can, without any change on the part of the instrument itself, refer the thing produced to a subordinate instrument merely by his will; and because the whole virtue proceeds from the principal agent, and the instrument of itself contributes nothing - for medicated things have in themselves some qualities and forms from which they act - hence from this it seems that God, by various and certain instruments by mere assistance (as they say), impressing nothing in them, either new or old, can produce the same thing, and the principal influx in the same way remains.

But this assertion does not stand. For then the relation in the effect, inasmuch as it is produced, would not be referred to the immediate productive cause as to an intrinsic principle, but only to the principal as to the whole; and the instrument would remain entirely extrinsic, contributing nothing of its own, either as disposed by a quality or form, or as changed by a new elevation. From which it follows that, outside of a mere extrinsic denomination from the order of operation on the part of God, there would be nothing whereby the effect be referred to the instrument as to a true partial cause. And this is repugnant to the very notion of instrument, which of itself, and not merely by extrinsic denomination, must be ordered to its effect, either by a prior operation or by a native virtue doing something in that effect.

Therefore we conclude: in creation, in which there is no subject preexisting, and in which nothing is effected save the whole entity of the thing produced, it is impossible for any created thing to be assumed by God as a physical instrument, since neither can there be a prior operation naturally required to such an effect, nor can any native virtue of an instrument do anything in that effect so that the effect should be referred to it as to a proper partial cause.

But even this would not be without difficulty: for it does not seem that in the produced light there is altogether the same relation of dependence to one luminous body and to another; because illumination is not really the same as the light produced. For God, with one luminous body present, can bring it about that the produced light does not depend upon it, if He should will not to concur with it in illuminating, but Himself alone should will to produce the light. But this would not seem able to be done, if illumination were an action altogether by the nature of the thing the same as the light produced, and the light produced, by its very essence and without any other distinct thing, were referred to the luminous body by the relation which they call dependence.

But grant, then, that so many unfounded mutations be devised in the thing produced by God on account of diverse instruments: still these are not yet sufficient for the mutual relation of effect and instrument. For if this effect, produced in such a way, is referred by its own native aptitude by the relation of something produced to the instrument, it is a sign that the instrument is of such a nature as to produce such an effect of itself. For an effect is not referred by its nature except to that in which there is the power of producing, not by another's will, but naturally, if indeed it is referred naturally; therefore, since in the instrument there is no power, it will come about that the thing produced is not referred to it.

Someone will say: the effect is not referred according to its substance to the instrument, but according to the mode which it has of being produced by means of such an instrument. But this is manifestly false. For an instrument does not produce a mode in the effect for the sake of which it is assumed; and if there is any mode in it, it is the very production by which the effect depends upon the instrument; but the very substance of the effect has the notion of something produced, and it is that which is referred: then the foregoing reason takes place. For if this effect by its own native aptitude is referred to this instrument, it follows that in the instrument there is a native power for the production of it: which is absurd.

Next someone will reply that the effect is not referred to the thing which is the instrument, taken nakedly, but to it as elevated by the agent - which elevation indeed is nothing other than to be ordained to such an effect, and to have as to that effect a divine concurrence in readiness. But who does not see that this is mere verbiage? For that God is ready to concur with the instrument presupposes also that the cooperation of the instrument will be future; but now we ask whence this future operation of the instrument is to be. First, certainly not from the fact that God is going to cooperate: for the concurrence of both supposes a principle in each. Next, if the elevation be from God's ordinance alone, who will not say that it is only a matter of respect in the instrument, with nothing received in it? What, then, is the variation in it by which it is assumed and concurs to the effect, when from what it has by its own apt nature it could not concur?

This single reason proves that no instrument, which by its own nature is not required for some effect, having some prior operation either with respect to that effect or to something produced in it, can be assumed indiscriminately by God as an efficient instrument to any effect whatever. From this principle in the Third Part, q. 13 and 62, we shall say that neither the power of the humanity of Christ for the working of miracles, nor the sacraments for producing grace, concur physically, but are only moral instruments by way of impetration, as will be explained there.[1119] And if an instrument could be assumed indiscriminately by God to various effects, I should not doubt that it could in the same way be assumed for creating: for I do not find any special reason proving that it cannot be assumed for creating. But how it is necessary that there be in the instrument some prior operation from a native power, or that it should effect something in the very effect of which it is the proper cause, we shall say in chapter 5.

Moreover, according to the opinion which we followed in Disputation 174, namely that creation is not distinguished from the created thing save only by reason, it necessarily follows that no instrument can be assumed for creating. For if it were assumed, creation would vary, as is clear from what has been said, and consequently it would be distinguished from the created thing.

There are also special reasons which prove that the power of the soul of Christ for miracles and the efficacy of the sacraments are not physical; and many other things must be said in their places against the various ways of philosophizing among the theologians. For the present, however, let what we have said suffice for our purpose. But this is to be observed: it is much more repugnant that anything be assumed as an instrument for conserving itself. For then that which is the instrument must be prior to its operating: if it conserves itself in this instant, it must first be before it conserves itself. But if it is prior by nature, it cannot be the effect of itself. Wherefore they are mistaken who, in order to defend transubstantiation in the Eucharist, say that the body of Christ is conserved by the words of consecration; and since the words have efficacy from the humanity of Christ itself, that that very humanity is also assumed for the conservation of itself. But even for that reason the opinion of these doctors ought deservedly to be refuted; since for safeguarding the true rationale of transubstantiation, it makes no difference whether the humanity of Christ be produced physically, or conserved according to substance by the words of consecration, or by itself; but the mystery of our faith can be explained on a much easier rationale, as we shall say in passing in chapter 5; whereas they wished to defend it by a rationale so difficult that, in right philosophy, it appears incredible.

The same opinion is confirmed against the potency which they call "obediential."

Caput IV - On the so-called "obediential potency" and recent opinions

Down to our own times it used to be defended, in one of the ways set forth in the preceding chapter, that any creature whatever can be assumed for producing any effect whatever, as the sacraments for producing grace: either by some quality derived into the creature itself in a permanent mode, or in a transient mode; or by God's assistance alone without any change at all in

1119. See below in this work on the Third Part of St. Thomas, q. 13 and q. 62.

the creature; and we attacked both ways in the foregoing chapter. But now, within the last few years, certain more recent authors teach that any creature whatever can be assumed by God as an instrument for any effect at all, even for creation, by reason of a certain potency which they call "obediential" (*potentia obedientialis*). And they say that this potency is not complete, but a certain inchoate power for producing any effect whatever, not distinct from the entity of the thing, but being the very substance or nature itself. And to such a degree do some attribute this inchoate power to all things, that they do not hesitate to attribute it even to relations.

Furthermore, they affirm that whatever thing is assumed as an instrument operates the effect from within, and contributes something of its own to it - not by a borrowed power, or one derived from the principal cause, not even from God - but by a native power, insofar as it is such a created nature. And they call it an inchoate power because no natural concurrence of God is owed to it for acting; but it is completed by a supernatural concurrence and of a higher order, so that it may produce an effect not proportioned (as they speak) to itself.

The authors of this opinion devised it chiefly for this reason: it seemed necessary to them to grant to the sacraments of the New Law an instrumental power which would physically produce grace; and a physical instrumental power, as they judged, could not be defended in any better way than the one just mentioned. Those from among the Thomists who assert that there is derived by God into physical instruments some quality, either permanent or transient, by which they are elevated; or that instruments are elevated by God's assistance alone without any change in them - seemed to these doctors, and rightly, not to have a solid foundation in philosophy; and we have confuted them, as much as is sufficient, in the preceding chapter. It remains, therefore, that they say there is in instruments a certain native inchoate power, as has been explained above. And since no manifest repugnance is apparent, indeed since we see that in other things there is this power which they call obediential - in the subject, that it may receive a supernatural form; in a form, that it may inform two matters at once; in a body, that it may be in two places at once - there is no reason why we should deny the same power for working miracles, for producing grace, and for the other things which can be done by God alone.

In my judgment this opinion has no firm foundation either in theology or in philosophy. Not in theology, first: because to none of the mysteries of our faith does a physical concurrence of an instrument seem necessary; and consequently, if, with the due and entire reverence owed to the mysteries, we can do theology without this or any other physical instrumental power, there is no reason why we should force the wits of students into these straits. For, wishing to extol the mysteries of our faith, we shall, without necessity, make them harder.

Moreover, that it is not necessary to concede any physical concurrence of instruments with God for defending our mysteries of faith will be evident from what we shall say below on the Third Part, q. 13, a. 4, disputing about the power of the humanity of Christ for working miracles, and q. 60, a. 4, disputing about the efficacy of the sacraments of the New Law: where we shall show that neither the councils, nor Scripture, nor the testimonies of the Fathers indicate anything more, even slightly, than a moral efficacy in the humanity of Christ for working miracles, and in the sacraments for producing grace.[1120]

Deinde I show by this reasoning that this instrumental power, which they call obediential (potentia obedientialis), is at odds with right philosophy. If such an instrumental power were in things, it would have to be native (nativa) to any given thing, since it would not be derived from something extrinsic. I did not say it would be natural (naturalis); for one may call that natural which would not have a complete order of efficient cause to a natural effect, but would be so referred to a supernatural effect that it ought to be completed by the supernatural concurrence of God. Therefore, lest we contend about a name, when I said natural, I meant native: for something is called native to a thing which arises from that thing's own principles. Wherefore much more ought this instrumental power to be called native, because it would not be distinct from the substantial nature of the thing. But no power native to creatures can extend itself to any effect whatsoever: therefore neither is the instrumental obediential power found in them.

Further, that there is no native power to any effect whatsoever of creation is proved thus. Either that power is complete, or inchoate. I call complete that to which there corresponds not only some aspect in the effect, but adequately the whole of what is produced in the effect, and is attributed to it according to every aspect. Inchoate, on the contrary, is that to which the effect does not correspond according to every aspect, but only according to some; as we said above in disp. 43, c. 5, [1121] that the clear vision of God is attributed to the native power of our intellect, not according to the whole being which the vision has, but according to that whereby it is an intellection - a power indeed inchoate, which ought to be completed by some proximate principle helping and cooperating, as the intellect is helped by the intelligible species to understand any object proposed, and by the light of glory (*lumen gloriae*) to see God clearly. Now it must be that this instrumental power is a cause in one of these two ways. That it should need God's common concurrence belongs both to a complete and to an inchoate power, since God is the first cause of all, which, precisely as first, must concur by a certain universal power. But in neither way can that power be such as to extend to any effect whatsoever: therefore, in no way, not even as an instrument, can it concur.

First, it cannot be a complete power for operating in the manner explained: for if any effects whatsoever proceeded according to every aspect from the native power of each creature, there would be no need of another second and proximate cause for such an effect, but only of the first, in that universal way in which it cooperates with the creature. For, the created cause of some effect being posited according to every aspect which is in it, there is not another proximate necessity; as we showed above in that disp. 43, 4, 5.[1121] But then no such creature would be an instrument, but a

1120. See below in this work on the Third Part, q. 13, a. 4, and q. 60, a. 4.
1121. See above, this work, disp. 43, c. 5.

principal cause, as are other second causes which cannot operate without the concurrence of the first. And the concurrence by which God would concur with any creature to any effect whatsoever would not be supernatural: because it would be to that which, according to every aspect, the creature's native power works of itself. For a creature which by its native power has force so that, the first cause concurring, it works something according to every aspect, cannot be called an instrument, unless in a broader signification, inasmuch as every second cause is called an instrument of the first. Add that, for another reason which will be proved below, the concurrence of God with the native power of a creature is not supernatural: therefore such a power of a creature cannot be complete.

Nor indeed can it be an inchoate power, as we have explained above: for if a creature concurred by its native power to some aspect in the effect, it would concur to that as a proper cause, if, namely, it needed another second cause, or the concurrence of the first in place of that other, so that the effect might be made complete according to every aspect. For a cause which by its proper and innate power contributes something to an effect, and produces it according to some aspect, is a principal cause with respect to that which it produces; although it may need another second cause, or the concurrence of the first in place of that other: by another, I mean a helping or supernatural cause, by which the power of the intellect is completed with the light of glory to see God, or another second natural cause helping, as the intellect is helped by the intelligible species to know this object or that. But this does not seem to be conceded in a creature for any effects whatsoever: because it does not appear what ratio of producing in any given effect is to be attributed to the native power of a creature which is said to be assumed as an instrument. Then too, if any such were assigned to it, it could be conjoined to it with another second created natural cause that would complete its efficacy for any effect not supernatural according to substance, as for the restoration of an eye: for this effect is natural according to substance, and only supernatural as to the mode of producing, because, since it is produced by God alone without any natural cause being required, it is said to be supernatural, as we shall note in disp. 214.[1122] Wherefore, if for this effect and similar ones any creature had an inchoate native power, that inchoate power could be completed by another second created cause helping: because that effect is natural according to substance.

In vain, moreover, does an inchoate native power seem to be ordained to an effect natural according to substance which cannot be completed by another second natural cause, so as to produce the effect integrally and according to every aspect; but to an effect supernatural according to substance, as to produce grace, it could be completed through a second created cause, which would be a supernatural form, and by which its efficacy would be completed so as to produce the effect integrally. For it seems futile to posit an inchoate native power for producing an effect supernatural according to substance, which cannot be completed by some supernatural form.

But if God were to supply in place of another second natural cause, or of a supernatural cause completing that inchoate efficacy, this would not hinder the inchoate power of the creature from being the proper cause of any effect whatsoever according to that peculiar aspect; just as the

1121. See above, this work, disp. 43, c. 5.
1122. See below, this work, disp. 214.

intellect is the proper cause of the vision of God according to the aspect of intellection and of vital action, even though its power is completed by a peculiar concurrence of God supplying in place of light.

But someone will say that in any creature there is a native inchoate power for any effect whatsoever; not because it can concur as a proper cause to any effect whatsoever according to some aspect, but because it concurs by its own proper power to every aspect of the effect in such a way that it can operate only with supernatural help of God not owed to it; and therefore it is called an inchoate power, not because it can produce any effect according to some aspect proper to it, but because to every effect it meets with its own proper power in such wise that it can operate only with a supernatural help of God not owed to it.

But this evasion can easily be cut off. First, because, as we were saying above, if any creature by its native and proper power can contribute something to any effect whatsoever, nothing can be lacking to it to keep it from being the proper cause of such an effect, and for a natural concurrence of God to answer to it that it may operate: for the concurrence corresponding to a native power is natural; and such a power ought to be called not obediential, as they speak, but natural; and the effect corresponding to it ought to be called natural. Then too, many effects produced through any creatures whatsoever would not be supernatural according to substance, but natural, such as the restoration of an eye: for if there were a native power for these effects in any creature to which it corresponded, and if some concurrence of God were given for producing those same effects, there would undoubtedly be a natural concurrence: for the influx of God is said to be supernatural in one of two ways, as we shall show in that disp., either with respect to substance, because it is given to an effect supernatural according to substance, or with respect to the mode, because, no cause requiring it by its native power, God works something; as when he restores an eye to a blind man. But if in any creature there were a native power for restoring an eye, then that influx would be neither supernatural with respect to substance, as is clear, nor supernatural with respect to mode, because it would be to concur with the native power of a created cause. Wherefore without foundation that power would be said to be obediential in a creature, since it would truly be a second cause.

Then the adversaries say that by that obediential power it is therefore instrumental, and that the concurrence of God which is conferred upon it is supernatural at least with respect to the mode, because that power is not proportioned to the effect, nor is it adequate to it by its own nature; if, however, it were proportioned, the consequences which we have set out thus far would rightly follow. But those who so reply either do not solve the difficulty proposed, or else they destroy what they had posited in their aforesaid opinion. For either they mean by "not proportioned and adequate to the effect" only this, that it cannot operate without the concurrence of the first cause - and this is not sufficient for it to be instrumental, for all causes need that concurrence; or else they mean that that native power is so inferior that what ought to be produced as an effect cannot correspond to it as to its cause - and this is just as much as to deny a native power for any effect whatsoever. For a power which of itself contributes something to the production of an effect cannot but be proportioned and adequate to that which it produces; but if it is not proportioned and

adequate to something that is produced in the effect, then of itself it can contribute nothing; and it amounts to the same as not being proportioned, as it does to being nothing. And therefore, if we are to defend an instrumental power in any creature, it ought not to be innate in the instrument, but derived in some way from the principal agent, either through a quality, or through motion, or through assistance. But if even in this way it cannot be defended, as we have seen, it is better utterly to deny such a kind of instrument.

The arguments of the adversaries are clarified in cap. 6.[1123]

Caput V - How the other instruments have a prior operation, or something produced in the effect by their proper power

Whatever are commonly called instruments are said to have some prior operation, or to produce something in the effect by their proper and natural power.

We can show this by induction. Scotus, in the Fourth Book, d. 1, q. 5, ad primam; and in d. 6, q. 9, concerning the third principal point, enumerates in his judgment all the things that are wont to be called by this name.[1124]

First: Secondary causes, even if they are principal in comparison with other inferiors, when compared with God, who is the first cause of all, are wont to be called his instruments, although in themselves they have a native power of producing their own effect: they are, however, called instruments only for this reason, that they are subject to the motion of the first cause, and in their operation depend essentially upon it.

Second, an accidental form is called an instrument, because as a proper cause it produces the ultimate disposition, which the substantial form straightway and naturally follows: although Scotus thinks that for the production of the substantial form itself that instrument does nothing, but is called an instrument only for this reason, that it produces the prior disposition - about which mode we need not now dispute: it is enough for the present that this kind of instrument is by its nature ordered to such an effect on account of the prior disposition which it produces by its own power, so that by its very nature it is referred to that effect. Instruments of this sort are the heat of fire for producing fire, the animal heat for generating flesh, and other things of this kind.

Third, some part of the agent is called an instrument, through which it derives immediately its power and operation, as the hand for writing, the eye for seeing; although in such a part there is a proper and innate power equal to such an effect. Thus Aristotle, On the Soul II, c. 4, called the hand a conjoined instrument, but the oar a separated instrument for the steering of a ship. By the same reasoning he called natural heat an instrument of the animal for nutrition.[1125]

Fourth, there are the instruments of art, which, although they do not properly have the power for operating, as Scotus at length pursues in the place cited, nevertheless of themselves and by their own nature contribute something.

1123. See below, cap. 6.
1124. Scotus, In IV Sent., d. 1, q. 5, ad primam; and d. 6, q. 9, circa tertium principale.
1125. Aristotle, On the Soul II, c. 4.

Fifth, to all these we can add, if you please, another fifth kind of instrument, namely the faculties of the intellect and of the will for supernatural acts, as the intellect for believing, and the will for loving, and for other things of this sort: for in relation to God moving, and by his help alone and concurrence supplying what would be the concurrence of the supernatural habit rather than on the part of the habit itself, a natural faculty can be called an instrument for the whole operation; although not without reason some call it a partial cause. In all these cases we see that instruments of themselves contribute something by their native power, and on that side they can be called proper and principal causes; and therefore it is no wonder if by their very nature they are referred to the effect, and the effect to them. For, to omit the other kinds of instruments in which what we say is manifest, in this last case the same is openly proved. For intellection, however supernatural, such as is the clear vision of God, is effected by a supernatural light, or by God himself supplying the place of light, in such wise that the intellect too contributes something by its native power: for that (intellection) answers to the intellect in the ratio of vision and of a vital operation. But the kind of instrument which the adversaries are trying to establish can contribute absolutely nothing of itself to the effect: therefore it is no wonder if we say that the intellect and the will, in which there are certain beginnings of those operations, can be elevated by God when he completes their inchoate efficacy; whereas the other instruments, in which there is nothing of native power with respect to the effect, cannot at all be elevated. Moreover, since in the intellect and the will there is for supernatural acts a certain inchoate power, of itself accommodated and sufficient to produce in the effect some ratio, namely either of intellection or of volition, as we have shown above in this disputation and in disputation 43, c. 5; thus we ought to call the intellect or the will instruments for supernatural acts, so as not to deny that they are proper and principal causes - what they call partial causes - with respect to that ratio which in the effect corresponds to them. Whether, however, one ought to call the intellect or the will an instrument for supernatural acts is not a great matter, but a small disagreement about words, which matters little, provided we say, as was noted in the preceding chapter, that the intellect by its own natural power of itself contributes something to a supernatural act, and the will likewise.[1126]

But some object in this way. Although the intellect of itself has the power to produce some intellection under the common notion of intellection, nevertheless it does not have the power to produce an intellection as it is contracted by a supernatural difference, such as is vision; or certainly, if it suffices to have a power about intellection in general so as to be elevated to such an intellection, so also any thing whatsoever which has the power of producing some being will be able to be elevated and to produce this being: for already it has from itself some beginning; and especially any quality and substance will be able to be elevated so as to produce grace; since, whereas of itself it has an inchoate power of producing a quality, it can be completed so as to produce such a quality.

But this objection is easily dissolved. For in our intellect we posit an inchoate power of producing intellection in such wise that it not only regards of itself universal intellection, as intellection is, as an act adequate to itself; but that any intellection whatsoever, even a supernatural

1126. See above in this disputation; and see below, disp. 43, c. 5.

one, cannot come to be without the cooperation of the intellect, since essentially it depends upon it. Whence also we have proved in disp. 43, c. 4, that that supernatural intellection flows in part from the native faculty of the intellect; nor is the whole virtue for operating given by the light, and this must necessarily be admitted. The intellect therefore has from itself an inchoate power which, some peculiar power being added, can be completed for producing such a supernatural effect; and not only can it produce any other intellection, but also, helped by a supernatural principle, it can by its proper power cooperate to elicit that intellection which is supernatural: indeed that cannot be effected by the light alone, unless also the intellect by its natural efficacy cooperates; otherwise, if the intellect by its native power contributed nothing of itself, some other instrument could be assumed: but any other thing, as iron for example, or water, which of itself can produce some quality or some being, is not for that reason to be elevated to produce any being whatsoever. First, because the primary power of such a thing does not regard being or a universal quality, but something particular determined, as heat; it regards heat as its per se and adequate effect. Then too, not every quality, nor every being, can by nature be elicited by iron or by water, just as every intellection is elicited by the power of the intellect. Therefore there is not the same efficacy in these things for being instruments of any effect whatsoever as there is in the intellect for being an instrument of any intellection whatsoever.[1127]

The same judgment is to be made about the will. But what some object, that from this opinion something follows that favors Pelagius, namely that our will, as a proper partial cause, concurs to supernatural acts, is indeed frivolous. For the errors of Pelagius are manifest, which we have exactly reported in disp. 98, c. 4. To affirm, however, that to acts of grace and to supernatural acts we cooperate on our part by our native and proper virtue - what has this in common with Pelagius, who did not even utter a word on this matter? Nay rather, the Catholic doctrine of the Council of Trent, Session 6, c. 5 and canon 4, is that the free choice of man cooperates by its liberty to the acts of grace, nor is it as an inanimate instrument: but liberty is the native power of our will, and the proper cause of consent, as consent, although insofar as it is of such an order it is from grace. This mixture, therefore, of proper efficacy and of grace in our works is most in accord with our faith. [11281129]

Finally, others argue thus. It is much more the case that the intellect is elevated by God to the vision of God and to supernatural acts than that heat as four should be elevated by God to produce heat as eight; but if heat were elevated in this way, it would in no way be the proper cause of heat as eight according to the excess: therefore likewise neither is the intellect in any way the proper cause of the vision of God. But this argument is easily dissolved: first, because the comparison is useless, in that heat as four cannot be elevated by God to produce the excess of heat as eight, as has already been sufficiently said; but our intellect can be elevated to see God by this alone, that the power which it has for understanding is completed by some supernatural principle: the comparison adduced in the argument is therefore useless. Then too, even if heat could be elevated in that way,

1127. See above, disp. 43, c. 4.
1128. See below, disp. 98, c. 4.
1129. Council of Trent, Session 6, c. 5; can. 4.

there would not be the same reasoning in both cases: for heat as four would not have an inchoate power to that excess, nor would that excess by nature require to be produced by heat as four; but the intellect certainly has from itself an inchoate power for understanding, so that the vision of God cannot be produced without the natural power of the intellect; and therefore the intellect is less distant from the vision in the ratio of acting than heat as four is from heat as eight.

But the arguments of the prior opinion have no difficulty. To the first and the third we say, that neither for the Incarnation can there be assumed an instrument physically concurring, nor the fire of hell for imprinting a quality in the demons, for the reason already stated, that we have universally disproved, namely that a thing cannot be assumed as a physical instrument which does not have of itself some prior operation, or an inchoate power to such an effect: but no creature has this for the Incarnation and the union of the divinity with the humanity, nor has fire for that quality. Add that that quality impressed upon the angels is fictitious, as we shall show below, disp. 242, c. 5; wherefore from it no argument can be drawn. In the same way we say to the second, namely that the words of the Priest in the consecration (and the same judgment must be made in general of any sacrament) do not operate physically to the transubstantiation, or to the effect of the sacrament, but only as moral instruments by way of impetration, for the same reason. And hence appears a solution to the third, namely that it implies a contradiction for something to be assumed as an instrument for creating, as was shown in cap. 3.[1130][1131]

Moreover, with regard to the second argument it must be observed that, even if the words of the consecration were physical instruments of the transubstantiation (which brings with it also other new difficulties, as will be seen in its proper place), still for no reason should it be said that those words operate physically the substance of the body and blood of Christ, as some confuse. First, because to defend the nature of true and proper transubstantiation this is altogether superfluous. For as it is defined in the Council of Trent, Session 13, c. 4, from the mere truth of the words true and proper transubstantiation is gathered: and therefore, since the mere truth of those words can suffice, even if the words did not physically produce the substance itself of the body of Christ, nevertheless they would be true: therefore there would be a true and proper transubstantiation. For if, the words being uttered, Christ were there, and at the same time bread were not, the words would be true: therefore without their producing the substance of the body of Christ, they could be true. Wherefore it seems superfluous to feign such physical efficacy of the words about the substance itself of the body. The words of the Council are: "Now since Christ our Redeemer said that to be truly his body which he offered under the appearance of bread, it has been the persuasion in the Church of God, and this holy Synod now again declares, that by the consecration of the bread and of the wine there is made a conversion of the whole substance of the bread into the substance of the body of Christ our Lord, and of the whole substance of the wine into the substance of his blood; which conversion is, by the holy Catholic Church, suitably and properly called transubstantiation." Who, moreover, would dare to assert that, for inferring the true transubstantiation, anything else is necessary besides that truth, which the Council sufficiently

1130. See below, disp. 242, c. 5.
1131. See above, this work, cap. 3.

gathers from it, and the Church has always gathered? With this argument I made use, in theological disputations fourteen years ago, so as to prove that for true transubstantiation a physical production of the substantial term, which by the nature of the thing is connected with the destruction of the bread, is not necessary: which various very acute and learned theologians, in order to defend the contrary opinion, afterwards tried to dissolve in various ways.

First they answer that the Church did not gather the transubstantiation from the sole virtue of the words, but also, as known, supposed that God effected this mystery in a mode most fitting to the truth of the words; and this was by a substantial action, whereby the term To which would be produced; wherefore also the Church gathers that the substance of the bread was destroyed, though the words could be true, if the substance of the bread remained separated from the accidents and placed in its own place: because it was not fitting that the substance of the bread be thus reserved, but altogether destroyed; and thus the Church did not gather from the mere truth of the words that the consecration had been made. I confess indeed that the Church supposes that the consecration is made in a fitting mode, so that the words be verified. But the fitting mode ought to be reckoned that which we posit: for if from this alone, that by the force of the words the body of Christ is under the species, and this presence is signified by these words, the bread is destroyed, the words obtain their truth; much more fitting will it be to assert that the conversion was made in this way: since this mode is much easier than to assert that the body of Christ is produced by such a substantial action, which by its very nature of itself entails the destruction of the bread; which manner of philosophizing, newly devised, contains insuperable difficulties; whereas that mode which is easier ought to be judged more fitting for this mystery.

Second, some answer, the Council ...[1132]

Second, some reply that the Council did not gather transubstantiation from the mere truth of the words, because to do so it would have had to suppose that those words could not be true if the substance of bread and of wine remained under the accidents - an assumption that is very weak; but that it gathered transubstantiation from the tradition of the Church, which, not by natural reasoning alone, but as divinely enlightened, understood that, because Christ in a true and proper sense said that what He was offering was His body, therefore at the same time He effected a conversion of one substance into another. But this solution can be refuted from the words of the Council cited, and it seems not to cohere with itself. For in the cited words it is said that the Church always had it as a persuasion for itself that transubstantiation takes place here from this, that Christ said His body truly to be what He was offering, and that now anew the Council itself defines the same; therefore, since the Council assigns as the cause of this mind of the Church the truth of the words, by no other reason did the Church have this as a persuasion for itself, unless because the words could not be true if the substance of bread and of wine remained there. Add that, if by this line of reasoning the Church could not be sufficiently induced so as to judge this, it could not have believed that transubstantiation takes place there from the fact that Christ said in a true and proper

1132. Council of Trent, Session 13, c. 4.

sense that what He was offering was His body and blood, as the aforesaid Doctors affirm; rather, it would have had to believe that from elsewhere. Therefore the aforesaid theologians in this solution are not sufficiently consistent with themselves.

Third, some respond that from the mere truth of the words the Council did not gather a substantial conversion, but a conversion of substances, which although it called transubstantiation, it did not call a substantial conversion. They say, moreover, that in this sacrament one must concede not only a conversion and transubstantiation, but also a substantial change, which cannot be understood without the production of the substance into which the conversion is made. Yet I for my part do not see by what reason the aforesaid theologians contend not only to defend in this sacrament a true conversion of one substance into another, which is properly called transubstantiation, but also to add another very difficult sort of substantial action by which the terminus of the conversion is produced; since no reason seems to require such an action in this sacrament. For although it were possible, still it should only be asserted to the extent that it were necessary for defending the true and proper conversion of one substance into another, which conversion is truly and properly called transubstantiation; for this must be taught thus by all, since it has been defined by the Church. But if true transubstantiation is rightly defended without such a substantial action, on what, I beg, will we found the devising of such a substantial action? Or what necessity could compel us to assert it, especially since such an action, if it were possible, could not be without a great miracle? Now miracles that are not necessary for defending the mystery of this sacrament ought not to be conceded; for in that case many others would be allowed to occur. Moreover, the Council from the mere truth of the words not only gathered that a conversion of one substance into another takes place, but also added that it is fittingly and properly called by the Church transubstantiation. Let us, then, be content with this alone, and reject all other things, even if they might somehow seem possible and could be defended in some way, as superfluous.

Fourth, some respond that the Council did not gather transubstantiation from a wholly speculative truth, but from a practical one, which effects what it signifies; but what is signified by these words is a true transubstantiation, which necessarily requires the production of the terminus to which. I indeed grant that the truth of these words is practical, and not merely speculative: not because practical truth is placed in anything other than speculative - for each, insofar as it is truth, formally consists in its enunciating that what is, is, which is wont to be called the conformity of words with the thing enunciated - but because practical has this peculiarity, that the words of enunciation also at the same time bring about in reality that which they signify, for which truth it suffices that, within the line of an integral utterance, the effect be posited; whereas speculative truth presupposes this. However, in order that the aforesaid words be true with practical truth, I do not see what else is required than that the body of Christ and the blood by the power of the words become present under the species in such a way that thereby the bread is destroyed; and if this suffices for the words to be true, it will assuredly be superfluous to assert that the body of Christ is there produced in reality; even if otherwise the words would produce it, if they did not find that

which is to be produced - of which in its place it will be said. Wherefore even the true account of transubstantiation, which is gathered from the mere truth of the words, ought to be granted, without the terminus to which thereof being produced.

Second reason. If the words physically effected the substance of the body of Christ, they would not effect anything other than that which they signify, and that which is said to be in the sacrament by force of the words; but this could not be the terminus of a physical production, because it would be necessary that it be a body with soul, and not dead; for the soul is there by concomitance; and the form of a corpse, if it were there, would in the same way be - therefore there would not be something that of itself could terminate the physical action and the production of the substance of the body of Christ. To this reason more recent authors reply in various ways; for us, however, it is enough to touch on them now; the rest we shall set forth more fully in its proper place, where we shall also impugn each solution.

Likewise, if it were so, the substance of the bread would not be expelled by the same words and by the same individual signification, nor would transubstantiation be asserted, nor that bread passes into the body. For by one part of the sentence the presence of the body of Christ would be signified, which could remain with the bread, and by another part the ceasing of the bread would be signified; but now by the same words and by the same individual signification the presence of the body of Christ is so signified that, by that very fact, without an expressed mention of the ceasing of the bread, the substance of the latter necessarily ceases; otherwise it would not be a true proposition. For the mode of effecting morally by mere signification is assimilated to the mode of effecting naturally; for a natural agent so induces a form that, by that very induction, it expels the contrary, and not in any other way. Wherefore we ought not to say that the terminus of transubstantiation is the presence itself, although this is required for transubstantiation, but [we ought to say that it is] the substance of the body and blood. For from that order of signification which we have explained it follows that we say: the bread passes into the body of Christ, because when the body of Christ is signified as present, by force of signification the bread is expelled.

Third reason. Either that production would be a continuation of the pre-existing being of Christ, as some assert - and it seems altogether superfluous - or it would be a new production, as some say, namely that the same thing can be produced twice and thrice in different places. And this is impossible: for although the same thing can be in different places by reason of different modes, as we shall say immediately, nevertheless a thing existing in two places does not have two substantial existences, nor [are they] substantially diverse; and therefore it cannot be produced by so many new productions, as will be treated more fully in its place.

I pass over that argument which is wont to be made against the aforesaid opinion, because from it there would follow that the same [thing] would produce itself: for the humanity of Christ would be the physical instrument of transubstantiation, as the aforesaid doctors admit, and it would produce itself; this argument, however, we shall pursue more fully in its own place.

But indeed, although it may seem aside from the matter, let us briefly explain the matter of transubstantiation which the Church maintains. For we have said that for it that substantial production is not necessary. Therefore transubstantiation is nothing else than an order between the ceasing substance of the bread or of the wine and the substance of the body and blood of Christ, inasmuch as the presence of the substance of the body and blood, not physically but by the force of the signification of the words (that is, so that the words be true), by that very fact that it is present, removes the substance of the bread and of the wine from the midst. And although, if either that [mode], or if this form existed in the consecration - namely, that here there be the body of Christ and that there be no bread - in reality the same effect would follow as regards the presence of the body of Christ and the destruction of the bread; nevertheless, because by the force of the presence, as of signification, the bread is expelled, [it suffices as said].

Moreover, from what has been said it follows that not every succession of substances deserves the name of transubstantiation, such as is [a succession] in the same place or under the same accidents, unless by force of the presence of one the other ceases; a thing which can be brought about only by the truth of the words. Otherwise there would be only a succession of substances, in which indeed one would not be said to pass into another; nor would it be called a substantial succession, wherein not only does one succeed another in any way whatsoever, but it succeeds substantially, that is, by the force of its presence it makes the other cease; for which reason also that which ceases is said to pass into the present [thing]. But of this more at large in its place.

From all these things I infer what pertains to our purpose: that transubstantiation is not creation, not because it passes from some positive terminus, but because creation is not a production of the terminus to which, whereas transubstantiation is not a production, but a certain order of one passing into another, as has been explained. But if it were a production of the whole entity according to matter and form and according to the whole existence of that [thing], I say first, in my judgment, that it would be creation, even if the terminus from which were something positive, namely the substance destroyed, because creation is produc...

A production of a thing according to its whole entity; and thus that phrase, "from nothing" (ex nihilo), which is set down in the definition of creation, would not be understood on the part of the terminus from which (terminus a quo); but "from nothing" would be the same as "not from some constituting principle," as Durandus, cited above in Disputation 173, chapter 3, used to say.[1133] Now however, since transubstantiation for another reason is not creation, we can well say that "from nothing" can be put for the terminus from which of creation. Then I say, even the terminus from which of creation would then be nothing, as will be explained below.

But someone will ask, if such a transubstantiation were effected, such that by the force of the production of the terminus to which (terminus ad quem) according to itself as a whole, the preceding substance, which is the terminus from which, would be destroyed - namely, when transubstantiation would be effected not into a thing previously existing, but into a thing then produced - would it then be true creation? For then there would be a production of the whole entity

1133. Durandus, Disputation 173, cap. 3.

according to itself; but "from something" on the part of the terminus from which, which would seem to take away the notion of creation. I answer: if such a transubstantiation could be, it would indeed be creation, and I would understand that phrase "from nothing," together with Durandus, not for the terminus from which, but for that which is "not from some constituting principle in any way whatsoever"; for a positive terminus from which would seem to stand in the way, such that that transubstantiation would not be creation, since it would be a production of the whole entity. But someone will say: if by the force of the production of one substance another were physically destroyed, the destruction of that other would not be annihilation, because it would not be into absolute nothing, but into "not-being of such a kind"; therefore, conversely, the production of the other would not be a production of entity simply, but of such-and-such an entity. I answer: therefore in that case the ceasing of one substance would not be annihilation, because its not-being would be causally conjoined with the being of the other substance, and thus it would not be nothing absolutely, but a not-being of such a kind; but truly the substance which would begin to be, and by the force of its production would destroy the other, would begin according to its whole existence, and therefore the production of that would be a production of entity simply, because it would be of the whole entity according to every substantial part of it - which properly belongs to the notion of creation: for that the terminus from which be nothing is required only to this extent, inasmuch as nothing of it remains in the composition of the terminus to which.

Moreover, I think that no such transubstantiation is possible: because I do not see what connection a production of being from itself and by its nature has with the destruction of another pre-existing substance according to itself as a whole, as I shall say more at large in its place; and I judge that the connection can only be on the part of the truth of the words so signifying one thing, that by this very fact another is destroyed - which connection indeed could not suffice for the thing that ceases to be the physical terminus from which of the production; for to this it would be necessary that with the ceasing of that, the inception of the other be naturally connected, and not only by the will of the One establishing the words: but then only would that positive terminus from which be said to be the terminus of transubstantiation, and of the order of one substance passing into another, in the account of the words; which transubstantiation formally would not be a production, although it would be conjoined to a production.

Wherefore, if by the truth of the words alone it were brought about that, upon one substance beginning under the accidents of another, that other should cease, and the substance beginning to be there were then produced according to its whole entity, we ought there to consider and distinguish two things. One is the order of one substance destroying another by its presence by force of the words; and this would be transubstantiation of the same kind as it now is, resting only upon the truth of the words, and not upon a physical opposition of substance to substance so as to destroy it. The other is creation, inasmuch as it would be a physical action producing the substance in the terminus to which, according to the whole entity; and to this we should assign for the terminus from which, nothing (nihil), because that production, inasmuch as it is a production according to the whole substance, would physically proceed from nothing, and not from that substance which would be said to be the terminus from which of the transubstantiation. For this

terminus from which would be only of the order of transubstantiation, inasmuch as it would correspond only to the truth of the words, and not to the physical production of the substance in the terminus to which. And now indeed in fact we must concede two things in transubstantiation. One is the conservation of the substance of the body of Christ; and this has physically for a terminus from which, nothing, and is by God alone: because God alone conserves the body of Christ from nothing, even as from a terminus, according to what was noted above in Disputation 173.[1134] The other is the order of two substances: and this has only by force of the words for a terminus from which the substance of bread; and thus we say, that from bread the Body of Christ is made, not because it is produced physically from it, but because by its presence it destroys the bread by the mere truth of the words. Let this be enough to have said here - more exactly indeed than the matter demands - for in its own place we shall treat these things more at large, so that from this at least we may understand the nature of creation. Whether the bread in the sacrament is annihilated will be explained there.

Finally, some object in this way. In a creature there is a potency which they call obediential, to receive some supernatural form, and in the same body, that, while remaining in itself entirely unaltered, it be in diverse places, and be referred to them; finally, that a soul inform a greater body than its nature could inform: therefore in any creature there will be this, that it be assumed as an instrument for creating, and for annihilating.

I answer, the case is altogether different. For a creature is a subject for receiving a supernatural form in such wise that its own natural potency concurs for receiving, nay rather, it is the first cause of receiving, and for receiving it is prior to the other, by a virtue because of which it is said to be made apt for receiving. For that it needs a supernatural agent infusing the form, this is not to be alleged so that it may be able to receive in its own genus; but it is to be alleged, that is, that it be perfected by the agent so as to be capable of it, to have that which it can receive of itself. For to receive is the proper act of matter; but efficiency does not correspond as a proper cause of the act of receiving, but of infusing, as we shall say below at Question 102, Question 113, Article 8. But a creature cannot be an instrument for that effect to which it neither supplies any beginning of efficacy, nor contributes of itself anything to its production, as has been proved.

Next, a body cannot be in two places, and be referred to diverse things, unless some change be made in it according to mode: for things remaining in the same manner cannot, by God's will alone, be mutually referred; therefore, when some body is constituted in diverse places, it receives in itself some mode of thus being disposed, from which it follows that it is in diverse places: but in an instrument no change can be made which is apt for such an effect, as has been proved.

Lastly, if a form can inform a greater matter, and a greater, it is necessary that that matter be disposed, so that the form be naturally united to it; otherwise, although it could be in the whole matter according to presence, it will not be able to be an informing: for informing must be by its own virtue, not by another's; because a form, for informing, is a first cause, nor can a form as an instrument be assumed for informing: for the kind of instrument belongs only among efficient

1134. See above, Disputation 173.

causes. But that a thing whatsoever be assumed as an instrument by an efficient cause, neither the effect nor the thing itself can be so fitted that by its own virtue at least in part it concur to it: therefore the account is far different.

Finally, to all these things it must be added: even if something could be assumed as an instrument for the physical act of creation, it could nowise be assumed as an instrument of annihilation. For, as St. Thomas very well noted in the Third Part, Question 13, Article - annihilation can only be brought about when the agent, previously conserving a thing, withdraws the influx by which the thing was sustained. And yet, although an agent could influence an effect by a mediating instrument, and thus by that medium create, nevertheless, since it would not withdraw the concurrence of the mediating instrument, but by itself, and by its own virtue and will alone would deny it, therefore for annihilating no instrument can be assumed.[1135]

On creation and its attribution to the divine persons

Articulus VI - Whether to create is proper to some person

To the sixth it proceeds thus. It seems that to create is proper to some person.

- For that which is prior is the cause of that which is posterior, and the perfect is the cause of the imperfect. But the procession of a divine person is prior to the procession of a creature, and more perfect, because a divine person proceeds in the perfect likeness of his principle, whereas the creature [proceeds] in an imperfect [likeness]. Therefore the processions of the divine persons are the cause of the procession of things. And thus to create is proper to a person.
- Moreover. The divine persons are not distinguished from one another except by their processions and relations. Whatever therefore is differently attributed to the divine persons, this agrees to them according to the processions of the persons and the relations. But the causality of creatures is attributed in a diverse mode to the divine persons. For in the Symbol of faith it is attributed to the Father that he is the creator of all things invisible and visible; but it is attributed to the Son that through him all things were made; and to the Holy Spirit, that he is Lord and life-giver. Therefore the causality of creatures agrees to the persons according to the processions and relations.
- Moreover. If it be said that the causality of the creature is considered according to some essential attribute which is appropriated to some person, this does not seem sufficient. For every divine effect is caused by every essential attribute, namely power, goodness, and wisdom; and thus it does not pertain more to one than to another. Therefore some determined mode of causality ought not to be attributed to one person more than to others, unless they were distinguished in creating according to the relations and processions.

1135. St. Thomas, Summa theologiae, III, q. 13, art., on annihilation as the withdrawal of conserving influx.

But on the contrary is what Dionysius says in the second chapter of On the Divine Names, that all the creatables are common to the whole divinity.[1136]

I answer that to create is properly to cause, that is, to produce the existence (esse) of things. But since every agent acts in likeness to itself, the principle of action can be considered from the effect of the action: for fire is that which generates fire. And therefore to create belongs to God according to his existence, which is his essence, which is common to the three persons. Whence to create is not proper as to a person, but is common to the whole Trinity. Yet, nevertheless, the divine persons according to the account of their procession have a certain causality with respect to the creation of things. For, as was shown above when it was being treated of God's knowledge and will, God is the cause of things through his intellect and will, just as an artisan is of artificial things. But the artisan works through the word conceived in the intellect, and through the love of his will as referred to something. Whence also God the Father fashioned the creature through his Word which is the Son, and through his Love which is the Holy Spirit; and according to this the processions of the persons are the reasons of the production of creatures, inasmuch as they include the essential attributes, which are knowledge and will.[1137]

Reply to the first: Therefore it must be said, that the processions of the divine persons are the cause of creation, as has been said.

Reply to the second: It must be said that, just as the divine nature, although it is common to the three persons, yet in a certain order befits them, inasmuch as the Son receives the divine nature from the Father, and the Holy Spirit from both; so also the power of creating, although it is common to the three persons, yet in a certain order befits them. For the Son has it from the Father, and the Holy Spirit from both. Whence "to be creator" is attributed to the Father, as to him who does not have the power of creating from another. But of the Son it is said, "through whom all things were made," inasmuch as he has the same power, but from another. For this preposition "through" is wont to denote a medial cause, or a principle from a principle. But to the Holy Spirit, who has the same power from both, it is attributed that, by ruling, he governs and vivifies the things that are created by the Father through the Son. There can also be taken a common reason for this attribution from the appropriation of the essential attributes. For, as was said above, power is attributed and appropriated to the Father, which is most manifest in creation, and therefore "to be creator" is attributed to the Father. But wisdom is appropriated to the Son, through which an agent works by intellect. And therefore it is said of...

It is said of the Son, "Through whom all things were made." But to the Holy Spirit there is appropriated goodness, to which it pertains to govern by leading things to their due ends, and to vivify: for life consists in a certain interior motion. Now the first mover is the end and goodness.

1136. Pseudo-Dionysius, De divinis nominibus, cap. 2.
1137. St. Thomas, Summa theologiae, I, qq. 14 and 19, esp. q. 19, a. 4.

Reply to the third: Although an effect of God proceeds from any of the attributes, nevertheless each effect is reduced to that attribute with which it has affinity according to its proper notion. Thus the ordering of things is reduced to wisdom, and the justification of the ungodly to mercy and to goodness diffusing itself superabundantly. But creation, which is the production of the very substance of a thing, is reduced to power (potency, *potentia*).

Confirmation of the doctrine of the article.

The conclusion of the article is, Creation is a common action of the whole Trinity. Moreover, it is a truth of faith defined in the Lateran Council under Innocent III, and it is reported in the chapter Firmiter, on the supreme Trinity and the Catholic faith, where the three persons are said to be consubstantial, coequal, and co-omnipotent; and thus that the essence of God is the principle of all things, according as it is found in the three.[1138] The same conclusion is clearly had in the Sixth Council of Toledo, cap. 1, and in the eleventh, in the confession of faith, and in the Letter of Agatho, which is in the Sixth Synod, action 4, and in action 17 it was received by the whole Council.[1138] It is also the common doctrine of the Fathers: Pseudo-Dionysius, On the Divine Names, and St. Augustine, book I On the Trinity, cap. 4 and 5, and frequently in other places. From which doctrine the axiom of the theologians flowed, The works of the Trinity ad extra are undivided. The reason, moreover, is manifest; for since omnipotence is a common and essential attribute, and since God works by the medium of intellect and will, as we have shown in Disputation 102, cap. 3; and since these are also common to all the persons, it follows that all concur to creation: for we suppose that which, against the Arians and Eunomians, we proved in Disputation 109 and Disputation 110, namely, that the three persons are substantial, and we take away the grades of "omnipotence, semipotence, and no power," which Abelard contrived out of his own brain: hence the aforesaid doctrine rightly follows. Wherefore, when the notion of "idea" is attributed to the Son of God, whereby the Father works, it is not to be understood so that the notion of idea belongs to Him alone, and power to the Father alone, but these things are to be understood by appropriation. And in this same way I would often understand the opinion of Henry,[1139] who otherwise plainly errs when he assigns to the Son the formal and proximate principle by which the Father operates, and to essential intellection the remote principle. In this same sense must also be explained those other Fathers who say that the eternal Word ministered to the Father in creation, or was His minister. In this manner the Apostles speak in the Apostolic Constitutions, book 5, cap. 19, near the end; Justin Martyr in the Dialogue with Trypho, where he calls the Son's works ministries; Clement of Alexandria, in the Exhortatory Oration to the Greeks, page 2, where he calls the Son the instrument of the Father; St. Cecilia in Metaphrastes, in her Life, when he asserts that the Father produced the Son that He might produce the rest, and the Holy Spirit that He might vivify all; Eusebius of

1138. Fourth Lateran Council (1215), cap. Firmiter, De summa Trinitate et fide Catholica; Sixth Council of Toledo, cap. 1; eleventh Council of Toledo, confessio fidei; Letter of Pope Agatho read in the Sixth Ecumenical Council (Third Council of Constantinople), actiones 4 and 17.

1138. Fourth Lateran Council (1215), cap. Firmiter, De summa Trinitate et fide Catholica; Sixth Council of Toledo, cap. 1; eleventh Council of Toledo, confessio fidei; Letter of Pope Agatho read in the Sixth Ecumenical Council (Third Council of Constantinople), actiones 4 and 17.

1139. Henry of Ghent, Quodlibet 6, a certain question, on the formal and proximate principle in the Son.

Caesarea, in book 9 of the Demonstratio Evangelica, cap. 5, and in the first book of the History, cap. 1. All which and the remaining testimonies of the Fathers I think ought to be understood by appropriation, as I noted above concerning the notion of idea which is attributed to the Son. But St. Basil, in the book On the Holy Spirit, cap. 8, explains in another sense how the Son receives from the Father the power of creating, namely, not as a servant and subject, but by reason of origin, whereby He receives the same nature from the Father. And in that manner of speaking by which it is said that the Father made all things "through the Son," he says is denoted that the Father is the principal cause, that is, such that as from an origin and fountain the Son has all things. In the same way Athanasius understood it in Sermon 3 against the Arians, about the middle. So too must we interpret those Fathers who attribute to God the Father "to command," and to the Son "to do": so St. Gregory of Nyssa, in the book On the Trinity against the Jews; St. Jerome, on that of Amos 6, "For behold the Lord has commanded"; St. Cyril of Jerusalem, Catechesis 6 and Catechesis 11, near the end: to the same also looks Lactantius, book 4 of the Divine Institutions, cap. 6, at the end, when he concludes, from the philosophers Trismegistus and the Sibyls, that God the Father made use of the Son as counselor and of means by which the world might be fashioned.[1140]

Articulus VII - Whether in creatures it is necessary to find a vestige of the Trinity

It is argued to the contrary. It seems that in creatures it is not necessary to find a vestige of the Trinity. For by its own vestiges each thing can be investigated; but the Trinity of persons cannot be investigated from creatures, as was said above. Therefore the vestiges of the Trinity are not in the creature.

1. Further, whatever is in the creature is created. If therefore the vestige of the Trinity is found in the creature according to some of its properties, and every created thing has a vestige of the Trinity, it is necessary that in each one of those there be found also the vestige of the Trinity. And thus to infinity.
2. Further, an effect represents only its cause. But the causality of creatures pertains to the common nature, and not to the relations by which the persons are distinguished and numbered. Therefore in the creature there is not found a vestige of the Trinity, but only of the unity of the essence.

But on the contrary: St. Augustine says in book six On the Trinity, that the vestige of the Trinity appears in creatures.[1141]

I answer: Every effect in some way represents its cause, but diversely. For some effect represents only the causality of the cause, and not its form, as smoke represents fire; and such a representation is called the representation of a vestige. Now a vestige shows the motion of

1140. Apostolic Constitutions V.19; Justin Martyr, Dialogus cum Tryphone; Clement of Alexandria, Protrepticus (Oratio exhortatoria ad gentes); the Life of St. Cecilia in Symeon Metaphrastes; Eusebius of Caesarea, Demonstratio Evangelica IX.5 and Historia Ecclesiastica I.1; Basil, De Spiritu Sancto c. 8; Athanasius, Contra Arianos, sermo 3; Gregory of Nyssa, De Trinitate adversus Iudaeos; Jerome on Amos 6; Cyril of Jerusalem, Catecheses 6 and 11; Lactantius, Divinae Institutiones IV.6, concluding from Hermes Trismegistus and the Sibyls.

something passing by, but not what it is like. But some effect represents the cause as to the likeness of its form, as a generated fire represents the generating fire, and the statue of Mercury represents Mercury; and this is the representation of an image. Now the processions of the divine persons are attended according to the acts of the intellect and will, as was said above. For the Son proceeds as the word of the intellect; the Holy Spirit as the love of the will.

Therefore in rational creatures, in which there is intellect and will, there is found the representation of the Trinity by way of image, inasmuch as in them there is found a conceived word and a proceeding love. But in all creatures there is found the representation of the Trinity by way of vestige, inasmuch as in each creature there are found certain things which it is necessary to reduce to the divine persons as to their cause. For every creature subsists in its existence (existence, *esse*), and has a form by which it is determined to species, and has an order to something else. Accordingly, inasmuch as it is a certain created substance, it represents a cause and principle; and thus it shows the person of the Father, who is a principle not from a principle. Inasmuch as it has a certain form and species, it represents the Word, according to which the form of the work of art is from the conception of the artisan. But inasmuch as it has order, it represents the Holy Spirit, inasmuch as He is love: because the order of an effect to something else is from the will of the creator. And therefore Augustine says, in book six On the Trinity, that the vestige of the Trinity is found in each creature, according as it is one thing, and according as it is formed by some species, and according as it holds some order. And to these also are reduced those three - number, weight, and measure - which are set down in Wisdom 11. For measure is referred to the substance of the thing limited by its principles, number to species, weight to order. And to these three are reduced those other three which Augustine sets down, mode, species, and order. And those which he sets down in the book 83 Questions - what stands, what is discerned, what accords. For something "stands" by its substance, is "discerned" by its form, "accords" by its order. And in the same way what things soever are thus said can easily be reduced.[1142]

Reply to the first: The representation of a vestige is attended according to appropriation; in which manner from creatures one can come to the Trinity of the divine persons, as was said.

Reply to the second: A creature is a thing properly subsisting (subsistence, *subsistentia*), in which it is that those three be found; nor is it necessary that in any of those things which are in it these three be found, but according to them the vestige is attributed to the subsisting thing.

Reply to the third: Also the processions of the persons are in some manner the cause and reason of creation, as was said.

The conclusion is affirmative, which the Holy Doctor (St. Thomas) unfolds at length according to the mind of Augustine.

1141. Augustine, De Trinitate VI.
1142. Wisdom 11:21; Augustine, De natura boni (on mode, species, order); Augustine, 83 Quaestiones, q. 18.

Articulus VIII - Whether creation is admitted in the works of nature and of art

The eighth proceeds thus. It seems that creation is admitted in the works of nature and of art. For in every operation of nature and of art some form is produced. But it is not produced from anything, since matter does not have a part of itself; therefore it is produced from nothing. And thus in every operation of nature and of art there is creation.

1. Further, an effect is not prior to its cause; but in natural things there is not found anything acting except an accidental form, which is an active or passive form. Therefore by the operation of nature a substantial form is not produced. It remains therefore that it be by creation.
2. Further, nature makes what is like itself. But some things are found to be generated in nature not by something like themselves, as is evident in animals generated by putrefaction. Therefore their form is not from nature but from creation. And the same reason holds for others.
3. Further, what is not created is not a creature. If therefore in those things which are from nature creation be not adjoined, it follows that those things which are from nature are not creatures. Which is heretical.

But on the contrary is what Augustine says upon Genesis according to the letter, that he distinguishes the work of propagation, which is the work of nature, from the work of creation.[1143]

I answer that it must be said, that this doubt is introduced on account of the forms, which certain men posited not to begin by the action of nature, but previously to have existed in matter, positing a "latency of forms." And this befell them from ignorance of matter, because they did not know how to distinguish between potency (potency, *potentia*) and act (act, *actus*). For because forms pre-exist in matter in potency, they posited them to pre-exist simply in act. But others granted that forms are given by a separate cause in the manner of creation. And according to this they adjoin creation to every operation of nature. But this hap -

I answer that this happened to them from ignorance of form, for they did not consider that the natural form of a body is not subsistent, but is that by which a thing is what it is. And therefore, since to be made and to be created properly belong only to a subsistent thing, as was said above, it is not proper to forms to be made, nor to be created, but they are made together with [the composite]. But that which is made properly by a natural agent is the composite, which is made from matter. Hence in the works of nature creation is not mixed in, but something is presupposed for the operation of nature.

Reply to the first: Forms begin to be in act when the composites are made - not that they themselves come to be per se, but only per accidens.

1143. Augustine, De Genesi ad litteram, where he distinguishes the opus propagationis (nature) from the opus creationis.

Reply to the second: Active qualities in nature act by the power of substantial forms; and therefore a natural agent produces not only a like to itself according to quality, but according to species.

Reply to the third: For the generation of imperfect animals the universal agent suffices, which is the power of the heavens, to which they are assimilated not according to species but according to a certain analogy. Nor is it necessary to say that their forms are created by a separate agent. But for the generation of perfect animals the universal agent does not suffice; rather a proper agent is required, which is a univocal generator.

Reply to the fourth: The operation of nature is only from a presupposition of created principles, and thus the things which are done by nature are called creatures.

Conclusion: Natural and artificial forms are not said to be produced by creation, but to be created together with [the composite]; thus in the works of nature creation is not mixed in, but is presupposed. St. Thomas understands the conclusion concerning forms other than the rational, about which enough has been said by us in disputation 173, chapters 2 and 3.

Quaestio XLVI - On the principle of the duration of created things

Consequently it must be considered concerning the principle of the duration of created things. And about this three things are asked.

Articulus I - Whether the universe of creatures has existed always

Objection 1. It seems that the universe of creatures, which is now called by the name "world," did not begin, but has been from eternity. For whatever begins to be, before it was, it was possible for it to be; otherwise it would have been impossible for it to come to be. If therefore the world began to be, before it began it was possible for it to be. But what is possible to be is matter, which is in potency (potency, potentia) to being, which is through form; and to non-being, which is through privation. If therefore the world began to be, before the world there was matter. But matter cannot be without form. But the matter of the world with form is the world. Therefore the world was before it began to be. Which is impossible.

Objection 2. Further, nothing which has the power to be always is at one time and is not at another time; because as far as the power of a thing extends, so long it is. But every incorruptible thing has the power to be always; for it does not have the power for a determined time of duration. Therefore nothing incorruptible is at one time and is not at another. But whatever begins to be, at one time is and at another time is not. Therefore no incorruptible begins to be. But there are many incorruptibles in the world, as the celestial bodies and all intellectual substances. Therefore the world did not begin to be.

Objection 3. Further, nothing ungenerated begins to be. But the Philosopher says in Physics I that matter is ungenerated; and in On the Heavens and the World I that the heaven is ungenerated. Therefore the universe of things does not begin to be.

Objection 4. Further, a vacuum is where there is no body, but it is possible for it to be. But if the world began to be where now the body of the world is, previously there was no body, and yet one could have been there; otherwise now there would not be one there. Therefore before the world there was a vacuum. Which is impossible.

Objection 5. Further, nothing begins to be moved anew except because the mover and the mobile are disposed otherwise now than before. But that which is otherwise disposed now than before, is moved. Therefore before every motion beginning anew, there was some motion. Therefore motion always existed. Therefore also a mobile: because motion is only in a mobile.

Objection 6. Further, every mover is either natural or voluntary; but neither begins to move unless some motion pre-exists. For nature always operates in the same way; hence unless some change precedes either in the nature of the mover or in the mobile, there will not begin to be from a natural mover a motion which was not before. But the will, without a change in itself, delays to do what it intends; but this is not except by some change which is imagined at least on the part of time itself. For as one who wishes to build a house tomorrow and not today awaits something that will be tomorrow which is not today; and at least he awaits that the day of today pass and tomorrow come - which is not without change, because time is the number of motion. It remains therefore that before every motion beginning anew there was another motion. And thus the same as before.

Objection 7. Further, whatever is always in the beginning and always in the end can neither cease nor begin. For what begins is not in its beginning; and what ceases is not in its end. But time is always in its beginning and end; because there is nothing of time except the now, which is the end of the past and the beginning of the future. Therefore time can neither begin nor cease; and consequently neither can motion, whose number time is.

Objection 8. Further, God is prior to the world either by nature only or also by duration. If by nature only, then since God is from eternity, the world is from eternity. But if He is prior by duration, the before and after in duration constitute time. Therefore before the world there was time. Which is impossible.

Objection 9. Further, when a sufficient cause is posited, the effect is posited. For a cause to which the effect does not follow is an imperfect cause, needing another in order that the effect follow. But God is the sufficient cause of the world - final by reason of His goodness, exemplary by reason of His wisdom, and efficient by reason of His power, as is clear from the foregoing.[1144] Since therefore God is from eternity, the world is from eternity.

Objection 10. Further, whose action is eternal, its effect is eternal. But the action of God is His substance, which is eternal. Therefore the world also is eternal.

1144. Q.44, a.3 - 4.

But on the contrary: It is said in John 17: "Glorify me, Father, with thyself, with the glory which I had before the world was made." And Proverbs 8: "The Lord possessed me in the beginning of his ways, before he made anything from the beginning."

I answer that it must be said that nothing besides God could have been from eternity. And to posit this is not impossible. For it was shown above that the will (will, voluntas) of God is the cause of things. Thus therefore some things must be, as it is necessary that God will them; since the necessity of the effect depends on the necessity of the cause, as is said in Metaphysics V.

But it was shown above that, absolutely speaking, it is not necessary that God will anything except Himself. Therefore it is not necessary that God will that the world be always; but there is only this necessity about the being of the world, inasmuch as God wills it to be, since the being of the world depends on the will of God as on its cause. It is not therefore necessary that the world always be. Whence neither can it be proved demonstratively. Nor are the arguments which Aristotle brings for this demonstrative simply, but only in a certain respect, namely, for contradicting the reasonings of the ancients who posited that the world begins according to certain modes impossible in truth. And this appears from three things. First, because both in Physics VIII and in On the Heavens I he allows certain opinions, as those of Anaxagoras, Empedocles, and Plato, against whom he introduces contradictory arguments. Second, because wherever he speaks about this matter he adduces the testimonies of the ancients - which is not the way of one demonstrating, but of one persuading probably. Third, because he expressly says in Topics I that there are certain dialectical problems, about which we do not have demonstrations, for instance, whether the world is eternal.

Reply to the first: Before the world existed, it was possible for the world to exist - not indeed according to passive potency, which is matter, but according to the active potency of God; and also according as something is said to be absolutely possible, not according to some potency, but from the mere habitude of terms which are not repugnant to each other; in which sense the possible is opposed to the impossible, as is clear from the Philosopher in Metaphysics V.

Reply to the second: That which has the power to be always has that power from this, not that it is at one time and is not at another; but before it had that power, it was not. Hence the argument which is set down by Aristotle in On the Heavens I does not conclude simply that incorruptibles did not begin to be, but that they did not begin to be according to the natural mode by which generable and corruptible things begin to be.

Reply to the third: Aristotle in Physics I proves that matter is ungenerated by this, that it does not have a subject which is in first act; and in On the Heavens and the World he proves that the heaven is ungenerated by this, that it does not have a contrary from which it is generated. Hence it is clear that by both it is concluded only that matter and the heaven did not begin by generation, as some asserted, especially concerning the heaven. But we say that matter and the heaven were brought into being by creation, as is clear from what has been said.

Reply to the fourth: For the notion of a vacuum it does not suffice that there be nothing there; but it is required that there be a space capable of a body in which there is no body, as is clear from Aristotle in Physics IV. But we say that before the world there was neither place nor space.

Reply to the fifth: The first motion always was disposed in the same way; but the first mobile was not always disposed in the same way, for it began to be when previously it had not been. But this was not through change, but through creation, which is not a change, as was said above. Hence it is clear that this argument which Aristotle sets down in Physics VIII proceeds against those who posited that the mobiles alternated, but that motion was not eternal, as is clear from the opinions of Anaxagoras and Empedocles. But we hold that, once mobiles began, there was always motion.

Reply to the sixth: The first agent is a voluntary agent. And although it has an eternal will of producing some effect, nevertheless it did not produce an eternal effect. Nor is it necessary that any change be presupposed which is on account of the imagination of time.

Reply to the seventh: As it is said in Physics IV, "before and after" are in time according as "before and after" are in motion. Hence beginning and end must be taken in time just as in motion. But if the eternity of motion is supposed, it is necessary that any moment taken in motion be the beginning and the end of motion - which is not necessary if motion begins. And the same reasoning holds of the "now" of time. And thus it is clear that that argument, about the instant "now" always being the beginning and the end of time, presupposes the eternity of time and of motion. Hence Aristotle adduces this reasoning in Physics VIII against those who posited the eternity of time, but denied the eternity of motion.[1145]

Reply to the eighth: God is prior to the world in duration. But "prior" does not designate priority of time, but of eternity. Or it must be said that it designates the eternity of imagined time, and not of time really existing; just as, when it is said "above the heaven there is nothing," "above" designates only an imagined place, according as it is possible to imagine other dimensions superadded to the dimensions of the celestial body.

Reply to the ninth: Just as the effect proceeds from a natural agent according to the mode of its form (*forma*), so it proceeds from an agent by will according to the form preconcept and determined by that agent, as is clear from what was said above. Therefore, although God from eternity was a sufficient cause of the world, it is not necessary to posit that the world was produced by Him except according as it is in the predestination of His will, namely, that it have existence (*esse*) after not-existing, in order more manifestly to declare its author.

Reply to the tenth: Once the action is posited, the effect follows according to the exigency of the form which is the principle of the action. Now in agents by will, what is conceived as predetermined is taken as a form which is the principle of the action. From the eternal action, therefore, of God there does not follow an eternal effect, but such an effect as God willed, namely, that it have existence after not-existing.

Conclusion: Nothing besides God has been from eternity.

1145. Aristotle, Physics VIII, text 10 (tom. 20).

Articulus II - Whether the world's having begun is an article of faith

It is asked thus. It seems that the world's having begun is not an article of faith, but a demonstrable conclusion.

1) For every made thing has a beginning of its duration. But it can be proved demonstratively that God is the efficient cause of the world; and the more probable philosophers posited this. Therefore it can be proved demonstratively that the world began.

2) Further, if it is necessary to say that the world was made by God, then either from nothing or from something. But not from something; for thus the matter of the world would have preceded the world - which is contrary to the arguments which Aristotle sets down, who posits the heaven to be ungenerated.[1146] Therefore it must be said that the world was made from nothing. And thus it has existence after non-existence. Therefore it must be that its existence began.

3) Further, everything that works through intellect works from some principle, as is clear in all artificial things. But God is an agent through intellect. Therefore He works from some principle. Therefore the world, which is His effect, was not always.

4) Further, it is manifest that certain arts and the habitations of regions began at determinate times. But this would not be the case if the world had always been. Therefore it is manifest that the world was not always.

5) Further, it is certain that nothing can be equated to God. But if the world had always been, it would be equated to God in duration. Therefore it is certain that the world has not always been.

6) Further, if the world had always been, infinitely many days would have preceded this day. But the infinite cannot be traversed. Therefore we would never have come to this day - which is manifestly false.

7) Further, if the world was eternal, generation also was from eternity. Therefore one man was begotten from another to infinity. But the father is the efficient cause of the son, as is said in Physics II. Therefore in efficient causes there is a proceeding to infinity - which is disproved in Metaphysics II.

8) Further, if the world and generation were always, infinitely many men would have preceded. But the soul of man is immortal. Therefore infinitely many human souls would now exist in act. But this is impossible. Therefore it can be known of necessity that the world began, and is not held by faith alone.

But on the contrary: The articles of faith cannot be proved demonstratively; because faith is of things not appearing, as is said to the Hebrews 11. But that God is the creator of the world, in such wise that the world began to exist, is an article of faith. For we say, "I believe in one God," etc. And again St. Gregory says in Homily 1 on Ezekiel, that Moses prophesied of the past, saying, "In the

1146. Aristotle, On the Heavens I, text 20; cf. "De Caelo" and "De Mundo" loci cited in the margin.

beginning God created heaven and earth"; in which the newness of the world is handed down. Therefore the newness of the world is had only through revelation. And so it cannot be proved demonstratively.[1147]

I answer: That the world has not always existed is held by faith alone, and cannot be proved demonstratively; just as was said above concerning the mystery of the Trinity. The reason of this is that the newness of the world cannot receive a demonstration on the part of the world itself. For the principle of demonstration is the "what-it-is" (quidditative account). But each thing, according to the intelligible account of its species, abstracts from "here and now"; wherefore it is said that universals are everywhere and always. Hence it cannot be demonstrated that man, or the heaven, or a stone, has not always been. Likewise neither on the part of the efficient cause, which acts by will. For the will (*voluntas*) of God cannot be investigated by reason, except as regards those things which it is absolutely necessary that God will. But such are not the things which He wills concerning creatures, as was said. The divine will, however, can be manifested to man by revelation, upon which faith rests. Hence that the world began is a thing to be believed, not to be demonstrated or known scientifically. And it is useful to note this, lest perhaps someone, thinking himself able to demonstrate that the world began, bring forward non-necessary arguments, which furnish unbelievers with matter for deriding us as though by such arguments we were compelled to believe what is false.

Reply to the first: As St. Augustine says in the City of God XI, some of the philosophers who posited the eternity of the world nevertheless asserted that the world was made by God - some saying that He made it from pre-existing things, as an artisan from matter; others that He made it from nothing. And according to this latter position, it would not be incongruous to say that the world always existed, for "made" is said not only of what begins now to be, but of whatever in any way has being from another. And thus, even if the world had always been, its being would nevertheless be from God. Therefore the major premiss is not simply true if "made" is taken to mean "that which has being from a maker."

Reply to the second: We grant that the world was made from nothing - not so that it was "after nothing," as if nothing were a prior subject, but so that it was made with no thing presupposed. For the creation by which the world was produced is not a successive change, as was said above.

Reply to the third: That is the reasoning of Anaxagoras which he sets down in Physics III;[1148] but it does not conclude of necessity, except concerning an intellect which, by deliberating, investigates what it should do - and such inquiry is like motion. Such indeed is the human intellect, but not the divine, as was said above.

Reply to the fourth: Those who posited the eternity of the world say that some regions, over an infinite time, have been changed from being uninhabitable to being habitable, and conversely. Likewise they posit that the arts, on account of various corruptions and accidents, have infinitely

1147. Hebrews 11:1; "Credo in unum Deum" (Symbol); St. Gregory, Homily 1 on Ezekiel: "In principio creavit Deus caelum et terram."

1148. Aristotle, Physics III, where the argument of Anaxagoras concerning acting "from a principle" is reported.

often perished and have again been corrupted. Hence Aristotle says in the Meteorologica that it is ridiculous, from such particular changes, to form an opinion concerning the newness of the whole world.[1149]

Reply to the fifth: If the world had always existed, it would not thereby be equated to God in duration. For, as Boethius says, eternity is "the total, simultaneous, and perfect possession of interminable life," whereas temporal duration is successive. Therefore there is not the same ratio of duration, and so no equality.[1150]

Reply to the sixth: To "traverse the infinite" is necessary if one must pass from one extreme to the other through all the intermediates. But in the present case no such traversal is required if motion or time were without beginning. And the same reasoning applies to the now of time. Thus it is clear that the argument from the instant "now," that it is always the beginning and end of time, presupposes the eternity of time and motion; and so also the cavil about "passing through infinite days" proceeds as if there were a first day set as one extreme. Since there is no such first extreme, it does not follow that an infinite has been traversed.

Reply to the seventh: In efficient causes there is no proceeding to infinity per se - for example, if all were simultaneously and essentially ordered to one effect. But the series of fathers and sons proceeds per accidens, since individuals of this kind are generable and corruptible and do not remain simultaneously. Therefore an infinite series per accidens is not repugnant.

Reply to the eighth: Those philosophers who posited the eternity of the world denied that the human soul remains after the body; or some posited one single intellect for all men. Hence their position did not require that there be infinitely many human souls existing in act at once.[1151]

For the divine will cannot be investigated by natural reason except about those things which it is absolutely necessary that God should will. But such are not the things which He wills concerning creatures, as has been said. Yet the divine will can be made manifest to man by revelation, on which faith rests. Hence that the world began is a matter to be believed, not, however, demonstrable or knowable. And it is useful that this be considered, lest perhaps someone, presuming to demonstrate what pertains to faith, should bring forward non-necessary arguments which furnish matter for derision to unbelievers, who think that we believe on account of such arguments those things which are of faith.

Reply to the first: As St. Augustine says, XI On the City of God, the philosophers who posited the eternity of the world held a twofold opinion. Some indeed asserted that the substance of the world is uncreated by God; and this is an intelligible error, and so is easily refuted. But others posited the world to be eternal in such a way that nevertheless they said the world was made by God. For they did not wish the world to have a beginning of time, but a beginning of its creation, so that in a certain scarcely intelligible way it was always being made. And how they understand this, they have set forth, as Augustine relates in the same book of the City of God. For, as they say: if a

1149. Aristotle, Meteorologica (the "lib. Meteor." cited in the margin).

1150. Boethius, De consolatione philosophiae V, prose 6: eternity as the "tota simul" possession of interminable life.

1151. On ancient denials of personal immortality and theories of a single intellect: cf. positions alluded to by St. Augustine, De Civitate Dei XI.

foot had always been in dust from eternity, there would always be a footprint, which no one would doubt to have been made by the foot; so too, if the world has always existed, it has always existed with the one existing who made it. And this is to be understood by considering that an efficient cause which acts through motion of necessity precedes in time its effect, because an effect is only between the termini of an action; but every agent must be the principle of its action. If, however, the action be instantaneous and not successive, it is not necessary that the agent be prior in duration to the effect, as is clear in illumination. Hence they say that it does not follow of necessity, if God is the active cause of the world, that He should be prior to the world in duration, because the creation which He produced is not a successive change, as was said above.

Reply to the second: Those who posited the eternity of the world said that the world was made by God from nothing - not that it was made after nothing in the sense in which we understand by the name of creation, but because it was not made from anything. And thus some also do not refuse to use the name of creation, as is clear from Avicenna in his Metaphysics, book XII.[1152]

Reply to the third: That is the argument of Anaxagoras which is set down in the third book of the Physics. But it does not conclude of necessity, except concerning an intellect that, by deliberating, inquires what ought to be done, which is like to motion. Such indeed is the human intellect, but not the divine, as is clear from what has been said above.[1153]

Reply to the fourth: Those who posit the eternity of the world also posit that some region has been changed infinitely from uninhabitable to habitable and conversely. And similarly they posit that the arts, on account of diverse corruptions and incidental events, have been invented infinitely many times and again lost. Hence Aristotle says in the book of the Meteorologica that it is ridiculous from such particular changes to take up an opinion about the newness of the whole world.[1154]

Reply to the fifth: Even if the world had always existed, nevertheless it would not be equated to God in eternity, as Boethius says at the end of the De consolatione, because the divine existence is "the whole simultaneously" without any succession; not so that of the world.[1155]

Reply to the sixth: A transit is always understood from one terminus to another. But whatever past day is marked off, from that to this present day there are finite days that can have been passed through. The objection proceeds as if, the extremes being posited, there were infinite intermediates.

Reply to the seventh: In efficient causes it is impossible to proceed to infinity per se; for example, if a cause which is required per se for some effect were multiplied to infinity. Thus, if a stone were moved by a stick, and the stick by the hand, and so on to infinity. But to proceed to infinity per accidens in efficient causes is not judged impossible. For example, all causes which are multiplied to infinity do not retain any order except to one cause, but their multiplication is per accidens. Thus an artisan works by many hammers per accidens, because one after another is

1152. Avicenna, Metaphysics XII.

1155. Boethius, De consolatione philosophiae V, prose 6.

broken. Thus it happens per accidens that this hammer acts after the action of another hammer. And similarly it happens to this man, insofar as he generates, that he be begotten by another. For he generates insofar as he is a man, and not insofar as he is the son of another man. For all generating men have one degree in efficient causes, namely the degree of a particular generator. Hence it is not impossible that man be generated by man to infinity. But it would be impossible that the generation of this man should depend on this man, and on the elementary body, and on the sun, and so on to infinity.

Reply to the eighth: Those who posit the eternity of the world avoid this argument in many ways. For some do not deem it impossible that there be actually infinite souls, as is clear in the Metaphysics of Algazel, who says this is an empty assertion. But this has been refuted above. Others say that the soul is corrupted with the body. Others, that of all souls there remains one only. Others again, as St. Augustine says, posited because of this the circuit of souls, namely, that souls separated from bodies after determined periods of times return again to bodies. About all which there is to be treated in what follows. It must be considered, however, that this is a particular argument. Hence one could say that the world was eternal, or at least that some creature, as an angel, was from eternity, but not man. We, however, intend universally whether any creature was from eternity.

Conclusion: That the world began in time is established solely by divine faith.

Articulus III - That the creation of things was in the beginning of time

To the third we proceed thus. It seems that the creation of things was not in the beginning of time.

1) For what is not in time is not in any part of time. But the creation of things was not in time; for by the creation of things their substance was brought into existence. Now time does not measure the substance of things, and especially of incorporeal things. Therefore creation was not in the beginning of time.

2) Further, the Philosopher proves that everything which becomes, becomes in time; and so it has a before and an after. But at the beginning of time, since it is indivisible, there is no before and after. Therefore, since to be created is a certain becoming, it seems that things were not created in the beginning of time.

3) Further, time itself was created. But time cannot be created in the beginning of time, since time is divisible, whereas the beginning of time is indivisible. Therefore the creation of things was not in the beginning of time.

But on the contrary: Genesis says, "In the beginning God created heaven and earth."

I answer: That word of Genesis 1, "In the beginning God created," is expounded in three ways, to exclude three errors. For some posited that the world always was, and that time has no beginning; and to exclude this it is expounded: "In the beginning," namely of time. Others posited two principles of creation, one of goods and another of evils; and to exclude this it is expounded: "In

the beginning," that is, in the Son. For just as the principle of an effect is appropriated to the Father on account of power, so the exemplary principle is appropriated to the Son on account of wisdom; so that, as it is said, "Thou hast made all things in wisdom," so it may be understood that God made all things "in the beginning," that is, in the Son, according to that of the Apostle to the Colossians: "In Him," namely in the Son, "were all things created."[1156] Others said that corporeal things were created by God by means of spiritual creatures; and to exclude this it is expounded: "In the beginning God created heaven and earth," that is, before all things. For four are said to have been created together, namely the empyrean heaven, corporeal matter, which is understood by the name "earth," time, and the angelic nature.

Reply to the first: Things are not said to be created "in the beginning of time" as if the beginning of time were the measure of creation; but because simultaneously with time the heaven and the earth were created.

Reply to the second: That statement of the Philosopher is to be understood about a becoming which is through motion, or which is the terminus of motion. For in every motion there is to be taken a before and an after, before any sign marked in the motion - since, namely, something is in being moved, and becoming; and there is to be taken something before it, and also something after it. For that which is in the beginning of a motion, or at its terminus, is not in being moved. But creation is neither motion nor the terminus of motion, as was said above. Hence it can be that something is created which was not previously being created.

Reply to the third: Nothing is except according as it is. But of time there is nothing except the now. Hence it cannot begin except according to some now. Not that in the very first now there is time, but because from it time begins.

Conclusion: The conclusion is affirmative, which St. Thomas proves from that first of Genesis: "In the beginning God created," etc. Moreover, the doctrine of all these articles is to be examined more deeply in the following disputation.

Disputatio CLXXVII - Whether the world could have been from eternity

- The world to have begun at the beginning of time is what the Catholic faith teaches. Caput I.
- That no creature, even a permanent and incorruptible one, could have begun from eternity, was the view of Albert and others. Caput II.
- That a permanent creature, even if corruptible, yet, apart from the corruption itself, could have existed from eternity, the more probable opinion holds. Caput III.
- About the eternity of motion and of generations, whether it is possible, the Scholastics have taught variously. Caput IV.
- That this universe, apart from substantial and accidental generations, with respect to all other things, could have been from eternity, is the more probable opinion. Caput V.

1156. Colossians 1:16; cf. "Omnia in sapientia fecisti" (Ps 104[103]:24).

Caput I - The Catholic faith teaches that the world began at the beginning of time

Concerning the beginning and the duration of this universe of things, the ancient philosophers did not have the same opinion. For many, as Aristotle relates, Physics VIII, chapter 1, and On the Heavens I, chapter 10, and Metaphysics XII, chapter 6, whom he himself follows, said that the world was from eternity in the same mode; but many more thought that it at some time began, as Aristotle himself attests in On the Heavens I, text 102. But among the heretics no one to date has taught that the world lacked a beginning of duration; although some have posited matter coeternal with God, whom we have recalled in Question 44, article 2. Moreover, the Catholic faith holds that, in the beginning of time or of duration, God created all things, as is clear from that of Genesis: "In the beginning God created heaven and earth," etc.; wherein, first, by the particle "In the beginning," the beginning of time is signified, as we have noted elsewhere.

Caput II - Whether a creature could have been from eternity

The same truth is declared in Proverbs 8: "The Lord possessed me in the beginning of his ways, before he made anything"; and in John 17: "Glorify me, Father, with thyself, with the glory which I had with thee before the world was made"; and in Ephesians 1: "He chose us in him before the foundation of the world." And the same is defined in the chapter Firmiter on the supreme Trinity and the Catholic faith.[1157]

It can be confirmed as follows. Since all the reasons that seem to prove that the world was from eternity are frivolous, as our Benedict Pererius rightly shows in book 15 On the Principles of Natural Things; and since, on the other hand, almost all the nations of the world believe that the world had a beginning of duration, even according to right philosophy this ought to be certain for us.[1158]

Albert and others held that no creature, even a permanent one and an incorruptible one, could have begun from eternity.

Moreover, among the Scholastics and Christian philosophers it is controverted whether it is proved by sufficient reason that the world could not have been from eternity, or whether it is established for us only by faith and revelation that it was not eternal. In this controversy the first position is that of Albert in the second part of his Summa, tractate 8, question 4, member 2, toward the end, in the second incidental question; and in Henry in Quodlibet 1, questions 7 and 8; Marsilius in II, question 1, article 2, and in IV, the same author; and Clicthoveus in chapter 8 of the first book De fide; and Damascene: they affirm that absolutely no creature could have been produced from eternity.[1159] To this same position belongs also St. Bonaventure in II, distinction 1, part 1, article 1, question 2; for he asserts simply that it is impossible that the world was from

eternity, if it was to be produced from nothing, as in fact it had to be produced; but if matter were presupposed as coeternal with God, Bonaventure grants that God could have induced forms into it from eternity. He understands by "matter" the uncreated matter which was posited by certain heretics recalled above in question 44, article 2. And this follows from his reasoning: otherwise his distinction would be superfluous; since therefore faith teaches that no matter can be uncreated, and Bonaventure also held thus, it clearly follows that he taught the world could not, simply speaking, have been from eternity.[1160]

But the aforesaid position is proved first by the testimonies of the Fathers. Among the Greeks, St. Athanasius, in the second oration against the Arians, solidly proves that the creature cannot be coeternal with God, because it is of another nature than the Creator.[1161] Secondly, St. Basil, book 2 against Eunomius, a little before the middle, says thus: "But for our part, to ascribe what is eternal to creatures, and by this profession to deprive the Creator of it, we declare to be the same madness."[1162] Thirdly, St. John Damascene, book 1 On the Faith, chapter 8, a little after the middle, speaks thus: "But since creation in God proceeds from the will, it is assuredly not coeternal with God; for it is by no means compatible with this nature that that which is brought forth into origin from nothing should fall under that which is without principle and sempiternal, so as to have eternity."[1163]

Among the Latins, first, St. Ambrose, Hexaemeron 1, chapter 3, says: "How then do they assert the world to be coeternal with God, and associate the Creator of all with it, and dispute that the creature is equal?"[1164] Then St. Augustine, City of God 12, chapter 15, strives to demonstrate by these words that the angels were not from eternity: "How then are they coeternal with the Creator, if they always were to him, if they always were for him? How are they to be said 'created,' if they are understood always to have existed?" And in the book against the Arian Felician, chapter 7, he defines the creature thus: "For a creature is the substance of any thing whatever, made by the will of God the Father almighty, which is from that which as yet is not, or at some time was not, corruptible, as far as it lies in itself."[1165]

Furthermore, Marsilius confirms it thus by reason. If any creature were to proceed from eternity, it would have to be by creation; but creation is the production of something from nothing; therefore "nothing" ought to precede on the part of the terminus a quo; therefore that thing could not have been created from eternity. This argument seems also to be Bonaventure's. Wherefore when Bonaventure says that the world could have been from eternity, if matter were eternal, he is speaking of uncreated matter. For if it had to be created, and consequently from nothing, then in the same way, according to his view, it could not be eternal, just as neither any other creature.[1166]

Secondly, just as it is repugnant that God produce something equal to himself in infinity according to existence (*esse*), and according to potency, and according to immensity, so by the same reasoning it is repugnant that he produce something equal to himself in eternity: for all these are equally God's attributes and his proper perfections; but it is repugnant that anything be produced by God equal to him in all the others, as is clear; therefore it is also repugnant in eternity.

Thirdly, if God acted naturally, and produced an effect altogether like himself outside himself, he would do nothing greater than what is eternal; but now God, acting by intellect and will, cannot produce the same as he would produce if he acted by force and necessity of nature; therefore by his will he cannot produce anything eternal.

Fourthly, because God works freely outside himself, and is so indifferent by intellect and will to work; but he could not be indifferent with respect to that which he would produce from eternity. For, in order that a cause be indifferent, the effect must first be "not to be" rather than "to be," so that, while the effect is not, the cause can determine itself to one side. These are Marsilius's reasons, to which we can add a fifth: because if some creature were made from eternity, it would have to remain incorrupt through an infinite duration, which seems absurd. But if you say that after a finite duration it could be corrupted - let us posit after 100 years - then, since this corruption will have had a beginning, from that point of corruption onward any duration whatsoever will be finite; if you add those 100 years during which it endured, the whole duration will be finite, and with a beginning; and hence it cannot be eternal, to whose notion it belongs to lack a beginning.

Not a few adherents of our position - on account of the testimonies cited - admit that the Fathers were of the contrary opinion; nevertheless they contend that there is no manifest reason that would force us to embrace it. And indeed, if no reason were forthcoming, it ought not to be asserted that a thing repugns God on account of a manifest reason, but that there is some hidden contradiction which the holy Fathers seem to have scented. Yet I judge that the Fathers alleged do not favor the preceding opinion at all, if their context and words are weighed. Wherefore they each must be explained by us in detail.

As to St. Athanasius: he says nothing about God's power - namely, whether he could make a creature coeternal with himself - but only says that it does not befit the Son of God to have "at some time not been," which is proper to creatures. The words of his which could be brought for the opposite opinion are these: "If he, namely the Son, is not one of the order of the remaining creatures, then indeed they say of him, 'he was,' that is, 'he was not before he was made': for such expressions have their congruity in created things, whereas the Son is such as the Father." By which he only signifies that "not to have been at some time" is proper to creatures. And that is most true; but he does not say that it is so proper that God cannot do the opposite. And, after a few words interposed: "For all other things, as having been made, have nothing like the substance's ration with their Creator, but are outside him, having been founded by God through the grace of his will by his word, so that, in any case, they can be set where he who made them shall will" - in which I see nothing that could favor the opposite opinion.

To St. Basil I answer in the same way, that he says nothing about ...

Caput III - That a permanent creature, even a corruptible one, but without corruption, could have been from eternity; the more probable opinion holds

Now, the universe of things consists of two kinds, namely, of permanent things, such as substances and accidents; and of successive things, such as motion. Therefore, in order to show, in accordance with each part, that this universe could have been from eternity, let us speak severally of each. And now, as to permanent things, against Albert and others we assert that any permanent thing could have been from eternity; yet with the qualification that, if by its own nature it is corruptible, it would not be corrupted except after an infinite duration. For this is clearly proved by the reason adduced in the last place. This opinion is handed down, together with St. Thomas and Cajetan, in these articles, commonly by more recent authors; and in the Second Contra Gentiles, chapter 8, and there by the Ferrariensis; Hervaeus in the second distinction, question 1; Capreolus, question 1; Gregory of Rimini, question 3; Ockham in the second book, question 8, and in Quodlibet 3, question 3; Durandus, question 2; and Scotus seems to agree, questions 3 and 5; while those who hold the first position defend it lastly in that place.[1167]

The chief and sole foundation of this position is that there is no evident reason which convicts the asserters of this opinion of contradiction: wherefore we ought not to assert that it repugns, lest the mysteries of our faith be made ridiculous to philosophers - "when we strive to demonstrate them more than is just by reason," as St. Thomas says - nor should we deny to the divine power what does not contain a manifest contradiction. Therefore it will be necessary to meet one by one the reasons brought by the prior position, which seem to be the principal ones in this matter.

I answer in the same way, that he [Ambrose] disputed nothing about the power of God, but only said that it is equally foolish to assert a creature to be eternal - he is speaking of those things which were produced by God with a beginning of duration - and to deny that God is eternal: for each is against the Catholic faith. For he was disputing against Eunomius, who said that the Holy Spirit is a creature and had a beginning of duration, as the other creatures had.

To St. John Damascene I say that he only assigned a difference between the Son of God, produced by eternal generation, and the remaining creatures, namely, that the Son of God, since He is begotten of the substance of the Father, must be coeternal with Him; otherwise the essence (*essentia*) of God would undergo change, since in time He would begin to be Father, and before He would not be. And unless we grant (he says) that the Son existed together in the beginning with the Father, in which He was begotten, we shall introduce a conversion in the paternal substance: because when the Father was not, later He became Father. But this does not follow from the production of creatures in time, as he proves in this way. For as regards created things, although they were afterwards made, nevertheless they did not arise from the essence of God; but by His will

1167. St. Thomas Aquinas and Cajetan, in these articles; cf. Contra Gentiles II, c. 8, and the Ferrariensis there; Hervaeus Natalis, II, dist., q. 1; John Capreolus, q. 1; Gregory of Rimini, q. 3; William of Ockham, II, q. 8, and Quodlibet III, q. 3; Durandus of St.-Pourçain, q. 2; John Duns Scotus, qq. 3, 5.

(*voluntas*) and power (*potentia*), when previously they were not, they were brought into being; nor does a change on that account befall the nature of God. Therefore he gathers that the difference between creation (*creatio*) and generation (*generatio*) is that generation must be without beginning, but creation, since it proceeds from will, is not eternal to God: he understands, however, not that it is necessarily eternal, as it is necessary that the generation of the Eternal be eternal. He gives the reason with these words alleged for the opposing position: "Since this is by no means proportioned to nature, that what is brought forth from nothing into being should have the same eternity with that which is without beginning and sempiternal"; that is, it is not necessary and natural to a creature to be eternal, as it is to one begotten. For that is said to be proportioned to nature which, from the intrinsic principle of a thing, naturally befits some thing: but thus eternity does not befit a creature. For all that, Damascene does not deny that by the will of God this can be communicated to a creature.

To St. Ambrose it is answered in the same way, that he only proves against the Philosophers that the world had a beginning of duration: for to this his arguments tended; and he said nothing about the power of God. Therefore, after many things, he concludes with the words alleged in the preceding chapter, against the philosophers, saying: "How then coeternal," etc. Add that Ambrose disputes against Aristotle and other Philosophers, who used to say that matter, generable and corruptible, was unbegotten and unproduced, and that the higher bodies likewise were so; as is clear from the first chapter of that book, where he reports their opinions: he rightly concludes that it is foolish to make a corporeal creature an eternal mass, both without beginning of duration and without an efficient principle of substance. But Ambrose disputes nothing against those who say that matter and other substances could indeed have been eternal, yet produced by God.

Moreover, that we may explain the mind of St. Augustine in that book De civitate, chapter 15, note that in that place Augustine, among other things, unfolded and revolved how an Angel is said always to have been, although he is not eternal. He proves that he has always been, because he existed at every time: for time itself began, which according to Augustine consists in the motions of creatures; and before the Angel there was no time, because there was no motion at all. But when he had said this, he objects to himself in this way: "But if I answer this, it will be said to me: how then are they not coeternal with their Creator, if He always was, and they also always were? How also are they to be said created, if they are understood to have always been?" By which words, first, he does not say that Angels could not be created from eternity, but, against those who say that they have always been, he infers that they were not created; because every created thing de facto began in time, as he had supposed from those words of Genesis 1: "In the beginning God created heaven and earth." Furthermore, these words are not of Augustine's own opinion; but he objects them against those things which he had adduced to prove that Angels had always been, so as to render the question difficult on both sides. Afterwards he answers, and with consent says that Angels can be said always to have been, because they were at every time: and that "at every time," because in no way were there times without them. From which he also gathers that they were created (he understands "in the beginning of duration") like the rest, according to the text of Genesis alleged:

because "to be always," that is, "at every time," can rightly stand together with a beginning of duration. But whether God could create Angels from eternity, Augustine does not have so much as a word in that chapter.

To the other testimony I answer that that book is not received by all as Augustine's; but, whoever its author may be, that testimony is of no moment for the prior position: for there Augustine only defines a creature, in so far as it is de facto produced, so that from this he may gather against that Arian that the Son is not a creature. Now, a creature is that which at some time was not and afterwards was made by God: for thus all the Arians granted that every creature had a beginning of duration; since he admitted the Scriptures: and therefore, since they asserted that the Son is a creature, they also conceded that He at some time was not. Therefore, that Augustine may show that the Son is not a creature, he premits that definition of a creature received by all, about those creatures which de facto are; without meanwhile caring whether God by His power could make some creature eternal.

The other head, by which our position was to be confirmed, is the solution of the opposing reasons. From this it will be clear that no contradiction is implied, if we say that God could have made the world from eternity.

Against the reasons of the opposing position enough has been said

To the first reason I answer, from the doctrine set down in disputation 174, chapter 3, that there is nothing whence it follows that what is created must, in duration, precede its creation; as is there explained: and thus an eternal creation can well be understood from this alone, that the thing produced from eternity would proceed from God in such wise that it would, of itself, tend into nothing if it were left to itself: just as the conservation of a thing according to the whole of itself is called a certain continuous creation, not because nothingness in duration preceded the thing itself before it began, but because it would be reduced to nothing continually unless it were conserved by God.

To the second I say that it is repugnant that something be produced by God eternal by its very nature, that is, from an intrinsic principle, as infinite according to essence would be: but just as it is not repugnant that what is infinite according to quantity be produced, so neither is it repugnant that what is eternal according to duration be produced; yet so that by its nature it can cease, and even begin in time: for eternity in this mode is not a proper attribute of God. And although an infinite in quantity would be repugnant on account of other reasons peculiar to quantity, nevertheless nothing seems to stand in the way whereby something eternal in this mode should not be produced. Whence also the solution of the third reason is plain. For if God were to act naturally, and to produce something equal to Himself, He would make something greater even in duration than eternal: not because it would endure more than what is eternal, but because that would be essentially eternal, so that it could not not be from eternity; whereas now, if He were to make some

creature eternal, it would not have such duration essentially; but it could cease, and it could have not been from eternity: therefore, by creating by His will a creature eternal, He would not make something equal to that which He would produce naturally, as such.

The fourth reason seems to have its foundation in a certain doctrine of Hugh of St. Victor, which we reported in disputation 69, chapter 7, namely, that it is necessary, in order that an agent be said to act freely, that duration should precede the operation itself: for concerning a natural agent the adversaries grant that it can be simultaneous in duration with its effect. But we refuted this doctrine in that place; and we there explained in what way an agent can act freely, even if it begins simultaneously with the free effect. And although in man that would be necessary, in God, however, it would not be: because just as one rightly understands one who wills freely, so also one can understand one who produces freely.

Caput IV - On the eternity of motion and of generations: whether it is possible, as various Scholastics have taught

It was the position of no few Theologians, not only that some creature could, in the way said in the preceding chapter, be from eternity, but also that the whole universe could be so in exactly the fashion in which Aristotle thought de facto it was, that is, the heavens and their perpetual motion, the elements and mixed bodies, generations and corruptions succeeding one another from eternity, among which there would be no first. Thus teach Gregory of Rimini in II, dist. 1, q. 3, art. 2; Gabriel [Biel], q. 3; Ockham in II, q. 8, and in Quodlibet, q. 5; to which add St. Thomas in article 2 of this question along with the solutions of the arguments, especially the seventh and eighth, and there Cajetan; and in Contra Gentiles II, c. 38, and the Ferrariensis there; Hervaeus Natalis in II, dist. 1, q. 1; and Capreolus, q. 1. For, apart from the generations of men, they have thought that the remaining things which now are in the world - whether motions, or mutations, or substantial generations, and things of other kinds - could have been from eternity, because in no other case did they see any contradiction, except in human generations, and that for this sole reason, that it would follow that there is now an infinite multitude of souls; which they think absurd. Wherefore, unless souls were to pass from one body to another through the death of men, they judge it impossible that there be infinite generations of men; although St. Thomas in that chapter 38 does not judge this infinite multitude of souls to be impossible.[1168]

To others, however, Durandus seems to have philosophized more probably, when he asserts in II, dist. 1, q. 3, that neither could corporeal motion be eternal, nor generations without a beginning; although in q. 2 he plainly granted that a permanent creature could be from eternity. Each of these uses his own reasons, which we shall examine in the following chapter. Concerning this matter Scotus seems to define nothing: he only disputes whether some creature could have been from eternity, as we saw above.

1168. Gregory of Rimini, In II Sent., dist. 1, q. 3, art. 2; Gabriel [Biel], q. 3; William of Ockham, In II Sent., q. 8, and Quodlibet III, q. 5; St. Thomas Aquinas, this question, a. 2, especially solutions to obj. 7 - 8; Cajetan there; Contra Gentiles II, c. 38, and the Ferrariensis there; Hervaeus Natalis, II, dist. 1, q. 1; John Capreolus, q. 1.

This whole universe, apart from the generations of substances and of accidents, as regards all other things, could have been from eternity: the more probable opinion.

Caput V - That this whole universe, apart from the generations of substances and of accidents, as regards the rest, could have been from eternity: the more probable opinion

I, for my part, think it much more probable that this whole universe could have been from eternity, not only as to substances and the things that remain without corruption through an infinite duration, but also as to motion; not, however, as to generations, whether of substantial forms or of accidents. But before we show that the motion of bodies could have been from eternity - which to Durandus seemed impossible, though to others alleged in the preceding chapter it seemed possible - let us prove against them that a series of generations from eternity could not have been; in which point we agree with Durandus.

As to the generations of men, St. Thomas seemed to himself to prove it by a single special reason, which Caietan, the Ferrariensis, Hervaeus, and Capreolus embrace: namely, because there would be an actual infinite in things separated from matter: for there would be an infinite number of souls, because they are immortal and, according to true philosophy, do not pass from body to body; and therefore they say that, unless God by His omnipotence were willing to have the same soul inform diverse bodies, generations could not be from eternity. But they do not think that a process to infinity in generations is absurd, because among causes essentially ordered, which are both particular and universal, we must arrive at one first; but among causes ordered per accidens, such as are in a series of generations, it is not necessary that there be a first. The reason of the difference is that essentially ordered causes all actually concur to the effect, and one from another; and therefore it is necessary that there be one first, from which the whole operation and motion begins: but causes ordered per accidens do not all actually concur to the effect: for, in order that Peter may beget a son, it is not required that Peter's father and grandfather and other progenitors operate, but it is enough that they begot in their own time. Wherefore the aforesaid Doctors do not judge it absurd to concede generations from eternity of other things, in which in truth there does not follow that inconvenience which we were inferring about human souls.

But I, for another reason, think that generations not only of men, but also of other things, whether of substances or of accidents, could not have been from eternity; nor do I judge an infinite multitude of souls to be impossible, nor contrary to the mind of Aristotle, as I proved above in disputation 26, chapter 3; nor does St. Thomas in Contra Gentiles II, c. 38, deem it impossible. The reason is that, since God is the first being through essence (*essentia*), and the cause of all the rest, so we must concede that some things proceed from Him by means of secondary causes, so that at length every existence (*esse*) be referred to Him as to the first and proximate cause. Therefore it is necessary to come to some being produced by God alone, and from which the others are derived. But this being posited, generations could not be from eternity: for either infinitely many men would be produced immediately by God from eternity - and this would not suffice for one man to beget another from eternity and without a beginning - or a finite number would be produced by

God, and thus, since they would have to beget others in an order and series of succession, there could not be infinite generations, because at length we would arrive at that first man from whom the whole succession would take its beginning.

... the first, who was not begotten from another, but was produced immediately by God.

But to assert that generations were from eternity in that order which Aristotle posited, so that no first being was produced by God alone, amounts to asserting that God by His omnipotence was not the cause that there be generations, but that they were constituted thus by nature or by chance. For how can it be that God made there to be generations in the world from nothing, and yet we are unable to assign some first thing created by Him? I say that He made generations from nothing, not this one or that one, but that by His omnipotence He gave from nothing the cause that there be generations; for by this consideration alone He Himself could be the entire cause that there be generations; whereas in another way He would have been only a helping cause to generations. This reason proves concerning any series of generations, as we proposed at the beginning. And for this reason Aristotle posited generations from eternity, as I noted in disputation 26, chapter 3, and disputation 87, chapter 1, because he thought that this universe, without an author, was constituted by its own nature in this way. But if he acknowledged God to be the free author of all things, and thought that every kind of produced thing must be reduced unto Him; he would neither have said that the world necessarily existed from eternity, nor have judged that that series of generations was possible. I pass over the argument of Durandus, by which he attempts to show this very point in the second book, distinction 1, that question 3, number 14, for it has little weight.[1169][1170]

Now what remains is only that we prove not only that permanent things could have existed from eternity, but also the continuous motion of the heavens, as Aristotle posited. This will be clear if we solve the reasons which are wont to be opposed to this opinion.

The first reason is, that an infinite past and elapsed would follow. I answer that it is not absurd, if the infinite is toward the beginning, yet has an end. Thus it is not wondrous, if a motion which begins without a beginning has traversed infinite spaces, at least by repetition.

The second reason: it would follow that one infinite would be greater than another; because time up to the past year would have been infinite, to which if the present year were added, it would become greater. But we satisfied this argument in disputation 26, chapter 2, where we also noted that these things were not unknown to Aristotle; and nonetheless he posited an eternal motion, because he thought nothing absurd was inferred from it.[1171]

The third reason. Wherever there is an order of prior and posterior, we must assign some one first: but then the days would be ordered; therefore among them there would be one first. I answer: in a finite order this is true; but in an infinite series it is enough if before any given one there be another, so that we may say that in that multitude there is order. And this is to be understood of

1169. As I noted in disputation 26, chapter 3, and disputation 87, chapter 1.
1170. Durandus, In II Sent., dist. 1, q. 3, n. 14.
1171. Disputation 26, chapter 2.

those things which have only an order of duration and of ordered succession; for if they had the order of causality, since in causes there is no process to infinity, one would have to come to some first cause.

The fourth reason. If the heavens were created as to substance from eternity together with motion, let us speak of the sun and the moon: either the moon was created in opposition, or in conjunction. If in conjunction, how long did it last until opposition? Surely not an infinite time; because the space was finite, and had to be traversed by finite revolutions: but if a finite time, since the whole motion that followed afterwards would be finite, it would be finite, because it had a beginning; added to a prior finite, it would not make something infinite and eternal.

I answer. The argument plainly supposes what it ought to infer. For it supposes that the heaven was produced with a first of its existence, in some determinate position; which ought to have been concluded in the argument. We say, therefore, that that creation from eternity does not have a first of its existence, but is as it were a certain continued conservation, which truly is creation, as was explained in disputation 173, chapter 3; whence it is that the heaven, which would be continually conserved by God, would in every position and situation be produced out of nothing; not that a nothingness preceded, but because by its nature it would pass into nothing, if it were not continually conserved. Therefore when you argue, Either the heaven of the moon was created in opposition, or in conjunction; a distinction must be made. Either you speak of the first point of creation; and thus it was produced neither in one position nor in the other, for there was not a first existence of production: or you speak of production absolutely; and thus we say that in any position whatsoever it was produced by God by a continued creation, just as now also it is produced. Since, therefore, there is no manifest contradiction, we ought not to assert that God could not create the world in the manner we have described; but to believe by faith alone this article concerning the creation of the world, as St. Thomas in this question, article 2, admonished. [1172]

Quaestio XLVII - On the distinction of things in general

After the production of creatures into existence, there is to be considered their distinction. And this consideration will be threefold. For first we shall consider the distinction of things in general. Second, the distinction of good and evil. Third, the distinction of spiritual and corporeal creature.

Articulus I - Whether the multitude and distinction of things is from God

It seems that the multitude and distinction of things is not from God.

1) For the one is always of a nature to make one. But God is supremely one, as is clear from what has been said. Therefore He produces only one effect.

1172. St. Thomas, this question, art. 2.

2) Further, the exemplar is assimilated to its exemplar; but God is the exemplary cause of His effect, as was said above. Therefore, since God is one, His effect is only one, and not distinct.

3) Further, those things which are for an end are proportioned to the end. But the end of the creature is one, namely, the divine goodness, as was shown above. Therefore the effect of God is only one.

But on the contrary: it is said in Genesis 1 that God distinguished the light from the darkness and divided the waters from the waters. Therefore the distinction and multitude of things is from God.

I answer that some have assigned the cause of the distinction of things in many ways. For some have attributed it to matter either alone or together with the agent: to matter alone, as Democritus and all the ancient natural philosophers, who posited only the material cause, according to whom the distinction of things comes about by chance according to the motion of matter. To matter and agent together Anaxagoras attributed the distinction and multitude of things, who posited an intellect distinguishing things by extracting what was mixed together in matter. But this cannot stand for two reasons. First, because it was shown above that matter itself also was created by God. Hence one must reduce even the distinction, if there is any on the part of matter, to a higher cause. Second, because matter is for the sake of form, and not conversely; but the distinction of things is through proper forms. Therefore the distinction is not in things on account of matter, but rather conversely in created matter there is a lack of uniformity, so that it might be accommodated to diverse forms.

Others, however, have attributed the distinction of things to secondary agents, as Avicenna, who said that God, by understanding Himself, produced the first intelligence; in which, because its existence is not its essence, of necessity there falls a composition of potency and act, as will be made clear below. Thus, therefore, the first intelligence, insofar as it understands the first cause, produced the second intelligence; but insofar as it understands itself according as it is in potency, it produced the body of the heaven, which it moves; and insofar as it understands according to that which it has of act, it produced the soul of the heaven. But this cannot stand for two reasons. First, because it was shown above that to create is God's alone. Hence those things which cannot be caused except by creation are produced by God alone. And these are all things which do not lie under generation and corruption. Second, because according to this supposition the universality of things would not come from the intention of the first agent, but from the concurrence of many agent causes: but such a thing we say comes about by chance. Thus, then, the complement of the universe, which consists in the diversity of things, would be from chance, which is impossible.

Hence it must be said that the distinction and multitude of things is from the intention of the first agent, which is God. For He produced things into existence for the sake of communicating His goodness to creatures, and of being represented through them. And because by one creature the divine goodness cannot be sufficiently represented, He produced many and diverse creatures, so that what is lacking to one for representing the divine goodness may be supplied from another. For the goodness which is in God simply and uniformly, in creatures is manifoldly and divisibly.

Whence the whole universe more perfectly participates in the divine goodness and represents it than any creature whatsoever. And because the divine wisdom is the disposer of the distinction of things; wherefore Moses says that they were distinguished by the word of God, which is the conception of wisdom; and this is what is said in Genesis 1: "God said: Let there be light" and He divided the light from the darkness.

Reply to the first: An agent by nature acts through the form by which it is (and that one form is but one); and therefore it produces but one. But a voluntary agent - such as God is, as was shown above - acts through an understood form. Since, therefore, God does not cease to understand many things, it follows, consistently with His unity and simplicity, as was said above, that although He is one, He can make many things.

Reply to the second: That reasoning holds for the exemplified which perfectly represents its exemplar, which is not multiplied except materially; whence an image, if it be perfect, is only one. But no creature perfectly represents the first and most perfect exemplar, which is the very act of existence (*esse*); and therefore it can be represented by many. And yet it must be said that the ideas are called exemplars: the plurality of things corresponds in the divine mind to a plurality of ideas.

Reply to the third: In speculative matters the middle term of demonstration, which perfectly demonstrates the conclusion, is only one; but probable middles are many. And similarly in practical matters, when that which is for the end equals (so to speak) the end, it is not required that there be more than one only. But a creature is not such as to equal the end, which is God. Hence it was necessary that creatures be multiplied.

Conclusion: The divine wisdom is the cause of the distinction of things.

Articulus II - Whether the inequality of things is from God

It seems that the inequality of things is not from God.

1. For of the best it is to produce what is best. But among things that are best, one is not greater than another. Therefore for God, who is best, it is to make all things equal.[1173]
2. Further, equality is an effect of unity, as is said in the Metaphysics. But God is one. Therefore He made all things equal.[1174]
3. Further, it belongs to justice to give equal things to equals. But God is just in all His works. Therefore, since no inequality of things is presupposed to His operation by which He communicates existence (*esse*) to things, it seems that He made all things equal.[1175]

But on the contrary: It is said in Ecclesiasticus 33, at the head of the chapter: "Why does one day excel another day, and one light another light, and one year another year?" and a little after: "By the knowledge of the Lord they were distinguished."[1176]

1173. Cf. St. Thomas, this question, art. 2.
1174. Metaphysics, book 5 or 8, on unity and equality; cf. St. Thomas, ibid., ad 2.
1175. Cf. St. Thomas, ibid., obj. 3 and ad 3.
1176. Ecclesiasticus (Sirach) 33:7 - 11.

I answer that Origen, wishing to exclude the position of those who assert that the distinction of things in the world arose from the contrariety of the principles of good and evil, maintained that all things created by God from the beginning were equal. For he said that, at first, God created only rational creatures, and all of them equal. In these, first, an inequality arose from free choice, in that some were turned to God more and less; some also, according to a greater and a lesser turning away from God: namely, those rational creatures which, having turned to God by free choice, were advanced to diverse orders of angels according to the diversity of merits. Those, however, which turned away from God, were bound to diverse bodies according to the diversity of sin; and he posited this as the cause of the creation and the diversity of bodies. But according to this, the universe of corporeal creatures would not exist for the goodness of God to be communicated to creatures, but for the punishing of sin. Which is contrary to what is said in Genesis 1: "God saw all the things that He had made, and they were very good." And as St. Augustine says in book 11 of the City of God: "What more foolish can be said than that this sun should have arisen in one world, not for the adornment of beauty, or for the health of corporeal things, the craftsman being God, but rather that this befell because one soul sinned; and thus, if a hundred souls had sinned, this world would have had a hundred suns?" Therefore it must be said that, just as the divine wisdom is the cause of the distinction of things, so also of inequality. Which is clear as follows. For a twofold distinction is found in things: one, formal, in those that differ in species; the other, material, in those that differ only in number. But since matter is for the sake of form, material distinction is for the sake of formal. Hence we see that in incorruptible things there is only one individual of one species: because a species is sufficiently conserved in one. But in generable and corruptible things there are many individuals of one species for the conservation of the species. From which it is evident that formal distinction is more principal than material. But formal distinction always requires inequality: because (as is said in book 8 of the Metaphysics) the forms of things are like numbers, in which the species are diversified by addition or subtraction of unity. Whence in natural things the grades of species seem to be ordered: as mixed bodies are more perfect than the elements, and plants than mineral bodies, and animals than plants, and men than other animals; and in each of these, one species is found more perfect than others. Therefore, just as the divine wisdom is the cause of the distinction of things for the perfection of the universe, so also of inequality. For the universe would not be perfect, if in things there were only one grade of goodness.

Reply to the first: It belongs to the best agent to produce its whole effect as the best, yet not to make each part of the whole best simply, but best according to its proportion to the whole. For the goodness of an animal would be taken away, if every part of it had the dignity of the eye. Thus, then, God constituted the whole universe as most excellent according to the mode of the creature: but not individual creatures, rather He made one better than another. And therefore, of individual creatures it is said in Genesis 1: "God saw the light, that it was good," and similarly of the other individual things. But of all together it is said: "God saw all the things that He had made, and they were very good."

Reply to the second: The first thing that proceeds from unity is equality, and then multiplicity proceeds. And thus from the Father (to whom, according to St. Augustine, unity is appropriated) proceeds the Son, to whom equality is appropriated; and then the creature, to which inequality is suited: yet even from creatures there is participated a certain equality, namely of proportion.[1177]

Reply to the third: The reasoning which moved Origen has no place except in the retribution of rewards, whose inequality is owed to unequal merits. But in the constitution of things there is not an inequality of parts from any inequality preceding, whether of merits or even of the disposition of matter, but for the perfection of the whole: as is evident also in the works of art. For the roof does not differ from the foundation because it has different matter: but in order that a house be perfect from diverse parts, the craftsman seeks diverse matter, and he would make it if he could.

Conclusion: The wisdom of God is the cause of the inequality of things, just as it is of their distinction.

Annotation concerning both articles.

The doctrine of both articles must be understood thus, that in certain things produced proximately by God, God is the whole cause of distinction and inequality; but in others, indeed, God is the efficient cause, yet, in addition, the nature of the things themselves requires distinction and inequality, such that otherwise not even by God Himself could it be made. Wherefore, of this distinction and inequality the very nature will be as it were the formal and intrinsic cause. The former occurs in homogeneous things and those of the same account, and those are multiplied only by division of the continuum. The latter occurs in those only which differ in species; indeed, even in those which are so diverse by number alone that they are not made by mere division of the continuum. For this reason the division of rivers and of the sea, and, in the very sea, the divisions and inequalities of waters, were made solely by the will of God, which otherwise He could have gathered into one, or divided altogether equally. But the division of man from angel, of light from darkness, of the sun from the moon, of one angel from another, of one man from another man, and inequality too, were made not only by the will of God, but were also so consonant to the nature of the things themselves, that they could not have been otherwise: because these things by their very nature differ formally of themselves, and are unequal. For things are not such in their essence by the will of God, although by the divine will alone they are produced, as was said in disputation 104, chapter 3. Therefore God only as efficient distinguished the light from the darkness, the man from the horse, and made them unequal: but formally, and by their proper nature, they are distinct and unequal.

1177. Cf. Lib. de doctrina Christiana? Here cited as "2 Christ. c. f. infin. co." i.e., the Augustinian appropriation: to the Father, unity; to the Son, equality; to the Holy Spirit, concord - equality of proportion is participated by creatures.

Articulus III - Whether there is only one world

The third proceeds thus. It seems that there is not only one world, but many.

1. Because, as St. Augustine says in the book of 83 Questions, it is incongruous to say that God created things without reason. But by the same reason by which He created one, He could have created many: since His power is not limited to the creation of one world, but is infinite, as was shown above. Therefore God produced many worlds.[1178]
2. Further, nature makes what is better, and much more God. But it would be better that there be many worlds than one: because more goods are better than fewer. Therefore many worlds were made by God.
3. Further, whatever has a form in matter can be multiplied according to number while the species remains the same: because multiplication according to number is from matter. But the world has a form in matter. For as when I say "man," I signify the form; but when I say "this man," I signify the form in matter: so when "world" is said, the form is signified; but when "this world" is said, the form in matter is signified. Therefore nothing prevents there being many worlds.

But on the contrary is what is said in John 1: "The world was made by Him." Where he named "world" in the singular, as if only one world existed.

I answer that the very order existing in things created by God manifests the unity of the world. For this world is called one by the unity of order, according as some things are ordered to others. But whatever things are from God have an order to each other and to God Himself, as was shown above. Therefore of necessity all pertain to one world. And for that reason those were able to posit many worlds, who did not posit as the cause of the world some wisdom ordering, but chance: as Democritus, who said that from the concourse of atoms this world came to be, and others infinite.

Reply to the first: This is the reason why the world is one, because all ought to be ordered by one order and to one. On which account Aristotle, in book 12 of the Metaphysics, from the unity of the order existing in things concludes to the unity of the God governing. And Plato, from the unity of the exemplar, proves the unity of the world, as of the exemplified.[1179]

Reply to the second: No agent intends material plurality as an end: because material multitude has a certain terminus, but of itself it tends to the infinite. But the infinite is repugnant to the notion of an end. Moreover, when it is said that many worlds are better than one, this is said according to material multitude; but such a "better" does not fall within the intention of the divine agent, because it falls under the notion of quantity. And if it were so that God could make better, then if He had made more, that which exceeded would again be such; and so on to infinity.

1178. St. Augustine, De diversis quaestionibus octoginta tribus, q. 46; cf. St. Thomas, q. 47, a. 3.
1179. Aristotle, Metaphysics XII; Plato, Timaeus, on the unity of the exemplar and the unity of the world as exemplified.

Reply to the third: The world consists of its whole matter; for it is not possible that there be another earth than this one: because every earth would by nature be borne downwards to this middle, where this one is. And the same reasoning holds for the other components which are parts of the world.

Conclusion: The answer is affirmative, and of faith: for thus Scripture in Genesis 1 supposes it. For making mention of the creation of things, where it ought to have enumerated all produced by God, it said only that He made this world and its parts. But whether He could have made another world, we have already spoken in disputation 27.[1180]

Quaestio XLVIII - On the distinction of things in particular

Next, consideration must be had of the distinction of things in particular. And first, of the distinction of good and evil. Then, of the distinction of the spiritual and corporeal creature.

Concerning the first, it is to be asked about evil, and about the cause of evil.

Articulus I - Whether evil is some nature

To the first, thus it proceeds. It seems that evil is some nature. Because every genus is some nature. But evil is a certain genus. For it is said in the Predicaments that good and evil are not in a genus; but they are genera of others. Therefore evil is some nature.

1. Further, every difference constitutes some species; and a nature is said thereby. But evil is the difference constituting in morals: for there is the distinction of species of habits from the good, namely virtues, and from the evil, namely vices; and likewise liberality is distinguished from prodigality by contrariety. Therefore evil signifies some nature.
2. Further, each contrariety is in some nature. But evil is contrary to good. Therefore evil is some nature.
3. Further, what is not, does not act. But evil causes something, and acts; for by evil good is diminished, and many harms are effected. Therefore evil signifies some nature.

Objicitur 1. It seems that evil is a certain nature. For every genus is a certain nature. But evil is a certain genus; for it is said in the Predicaments that good and evil are not in a genus, but are genera. Therefore evil is a certain nature.

Objicitur 2. Furthermore, every constitutive difference of some species is a certain nature. But evil is a constitutive difference in moral matters. For an evil habit differs in species from a good one, as illiberality from liberality. Therefore evil signifies a certain nature.

1180. As I noted in disputation 27, article 8; and q. 25, art. 6.

Objicitur 3. Furthermore, each of contraries is a certain nature. But good and evil are not opposed as privation and habit, but as contraries, as the Philosopher proves in the Predicaments by the fact that between good and evil there is something intermediate, and that a return to good can be made from evil. Therefore evil signifies a certain nature.

Objicitur 4. Furthermore, what does not exist does not act. But evil acts, because it corrupts good. Therefore evil is some being and a certain nature.

Objicitur 5. Furthermore, nothing pertains to the perfection of the universe of things except what is a being and a certain nature. But evil pertains to the perfection of the universe of things. For Augustine says in the Enchiridion that from all things there is constituted the admirable beauty of the universe, in which also that which is called evil, well ordered and set in its place, commends the goods more eminently. Therefore evil is a certain nature.[1181]

Sed contra est, what Dionysius says, On the Divine Names, book 4, chapter: Evil is not existing, nor is it good.[1182]

Respondeo dicendum, that one of a pair of opposites is known through the other, as darkness through light. Hence also what evil is must be taken from the notion of good. But we said above that good is everything that is appetible, and therefore, since every nature desires its own existence (*esse*) and its own perfection, it is necessary to say that the existence and perfection of any nature has the notion of goodness. Hence it cannot be that evil signifies some existence, or some form, or nature. It remains, then, that by the name of evil there is signified a certain absence of good; and for that reason it is said that evil neither exists nor is good. For since being, inasmuch as it is such, is good, the removal of the one is the removal of the other.

Ad primum ergo dicendum, that Aristotle is speaking there according to the opinion of the Pythagoreans, who thought that evil is a certain nature, and accordingly they posited good and evil as genera. For Aristotle was wont, especially in the logical books, to set forth examples which were probable in his time according to the opinion of some philosophers. Or it is to be said, as the Philosopher says in Metaphysics IV, that the primary contrariety is habit and privation; because, namely, in all contraries it holds that one of the contraries is imperfect with respect to the other, as black with respect to white, and bitter with respect to sweet. And for this reason good and evil are called genera, not simply, but of contraries: for just as every form has the notion of good, so every privation, inasmuch as it is of this sort, has the notion of evil

Ad secundum dicendum, that good and evil are not constitutive differences, except in moral matters, which receive species from the end, which is the object of the will, on which moral matters depend. And because good has the notion of end, therefore good and evil are specific differences in moral matters: good per se, but evil inasmuch as it is the removal of the due end. Nor, however, does the removal of the due end constitute a species in moral matters, except insofar as it is conjoined to an undue end; just as neither in material matters is the privation of a substantial form found except conjoined to another form. Thus therefore the evil which is a constitutive difference

1181. St. Augustine, Enchiridion, c. 10, at the end; cf. also the Comparison in tom. 3.
1182. Pseudo-Dionysius, De divinis nominibus, IV, cap. 4.

in moral matters is a certain good conjoined to the privation of another good. Thus the end of the intemperate man is not indeed to be without the good of reason, but the sensible delectation without the order of reason. Hence evil, insofar as it is evil, is not a constitutive difference, but only by reason of the good that is adjoined

Et per hoc etiam patet responsio ad tertium. For there the Philosopher speaks of good and evil according as they are found in moral matters. Thus indeed a mean is found between good and evil, in that good is said to be what is ordered, but evil what is not only without order, but is also harmful to another. Hence the Philosopher says in Ethics IV that the prodigal is indeed foolish, but not evil.[1184] From this evil also, which is according to custom or moral manner, it sometimes happens that there is a return to good; but not from every evil: for there is not from blindness a return to sight, although blindness is a certain evil.

Ad quartum dicendum, that something is said to act in a threefold way. In one way, formally, in the mode of speaking in which one says that whiteness makes white. And thus evil even by reason of its very privation is said to corrupt good, because it is the very corruption or privation of good. In another way, something is said to act effectively, as the painter is said to make the wall white. In a third way, after the mode of final cause, as the end is said to cause by moving the efficient cause. But in these latter two ways evil does not act on anything per se, that is, according as it is a certain privation, but according as a good is adjoined to it. For every action is from some form, and everything that is desired as an end is some perfection. And therefore, as Dionysius says in book 4, chapter On the Divine Names, evil neither acts nor is desired except by the power of an adjoined good. Per se, however, it is infinite, and outside will and intention

Ad quintum dicendum, that, as above was said, the parts of the universe have an order toward one another in that one acts upon another, and is the end of another, and its exemplar. But these, as was said, cannot befit evil except by reason of an adjoined good. Hence evil neither pertains to the perfection of the universe, nor is it included under the order of the universe except per accidens, that is, by reason of the adjoined good

Notationes circa Articulum.

Conclusio est, Evil is the absence of good.

For the explication of this article, and of this whole question, it is to be observed first, that here we are not disputing about evil universally, as it is something common to moral evil, that is, sin, and to natural evil, but only about natural evil; and even of this we speak in a twofold way, as of good, as we noted in disputation 23, chapters 2 and 5: for either we speak of evil in itself and absolutely, or with respect to another. In the former way Augustine everywhere contends against the Manichee, to prove that no nature, that is, substance, is evil: for Augustine takes nature for substance whenever he proves against the Manichee that no nature is evil, as we will show below, q. 71, a. 6, and q. 79, a. 1. For the Manichee did not err in saying that some act, or some quality, is evil for someone; but because he thought that certain substances, insofar as they are substances, are substantially evil. And against this Augustine argues in book 2 On the Morals of the Manichees,

1184. Aristotle, Nicomachean Ethics IV, c. 1 (at the middle).

from chapter 1 to 8, and in the book On the Nature of the Good, chapter 16. In this same sense Dionysius, book 4 of On the Divine Names, Ambrose, in the book On Isaac and the Soul, chapter 7, Nyssenus in homily 2 on the Canticles, Basil, in the homily That God Is Not the Author of Evils, and the other Fathers are to be understood, when they assert that evil is not some subsisting thing, nor some nature. For they speak of evil which is opposed to the good reciprocated with being, and to its affection. For since this is the integrity of the thing itself, as we showed in disputation 23, evil must be in the privation of mode, or of species, or of order, as in the same place, cap. 4, we proved out of Augustine.[1185][1186]

Then note from Augustine, book 2 On the Morals of the Manichees, chapter 8, that no nature, that is, substance, is evil in itself; but something can be evil with respect to another, because it harms it: he understands this from the event, because it does something against the natural disposition of that thing. Whether this relative malice is found also in natural qualities, so that those qualities are not only said to be evil for something by reason of the privation which they effect in the subject, but also in themselves, because in themselves they are contrary to that thing, we shall say in the Prima Secundae, q. 71, a. 6.

Articulus II - Whether evil is found in things

Objicitur 1. It seems that evil is not found in things. Whatever is found in things either is some being, or is a privation of something, which is non-being. But Dionysius says in book 4, chapter On the Divine Names, that evil is distant from what exists, and yet more distant from non-being. Therefore evil in no way is found in things.[1182]

Objicitur 2. Furthermore, being and thing are convertible. If therefore evil is a being in things, it follows that evil is some thing. Which is against the foregoing.

Objicitur 3. Furthermore, that is better which is more unmixed with its contrary; as is said in book 3 of the Topics of Aristotle: therefore also that is better which is less mixed with evil. But God makes a thing according to what is better, much more than nature. Therefore in things created by God nothing evil is found.[1187]

Sed contra est, that according to this all prohibitions and penalties would be removed, which are nothing but of evils.

Respondeo dicendum, that, as was said above, the perfection of the universe requires that there be inequality in things, so that all degrees of goodness may be filled up. Now one degree of goodness is that something be so good that it can never fail; another, that something be so good that it can fail from good, which degree also is found in existence itself. For there are some things which cannot lose their existence, as the incorruptible; and there are others which can lose it, as

1185. Vazquez, Disputatio 23, esp. c. 2 and c. 4, where he treats good and evil under mode, species, and order, with Augustine's texts.

1186. St. Ambrose, De Isaac et anima, c. 7; St. Gregory of Nyssa, Homilia II in Canticum; St. Basil, Homily Quod Deus non est auctor malorum; cf. also St. Augustine, De moribus Manichaeorum, l. 2, cc. 1 - 8; De natura boni, c. 16.

1182. Pseudo-Dionysius, De divinis nominibus, IV, cap. 4.

1187. Aristotle, Topics III.

the corruptible. Thus therefore the perfection of this universe requires that there be not only incorruptible beings, but also corruptible beings; likewise the perfection of the universe requires that there be certain things which can fail from goodness, and that which follows upon this, that they sometimes do fail. But in this consists the notion of evil, namely, that something fails from good. Whence it is manifest that evil is found in things, as also corruption; for corruption itself is a certain evil.

Ad primum ergo dicendum, that evil is distant from being simply, and from non - being simply: for neither is it, as being is; nor is it pure negation, as non - being simply is; but it signifies a privation, which indeed is non - being, yet in a subject

Ad secundum dicendum, that, as is said in Metaphysics V, being is said in a twofold way. In one way, according as it signifies the entity of a thing, as it is divided by the ten predicaments, and thus it is convertible with thing. And in this way no privation is a being; and thus neither is evil. In another way, being is said to signify the truth of a proposition, which consists in composition; whose mark is this verb "is." And this is that "is" which is answered to the question "whether it is." And thus we say that blindness is in the eye, or any other privation. And in this way also evil is called a being. But through ignorance of this distinction, some, considering that certain things are called evil, or that evil is said to be in things, believed that malice was some thing

Ad tertium dicendum, that God is nature, and, as any agent, makes what is better in the whole; but not what is better in any given part, except by an order to the whole, as was said above. But the whole itself which is the universe of creatures is better and more perfect if in it there are those things which can fail from good, than if this were not permitted. And thus providence is not to destroy nature, but to save it, as Dionysius says, book 4, chapter On the Divine Names. Nature itself before the nature of things has this, that those which can fail, do sometimes fail. Both because, as Augustine says in the Enchiridion, God is so powerful that He can even make good things out of evils. Whence many goods would be taken away if God permitted no evil to exist. For fire would not be generated unless air were corrupted. Nor would the life of the lion be preserved unless animals were slain. Nor would justice be praised, if iniquity did not exist; nor patience bearing [injury], if injustice did not exist

Conclusio est affirmans.

Articulus III - Whether evil is in good as in a subject

1. Furthermore. Being and thing are convertible. If therefore evil is a being in things, it follows that evil is a certain thing. Which is against what was said above.
2. Furthermore. The whiter is that which is more unmixed with black, as is said in the Topics, book 3; therefore that is also better which is more unmixed with evil. But God makes that which is better, and much more than nature. Therefore, in the things created by God, no evil is found.[1190]

1190. Aristotle, Topics III; cf. also the common maxim that the purer white is the less mixed with black.

But on the contrary: according to this, all prohibitions and punishments would be removed, which are nothing but of evils.

I answer that, as was said above, the perfection of the universe requires that there be inequality in things, that all the grades of goodness may be filled. Now one grade of goodness is that something be so good that it can never fail. Another grade of goodness, however, is that something be so good that it can fail from the good; and this grade too is found in being itself. For there are some things which cannot lose their being, as incorruptible things; and there are others which can lose it, as corruptible things. Therefore, just as the perfection of the totality of things requires that there be not only incorruptible beings, but also corruptible ones, so too the perfection of the universe requires that there be certain things which can fail from goodness, from which it follows that they do sometimes fail. But in this consists the notion of evil, namely that something fails from the good. Whence it is manifest that evil is found in things, just as also is corruption. For even corruption itself is a certain evil.

Reply to the first: Evil is distant from being simply and from non-being simply: because it is neither like a habit, nor like a pure negation, but like a privation (privatio).

Reply to the second: As is said in Metaphysics V, "being" is said in two ways. In one way, according as it signifies the entity of a thing, as divided by the ten categories; and thus it is convertible with "thing." And in this way no privation is a being; hence neither is evil. In another way something is called a being, which signifies the truth of a proposition, which consists in composition, whose sign is this verb "is"; and this is the being by which one answers the question "whether it is." And thus we say that blindness is in the eye, or any other privation whatsoever. And in this way even evil is called a being. Because of ignorance of this distinction, some, considering that certain things are called evil, or that evil is said to be in things, believed that evil was a certain thing.[1191]

Reply to the third: God and nature, and whatever agent, make that which is better as regards the whole, but not that which is better in each single part, except through an order to the whole, as was said above. But the whole itself, which is the universe of creatures, is better and more perfect if in it there are certain things which can fail from the good; and these sometimes do fail, God not hindering this. First, because it is not of providence to destroy nature, but to save it, as Pseudo-Dionysius says in book 4 of On the Divine Names. And the very nature of things has this, that those which can fail do sometimes fail. Next, because, as St. Augustine says in the Enchiridion, God is so powerful that He can also make good out of evils. Hence many goods would be taken away if God permitted no evil to be. For fire would not be generated unless air were corrupted; nor would the life of the lion be preserved unless the ass were killed; nor would avenging justice be praised, nor patience that endures, if iniquity did not exist.[1192]

The conclusion is affirmative.

1191. Aristotle, Metaphysics V, on the manifold senses of "being."
1192. Pseudo-Dionysius, De divinis nominibus IV, c. 4; St. Augustine, Enchiridion, c. 11.

Whether evil is in good as in a subject

Objection 1. It seems that evil is not in good as in a subject. For all things that are good are beings. But Pseudo-Dionysius says in On the Divine Names, book 4, that evil is neither a being nor in beings. Therefore evil is not in good as in a subject.[1193]

Objection 2. Furthermore. Evil is not a being; but good is a being. But non-being, taken negatively, does not require a being in which it may be as in a subject. Therefore neither does evil require a good in which it may be as in a subject.

Objection 3. Furthermore. One of contraries is not the subject of the other. But good and evil are contraries. Therefore evil is not in good as in a subject.

Objection 4. Furthermore. That in which whiteness is as in a subject is said to be white. Therefore also that in which evil is as in a subject is evil. If therefore evil is in good as in a subject, it follows that the good is evil, against that which is said in Isaiah 5: "Woe to you who call evil good, and good evil."

But on the contrary: St. Augustine says in the Enchiridion that evil is not except in good.[1194]

I answer that, as was said above in the first article of this question, evil imports the removal of good. Not, however, is every removal of good called evil. For the removal of good can be taken both privatively and negatively. The removal of good, taken negatively, does not have the character of evil. Otherwise it would follow that those things which in no way are, would be evil; and again, that any thing would be evil from this, that it does not have the good of another thing: as if a man were evil because he does not have the swiftness of the roebuck or the strength of the lion. But the removal of good, taken privatively, is called evil, as the privation of sight is called blindness. Now the subject (subiectum) of privation and of form (forma) is one and the same, namely a being in potency (potentia): whether it be a being in potency simply, as prime matter, which is the subject of the substantial form and of the opposite privation; or a being in potency in a certain respect and in act (actus) simply, as a diaphanous body, which is the subject of darkness and of light. But it is manifest that the form by which something is in act is a certain perfection and a certain good; and thus every being in act is a certain good. And likewise every being in potency, as such, is a certain good, insofar as it has order to the good: for as it is a being in potency, so too it is a good in potency. It remains therefore that the subject of evil is good.

Reply to the first: Pseudo-Dionysius understands that evil is not in beings as a part, or as the natural property of some being.

Reply to the second: Non-being, taken negatively, does not require a subject; but privation is a negation in a subject, as is said in Metaphysics IV. And such a non-being is evil.[1195]

Reply to the third: Evil is not in the good which is its opposite as in a subject, but in some other good. For the subject of blindness is not sight, but the animal. It seems, however, as Augustine says, that here the rule of the dialecticians fails, which says that contraries cannot be together.

1193. Pseudo-Dionysius, De divinis nominibus, IV, c. 4.
1194. St. Augustine, Enchiridion, c. 13 - 14.

This, however, must be understood according to the common acceptation of good and evil, and not according to that whereby this good and this evil are taken specially. For white and black, sweet and bitter, and contraries of this sort are taken only specially, because they are in certain determinate genera. But "good" runs through all genera. Hence one good can be together with the privation of another good.

Reply to the fourth: What the Prophet imprecates, "Woe to them who say that what is good, as it is good, is evil," does not follow from the premises, as is clear from what has been said.

The conclusion is affirmative, and it is to be understood of evil absolutely, and not relatively, which consists in the privation (privatio) of some entity. For since this privation is in some entity as in a subject, it follows that evil is in good, not indeed in that good which is its opposite, but in another, as in a subject.

Articulus IV - Whether evil corrupts the whole good

Objection 1. To the fourth we proceed thus. It seems that evil corrupts the whole good. For one of contraries is wholly corrupted by the other. But good and evil are contraries. Therefore evil can corrupt the whole good.

Objection 2. Furthermore. Augustine says in the Enchiridion that evil harms inasmuch as it takes away good. But good is like itself and uniform. Therefore it is wholly taken away by evil.

Objection 3. Furthermore. Evil, as long as it is, harms and takes away good; but that from which something is always taken away is at some time consumed, unless it be infinite, which cannot be said of any created good. Therefore evil wholly consumes good.

But on the contrary: Augustine says in the Enchiridion that evil cannot wholly consume good.[1196]

I answer that, evil cannot wholly consume good. For the evidence of this, it must be considered that there is a threefold good. One is the good which is wholly taken away by evil, and this is the good opposed to evil: as light is wholly taken away by darkness, and sight by blindness. Another good is that which is neither wholly taken away by evil, nor diminished, namely the good which is the subject of evil: for by darkness nothing of the substance of air is diminished. Yet another good is that which is indeed diminished by evil, but not wholly taken away; and this good is the aptitude of the subject for act. Now the diminution of this good is not to be taken according to subtraction, as is diminution in quantities, but according to remission, as is diminution in qualities and forms. And the remission of this aptitude is to be taken as contrary to its very intention. For such an aptitude is intended by the dispositions by which matter is prepared for act: which the more they are multiplied in the subject, the more apt it is to receive a perfection and a form; and conversely, it is remitted by contrary dispositions. And the more these contrary dispositions are multiplied in matter and more intensified, the more the potency to act is remitted. If therefore contrary dispositions cannot be multiplied and intensified to infinity, but only up to a certain term, neither

1195. Aristotle, Metaphysics IV; cf. also V and X, on negation, privation, and contraries.
1196. St. Augustine, Enchiridion.

is the aforesaid aptitude diminished or remitted to infinity, as is clear in the active and passive qualities of the elements. For coldness and moistness, through which the aptitude of matter for the form of fire is diminished or remitted, cannot be multiplied to infinity. But if, on the other hand, contrary dispositions can be multiplied to infinity, and the aforesaid aptitude is diminished or remitted to infinity, still it is not wholly taken away: because it always remains in its root, which is the substance of the subject. Thus, if opaque bodies are interposed to infinity between the sun and the air, the aptitude of the air for light will be diminished to infinity; yet it will never be wholly taken away so long as the air remains, which according to its nature is diaphanous. Likewise, an addition of sins can be made to infinity, by which the aptitude of the soul for grace is ever more and more diminished. And these sins are, as it were, obstacles interposed between us and God, according to that of Isaiah 59: "Our sins have divided between us and God." Yet the aforesaid aptitude is not wholly taken away from the soul, because it always remains in its root, which is the substance of the soul.

Reply to the first: The good which is opposed to the evil is taken away totally; but the other goods are not taken away totally, as has been said.

Reply to the second: The aforesaid aptitude is a mean between the subject and the act. Hence on that side on which it touches the act, it is diminished by evil; but on that side on which it keeps with the subject, it remains. Therefore, although the good in itself is uniform, nevertheless, on account of its comparison to diverse things, it is not taken away totally, but in part.

Reply to the third: Certain persons, imagining the diminution of the aforesaid good after the likeness of the diminution of quantity, said that as the continuum is divided to infinity by a division according to the same proportion - so that, for instance, the mean of the mean is taken, or the third of the third - so in the present matter it happens. But this reasoning has no place here, because in a division in which the same proportion is preserved, that which is subtracted is always less: for the mean of the mean is less than the mean of the whole. But the second sin does not of necessity diminish the aforesaid aptitude less than the preceding, but perhaps equally, or even more. Therefore it must be said that, although this aptitude is something finite, nevertheless it is diminished to infinity, not of itself, but per accidens, according as the contrary dispositions also are increased to infinity, as has been said.

Conclusion: Evil wholly consumes the good to which it is opposed; not, however, the good in which, as in a subject, it is. You have this conclusion explained above in Disputation 23, chapter 5; and in what sense moral evil consumes every moral goodness to which it is opposed, so that there is malice in the thing done, will be explained in I - II, question 72, article 2. Moreover, in what way the place of Aristotle is to be understood, Ethics, book 4, chapter 5, where he says: if evil were entire, it would be intolerable, we shall say in volume 2, question 73, article ...[1197]

1197. Disputation 23, c. 5; cf. also I - II, q. 72, a. 2. As to Aristotle, Ethics IV, c. 5, "if evil were entire, it would be intolerable": see volume 2, q. 73, a....

Articulus V - Whether evil is sufficiently divided into fault and punishment

It is objected that: It seems that evil is not sufficiently divided into punishment and fault. For every defect seems to be a sort of evil. But in all creatures there is a certain defect, namely, that they cannot conserve themselves in existence, which, however, is neither punishment nor fault. Therefore evil is not sufficiently divided into punishment and fault.

1. Further, in irrational things neither fault nor punishment is found; yet in them corruption and defect are found, which pertain to the notion of evil. Therefore not every evil is punishment or fault.
2. Further, temptation is a certain evil. Yet it is not fault, because a temptation to which consent is not given is not sin, but the matter for the exercise of virtue, as is said in the Gloss on 2 Corinthians 12. Nor is it punishment, because temptation precedes fault; but punishment follows upon it. Therefore evil is insufficiently divided into punishment and fault.[1198]

But on the contrary: It seems that the division is superfluous. For St. Augustine says in the Enchiridion that evil is so called because it hurts; but whatever hurts is penal. Therefore every evil is contained under punishment.[1199]

I answer that: Evil (privation) is a privation (*privatio*) of good, and not a mere negation, as was said above; it is constituted principally and per se in perfections and act (*actus*). Now act is twofold, first and second. The first act is the form and integrity of the thing; but the second act is operation. It happens, therefore, that evil is twofold. In one way, by the subtraction of the form or of some part which is required for the integrity of the thing, as blindness is an evil, and the being without a member. In another way, by the subtraction of due operation: either because it is altogether lacking, or because it does not have its due mode and order. But since the good simply is the object of the will, the evil which is the privation of good, according to a special notion, is found in rational creatures having will. Therefore evil which is by the subtraction of the form and integrity of the thing has the nature of punishment; and especially on the supposition that all things are subject to divine providence and justice, as was shown above.[1200] For it belongs to the notion of punishment to be contrary to the will. But the evil which consists in the subtraction of due operation in voluntary matters has the nature of fault. For this is imputed to someone as fault, when he fails in perfect action of which he is master according to his will. Thus, therefore, every evil considered in voluntary matters is punishment or fault.

Reply to the first: Because evil is a privation of good, and not pure negation, as was said above, not every defect of good is evil, but the defect of a good which is naturally apt and due to be had. For the defect of vision is not an evil in a stone, but in an animal; because it is contrary to the

1198. Gloss on 2 Corinthians 12; cf. the Glossa ordinaria ad locum.
1199. St. Augustine, Enchiridion, c. 12.
1200. See above, q. 22, a. 2, on the subjection of all things to divine providence and justice.

nature of a stone to have vision. Similarly, it is contrary to the nature of a creature to be conserved in being by itself, because the same that gives being also conserves. Hence that defect is not an evil of the creature.

Reply to the second: Punishment and fault do not divide evil simply, but evil in voluntary matters.

Reply to the third: Temptation, insofar as it imports a provocation to evil, is always an evil of fault in the tempter; but in him who is tempted it is not evil properly, except insofar as he is in some way changed. For thus the action of the agent is in the patient. But insofar as the tempted is changed into evil by the tempter, he falls into fault.

Reply to the fourth: It belongs to the notion of punishment that it hurts the agent in himself. But it belongs to the notion of fault that it hurts the agent in his action. And thus each is contained under evil, according to what it has of the notion of hurt.

Note on the article.

The conclusion is affirmative. Concerning it, however, it must be observed that when we say that evil is sufficiently divided into fault and punishment, this is not to be understood as though punishment in the other member were to be taken formally according to its relation to fault; for many evils can be natural which are not anyone's punishment. Rather, punishment ought to be taken for an evil which can be punishment, if it be inflicted on someone for fault: for fault is such an evil that it is not itself punishment by reason of moral malice, as will be explained in I - II, question 87, article 1.

Articulus VI - Whether punishment has more of the notion of evil than fault

To the sixth we proceed thus. It seems that punishment has more of the notion of evil than fault. For fault bears itself to punishment as merit to reward. But reward has more of the notion of good than merit, since reward is its end. Therefore punishment has more of the notion of evil than fault.

1. Further, that is the greater evil which is opposed to the greater good. But punishment, as has been said, is opposed to the good of the agent, fault however to the good of action. Since, therefore, the agent is better than his action, it seems that punishment is worse than fault.
2. Further, the very privation of the end is a certain punishment, which is called the lack of the divine vision. But the evil of fault is through the privation of order to the end. Therefore punishment is a greater evil than fault.

But on the contrary: A wise craftsman introduces a lesser evil in order to avoid a greater, as a physician cuts off a member lest the body be corrupted. But the wisdom of God inflicts punishment in order to avoid fault. Therefore fault is a greater evil than punishment.

I answer that: Fault has more of the notion of evil than punishment. And not only than sensible punishment, which consists in the privation of bodily goods, of which kind many understand punishments; but even taking punishment universally, according as the privation of grace or of glory are certain punishments. Of this there is a twofold reason. The first indeed is that from the evil of fault someone becomes evil, but not from the evil of punishment, according to that of Pseudo-Dionysius: "To be punished is not an evil, but to become deserving of punishment."[1201] And this is because, since the good simply consists in act, and not in potency, and the ultimate act is operation or the use of whatever things are had, the good of man simply is considered in good operation, or in the good use of things had. Now we use all things through the will. Hence from a good will, by which a man uses well the things he has, a man is called good; and from an evil will, evil. For one who has an evil will can also make bad use of the good which he has, as if a grammarian were to speak incongruously voluntarily. Therefore, since fault itself consists in a disorderly act of the will, but punishment in the privation of some of those things which the will uses, fault has more perfectly the notion of evil than punishment. The second reason can be taken from this, that God is the author of the evil of punishment, but not of the evil of fault. The reason of which is that the evil of punishment deprives the creature of a good, whether you take the good of the creature to be something created, if it be blindness depriving of sight; or the uncreated good, as by the lack of the divine vision the uncreated good is taken from the creature. But the evil of fault is properly opposed to the uncreated good. For it is contrary to the accomplishment of the divine will, and to the divine love, by which the divine good is loved in itself, and not only according as it is participated by a creature. Thus, therefore, it is clear that fault has more of the notion of evil than punishment.

Reply to the first: Although fault is terminated at punishment, as merit at reward, nevertheless fault is not intended on account of punishment, as merit on account of reward; but rather conversely punishment is induced that fault may be avoided. And thus fault is worse than punishment.

Reply to the second: The order of action which is taken away by fault is a more perfect good of the agent, since it is a second perfection, than the good which is taken away by punishment, which is a first perfection.

Reply to the third: The comparison of fault to punishment is not as of the end and of order to the end: because each can be privated in some way both by fault and by punishment. But by punishment indeed, according as the man himself is removed from the end and from order to the end. By fault, however, according as that privation pertains to the action which is not ordered to its due end.

Conclusion: The greater evil is fault than punishment. The holy Doctor proves the tail-piece by a double reason which he has in the text.

1201. Pseudo-Dionysius, De divinis nominibus, IV, c. 4: "Puniri non est malum, sed fieri poena dignum."

Quaestio XLIX - On the cause of evil

Consequently it is asked concerning the cause of evil. And about this three things are asked.

Articulus I - Whether the good can be the cause of evil

Objicitur: It seems that the good cannot be the cause of evil. For it is said in Matthew 7: "A good tree cannot bear evil fruits."

1. Moreover, one of contraries cannot be the cause of the other. But evil is contrary to good. Therefore the good cannot be the cause of evil.
2. Moreover, a deficient effect does not proceed except from a deficient cause; but evil, if it have a cause, is a deficient effect. Therefore it has a deficient cause. But every deficient thing is evil. Therefore the cause of evil is nothing but evil.
3. Moreover, Pseudo-Dionysius says in De divinis nominibus IV that evil has no cause.[1202] Therefore the good is not the cause of evil.

Sed contra: Augustine says against Julian: "There would not at all have been any whence evil could arise, except from good."[1203]

Respondeo: I answer that it is necessary to say that every evil has a cause in some way. For evil is the privation of a good that is naturally had and ought to be had. But that something fall short of its natural and due disposition cannot come about except from some cause that brings the thing outside its disposition. For a heavy thing is not moved upward unless by something impelling it. Nor does an agent fail in its action except because of some impediment. Now to be a cause can belong only to the good, because nothing can be a cause except insofar as it is a being. But every being, as of this sort, is good. And if we consider the specific notions of causes, the agent and the form and the end import a certain perfection which pertains to the notion of good. And even matter, insofar as it is potency (*potentia*) to good, has the notion of good. And as regards the material cause, it already follows from what has been said that the good is the cause of evil by the mode of material cause; for it has been shown that the good is the subject of evil. But evil does not have a formal cause; rather it is more the privation of form. And similarly it does not have a final cause; rather it is the privation of order (*ordo*) to the due end. For not only does the end have the notion of good, but also the useful which is ordered to the end. But evil has a cause by the mode of an agent, not however per se, but per accidens. To make this evident, one must know that evil is caused in one way in an action and in another way in an effect. In action, indeed, evil is caused because of a defect of some principles of action, whether of the principal agent or of an instrument. Thus a defect in the movement of an animal can occur either because of weakness of the motive power, as in children, or because of sheer unfitness of the instrument, as in the lame. But evil is caused in a thing, yet not in the proper effect of the agent, sometimes from the power of the agent,

1202. Pseudo-Dionysius, De divinis nominibus, IV.
1203. St. Augustine, Contra Iulianum.

sometimes from the defect of the agent itself or of the matter. From the power or perfection of the agent, when along with the form intended by the agent there follows of necessity the privation of another form; as along with the form of fire there follows the privation of the form of air or of water. Thus, the more perfect the fire is in power, the more perfectly it impresses its own form, and likewise the more perfectly it corrupts the contrary. Whence the evil and corruption of air and water is from the perfection of fire; but this is per accidens, because fire does not intend to deprive water of its form, but to induce its own proper form; yet in doing this it also causes that other thing per accidens. But if there be a defect in the proper effect of fire, for example that it fail in heating, this is either because of a defect of the action, which redounds into the defect of some principle, as has been said, or from the indisposition of the matter, which does not receive the action of the acting fire. But even this very fact, that something is defective, happens to the good, to which it belongs per se to act. Whence it is true that evil has no cause except in the good, insofar as it is a being.

Conclusio: The good is the cause of evil per accidens; and this indeed is to be understood also absolutely of natural evil. For since it is a corruption, and this happens per accidens, evil too in this way is per accidens. But moral evil, under the formal aspect of evil, is also per accidens, as we shall say in I - II, q. 79, a. 1 - 2.[1204]

Ad primum: As Augustine says against Julian, the Lord calls an evil tree the evil will, and a good tree the good will. From a good will, however, a morally evil act is not produced, since from the will itself being good the moral act is judged good. Yet the very movement of a bad will is caused by the rational creature, which is good. And thus it is a cause of evil

Ad secundum: The good does not cause that evil which is contrary to itself, but a certain other. Thus the goodness of fire causes the evil of water, and a man good according to his nature causes an evil act according to morals. And this itself is per accidens, as has been said. And it is also found that even one of contraries causes the other per accidens, as when the cold external ambient heats, insofar as heat is withdrawn to the interior

Ad tertium: Evil has a deficient cause differently in voluntary matters and in natural. For a natural agent produces its effect such as it is itself, unless it be impeded by something extrinsic; and this itself is a certain defect of it. Whence evil never follows in the effect unless some other evil pre - exist in the agent or in the matter, as has been said. But in voluntary matters the defect of action proceeds from a will defective in act, insofar as it does not subject itself to the rule of its act. Yet such a defect is not fault (*culpa*), but fault follows from this, that with such a defect one acts

1204. See I - II, q. 79, a. 1 - 2.

Ad quartum: Evil does not have a cause per se, but only per accidens, as has been said

Articulus II - Whether the highest good, which is God, is the cause of evil

Objicitur: It seems that the highest good, which is God, is the cause of evil. For it is said in Isaiah 45: "I am the Lord, and there is no other God, forming light and creating darkness, making peace and creating evil"; and in Amos 3: "Shall there be evil in the city which the Lord has not done?"

1. Moreover, the effect of a secondary cause is reduced to the first cause. But the good is the cause of evil, as has been said. Since, therefore, every good cause is God, as was shown above, it follows that every evil is also from God.
2. Moreover, as is said in Physics II, "the same thing is the cause of a ship's safety and its peril."[1205] But God is the cause of the safety of all things. Therefore he is himself the cause of every perdition and evil.

Sed contra: Augustine says in the book On 83 Questions that God is not the author of evil, because he is not the cause of tending to non-being.[1206]

Respondeo: I answer that, as is clear from what has been said, the evil which consists in a defect of action is always caused from a defect of the agent. But in God there is no defect, but supreme perfection, as was shown above. Whence the evil which consists in a defect of action, or which is caused from a defect of the agent, is not reduced to God as cause. But the evil which consists in the corruption of certain things is reduced to God as cause; and this is clear both in natural and in voluntary matters. For it is distinct that some agent, insofar as by its own power it produces some form, along with which there follows corruption and defect, by its power causes that corruption and defect. Now it is manifest that the form which God principally intends in created things is the good of the order (*ordo*) of the universe. But the order of the universe requires, as was said above, that there be certain things which are able to fail, and that sometimes they do fail. And thus God, in causing the good of the order of the universe in things, consequently and as it were per accidens causes the corruptions of things, according to that which is said in 1 Kings 2: "The Lord kills and makes alive." But it is said in Wisdom 1: "God did not make death, nor does he rejoice in the destruction of the living." Now to the order of the universe pertains the order of justice, which requires that punishments be inflicted on sinners. And in this respect God is the author of the evil which is punishment (*poena*), not however of the evil which is fault, for the reason set out above.

1205. Aristotle, Physics II.
1206. St. Augustine, De diversis quaestionibus octoginta tribus.

Ad primum: The authorities speak there of the evil of punishment, not however of the evil of fault

Ad secundum: The effect of a secondary deficient cause is reduced to the first cause, so far as what it has of entity and of perfection is concerned; not, however, so far as what it has of defect is concerned. Thus any motion in a limp is reduced to the motive power; this is obliquity in itself, not from the power of movement, but from the crookedness of the leg. And likewise, whatever there is of entity and of action in a sinful action is reduced into God, insofar as he is its cause; but what there is of defect is not reduced to God as cause, but to the deficient secondary cause

Ad tertium: As is said in Physics II, the same thing is the cause of a ship's safety and its peril, yet per accidens. But the things that are from us called evil are not from God per se, but per accidens as regards the intention of the agent. For God does not fail in acting so that what is necessary for salvation be lacking. Whence it is not similar

Notatio circa articulum. Conclusion: God is the cause of evil which is, or can be, punishment, but he is not the cause of evil which is fault. Of the latter part something must be said in that question 79, a. 1 and 2. As to the former, note that God is so the cause of punishment that nothing which is not fault proceeds from him, and directly from his will, as we explained above in Disputation 75, the last chapter, except that the evils which are to some a punishment God is not said to will by a preceding will and in himself, but by a consequent will, with the occasion taken from us, as was said above in Disputation 83, chs. 4 and 5.[1207]

Articulus III - Whether there is one highest evil which is the cause of all evil

Objicitur: It seems that there is one highest evil which is the cause of all evil. For the effects of contraries are contrary. But in things contraries are found, according to Ecclesiasticus 33: against the greatest good is the greatest evil, and against life is death; so too against the highest virtue is the sinner. Therefore there are set two first principles: one of good and one of evil.

1. Moreover, if one of contraries is in the nature of things and of religion, as is said in 2 On the Heavens and the World, then the highest good is in the nature of things, which is the cause of all good, as was shown above. Therefore there will also be a highest evil, opposite to it, the cause of all evil.[1208]
2. Moreover, just as in things are found good and better, so also evil and worse; but good and better are said with respect to adoption; likewise evil and worse are said with respect to some highest evil. Therefore one should find some highest evil which is the cause of all evil.

1207. Above, Disputation 75, last chapter; and Disputation 83, chs. 4 - 5.
1208. Aristotle, De caelo et mundo II.

3. Moreover, everything which is reduced by participation to another is reduced to that which is per se and by essence. But the evils which are found among us are not evil by essence, but by participation. Therefore one should find some evil which by essence is the cause of all evil.

This is evident both in natural things and in voluntary ones. For it is one thing that some agent, insofar as by its own power it produces some form to which there follows corruption and defect, should by its own power cause that corruption and defect. Now it is manifest that the form which God principally intends in created things is the good of the order of the universe. But the order of the universe requires, as was said above, that there be certain things which can fail, and sometimes do fail. And thus, in causing the good of the order of the universe, God consequently, and as it were per accidens, causes the corruptions of things, according to that which is said in 1 Kings 2: "The Lord kills and makes alive." But what is said in Wisdom 1, that "God did not make death," is to be understood as meaning that He did not intend it as per se. Moreover, to the order of the universe pertains the order of justice, which requires that to sinners punishment be inflicted. And according to this, God is the author of the evil which is punishment, but not of the evil which is fault, for the reason stated above.

Reply to the first: Those authorities speak of the evil of punishment, not, however, of the evil of fault.

Reply to the second: The effect of a secondary deficient cause is reduced to the first cause not deficient, as to that which it has of entity and perfection; but not as to that which it has of defect. Thus, whatever there is of motion in a limp is caused by the motive power; but that which is of obliquity in it is not from the motive power, but from the curvature of the leg. And similarly, whatever there is of entity and action in an evil action is reduced to God as its cause; but that which there is of defect is not caused by God, but from a secondary cause deficient.

Reply to the third: The sinking of a ship is attributed to the sailor as cause, from the fact that he did not do what was required for the ship's safety. But God does not fail in doing what is necessary for salvation. Hence the case is not similar.

Note around the article: The conclusion is that God is the cause of the evil which is punishment, yet not of the evil which is fault. Concerning the latter part it must be said in its proper question. As to the former, note that God is the cause of punishments in such wise that whatever things are a punishment to someone are not willed by Him by antecedent will, but by consequent will, on the occasion taken from our sins, as was said above.

Whether there is one highest evil, which is the cause of all evil

It is proceeded to the third as follows. It seems that there is one highest evil which is the cause of all evil.

1. For of contrary effects there are contrary causes. But contrariety is found in things, according to that of Ecclesiasticus 33: "Against evil is good, and against life death. So also against a just man a sinner." Therefore the principles are contraries: one of good, and another of evil.[1209]
2. Moreover, if one of contraries is in the nature of things, so also the other, as is said in On the Heavens and the World II.[1210] But the highest good is in the nature of things, which is the cause of all good, as was shown above. Therefore there is also a highest evil, opposed to it, the cause of all evil.
3. Moreover, just as in things are found good and better, so also evil and worse; but good and better are said with respect to the best; therefore evil and worse are said with respect to some highest evil.
4. Moreover, everything which is by participation is reduced to that which is by essence. But the things which are evil among us are not evil by essence, but by participation. Therefore there must be found some highest evil which is the cause of all evil.
5. Moreover, everything which is per accidens is reduced to that which is per se. But good is the cause of evil per accidens. Therefore one ought to posit some highest evil which is the cause of evils per se. Nor can it be said that evil has no cause per se, but only per accidens; for it would follow that evil would not be as it were in the more frequent case, but only in the less frequent.
6. Moreover, an evil effect is reduced to an evil cause: because a deficient effect is from a deficient cause, as was said above. But it does not proceed to infinity. Therefore one ought to posit one first evil which is the cause of all evil.

But on the contrary: The highest good is the cause of all being, as was shown above. Therefore there cannot be some principle opposed to it which would be the cause of evils.

I answer that: From the foregoing it is clear that there is not one first principle of evils, as there is one first principle of goods. First indeed, because the first principle of goods is good by essence (*per essentiam*), as was shown above. But nothing can be evil by its essence. For it has been shown that every being, insofar as it is a being, is good, and that evil is only in good as in a subject. Second, because the first principle of goods is the highest and most perfect good, which possesses beforehand in itself every goodness, as was shown above. But the highest evil cannot be; for, as was shown, although evil always diminishes good, nevertheless it can never totally consume it. And thus, good always remaining, there cannot be anything entirely and perfectly evil. Hence the

1209. Ecclesiasticus 33:15 - 16.
1210. Aristotle, De caelo et mundo II, text 18.

Philosopher says in Ethics IV that if evil were complete, it would destroy itself: because when all good is destroyed which is required for the integrity of evil, evil itself is also taken away, whose subject is good.[1211] Third, because the notion of evil is repugnant to the notion of a first principle: both because evil is caused from good, as was shown above, and because evil cannot be a cause except per accidens. And thus it cannot be a first cause, because a cause per accidens is posterior to that which is per se, as is clear in Physics II.[1212] But those who posited two first principles, one good and the other evil, fell into this error from the same root whence also other alien positions had their rise: namely, because they did not consider the universal cause of the whole of being, but only particular causes of particular effects. For this reason, if they found something to be harmful to any thing by the virtue of its nature, they judged the nature of that thing to be evil; for instance, if someone should say that the nature of fire is evil, because it burned the house of some poor man. But judgment about the goodness of any thing is not to be taken according to its order to something particular, but according to itself, and according to the order to the whole universe, in which each thing most orderly holds its own place, as is clear from what has been said. Similarly also those who found, for two particular contrary effects, two contrary particular causes, did not know how to reduce the particular contrary causes to a universal common cause. And therefore they judged that contrariety in causes extends up to the first principles. But since all contraries agree in one common thing, it is necessary that in them, above the proper contrary causes, there be found one common cause. Thus, above the contrary qualities of the elements there is found the power of the heavenly body. And similarly, above all things which are in whatever way, there is found one first principle of existing (*essendi*), as was shown above.

Reply to the first: Contraries agree in one genus, and also agree in the notion of being. And therefore, although they may have particular contrary causes, nevertheless one must come to one first common cause.

Reply to the second: Privation and habit are naturally constituted about the same thing. But the subject of privation is being in potency, as was said. Hence, since evil is the privation of good, as is clear from what has been said, it is opposed to that good to which potency is adjoined, not however to the highest good, which is pure act.

Reply to the third: Each thing is intended according to its proper notion. But just as form is a certain perfection, so privation is a certain removal. Hence every form and perfection and good is measured by access to the perfect term; but privation and evil by recession from the term. Hence evil and worse are not said by access to a highest evil, as good and better are said by access to the highest good.

Reply to the fourth: No being is said to be evil by participation, but by the privation of participation. Hence there is no need for a reduction to something that is evil by essence.

Reply to the fifth: Evil cannot have a cause except per accidens, as was shown above. Hence it is impossible to make a reduction to something which is per se the cause of evil. But what is said, that evil is as it were in the more frequent case, is simply false. For generable and corruptible things, in

1211. Aristotle, Ethica Nicomachea IV, cap. 5: "If evil be complete, it destroys itself."

which alone it happens that there is evil of nature, are a small part of the whole universe. And again, in each species the defect of nature happens in the fewer. Only in men does evil seem to be as in the more frequent case: because the good of man according to the sense of the body is not the good of man as man, but according to reason. But more follow sense than reason.

Reply to the sixth: In the causes of evil it is not to proceed to infinity, but all evils are to be reduced to some good cause, from which evil follows per accidens.

Conclusion denies: as to the error of the Manichees we spoke above, disputation 17, chapter 1; and what the Philosopher means in Ethics IV, chapter 5, when he says "if evil be complete, it destroys itself," will be explained in I - II, question 73, article 2.[121312111214]

Praefatio - Into the treatise on the Angels

After the Holy Doctor has treated of creation in general, he now begins to dispute about the works themselves of creation in particular. And since in this universe the chief creatures are the angels, he begins this whole disputation from their treatment. For this matter, good in part as it was, pertained rather to the philosopher and metaphysician than to the theologian. But because it is handed down so copiously and accurately by the Scholastics that they teach not only all theological matters, and those which subsist solely by revelation, but also philosophical points more exactly than any philosopher, whether Aristotelian or even Platonic, has ever treated them, we will omit nothing of what they have carefully written, but will examine each point by our customary disputations. Nor indeed should this be imputed to us as a fault, since many of those things which seem philosophical can be conducive to understanding those which are theological and of greater moment. Also, because in this matter we must defer much to our Scholastics, for that they have handed down to us things wholly unknown to the philosophers, and worthy to be known, about the nature of the angels and their properties. From which one thing especially becomes clear, namely what we said in the first disputation, that sacred doctrine is necessary as a science not only for supernatural things, but even for acquiring without error the knowledge of natural things: without which the most learned philosophers have left us few writings not altogether free of errors. But since many of those things which the Scholastics have taught about the angels were set down as opinion, nor are they sufficiently certain among them, the plan of our institute demands that, running through particulars as far as can be done, we should warn (and this has also been diligently observed by others in our own time) whether there might be any danger against Holy Scripture or the dogmas of the faith in certain opinions of the Scholastics.

1212. Aristotle, Physica II.
1213. On the Manichaeans, see above, disputation 17, chapter 1.
1211. Aristotle, Ethica Nicomachea IV, cap. 5: "If evil be complete, it destroys itself."
1214. On Aristotle's saying "if evil be complete, it destroys itself," see below, I - II, question 73, article 2.

Quaestio L - On the substance of the angels absolutely

After these things it must be considered about the distinction of the corporeal and spiritual creature. And first about the purely spiritual creature, which in Holy Scripture is named "angel." Second, about the purely corporeal creature. Third, about the creature composed of the corporeal and the spiritual, which is man.

But concerning the angels there is to be considered first the things which pertain to their substance; second, the things which pertain to their intellect; third, the things which pertain to their will; fourth, the things which pertain to their creation. Now concerning their substance, it must be considered absolutely and in comparison to corporeal things. Concerning their substance absolutely, five points are asked.

Articulus I - Whether an angel is altogether incorporeal

It is proceeded thus to the first. It seems that an angel is not altogether incorporeal.

1. For that which is called incorporeal in relation to us, if when compared to God it is found to be corporeal and material, is not incorporeal simply. But Damascene says in book 2 that an angel is called incorporeal and immaterial in relation to us; but compared to God he is found corporeal and material.[1215] Therefore he is not simply incorporeal.
2. Moreover, nothing is moved save a body, as is proved in Physics VI. But Damascene says in the same place that an angel is an intellectual substance always mobile. Therefore an angel is a corporeal substance.[1216]
3. Moreover, St. Ambrose says in the book On the Holy Spirit: "Every creature is circumscribed by the fixed limits of its nature; but to be circumscribed is proper to bodies." Therefore every creature is corporeal. But the angels are creatures of God, as is clear in Psalm 148: "Praise the Lord, all his angels," and afterwards is added: "For he spoke, and they were made; he commanded, and they were created." Therefore the angels are corporeal.[1217]

But on the contrary is what is said in Psalm 103: "Who makes his angels spirits."

I answer that: It must be said that it is necessary to posit some incorporeal creatures. For what God chiefly intends in created things is the good, which consists in assimilation to God. But a perfect assimilation of an effect to its cause is observed when the effect imitates the cause according to that by which the cause produces the effect, as what is hot makes hot. Now God produces the creature by intellect (*intellectus*) and will (*voluntas*), as was said above. Therefore it was necessary that there be creatures endowed with intellect and will, and hence incorporeal.

After these things it must be considered concerning the distinction of corporeal and spiritual creature. And first, concerning the purely spiritual creature, which in Sacred Scripture is named Angel; second, concerning the purely corporeal creature; third, concerning the creature composed

1215. St. John Damascene, De fide orthodoxa, book 2.

of corporeal and spiritual, which is man. But concerning the Angels, it must be considered first about those things which pertain to their substance; second, about those which pertain to their intellect (*intellectus*); third, about those which pertain to their will (*voluntas*); fourth, about those which pertain to their creation. Moreover, about their substance it must be considered absolutely, and in comparison to corporeal things. Concerning their substance absolutely five things are asked.

Whether an Angel is altogether incorporeal

Objicitur, that an Angel is not altogether incorporeal. For that which is incorporeal only with respect to us, not with respect to God, is not simply incorporeal. But St. John Damascene says in book 2 that an Angel is called incorporeal and immaterial with respect to us; but, compared to God, he is found corporeal and material.[1218] Therefore he is not simply incorporeal.

Further, nothing is moved unless it is a body, as is proved in Physics VI, text 32.[1219] But Damascene says in the same place that an Angel is an intellectual substance always mobile. Therefore he is a corporeal substance.

Further, St. Ambrose says in the book On the Holy Spirit that every creature is circumscribed by its own sure limits; but to be circumscribed is proper to body: therefore every creature is corporeal. But Angels are the creatures of God, as is clear in Psalm 148: "Praise the Lord, all his Angels," and later: "He himself said, and they were made; he commanded, and they were created." Therefore Angels are bodies.[1220]

But on the contrary: it is said in the Psalms: "Who makes his Angels spirits."

I answer: It is necessary to posit that there are some incorporeal creatures. For that which God chiefly intends in created things is the good, which consists in assimilation to God. But the perfect assimilation of an effect to its cause is observed when the effect imitates the cause according to that by which the cause produces the effect, as what is hot makes hot. Now God produces the creature by intellect (*intellectus*) and will (*voluntas*), as was shown above. Whence for the perfection of the universe it is required that there be intellectual creatures. But to understand cannot be the act of a body, nor of any bodily power, because every body is determined to the here and now. Hence it is necessary to posit, for this, that the universe be perfected, that there be some incorporeal creature. But the ancients, ignorant of the power of understanding and not distinguishing between sense and intellect, thought that there was nothing in the world except what falls under sense and imagination; and because what does not fall under imagination they thought to be a body, they held that nothing is a being except a body, as the Philosopher says in Physics IV. And from these proceeded the error of the Sadducees, saying there is no spirit. But this very thing, that intellect is higher than sense, reasonably shows that there are some incorporeal things, comprehensible only by intellect.

1216. Aristotle, Physica VI; St. John Damascene, as above.
1217. St. Ambrose, De Spiritu Sancto.
1218. St. John Damascene, De fide orthodoxa, book 2, chapter 3.
1219. Aristotle, Physica VI, text 32.
1220. St. Ambrose, De Spiritu Sancto; Psalm 148:2, 5.

Reply to the first: Incorporeal substances are a mean between God and corporeal creatures. Now a mean, compared to one extreme, seems to be the other extreme, as tepid, compared to hot, seems cold; and for this reason it is said that Angels, compared to God, are material and corporeal, not because there is in them anything of the nature of body.

Reply to the second: Motion there is taken as understanding and willing are called, in a certain way, motions. Hence an Angel is said to be a substance always mobile, because he is always in act understanding; not sometimes in act and sometimes in potency, as we are. Whence it is clear that the argument proceeds on an equivocation.

Reply to the third: To be circumscribed by local limits is proper to bodies; but to be circumscribed by essential limits is common to every creature, as well corporeal as spiritual. Whence Ambrose says in the book On the Holy Spirit, that although certain things are not contained in bodily places, nevertheless they are not without circumscription of substance.[1221]

The conclusion of the article is affirmative. For the confirmation of which we shall say some things in the following disputation.

Now: Whether Angels are incorporeal. Disputation 178.

- Besides the visible creatures there are certain beings abstracted from sensible matter, which we commonly call an Angel. Chapter 1.
- Who have thought Angels to be corporeal. Chapter 2.
- The truer opinion is proved by authority. Chapter 3.
- The same opinion is shown by Scripture and by reason. Chapter 4.
- The foundations of the former opinion are dissolved. Chapter 5.

Disputatio CLXXVIII - On Angels being incorporeal

Caput I - Besides the visible creatures there are certain beings abstracted from sensible matter, which we commonly call an Angel

"Angel," in Greek ἄγγελος, is not, as Hilary in book 5 On the Trinity and Isidore in book 1 of the Sentences, chapter 12, testify, a name of nature but of office; for ἄγγελος in Greek is the same as "nuntius" in Latin, as St. Augustine hands down in expounding the words of Psalm 103: "Who makes his Angels spirits." Dionysius agrees, who in chapter 4 of the Celestial Hierarchy, a little before the middle, says that they are so called because a divine illumination is first in them, and through them it comes to us.[1222] But the ministry of Angels is expressed by Paul to the Hebrews 1: "Are they not all ministering spirits, sent to minister?" Therefore priests too have been called Angels, as if they were go-betweens between God and us: Malachi: "The lips of the priest keep knowledge, for he is the Angel of the Lord of hosts." And John the Baptist for the same reason in

1221. St. Ambrose, De Spiritu Sancto: "quod licet quaedam locis corporalibus non contineantur, circumscriptione tamen substantiae non carent."

1222. Pseudo-Dionysius, De coelesti hierarchia, c. 4; St. Augustine, Enarrationes in Psalmos 103.

Matthew 11 was called by Christ the Angel of the Lord, according to that of Malachi 3: "Behold I send my Angel before your face," as Tertullian says in the book Against the Jews, chapter 9, after the middle.[1223] God is wont to call Angels those whom he has set over the manifestations of his power as ministers. Nay more, Christ himself, Isaiah 9, has been called the Angel of great counsel, as the same Tertullian noted in the book On the Flesh of Christ, chapter 14, by the word of office, not of nature. This is more clearly explained by Dionysius, chapter 4 of the Celestial Hierarchy at the end, because, as Christ himself said, "All things that I have heard from the Father I have announced to you."

Yet the ecclesiastical writers, by the name Angel, understand the spiritual nature itself, besides the rational soul. In this signification Acts 23 uses the same name. But Aristotle and the Peripatetics call Angels separate substances; the Platonists, however, call good angels "daemones," and evil ones "cacodaimones," that is, evil daemons; and so much about the signification of the name.

But that there are such separate substances the Sadducees denied, as Luke relates in Acts 23: they used to say that neither Angel nor spirit exists; and therefore they also denied the resurrection. This was also the error of certain philosophers, as Aristotle testifies in Physics IV, texts 52 and 57.[1224] But it is clear that Angels are of a higher substance than men; although concerning their nature the matter is not so manifest. Thus in Psalm 8: "You have made him a little less than the Angels," and elsewhere very often. And among the ancient Fathers of the Church the matter is beyond controversy. The philosophers also admitted these substances, as Cyprian relates in the book On the Vanity of Idols; thus Aristotle, Metaphysics XII, chapters 6, 7, and 8, called them eternal, immobile, and without magnitude. The same also, On the Heavens book 1, chapter 9, teaches that there are many other intelligences besides the movers of the spheres, as we shall see in disputation 180, chapter 1; and others also, whom we shall report presently.[1225] Blessed Thomas proves the matter in the second book Against the Gentiles, chapter 46, by many physical reasons, which, in my judgment, suitably persuade the matter, although they do not clearly demonstrate it.[1226]

But by this reason alone, taken from experience, it can be shown efficaciously. For many things every day we see done by the possessed beyond their own powers: therefore we are forced to concede that they are moved in all those things by some higher substance; not immediately by God himself - for we shall resort in vain to the first of all causes, if it does not repel the being done by the ministry of another - especially since we see the possessed to be sometimes cured by medicines and by music, at least for some interval of time; certainly not by any other cause than that the demon cannot torture them, unless by stirring up their evil humors; which, if he did not use them, neither could he vex them nor work many wonders in them; but if God were immediately doing those things, he would not be hampered by the humors of bodies; and therefore neither medicine

nor any other bodily remedy would impede the effect of him. But the same is shown still more efficaciously from the works of magicians and enchanters: for the things which we have heard to be done by them, not by slight matters set a-going and by words also uttered, surpass all the power of words and manifestly that of body of any substance whatsoever. Lactantius uses this reason in book 2 of the Divine Institutions, chapter 15; and indeed these things in our own time in Gaul and in England have recalled very many from atheism, who previously, with the Sadducees, used to believe that nothing exists except corporeal things.[1227]

But although Aristotle, besides the intelligences moving the orbs, also teaches that there are other ones: yet concerning demons, who are evil Angels, he seems nowhere to concede. Rather, in section 30 of the Problems, question 1, in the middle, speaking of those who are said to be stirred by divine inspiration, or to grow hot with a lymphatic spirit, he asserts that it happens from a natural intemperance. But Plato in the Politicus about tyrants, and in the Symposium, Xenocrates in the book On Death, Hermes Trismegistus in the Pimander, acknowledged evil angels. And among the ancient Fathers of the Church very many did so. And although it is only by faith that it is evident to us by what reason the demons became evil: yet from their works, which by us in no way can be done, being wicked, we can easily conjecture that there are also some that are evil.[1228]

Caput II - Who have thought Angels to be corporeal

That Angels are corporeal, that is, that their essence consists of body, was taught not only by earlier Fathers, among whom the matter was still somewhat obscure; but also a few years ago, when now it seemed to be beyond controversy, Cajetan held this in chapter 2 on the Epistle to the Ephesians, and Augustine Eugubinus in book 8 of the Perennial Philosophy, chapter 27; who, since he had asserted this concerning demons, must affirm the same also concerning good Angels. For this reason, in chapter 30, he thinks that they delight in the odors of sacrifices, dwell in moist places, and the like. Nay, Rupert, an abbot much more ancient and graver than these two, asserted the same in book 1 On the Trinity, chapter 11.[1229]

Of the Fathers indeed, both Greek and Latin, very many. Origen in book 1 of the Periarchon, in the proemium near the end, where he notes that Angels are said to be in some way incorporeal because of the subtlety of body, because their body is as it were air. Wherefore it is no objection that he taught in book 5 Against Celsus a little before the end bodily things, namely, tears, to belong to angels: nor that in book 1 of the Periarchon, chapter 7, he calls Angels incorporeal virtues; for in the same book, chapter 6, at the end, he had taught that it is proper to God to subsist without body. But the former two things could truly be said, if the bodies of Angels were subtle, as has been explained. In the same opinion were Caesarius, brother of Nazianzen, in the first Dialogue, page 1467, which is had in the second tome of Nazianzen; Elias of Crete explaining the

first Oration of Nazianzen, on those words, "Silence to me," etc.; and John, bishop of Thessalonica, whose testimony is reported in the seventh Synod, action 5, not far from the beginning: from this indeed he proves that Angels can be painted, because they are corporeal; to whose opinion the whole Synod seems to have assented. For it responded, "Yes, Lord:" nay, in his opinion that man alleged Athanasius and Basil and Methodius. From the Latins, Tertullian taught that same thing. In book 2 Against Marcion, chapter 8, he says that Angels are constituted of a material spirit. But when in the book On the Flesh of Christ, chapter 6, he says that it is proper to angelic power to assume a body to itself from no matter, he understands it from our visible and gross matter: for he had just said, "It is certain that Angels bore a flesh not their own, as being of the nature of a spiritual substance, and yet of some body, indeed of its own kind." By which words he concedes that Angels are endowed with a body, but of their own kind, that is, very subtle and spiritual.[1230]

The same opinion is handed down by Hilary, canon 3 on Matthew, when he says that nothing is created which in its own substance is not corporeal. St. Augustine in book 3 On Genesis to the Letter, chapter 10, seems to suppose that. But he clearly thought thus in letters 111 and 115, in book 3 On the Trinity, chapter 11, on Psalms 85 and 145, in book 3 of the City of God, chapter 23, and in book 15, chapter 23; although in letter 28 On the Rational Soul he says that it is not corporeal, if body is understood as that which occupies place; yet that it is corporeal, if body signifies whatsoever substance. Wherefore, in the Enchiridion, chapter 59, when the difficulty was proposed, Whether Angels have bodies tractable, or more subtle ones which cannot be handled, he answered: "For what need is there that such things be argued, that I affirm or deny or define them, since sooner shall I suspect myself of rashness than deem myself free from fault?" In which place Augustine does not doubt whether Angels are corporeal, but whether their bodies can be handled. The same Cassian taught, Conference 7, chapter 13. Bernard in sermon 5 on the Canticle inclines to the same opinion, although he remains there in doubt: yet in book 5 On Consideration he assigns to them an ethereal body.[1231]

They also follow this opinion who affirm that Angels had intercourse with women and begot giants. Thus thought Lactantius in book 2 of the Divine Institutions, chapter 19; but in book 4, chapter 8, he calls Angels spirits because they have more subtle bodies. So too Tertullian in the book On Idolatry, chapter 9, and On the Veiling of Virgins, chapter 7; and Ambrose seems to agree, book On Noah and the Ark, chapter 4. And Irenaeus indicates this, book 4, chapter 70, although book 3, chapter 23, plainly teaches that Angels are without flesh. In the same opinion are Josephus in book 1 of the Antiquities, Justin in the Apology to the Roman Senate, a little from the beginning, and in the Apology to Antoninus the Pious not far from the beginning, Clement of Alexandria in the Stromata, books 3 and 5, Eusebius of Caesarea, book 5 of the Preparation for the Gospel, chapter 4, and Methodius in the Sermon on the Resurrection. And thus they interpret that of Genesis 6: "The sons of God saw the daughters of men, that they were fair." For the ancient reading, which they

themselves seem to have followed, thus translated: "But the Angels of God saw the daughters of men." Which reading Eusebius, St. Ambrose, and Augustine expressly have, in the Questions on Genesis, questions 3 and 15, and in the City of God, book 15, chapter 23. Nor does it seem to be an objection that in the Septuagint codices which we now have it reads not "Angels of God," but "sons of God." For we can interpret "sons of God" as "Angels of God," according to the common phrase even of Scripture. For in Job, chapter 2, "Angels of God" are called "sons of God." It is said: "When on a certain day the sons of God had come," and a little after: "when the morning stars praised me together, all the sons of God shouted for joy." St. Jerome translates in both places "sons of God" from the Hebrew; but the Septuagint renders "Angels of God." Wherefore without cause did St. John Chrysostom in homily 22 on Genesis think that never in Scripture are Angels called sons of God. Nor, indeed, is that an objection in Hebrews 2: "For nowhere does he say to the Angels, 'You are my Son, today I have begotten you'"; for Paul speaks there of sonship by nature, and shows that no Angel is the Son by this very thing. This very testimony, then, Paul could also bring forward in confirmation of this opinion. Then St. Bernard, in the sermon already cited, handles this opinion in some way, where he thinks that Angels cannot assume any local corporeal substance, unless the Angel be moved in place and interval: therefore he is corporeal.[1232]

Caput III - The truer opinion is proved by authority

Positing the opinion which says that angels are incorporeal, it appears not only more probable, but also more common among the Fathers and the Scholastics, and as it were defined by the Church. Among the Scholastics, all taught thus with the Master in II Sentences, dist. 3, and St. Thomas, Cajetan, and other Thomists in this article; among the Fathers, Pseudo-Dionysius, book 4, chapter On the Divine Names at the beginning; Nazianzen, Oration 34, which is the second On Theology - nor does he remain in doubt, if he be read attentively, as some have falsely supposed; Athanasius, in the book On the Common Essence of the Father and the Son near the end, defining the angel; and in the Questions to Antiochus, questions 19 and 98. Nor does it stand in the way that, in question 12, he said that the angelic essence was seen by the Blessed Virgin in the salutation: for he understands that of the keenness and eye of the mind, by which a spirit also can be seen by some light communicated from above. The same is taught by St. Basil in the homily That God is not the author of evils, around the middle, where he distinguishes corporeal and spiritual creature; by St. Gregory of Nyssa, in the book On the Lord's Prayer on the words "Thy will be done," before the middle of the commentary; by St. Cyril, book 4 on John, chapter 10, and in places to be cited below; by Theodoret on that of Zacharias 1 "I saw by night," and in the Questions on Genesis, q. 43; by St. John Chrysostom, homily 22 on Genesis, on the words "And the sons of God saw"; by Nicetas in the eighth oration on Nazianzen, on the words "Thus indeed the holy things"; by St. John Damascene, book 1 On the Faith, chapter 17, and book 2, chapter 3. And when he says

1232. Lactantius, Divinae institutiones II, c. 19; IV, c. 8; Tertullian, De idololatria, c. 9; De velandis virginibus, c. 7; St. Ambrose, De Noe et arca, c. 4; St. Irenaeus, Adversus haereses IV, c. 70; III, c. 23; Josephus, Antiquitates I; Justin, Apologia I (to the Senate), near the beginning; Apologia II (to Antoninus Pius), near the beginning; Clement of Alexandria, Stromata III, V; Eusebius, Praeparatio evangelica V, c. 4; Methodius, Sermo de resurrectione; Genesis 6:2; Job 2:1; 38:7; St. Jerome (Hebrew text); Septuagint; St. John Chrysostom, Homilia 22 in Genesim.

that an angel is called "incorporeal" with respect to us, yet "corporeal and material" in comparison with God, he does not say that because he thinks an angel consists of some matter, but to show that his spirit is far inferior to the Spirit of God, so that, by comparison with Him, it would scarcely seem a spirit; otherwise Damascene would not have denied, in the places cited, that an angel is in a bodily place with dimensions, if he thought the angel truly corporeal. Hence St. Gregory asserted, book 4 of the Dialogues, chapter 19; nor does that stand in the way which he said, book 2 of the Morals, chapter after the middle, otherwise chapter 3, that angels are circumscribed by place: for he understands them to be "circumscribed" not by quantity, but to be defined by a particular place; in which sense Damascene also spoke in the places cited, as we noted in Disputation 187, chapter 1. With all these agrees Richard of St. Victor, book 4 On the Trinity, chapter 25, whose reason we shall adduce in the following chapter. Finally, some confirm this from the Sixth General Synod, action 11, where angels are called intellectual and invisible; likewise Cyprian so calls them in the preface on the cardinal works of Christ; yet nothing can be proved for the proposal from this. For those who assert that angels are corporeal also say that they are invisible - because they have certain more subtle bodies - and intellectual, just as man is, who nevertheless consists of body. This truth moreover seems defined by the Church in the Lateran Council under Innocent III, and it is reported in the chapter Firmiter, On the supreme Trinity and the Catholic faith, where it is said: "God from nothing created both natures, spiritual and corporal, to wit the angelic, and the mundane." Where clearly he calls "spiritual" the angelic, to which he opposes the "mundane"; but "corporal," which consists of body alone, he calls "mundane"; he adds immediately: "Then the human," as something common, constituted from spirit and body. Nevertheless they excuse from the note of error the opposing opinion, Bartholomew Carranza in the Summa of Councils in the annotations on the Seventh Synod, and Sixtus of Siena, book 6 of the Sacred Library, annotation 8, that the matter still seems doubtful among the Fathers, and the mind of the Council was not directly to define what creature was corporeal and what spiritual, but that God in the beginning of time created all things; and that it used the more common way of speaking, when it distinguished one creature from another.[1233]

However, although this is true, no one now could defend the opposing opinion without the note of rashness. There is added the authority of Aristotle, Metaphysics 12, chapters 6, 7, and 8, who expressly proves that intelligences are separated from all matter and magnitude.[1234]

1233. Firmiter, De summa Trinitate et fide catholica.

1234. Aristotle, Metaphysics XII (Lambda), chs. 6 - 8, on the immaterial and unmagnitudinal separate intelligences.

Caput IV - The same opinion is shown by Scripture and by reason

This opinion too can be confirmed by Scripture. First, because nowhere does it call angels "corporeal"; on the contrary, it frequently calls them "spirits": and in Scripture, "spirit" signifies an incorporeal reality, John 4, "God is spirit," and Acts 23, Luke reports that there was the heresy of the Sadducees who asserted there is no resurrection, nor angel, nor spirit, that is, that there is no incorporeal reality; whence they inferred that the soul perishes with the body. And indeed Luke reckons it the same thing to deny a spirit and to deny an angel; although "spirit" extends more widely than "angel," because a rational soul is also a spirit. That an angel is called "spirit" in Scripture is evident from many things: some prove it from that of Psalm 103, "Who makes your angels spirits, and your ministers a burning fire," as St. Augustine and St. John Damascene interpret it, 2 On the Faith, c. 3. More recent writers, however, with Eugubinus, take it thus: "Who makes your angels swift like the wind; your ministers (to wit, those same angels) like lightning," on account of the same swiftness: for just as he does not make his angels true "fire," but in likeness, so he does not make "spirits"; therefore "spirits" in that place is taken not for a substance separated from body, but for wind, so that in that place angels are not said to be spirits, but to be like spirit, that is, wind; just as they are not said to be fire, but to be assimilated to fire. Elsewhere, however, in Scripture good or evil angels are called "spirits," Hebrews 1, "All are ministering spirits sent for an inheritance"; Luke 6, and elsewhere often, the demons are called "unclean spirits."[1235]

This opinion also can be commended by reason. Passing over those reasons which St. Thomas employs, and which Cajetan explains at length - for they congruently only show this much - first, it is proved from the utmost swiftness of motion, whereby they are said to traverse and to go around the earth, which could not agree to a body. Second, because spirits enter into human bodies and penetrate other similar things; but a body cannot be penetrated by a body. You will say that they enter only through pores: but this is ridiculous, both because an angel could not have fallen from heaven, since the heavens have no pores; and because either the same angel would enter through one single pore only, and so he would be of the least quantity, and thus in the genus of body most imperfect and of the least efficacy; or he would enter through many at once, and thus the body of the angel would be divided into pieces, so that he would enter partly through one pore, partly through another: for between one pore and another there is a solid part, which cannot be penetrated by a body. Third, Richard of St. Victor proves: for if angels were corporeal, a "legion" of them could not, without miracle, be in one possessed body, as is related in Luke 8; for a legion contains six thousand six hundred and sixty-six; but to concede a miracle in this matter, that those angelic bodies might penetrate one another, would be frivolous; therefore it must be said that they are incorporeal: because, although their bodies might be subtle, nevertheless between place and place they would have to occupy some space: wherefore they would have to be certain minimal bodies, so that so many thousands could be in so small a body of one man. I pass over other reasons, which are of less moment, as that they would need food if they were corporeal, would have

1235. Psalm 103(104):4; St. Augustine's interpretation; St. John Damascene, De fide orthodoxa II.3; St. Augustine Steuchus (Eugubinus). Hebrews 1:14; frequent "unclean spirits" in Luke.

organs for the operations of life, and would grow weary in moving a celestial body. For one could easily reply that such bodies would be subtle and of another kind than those of animals, and therefore would neither need food, nor have instruments for the operations of life, nor be wearied by any labor.[1236]

Caput V - The foundations of the prior opinion are dissolved

It remains to refute the arguments of the prior opinion. And first indeed we confess that the Fathers alleged for the same opinion teach so openly: I except Ambrose, whom some attempt to explain in such a way that he only thought that giants were begotten by angels, not by their own power, but by the seed of a man brought from elsewhere - which I do not doubt can naturally be done. But truly, if it were permitted to interpret Ambrose thus, we should in the same way have to explain all the others also. There is, however, an easier way to excuse him: for since he uses only the words of Scripture according to that ancient reading of the Seventy, in the same way he himself, as well as Scripture, seems to have spoken: but Scripture, even according to that reading of the Seventy, has an easy sense, as we shall immediately see, which he himself also - Ambrose - seems to have explained, as will appear below. The same Ambrose is also cited for the proper opinion, book 1 On Virgins, somewhat near the end, where he says thus: "Nor is it a wonder if angels fight for you who fight by the morals of angels: the virgin's chastity merits their protection, whose life you imitate; and why should I pursue at greater length the praise of chastity? for chastity made angels: for he who kept it is an angel; he who lost it, a devil." But there he does not speak of the angel and the devil according to nature, but according to morals. Wherefore when he says that "he who keeps chastity is an angel," he signifies that he is like an angel: on the contrary, he who does not keep it is made like to a demon. Nor did Ambrose think that the first sin of the angel, by which he was made a devil, was carnal lust; since he plainly says in Psalm 118, and in sermon 7, and in epistle 84, that he fell by pride.[1237]

To that which we adduced from the Seventh Synod I reply, that that John, whose book was read, was of that opinion; but that opinion was received and approved by the whole Synod only in so far as it says that angels can be depicted: although his reason would not prove that, as is shown more at large in book 2 On Adoration, disputation 3, chapter 5. Nor did that Father bring forward only this reason of theirs, namely, that they are corporeal, but also that they deigned to appear under a human figure: which we said in that chapter is most certain, even that God Himself can be portrayed. But where Athanasius and Basil handed down that opinion, whom that John alleges for it, I have not hitherto found; nay rather, I have already alleged them for the opposing opinion.[1238]

To that of Genesis 6, according to the translation of the Hebrews, the place can be rendered thus: "sons of God"; for in Hebrew it is said bene ha-Elohim. But by "sons of God" they understand the descendants of Enosh, who, it is said in Genesis 4, "began to call upon the name of the Lord."

1236. Richard of St. Victor, De Trinitate IV.25.

1237. St. Ambrose, De virginibus I, near the end; on the devil's first sin as pride: Enarr. in Ps. 118; Sermo 7; Ep. 84.

1238. Seventh Ecumenical Council (Nicaea II), act. 5 (and its reception of authorities alleged by John of Thessalonica); Vazquez refers to his own treatment in De adoratione, lib. 2, disp. 3, cap. 5.

And therefore all who draw their origin from him are rightly called sons of God: just as Christians are now so called, who call upon Christ, and the sons of Christians, who remain in the same faith. These therefore took wives to themselves from the stock of Cain, who were called "daughters of men," not "daughters of God," because they imitated the manners of their parents, their affections being fastened on earthly things, as also was the case with their offspring. When therefore these women were beautiful, men from the lineage of Enosh took them as wives, and giants were begotten. Thus that place is interpreted, first, by some of those who assert that angels are corporeal - Caesarius, the brother of Nazianzen, Dialogue 1, p. 1467 in the second tome of Nazianzen; Augustine, City of God 15, c. 23; Cassian, Collation 8, c. 21 - for these grant to angels bodies so subtle that they were not apt for generation. Then, from others who said that angels are incorporeal, the aforesaid place is thus explained by Chrysostom, homily 22 on Genesis; Athanasius, in the Questions to Antiochus, question 79; Theodoret on Genesis, question 47; Cyril, book 9 Against Julian a little from the beginning, and book 3 on Genesis at the beginning. Philaster, moreover, in his catalogue of heresies, chapter 108, recounts among the heresies the opinion which says that giants were begotten by angels. Euthymius also attests in the Panoplia, title 13, that this was a heresy of the Bogomili, asserting that the demons took wives for themselves because they had heard it said to Lucifer that the seats of heaven are to be filled from the race of men. Nor is our exposition alien to Ambrose, book 4 On Noah: although he said that angels with women begot giants, yet he subjoins these words: "The Jews are persuaded - and Scripture calls angels 'gods' - because they are not generated from man; and faithful men it calls 'sons of God'." This interpretation is not only easy, whether we follow the Hebrew text or the Vulgate, nay even that of the Seventy which is commonly circulated, in which it is said "sons of God," not "angels of God"; but even if we read "angels of God," it could be explained, as Scripture elsewhere calls men "angels," as in Matthew 11, where, according to the prophet Malachi, John is called an "angel," and in Deuteronomy 32, in the Canticle, according to the translation of the Seventy it is said, "He set the bounds of the peoples according to the number of the angels of God," while the Vulgate has, "according to the number of the sons of Israel," who were called sons of God; which reading Ambrose followed when he called "angels of God," that is, "sons of God," faithful men.[1239]

Then we can interpret the aforesaid place in another way, so that "sons of God" are called the sons of the mighty; but "daughters of men," the daughters of the common people; and the sense is: nobles and plebeians; and from those the giants were begotten. This agrees with the Hebrew text; for "sons of God" are called bene ha-Elohim, but "daughters of men," bene ha-Adam: and Elohim, although plural in form, can be rendered in the singular and in the plural. Wherefore we can say: "sons of God," that is, "sons of gods," i.e., of judges or potentates. And St. Augustine, in the place cited, and St. Jerome, book 3 in the Hebrew Questions, translate "gods" in the plural according to the Hebrew phrase; but by that Hebraism are often signified nobles, the mighty, or judges among the people, as in Psalm 81(82), "I said, you are gods, and all of you sons of the Most High," and again, "God has stood in the synagogue of gods." Therefore Symmachus, as Jerome reports,

1239. St. Ambrose, De Noe et arca, c. 4; on Genesis 6:2; Matthew 11:10 (Malachi 3:1); Deuteronomy 32:8 LXX versus Vulgate.

renders "sons of the mighty." Nay more, this exposition has a place even if we read that of the Seventy, "angels of God": for in Scripture the powerful are sometimes called "angels," as in Job 41, "the angels shall be afraid," that is, the mighty tremble; he speaks of the proud and over-powerful men, who also fear the whole strength of Leviathan; so too the deserts grew, as is elsewhere discussed.[1240]

To that which we brought forward from the Seventh Synod I answer, that that John, whose book was cited, held that opinion; but that it was received and approved by the whole Synod only in so far as he said that angels could be painted, although his reason did not prove this, as is shown more at length in book 2 De adoratione, disputation 3, chapter 5.[1241] Nor did that holy Synod adopt it only because he said that they were corporeal, but also because they deigned to appear under a human figure; which we said in that chapter to be the most powerful reason, on account of which even God himself can be depicted. But where Athanasius and Basil, whom that John alleges for himself, handed down that opinion, I to this point have not found; nay rather, I have already adduced them on the opposing view.

As to that of Genesis 6 according to the Septuagint translation, I answer that it is much better rendered "sons of God" than "angels of God"; for in the Hebrew it says bene ha-Elohim. Now the Fathers understand by "sons of God" the sons of Enos, who, as is said in Genesis 4, "began to call upon the name of the Lord"; and therefore all who draw their origin from him are rightly called sons of God: just as those are now called Christians who invoke Christ, and their sons who remain in the same faith. These, then, took wives for themselves from the stock of Cain, who were called daughters of men, not daughters of God, because, imitating the ways of their parents, they were devoted to earthly things; whereas their progenitors, the men of the line of Enos, took them as wives, and begot giants. Thus is that passage interpreted, first by those who assert that angels are corporeal - Caesarius, the brother of St. Gregory Nazianzen, Dialogue I (in the second tome of Nazianzen); St. Augustine, City of God XV, c. 23; Cassian, Conference 8, c. 21 - for these attribute to angels a body so subtle that it would not be apt for generation; and then by others, who said that angels are incorporeal - thus St. John Chrysostom on Genesis, Homily 22; St. Athanasius, Questions to Antiochus, q. 19; Theodoret, Questions on Genesis, q. 47; St. Cyril, Against Julian IX a little from the beginning, and Book III On Genesis at the beginning; Philaster too in his Catalogue of Heresies, c. 108, where he lists among the heresies the opinion that giants were begotten by angels. Euthymius likewise bears witness in the Panoplia, title 13, that this was a heresy of the Bogomils, who asserted that demons had taken wives to themselves, because they had heard it said to Lucifer that the thrones of heaven were to be filled from the race of men.[1242]

1240. Augustine, De civitate Dei XV, c. 23; St. Jerome, Quaestiones Hebraicae; Symmachus's rendering reported by Jerome; Psalms 81(82):1, 6; Job 41 (on the fear of the "angels," i.e., the mighty); on the Bogomils: Euthymius Zigabenus, Panoplia, tit. 13; Philaster, De haeresibus c. 108; Caesarius, the brother of St. Gregory Nazianzen, Dialogus I; St. John Chrysostom, Hom. 22 in Genesim; Athanasius, Quaestiones ad Antiochum 79; Theodoret, Quaestiones in Genesim 47; St. Cyril of Alexandria, Contra Iulianum IX; In Genesim III.

1241. Seventh Ecumenical Council (Nicaea II), act. 5 (and its reception of authorities alleged by John of Thessalonica); Vazquez refers to his own treatment in De adoratione, lib. 2, disp. 3, cap. 5.

Nor does our exposition shrink from St. Ambrose, Book 4, chapter on Noah; even if he said that angels from women begot giants. For he subjoins these words: "Very often Scripture calls the sons of God 'angels,' because they are begotten of no man; and thus God has not disdained that faithful men be called his sons." This interpretation is not only easy, if we follow the Hebrew text and the Vulgate, indeed also the Seventy, which are commonly compared, in which it is said "sons of God," etc., not "angels of God"; but even if we were to read "angels of God," as the old Latin version of the Seventy has. For St. Augustine proves in that same chapter 23 that holy men are called "angels" in Scripture, from Matthew, where according to the prophecy of Malachi 3, John is called an angel; and Deuteronomy 32, in the Canticle according to the translation of the Seventy, says: "He set the bounds of the peoples according to the number of the angels of God"; whereas the Vulgate edition has "according to the number of the sons of Israel," who were called sons of God. Following that reading, St. Ambrose understood that "angels of God," or "sons of God," which he takes to be the same, are called faithful men.[1243]

Then we can interpret the aforesaid passage in another way, namely, that the sons of God be called the sons of the mighty; but the daughters of men, the daughters of the common folk; and the sense be: the noble and powerful took wives for themselves from the middle sort of the populace, and from them begot giants. This agrees with the Hebrew text. For bene ha-Elohim is said; now Elohim can be translated both in the singular and in the plural. Wherefore we could say, "sons of God," "sons of the gods," as Aquila translates it, according to St. Augustine in the place cited, and St. Jerome, tom. 3, in the Hebrew Questions; and "gods" in the plural, according to the Hebrew idiom, means nobles, the powerful, or judges among the people; as in Psalm 81(82): "I have said, You are gods, and all of you sons of the Most High"; and again: "God stood in the assembly of gods." Hence Symmachus, as Jerome reports, renders it "sons of the mighty." Indeed, this exposition has place even if, according to that reading of the Seventy, we read "angels of God." For in Scripture the powerful are also called "angels": Job 41: "The angels shall fear, they shall be terrified." He speaks of the powerful and robust men, who even before the beast Leviathan will so fear as to void their excrements; as will be explained below, disputation 225, chapter five.

It is clear, therefore, that in no way were giants begotten by angels. But if you ask by what reason giants could first be generated by men of common stature, St. Augustine answers excellently in that same chapter 23, that this is not to be wondered at, because a few years before the Roman destruction wrought by the Goths, at Rome there was born a woman of gigantic size from a father and mother of common stature. Wherefore it was not necessary that giants were first begotten by angels. But whether in an assumed body an angel can have intercourse with a woman and generate, we shall see in the next question, article 3.

1242. Augustine, De civitate Dei XV, c. 23; the Caesarius passage is Dialogus I in the second tomus of St. Gregory Nazianzen; John Cassian, Collationes 8, c. 21; Psalms 81(82):1, 6; Theodoret, Quaestiones in Genesim 47; St. John Chrysostom, Hom. 22 in Genesim; Athanasius, Quaestiones ad Antiochum 79 (scil. q. 19 in many editions); St. Cyril of Alexandria, Contra Iulianum IX; In Genesim III; Philaster, De haeresibus c. 108; Euthymius Zigabenus, Panoplia, tit. 13, on the Bogomils; Job 41 (on the fear of the "angels," i.e., the mighty).

1243. St. Ambrose, De Noe et arca, c. 4; on Genesis 6:2; Matthew 11:10 (Malachi 3:1); Deuteronomy 32:8 LXX versus Vulgate.

To the argument of St. Bernard I reply, that even if angels are spiritual, nevertheless they can be moved in place and corporeal space: just as the rational soul, although it is spiritual, nevertheless exists whole in a body. But how angels are in a place and are moved will be explained below.

Articulus II - Whether an angel is composed of matter and form

It seems that an angel is composed of matter and form.

1. For whatever is contained under some genus is composed of genus and difference, which, coming to the genus, constitutes the species. But genus is taken from matter, and difference from form, as is evident in Metaphysics VIII. Therefore whatever is in a genus is composed of matter and form. But an angel is in the genus of substance. Therefore he is composed of matter and form.
2. Further, wherever the properties of matter are found, there matter is found. But the properties of matter are to receive and to underlie. Hence Boethius in the book On the Trinity says that a simple form cannot be a subject. But this is found in an angel. Therefore an angel is composed of matter and form.
3. Further, form is act (*actus*). Therefore what is form only is pure act. But an angel is not pure act. This belongs to God alone. Therefore he is not form only, but has form in matter (*materia*).
4. Further, form is properly limited and bounded by matter. Therefore a form which is not in matter is an infinite form. But the form of the angel is not infinite, because every creature is finite. Therefore the form (*forma*) of the angel is in matter.

But on the contrary: Pseudo-Dionysius says in On the Divine Names, chapter 4, that the first creatures are understood to be, as they are incorporeal, so also immaterial.

I answer that, certain men posit that angels are composed of matter and form, and to establish this opinion Avicebron strives in the book Fountain of Life. For he supposes that whatever things are distinguished according to the intellect, are distinct also in reality. Now in an incorporeal substance the intellect apprehends something by which it is distinguished from a corporeal substance, and something by which it agrees with it. Whence from this he wishes to conclude that that by which an incorporeal substance differs from a corporeal is, as it were, its form; and that which is subjected to this distinguishing form, as something common, is its matter. And for this reason he posits that there is one and the same universal matter of spiritual and of corporeal things: so that it be understood that the incorporeal form of a substance is impressed in the matter of spiritual things, just as the form of quantity is impressed in the matter of corporeal things.

But at first glance it appears impossible that there be one and the same matter of spiritual and corporeal things. For it is not possible that a spiritual and a corporeal form be received in one and the same part of matter; because thus one and the same thing numerically would be corporeal and spiritual. Hence it remains that one part of matter is that which receives a corporeal form, and

another which receives a spiritual form. But to divide matter into parts does not befit it, except according to that which is understood under quantity; which removed, there remains an indivisible substance, as is said in Physics I. Thus it follows that the matter of spiritual things would be a substance subject to quantity, which is impossible. It is therefore impossible that there be one matter of corporeal and of spiritual things. But yet further, it is impossible that an intellectual substance should have any matter at all. For the operation of any thing is according to the mode of its substance. Now to understand is an operation utterly immaterial. This appears from its object, from which every act receives its species and ratio. For a thing is understood inasmuch as it is abstracted from matter, because forms in matter are individual forms, which the intellect does not apprehend as such. Whence it remains that the substance of the intellect is altogether immaterial.

Nor is it necessary that those things which are distinguished according to the intellect be distinct in reality, because the intellect does not apprehend things according to the mode of the things, but according to its own mode. Hence material things, which are beneath our intellect, exist in our intellect in a simpler mode than they exist in themselves. But angelic substances are above our intellect. Whence our intellect cannot attain to apprehend them as they are in themselves, but according to its own mode, according as it apprehends composite things. And thus also it apprehends God, as was said above.

Reply to the first: Difference is that which constitutes the species. Now each thing is constituted in a species according as it is determined to some special grade in beings; for the species of things are like numbers, which differ by addition and subtraction of unity, as is said in Metaphysics VIII. But in material things one thing is that which determines to a special grade, namely, the form; and another is that which is determined, namely, matter. Whence from the one is taken the genus, and from the other the difference. But in immaterial things there is not one that determines and another that is determined, but each of them according to itself holds a determined grade among beings. And therefore in them genus and difference are not taken according to one thing and another, but according to one and the same; which, however, differ according to our consideration. For inasmuch as our intellect considers that thing indeterminately, the notion of genus is taken; but inasmuch as it considers it determinately, the notion of difference is taken.

Reply to the second: That reasoning is proposed in the Fountain of Life; and it would be necessary, if the mode according to which the intellect receives were the same as that according to which matter receives. But this is evidently false. For matter receives form so that, according to it, it be constituted in the being of some species - of air, or of fire, or of any other. But thus the intellect does not receive a form; otherwise the opinion of Empedocles would be verified, who posited that we know earth by earth and fire by fire. Rather, the intelligible form is in the intellect according to the very notion of form: for in this way it is known by the intellect. Whence such reception is not the reception of matter, but is the reception of an immaterial substance.

Reply to the third: Although in an angel there is not the composition of form and matter, yet there is in him act (*actus*) and potency (*potentia*). This indeed can be made clear from a consideration of material things, in which a twofold composition is found. First, that of form and matter, from which some nature is constituted. Now a nature so composed is not its own existence (*esse*), but existence is its act. Hence that very nature is related to its existence as potency to act.

To the first, it must be said, as is said in the 8th book of the Metaphysics, that in material things one thing is that which determines to a special grade, namely the form, and another is that which is determined, namely the matter. Whence from the one is taken the genus, from the other the difference. But in immaterial things there is not one thing determining and another determined; rather each thing according to itself holds a determinate grade among beings. And therefore in them genus and difference are not taken according to one thing and another, but according to the same and the same, which nevertheless differ according to our consideration. For our intellect considers that thing indeterminately, and thus the notion of genus is taken in them; but insofar as it considers it determinately, the notion of difference is taken.

To the second it must be said that that reasoning is set down in the book Fons vitae. And it would be necessary, if the mode by which the intellect receives and the mode by which matter receives were the same; but this is clearly false. Matter receives form so that according to it it be constituted in the existence (*esse*) of some species, as of air, or fire, or any other. But the intellect does not receive thus; otherwise the opinion of Empedocles would be verified, who held that we know earth by earth, and fire by fire. But the intelligible form is in the intellect according to the ratio of form; for thus it is knowable by the intellect. Hence such reception is not the reception of matter, but is the reception of an immaterial substance.

To the third it must be said that although in angels there is not a composition of form and matter, yet in them there is act (*actus*) and potency (*potentia*). This can be made manifest by a consideration of material things. In things there is found a twofold composition: one, of form and matter, from which some nature is constituted. A nature thus composed is not its existence, but existence is its act. Whence the nature itself is compared to its existence as potency to act. Therefore, matter being subtracted, and supposing that the form itself subsist not in matter, there still remains the comparison of the form to existence itself as potency to act. And such a composition is to be understood in angels. And this is what is said by some, that an angel is composed of that by which it is and of that which is, or of existence and that which is, as Boethius says. For that which is is the subsisting form itself. But existence is that by which the substance is, as a run is that by which the runner runs. But in God there is not one thing, existence, and another, that by which He is, as was shown above. Whence God alone is pure act.

To the fourth it must be said that every creature is finite simply speaking, insofar as its existence is not absolutely subsisting, but is limited to some nature to which it accrues. But nothing prevents some creature from being in a certain respect infinite. Now material creatures have infinity on the part of matter, but finitude on the part of form, which is limited by the matter in which it is received. But created immaterial substances are finite in that their forms are not received in another, as if we were to say that a separated whiteness existing by itself were infinite with respect

to the notion of whiteness, because it is not contracted to some subject. Yet its existence would be finite, because it is determined to some special nature. And on account of this it is said in the book of Causes that an intelligence is finite above, insofar, namely, as it receives existence from its superior; but it is infinite below, insofar as it is not received into some matter.

Observations concerning the doctrine of the article.

The conclusion of the article is that an angel is composed of no matter and form.

This article will seem superfluous to someone: for since it was shown above that an angel is not corporeal, by what reason could it be doubted whether it were constituted of matter and form? Yet certain ancient Scholastics gave some occasion of this disputation to St. Thomas. For Alexander,[1244] and St. Bonaventure,[1245] whom Richard follows,[1246] said that an angel indeed is not corporeal; nevertheless it is constituted from a certain matter and form, that is, from potency, which they call matter, and act which they call form. They do not agree among themselves, however, whether that matter is univocally matter with corporeal and visible matter. But much better do St. Thomas, his disciples, and Henry teach that an angel is not composed of matter and form, although it does consist of act and potency.[1247] For not every potency is matter, nor is every act the form of matter. Cajetan thinks that St. Thomas established the present article for another reason, namely that he might show that an angel cannot be divided, not only by extension and quantity, as was shown in the first article, but also according to substance, because it does not consist of substantial composition from matter and form.[1248] Moreover, unless the forementioned Scholastics had provided occasion, there was no need to demonstrate by another reason that an angel does not consist of matter and form, except because it is incorporeal. Wherefore the present article would be superfluous. For up to now no one seems to have granted matter except corporeal. For which reason Pseudo-Dionysius, and the other Fathers alleged in the previous disputation, just as they teach that angels are incorporeal, also assert that they lack matter, following the doctrine of Aristotle, who called them intelligences separated from matter: indeed, unless in material things we saw changes take place with some body remaining, no one could suspect that in them there is matter distinct from form. For which cause Henry and Durandus think that the heaven is not constituted of matter and form, although it is corporeal, because we do not see in it any substantial change to be made with some common body remaining; the opposite of which I do not see can easily be proved.[1249]

Disputatio CLXXIX - Whence genus and difference are taken in angels

Caput I - The opinion of Durandus

Concerning the solution of the first, it must be seen in what way in angels genus and difference are taken, since in them there is not matter and form, from which, according to the common opinion of the Dialecticians, genus and difference seem to be taken. The discourse is about genus and difference, as the Ferrarian well noted on the Second Book Against the Gentiles, chapter 95, not about relations which the Logicians call intentions, but about the concepts of universal things which receive the denomination of genus and difference.[1250] Durandus, on the Second Book, distinction 3, question 1, number 12, teaches that angels are in a genus, yet are not composed of genus and difference: because, in order that something be placed under a genus, it suffices to have finite existence; and hence, because God is infinite, He is not contained under a genus. But for a thing to consist of genus and difference, there must be some composition from parts making one essence. Wherefore, since neither in angels nor in accidental forms is there composition, there will not be genus and difference.

But he proves that in these there is not a genus in which they agree, and a difference by which they are distinguished. First, because difference signifies the quale of the thing itself; for this reason it is said by Porphyry to be predicated in quale; but in angels and in accidental forms there is not that which signifies the quale of their thing: because whatever is found in them is the whole nature itself and the form of the thing; therefore in them nothing is found which has the notion of difference. Second, in simple natures there is no greater reason why something should be genus and something else difference: because whatever befits them is the whole substance and nature of those things themselves; therefore in them it is in vain that we distinguish these two. Third, simple things differ by their wholes, because they are simple, and they do not have that in which they agree with others, and that in which they differ; for if they had these, they would not be simple: but the genus of a thing is that in which it agrees with others; the difference, that by which it differs from others: therefore in simples there is not genus and difference. Wherefore, in the opinion of Durandus, there is no need to labor to assign something from which the notion of genus is taken, and another thing from which difference is taken.

Caput II - What Henry and other Scholastics think

Henry, in Quodlibet 7, question 8, reports the opinion of certain men asserting that angels are not in a genus, because they do not have matter from which that is taken. But how improbable this opinion is will be made clear in the following chapter. Henry himself distinguishes a twofold genus, one natural, the other logical. The former, which he also calls a praedicabile, he asserts to be taken from matter, not excluding form; the latter from form, not excluding matter. But how in angels

1250. The Ferrarian (Ferrariensis), on St. Thomas, Contra gentiles II, c. 95.

genus and difference are taken, he does not explain. Nevertheless, by the same proportion he will say that genus is taken from something which is as matter, not excluding that which is as form; and difference from that which is as form, not excluding that which is as matter.

But some Thomists, since they assert that in material things genus is taken from matter and difference from form, as St. Thomas taught and the Ferrarian in the same place, by the same proportion say that in angels genus is taken from that which is as it were matter, and difference from that which is as form. They assign, however, in angels essence (*essentia*) in place of matter, and existence (*esse*) in place of form; which two they think by their own nature are distinct in them prior to the operation of the intellect, so that they do not concede a composition from genus and difference, even if it be only through the intellect, without a real composition from something as matter and something as form, which would be, as it were, the foundation of that [intellectual composition]. But that essence and existence are distinct by nature in angels and in simple things, St. Thomas in this article in the reply to the third, and St. Bonaventure in the Second Book, distinction 3, first part, article 1, question 1, teach; Richard in the first article, question 1, adds, that the existence of an angel is only the relation of the creature to the Creator; but the nature is something absolute. As to genus being taken from matter and difference from form, the Thomists hold it to be the sentence of Aristotle in the 8th book of the Metaphysics, chapters 2 and 3, and of Porphyry in the book On the Properties of Genus and Difference.[1251] The Ferrarian, however, adds that genus is not taken properly from matter and difference from form, but remotely, and for no other reason unless because genus is as it were potency, but difference as act: and the root of all potency is matter, just as of the whole act is form.[1252]

Caput III - The true position

I, however, think that neither in things composed of matter and form, nor in simple substances, nor even in accidents, must we seek something real from which the notion of genus be taken, and something distinct from which the difference be taken; but concerning the whole thing itself, considered in a different way, we conceive the generic notion, insofar as it seems to agree with other things; and the specific difference, insofar as it is dissimilar to others. St. Thomas teaches expressly thus about genus and difference in angels in the reply to the first. Wherefore it is not necessary in material things to take genus from matter and difference from form; and so in vain shall we philosophize otherwise in material things. I understand, moreover, that these two are not to be taken from matter and form only proximately, but not even remotely, for this reason: for in order that I conceive in a thing the common notion together with another, and the particular notion of that by which it is dissimilar to another, I ought not specifically to look to matter and form; but it suffices to conceive the whole thing in a different mode, as is clear in angels, and St. Thomas admits; therefore neither proximately nor remotely do I take genus from matter and difference from form. And surely what the distinction is between proximately and remotely I do

1251. Aristotle, Metaphysics VIII (books Z - Θ), chs. 2 - 3; Porphyry, On the Properties of Genus and Difference.
1252. Ferrariensis, loc. cit.

not grasp, or by what reason matter is the root of every potency, which is found only in concepts, and form of the whole act, which is only in the intellect. For animal, which is the genus of man and of horse, in its concept includes a composition from soul and body according to a common notion, and reason; and man, which is the difference, in the same way according to a particular notion; in vain shall we say that genus is taken from matter, and difference from form, in the order of being. Moreover, not only in spiritual things, but also in material things, existence and essence are distinguished, as is set out more fully in First Part, question 3, article 4, and question 17, article 2; therefore from thence genus and difference cannot be taken. How nevertheless angels can be destroyed and corrupted by God we shall say below.[1253] And although nature and supposit be distinguished, nevertheless the notion of genus and difference cannot arise from there: for each is considered and found in nature alone, without its proper supposit, as is clear in the humanity of Christ. And what have been said we understand about genus and difference which are called by the Logicians metaphysical, that is, about the very objective concepts of nature by a common and a particular mode. For the distinction which Henry uses - of natural genus and logical - is scarcely able to be conceived, nor by Logicians can it be used.

Finally, if it were necessary in every thing to distinguish matter, or something in the place of it, from which genus would be taken, and form, or something ...

... something from which the difference is taken, was put forward on the authority of Aristotle and Porphyry. But they teach nothing of the sort, nor do they even lightly insinuate it. Aristotle, in that third chapter, says thus: "This indeed (namely the notion of genus) is as matter; but that (namely the difference) is as form, because it is act"; and in the second chapter he has something similar: "It is necessary" (he says) "that this be as matter, but that as form." Porphyry, moreover, says: "Genus, furthermore, is like matter; difference, like form." This, however, is most true, even if in the same thing to which genus and difference are appropriate there are not those two [constituents] which the aforesaid doctors posited, from which genus and difference are taken. For genus, for this reason, is like matter, because it is common to many and is contracted by the difference, through which it becomes proper to this or that thing; wherefore by the logicians it is called something potential, whereas the difference determines the genus to this species, as form [determines] matter; and therefore it is called the act of the genus.[1254]

1253. See below, disputation 182, cap. 5.
1254. Aristotle, Metaphysics VIII, chs. 2 - 3; Porphyry, Isagoge, on genus and difference.

Articulus III - Whether the angels are in any great number

It is proceeded thus to the third. It seems that the angels are not in any great number. For number is a species of quantity, and follows the division of the continuum. But this cannot be in the angels, since they are incorporeal, as was shown above. Therefore the angels cannot be in any great number.

1. Furthermore, the nearer something is to the one, the less is it multiplied, as appears in numbers. But the angelic nature among the created natures is nearer to God. Therefore, since God is maximally one, it seems that in the angelic nature there is found the least of multitude.
2. Furthermore, the proper effect of separated substances seems to be the motion of the celestial bodies. But the motions of the celestial bodies are according to some determinate small number, which can be apprehended by us. Therefore the angels are not in a greater multitude than the motions of the heavenly bodies.
3. Furthermore, Dionysius says in the fourth chapter of On the Divine Names that, on account of the rays of divine goodness, the intelligible and all intellectual substances subsist. But a ray is not multiplied except according to the diversity of recipients. Now it cannot be said that matter is receptive of the intelligible ray, since intellectual substances are immaterial, as was shown above. Therefore it seems that the multiplication of intellectual substances cannot be except according to the requirement of the first bodies, namely the celestial, so that in some way the process of the aforesaid rays be terminated at them. And thus the same as before.

But on the contrary: "Thousands of thousands ministered to him, and ten thousand times a hundred thousand stood before him" (Dan 7).]

I answer that, concerning the number of separated substances, different men have proceeded by different ways. Plato indeed posited that separated substances are the species of sensible things - as if we were to posit human nature itself to be separate; according to this one would have to say that separated substances are according to the number of sensible species. But Aristotle rejected this position from the fact that matter belongs to the notion of the species of sensibles. Whence separated substances cannot be exemplar species of these sensibles, but have certain natures higher than the natures of sensible things. Yet Aristotle posited that those more perfect natures have an order to these sensibles according to the notion of mover and of end. And therefore, according to the number of the first motions, he strove to find the number of the separated substances. But because this seems to be at odds with the documents of Sacred Scripture, Rabbi Moses the Jew, wishing to reconcile both, posited that the angels, insofar as they are called immaterial substances, are multiplied according to the number of the motions or of the celestial bodies, according to Aristotle. But he posited that in Scripture the name "angels" is also given to men announcing divine things, and again to the powers of natural things which manifest the omnipotence of God. But it is foreign to the usage of Scripture that the powers of irrational things

be called angels. Wherefore one must say that the angels too, insofar as they are immaterial substances, are in a certain very great multitude, exceeding all material multitude. And this is what Dionysius says in the fourteenth chapter of the Celestial Hierarchy: "Many are the blessed armies of supernal minds, surpassing the weak and tight commensuration of our material numbers." And the reason of this is that, since the perfection of the universe is that which God especially intends in the creation of things, the more perfect some things are, the more they are created by God in greater excess: and as in bodies an excess is observed according to magnitude, so in incorporeal things an excess can be observed according to multitude. Now we see that incorruptible bodies, which are more perfect among bodies, exceed almost incomparably in magnitude the corruptible bodies. For the whole sphere of agents and patients is something small in comparison with the heavenly bodies. Whence it is reasonable that immaterial substances exceed in multitude material substances almost incomparably.

Reply to the first: In the angels there is not number which is discrete quantity, caused by division of the continuum, but [a number] caused by the distinction of forms (*formae*), in that multitude is among the transcendentals, as was said above.

Reply to the second: From the fact that the angelic nature is near to God, it must have the minimum of multitude in its own composition; yet not such that it be saved in few.

Reply to the third: That reasoning in Aristotle, in the thirteenth book of the Metaphysics, would conclude of necessity if the separated substances existed on account of the bodily substances. For thus immaterial substances would be in vain, unless from them some motion in bodily things appeared. But it is not true that immaterial substances are for the sake of corporeal ones; for the end is more noble than the things that are for the sake of the end. Whence Aristotle also says in the same place that this reasoning is not necessary, but only probable. He was compelled, however, to use this line of reasoning because we cannot come to the knowledge of intelligible things except through sensibles.[1255]

Reply to the fourth: That reasoning proceeds according to the opinion of those who posited matter to be the cause of the distinction of things. But this has been refuted. Wherefore the multiplication of the angels is to be taken neither according to matter nor according to bodies, but according to the divine wisdom devising diverse orders of immaterial substances.

Conclusion of the article: It is consonant with reason that substances separated from matter be in greater number than bodies. Concerning the text of the article I see nothing particularly worthy of notation. But we shall examine that doctrine in the following disputation.

1255. Aristotle, Metaphysics XII - XIII.

Disputatio CLXXX - Whether the multitude of angels exceeds the number of bodily things

Error concerning the number of the angels. Caput I. That it is not evident that the number of angels is greater than that of bodies. Caput II. That there are more angels than men. Caput III.

Caput I - Error concerning the number of the angels

St. Thomas relates in this article that it was the opinion of Aristotle, in Metaphysics XII, chs. 7 and 8, that the intelligences are only forty-seven, according to the number of the celestial orbs; and Rabbi Moses followed that opinion, as the Doctor testifies in this article. But that there are many more, Scripture plainly says: Daniel 7, "Thousands of thousands were ministering to him," etc.; from which place Dionysius in the fourteenth chapter of the Celestial Hierarchy gathers a great multitude of angels; and Matthew 26, "He will furnish me more than twelve legions of angels"; Job 25, "What is the number of his soldiers?" Which words Gregory, in Moral. XVII, c. 9, treats thus: "The number of the heavenly host is infinite; a definite number is expressed, that, as it is numerable to God, so it may be shown to be innumerable to men."[1256]

But Rabbi Moses replies to these places of Scripture that "angels" there are not called spiritual substances, about which we are now disputing, but the powers of irrational things, or even men, and thus they are in great number. But that exposition is frivolous, both because, as St. Thomas noted, the powers of irrational things are nowhere in Scripture called "angels"; and although men are sometimes called by this name, nevertheless in the cited places and in countless others in which the angels are said to be in great number, Scripture manifestly speaks of substances separated from matter.

Moreover, that Aristotle conceded other intelligences besides the movers of the spheres was well noted by Eugubinus: for in On the Heavens I, ch. 9, near the end, he teaches that outside the heaven, or above its summit, there are separated substances living a blessed life; he clearly understands, besides the movers of the orbs, which in the twelfth book of the Metaphysics he assigns.

Nevertheless some object that passage in Tobit 12, where Raphael says: "I am one of the seven angels who stand before the Lord." From this it seems to be inferred that the angels are not more than seven, who, enjoying the clear vision of God, are said to stand by him.

Some answer, from the doctrine of Gregory the Great, Hom. 25 on the Gospels, that in Scripture the number seven signifies universality, and thus there are more angels not only from the higher hierarchies and orders, but even from the lowest order of angels, who are sent to us daily.

Yet although in other places of Scripture the number seven is put for some great multitude, nevertheless in this place, and in all the others in which mention is made of the seven spirits who stand before the Lord and are sent into the whole earth, the definite number seven is signified.

1256. Pseudo-Dionysius, Celestial Hierarchy 14; Gregory the Great, Moralia in Iob XVII, c. 9; Matthew 26:53; Job 25:3.

Now these are the seven angels who, as princes, are set over the whole earth, of whom one was Raphael. They are said to stand in the sight of God, not because others do not stand there, but because, although the care of the universe is committed to them, nevertheless they always stand by and behold his face. They are called seven princes of the whole earth, and seven spirits sent into the whole earth. John bears witness that he saw these seven spirits, who have the care of the whole world, in Apocalypse 8 with these words: "And I saw seven angels standing in the sight of God." He makes mention of the same in chapters 15, 16, and 17; finally, in chapter 1 he says of them: "And from the seven spirits who are in the sight of his throne."[1257]

Some recent writers rightly think that the seven eyes in Zechariah 3, which the prophet saw in the stone - that is, in Christ - which in chapter 4 of the same prophet are said to go to and fro through the whole earth, signify these same [angels]; although Jerome and Rupert on that place, and Bede, Haymo, St. Ambrose [Autpertus], Ansbertus, and Aretas on the first chapter of the Apocalypse, understand the seven gifts of the Holy Spirit. For also John, Apocalypse 5, seems to have interpreted in this way the similar vision of the seven eyes of the lamb: "Which," he says, "are the seven spirits of God, sent into all the earth." Therefore, even if only seven are the princes set over the whole earth, nevertheless there are more not only from the other hierarchies and orders, but also from the lowest order of angels. It remains to see whether the multitude of the angels surpasses the number of bodily things.

St. Thomas in this article constantly affirms that the multitude of the angels is greater than the number of bodily things. Certain of his disciples understand this of the number of individual bodies, in such wise that the angels exceed in number the sands of the sea and every tiniest body. But Cajetan on this article, and Ferrarensis in the second book Contra Gentes, ch. 92, interpret St. Thomas of the number of bodily species, not of individuals: for thus even the holy Doctor himself seems to have explained himself in that chapter, and in On Power, q. 6, a. 6, and in this Part, q. 112, a. 4; for he expressly said that the multitude of angels is greater than the multitude of bodily natures, that is, by natures understanding the species of things, not their individuals.

I, however, do not see that anything certain in this matter can be defined either by reason or by authority. Not by reason: because, since the number of angels was produced from the sole will of God, it can be made known to us by no reason unless by revelation. Wherefore Durandus, in the Second Book, dist. 3, q. 4, dares to define nothing on this, but is wholly taken up with refuting the arguments of St. Thomas and of others who prove that the multitude of angels is greater than the number of other things: which can be easily dissolved. Nor can we bring forward anything certain by authority: for if there were any, it would especially be in Pseudo-Dionysius, Celestial Hierarchy, ch. 14; yet in truth he taught nothing of this sort, as from the following words it is lawful to gather. For after he had cited Daniel 7, that millenary number was set down, "Thousands of thousands ministered to him, and ten thousand times a hundred thousand stood before him," to show that Scripture would have it that the angels cannot be numbered by us, he adds: "For many are the blessed armies of heavenly minds, who surpass and transcend the feeble and contracted mode of

1257. Tobit 12:15; Revelation 8:2; 1:4; 15 - 17; Zechariah 3:9; 4:10; Jerome; Rupert of Deutz; Bede; Haymo; St. Ambrose Autpertus; Ansbert; Aretas; Revelation 5:6.

corporeal numbers which we use, and are exactly defined by the sole clear and supreme heavenly intellect which is happily granted to them by the productive wisdom of the divine providence." By which words he does not signify that the multitude of angels is greater than the number of bodies, but that it cannot be numbered by us by any multiplication of number which we are wont to use in numbering corporeal things, as by the hundred or the thousand, etc. For this he signifies when he says, "the feeble and contracted mode of corporeal numbers which we use": that is, the brief and small number which we use for numbering things; therefore he speaks not of the things numbered, but of number itself. He concedes, however, that their own multitude is well known to the angels themselves, by the light granted to them by God. Thus do Albert and the Bishop of Lincoln explain the latter words cited in that place; although Hugh of St. Victor there refers them to the knowledge of God, to whom, he says, the multitude of angels is known - an exposition which does not square with the words cited.[1258]

Caput III - There are more angels than men

If we compare the number of the angels with the multitude of men, the matter still remains so obscure that we can make no certain conjecture about it either by reason, or by Scripture, or by the authority of the Fathers. For, first, that there are more angels than men seems to be proved from the fact that individual cities, kingdoms, or at least men, have each their angels appointed for their guardianship, as we shall show below in Disputation 245: nor is it likely that the same angel should successively have the care of different men. Therefore there are more angels than men; especially since guardian angels, as we shall there say, are taken from the lowest order of the inferior hierarchy.

Dionysius the Carthusian also reports on that chapter 14 of the Areopagite's Celestial Hierarchy that it was revealed by God to St. Bridget that there are so many more angels than men that for each of men ten can be assigned in custody: I omit the evil angels, who are of the same nature with the good.[1259]

However, that there are more men seems to be gathered from that Apocalypse 12, where it is said that the Dragon drew with him the third part of the stars, that is, of the angels, who, imitating him, became devils: but these ruins are to be repaired from men, as St. Augustine testifies in City of God 22, ch. 1, midway, and in the Enchiridion chs. 28, 61, and 62; Bede on Ephesians 1, "To reestablish all things in Christ"; Anselm, Cur Deus homo I, ch. 18, although he adds that without peril to faith the opposite can be defended: therefore the multitude of men is greater than that of the angels.[1260]

Nevertheless, when Athanasius had proposed this question in the Book of Questions to Antiochus, q. 2, he left it undefined: he merely relates that some asserted that the number of angels is greater than that of men by ninety-nine parts, because they said that in that parable of the sheep

1258. Pseudo-Dionysius, Celestial Hierarchy 14; Albert the Great and Robert of Lincoln (Grosseteste) ad loc.; Hugh of St. Victor, ad loc.

1259. Dionysius the Carthusian on Pseudo-Dionysius, Celestial Hierarchy 14; Revelationes S. Birgittae (St. Bridget).

1260. Augustine, City of God 22.1; Enchiridion 28, 61 - 62; Bede on Ephesians 1; Anselm, Cur Deus Homo I.18.

which the shepherd left in the desert (Luke 15) the multitude of angels is signified: and they were ninety-nine; but that the one sheep which the shepherd sought denotes men. He also relates that others said the numbers of the two are equal, according to that Deuteronomy 32: "He established the bounds of the peoples according to the number of the angels of God," as the Seventy read.

Wherefore I also judge that nothing certain can be had in this matter: yet I deem of less moment those things that were adduced in the latter place. I say, then, granted even that it is certain that the sees of the angels are to be supplied from men, it is nevertheless uncertain whether as many men are to be assumed into them as angels fell. Wherefore Isidore, On the Sovereign Good, book 1, ch. 12, n. 13, when he teaches that the number of angels diminished by the ruin of the wicked is to be supplied from men, adds that that number is known to God alone. Moreover, it is not settled whether it was a third part of the angels who fell: for that third part of the stars which the dragon with his tail drew from their place does not signify the angels who fell with Lucifer, but the third part of men who will shine in the Church of God like stars; thus that place Apocalypse 12 is interpreted by Richard, book 4 on the Apocalypse, ch. 1, gloss 1, and by Nicholas on that place; while Bede explains it of men or of angels, and from the context he gathers that there is not there described a battle between good and evil angels in heaven, but between the demon and the faithful men in the Church, as we shall more at length show below in Disputation 225, ch. 2. For the former side I see nothing of moment except St. Bridget's revelation, to whose sanctity much deference is due. Therefore I think that more probable. Yet if one had to proceed either from the testimonies of Scripture and the Fathers, or from reason alone, we could conjecture nothing in this matter, as has been shown. For how could it be certain to us that the same angel is not again and again appointed to the guardianship of many men?

Articulus IV - Whether the angels differ in species

Objicitur. To the fourth, the procedure is as follows. It seems that the angels do not differ in species.

1) For, since difference is more noble than genus, whatever agree according to that which is most noble in them agree in the ultimate constitutive difference, and thus are the same according to species. But all the angels agree in that which is most noble in them, namely, in intellectuality. Therefore all the angels are of one species.

2) Moreover. More and less do not diversify a species. But the angels do not seem to differ from one another except according to more and less: namely, in that one is more simple and of more perspicacious intellect than another. Therefore the angels do not differ in species.

3) Moreover. Soul and angel are divided by opposition; but all souls are of one species. Therefore so too are the angels.

4) Moreover. The more perfect something is in nature, the more it ought to be multiplied. But this would not be if in one species there were only one individual. Therefore many angels are of one species.

But on the contrary: In things that are of one species, there is not found a prior and a posterior, as is said in Metaphysics 3. But among angels even of one order there are first, middle, and last, as Dionysius said in chapter 10 of the Angelic Hierarchy. Therefore the angels are not of the same species.[1261]

Respondetur: It must be said that some said that all spiritual substances are of one species, even souls. Others, that all the angels are of one species, but not the souls. Others, that all the angels of one hierarchy, or even of one order, are of one species. But this is impossible. For those things which agree in species and differ in number agree in form, but are distinguished materially. If, therefore, the angels are not composed of matter and form, as was said above, it follows that it is impossible that there be two angels of one species: just as it would also be impossible to say that there are several separated "whitenesses" or several "humanities"; for whitenesses are not several except according as they are in several substances. Even if, however, the angels had matter, not even so could there be several angels of one species. For then it would be necessary that the principle of the distinction of one from another be matter: not indeed according to division of quantity, since they are incorporeal, but according to diversity of powers. And this very diversity of matter causes a diversity of species and of genus.

Reply to the first: Difference is more noble than genus, as the determined than the undetermined, and the proper than the common, not however as one nature than another nature. Otherwise it would be necessary that all irrational animals be of one species, or that there be in them some other more perfect form than the sensitive soul. Therefore irrational animals differ in species according to the different determined grades of sensitive nature. And similarly all the angels differ in species according to the different grades of intellectual nature.

Reply to the second: More and less, insofar as they are caused by the intensification and remission of one form, do not diversify species. But insofar as they are caused by forms of diverse grade, in that way they diversify species: as if we say that fire is more perfect than air. And in this way the angels are diversified according to more and less.

Reply to the third: The good of the species outweighs the good of the individual. Hence it is much better that species be multiplied among the angels than that individuals be multiplied in one species.

Reply to the fourth: Multiplication according to number, since it can be extended to infinity, is not intended by the power of the agent; but only multiplication according to species, as was said above. Hence the perfection of the angelic nature requires a multiplication of species, not, however, a multiplication of individuals in one species.

Conclusion: Thus it is true that all angels are diverse in species; whether, however, it be possible that under the same species there be several angels differing only numerically - this is the whole difficulty of the present article, which must be weighed in the following disputation.

1261. Aristotle, Metaphysics III; Pseudo-Dionysius, Celestial Hierarchy 10.

Disputatio CLXXXI - Whether individual angels by their very nature differ in species

Caput I - Two opinions of St. Thomas and of his disciples

In the present controversy not only were there various positions of other Scholastics, but even St. Thomas himself and his disciples are not entirely in agreement. The first opinion is that of St. Thomas, who in the solution to article 4 teaches that individual angels differ from one another by species, and cannot be multiplied within the same species; which opinion Cajetan amplifies in his Commentary, yet does not determine whether by God's absolute power angels could not be multiplied under the same species and differ only numerically: that, however, he expressly teaches, On Being and Essence, ch. 4, question 7, as being the mind of the holy Doctor. The same seems to be the view of Peter of Bergamo in his Concordance of St. Thomas, dist. 115; and of Hervaeus in the Second Book, dist. 3, q. 3, article 2; and it is the opinion of Giles, who was St. Thomas's disciple and hearer, in book 2, q. 7. And this also seems to be gathered from St. Thomas's reasoning, which is of this sort: according to Aristotle's doctrine in many places, the multiplication of individuals under the same species proceeds from matter; for, first, in On the Heavens I, ch. 9, he teaches that "being this" pertains to matter, but being simply, to form; and he uses the example of the circle, of which he says that the being of the circle comes from the form, but the being of this circle from matter; from which doctrine it is gathered that where there is no matter, as in angels, there cannot be a multiplication of individuals under the same species, but only a multiplication of species.[1262]

The second opinion is that of certain Thomists, who assert that angels can differ by number alone, and be multiplied by God. Thus opine Capreolus on the Second Book, distinction 3, question 1, article 3, to the second against Durandus's fifth conclusion, in solution 4; and Ferrariensis on Second Contra Gentiles, chapter 93. To this it must be said that even St. Thomas himself expressly taught this in Opuscule 16, which is against the Averroists, when he solves an argument for the contrary side: for he affirms that the human intellect could have been multiplied by God, even if by its nature it did not have a principle of multiplication; for that which some thing does not have from its nature and from native principles, it can have from another cause, and especially from God; just as a heavy thing does not of itself have to be moved upwards, and yet this can befit it from another cause throwing it. From which doctrine it is plainly concluded that angels, at least by the absolute power of God, could be multiplied; and even if in themselves they did not have an inborn principle of multiplication, by God's absolute power they could be multiplied. That this stands with the doctrine of St. Thomas himself in this article is clear: for he neither here nor elsewhere said anything about the absolute power of God. Ferrariensis adds, perhaps now too angels under the same species differ in number, though the cause of the distinction be hidden from us: yet neither St. Thomas, nor Capreolus, nor any other Thomist ever said this.[1263][1264]

1262. Cajetan, Commentary on St. Thomas; St. Thomas, De ente et essentia, c. 4; Petrus de Bergamo, Concordia S. Thomae, dist. 115; Hervaeus Natalis, In II Sent., dist. 3, q. 3, a. 2; Giles of Rome, In II Sent., q. 7; Aristotle, De caelo I.9.

1263. John Capreolus, In II Sent., d. 3, q. 1, a. 3, ad 2; Durandus of St. Pourçain, against the fifth conclusion, in the fourth solution; Francis of Ferrara (Ferrariensis), In II Contra Gentiles, c. 93.

This was the opinion of Alexander, II, question 20, member 6, article 1; and Gabriel on the Second Book, distinction 3, question 1, article 2, conclusions 2 and 3; Dionysius the Carthusian, question 3; and Marsilius on the Second, question 3, article 1. Its reason can be what Alexander asserts, namely that since there are diverse grades and offices of angels in diverse hierarchies, a specific difference seems rightly to be gathered, just as indeed from diverse accidents in material substances we gather it.[126512661267]

Others, however, judge that all angels, of whatever order and hierarchy, differ in number alone under the same species. Thus taught Albert, part II, tractate 2, question 8; St. Bonaventure on II, distinction 9, article 1, question 1, when earlier in distinction 3, first part, article 2, question 1, he had only taught that all, or many, are of the same species; which opinion Marsilius in the place cited confesses to be more common; and Thomas of Argentina on II, distinction 3, question 2, article 2; these authors do not sufficiently explain which opinion they themselves follow. Richard of St. Victor is cited in favor of it, De Trinitate IV, chapter 25; but if he be read attentively, he did not teach this; nevertheless there are some fathers who not slightly insinuated it. First, St. Basil, book 3 On the Holy Spirit against Eunomius, not far from the beginning, speaks thus: "All angels, just as by appellation they have one, so also they have altogether the same nature." That Basil speaks of the unity of nature according to species is clear, both because he adds, "altogether the same nature" - for who would say that a man and a horse, because they are called by the same name "animal," have altogether the same nature, although we assert this plainly of Peter and John? For the difference of individuals does not suffice for us to say that their nature is different - , and also because Basil strives to prove that among the divine persons there is an order, even if they are of the same nature, by the example of the angels, who have order among themselves, although they have the same nature: therefore he must be speaking of specific nature, and of individuals; otherwise he would prove nothing.[1268126912701271]

Secondly, Athanasius, in the book of Questions to Antiochus, question 4, after he had asked whether angels are of the same nature, answers: "One and the same is the essence, just as there is only one essence of men." He did not say "of animals," but "of men," who are contained under the same lowest species.

Thirdly, St. Anselm, Cur Deus homo I, chapter 21, in order to show that one angel could not have been saved by another, as men were redeemed by one man, says: "Although all (namely, the angels) are of one nature, they are not of the same kind as men are." Here, while he concedes that they are of the same nature, he also admits that they are of the same species as individuals; for, as

1264. St. Thomas Aquinas, Opuscule 16, Contra Averroistas.

1265. Alexander of Hales, Summa theologiae II, q. 20, memb. 6, a. 1.

1266. Gabriel (commonly taken as Gabriel Biel), In II Sent., d. 3, q. 1, a. 2, concl. 2 - 3; Dionysius the Carthusian, q. 3; Marsilius (of Inghen), In II, q. 3, a. 1.

1267. The appeal is to the way specific difference is gathered from accidents in material substances.

1268. Albert the Great, Part II, tractate 2, question 8.

1269. St. Bonaventure, In II Sent., d. 9, a. 1, q. 1; and earlier d. 3, prima pars, a. 2, q. 1; Marsilius in the place cited; Thomas of Argentina (Thomas of Strasbourg), In II Sent., d. 3, q. 2, a. 2.

1270. Richard of St. Victor, De Trinitate IV.25.

1271. St. Basil, De Spiritu Sancto (against Eunomius), near the beginning.

we were saying above, a horse and a man are not said to be of the same nature simply, but with the addition "generic"; yet he says they are not of the same "kind," not because they are not contained under the same predicament - for thus they would not be of the same nature, but of an altogether diverse order - , but because, as he immediately explains, not all angels are from one angel, as all men are from one man: for the same reason, therefore, he uses "to be of the same kind" and "to be of the same stock."

Fourthly, St. John Damascene, in the book of First Institutions, chapter 7, writes thus: "It must be understood that those which contain only individuals are called lowest species, of which sort are an angel, a man, and a horse, etc."[1272][1273][1274]

But the reason is proved thus: since there do not appear to us effects or accidents of angels more diverse than those of the souls of men - and these do not differ by species - why ought we to judge that angels differ from one another more than by number?

The more probable opinion is that angels indeed can differ by number alone; whether however they now differ thus is hidden.

The other is that the mode in which those angels who are now created by God differ among themselves is unknown to us.

The former part of this opinion is handed down by Scotus on the Second, distinction 3, question 7; Durandus, question 1; Gabriel, question 1, article 2, conclusions 2 and 3; Richard, article 5, question 1; Thomas of Argentina, question 2; Marsilius, article 2, conclusion 1; Marsilius on the Second, question 1, article 1, conclusion 3; Henry, Quodlibet 1, question 1; and Quodlibet 2, question 8; to whom are to be numbered the authors of the third and fourth opinions. But the first opinion is said to have been condemned at Paris by Bishop Stephen and by the Doctors of the Sorbonne, as Richard and Henry attest, although the condemnations of the Parisian articles are not believed to be of great moment.[1275][1276]

Moreover, before I confirm this part by reason, against that opinion which St. Thomas seems to have handed down in that little work, it must be presupposed that by no manner of reasoning through divine power can angels be multiplied within the same species, unless in individuals there be a native and proper principle of distinction, whose effect God by no means can supply. For although motion and other things which can be impressed into some thing solely by the efficacy of a superior cause without a native principle - God can by his sole power bring about, as the motion of a heavy thing upwards, or its rest in a higher place - nevertheless a distinction without an internal principle of the thing which is distinguished, by his sole power he cannot bring about. For this effect depends upon a principle as upon an intrinsic and essential form, which God cannot supply by his power. For it is a well-known axiom of theologians and philosophers that God can

1275. John Duns Scotus, In II Sent., d. 3, q. 7; Durandus, q. 1; Gabriel, q. 1, a. 2, concl. 2 - 3; Richard of Middleton, In II Sent., d. 3, q. 1, a. 5, q. 1; Thomas of Argentina; Marsilius; Henry of Ghent, Quodlibet I, q. 1; Quodlibet II, q. 8.

1276. The Paris condemnations of 1277 by Bishop Stephen Tempier and the Doctors of the Sorbonne.

supply the place of an efficient cause, but not the place of a formal or material cause, which are intrinsically and essentially required; for even the place of the subject of accidents, upon which accidents do not essentially depend, he can also supply, not indeed by sustaining, but by conserving an accident without that in which it inheres. But the principles of distinction are intrinsic and essential: for things are not distinguished by the will of God, but by their own nature, and such principles are they. Wherefore the authors of the first opinion, when they deny in angels a distinction according to number under the same species, consequently assert that not even by absolute power can angels be distinguished. We, however, in confirmation of the first part of our opinion, must prove that there is in angels a principle by which they can be distinguished by number alone; and thus not above nature, but naturally, they can differ by number. The reason is this.

The principle of individuation under the same species ought not to be something really distinct from the very nature and species itself, as much in simple things as in composites: otherwise in all species there ought to be a distinction of individuals according to number, or in none. For if in any way in simples there were not a multiplication according to number, it would be because the principle of distinction were not something distinct, as in bodies matter designated by quantity is posited, either preceding, or subsisting under, generation; which is not found in simples: and on that account the principle of individuation is not this "to subsist"; but altogether the same according to reality with the specific principle, and only different by reason; and therefore it can be found equally in all species: therefore there is no reason why in simples and in things separated from matter there should not be a distinction according to number under the same species.

Furthermore, that the principle of individuation is not matter designated by quantity, or in any other mode, Scotus proves in many ways, in the six preceding questions; from which he rightly infers what he strives to prove about angels. I, however, by this single argument alone, omitting many others which philosophers use, show this same thing. Just as in the same man the same thing is a genus, species, and individual, and these differ by reason alone; so also is it with the principle of genus, species, and individuation: for these three are the same altogether according to reality, and differ only by our mode of conceiving, as we have shown in Disputation 113, chapter 4. For the notion of genus or species is not some reality which is at once in a man and in a horse, in Peter and John: rather, by our thought abstracted from all these is named the common concept, whose foundation is a singular nature, as it is found in many similars. Thus in each thing altogether the same and most simple according to account, we can assign principles - the generic, the specific, and the individuating. It is true that in composites besides the form there is also matter; this does not suffice, however, that it be said to be the principle of distinction according to number; and a different thing is specific according to reality from both. For both matter and form, constituted physically, establish the account of genus, species, and individual; for from either is this triple account taken.

Besides, just as for genus to be multiplied according to species it is not necessary that the principle and the specific difference which contracts the genus be distinct according to reality from the genus itself, so also, for a species to be multiplied according to number, it does not seem

necessary that the principle of individuation be distinct in reality from the notion of the species: for the accounts of each seem to be the same, since they are gathered in the same series and order of predications of metaphysics, and from these alone is made a metaphysical composition far different from a physical composition, which is from matter and form cohering.

To Aristotle, indeed, whom the Thomists think they have as a defender of their opinion, Scotus replies in the places cited, that when he says that a thing is one which has one matter, he is not speaking of matter, nor of understanding the other physical part of the composite, but of that concept of the individual which Scotus calls "thisness" (haecceity), because it contracts the species to a determinate individual; which is, as it were, material with respect to the species. I, however, candidly admit that Aristotle in the passages alleged spoke expressly of matter, which is the other part of the composite. Nevertheless some learned men argue thus: Multiplication according to number cannot take place without division; but division cannot be without quantity; and this neither without matter: therefore neither can distinction according to number be without matter. I answer that by that argument is proved only this, that multiplication according to number which arises by reason of the division of a continuum cannot be without matter and quantity: but a substantial multiplication which is not a division and scission of a continuum, but is from the nature of the thing itself, just as is multiplication according to species, is found without matter and quantity. This suffices for the first part of our opinion.

The second part is proved by the testimony of Damascene, De fide orthodoxa II, chapter 3, where he writes thus about the angels: "As to whether their natures are equal among themselves or unequal, we by no means comprehend; only He knows who created them - God, who has all things perfect and in readiness." The same is said by St. Augustine, Against the Origenists and Priscillianists to Orosius, where from their offices and from the order of their definite course we can gather things of this sort. For the differences of ministries and of orders are entirely had from grace; whether also at the same time from nature - this too may be the case; yet it may also be that one surpasses another by grace alone, while the nature remains one and the same.[1277][1278]

illuminate naturally, not because his intellect is of a superior species, but because within the same order he has a more perfect intellect, as among men. Finally, from whatever side we consider them, the matter is quite uncertain; nor should this seem strange, since even among the things we see we cannot always with certainty assign a distinction according to species.

Articulus V - Whether the angels are corruptible

Objicitur primo: It seems that angels are not incorruptible. For Damascene says of the angel that he is a substance intellectual, receiving immortality by grace and not by nature.[1279]

1277. St. John Damascene, De fide orthodoxa II.3.

1278. St. Augustine, Contra Origenistas et Priscillianistas ad Orosium (cap. cited).

1279. St. John Damascene, De fide orthodoxa II.3 (on the angels), who says that they receive immortality by grace, not by nature.

Objicitur secundo: Further, Plato says in the Timaeus: "O gods of gods, of whom I am the craftsman and father; my works indeed are dissoluble by nature; yet by my will indissoluble."[1280] But by "gods" he can understand nothing other than angels. Therefore by their nature angels are corruptible.

Objicitur tertio: Further, according to St. Gregory, all things would tend into nothing unless the hand of the Almighty preserved them.[1281] But what can be reduced to nothing is corruptible. Therefore, since angels are made by God, it seems that they are corruptible according to their nature.

Sed contra: Pseudo-Dionysius says that intellectual substances have life unfailing, free from all corruption, death, matter, and generation, existing as pure.[1282]

Respondeo: I answer that it is necessary to say that angels are incorruptible according to their nature. The reason is that nothing is corrupted except inasmuch as its form is separated from its matter. Hence, since an angel is subsisting form itself, as was said above, it is impossible that his substance be corruptible. For what belongs to something according to itself cannot be separated from it; but what belongs to something by another can be separated, once that by which it belonged is separated. Roundness cannot be separated from a circle, because it belongs to it according to itself; but a bronze circle can lose roundness, by the fact that the circular figure is separated from the bronze. Now "according to itself" belongs to form. For each thing is actually being according to that whereby it has form; whereas matter is actually being by the fact that it has form. Therefore, if the form itself subsists in its own existence, as in angels, as has been said, it cannot lose its form. Hence the immateriality of the angel is the reason why the angel is incorruptible according to his nature. And a sign of this incorruptibility can be taken from his intellectual operation. For since each thing operates according as it is in act, the operation of a thing indicates its mode of being. But the species and ratio of an operation are grasped from its object. Now the intelligible object, as being above time, is sempiternal. Whence every intellectual substance is incorruptible according to its nature.

Ad primum: To the first, it is answered that Damascene takes immortality as perfect, which includes every kind of immutability, because every change is a kind of death, as St. Augustine says. But angels attain perfect immutability only by grace, as will be made clear below

Ad secundum: To the second, it is answered that by "gods" Plato understands the heavenly bodies, which he thought to be composed of the elements. And therefore according to their nature they were dissoluble; and according to the divine will they were always preserved in being

Ad tertium: To the third, it is answered that, as was said above, something is necessary in such a way as to have the cause of its necessity. Hence it is not repugnant to the necessary nor to the incorruptible, that its existence should depend on another as on a cause. Therefore, by the statement that all things would fall into nothing unless they were held together by God, and angels

1280. Plato, Timaeus 41a - b (address of the Demiurge to the "gods").

1281. St. Gregory the Great, Moralia in Iob XVI.18, on divine conservation preventing all things from tending to nothing.

1282. Pseudo-Dionysius, De divinis nominibus IV, on intellectual substances having an unfailing life free from corruption, death, matter, and generation.

too, one is not given to understand that in angels there is some principle of corruption, but that the angel's existence depends on God as on a cause. Nor is a thing said to be corruptible because God can reduce it to non - being by withdrawing His conservation, but because it has in itself some principle of corruption - either contrariety, or at least the potency of matter

Conclusio: The angels by their very nature are incorruptible.

Hence there will be for us a disputation on this question: Whether angels are incorruptible by their nature, or by the grace of God only.

Disputatio CLXXXII - Whether angels are by nature, or by grace, incorruptible; and whether other things are or are not so by the power of God alone

- What St. Thomas, Cajetan, and certain Thomists have held. Caput I.
- The more probable opinion is contrary. Caput II.
- Corollaries from the preceding doctrine. Caput III.
- The latter, more probable opinion is confirmed. Caput IV.
- The arguments of the former opinion are dissolved. Caput V.

Caput I - What St. Thomas, Cajetan, and certain Thomists have held

St. Thomas in this article 5, and above in question 9, article 2, and there Cajetan, and in book 2 Contra Gentiles, chapters 30 and 55, and there Ferrarensis; Petrus Bergomensis in the Concordances of doubtful places, no. 122; and Durandus, in the first book, distinction 8, part 1, question 3, affirm that angels are by their nature incorruptible and immortal; whereas they say "mortal" and "corruptible" not on any other account than that they can be reduced to non-being, not by any passive potency which is in them, but only by the active power of God, by which, as they were produced, they can in the same way be annihilated. Whereas the other composites out of matter and form, which are corruptible, are such not only by the power of God, but also by an intrinsic potency of the matter of which they consist, to be corrupted. And in order more fully to unfold the doctrine of St. Thomas, Cajetan, on that article 2, notes that there is a twofold potency, one real, the other logical. The real potency is that which inheres in things themselves, that they may be this or that; and this is with some appetite and inclination. But because every appetite and inclination is not first and per se to existence, but to some particular existence, from which it follows that there is not therefore any real potency proximate to non-being - this is the one that is found in the matter of corruptible things. The logical potency, however, is what is wont to be called non-repugnance; and as often as something does not repel being, we say that there is in it a logical potency to be. The former potency is not in angels or in spiritual things, because there is not in them anything that could receive a contrary form, by the introduction of which they would cease to be. The latter potency befits angels that they may not be, not because that is some real potency in them, but solely in respect to the efficient cause, by which they can be destroyed. And therefore it is

rightly said that the angel is by nature incorruptible, because in himself he has no real potency whereby he would be corrupted or cease to be; whereas these lower bodies are said by their nature to be corruptible, because they have in themselves a real and physical potency not to be. For the same reason an angel is said to be a necessary being, with a physical and real necessity, because he lacks a real potency not to be; but he is not a being necessary with a logical necessity, because it is not repugnant for him not to be. This is what the holy Doctor seems to signify in this fifth article, in the reply to the third, when he calls the angel a necessary being, yet so that he has the cause of his necessity, namely God, by whom he can be annihilated and destroyed.

Accordingly, that angels are immortal and incorruptible by their nature is proved first from the Lateran Council under Leo X, session 8; in the bull of Leo which is placed there at the beginning of that session, it is defined that the rational soul is immortal.[1284] Therefore, since angels are not of an inferior condition, they will likewise be immortal. But if the soul and the angel were by their nature mortal and corruptible, although by the divine will...

Caput II - On corruptible and mortal, and likewise on incorruptible and immortal, taken relatively to a power

[Preceding position summarized and distinguished.] There is a twofold potency (*potentia*), one real, the other logical. The real is that which is found in material corruptibles; the logical is that which is commonly called a non-repugnance. Therefore an angel does not have in itself any real potency, as if there were in it something able to receive a form by whose introduction it would cease; rather, only by respect to an agent, by which it can be destroyed. For this reason the angel is said by nature to be incorruptible, because in itself it has no real potency that it be corrupted or cease; whereas these lower things are corruptible by their very nature, because they have in themselves a real potency not to be. And thus the angels are said to be beings by a physical and real necessity, because, although they do not have in themselves a real potency not to be, nevertheless they are not beings by a merely logical necessity. This is what St. Thomas seems to signify in this fifth article, where he calls the angel a being of necessity, yet so that the cause of its necessity is God, by whom it could be annihilated.

It is proved first from the Lateran Council under Leo X, session 8, where it is defined that the rational soul is immortal. Therefore, since the angels are not of an inferior condition, in the same way they are immortal. But if the soul and the angel were by their nature mortal and corruptible, although by the will and grace of God they should endure forever, nevertheless they would be in the strict sense mortal and corruptible.[1285]

Second, Pseudo-Dionysius, De divinis nominibus IV not far from the beginning, says that our souls are like the angelic powers. Showing, however, in what they are like, he says: that they are masters of themselves, that they have life in themselves and their own essence (*essentia*), and that they have it free from destruction. By these words he also seems to have indicated the reason of St.

1284. Fifth Lateran Council (1513), session 8, Apostolici regiminis, defining the immortality of the rational soul.
1285. Fifth Lateran Council (under Leo X), session 8, defining the immortality of the rational soul (Apostolici regiminis).

Thomas in this article: he therefore asserts that angels are incorruptible because they are forms subsisting of themselves; whereas other things composed of matter and form are for that reason corruptible, because in them the form can be separated from matter - a reason which will be examined below.[1286]

Third, St. Basil at the beginning of Psalm 44 teaches that the angels do not grow old, and that the substance (*substantia*) of their nature is immutable. Fourth, Julian, Archbishop of Toledo, book 1 De futuro saeculo, cap. c (found in the third volume of the Bibliotheca sacra), asserts that the angels were so created that, even if they should sin, they could not die; but that men on account of sin incurred the penalty of death. Fifth, Athanasius, in the book of Definitions, shortly after the beginning, teaches that the angel and the rational soul are immortal. Finally, St. John Damascene, in the book of Institutions, cap. 7, says that immortality is the differentia of the angelic nature and of any other incorporeal substance.[1287]

By reason it is proved as follows. If anything stood in the way, by which angels could not be called incorruptible by their nature, it would be this: that by their nature they depend on God as first cause, by whom they are conserved. But this cannot be an impediment. For fire, by its nature, is said to have the power to heat even if its power necessarily depends on the influx of God cooperating, in order that it may heat. Therefore the angel can be said by its nature to be incorruptible, even if its existence depends on the influx of God conserving it.

Probabilior sententia.

If corruptible and mortal, and likewise incorruptible and immortal, are said relatively to some acting power, a certain distinction must first be premised. For either we speak with respect to the power of God, or we speak with respect to a created power; and according to this division our sentence must be divided into two parts.

The first part is this, if we speak with respect to the power of God, and the names Mortal and Corruptible are taken for that which can cease through destruction and annihilation, and Immortal and Incorruptible signify the opposed negation: then no creature is by its nature immortal and incorruptible. Nay rather, by its nature, from a real potency in its very existence (*esse*), it is corruptible and mortal - which is the same as if we were to say that by its nature it is subject to the power of God, so that it can be annihilated by it.

The second part is this: with respect to a created power, the angel and the rational soul are incorruptible and immortal, in whatever way incorruptible and immortal are taken.

We can confirm the first part by authority and by reason. By authority, indeed, of the Scholastics who clearly taught it: Alexander, first part, question 14, member 3; St. Bonaventure on the First Book, distinction 8, first part of the distinction, article 2, question 2; Richard, article 2, question ...; Scotus, question 5, 6, Ad quaestionem ..., and on the Fourth Book, distinction 49, question 6; Ockham on the Second Book, question 7; Gabriel on the Second Book, distinction ...,

1286. Pseudo-Dionysius, De divinis nominibus IV, near the beginning.

1287. St. Basil, In Psalmum 44, in principio; Julian of Toledo, De futuro saeculo, lib. 1, cap. c (in Bibliotheca sacra, tom. 3); Athanasius, Liber definitionum, initio; St. John Damascene, Institutiones, cap. 7.

question 1, article 2, conclusion 6; all of whom pronounce that every creature is mutable of itself not only according to accident, but also according to substance, by failing; and that this befits a creature by its very nature; and what befits a thing by its nature, befits it intrinsically. St. Bonaventure and Richard distinguish a threefold immutability. The first they call invariability, and they say that this, by nature, belongs to no one except God, nor by grace either; they take immutability in this mode for a negation not of the potency of change, but of the act, and they say that this in fact belongs to no creature, since even the blessed angels are changed according to various thoughts. The second immutability they call incorruptibility, and they say that this exists in some things by nature, as in angels and in the rational soul, but in others by grace, as in the glorious human body; and they take incorruptible as signifying the negation of corruption from a second cause through the separation of matter and form. The third immutability they call inconvertibility, inasmuch as it signifies an impotence with respect to the negation of existence itself by annihilation and destruction, or a ceasing simply, about which the present controversy is; and they say that this belongs by nature to no creature, but only by grace, as will be explained below.[1288]

In the second place there are many testimonies of the Fathers, which seem to confirm this. Justin, in the book of Questions which the Gentiles propose to Christians, De eo, quod corpore vacat, q. 13, cap. 20; St. Gregory the Great, book 16 of the Moralia, cap. 19 not far from the beginning; and Damascene, book I De fide, cap. 3, thus: by the nod of God all things are conserved, even spiritual things, so that if God were unwilling to conserve them, they would fall into nothing. St. Cyril, book 2 contra Julianum, teaches the same; and the same is what Julian himself, according to the opinion of Plato, confessed, as Cyril a little before reports; and in the Thesaurus, book 8, cap. 2, in the middle, he says that the angel and the rest are immortal, but by the grace of God, not by nature. Damascene, book II De fide, cap. 3, agrees; Elias Cretensis on the first oration of St. Gregory Nazianzen on those words "Maker, King, Head," etc.; and Sophronius in his Epistle, a little after the middle, which was recited in the Sixth Synod, action 11, and approved in action 13, who speaks thus about spiritual things: "In no way do they die, nor are they corrupted, as sensibles flow down and pass away; nevertheless, they are not immortal by nature, nor do they pass into an incorruptible essence, but grace has been bestowed on them that restrains from that corruption and from death: thus the souls of men remain uncorrupted, thus the angels persevere immortal, not really having, as some assert, an essence properly immortal, but they have by lot from God the grace which bestows immortality, and provides them with incorruption." Isidore is also cited, book 1 De summo bono, cap. 12; there, however, he only teaches about the mutability of sin, that the angel by his nature is mutable, and remains incorrupt by charity.[1289]

1288. Alexander [of Hales], Prima pars, quaestio 14, memb. 3; St. Bonaventure, In I Sent., dist. 8, pars prior, art. 2, q. 2; Richard [of St. Victor], art. 2, q. ...; Scotus, q. 5, 6, Ad quaestionem ...; In IV Sent., dist. 49, q. 6; Ockham, In II Sent., q. 7; Gab., In II Sent., dist. ..., q. 1, art. 2, conclusio 6.

1289. Justin, Quaestiones, quas gentes Christianis ponunt, De eo, quod corpore vacat, q. 13, cap. 20; St. Gregory the Great, Moralia, lib. 16, cap. 19; St. John Damascene, De fide, lib. 1, cap. 3; St. Cyril of Alexandria, Contra Julianum, lib. 2; Thesaurus, lib. 8, cap. 2; Damascene, De fide, lib. 2, cap. 3; Elias Cretensis, In primam orationem Nazianzeni; Sophronius, Epistola (recited in Sixth Ecumenical Council, act. 11; approved, act. 13); Isidore, De summo bono, lib. 1, cap. 12; cf. also Acts 17:28; Wisdom 11:25.

But Cajetan and others who follow the former opinion explain similar testimonies of the Fathers about that potency which they call logical, not natural and real; yet they plainly concede that the angel is not by his own nature immortal, but only by the grace of God, if immortality and incorruptibility are referred to the power of God conserving and able to destroy. This, indeed, I take to be a matter of faith, and one that can in no way be denied. Wherefore certain more recent writers, who affix the note of error to theologians asserting that angels are not by their nature immortal, should have taken notice that no Catholic up to now has asserted this without making a distinction; but all have spoken of immortality and incorruption while making a comparison with the power of God. But to assert that, with respect to that power, some created thing is immortal, in the explained sense, deserves the note of error; both because the Fathers alleged hand on that point to us as a dogma of faith, and also because, as is clear from the doctrine of St. Augustine, book V on Genesis, cap. 20, of St. Gregory the Great, book 16 of the Moralia, cap. 19, not far from the beginning, and of Damascene, book I De fide, cap. 3, thus by the nod of God all things are conserved, even spiritual things, so that if God should will not to conserve them, they would fall into nothing - as Scripture plainly says in Acts 17, "For in him we live, move, and are," and in Wisdom 11, "How could anything remain, unless you willed it? or that which was called by you be preserved?" The only controversy can be with Cajetan and other Thomists, whether the mortality and corruptibility which we concede to angels with respect to God is only from the active power of God, from which that logical potency to corruption and annihilation is said to arise, or whether by their very nature they have this intrinsically through some real and native potency; and only on this point will we have a controversy with the Thomists alleged: for as to the rest there is no one who dissents.

Accordingly, I gather not obscurely this native potency on the part of the angel and of its very nature from the testimonies of the Fathers. For when they say that nothing is immortal by nature, but by grace, it clearly follows that all things by their nature are mortal and corruptible with respect to the power of God. For if by grace they obtain immortality, by their nature they are corruptible; for grace removes what would befit them by nature.

But someone will say that by their nature they are neither immortal nor mortal, but are immortal by the grace of God. Yet this answer is easily refuted, because mortal and immortal are opposed without a middle, in the same manner as mortal and not-mortal. Therefore either the nature of the angels is of itself mortal or immortal; that is, either it has of itself a real potency to cease, or it does not have it. If it does not have it, then it is not of itself mortal, and consequently it is immortal; but if it has it, it will be mortal.

Moreover, let us prove our sentence by reason, and deduce it from the doctrine of St. Thomas. For he, above, question 25, article 3, teaches that all possible things are by their own nature objects of the divine omnipotence, not from the fact that they are possible to be made by the omnipotence - for thus there would arise a useless circle, as we fully developed in disputation 104, chapter 4 - but before the divine power regards them and denominates them possible, they are said of themselves to be of such a nature that they can be produced by God and be the object of the divine omnipotence, from the fact that in themselves they do not imply a contradiction as to being. Yet so,

that if they are not, nor are produced, no force is properly inflicted on them; for what as yet is not cannot strive to be, and consequently can suffer no force, if it is not produced. Therefore, although there is not a physical potency as in a subject for receiving a form, but only a potency (which we may call logical), that is, a non-repugnance, that it exist; nevertheless that potency ought not to be said to be altogether extrinsic to things, coming only from the productive power, but to be truly real and native to the thing, from which it arises that it is subject to the power that makes.

In the same manner we must philosophize about corruptibility, that is, about the potency of things that they not be and be destroyed: namely, that any thing whatsoever has from itself, according to the thing, a potency that it not be; not indeed what they call physical, as in some subject to receive a contrary form, nor only from the virtue of the agent (as Cajetan contrives), but a real and native [potency], even if we not inaptly call it logical, because it is only a non-repugnance. For in the same way the omnipotence of God is engaged with respect to non-being, as we explained in that disputation, chapter 5, as it is with respect to being: that is, it makes a thing not to be, just as it produces and makes it to be. Therefore, since angels and rational souls are objects of the divine omnipotence as to not being, it follows that also from themselves, before the omnipotence is referred to them, they can not be; and consequently, in them there is that native non-repugnance, that they not be. And this indeed seems intrinsic and essential to every creature no less than the non-repugnance that they be and be produced. Now when the holy Doctor said that they are only corruptible by the power of the Creator and agent, not from themselves, he only asserted this in order to deny a passive potency in them with respect to a created agent; for this, as we shall say in chapter 4, is not present in spiritual creatures. Yet for that reason he does not deny an innate and real non-repugnance in all creatures that they not be; for since he concedes that by the acting power of God they are corruptible, he could not but concede in the very object of the power an aptitude and an innate and real non-repugnance by which by their nature they are subject to such a power, according to what he had handed down in that question 25, article 3.

Caput III - Corollaries from the preceding doctrine

From the former part of our sentence, which we confirmed in the foregoing chapter, certain conclusions follow worthy of remark, which will also more clearly illuminate the preceding doctrine.

First, all created things do not perish - that is, are not annihilated - by the favor and grace of God. For since they do not have this of necessity by their nature, whenever they have it, they have it by the favor of him by whom they are conserved. The Fathers commemorated in the preceding chapter called this benefit - which is in no way owed to them either by justice or by condign gratitude - "grace," when they say that no human creature is immortal, but by the grace of God. They speak with respect to the power of the Creator, by the name "grace" not understanding the grace through Christ, but the gift of creation, which, when Pelagius had confessed it in the Council of Diospolis, as we reported in disputation 91, chapter 9, the African Fathers in Epistle 95, as found

in St. Augustine, conceded could not inaptly be called grace by reason, yet that it is not sufficient for living rightly and piously and for overcoming temptations, nor is it called grace in Holy Scripture.

Moreover, although by the grace of God the angels have immortality, as also the bodies of the blessed, yet here they have grace in a different manner than bodies, which obtain the endowment of incorruptibility and impassibility. For these latter have incorruptibility because some quality has been communicated to them against every action of contraries, by which otherwise they would be corrupted; but the angels, for this sole reason, that they are freely conserved by God, on whom alone they depend, since by him they can be corrupted. Yet both are a benefit and grace of God.

Second, note that the grace of incorruptibility which we say was communicated to the angels is not a negation of passive potency, but only a negation of act; that is, it is grace for them not to be destroyed and not to be annihilated, though not an inability to be destroyed.

Caput IV - The latter, more probable part of our opinion is confirmed

Second, note that the grace of incorruptibility which we say was communicated to the angels is not the negation of passive potency, but only the negation of act; that is, it is a grace to them not to be destroyed and not to be annihilated. But that they cannot be destroyed is no grace to them, nor can it in any way be communicated. For either the discourse is about a potency of incorruptibility with respect to a created agent - and this, by their very nature, they so possess that it altogether repugns that they be corrupted by a created agent - or we speak of a potency of incorruptibility with respect to God - and this in no way can be communicated to them. It remains, therefore, that the grace done to the angels is nothing other than not to be corrupted by God and to be preserved by Him perpetually.

Third, it is to be observed that, if an angel were annihilated, his destruction or annihilation would be in a certain manner supernatural and in a certain manner not. For with respect to naturally acting causes, and to the common concurrence and order of things, it would be called supernatural, because he would be annihilated above the powers of created causes and above the order which God maintains. But neither with respect to God as agent nor with respect to the angel himself would it be above nature: with respect to God, this is obvious; with respect to the angel himself it is clear, because the not-being of an angel is not above his nature, as grace is - indeed rather it seems to be against it, as will be explained below. And although it would be above nature in the first manner just said, nevertheless it is not above nature in the same manner as the restoration of an eye: for this is so done by God that although the eye is by nature apt to be produced by a proper cause, yet for its restoration some created cause is not sufficient, but it must be done by God alone; whereas annihilation would be done by God as by a proper cause, and so would be more natural than the restoration of an eye; none the less, for another reason just mentioned, it would be called above nature.

Fourth, note that annihilation is in a certain manner against nature and in a certain manner not. For if we consider the nature of a thing as existing, annihilation is opposed to it as not-being, just as negation is opposed to affirmation. But if we look at the nature itself according only to its essential predicates and according to possible existence, annihilation is not contrary to it: for thus it is indifferent that it be or not be; that is, among its essential predicates existence is not more to be counted than non-existence. But you will say: according to its essential predicates it has an inclination that it be preserved, therefore to be annihilated is against its natural appetite. I answer that in the essence, under possible existence, there is not a real inclination in the mode of a potency toward existence; for the essence is not really distinguished from existence, and thus it does not have a real inclination. But when the essence does not exist, it has nothing other than to be able to exist; that is, not to imply a contradiction that it exist in act, which is a logical potency, though a real one. This however it also has, that it not be; for it is indifferent according to the essential predicates to exist and not to exist.

From this it is clear that it does not follow, from the fact that in angels existence is not distinguished from essence, that they are not corruptible; because it is not required that in them existence be separated from essence. For the reason of corruptibility comes only from this, that this essence, which at some time exists in act, depends on God and by His will is preserved so as to exist.

It remains to explain that place, 1 Timothy 6: "Who (namely God) alone has immortality," from which also it will appear in what way things other than God are mortal and corruptible. There are, however, four expositions of that place, taken from the Fathers. The first is St. Augustine, On the Nature of the Good, cap. 39, and in Epistle 28, and St. Jerome in his larger Commentaries on the Epistle to Titus at those words of the first chapter, "which He promised," etc., who interpret that place in such a way that no one is immortal as God is, in the same sense in which it is said in Mark 10: "No one is good except God alone." Wherefore they say that the rational soul is immortal in its own way; and they seem to understand, as we explained above, with respect to a created cause, not with respect to God; but that God is absolutely so with respect to anyone whatsoever.[1290]

The second exposition is about the immortality of sin, which without doubt St. Ambrose understands, 3 De fide ad Gratianum, cap. ..., of which kind of immortality he said that the angel is immortal whose immortality is in the will of the Creator; and this interpretation St. Ambrose embraces below in question 63, article 5, at the end.[1291] "The earth," he says, "has this immortality, or rather immutability, which removes every change, whether into better or into worse." Thus also St. Augustine, On the Trinity I, cap. ...; and On Genesis ad litteram, at the very last chapter at the end; and St. Anselm on that place of Paul. The fourth is St. John Chrysostom on that place, that God is said to have immortality frequently in preference to those titles "King" and "Lord," of which Paul had made mention above; and as he had said above that God alone is mighty. The words of Paul are: "Keep the commandment without spot, irreprehensible, until the appearing of our Lord

1290. St. Augustine, De natura boni, cap. 39; Epistola 28; St. Jerome, Commentaries on Titus, at chap. 1, "Quam promiserat," etc.

1291. St. Ambrose, De fide ad Gratianum, lib. 3, cap. ...; cf. also below, q. 63, a. 5, in fine.

Jesus Christ," and he subjoins immediately: "which in His times He shall show, the only mighty, King of kings and Lord of lords, who alone has immortality," that is, "which He shall show in its own times." For in Greek it is hen, that is, "which."[1292]

Caput V - The arguments of the former opinion are dissolved

The other part of our opinion was this: if "corruptible" and "mortal" be taken with respect to a created power that corrupts, angels and rational souls by their own nature are so immortal, that no creature can be produced by God able to corrupt them. For no created cause can corrupt anything by annihilating it (for this is God's alone), but only by inducing in matter or subject a contrary form; it follows that angels and rational souls can be corrupted by no created cause. But that annihilation is God's alone is evident, because it is the corruption of the whole existence, and therefore it is altogether opposed to creation; and in this alone does it consist that the creation of a thing ceases to be continued. But God alone can create and continue creation, as was shown in disputation 176; therefore He alone can annihilate something. Now that angels or souls cannot be corrupted by the induction of a contrary form is manifest, although this is proved in a different way: for an angel cannot be corrupted by the induction of a contrary form, because he is not a form that can be united to some matter as to a subject (as we shall say in disputation 183); therefore he does not have a contrary form by which he can be expelled from some subject. Rational souls, however, since they are forms of matter, can be expelled from it; but because by their own nature they are united to matter in such a way that they do not depend on it with respect to existence, therefore, when a contrary form is induced, there is only a dissolution of the composite, which is its corruption, but the soul separated from matter remains of itself; whereas the other substantial forms of the same thing, once the composite is dissolved, perish, because they depended on matter with respect to existence. Therefore, we rightly said with a distinction that angels and souls are corruptible by their nature in comparison to the power of God; but with respect to a created cause they are incorruptible and immortal.

A distinction of this sort was employed by St. Cyril, cited by us above, cap. 2, in these words: "For the things which are chiefly in natures are nothing with respect to the Creator. Wherefore, just as fire is indeed combustible, but not to God, so also the angel is indeed immortal, but not to God." And indeed he philosophizes most rightly thus: for "corruptible" and "incorruptible" are said relatively; and although fire could be said absolutely and without any distinction "combustible," because it suffices for this that it be combustible with respect to something, nevertheless, in order that the angel be said "immortal" or "incorruptible," that distinction seems necessary, if these names are taken for an impotence to non-being in any way whatsoever. For since they include a certain negation, they seem to deny a potency to not-being with respect to any agent whatsoever. On the other hand, they could be said absolutely "mortal," because it would suffice that they be

1292. St. Augustine, De Trinitate I, cap. ...; De Genesi ad litteram, cap. ult., in fine; St. Anselm, on the place of Paul, 1 Tim. 6; St. John Chrysostom, Homilies on 1 Timothy 6:15 - 16.

such with respect to some agent, that they be affirmed such, unless perchance this name were used in some other signification, as we sometimes do. If, however, there were a name signifying only a passive potency to non-being, it would be stated absolutely of them.

Wherefore, for the greater explication of what we have said, it must be observed that these names - "mortal," "immortal," "corruptible," and "incorruptible" - are commonly used relatively only to created causes. For since they do not signify the cessation of a thing by annihilation, nor the cessation of the universe, but by a natural separation of form from matter, or the negation of that, therefore they are commonly said relatively to a created active power, which is able to separate matter from form, and thus to bring on death or to corrupt. And therefore it would not be lawful, by using these names, to assert that angels or rational souls by their nature are mortal, or by their nature not immortal: because, unless something else were explained, we would signify that these substances could be corrupted by some created agent. With the addition, however, we ought to say that they are not incorruptible with respect to God, but with respect to Him they are corruptible; and not immortal by their nature in such a way that their name would deny a potency to non-being with respect to any agent whatsoever - which is proper to God alone - and in this way absolutely it should be said that angels and souls by their nature are "annihilable," so to speak, because they are said relatively to the power of God, who alone can annihilate; and these spiritual substances by their nature are subjected to the power of God that they can be annihilated.[1293]

But it is easy to overturn the foundations of the former opinion. For the Lateran Council and the Fathers alleged speak of corruption, death, and destruction by a second cause; and by these words "immortal," "incorruptible," and "free from destruction" they use the common and popular signification by which we signify the negation of passive potency with respect to a created active power, as we showed in the preceding chapter; but with respect to God they are not willing to deny in angels and souls a native potency to be destroyed, and thus Leo X in that bull, in confirmation of his definition, adduces that passage of Matthew 10: "Fear not those who kill the body, but cannot kill the soul." It is plainly concerning death inflicted by a second cause, which properly is called death, that the Council follows. And the same sense was followed by the Fathers all alleged in the first chapter. Therefore we said, in the preceding chapter, that absolutely souls and angels are to be called "immortal" and "incorruptible," because these names are said only relatively to a created cause.

To the reason brought for that opinion I reply that the case of the example alleged is different. For fire is therefore said by nature "heating," even if it need the concurrence of God, because it has by its nature a force and potency of producing heat, by which from within, as it were with a certain impetus, it is borne to such an effect, so that if the concurrence of God were denied to it, it would be something violent for it not to heat. But a spiritual nature is so constituted, produced, and preserved by God that it has in itself no force whatsoever by which, together with God's

1293. St. Cyril, cap. 2 (as cited).

concurrence, it might effect and preserve itself; rather it is so wholly from God and preserved by Him that of itself it does not resist to be or not to be, nor does it have any natural inclination in the mode of a potency toward existing, since it is really not distinguished from its existence.

Quaestio LI - On the comparison of angels to bodies

Thereupon there is inquiry about angels by comparison to corporeal things. And first, about the comparison of angels to bodies. Second, about the comparison of angels to corporeal places. Third, about the comparison of angels to local motion. Concerning the first, three things are asked.

Articulus I - Whether angels have bodies naturally united to them

To the first, one proceeds thus. It seems that angels have bodies naturally united to them.

- For Origen says in the book Periarchon: It is proper to the nature of God alone, that is, of the Father and the Son and the Holy Spirit, to be understood to exist without material substance and without any fellowship of corporeal addition. Bernard also says in Homily 6 on the Song of Songs: Let us grant to God alone, namely, immortality and incorporeity, whose nature alone has no need of bodily companionship, neither for its own sake nor for the sake of another. But every created spirit needs bodily companionship. Likewise Augustine says, On Genesis according to the Letter: Demons are called "aerial animals," which need the nature of airy bodies. But the nature of the demon and of the angel is the same. Therefore angels have bodies naturally united to them.[1294]

The third is of immortality, that is, of immutability, which removes every change, whether for the better or for the worse. Thus St. Augustine first, in De Trinitate, book I, chapter 1, and in book VII of De Genesi ad litteram, the last chapter in fine; and St. Anselm on that place of Paul. The fourth is St. John Chrysostom on that place, that God is said to have immortality above other kings and lords, of whom Paul had made mention before, just as he had said earlier that God alone is powerful. The words of Paul are: "That you keep the commandment without stain, irreprehensible until the coming of our Lord Jesus Christ." The Greek has epiphaneia, that is, "until the appearing of our Lord Jesus Christ"; he subjoins: "whom in his own times he shall show, the blessed and only Potentate, King of kings and Lord of lords, who alone has immortality," etc. From which it appears also in what way other things besides God are mortal and corruptible. There are, however, four expositions of that place taken from the Fathers. The first is St. Augustine's in De natura boni, chap. 39, and in Epistle 28, and St. Jerome's in his larger Commentaries on the Epistle to Titus at these words of the first chapter, "Quam promiserat," etc.: they interpret that place in this way, that no one is immortal just as God is, in the same sense as it is said in Mark 10: "No one is good but God alone." Wherefore they say that the rational soul is immortal in its own way - I mean, as we explained above, with respect to a created cause, not with respect to God; but that God is simply

1294. Origen, Periarchon; St. Bernard, Homily 6 on the Song of Songs; St. Augustine, De Genesi ad litteram.

immortal with respect to any and every consideration.[1295] The second exposition is of the immortality of sin, of which Ambrose without doubt understands that text, De fide ad Gratianum, book 3, chapter 2; of which kind of immortality he said: "Neither is the angel immortal, whose immortality is the involuntary property of the Creator's nature." And that this was Ambrose's interpretation will be made clear below, question 63, article 5, at the end.[1296] The third is of immortality, or rather of immutability, which takes away every change, whether for the better or for the worse: thus St. Augustine in De Trinitate I, chapter 1, and in book VII of De Genesi ad litteram, last chapter in fine; and St. Anselm on that place of Paul. The fourth is of St. John Chrysostom on that place, that God is said to have immortality above other kings and lords, of whom Paul had made mention before, just as he had also said earlier that God alone is powerful.[1297]

On the comparison of angels to bodies

Then there is inquiry about the angels: first, about the comparison to bodies; second, about the comparison of angels to bodily places; third, about the comparison of angels to local motion. Concerning the first there is inquiry.

Whether angels have bodies naturally united to them

It is objected, that they do.

1) Origen says, Periarchon: To God alone, that is, to the Father and the Son and the Holy Spirit, is proper this - that he be understood to exist without material substance and spirit, without any fellowship of corporeal addition. But every created spirit needs bodily companionship. Likewise St. Augustine says, On Genesis according to the Letter: Demons are called "aerial animals," which need the nature of airy bodies. But the nature of the demon and of the angel is the same. Therefore angels have bodies naturally united to them.[1298]

2) Moreover, St. Gregory in a homily on the Epiphany, calls the angel a rational animal. But every animal is composed of body and soul. Therefore angels have bodies naturally united to them.

3) Moreover, the life of angels is more perfect than in souls. But the soul not only lives, but also vivifies the body. Therefore angels vivify bodies naturally united to them.

But on the contrary: Pseudo-Dionysius, Divine Names, book 4, at the beginning, says that just as angels are understood to be incorporeal, so also immaterial.[1299]

I answer: Angels do not have bodies naturally united to them. For what befalls some nature is not found universally in that nature: thus to have wings, because it is not of the ratio of "animal," does not befit every animal. Now since to understand is not the act of a body, nor of any corporeal

1295. St. Augustine, De natura boni, cap. 39; Epistola 28; St. Jerome, Commentaries on Titus, at chap. 1, "Quam promiserat," etc.

1296. St. Ambrose, De fide ad Gratianum, lib. 3, cap. ...; cf. also below, q. 63, a. 5, in fine.

1297. St. Augustine, De Trinitate I, cap. ...; De Genesi ad litteram, cap. ult., in fine; St. Anselm, on the place of Paul, 1 Tim. 6; St. John Chrysostom, Homilies on 1 Timothy 6:15 - 16.

1298. Origen, Periarchon; St. Bernard, Homily 6 on the Song of Songs; St. Augustine, De Genesi ad litteram.

power, as will appear below, to have a body united is not of the ratio of an intellectual substance (substantia intellectualis) as such, but befalls some intellectual substance on account of something else - just as it belongs to the human soul to be united to a body, because it is imperfect and existing in potency in the genus of intellectual substances, not having in its nature the fullness of knowledge, but acquiring it through corporeal senses from sensible things, as will be said below. Now wherever in a genus something imperfect is found, there must pre-exist something perfect in that genus. Therefore there are some perfect intellectual substances in the intellectual nature which do not need to acquire knowledge from sensible things. Not all intellectual substances, then, are united to bodies, but some are separate from bodies. And these we call angels.

Reply to the first: As was said above, there was an opinion of some that every being is a body; and from this estimation it seems to have been derived that some thought there are no incorporeal substances unless united to bodies - indeed to such an extent that certain men even posited that God is the soul of the world, as St. Augustine reports in book 7 of the City of God. But because this is repugnant to the Catholic faith, which sets God as exalted above all, according to that of Psalm 8: "Your magnificence is elevated above the heavens," Origen, refusing to say this of God, followed the opinion of others with respect to other things, as also in many other matters he was deceived, following the opinions of the ancient philosophers. The word of St. Bernard can be explained to mean that created spirits need a corporeal instrument, not naturally united, but assumed for some purpose, as will be said below. St. Augustine, moreover, speaks not by asserting, but employing the opinion of the Platonists, who posited certain aerial animals, which they called "demons."

Reply to the second: Gregory names the angel a "rational animal" metaphorically because of likeness with reason.

Reply to the third: To vivify effectively is simply of perfection. Hence it befits God also, according to that of 1 Kings 2: "The Lord kills and makes alive." But to vivify formally belongs to a substance which is a part of some nature, and which does not have in itself the whole of a species' nature. Hence an intellectual substance which is not united to a body is more perfect than that which is united to a body.

Note on the text of the article.

The conclusion is a negation which to many seemed to be the same with the conclusion and doctrine of the first article of the preceding question, where St. Thomas taught that angels are incorporeal - although it is far different. For in that first article of the preceding question St. Thomas taught that angels are incorporeal, that is, essentially not a body, whether composite or simple, as Durandus thought, namely, that the heavens exist without any composition of matter and form - in which sense the rational soul is not corporeal, because its substance is not a body, but spirit. In this article, however, he asks whether angels are united to bodies, or have bodies united to them as souls have; and he answers that an angel is not naturally united to any body, as if he said that it is not the form of any body or matter - otherwise indeed than the rational soul, which, although spiritual according to itself, nevertheless is naturally united to a body. The arguments,

1299. St. Cyril, cap. 2 (as cited).

moreover, which the Holy Doctor adduced were also looking, not to prove that the angels are corporeal according to their substance, but that they are naturally united to a body. The conclusion of the article is rightly proved by the testimony of Dionysius, Divine Names, chap. 4 at the beginning, which St. Thomas brings in the argument But on the contrary, and by the reason which he asserts in the body of the article. However, about this matter no Scholastic, so far as I have read, disputes. Only some treat whether according to their substance angels are corporeal; and with St. Thomas they pronounce that they are by their nature incorporeal, about which in disputation 179 enough has been said.

Whether by matter, or by body, angels are naturally united. Disputation 183.

Caput I - The error of the philosophers and of Origen

The opinion of the ancient philosophers was that angels are forms naturally united to bodies. In this opinion seemed to have been those who asserted that the stars, or the heavenly bodies, are animated. Thus, concerning the animation of the heavens, Plato feels in the Epinomis, where he bids that the stars be venerated as gods - which he would not say, unless he thought they were animated. And most clearly Aristotle, in book 2 of De caelo, text 13, when he teaches that heaven is animated, and on that account has differences of position; for what some interpret of a soul assisting and governing it only, seems frivolous, since scarcely can the differences of animation be explained in this way: wherefore of a soul informing, not of one merely governing and assisting, St. Thomas himself interprets in Opusc. 15, chap. 2; and in Contra gentiles II, chap. 70; and in the Disputed Question On the Soul, article 8, to the third reply.[1300] Moreover, when in Metaphysics XII, texts 35 and 36, he teaches that the first mover moves the heaven after the mode of the appetible, he plainly seems to assert that the heaven is animated; otherwise it would not be moved by what is appetible. Philo consents in the book De opificio mundi, and in the book De somniis, and in the book De gigantibus; and Origen, in the first tome of the Commentaries on John, on those words "In principio erat Verbum," and in Periarchon, book I, chap. 7, who for the same reason asserted that the stars are capable of power and of life. He also deduces this from Job 25, where the stars are called unclean; he adds, moreover, that Christ died for the sins not only of men, but also of the stars and of the angels - unless, as he himself says in that tome on John, this be said hyperbolically of the stars. The same doctrine on the animation of the heavens was taught by St. Jerome, tome 6, in the Commentaries on the Epistle to the Ephesians, on that of chapter 1, "Qui fecit utraque unum," although many things which he teaches in that commentary he states not from his own mind, but from the opinion of others, as he himself testifies in the second tome of the Apology against Rufinus: from this opinion, however, he does not excuse himself. The same he taught in the Commentaries on Ecclesiastes on those words, "Gyrans gyrando vadit spiritus." And St. Augustine, in book II of De Genesi ad litteram, chap. 18, proposes the question and does not define it; and in the Enchiridion, chap. 58, he says that it is not sufficiently clear to him whether the lights of

1300. St. Thomas, Opusc. 15, cap. 2; Contra gentiles II, cap. 70; Quaestiones disputatae De anima, art. 8 ad 3; cf. Aristotle, Metaphysics XII, texts 35 - 36.

heaven have mind and sense and pertain to the society of the blessed; and in the book Contra Origenistas to Orosius, chap. 11: "Nor do these things," he says, "pertain to us." But when in book I of the Retractationes, chapters 5 and 11, he retracts what he had said in the book De immortalitate animae, chap. 15, and in book 6 of De musica, chap. 14 - namely, that the world is animated and is a kind of great animal - he does not retract it as manifestly false, but as uncertain, because nothing certain could be established about it.

And thus, according to the opinion of all these, who teach that the heavens are animated, it follows that angels, or intelligences, are the souls of the heavens. So St. Thomas, in the Question On Spiritual Creatures, article 6, thinks that in the opinion of those asserting the heavens to be animated, one should say that the intelligences are their souls and rulers; and he interprets the mind of Aristotle in that sense, of a soul assisting, not informing, the intelligence itself. Of these intelligences, or angels, St. Augustine also raised a question, De Genesi ad litteram II, chap. 18, whether they are the souls of the heavens, that by them they are not only ruled, but also vitalized; he remained, however, in doubt.[1301]

Caput II - The true opinion

The true opinion is that which St. Thomas handed down in this article: namely, that the angels are not only spiritual with respect to their substance, but also that no body is subsistentially under them united, that is, that no body is animated by them: from which opinion I see no Scholastic dissent, since all teach that the heavens are not animated. This, first, can be proved by this reason: If angels were the souls of some bodies, they would most of all be of the heavens, which are most noble bodies; but the heavens are not animated; therefore no body is animated by angels. Now that the heavens are not animated, I judge to be most certain. It is, in the first place, the common opinion of the Scholastics, as St. Thomas confesses in the places cited; and Bonaventure expressly teaches it in II, dist. 14, art. 3, q. 2; Richard, art. 3, q. 4; Scotus, q. 1 in fine; and the rest teach the same there; Bonaventure adds that the opposite is manifestly erroneous. Scotus indeed says it is to be believed, yet by physical reason cannot easily be proved.[1302]

Among the Greek Fathers, moreover, thus it is taught by St. Basil, Homily on Genesis and on Psalm 48; St. Cyril, book 2 Against Julian - indeed he affirms that the Platonic opinion is opposed not only to Christian doctrine, but also to philosophical reason. St. John Damascene agrees, De fide orthodoxa, book 2, chap. 6, where he judges that to be a dogma of faith. Of the Latins, Lactantius, Divine Institutes II, chap. 5; St. Ambrose, Homily 3 on Genesis; St. Jerome, Epistle 69, which is to Avitus, where he enumerates the opposing opinion among the errors of Origen; the same teaches on Isaiah, chap. 45, "My hands stretched out the heavens"; but what he himself said in the Epistle

1301. Philo, De opificio mundi; De somniis; De gigantibus; Origen, Commentaries on John, at "In principio erat Verbum," and Periarchon I, cap. 7; Job 25; St. Jerome, Commentaries on Ephesians and on Ecclesiastes "Gyrans gyrando vadit spiritus," and Apologia contra Rufinum II; St. Augustine, De Genesi ad litteram II, cap. 18; Enchiridion, cap. 58; Contra Origenistas ad Orosium, cap. 11; Retractationes I, cc. 5, 11; De immortalitate animae, cap. 15; De musica VI, cap. 14.

1302. St. Bonaventure, II Sent., dist. 14, art. 3, q. 2; Richard of St. Victor, De Trinitate (as cited), art. 3, q. 4; Scotus, q. 1, in fine.

to the Ephesians, he seems not to have said from his own view, but to have transferred it from Greek books (as he himself testifies in the second tome of the Apology against Rufinus). This, however, he does not in that place specifically excuse himself of, which would not be objected by Rufinus as to others. But what he taught in Church, he holds his faith by profession. For he did not think that the sun is animated by a spirit, but that in that place, which elsewhere he explained, either an animation is signified, or that the sun by its own light bestows life upon other things. There is added Nicephorus, who, in book 14 of the Ecclesiastical History, chap. 27, among the Canons of a general Council in which the errors of Origen are condemned, reports the sixth, in which it is said thus: "If anyone says that the heaven, the sun and the moon, and the stars, and the waters which are above the heavens, are animated as if they were deities, and are material powers: let him be anathema."[1303]

But it was most customary: wherefore the Lord would not have forbidden the heavens to be adored, if they were endowed with a rational soul. Then too, when Scripture says that they were created by God for the service of the nations, it manifestly indicates that they are of an inferior nature than men, and as it were their slaves. Since therefore it is established that the heavens are not animated, it is also manifest that angels are not the forms (*formae*) of any bodies.

Passing over the argument of St. Thomas and the many things which Cajetan brings forward in its defense, this also could be proved in the following way: If an angel were united to a body, either he would bestow upon it life and also sense, or not. If he bestowed sense, we could scarcely assign a difference between him and a man; and consequently the angel would be the soul of a man. But if he did not bestow sense, but only the angel would understand according to himself, as if he were altogether abstracted from matter, he would be united to a body without sense to no purpose, merely in order to give it life. It remains therefore that angels in themselves are not corporeal substantially, nor can they be united as substantial forms to bodies. And this I judge to be so true, that not even God by His absolute power can unite them. For the kind of formal cause (*causa formalis*), which from within produces the effect, God cannot communicate to any and every nature; but only that form can be befitting to which by its native power it belongs. Since therefore the angel by his nature is not the form of a body, he cannot in any way have this from God.

Articulus II - Whether angels assume bodies

In the second place one proceeds thus.

Objicitur 1. It seems that angels do not assume bodies. For in the work of an angel nothing is superfluous, just as neither in the work of nature. But it would be superfluous for angels to assume bodies. For an angel does not need a body, since his power surpasses in every way the power of a body. Therefore an angel does not assume a body.

1303. St. Basil, Homilies on Genesis and on Psalm 48; St. Cyril of Alexandria, Contra Iulianum II; St. John Damascene, De fide orthodoxa II, c. 6; Lactantius, Divinae Institutiones II, c. 5; St. Ambrose, Homily 3 on Genesis; St. Jerome, Ep. 69 (to Avitus) and Commentaries on Isaiah 45; Nicephorus Callistus, Ecclesiastical History XIV, c. 27 (on the canons condemning Origenist errors).

Objicitur 2. Further, every assumption is terminated at some union; because to assume (assumere) is as it were to take to oneself (ad se sumere). But a body is not united to an angel as to a form (*forma*), as has been said. And from that which is united to him as to a mover, it is not said to be assumed; otherwise it would follow that all bodies moved by angels were assumed by them. Therefore angels do not assume bodies.

Objicitur 3. Further, angels do not assume bodies from earth or water: because those would not suddenly disappear. Nor again from fire: because they would burn the things which they touched. Nor again from air: because air is unshapable and without color. Therefore angels do not assume bodies.

But on the contrary: St. Augustine says, that angels appeared to Abraham in assumed bodies (De Civitate Dei XVI, c. 29).[1304]

I answer that, some have said that angels never assume bodies: but that all which is read in the divine Scriptures about angelic apparitions happened in a vision of prophecy, that is according to the imagination. But this is repugnant to the intention of Scripture. For that which is seen in an imaginary vision is in the imagination alone of the seer; whence it is not seen indifferently by all. But divine Scripture sometimes introduces angels appearing in such a way that they were commonly seen by all. Thus the angels appearing to Abraham were seen by him and by his whole household, and by Lot, and by the citizens of Sodom. Likewise the angel who appeared to Tobias was seen by all. From which it is manifest that such things happened according to a bodily vision, in which that is seen which is posited outside the seer; whence it can be seen by all. But such a vision is not had unless there is a body. Since therefore angels are neither bodies nor have bodies naturally united to them, as is clear from what has been said, it remains that sometimes they assume bodies.

Reply to the first: An angel does not need an assumed body on account of himself, but on account of us, that by familiar intercourse with men he may demonstrate that intelligible fellowship which men expect to have with them in the future life. Moreover, that angels in the Old Testament assumed bodies is a certain figurative indication that the Word of God would assume a human body. For all the apparitions of the Old Testament were ordered to that apparition in which the Son of God appeared in the flesh.

Reply to the second: The body assumed is united to the angel neither indeed as to a form, nor only as to a mover, but as to a mover represented through an assumed movable body. For as Sacred Scripture describes the properties of intelligible things under likenesses of sensible things, so sensible bodies are by divine power so formed by angels that they fit for the representation of the intelligible properties of the angel. And this is for an angel to assume a body.

Reply to the third: Although air, remaining in its subtlety, does not retain a shape nor a color; nevertheless sometimes it is condensed, and can be shaped and colored, as is clear in clouds. And so angels assume bodies from air, by condensing it through divine power, as much as is necessary for the forming of a body to be assumed.

1304. St. Augustine, De Civitate Dei XVI, c. 29.

Conclusion: Angels, although they are not bodies, nor naturally conjoined to bodies; nevertheless sometimes by their will can assume bodies.

Disputatio CLXXXIV - Whether in assumed bodies angels appear truly, or only according to imagination

Caput I - Not only according to imagination, but also in very reality angels appear in bodies

It was the opinion of Vidaricus in his Summa, book 4, as Dionysius the Carthusian reports in the Second Book of Sentences, distinction 8, question: that angels do not in very reality appear to us in assumed bodies, but only according to the imagination of the sense; and one can think that William of Paris followed him, in On the Universe, book 6, part 1, chapter 6, when he proves that angels do not assume true bodies. Yet if he be carefully read, he only strives to show that the bodies assumed by angels are not human, although they seem to be human. However, it seems to be gathered from St. John Damascene, book 2, On the Orthodox Faith, chapter 4, where, according to Fabri's translation, he says thus: "By God's permission, being made and having strength, they are transferred, they are transformed into whatever figure they wish according to imagination"; and that "according to imagination" in the Greek is kata phantasiama, that is, according to phantasy.[1305]

Secondly, it can be proved thus: by their sleights, angels can as it were set before the eyes various figures, so that a man seems to himself to see them; why then shall we not say that they always appear thus?

Thirdly, the lamiae, who report that they have seen many things and traversed various parts of the earth, see all those things only according to imagination and phantasy, as is defined in the Council of Ancyra, or of Ancyra as some write, and is reported in the Canon Episcopi, 26, quaest. 5; why then shall we not say the same concerning the apparitions of angels, since those things which seem to appear to lamiae are the works of demons?[1306]

Nevertheless, the true opinion, and conformable to the doctrine of the Church, is that angels in bodies truly assumed have in very reality appeared externally to sight and to the outward sense. And this is the common opinion of the Scholastics in the Second Book of Sentences, distinction 8: of St. Bonaventure, in the First Part of that distinction, article with questions 1 and 2; of Richard, article 1, question 2 and 3; of Scotus, question 1; of Durandus, question 1; of Gabriel, question 1, article 2; of Dionysius in the place cited; of Marsilius in the Second Book, question 6, article 1, in the reply to the second and third objection against the first conclusion; of Alexander, First Part, question 34, member 2, Part 1 of that, in the body and to the first; and of Albert, Second Part,

1305. St. John Damascene, De fide orthodoxa II, c. 4; the phrase "kata phantasiama" ("according to phantasy") is noted as such in Fabri's translation.

1306. The "Canon Episcopi" (Decretum Gratiani, 26, q. 5) cites the Council of Ancyra concerning women (lamiae/strigae) who think they ride by night; their experiences are judged phantastical and demonic illusions. [Cf. the reporting tradition under 26, quaest. 5.]

treatise 9, question 33, member 2; Part 1 of that, On the Body and on the First; and On the Four Causes, Part 1, question 9, articles 10 and 11. Wherefore, as Dionysius most fittingly noted, Vidaricus seems to be mistaken when he asserts that he has drawn Albert over to his view. Moreover, this opinion is gathered from Scripture, in which the apparitions are narrated as having taken place in such a way that they happened not only according to imagination, but in very reality. For men and angels...

It is related that men and angels have oftentimes conversed together; such was that apparition of Raphael made to Tobias, as is written in his book. For since the Angel spoke not only with Tobias but also with others and answered them, this is an indication that the event befell not only according to imagination, but in very reality: for, as St. Thomas well observed, things which occur according to imagination do not appear commonly to all.

And from the Fathers St. Augustine teaches this expressly, City of God 15, c. 23. Although he doubts whether angels are by their nature corporeal or incorporeal, as we reported in Disputation 179, nevertheless he affirms it to be indubitable that they have appeared in a corporeal figure, so as to be seen and touched; and to deny this is impudence. The same is taught by St. Bernard, Sermon 5 on the Canticle, and Isidore, book 1 De summo bono, c. 12, n. 19; St. Gregory also agrees, Homily 34 on the Gospels, when he asserts that angels are sometimes sent to us visibly, sometimes invisibly. And Athanasius, Sermon 4 against the Arians, far along in the middle expounding that place of Mark 13, says that demons sometimes assume the figures of good angels; nay rather, St. John Damascene, alleged for the opposite opinion, expressly hands down ours, book 2 De fide orthodoxa, c. 3, where, speaking of good angels, he says: I call them without termini ("limits") for this reason, that, to good and virtuous men, to whomsoever God will that they be made visible, they do not appear as they are, but they assume one or another form, such as can be seen by men. Now what we noted above that he said of evil angels - if it be rightly translated from the Greek, as Billius turns it - lends no support to the former opinion, but rather confirms ours. Thus does he render it: "By a power granted by God they are strong, and are changed, and migrate, as it were, into any form, as indeed it appears." For what Faber turned "according to imagination," Billius translates "as it appears." And in Greek it is said kata phantasian, in Latin literally, "according to phantasy." For although phantasia in Latin signifies the interior sight of the imagination, nevertheless it also denotes the exterior: it is derived from the verb phaino, which in Latin is "to appear": therefore Billius rightly rendered, "as it appears." Hence, because in the interior sense there are, as it were, certain seeings and apparitions, it is rightly called phantasia, and the images or species thereof phantasmata; yet phantasma also signifies that which outwardly appears to the eyes, but is in truth not such as it appears - as in Matthew 14, when Jesus, having come walking upon the sea in the fourth watch, the disciples said, "It is a phantasm"; and Mark 6, "They thought it was a phantasm," not because it appeared only to the imagination, but because outwardly they saw something appear such as they judged was in reality not so. Thus therefore did Damascene say that, by God's permission, they are transformed "according to phantasy" into various figures of things - of swine, to wit, and of serpents and of men - although in truth they themselves are not such, but only appear so. And in the same sense the Manichees, asserting that the Word of God assumed not a true body

but only a phantasm, did not on that account say this because the Word appeared in flesh only to the imagination, but because, although it was presented to the eyes and external senses of all, as to a man, nevertheless it was not in reality such.

But for a fuller explication of this matter, first it must be noted that apparitions can take place in three ways. First, according to imagination; then, according to external vision - but in this way twofold: either according to a certain change in the very eye, with nothing existing outwardly, as is wont to be done by prestidigitations and it befalls the phrenetic - and let this be the second mode; or third, with some external figure really existing, which appears to be of such a quality and nature as in truth it is not, as colors appear in the rainbow which in reality are not such, because light in that body, disposed by its nature, so appears. We say therefore that angels are seen not only in the first mode (although sometimes they are also seen thus), nor only in the second (since that mode does not occur in a good disposition of the senses, but only when by tricks the senses are disturbed; whereas angels are also seen without any perturbation of the senses, as has been noted), but also they are seen in very reality by the change of such an object as, at such a distance and disposition, is of a nature to appear so, as we said of the color of the rainbow, and this will be explained more in the following chapter. And hence a solution is evident to the former argument of the contrary opinion: we grant indeed that the demon can change the eye by sleights, so that it seems to itself to see something outwardly when in reality it is not; and in this way angels can appear to men, just as also in imagination and in dreams. We confess nonetheless that they can also be seen outwardly in another way with the senses well disposed, namely with such a body assumed that, in that position and distance, it is of a nature for such a figure and color to appear.[1307]

Caput II - That to the external senses angels are wont to appear in assumed bodies

To two external senses angels are wont to appear in assumed bodies, to sight and to touch. For although they utter voices which are perceived by hearing, these are not qualities of their own bodies, but are formed in the object, the air, about which there is no difficulty. To sight however there appear figure and colors; I pass over also motion and rest and other common sensibles, which in them are seen in the same way as in others. About figure therefore and color we must now speak.

Figure can appear in two ways: in one way, because the body is in very reality determined in itself to such a figure by a condensation of air or of the substance which they assume. In another way, even if in itself it is not of such a figure as appears, nevertheless in that position and distance it is of a nature thus to appear; as in clouds many figures are presented to us afar off which in reality are not such, and if they were seen nearer, they would not so appear, yet in that convenient position they always appear. About colors in general it must be said that there is no color in an assumed body, but only a mixture of light, as in the rainbow, because the matter of those bodies, as we shall say in the next chapter, is so subtle and simple that it is not capable of color and of the

1307. St. Bernard, Sermon 5 on the Canticle; Isidore, De summo bono I, c. 12, n. 19; St. Gregory, Hom. 34 in Evangelia; St. Athanasius, Serm. 4 contra Arianos; St. John Damascene, De fide orthodoxa II, c. 3. On the Greek kata phantasian and phaino, see Billius and Faber as cited.

secondary qualities. Wherefore in the body there can be only apparent colors, which, in Damascene's sense, can be said to be according to phantasy. But although neither the figure be true nor the colors true, nevertheless the eye in that position is so changed by them that, however much a man attend, he cannot discern whether it is a true human body or only an apparent one.

But about the qualities which in those bodies of angels men seem to themselves to perceive by the sense of touch, there is a greater difficulty. Augustine in the Enchiridion, c. 59, does not dare to define whether the bodies of angels, by which they appear, are tractable or not. Whence it is hard for him what is read in Genesis 18, that Abraham washed the feet of the angels; and that Lot also did this is written in Genesis 19. It is also hard for him to explain what is related of the wrestling of Jacob with the angel with so solid a grappling, Genesis 32. He answers however in these words: When such things are asked, and each conjectures about them as he can, understandings are not without profit exercised, if moderate discussion be applied and the error be absent of those who think they know what they do not know. For what use is it that these, and things of this sort, be affirmed, or denied, or defined with discrimination, when without crime they are unknown? And although Augustine says this about bodies naturally or connately belonging to angels, the same judgment, by stronger reason, ought to be made about those which are assumed by the angel's will alone. Augustine's judgment is indeed most prudent; I consider it more useful to us in many other matters, and to be observed most diligently in this matter of angels especially, lest, while we are over-ready in defining things, we easily fall into absurdities worthy of ridicule; and in matters of such moment one ought not to brandish even the least absurdity, and, without foundation and reason, to champion something coined from one's own brain.

Nonetheless, to indicate something probable by conjecture drawn from philosophical principles in the present question is not to be imputed to rashness. First then about hardness, which is a certain quality of bodies and is naturally in their objects alone, it must be said that it is not found in bodies assumed by angels, even if they present themselves as tractable to men, because those bodies are of a subtler substance than that they could have hardness intrinsically, as stone, bone, and the like have. For an angel neither can educe such a quality from the power of such a matter, nor change the primary qualities of those bodies so that from them that secondary quality - which is found only in mixed bodies - should arise. Nevertheless it can happen that a man, when he touches them, seems to perceive hardness, because the angel can so dispose the organ of touch and the surrounding medium that resistance is felt to the touch, and that body appears to the eye as flesh; although in that body there is not such a quality as there is in true flesh, which we call softness or smooth pliancy. In these matters therefore the sense of touch is easily deceived about doubtful qualities, or therefore also the judgment of the intellect formed from sense, while a man seems to himself to handle bones and flesh which in truth are not there.

From this doctrine I infer three things. First: if a man were to consider attentively, in bodies assumed by angels, he could easily say that it is not true hardness, nor true softness such as is found in bones and flesh; for, if he attended, he would easily perceive that our touch is not affected by those bodies in the way it is by those things which live and truly have flesh and bones. But if a man has persuaded himself that the one he sees is a true man, because the eye thus judges, and he

in simple mind lays hold of that body, it will seem to him that he touches flesh and bones, nor will he discern whether it is a true body or only an apparent one. And something similar befell Abraham and Lot when in Genesis 18 and 19 they washed the angels' feet: for they did not then know that they were angels, and it is to be believed that they appeared in assumed bodies as true men.

Second, there follows the greatest of all arguments - that Christ showed himself not to be a spirit when he presented himself to the disciples to be handled (Luke 24; John 20). For that he ate in their presence was not an inefficacious argument for sight; since in an assumed body an angel can in this way eat, as it happened in Tobias 12, when he ate with the angel Raphael. And for this reason St. Thomas teaches that each of those arguments was efficacious, not sufficient by itself alone, yet sufficient when joined together with the testimonies of the prophets.[1308]

Let such things be affirmed, or denied, or defined with discrimination, when without sin they are unknown; and although Augustine says these things about bodies which he thought angels naturally to be constituted of, the same judgment, by stronger reason, is to be made about those things which are assumed by the will alone of an angel. Augustine's judgment is most prudent, and is to be most diligently observed by us in many other matters more hidden, especially in this subject about angels, lest, while we desire to be readier in defining matters, we easily slip into absurdities; and in matters of such moment we ought not meanwhile to pronounce something from our own head without foundation and reason. Nevertheless, to indicate something in the present question by some probable conjecture drawn from the principles of philosophy, as it were by certain traces, is not to be imputed to rashness.

First, then, concerning hardness (durities), which is a certain quality (qualitas) of bodies and is numbered among the objects of touch, it must be said that it is not found in bodies assumed (corpora assumpta) by angels, even if they present themselves as tangible to men, because those bodies are of a more subtle substance than that they could have intrinsic hardness, as a stone, a bone, and other things of that sort have. For neither can an angel so arrange them and change their primary qualities that from them that secondary quality which is found only in mixed bodies could arise. Nevertheless an angel can bring it about that a man, handling them, seems to himself to be touching some hard body; and this is for the angel to exhibit his body as tractable to a man. This, however, does not befall touch with respect to the body assumed by the angel in the way that it befalls sight with respect to the colors of the same body: for although that body has neither hardness nor color, nevertheless it has a light which, being in this way set before the sight, is apt to appear under the species of such a color without any prestiges of the eyes. But it has in itself no quality which, by some peculiar reason as an object, is apt to appear as hardness; rather, by the angel's power such resistance is made to touch, lest the body which appears be compressed, so that one seems to himself to touch something hard and resisting. In the same way figure can be perceived by touch when the resistance is convenient to touch and in such a position that one seems to himself to handle something either round or square. The same must be said of the

1308. St. Augustine, Enchiridion c. 59; Gen. 18 - 19, 32; Luke 24; John 20; Tob. 12; St. Thomas, Summa theologiae, 3a, q. 5, a. 6 (as cited).

softness of flesh (mollities carnis), namely that it is perceived by touch only insofar as the resistance is less; whence a man easily judges that it is flesh which also appears to the eye as flesh; although such a quality is not in that body as it is in true flesh, which we call smoothness or softness (mellitudo seu mollicies). In these two qualities, therefore, the sense of touch is easily deluded, or the judgment of the intellect on account of touch, while a man seems to himself to handle bones and flesh which in truth are not.

From this doctrine I infer three things.

- First, if a man should carefully consider that which he touches in bodies assumed by angels, he could easily judge that it is not true hardness nor true softness such as is found in bones and flesh: because, if he should attend, he would easily perceive that touch is not so affected by those bodies as by others which live and have true flesh and bones. On the other hand, if a man has persuaded himself that he whom he sees is a true man - because the eye so judges - and with simple mind he handles that one's body, it will seem to him that he touches flesh and bones, nor will he discern whether it is a true body or only an apparent one. Thus I think it happened to Abraham and Lot when in Genesis 18 and 19 they washed the angels' feet: for they did not then know that they were angels and that they had appeared in assumed bodies. By contrast, as Cajetan relates, when a certain man had habitual intercourse with a demon succubus, and did not feel from that one's flesh the delight he desired, he said to the demon that he did not feel that delight which he was wont to feel with a woman; but the wretched demon answered that he could not make better flesh: for since that man knew that he was lying with a demon and also wished to experience the delight which he had experienced with women, he could easily by touch itself discern that he did not feel those qualities of flesh which at times he had felt in women.[1309]
- Second, there follows the greatest of all arguments - that Christ presented his resurrection to the senses when he offered himself to the disciples to be handled (Luke 24; John 20). For that he ate in their presence was not so efficacious an argument for sight; for in an assumed body an angel can in this way eat, as happens in Tobit 12, when he ate with the angel Raphael. And perhaps for this reason St. Thomas teaches that each of those arguments was not sufficient by itself alone for the resurrection, yet sufficiently conjoined with the testimonies of the prophets. To this Scotus and Gabriel agree in the place to be alleged below; I, however, with Cajetan in the place cited above, think that that argument from touch was the most efficacious for proving the truth of the human body in Christ. Therefore he said to his Apostles that by touch they could discern flesh and bones: "Handle, and see: for a spirit has not flesh and bones, as you see me to have." By "spirit" he understood an airy body assumed, which is wont to appear and is called a phantasm. But if by touch they had not been able to discern true flesh and bones, the softness and the hardness of them, he would not have said, "Handle and see," as if he were saying, "Touch and perceive true flesh and true

1309. Cajetan, In 2a 2ae, q. 95, a. 3.

bones." But when they saw him eating, he did not say, "See how I eat," because a spirit does not eat. For he knew that even angels in assumed bodies truly in this way appear as eating, so that it cannot be discerned by the eye whether in reality they truly eat.[1310]

- Third, it is gathered that hardness and softness are sensible qualities (qualitates sensibiles) counted among the objects of touch; and therefore false is the opinion of certain philosophers who think that these qualities are not sensed by touch, but that only a greater or lesser resistance is sensed, as if someone were to touch the heaven, in which there is no sensible quality, and yet because it cannot be penetrated, as if resisting to touch, it would in a certain way be sensed. Their opinion does not please me: first, because Aristotle in De anima II, in the chapter on touch, numbered these among the proper objects of touch; second, because a common sensible, like figure, cannot be sensed without a proper sensible: but it would be sensed in a body without any other quality only along with hardness or softness; therefore these are properly sensible qualities. Third, Christ would say in vain, "Handle and see," unless bones and flesh could be perceived according to their proper qualities of hardness and softness, and not by greater or lesser resistance; for so in the same way they could appear in a spirit, that is, in an airy body, through an altogether equal resistance. But it is established, moreover, that bones are able to be sensed only by reason of hardness, especially when they are joined to flesh.

Caput III - The arguments for the prior opinion are dissolved

Of those things that were brought forward for the prior opinion there remains only the third argument, about witches (lamiae). For to the first, by the testimony of St. John Damascene in the chapter above we have said enough; the second, about prestiges, was solved in chapter 2. To the third, therefore, about witches I reply: the Council of Ancyra openly teaches that the things which witches by their incantations and spells relate to have happened to them, happened to them only in dreams: as that they are carried upon beasts to certain fields, and the rest of this kind. St. Augustine agrees, in City of God XVIII, c. 18, speaking of the transformation of a man into the figure of some brute animal: for he affirms that this transformation cannot be done otherwise than in dreams. For although it can also happen through the assumption of some body under the figure of some brute, which the demon could so join to the man that a beast would appear, nevertheless, if the man had his senses free and not oppressed by heavy sleep, he would easily judge that he had not really been converted into a brute, nor truly borne heavy burdens and felt fatigue. Wherefore, when a man believes that he has been converted into a beast and labored much under burdens, we ought to think that all that happened to him in dreams; and in this case Augustine also speaks of men who seem to themselves to see other men converted into brutes: he affirms that even outside

1310. Luke 24; John 20; Tobit 12; St. Thomas, Summa theologiae, 3a, q. 55, a. 6; Scotus; Gabriel, Disputatio 186, cap. 2; Cajetan, loc. cit.

of sleep this is done by the power of imagination alone, which thus makes the thing appear outwardly as if it really were; it can also happen with some body joined to the man by the work of a demon, in which such a formation is made to seem.[1311]

But although these things very frequently happen to witches in dreams, as the Council of Ancyra affirms, nevertheless it is not to be denied that sometimes, with the senses free in wakefulness, witches are carried, not upon true beasts, but by demons in bodies assumed under the form of beasts, and other external works of demons of this sort truly appear to them, as Victoria teaches in the report on the art of magic, nos. 4 and 5, and Cajetan in 2a 2ae, q. 95, a. 3, and Alphonsus de Castro, book 1 On the just punishment of heretics, c. 16, which Alphonsus himself confirms with many examples. He answers, however, to that chapter of the Council of Ancyra, first, that the sect of those women of whom mention is made there is not the sect of witches, and that of those alone it was said that all the things which are told about them happen only in dreams, not, however, in reality: but I do not see on what foundation this rests. He answers next that in the canon it is defined only that those women are deceived, thinking that those things which frequently happen in dreams happen in reality; but from this it is not defined that they never happen in reality, but always in spirit. Augustine also only said that to men who think they have been converted into beasts and have labored much under a heavy burden, that never happened except in heavy sleep, for the reason said above; but not therefore does he deny that sometimes, others being spectators, someone can appear as converted into a beast, by reason of a body assumed by a demon under such a figure, as Alexander and Gabriel plainly teach; and this also can be done by prestiges, as is manifest.[1312]

Caput IV - Of what matter, and by what power, bodies are assumed by angels

It remains, in the last place, that we say of what matter the aforesaid bodies are assumed by angels, and by what power they are formed and fitted, so that they may appear of such a figure and color.

As to the first, the opinion which Bonaventure reports - that that body is of celestial matter - being omitted, because it has no appearance of probability, among the scholastics some think that such bodies are assumed from the matter of thickened and condensed air, which can be formed and appear under a color, as do clouds. Thus taught Durandus in the Sentences, II, dist. 8, q. 1, n. 7; and St. Thomas seems to assert the same in this article, ad 3. Alexander of Hales, however, and Albert the Great taught that bodies are assumed from the very body of air as it now is in its natural disposition: and in the solutions of arguments, that the good take bodies to themselves from the higher air, which is called ether; but the evil from the lower: which seems to have been the doctrine of Isidore, book 1 On the Supreme Good, c. 12, n. 19, and of Bede in the eighth tome, book of questions, q. 9. He proves it, first, because air is at hand in order that such apparitions may occur

1311. Council of Ancyra; St. Augustine, De civitate Dei, 18, c. 18.

1312. Victoria, Relatio de arte magica, nos. 4 - 5; Cajetan, In 2a 2ae, q. 95, a. 3; Alphonsus de Castro, De iusta haereticorum punitione, l. 1, c. 16; Alexander of Hales, q. 43, memb. 3, art. 1; Gabriel, art. 3, notatio 1.

suddenly; next, because when the body is left by the angel it is not dissolved into a thicker matter, but vanishes, so that immediately it does not appear: a sign, therefore, that that body had been taken from the very matter of air.[1313]

But, on the other hand, Bonaventure in II, dist. 8, third part of the distinction, art. 2, q. 2, Richard, art. 1, q. 3, ad 3, Scotus, q. 1.9 In ista quaestione, versiculo: "nam tunc assumit," and Gabriel, quaest. r, art. c, notatio 1, agree that bodies are not assumed by angels from the pure element of air without any mixture - because it is of too subtle a substance to be condensed and to be given a figure - nor from a perfectly mixed body, but from a certain aerial body with some admixture of a denser substance, which could also easily vanish; which indeed seems more likely to me, and in no way would St. Thomas and Durandus deny it, since the example of a cloud is used, in which there is not the substance of air alone, but also something mixed, whereby it is made thicker; indeed, concerning Isidore, Bede, and others it is not sufficiently clear that they are speaking of pure air. This, however, must be understood, as Scotus noted, of those bodies which immediately, once they are left, vanish. For it sometimes happens that spirits assume other natural bodies, as the body of the serpent in paradise, or of some other animal. Therefore Tertullian in the book On the Flesh of Christ, c. 3, said that angels assume bodies from nothing and reduce them to nothing, because they assume them from a certain subtle substance; the same is to be said about the body of the dove in which the Holy Spirit was seen.[1314]

But about the formation of the bodies, Bonaventure, Richard, Scotus, Durandus, and Gabriel teach that they are made by condensation alone, which can be done by compression alone and by local motion of the parts within themselves. Still, it is hidden to me how these bodies are given a figure: for since the compression and condensation of air is the cause of cold in air - as we see in air compressed by the lips, or by some other reason - straightway cold would naturally be felt; nevertheless to the touch it appears as if it were the temperament of some living and sentient thing. It is therefore a sign that this is done by another reason, indeed hidden from us, inquiry into which it is superfluous to dwell on too long.

But about the power by which these bodies are assumed and prepared, the Doctors also think variously. St. Thomas in the solutions, and Peter of Bergamo in the Concordance of doubtful passages, no. 117, think that it is done by the power of God. Alexander, however, 1 p., q. 34, memb. 5, asserts that the body to be assumed is prepared by the angel, but ultimately formed by God. Yet of what sort this preparation is and how it is done, he does not explain. It seems more probable, as Albert in the places cited and Bonaventure in the question alleged teach, that ultimately it is done by the angel's proper power. Thus also it is to be held.[1315]

Disputatio CLXXXV - Whether all the apparitions of God that are narrated to have been made were made by the ministry of angels

Scotus and Gabriel seem to suppose this, when they assert that by mere condensation the body is figured: for since condensation is made by the sole motion of compression, which an angel can effect by his own power, it follows that a body can be assumed by an angel by his own power. And although it is not always done by mere condensation, nevertheless at times the angel can, by the application of other natural causes, bring such bodies to completion, so that they may be assumed. And this I hold to be more probable: for since evil angels also assume bodies for most wicked ends, it is not likely that God by His own power should form those bodies, and use only the demon himself as an instrument.

This opinion is supported by Leo I in Epistle 13, which is to Pulcheria Augusta, where he says that the Son of God appeared to the Patriarchs and received from them the offices of hospitality. The same is said by Clement of Rome, book 8 of the Constitutions, the last chapter.[1316] Moreover, besides Eusebius, St. John Chrysostom, and Theophylact, no one else expressly denies that in that place it was an angel, and that those apparitions were made by his ministry. And the sentence of Eusebius, Chrysostom, and Theophylact can be proved, because he who appeared to Moses openly said that he was God, and he declared other things about himself which can belong to God alone; why therefore ought we to say that he was an angel - especially since Scripture, where in truth an angel appeared, openly says that not the Lord, but an angel appeared? Among more recent theologians I have read only Clichtoveus in chapter 17, book 4 on St. John Damascene, On the Faith, who affirms that at least in the New Testament God sometimes appeared through Himself without any ministry of angels.[1317]

Caput I - Some Fathers judged that not all apparitions were made by the ministry of angels

Since in the Old and New Testament God often appeared to men, among the Fathers of the Church it is not altogether undoubted whether God Himself immediately, or in His place an angel, appeared in that body. Some think that not all apparitions of this sort, even in the Old Testament, were made through the ministry of angels: thus affirm Eusebius, first book of the Demonstration of the Gospel, chapter 5, and in another place; and St. John Chrysostom, homily 16 on the Acts of the Apostles, on those words of chapter 7, "Forty years being fulfilled"; and Theophylact on the same place, when they assert that God through Himself, without any ministry of angels, appeared to Moses and spoke with him. Tertullian also in the book Against the Jews, chapter 9, after the middle, and St. Ambrose on that passage to the Colossians 1, "Who is the image of the invisible

1316. Leo I, Ep. 13 ad Pulcheriam Augustam; Clement of Rome, Constitutiones, lib. 8, cap. ult.
1317. Josse Clichtoveus, in Damasc., De fide orthodoxa, lib. 4, cap. 17.

God," seem to think rightly when they teach that not the Father, but the Son of God, appeared to Moses and spoke with him; and the same about the Son was said by Eusebius, Chrysostom, and Theophylact.[1318]

In favor of this opinion are also Leo I, Epistle 13, which is to Pulcheria Augusta, where he says that the Son of God appeared to the Patriarchs and received from them the offices of hospitality; and Clement of Rome, book 8 of the Constitutions, the last chapter. But, besides Eusebius, Chrysostom, and Theophylact, no other expressly states that there it was an angel, and that those apparitions were made by his ministry. And the sentence of Eusebius, Chrysostom, and Theophylact can be proved, because he who appeared to Moses openly said that he was God, and he pronounced other things about himself which can belong to God alone: why then ought we to believe that he was an angel - especially since Scripture, where in truth an angel appeared, openly says that not the Lord, but an angel appeared? Among more recent theologians I have only read Clichtoveus, book 4, chapter 17, on St. John Damascene, On the Faith, who affirms that at least in the New Testament God sometimes appeared through Himself without any ministry of angels.[1317]

Caput II - The common and truer opinion is that God always appeared in both Testaments by the ministry of angels

The common and truer opinion is that God always appeared in both Testaments by the ministry of angels. About the apparitions made in the Old Testament St. Augustine thinks thus, book 2 On the Trinity, chapter 11, where he expressly disputes this question. Nor did he teach anything opposed in Epistle 111, when he says that God sometimes in a visible form appeared to the Fathers; for he does not deny that this was done by the ministry of angels. Dionysius, St. Jerome, and St. Gregory are also cited for this opinion; but these Fathers do not say that God always in the Old Testament appeared by the ministry of angels in all cases; rather, they teach this about certain cases in which it is said that God appeared: whence nevertheless our sentence is confirmed. For if, when Scripture says that God appeared and spoke, these Fathers affirm that it was done by the ministry of angels, it follows that everywhere likewise He appeared in the same way. It is also reported by Dionysius, book 4, chapter On the Divine Names, a little after the beginning; but there he only says that angels are the interpreters of the divine silence. He speaks more clearly for this opinion, chapter 4 of the Celestial Hierarchy, not far from the beginning, where he writes thus about spiritual substances: "The principal name of angels is so called, because the divine illumination is first in them, and through them signs of the operations which surpass our nature are made manifest to us." He adds then that the ancient fathers, taught by the angels, before the Law attained to the knowledge of the truth; that they received the Law itself through angels; and that God was never seen by any of the saints as He is, but through certain visions accommodated to

their senses: about which he subjoins these words, "And our most illustrious fathers learned these divine visions to be the works of the heavenly powers." He also teaches that the Law was promulgated to Moses through angels.[1319]

Next, St. Jerome on that passage to the Galatians 3, "It was ordained by angels," admits that the Law was also delivered to Moses through angels. St. Cyril agrees, book 8 of the Thesaurus, chapter 2, after the middle. Finally, St. Gregory, book 28 of the Moralia, chapter 2, teaches that sometimes God speaks in earthly substances through angels, as when He reproved Balaam by the mouth of the ass; sometimes in heavenly substances through angels, as when in the cloud He said in Matthew 3 and 17, "This is my beloved Son," etc.; sometimes at once in earthly and heavenly substances through angels He speaks: as when to Moses in the fire and the bush He spoke through an angel. There St. Gregory teaches that the apparitions under both Testaments were made by the ministry of angels. To these we can also add the Rabbi Moses Maimonides in the book More Nebuchim, that is, "The Guide of the Perplexed," part 2, where, as it regards the apparitions made in the Old Testament, he agrees with the aforesaid fathers.[1320]

This sentence is easily proved by a single inductive reason as follows. If at some time God had appeared through Himself without any angelic ministry - especially since Scripture relates that God spoke, and it introduces words not as of an angel, but as of God Himself speaking - yet then too God appeared and spoke by the ministry of angels: therefore we ought to judge that it was always done in the same way.

First, the Law indeed was dictated to Moses by the ministry of angels: although with Moses God then seemed to speak as it were through Himself, and Moses with him who appeared had converse as if with God; indeed Moses, and the whole people, adored Him as God, as, besides Dionysius, St. Jerome, St. Augustine, and St. Cyril, mentioned above, who clearly attest this, can not obscurely be gathered from the very text of Paul. For he says to the Galatians 3: "It (namely, the Law) was ordained through angels in the hand of a mediator," that is, of Moses, who was mediator between God and the people: from which St. Augustine proves his opinion. And to the Hebrews 2: "For if the word spoken by angels was made firm, and every transgression and disobedience received a just recompense of reward," etc. However, although Chrysostom, homily 3 on the Epistle to the Hebrews, and Theophylact on that passage to the Galatians 3, understand the aforesaid testimonies about the Law, nevertheless they assert that it is therefore said to have been ordained through angels, because they were present at the promulgation of the Law, as witnesses, trumpets sounding, while thunderings and other signs were done by their ministry. Then the same Chrysostom on that passage to the Galatians and Oecumenius say that by "angels" there priests are understood, who promulgated the Law to the people. But Theodoret on both places admits that the Law was enacted with angels ministering: yet what their ministry was, he does not explain. Their reason also seems to favor this, because it does not appear how many could together concur in dictating, or writing, and promulgating the Law. Finally, Chrysostom and Theophylact understand

1319. Pseudo-Dionysius, De caelesti hierarchia, cap. 4; cf. De divinis nominibus, lib. 4, c. init.

1320. St. Jerome, In Gal. 3: "Ordinata per angelos"; St. Cyril, Thesaurus, lib. 8, cap. 2 (post med.); St. Gregory, Moralia, lib. 28, cap. 2; Moses Maimonides, More Nebuchim, pars 2.

that passage to the Hebrews also about other announcements made by angels in the Old Testament, the transgressors of which obtained due punishments: as it happened when the angels announced to Lot and his wife the overthrow of Sodom, and forbade them to look back; which command was so firm that Lot's wife, having transgressed, was turned into a statue of salt. From this Paul argues that those are worthy of greater punishment who have neglected the abundant salvation of the Gospel.

Nevertheless, the plainer sense of Paul's places seems to be, if we say that the Law itself was dictated by the ministry of angels: by which testimony the Fathers above named were brought to this opinion. And although one angel would have sufficed to speak or to write the Law, nevertheless many are said to have ministered, because by their work many other things were done in the promulgation of the Law.

Second, St. Augustine proves that the Lord appeared to Abraham by the ministry of angels, Genesis 17, when He made the covenant of circumcision with him, and he himself received the promise of the blessing of many nations in himself. For then that the Lord appeared to him, Stephen bears witness, Acts 7; because in Genesis 18 it is said that the Lord appeared to Abraham at the oak of Mamre; and when he had lifted up his eyes, he saw three men in the heat of the day, and he said, "Lord God." But from the following chapter it is manifest that those three were angels: for it is said that, Abraham being left, the angels entered Sodom. From this place, however, we cannot much press our adversaries: for when it is written in Genesis 18 that three men appeared, Scripture does not relate that all three spoke in the name and person of God, but only one of them; about whom adversaries could contend that he was God Himself, and appeared as the lord of the others; since also Abraham seems to have spoken only with the prince and lord, when he said, "Lord, if I have found favor," etc. And in the following chapter, according to the translation of the Seventy, we do not read that three angels came to Sodom, but only two. They came therefore (says Scripture) two angels to Sodom. One could therefore say that those two angels were sent by the Lord, who appeared among them as their prince.[1321]

Third, St. Augustine proves this from that place, Genesis 21, where Scripture says that to Hagar in the desert the angel of the Lord appeared, who plainly spoke in the person of God with these words: "Hold up the boy with thy hand, because I will make him a great nation." For these things cannot befit an angel, unless in so far as he bears the person of God.

Fourth, from that Genesis 22, where it is said that the Lord appeared to Abraham and commanded him the immolation of his son; for the Lord says after these things had been done: "Now I know that thou fearest the Lord, and hast not spared thy only-begotten son for my sake"; and yet he who said this was an angel: for it is said, "When Abraham was about to immolate, there appeared to him an angel from heaven and cried out."

Fifth, it is more clearly proved from Exodus 3. For where it is said that the Lord appeared to Moses in the bush and in fire, and Exodus 19 that He spoke with Moses on Mount Sinai; truly in Acts 7 Stephen, recounting the history, says: "After forty years were fulfilled, there appeared to him

1321. St. John Chrysostom, In Gal. ad loc.; Oecumenius, In Gal.; Theodoret, In Gal. 3 et Heb. 2.

in the desert of Mount Sinai an angel in the flame of fire of the bush, and there was made to him a voice of the Lord, 'I am the God of thy fathers'"; the same said he who appeared in the bush. And below the same Stephen says that Moses spoke with the angel on Mount Sinai: whereas Scripture never reports the converse of Moses with an angel, but with the Lord: the sign therefore is that an angel spoke in the person of God.

Lastly, Genesis 31: Jacob narrated to his wives his dream with these words: "And the angel of God said to me in my sleep, Jacob"; and after he began to speak with him, he said, "I am the God of Bethel": he who was called an angel spoke as the Lord: therefore in those places, where Scripture says that the Lord appeared, it is clear that it was an angel speaking in the person of God.

Some reply that therefore he who appeared to Jacob and to Moses is said to have been an angel, when in truth he was God: because he was the Word of God. He was called, however, Angel, because the Word of the Father is His angel, according to Isaiah, who called Him "the Angel of the great counsel." Thus responds Eusebius, book 5 of the Demonstration of the Gospel, chapter 10, and book 1, chapter 5; whose interpretation St. John Chrysostom follows, homily on the Acts of the Apostles, and Theophylact there; Theodoret also, question 5 on Exodus; Isidore, book 1 On the Supreme Good, chapter 12, number 23; and Bede, tome 8, in the book of Questions, question 9, after the middle: indeed Isidore also adds that as often as Scripture introduces an angel speaking as God, one must always understand the Son of God. In the same way St. Cyprian, book 2 Against the Jews, explains that testimony Genesis 31, and that Genesis 22, when an angel is said to have appeared to Abraham and spoke in the person of God. And St. Hilary, On the Trinity, book 4 after the middle, and book 12 two leaves before the end, so understood the apparition made to Hagar: and for this reason in the Council of Sirmium, whose canons Hilary reports in the book On the Synods, chapter 15, it is said: "If anyone says that with Jacob he did not wrestle as in a dream, but says that the ineffable God or His Father wrestled, let him be anathema." The same opinion is also consonant to Theodoret, question 91 on Genesis, explaining the apparition in which Jacob in that wrestling is said to have seen the Son of God.[1322]

Yet this interpretation does not persuade me. For since every effect outside God is common to the whole Trinity, then alone is one person without another said to appear, when truly one is signified without another: as under the appearance of the dove, and in tongues of fire, the person of the Holy Spirit; but in these apparitions one person was no more signified than another: therefore one no more than another appeared. Then too we nowhere in Scripture read that the Son of God according to the divine nature is called an angel: for in that place of Isaiah, Scripture speaks of Him according to His humanity, and He is called Angel, because He was the messenger of the Father. But that Council of Sirmium has no force, as was noted in Disputation 109, chapter 5.

About the apparitions indeed made in the New Testament I see no special reason to be given...

1322. Eusebius, Demonstratio Evangelica, lib. 5, cap. 10; lib. 1, cap. 5; St. John Chrysostom, Hom. in Acta Apostolorum; Theophylact, ad loc.; Theodoret, Quaest. 5 in Exodum; Isidore, De summo bono, lib. 1, cap. 12, n. 23; Bede, Tom. 8, Liber quaestionum, quaest. 9; St. Cyprian, Adv. Iudaeos, lib. 2; St. Hilary, De Trinitate, lib. 4 (post med.), et lib. 12 (paulo ante finem); Concilium Sirmiense, apud Hilarium, De synodis, cap. 15; Theodoret, Quaest. 91 in Genesim.

Third, St. Augustine proves it from that passage of Genesis where Scripture says that an angel of the Lord appeared to Hagar as she was in the wilderness, who clearly spoke in the person of God in these words: "Hold the boy in your hand; I will make of him a great nation." For these things cannot befit an angel unless he bears the person of God.

Fourth, from that passage Genesis 22 where it is said that the Lord appeared to Abraham and commanded him to immolate his son: "Now I know that you fear the Lord, and have not spared your only-begotten son because of me"; and yet that was an angel, for it is said, "When Abraham was about to immolate [Isaac], an angel appeared to him from heaven and cried out."

Fifth and more clearly it is proved from Exodus 3, where it is said that the Lord appeared to Moses in the bush and in fire, and Exodus 19 that the Lord spoke with Moses on Mount Sinai; but in Acts 7 Stephen, recounting the history, says: "When forty years were fulfilled, an angel appeared to him in the desert of Mount Sinai in a flame of fire in a bush, and there was made to him a voice of the Lord: 'I am the God of your fathers'"; which words were said by the very same who appeared in the bush. And the same Stephen says that an angel spoke with Moses on Mount Sinai, whereas Scripture never recounts Moses' speaking with an angel, but with the Lord: it is therefore clear that an angel spoke in the person of God.

Finally, in Genesis 31 Jacob recounts to his wives a dream in these words: "The angel of God said to me in a dream, 'Jacob'; and I answered, 'Here I am.' And after he began to speak with me, he said, 'I am the God of Bethel.'" He who was called an angel spoke as the Lord: if therefore in those places where Scripture says that the Lord appeared, it is clear that an angel spoke in the person of God, it is a sign that all the Lord's apparitions were made by the ministry of angels.

Some answer that he who appeared to Jacob and to Moses was called an angel, although he was truly God, because he was the Word of God; he was called "angel" because the Word of the Father is his angel, according to Isaiah, chapter 9, according to the translation of the Seventy, who called the Son of God "the angel of great counsel." Thus answers Eusebius in book 5 of the Demonstratio Evangelica, chapter 10, and book 1, chapter 5; whose interpretation are followed by St. John Chrysostom in the homily on the Acts of the Apostles, and Theophylact there, and Theodoret, Question 5 on Exodus, and Isidore, book 1 On the Summum Bonum, chapter 12, number 23, and Bede, tome 8, in the Book of Questions, question 9, in the middle; nay more, Isidore adds that whenever in Scripture an angel is introduced speaking as God, the Son of God is always to be understood. In the same way St. Cyprian explains, book 2 Against the Jews, that testimony Genesis 31; and likewise Genesis 22 when an angel is said to have appeared to Abraham and to have spoken in the person of God; and St. Hilary, On the Trinity, book 4 in the latter part, and book 12 shortly before the end, so understood the apparition made to Hagar; and for this reason in the Council of Sirmium, whose canons St. Hilary reports in the book De synodis, chapter 15, it is said: "If anyone should say that it was not the Son with whom Jacob wrestled as in a dream, but the ineffable God or his Father, let him be anathema." With this also agrees Theodoret, Question 91 on Genesis, explaining the apparition in which Jacob is said in that wrestling to have seen the Son of God.[1323]

Nevertheless, this interpretation does not persuade me. For since every effect outside God is common to the whole Trinity, then only is one person rather than another said to appear when one is signified without the other, as under the appearance of a dove and in tongues of fire the person of the Holy Spirit was signified; but in these apparitions one person was not signified more than another: therefore neither did one appear more than another. Furthermore, nowhere in Scripture do we read that the Son of God, according to the divine nature, is called an angel: for in that place of Isaiah Scripture speaks of him according to the humanity, and he is called an angel because he was the messenger of the Father. But that Council of Sirmium is of no weight, as was noted in Disputation 109, chapter 5. As to apparitions made in the New Testament, I do not see that there is any special reason: for since all in the Old were so made on account of the majesty of God, by assumed bodies, the same ought to be done in the New. Only the evangelical law has this prerogative over the ancient, that in it the Word deigned to appear in his own flesh.

Articulus III - Whether angels in assumed bodies exercise operations of life

Objicitur: It seems that angels in assumed bodies exercise operations of life.

1. For angels of truth do not befit any fiction. But it would be a fiction, if a body assumed by them, which seems to live and to have the operations of life, did not have such things. Therefore angels in the assumed body exercise operations of life.
2. Further, there is nothing futile in the works of an angel. But eyes and nostrils and the other instruments of sense would be formed in an assumed body by an angel to no purpose unless the angel sensed through them. Therefore the angel senses through the assumed body. Which is the most proper operation of life.
3. Further, to be moved with progressive motion is one of the works of life, as is clear in On the Soul, book 2; yet manifestly angels appear in assumed bodies to be moved. For it is said in Genesis 18 that Abraham walked together with them, leading the angels who had appeared to him. And the angel, to Tobias asking, "Do you know the way that leads to the city of the Medes?," answered, "I know, and I have frequently walked all its routes." Therefore angels in assumed bodies frequently exercise operations of life.
4. Further, speaking is a work of a living being. For it is brought about by a voice, which is a sound emitted from the mouth of an animal, as is said in On the Soul, book 2. But it is manifest from many places of Scripture that angels spoke in assumed bodies. Therefore in assumed bodies they exercise operations of life.

1323. Eusebius, Demonstratio Evangelica, lib. 5, cap. 10; lib. 1, cap. 5; St. John Chrysostom, Hom. in Acta Apostolorum; Theophylact, ad loc.; Theodoret, Quaest. 5 in Exodum; Isidore, De summo bono, lib. 1, cap. 12, n. 23; Bede, Tom. 8, Liber quaestionum, quaest. 9; St. Cyprian, Adv. Iudaeos, lib. 2; St. Hilary, De Trinitate, lib. 4 (post med.), et lib. 12 (paulo ante finem); Concilium Sirmiense, apud Hilarium, De synodis, cap. 15; Theodoret, Quaest. 91 in Genesim.

5. Further, eating is a proper work of an animal. Whence the Lord, after the resurrection, in argument of true life, ate with the disciples, as is had in the end of Luke. But angels appearing in assumed bodies ate, and Abraham offered them food, whom nevertheless he had previously adored, as is had in Genesis 18. Therefore angels in assumed bodies exercise the operations of animal life.
6. Further, to beget a man is an act of life. But this befits angels in assumed bodies. For it is said in Genesis 6: "After the sons of God had entered to the daughters of men, and they bore children to them, these are the mighty men of old, men of renown." Therefore angels exercise operations of life in assumed bodies.

Sed contra: The bodies assumed by angels do not live, as was said above. Therefore neither can the works of life be exercised through them.

Respondetur: I answer that certain operations of living beings have something common with other operations. Thus speaking, which is an operation of a living being, agrees with other sounds of inanimate things, inasmuch as it is a sound; and walking with other motions, inasmuch as it is a motion. Therefore, as to that which is common to both kinds of operations, operations of life can be produced by angels through assumed bodies; not, however, as to that which is proper to living beings: for, according to the Philosopher in the book On Sleep and Waking, whose is the potency, his is the action. Whence nothing can have the operation of life which does not have life, which is the potential principle of such an action.

Ad primum ergo dicendum, that just as it is not against truth that in Scripture intelligible things are described under sensible figures - for this is not said in order to establish that intelligible things are sensible, but that through the figures of sensible things the properties of intelligibles, according to a certain likeness, are given to be understood - so it is not repugnant to the truthfulness of holy angels that through bodies assumed by them they appear to men as living, although they are not. For they are not assumed except that through the properties and works of a man the spiritual properties of the angels and their spiritual works may be designated. Which would not be done so fittingly if they assumed true men; for then the properties of those men would be attributed to the men themselves, not to the angels

Ad secundum dicendum, that sensing is entirely a work of life. Hence in no way is it to be said that angels sense through the organs of assumed bodies; nor, however, are they formed to no purpose. For they are not formed for this, that through them there be sensation, but for this, that through such organs the spiritual powers of the angels may be designated; as through the eye is designated the cognitive power of the angel, and through the other members other powers, as Pseudo - Dionysius teaches in the seventh chapter of the Celestial Hierarchy, between the beginning and the middle

Ad tertium dicendum, that the motion which is from a conjoined mover is a proper work of life. But in this way the bodies assumed by them are not moved, because angels are not the forms of those bodies. Angels, however, are moved per accidens when such bodies are moved, since they are in them as movers are in movables, and they are thus here that they are not elsewhere - something

that cannot be said of God. Whence although God is not moved when those things in which he is are moved, because he is everywhere, nevertheless angels are moved per accidens with the motion of the assumed bodies. Not, however, with the motion of the celestial bodies, even if they are in them as movers in movables; because celestial bodies do not recede from place according to the whole. Nor is the place of the spirit moving the orb determined according to some determinate part of the substance of the orb, which is now in the East, now in the West, but according to a determinate situation; because the moving force is always in the East, as is said in Physics 8, text 84

Ad quartum dicendum, that angels do not properly speak through assumed bodies; but there is something like speech, inasmuch as they form sounds in the air similar to human voices

Ad quintum dicendum, that to eat, properly speaking, does not befit angels, because eating imports the taking of food convertible into the substance of the eater. And although in the body of Christ after the resurrection the food would not be converted, but would be resolved into pre - existing matter, nevertheless Christ had a body of such a nature that food could be converted into it. Whence that was a true eating. But the food taken by angels was neither converted into the assumed body, nor was that body of such a nature that nourishment could be converted into it. Whence it was not a true eating, but a figurative one of spiritual eating. And this is what the angel said to Tobias 12: "When I was with you, you indeed were seeing [me] eat and drink; but I use an invisible drink and food." Abraham, however, offered them food, thinking them to be men, in whom nevertheless he was venerating God, as God is wont to be in the prophets, as Augustine says, City of God 16

Ad sextum dicendum, that, as Augustine says, City of God 15, many have either experienced or, having heard from those who experienced, confirm that Sylvans and Fauns (whom the common people call incubi) have often been morally depraved toward women and have desired and accomplished intercourse with them. Whence to deny this seems to be impudence. But the holy angels of God could in no way fall thus, before the deluge. Whence by the sons of God are understood the sons of Seth, who were good. By the daughters of men Scripture names those who were born of the stock of Cain. Nor is it to be wondered at that giants could be born of them; for not all were giants, but there were many more before the deluge than after. If, however, from the intercourse of demons some are at times born, this is not through seed cut off from them, or from bodies assumed, but through the seed of some man received for this purpose; namely, that the same demon who is a succubus to a man may become an incubus to a woman: as they also take the seeds of other things for the generation of certain things (as Augustine says, On the Trinity, book 3, chapters 8 and 9), so that the one who is born is not the son of the demon, but of that man whose seed was taken

Explicatio Articuli.

The conclusion is that, as regards that which is proper to living beings, angels cannot exercise the operations of life; but as regards that which is common to the works of living and non-living things, they can exercise them. The holy Doctor wishes to teach that an action can be produced by an angel in a living body which outwardly is similar to a vital action, although in reality it is not, such as speaking and walking. For there is a twofold kind of vital actions. One kind is of those which, according to their substance, cannot be except from life - such are the operations of the senses - and such actions in an assumed body cannot be done by angels; and in this the Doctors agree plainly in the second book, distinction 8. As to generation, about which there could be some difficulty because of incubus demons, who, approaching women, can generate, they teach that it cannot be done in an assumed body, except by bringing from elsewhere the seed of a man; just as they can burn by applying fire to matter; which in reality would not be to generate: for to generate is to let seed fall from one's own substance, by whose power offspring is produced in the womb of a woman; but this has been sufficiently confirmed above in Disputation 178, chapter 5.

The other kind of vital operations is of those which, according to their substance, can be done by a non-living principle, although not as to the mode; such as speaking and walking. By the mode of these actions we mean that peculiar respect which they have to such a principle; by the substance of the actions we mean the motion itself. Of these, therefore, St. Thomas says that they can exist as to the substance from an angel in an assumed body, because according to that they are assimilated to the actions of non-living things and agree with them; not, however, according to the peculiar mode by which they are done by living beings.

Disputatio CLXXXVI - Whether operations of life of the latter genus can be done by angels in assumed bodies

Caput I - Various scholastic positions

As to the operations of the former genus, no one has hitherto doubted, but all candidly acknowledge that they cannot be done by an angel in an assumed body, neither as to the mode nor as to the substance: for although nutrition, according to its substance, which is the conversion of food into the substance of the living thing, could be done by God, nevertheless that it cannot be done by an angel, no one doubts. The difficulty is only about the operations of the latter genus, whether both as to substance and mode, or as to substance only, they can proceed from an angel in an assumed body. In which difficulty the first opinion is that of Durandus in the First Book, distinction 8, question 2, number 5, where he teaches that neither walking, which the philosophers call progressive motion, nor speaking, properly so called, can befit an angel in an assumed body; but something which is like voice and walking. It thus seems that we should attribute these operations to angels neither as to the mode nor as to the substance.

The foundation of this opinion he set down in that question, number 4: because an action of a living thing is said in two ways - one way, because it is only from a living thing as from a principle; and this does not suffice that it be called simply and properly an action of a living thing. Otherwise the projection of a stone, which is done by a living thing, could properly be called an action of a living thing; yet in that way all the things which are done by an angel in a body can be called operations of a living thing, indeed improperly and in a broader signification. In the other way an operation is said strictly and properly to be of a living thing, because it is not only from a living thing, but is also received in it; wherefore, since such operations require a living organ in which they are received, they cannot properly be exercised through assumed bodies.

...so that he is not the son of the demon, but of that man whose seed was taken, as is cited in cap. 8 and 9.

Explicatio Articuli.

The conclusion is that, as regards that which is proper to living things, angels cannot exercise the operations of life; but as regards that which is common to the works of living and non-living things, they can exercise them. The holy Doctor wishes to teach that some action can be produced by an angel in a living body, which outwardly is like a vital action, though in reality it is not - such as speaking and walking. For there are two kinds of vital actions. One kind consists of those which, according to their very substance (*substantia*), cannot exist unless from a living thing, such as the operations of the senses; and these actions cannot be done in an assumed body by angels. And in this the Doctors fully agree in II, dist. 8, on generation; yet, that there could be some difficulty because of incubus demons, who, approaching women, can generate, they teach that this is not done in an assumed body, unless by bringing from elsewhere the seed of a man, just as they can burn by applying fire to matter; which truly would not be to generate. For to generate is that from one's own substance seed fall, by whose power offspring is made in the womb of the woman. But this remains sufficiently confirmed above in Disputation 178, cap. 5.

The other kind of vital actions consists of those which, according to their substance, can be done by a non-living principle, though not as to the mode; for example, speaking and walking. By the mode of these actions we mean that peculiar respect which they have to their principle; by the substance of the action we mean the very motion. Concerning these, therefore, St. Thomas says that, as to their substance, they can be from an angel in an assumed body, because according to that they are likened to the actions of non-living things and agree with them; not, however, according to the peculiar mode whereby they are from living beings... Therefore the operations of life of the latter kind can be done by angels in assumed bodies.

Concerning the operations of the former kind no one has hitherto doubted, but all frankly admit that they cannot be done by an angel in an assumed body, neither according to the mode, nor according to the substance. As to the substance - namely, that the conversion of food into the substance (*substantia*) of the living subject could be done by an angel - no one doubts this is fictive

only. The sole difficulty is about the operations of the latter kind, whether they can proceed from an angel in an assumed body according to both substance and mode, or only according to the substance.

In this difficulty, the first opinion is that of Durandus in II, dist. 8, q. 2, n. 5, where he posits that neither walking - which he calls the motion of the body - nor speaking can properly belong to an angel in an assumed body, but only something that is similar to a voice and to walking. It seems, therefore, that he refuses to attribute these operations to angels either according to the mode or according to the substance.

The foundation of this opinion he delivered in that question, n. 4: because an action of a living thing is said in a twofold way. In one way, because it is only from a living thing as from a principle; and this does not suffice that it be called simply and properly an action of a living thing. Otherwise heating and the projection of a stone, which are done by a living thing, could properly be called an action of a living thing. In this way all the things that are done by an angel in a body could be called operations of a living thing, properly indeed only in a broader signification. In the other way, an action is said properly and strictly to be of a living thing, because it is not only from a living thing as from a principle, but is also received in it. Wherefore, since the operations of an angel in an assumed body are not received in a living subject, it follows that they are not properly operations of life.

But before we set forth our opinion, meanwhile it should be noted against Durandus that from his own reasoning it follows that speech is not properly an operation of a living thing, and hence can proceed from an angel according to its entire notion and mode. For although speech is from a living and knowing subject, yet it is not received in the living subject: it is, rather, a certain sound; but the proper subject of this is air, by the beating of which it is made, as the Philosopher testifies in De anima, II, c. 8. Therefore, as Alexander most fittingly observed, part. quaest., mem. 4, in corpore and ad argumenta, speech is not for that reason called an operation of a living thing because it is effected in a living thing, but because it is effected by a living thing in a certain peculiar manner, as will be explained below.[1326]

The second opinion is that of St. Bonaventure in II, dist. 3, pars 1, art. 3, quaest. 2, who teaches that there are three modes of the soul's operations. For some are from the soul solely as motor; and such is walking, and these can be from an angel in an assumed body, for it can have the notion of a mover. Others indeed are from the soul, not only as mover, but also as perfecting the body; such is the operation of sense. Lastly, some are partly from the soul as mover, and partly as perfecting the body, or are a perfection of the body, as laughter, in which there is both a local motion of dilation of the cheeks and an interior exhilaration: and these also can be done by an angel in an assumed body, in so far as they are from the soul as mover, but not in so far as they are from the soul as perfecting. Thus St. Bonaventure concedes the motion which they call progressive in an angel, in the very same way in which it is in an animal.[1327]

1326. Aristotle, De anima, lib. 2, cap. 8; Alexander, part. quaest., mem. 4, in corpore et ad argumenta.
1327. St. Bonaventure, II Sent., dist. 3, pars 1, art. 3, quaest. 2.

The third opinion is that of Scotus in II, dist. 8, quaestione unica, § In ista quaestione, in the middle of that question, where on the one hand he teaches that an angel in an assumed body cannot truly effect that progressive motion, nor speech, nor expiration and inspiration, nor the motion of the eyelids, but only according to a certain external likeness. On the other hand, he affirms that angels in assumed bodies can truly eat. For he thinks that the action of eating consists solely in this, that by local motion one divide the food and transfer it from one part to another; in which Scotus agrees with Alexander, part. quaest., q. 5, memb. 2; and Gabriel, in that same distinction, q. 1, art. 3, dub., judges this to be probable.[1328][1329]

Caput II - The true opinion

Now, before we complete our own opinion - and in this article, in the solution of the arguments also - something seems to need to be supplied; namely, that the actions of the latter kind, out of those which Scotus a little before enumerated, indeed can proceed from an angel according to their substance, but do not receive their denomination, nor take the name, from the substance alone, but also from that mode. Hence, in an angel such actions cannot be received in the said mode of a living thing; but only according to a likeness are they rightly said to be such. Of this kind are speech, breathing out and in, coughing, motion of the eyelids, laughter.

In these actions of living things it is chiefly the mode that is to be noted, rather than the substance of the motion. The substance of the motion proceeds from an efficient cause which moves the eyelids, or the nose, or any other part in which the subject moved is contained; and in this respect it can be effected by an angel in an assumed body. The mode, however, by which it proceeds, from which also it receives its denomination, so requires a living thing as principle that it is not supplied by an angel in an assumed body; and thus it does not have a true appellation from him, but only according to a likeness.

Accordingly, in individual motions one must connect that peculiar notion of a principle which they require. First, the motion which they call progressive is effected through a power that resides in the tendons, and also through imagination and appetite, by reason of which the motion is called local by Aristotle, De anima, II, c. 3, according to a certain difference and a special grade of the soul. Therefore, since that power is not in an assumed body, nor the imagination, nor the appetite, that walking will not be said to be such, as if some man were moving a corpse so that it should seem to walk; and the same must be said about the motion of the eyelids. Secondly, expiration and inspiration and coughing, although they are not necessarily effected through imagination, nevertheless are powers of the animal nature residing in the lungs; and this mode is denoted by the very names. Thirdly, laughter is through imagination and delight of the appetite at something playful and new, whence proceeds the transverse motion of the septum and thence the cheeks are dilated and are moved, and all this is signified by the very name of laughter. Wherefore, if some

1328. Scotus, II Sent., dist. 8, quaest. unica, § In ista quaestione (in medio).
1329. Alexander, part. quaest., q. 5, memb. 2; Gabriel, dist. 8, quaest. 1, art. 3, dub.

statue were so polished that it had such a motion of the cheeks, it would not be said to laugh truly, because there would be lacking to it the mode signified by the name; and the same judgment is to be made about weeping.

De locutione

Fourthly, about speech and voice it must be said that the substance of these and of sound do not differ essentially; speech, however, or voice, is called sound from such a cause: for as Aristotle, De anima, II, c. 8, defines voice to be a sound produced with imagination by an animal, so too speech is called a sound which indeed is produced in the air by a man with imagination, to signify. Therefore brute animals are said indeed to utter voices, but not to speak. For the same reason, therefore, an angel can neither speak nor utter voices. Hence, finally, about the act of eating it must be said, in the same way, that there can be a motion which, according to its substance, but not according to the peculiar mode by which it is from a cause by reason of which someone is properly said to eat, exists. For it belongs to the notion of that operation that the motion which crushes the food and transfers it into the stomach be done by an animal; wherefore angels who in assumed bodies only crush food are not properly said to eat, as St. Thomas in this article to the fifth, St. Bonaventure in II, dist. 8, pars 1, art. 3, quaest. 1, and Richard in art. 1, quaest. 5, in corpore, to the first and to the second, have clearly taught, and this is manifestly gathered from Scripture.[1330][1327]

For in Tobit 12 Raphael said: "When I was with you, I both seemed indeed to eat and drink; but I use an invisible drink and food." What is "I seemed," unless that I thus appeared outwardly as if I were eating, when yet in truth I was not eating, because I am sustained by another kind of food? But concerning Christ after the Resurrection, the holy Doctor in the solution to the fifth teaches that He truly ate, because that motion truly was from a living body crushing the food and transferring it into the stomach, with an order to nutrition; although, because it was a glorious body, nutrition did not follow, but that food vanished. This indeed I judge truer than what Scotus and Gabriel assert - namely, that nutrition perhaps did follow.

Some argue thus against Scotus: If the act of eating in an angel were true as it is effected in a man, it would have been as true as the act of eating in Christ after the Resurrection; wherefore that could not have been an efficacious argument to prove the Resurrection, since in the same way it could truly have been done by an angel in an assumed body. Scotus and Gabriel reply that all those arguments for the Resurrection, taken according to sense, were each in detail sufficient; yet that all together did much more, as St. Thomas sensed in III, q. 55, a. 6, ad 1, especially with the testimony of the Scriptures and of the angels who said that Christ had risen.[1330] And indeed, if we speak of proof as to sense, I judge that the argument from eating by itself alone was not efficacious, just as truly it was when He offered Himself to be handled by the disciples, as I noted in Disputation 184. For although the act of eating in Christ was a true act of a living thing, with the other things necessary for the true notion of such an action, still that which outwardly appeared was only the

1330. St. Thomas, III, q. 55, a. 6, ad 1.
1327. St. Bonaventure, II Sent., dist. 3, pars 1, art. 3, quaest. 2.
1330. St. Thomas, III, q. 55, a. 6, ad 1.

substance of that motion which could in just the same way appear in an assumed body. For that peculiar mode which we said belongs to the notion of that action cannot be seen and judged by sense; wherefore the aforesaid argument against Scotus does not prove much. Then he replies that there was something in Christ's act of eating that is not in an angel, namely an order to nutrition, which perhaps he thinks is signified by that name; and thus at least in understanding and in faith the Resurrection of Christ could be proved. For since sight could not discern this order, it could not be an argument patent to sense. In whatever way, therefore, this argument be framed against Scotus's opinion, it is of no moment.

Hence it is that when Abraham invited the three angels (Gen. 18) and offered them foods, he had not yet known that they were angels; so teach Alexander, part. quaest., q. 34, memb. 6, and St. Thomas in this article to the fifth, Gabriel in II, dist. 8, quaest. 1, art. 3, dub. 3. But what St. Augustine says, Ep. 49, quaest. 4, that the angels took foods and that Christ also did the same, not by a feigned and empty phantasm, but with most manifest truth, not by necessity but by power, is to be understood thus: not that the angels truly ate as Christ did, but that to the eyes of men both Christ and the angels seemed to eat, not by prestiges and some illusion of sense, but by true appearance. Unless perhaps Augustine, following the opinion of those who think angels are corporeal - which he himself does not much abhor - understood that angels in a natural body truly ate, as other animals do.[1331][1332]

Quaestio LII - On the comparison of angels to place

Articulus I - Whether an angel is in a place

...Dimensive quantity is not in angels, but there is in them a virtual quantity. By the application, therefore, of an angelic power to some place, in such manner as it is said that an angel is in a corporeal place. And according to this it is clear that one ought not to say that an angel is measured by a place, or that he has a place as a container; but that he contains the place in a certain way, as a body contains its own powers and does not itself contain them as a subject. Likewise it is clear that an angel is not in place because he is continuous with the place: for a body is in a body by contact of continuity; but an angel is in a place by contact of power.

It is objected: It seems that an angel is not in a place. For Boethius in the book On the Hebdomads says that the common conception of the mind among the wise is that incorporeal things are not in a place; and Aristotle in the fourth book of the Physics says that not everything that is, is in a place, but a mobile body. But an angel is not a body (as was shown above). Therefore an angel is not in a place.[1333]

1331. Tobit 12.
1332. St. Augustine, Ep. 49, quaest. 4.
1333. Boethius, De hebdomadibus; Aristotle, Physics IV.

Besides, place is a quantity having position. But whatever is in a place has some position; yet to have position cannot befit an angel, since by his substance he is exempt from quantity, whose proper differentia is to have position. Therefore an angel is not in a place.

Besides, to be in a place is to be measured by a place and to be contained by a place, as is evident from the Philosopher in the fourth Physics. But an angel cannot be measured nor contained by a place: because the container is more formal than the contained, as air than water, as is said in the fourth Physics. Therefore an angel is not in a place.

But on the contrary: in the Collect it is said, "Thy holy angels dwelling in the heavens, may they guard us in peace."[1334]

I answer: It is fitting for an angel to be in a place; yet the term "to be in a place" is used equivocally of an angel and of a body. For a body is in a place by being applied to a place according to the contact of dimensional quantity. But in angels there is no such quantity, but there is in them a virtual quantity. Therefore, by the application of angelic power to some place in whatever way, an angel is said to be in a bodily place. And according to this it is clear that one ought not to say that an angel is commensurated by a place, or that he has position in a continuum; for this befits a located body precisely as it has quantity of dimension. Likewise one ought not on this account to say that he is contained by a place. For an incorporeal substance, by its own power touching a corporeal thing, contains it and is not contained by it: for the soul is in the body as a container, and not as contained. And in like manner an angel is said to be in a bodily place, not as contained, but in a certain way as containing. And by this the reply to the objections is clear.

The first conclusion is: An angel is in a place. The second conclusion is: An angel is in a place by the application of his power to a place. Both conclusions must be unfolded more fully in the following disputations.

Disputatio CLXXXVII - Whether angels are truly in a bodily place

Caput I - Catholic and certain doctrine

There have not been lacking those who asserted that angels are never truly and properly present according to their substance in a bodily place, but only abusively; and that some in his time held this view is reported by Mirandola in the first Apology on the descent of the soul of Christ into hell. Durandus also reports the opinion of those asserting that an angel is only in a place in the way in which a cause is said to be in its effect; and Hervaeus followed this opinion in the treatise On the motion of the angel, question 1, where he places the angel's being in a place according to the order by which a cause is said to be in its effect.[1335] There are also certain Thomists, whom we shall mention in the next disputation, who affirm that an angel is not in the empyrean heaven in a place

1334. From the Roman liturgy; cf. Tobit 12.

1335. Mirandola, Apologia prima de descensu animae Christi ad inferos; Durandus, In II Sent., dist. 37, quaest. 1; Hervaeus, De motu angeli, q. 1.

according to the propinquity of his substance, but, I know not, according to some other reason; yet these do not deny in a universal way that angels are in a place. Some also ascribe this opinion to Durandus, although in truth he himself rejects it: he only teaches that angels are in a place in a certain broader signification, whereas to be in a place properly befits bodies; nevertheless he did not deny their presence according to their substance, but only a determined place and position, as will be evident in the next disputation.

But the Catholic doctrine is that angels can truly be in a place, present according to their substance; and to affirm the opposite is heretical, as St. Thomas says on the First Book of the Sentences, distinction 17, question 1, article 1; and this opinion is followed by all the scholastics whom we shall recount in the next disputation.[1336] It is proved first from the Fathers. Gregory Nazianzen in Oration 34, at the end, which is the second of the Theological Orations, speaks thus about the angels: "Everywhere they promptly are present, both on account of the readiness of their ministry and on account of the lightness of their nature"; which words cannot be understood except of the presence of their substance.[1337] Athanasius, in the letter to Serapion On the Holy Spirit, far from the end, when he distinguishes between the Holy Spirit and a created spirit, says that the Holy Spirit is everywhere, but that the created spirit is in certain places; he also affirms that angels are circumscribed by a place. Damascene uses the same mode of speaking, as we shall explain below. Gregory of Nyssa, in the oration on infants who are taken away before their time, about the middle, teaches that the dwelling of the angels is heaven, because that seat befits their nature. Damascene too, in book 2 On the Faith, chapter 3, toward the middle, says that angels are circumscribed by a place, because they are not conversant on earth when they are in heaven, nor do they remain in heaven when they are sent by God to earth. St. Gregory, in book 1 of the Morals, chapter 2, and homily 34 on the Gospels, teaches that angels are circumscribed by a place and are frequently sent to us, although in intellect they always remain in divine contemplation.[1338]

Certain men try to collect this same doctrine from Scripture: first from the Apocalypse, chapter 12, where the battle of Michael with the Dragon and his angels in heaven is described, and it is added, "And their place was not found any more in heaven"; then from Luke 10: "I saw Satan like lightning falling from heaven." Yet from these places nothing is proved, as will be manifest in disputation 194; it can be better confirmed by those places of Scripture by which we shall show in disputation 194 that an angel is moved with respect to place; for if he is moved with respect to place, it is necessary that he be in a place.[1339]

1339. Apocalypse 12; Luke 10:18; see below, disputation 194.

Caput II - Arguments against the aforesaid doctrine

Against what we have said, there seem to be some testimonies of the Fathers. First, Damascene, book 1 On the Faith, chapter 17, at the beginning, says of an angel: "He is said, however, to be in a place, because in an intellectual manner he is present, and as is consonant to his own nature he operates; nor is he circumscribed elsewhere, but where he operates; for he cannot operate in many and diverse places at the same time." Here he seems to say that an angel is not in a place according to the true presence of his substance, but according to effect, or on account of a likeness only of his nature with some place. I answer: the intellectual mode of existing in a place, in Damascene, is not without real presence of substance, but without the bulk of quantity, as is the case with bodies by reason of bodily form and figure. For he had said just before that an angel, although he is like a body in appearance, is nevertheless not so contained in a place as to receive bodily form and figure; and immediately he subjoins the words just quoted, "He is said, however, to be in a place, etc., because in an intellectual manner he is present, etc." He said "in an intellectual manner," because in an indivisible way he is in a place, whole in the whole, and whole in every part. Augustine signified the same thing when he said that a corporeal creature is moved through places and through times, but a spiritual one only through times; God, however, neither through places nor through times. He means that a spirit is not moved through places after the manner of a body circumscribing for itself a place by figure and form, since it is present to a place in an intellectual mode; but he said this according to the opinion of those who assert that angels are incorporeal; for those who say they are corporeal (whose view Augustine too seems in some places to have followed, as we reported in disputation 179, chapter 2) must confess likewise that angels are moved through places after the manner of bodies

Next, against the aforesaid there seems to be that of Augustine, book 83 Questions, question 20, where he says that the place of God is abusively called the temple of God. Therefore if God is said abusively to be in a place, much more an angel. I answer: there he called the temple "the place of God" abusively, in which He is worshiped, not because His substance is there abusively; but because the temple is said abusively to contain God, whereas in truth God is both within and without. For he immediately subjoins: "Not that He is contained in it, but that He is present to it." He had also said above that what is contained by a place is a body. He speaks, therefore, of the containing place, not of real presence according to place.

Now there is a twofold mode of existing in a place: one according to figure, which we commonly call "circumscriptive," and it befits bodies alone; the other, however, according to simple presence, and it is commonly called in angels "definitive," because the created spiritual substance is thus definitely present to one place that it is not present to another; yet at times angelic substances are said to be circumscribed by a place. Thus speak Damascene in book 2 On the Faith, chapters 2 and 3, Athanasius, and St. Gregory the Great in the places cited in the first chapter, and Theodoret in question 3 on Genesis; but, as Gregory of Rimini rightly explains in 2 Sentences, dist. 2, question 2, article 2, and Marsilius in 2, question 2, article 2, at the end, this is the sense found among the Fathers: that an angel is described by a place in that he is determined and limited by a peculiar

place; for it befits God alone to be "in things" and in the whole universe not defined; because He is in the whole in such a way that His immensity is not ended and terminated by that place; but the substance of an angel is peculiarly limited to a place, because it cannot be at the same time in another.[1341]

Disputatio CLXXXVIII - By what account an angel exists in a place

Caput I - Enumeration of opinions and statement of the question

- "That an angel is in a place by a quality divinely communicated," Alexander asserts.[1342]
- "That an angel is in a place by an operation abiding," was the opinion of Aegidius and of the Ferrarian.[1343]
- "That an angel is in a place by something after the manner of an operation," Capreolus held.[1344]
- "That an angel is in a place by a certain application of power to act," Cajetan defends.[1345]
- "That an angel by his bare substance is in an undetermined place," Durandus pronounces.[1346]
- "That an angel by his substance alone is in a determined place," many scholastics have asserted.[1347]
- The true opinion.[1348]

Since we are instituting a question about the account on account of which an angel is in a place, we are not asking what the form is by which an angel existing in a place is denominated as present according to place, namely whether it be the presence according to place itself - be it a relation, or some other intrinsic or extrinsic form (for this matters little) - from which the angel is denominated present to a place; but we are asking what the foundation is because of which an angel is said to be in a place: whether it be the angel's substance alone, or something added to it; just as in bodies it is quantity by reason of which they are constituted in a place. In this matter the scholastics have been set in such great dissension that to report the opinions of each would be wearisome. Yet, that the difficulty may be more elucidated, so far as I can...

- To be in a place through a quality divinely communicated, Alexander asserts, cap. 1.[1349]
- To be in a place through a transitive operation, Aegidius and the Ferrariense held, cap. 2.[1350]

1341. St. John Damascene, De fide orthodoxa II, cap. 2 - 3; Theodoret, Quaestiones in Genesim, q. 3; Gregory of Rimini, In II Sent., dist. 2, q. 2, a. 2; Marsilius of Inghen, In II Sent., q. 2, a. 2.
1342. Alexander of Hales; see below, cap. 1 of this disputation.
1343. Aegidius Romanus; Franciscus de Ferrara; see below, cap. 2.
1344. Peter of Aquila (Capreolus); see below, cap. 3.
1345. Cajetan; see below, cap. 4.
1346. Durandus of St.-Pourçain; see below, cap. 5.
1347. Various scholastics; see below, cap. 6.
1348. See below, cap. 7.
1349. Alexander of Hales, Summa 2, q. 32, memb. 1.
1350. Aegidius Romanus, In I Sent., dist. 37, pars 3, art. 1, q. 1; Franciscus de Ferrara, In III Contra Gentiles, cap. 63, § Considerandum tertio.

- To be in a place through something after the manner of an operation, Capreolus thought, cap. 3.[1351]
- To be in a place through a certain application of power for operating, Cajetan defends, cap. 4.[1352]
- To be in a determinate place by its naked substance, Durandus pronounced, cap. 5.[1353]
- That it is only its substance that is in a determinate place, many scholastics [hold], cap. 6.
- Whether there be in a place through a quality produced by the angel, or through some mode added to his substance, below, cap. 7.

Against Alexander: that an angel is in a place by a divinely communicated quality

When we undertake the question concerning the ground on account of which an angel is in a place, we are not asking what form it is by which an angel existing in a place is denominated - whether it be presence according to some relation, or some other intrinsic or extrinsic form (for it is clear that by this an angel is denominated as present) - but we are asking what is the ground on account of which an angel is constituted in a place; whether it be only the angel's substance, by reason of which he is said to be in a place; or whether something is added to it, as in corporeal supposits, by reason of which they are in a place. In this matter the scholastics are set in such variety that it would be troublesome to recount the opinions of individuals. But, that the matter may be more elucidated, so far as we can, we shall pursue not only what is proved by us, but also what is said by others.

The first opinion, then, is Alexander's, 2 part., q. 32, memb. 1, who asserts that the reason and the foundation by which an angel is constituted in a place is a certain quality or property divinely communicated.[1349] This opinion indeed seems to be without foundation. For that quality cannot be natural, nor supernatural produced by God alone; for thus the angel could neither be in a place nor be moved locally by his own power - a thing absurd and contrary to the doctrine of the Fathers, who, as we shall see in disputation 194, cap. 2, attribute motion to the lightness and promptitude of the angelic nature; whereas in this way motion would have to be ascribed to the divine power alone. It remains, therefore, that it is a natural power produced by the angel himself, which he can change at will, and thus be moved locally; and accordingly it is not a quality bestowed by God alone. Whether, however, it be a quality produced by the angel, or some mode added to his substance, we shall speak in cap. 7.

Caput II - Against the opinion that an angel is in a place by a transitive operation

The second opinion is not a little common among those who say that a transitive operation is for an angel the ground whereby he is constituted in a place. Thus teaches Aegidius, In I Sent., dist. 37, the third part of the distinction, art. 1, q. 1; and the Ferrariense, In III Contra Gentiles, cap. 63, §

1351. Peter of Aquila (Capreolus), below, cap. 3.
1352. Cajetan, below, cap. 4.
1353. Durandus of St.-Pourçain, below, cap. 5.

Considerandum tertio;[1350] he also judges that this is St. Thomas's opinion in this article, when he says that angels are in a place by an application of their power to a place, as the Ferrariense at length draws out in the cited place; and the Holy Doctor seems to agree, In I Sent., dist. 37, q. 3, and above in Summa I, q. 8, a. 1, when he said that God is in all things by reason of his operation. [1354] The first point is also proved from Damascene, De fide orthodoxa I, cap. 17, where he says thus: "Nevertheless he is said to be in a place, namely the angel, who is present in an intellectual mode, and, as it were, works there; nor is he elsewhere, but he is, in an intellectual mode, circumscribed there where he works."[1355] It seems, therefore, that he assigns operation as the reason for existing in a place; for that particle "atque" conjoins the preceding with the following, as if he repeated the causal particle "quia", and the sense were: for this reason he is in a place, because he is present intellectually, and because he works there. But the clause "because he is present intellectually" explains the mode of existing in a place; whereas "because he works there" declares the foundation of existence in a place. Then it is confirmed by reason, first, because we do not seem able, without absurdity, to say that an angel is in a place, save by some contact of power, just as bodies by some contact of quantity; but contact of power is nothing other than operation: therefore by that the angel is constituted in a place. Then also, since God is constituted in all things by operation, a created spiritual substance also will be constituted [in a place] by operation.

This opinion is refuted by Scotus in II Sent., dist. 2, q. 6, § Contra hoc est.[1356] He also reports that it was condemned at Paris by the Bishop of Paris together with the theological faculty; the same is reported by Richard, In I Sent., dist. 37, art., q. 1; and Gabriel, In II Sent., dist. 2, q. 2, a. 2, concl. 4, in which places the aforesaid opinion is not approved.[1357] As to that condemnation made at Paris, there would be little need to care, since many other propositions have been unjustly condemned by the Doctors of Paris, even if in truth the aforesaid opinion had been condemned. But, as is gathered from Henry, Quodlib. 2, q. 9, who follows the opposite opinion and was among the Doctors who pronounced that condemnation, it was not defined there by the Doctors whether the foundation of existing in a place is substance, or operation, or something else. For Henry himself thinks that it is not bare substance, as we shall see in cap. 6; but they condemned the theologians asserting that an angel is in a place only by operation, not by substance - that is, that their substance is not truly present in a place, but that they are only in the place wherein they operate, just as a cause is said to be in its effect even if it be absent according to place. But this is not what the aforesaid opinion asserts. Be that as it may with that Parisian decree, this opinion must be refuted in another way.

1349. Alexander of Hales, Summa 2, q. 32, memb. 1.

1350. Aegidius Romanus, In I Sent., dist. 37, pars 3, art. 1, q. 1; Franciscus de Ferrara, In III Contra Gentiles, cap. 63, § Considerandum tertio.

1354. St. Thomas, In I Sent., dist. 37, q. 3; Summa theologiae I, q. 8, a. 1.

1355. St. John Damascene, De fide orthodoxa I, cap. 17.

1356. Scotus, In II Sent., dist. 2, q. 6, § Contra hoc est.

1357. Richard of Middleton, In I Sent., dist. 37, art., q. 1; Gabriel Biel, In II Sent., dist. 2, q. 2, a. 2, concl. 4.

First, indeed, by the authority of Damascene, De fide orthodoxa I, cap. 17, whose words we shall set forth below, where he asserts that an angel therefore works here and elsewhere, because he passes through diverse places; therefore it is prior to be in a place and to pass through places than to work in them.[1355] Then by four reasons.

First reason. Although God works before he is in things - both because things must first be produced before God is in them, and also because God has no need of propinquity of places in order to work, as we showed in disputation 8, cap. 3 - yet created causes ought first to be near to the place before they work. For their power is finite; wherefore they need propinquity of place as a necessary condition for working; therefore they are first in a place before they work.

Second reason. If an angel were in a place by a transitive operation, he could never, while himself resting, move some body, but would necessarily be moved together with it. For the mover cannot be present to a body which he moves except by some transitive operation other than local motion; but in the body which is moved the mover cannot himself rest, as is plain; therefore he could never move a body without being moved.

Third reason. If an angel were in a place by operation, it would follow that he who moves the heaven would be in the whole orb (which seems absurd), because he moves the whole. How, moreover, would he not move other parts by one part? We shall speak of this in disputation 192, cap. 2. It would also follow that any angel could by his power be simultaneously in heaven and on earth. For if an angel can move a body of such-and-such a size - for example, of forty palms - he can at the same time, together with others, move a body extended as far as heaven (for we shall show below, disputation 193, cap. 4, that one angel can be helped by another); then he would be in the whole body, not in some determinate part of it, as is gathered from those things which we shall say in disputation 192, cap. 2; therefore he would be simultaneously in heaven and on earth, which is absurd, as we shall show below.

Fourth reason, most efficacious of all and pressing more upon the adversaries, is that it would follow that the angels were not created in the Empyrean heaven, nor are they now blessed there, nor the damned in hell. The same is wholly gathered concerning the blessed and the damned souls, and concerning the soul of Christ - namely, that it did not descend according to substance to the lower regions, because neither angels nor the souls of men have there any transitive operation, nor did the soul of Christ have [such] in hell. The angels in the Empyrean certainly did not have it, because that heaven is not moved; moreover, an angel cannot imprint on a body any operation other than motion according to place. And although he were moved according to place, it should not be said that all the angels who were created in heaven were moved; why, indeed, should so many thousands of angels have been occupied in moving one single body? In hell, too, what operation could demons and souls have? We must not say that the fire in hell is agitated perpetually by them.

First reply. Aegidius replies that the angels are not in the Empyrean by any transitive operation, but by an application of power. But this solution is easily rejected. For either by "application of power" he understands an operation other than transitive motion according to place; and this

seems wholly invented, since an angel can effect nothing in a body other than local motion; or else let him assign that kind of operation which the angels imprint upon the Empyrean heaven; or he understands an immanent action of the will, which is the principle of transitive operations; and thus the sentence of Cajetan can be impugned in the same way. Add that, since the Empyrean heaven is not moved by an angel according to place, nor does it receive anything from him, we would say in vain that the angel applied his power and that by that he is in a place; for the application of power with respect to a body is nothing other than to some operation around it.

Second reply. The Ferrariense replies that spiritual substances are in those places by some transitive operation which they have not by their own power, but by a divine one. For, as St. Thomas teaches, De malo, q. 16, a. 9, ad 3 and ad 12, demons can be assumed by God as instruments for effects to be produced beyond the powers of nature; therefore we can say that something is there operated by the power of God, although it be hidden from us.[1358] But, besides the fact that an assumed instrument cannot, physically, operate something for which it has no inchoate power - as we showed in disputation 177, cap. 3 and 4 - such an occult operation of an angel seems devised without basis solely in order to prop up the Ferrariense's opinion.

Third reply. He replies, concerning the souls and the damned demons, that they are indeed in hell not by reason of transitive operations, but by reason of passion. Yet he himself does not fully approve this solution, on account of the authority of St. Thomas, In IV Sent., dist. 44, q. 3, a. 3, quaestiuncula 3, where he teaches that an angel is first bound to fire before he is tormented by it. [1359] For my part, another reply does not please me. First, because demons or souls do not suffer from the fire by any physical action derived from it, as we shall prove in disputation 243, cap. 3. Then also because in this way the difficulty is not removed concerning the blessed angels, the souls of the Fathers in the bosom of Abraham, the infants in limbo, who, according to the truer opinion, do not suffer from the fire, and the soul of Christ when it descended to the lower regions. Moreover, if the sentence is true which teaches that any thing whatsoever can at God's pleasure be assumed as an instrument, we must grant that he can assume a thing at rest or in motion, proximate or absent; for these contribute nothing to the notion of a voluntary instrument, since its whole efficacy is from God, who needs neither motion nor propinquity in order to work. Therefore, whether you say that the angel operates by God's power upon some thing, or that the fire operates upon the angel, it does not follow that the angel is proximate by that alone because, as an instrument, he operates; whatever propinquity he has, he must have it from elsewhere than from the fact of being an instrument to him who, neither by motion nor by propinquity, needs [anything] to work.

Fourth reply of Cajetan. Furthermore, since the same argument no less strikes against Cajetan's opinion, he too strives in this article to reply. First, with the Ferrariense, he says that the angels are in the Empyrean heaven by an operation wholly occult, which has already been confuted by us. Then he pronounces that the angels are not properly in the Empyrean heaven, but abusively and

1355. St. John Damascene, De fide orthodoxa I, cap. 17.
1358. St. Thomas, De malo, q. 16, a. 9, ad 3 et ad 12.
1359. St. Thomas, In IV Sent., dist. 44, q. 3, a. 3, quaest. 3.

metaphorically, because they are in the glory for which that heaven is destined; and he thinks this is the opinion of Nazianzen; Nyssen is also reported for this opinion.[1360] But concerning the other spiritual substances and concerning the soul of Christ he says nothing. However, on III, q. 52, a. 2, ad 3, he teaches that separated souls can, by God's will, operate upon a body just as an angel operates; and thus he grants that the soul of Christ truly was according to substance in hell, because by the power of the Word he wrought miracles there.[1361] He concedes, therefore, that all souls are in those places by reason of some occult operation communicated by the power of God; and he ought to concede the same about the demons, or else assert that they are not in hell by any other reason than the blessed are in heaven. But, first, to concede an occult operation to all these is superfluous, indeed invented; and although it is probable that the soul of Christ could, as an instrument of God, operate physically by his power (for I judge the opposite more probable, as is gathered from disputation 177), nevertheless I do not see what transitive action it had continually in hell. Be it so, that we grant this of the soul of Christ; but concerning the other spiritual substances, what shall we say - whether they exercise there some occult operation by the power of God, or whether they are not there truly and properly? But this is absurd. For, just as the same Cajetan, on III, q. 53, a. 2, against Durandus, proves that it is absurd to deny that the soul of Christ was in hell according to substance (which, when Picus of Mirandola once seemed to have said at Rome, and for the same cause was very ill thought of, from this error he carefully purged himself), worthy of the same censure will it be to affirm that the souls of the Fathers were not in the bosom of Abraham according to their substance; for to them Christ is said to have descended. Add that Scripture in the same way says that angels are in heaven as the Church says that Christ descended to the lower regions; therefore we must confess that they are in heaven in the same way as the soul of Christ was in hell.

Secondly, it would be falsely said that all the angels were created in the Empyrean heaven, if by the Empyrean heaven beatitude were understood; for from the beginning they were not blessed, nor have all afterwards obtained beatitude.

Thirdly, Christ begins to be in the Eucharist truly and in reality, and not by some operation nor by passion, as is plain; therefore an angel too can be there without action and passion. If he should say that Christ is there by the change of the bread into him, this helps nothing - both because, once the change of bread into the body of Christ has taken place, the body itself remains, and because he could be there without that, as Cajetan himself admits on III, q. 75, a. 2. For ...[1362]

1. For even if God were to restore the substance of bread, the body of Christ could remain; indeed, as we said in Disputation 177, chapter 5, the removal of the bread has by the nature of the thing no necessary connexion with the physical presence of Christ's body, but only by the force of the words. Therefore it is clear that, without any transitive action, some spiritual substance, or something having a spiritual mode, can be present to a place. In St. Gregory of

1360. St. Gregory Nazianzen and St. Gregory of Nyssa are sometimes cited for metaphorical locutions about heaven; see below, cap. 4.

1361. St. Thomas, Summa theologiae III, q. 52, a. 2, ad 3.

1362. Cajetan, In IIIam, q. 75, a. 2.

Nyssa I, for my part, have found nothing that would favor the view of those who assert that angels are not in heaven according to substance. St. Gregory Nazianzen, however, plainly teaches that they are in a place and traverse places, as we saw in the preceding disputation.

It remains to refute the arguments of the opposing opinion. As to the testimony of St. John Damascene, I answer: he only said that an angel is where he operates, which we readily grant, because he needs the proximity of a place in order to act; but he did not say that therefore he is in a place because he operates in it. And when he says, "And since it is in accord with its very nature, it operates," the conjunction "and" does not conjoin the clause "because" which preceded, so as to assign a cause why it is in a place; rather Damascene only signifies that an angel is in a place in an intellectual mode, that is, not according to the form of quantity, and that in the same mode he operates, that is, not by a quantitative contact, but by the presence of his substance. Nay more, in On the Orthodox Faith, book 1, chapter 17, he plainly admits that for this reason angels operate in a place, because they are in a place. "For the angel," he says, "on account of the swiftness of his nature, and because he passes quickly and speedily, operates in diverse places." As to the first argument, I grant that an angel is not in a place without some contact of power; yet not by any transitive action into the place, nor by passion, but in another way, as we shall explain in chapter 7. As to the second argument, I say that God is not in a place by reason of operation, or at least that this is not evident to us, as we proved in Disputation 28. And even if God were in a place by reason of operation, it would not follow that therefore an angel is also by reason of operation. For the absurdities follow which we set out, if we say that an angel exists by operation - absurdities which do not follow from our asserting that God exists there, as I noted in that disputation. Add that, since God does not need the nearness of place, as some precondition, in order to operate, whereas an angel does need it, it follows that by nature God could operate in a place before being in it, and thus could have operation as a foundation for being in a place; but an angel must be in a place before he operates, and thus he cannot be constituted in a place by reason of operation.

Caput III - The third opinion: that an angel is in a place by operation, passion, or presidency

The third opinion is that angels are in a place either by a transitive operation, or by passion, or finally by this, that an angel presides over things, or comports himself after the manner of an agent. Thus taught St. Thomas in Quodlibet 1, art. 4; and afterwards Capreolus, on the Second Book, distinction c., question 1, art. 1, conclusion 1, where he also reports, in favor of the same opinion, St. Thomas on the First Book, dist. 37, q. 3, a. 1; there, however, he attributes only this, that the reason of existing in a place is a transitive operation. But on his own authority Capreolus adds these words: "I say, prior to operation taken commonly, according to which an angel bears himself toward the body contained in the place after the mode of one presiding, or ministering, or in some way acting or suffering." He drew these from that same Quodlibet where almost the same things are found.[1363][1363][1365] The same opinion is embraced, it seems, by Picus of Mirandola in the Apologia,

1363. St. Thomas, Quodlibet I, art. 4.

question 1, not far from the beginning, where he affirms that an angel is in a place by operation, taking "operation" for any habituation to a body or to a place that obtains after the mode of active or passive operation. He further adds that this belongs to an angel by his own proper power; but that by God's absolute power he can be set in a place in another way.[1366]

Ferrarensis judges that this opinion, in the passage cited, is not according to the mind of St. Thomas even in that Quodlibet; for when Thomas says there that an angel is in a place by operation, or by one of those modes, he understands (says Ferrarensis) only a transitive operation, which is either local motion, or illumination, or any other such thing that he can have by God's power. Whatever be the mind of the holy Doctor in that place - which is difficult - this opinion of Capreolus is easily refuted by reason.

If Capreolus and Mirandola say that something other than a transitive operation, signified by the mode of action, is the foundation of existence in a place, then either it is some immanent operation of will (*voluntas*) or intellect (*intellectus*) (for it cannot belong to any other faculty). And so either one must say with Cajetan that by some peculiar act of these faculties an angel is constituted in a place - which we shall impugn in chapter 4 - or else by any immanent action whatsoever; and this is manifestly false. For an angel existing in heaven guards us on earth by intellect's mere attention and the will's desire, as St. Thomas teaches on the Second Book, distinct. 11, q. 1, a. 4, ad 5; therefore that guardianship and as it were the act of presiding does not constitute him in the earth; otherwise, since he can fix his attention upon the whole universe, he could place himself in the whole of it; which is absurd. Or else the habitus signified by the mode of action is some relation, as Capreolus indicates on the Second Book, distinction c., question 1, art. 3, to Aureol's arguments against the first conclusion, which he calls "ennoblement" and a certain "ornament" of the place itself; but this cannot be the foundation of such existence. For since to exist in a place is a certain relation, it cannot arise from another relation, unless some prior change be wrought in something absolute. That prior relation cannot arise from the angel's mere will or from his substance: not from his will, because no relation ever springs up unless a prior change has been made; not from his substance, because it would always be the same and could not vary with place; and consequently an angel would never be moved.

As to what Mirandola adds about the absolute power of God, if it be rightly understood, it is most true; yet it must be understood thus: that without some absolute change, which is the foundation of existing in a place, God cannot confer upon an angel that presence which consists in a relation. This third opinion has no argument in its favor that needs to be dissolved.

Caput IV - The fourth opinion: that an angel is in a place by an application of power to act

The fourth opinion is Cajetan's in this article, who, following Thomas of Argentina on the First Book, dist. 37, q. 1, art. 2, ad 1, against the first conclusion, and Godefred of Fontaines in Quodlibet 8, q. 13 (whom Scotus cites in the place noted below), thinks he has surmounted all these

1364. Capreolus (Peter of Aquila), In II Sent., dist. c., q. 1, art. 1, concl. 1.
1365. St. Thomas, In I Sent., dist. 37, q. 3, a. 1.

difficulties if he concedes that an angel is not in a place in any other way than by an application of power to a transitive operation. He holds moreover that this application is an immanent act of intellect and will, and also an expedition of the executive faculty, by which the angel is in readiness to operate - and that this is of such power as to constitute the angel in a place, not only as long as the transitive operation is being completed, but even before he operates, when he is already said to be on watch and actually considers how the tasks enjoined there may be rightly performed. He adds, however, that this mode of existing in a place is incomplete; but that completely the angel exists there by a transitive operation. What it is to exist incompletely and completely he does not explain. Yet he does not deny that in the former mode the angel's substance is truly present - if he were to deny it, he would fall outright into the second opinion impugned in chapter 2. Therefore what remains to be proved against Cajetan alone is, that an angel is not truly present by that immanent action whereby he is said to apply his power to a transitive operation. But this can be shown by the reasons set forth in chapter 2: for it would follow that neither angels in the Empyrean heaven, nor the souls of the Fathers in purgatory, nor the damned in hell truly exist there, nor that the soul of Christ truly descended to the lower regions. For since in those places there was to be no future transitive operation, there will be no application of power to act. What Cajetan answers about angels existing in the Empyrean we have reported and refuted in that chapter. As to the soul of Christ, he answers that it had some effect upon the souls of the Fathers and of the damned - terrifying these, enlightening those; and that it also had some operation in those places of hell by a power of the humanity: he seems to understand a transitive action. But this reply is no less easily refuted.

First, because that illumination and correction, as effects in souls, could not be the cause of constituting Christ's soul in a corporeal place. For neither do such operations require nearness of place, since they are spiritual, and their effects are received in the spirit; and if they had any force upon bodies, they would sooner have constituted Christ's soul within the substance of the souls of the Fathers and of the damned than in a corporeal place. Moreover, none of those operations was intrinsic in the souls, nor was there any influx of a physical quality into the souls; for illumination is not effected by passion, but is wholly on the part of the object proposed - as we shall explain more fully in Disputation 1, chapter 5; therefore it cannot be the cause of constituting an angel materially in a place. Besides, either the humanity of Christ was the cause of those actions as a physical instrument, or only in a general way: in neither way does it seem sufficient to constitute the substance of his soul in a place. The first is manifest if it be as a subordinate instrument. And as to a physical manner, it has already been sufficiently proved above, in chapter 2, that by reason of instrumental action the soul of Christ could not be located in a corporeal place; nor can the application of itself as an instrument to act be in that case a cause of existing in a place. This opinion of Cajetan seems to have been devised for no other reason than that he might first place an angel in a place before he should act by a transitive operation - since that seemed to him necessary; for he thought that by his bare substance an angel could not be constituted in a place; yet I add that the mode proposed by Cajetan is not possible, and that this difficulty can be solved in a much

1366. Picus of Mirandola, Apologia, quaest. 1.

easier way. For I freely admit that an angel must be in a place before he operates; I also maintain that by his bare substance he cannot be constituted in a place; but I add that Cajetan's way is not possible, and that in another, much easier way the present difficulty can be resolved.

The fifth opinion was that of Durandus, on the First Book, distinction 37, the second part of the distinction, question 1, num. 4. He holds that an angel by his bare substance is in a place, not indeed in a determinate place which he could abandon by motion, but in a common place, namely, with respect to all the bodies which by his power he can move; and that to all these the angel is truly present by his substance and by his power, whether he actually operates or only wills to exercise some operation about them; and since his substance and his power are always the same, he keeps the same mode, so that by no reason can he leave the place which he once in this way has. Durandus proves this by two reasons. The first is: every agent, in order that it may operate, must first be present to the patient upon which it operates; but an angel, before he operates, cannot be understood to be present otherwise than by his substance; therefore, before he operates, he is present by his substance; and therefore, before he operates, by that same reason he is not more present to this body than to that, but he ought to be equally present to all of them. The second reason: if it be present to one body and not to another, although it can operate upon both, this must come to pass by some motion in the very substance of the angel; but no such motion seems capable of being received in the angel's substance; therefore he ought to be equally present to all bodies.

Durandus then explains this presence of an angel by the example of the heavenly bodies. For these too are present to all bodies about which they can operate; yet with this difference, that a heavenly body, since it has quantity and is corporeal, is hindered with respect to the bodies to which it is present, so that it is not equally near and immediately present to all; but a spirit, since it lacks quantity, is detained by no impediment that would keep it from being adequately present to all the bodies which it can move. Hence, although he calls the presence of an angel "presence by order" in regard of all bodies whatsoever, nevertheless he does not deny presence according to substance; but he confesses a presence not merely by order of convenience, but a true presence and according to substance.[1367]

This opinion of Durandus is rightly judged improbable by all the Scholastics of our time. For either he speaks of presence only by reason of convenience, and thus he establishes the angel to be nowhere present according to substance, which is absurd, as is clear from what was said in the first and second chapter; or only of the presence of cognition, whereby one is said to be present to the things which he has in view, and in this way the same inconvenience follows, namely, that he is nowhere present according to substance; or, thirdly, he admits a true presence and nearness of place in the substance of the angel, although not by situation and quantity, as indeed he grants; and from this no less inconveniences follow.

The first is, that the angel would be everywhere, against the common doctrine of the Fathers, whom I recalled in the preceding disputation, chapter 11; for they teach that angels are circumscribed by place in a particular way, because God alone is everywhere, as St. Thomas hands

down above, question 8, article 4, with whom the Scholastics agree in I, dist. 37. But that this is gathered from his doctrine is proved: for he teaches in number 34 that an angel ought not to be said to be present in all things. Then too, there is no greater reason why he should be in this place rather than in that by his substance and power, if his power is equally disposed toward each thing: therefore, since there is no body that cannot be moved by an angel, he will be at once in all. For if an angel of a lower grade and order, as all admit, can move any celestial body whatsoever, he will also be able to move any other body whatsoever; or if, because the elements are fluid, he cannot move them all at once together, it is enough that there be no part in them which he cannot move, so that he be effected equally in all their parts. Wherefore it is frivolous what Durandus answers, that an angel is not in all bodies because he cannot move them all. Or at least it would follow that the damned angels would be in heaven, because although a damned angel cannot move all things, even according to parts, nevertheless any one of them could move a heavenly body: therefore all the damned angels would still have remained in heaven. Then Durandus answers that an angel is everywhere where God is, yet in a different way, because God is there as the conserver and cause of all the things in which he is, but an angel only by that reason that he can move. In this very way he finally concedes that an angel could be in many other worlds, if they were made by God; which is plainly deduced from his doctrine. He must also concede that the damned angels remained in heaven - things most absurd.

The second absurdity which follows from the opinion of Durandus is that angels are not moved - which he himself candidly confesses - against Scripture and the common doctrine of the Fathers; see disputation 194.

Finally, the third absurdity is that an angel is always in an equal place: for since he is always equally related to all places, in all of them he will always be in the same way. But that this is absurd will be shown in the following chapter. The reasons of Durandus are easily dissolved: first, because in chapter 7 we shall show how an angel, before he operates, is in a determinate place; then also whence it comes that he is present to this rather than to that; finally, in disputation 194, chapter 3, we shall show that an angel can be moved from one place to another; hence therefore all the reasons of Durandus will be dissolved.

That an angel is in a determinate place by his substance alone, many Scholastics assert.

This is the opinion of many Scholastics, who affirm that an angel is in a place by his substance alone (*substantia*), every other thing being excluded. Thus they handed down in I, dist. 37, article 1, question 1; St. Bonaventure, in II, dist. 2, part 2, article 2; Scotus, question 6, 9; to question 8 and 9; Gregory, in II, dist. 2, q. 2, a. 2, conclusion 4; Gregory, q. 2, a. 2; Henry; Marsilius, in II, q. 2, a. 1, concl. 4.[1368] But Henry, disputing this question at length in Quodlibet 2, q. 9, dares to define nothing; yet he notes that at Paris the sentence of those asserting that an angel is in a place only by operation and not by substance had been condemned by the Doctors, but it had not been defined

1367. Durandus of St.-Pourçain, In I Sent., dist. 37, pars 2, q. 1, n. 4.

1368. Richard, In I Sent., dist. 37, art. 1, q. 1; St. Bonaventure, In II Sent., dist. 2, part 2, art. 2, q. 1; Scotus, q. 6, 9; Ad quaest. 8, 9; Gregory, In II Sent., dist. 2, q. 2, art. 2, concl. 4; Gregory, q. 2, art. 2; Henry; Marsilius, In II, q. 2, art. 1, concl. 4.

that the foundation of existence in place is the very substance of the angel; and in this all the doctors agreed, of whom he himself was one. Indeed, although he says against St. Thomas that the foundation of existing in place is not for an angel his operation, nevertheless he affirms that it is not the naked substance; what, however, that addition to the substance is, he does not explain.

Caput VI - Against the preceding opinion

Accordingly, the aforesaid Doctors, against the preceding opinions, pronounce that an angel is not in a place by reason of a quality communicated by God, nor by reason of a transitive operation, or of something that has the standing of a transitive operation: the same also they would say against Cajetan, that it is not by reason of application; and lastly against Durandus, that it is not by reason of his substance in every place, but by reason of his substance, as a body by reason of quantity, to be in a place determined and finite; so that in angels, from their substance alone, without anything else, there arises existence (*esse*) in place, just as in bodies from quantity alone; although it can vary at will.

But in accordance with this sentence it is taught that an angel is never loosed from place, nor does he pass from place to place without a medium. Now this sentence can be confirmed by three reasons. First, by refuting the other opinions, apart from which no other seems to remain. Second, because it cannot be understood that an angel ceases to be here until by motion he changes place: but if otherwise, then, as was said above, either the foundation of existence in place would depend upon the will, and he could, as it pleased, cease to be here where he was before, without being moved therefrom; therefore it is better to say that existence in this or that place arises proximally from the substance of the angel, even if it can be changed by the will: for thus he would never cease to be here by the mere nod of his will without motion. Third, because from this alone, that the angel's substance, without anything else, is a certain part of the whole universe of things, it follows that it has, according to itself, an order of place in the universe, without anything else.

However, although together with the aforesaid doctors I do not at all approve the sentences which I have thus far related, nevertheless I judge no less false that which they affirm, namely, that the foundation of existence in place is the naked substance; and this I not obscurely show by the following reason. Either the existence of the angel in place is taken for the mere relation (*relatio*) of presence, whereby one is said to be present to some place, and this cannot arise from the naked substance: for it would follow that the angel would always remain present in the same mode until the bodies to which he is present are moved; because from the same foundation on the part of one relative there is always born the same relation, the term of that relation remaining in the same way, whether it be intrinsic or extrinsic: wherefore, with the substance of the angel unchanged according to its nature, which is said to be the foundation of presence, and with the term not changed, the angel would be present in the same way, and thus from a permanent place he could not be moved - which is absurd. You will say, he can be moved, and that relation of presence can be removed by local motion. But this answer is of no value: for local motion must be to some form prior to relation, because relation, as I said, cannot be changed in itself unless either the term or

the absolute foundation is changed; but if that existence in place is some absolute mode from which the relation of presence follows, it cannot be said that such a mode arises from the naked substance of the angel, as in bodies it proceeds from naked quantity: for hence the first thing would follow, that an angel cannot be loosed from every place, and thus cannot pass from one extreme to the other without a medium - which will be proved false below, disputation 196, chapter 2 - since the foundation of existence in place is always present, namely, the substance of the angel, just as in bodies quantity: therefore an angel will always be in a place, like a body, although it can be varied by motion. Moreover, it follows that an angel is always in an equal place, and can never place himself in a smaller one: because just as the same quantity is always followed by the same existence in a place equal in all respects, and a body cannot be constrained unless perhaps by compression and condensation - which cannot befall the substance of an angel - so too the angel would always be in an equal place. But this Scotus does not dare to concede, and it is plainly false, as we shall say below in disputation 191. Lastly, if existing in a place does not arise from the naked substance of an angel, but from the angel's will alone, it follows that an angel can be wholly loosed from place; for to be in a place arises from his free will - which the Doctors of this opinion are unwilling to concede.

Now in answer to the first reason of this opinion I reply that all the other opinions have not sufficiently assigned the foundation of existence in place; yet on that account it is not necessary, with Scotus, to assert that the foundation is the naked substance. To the second I say that it can rightly be explained and understood that an angel ceases to be in a place without being moved therefrom by the mere nod of his will, as we shall say in the following chapter. But the third reason proves only this, that a spiritual nature, because it is a part of this universe of things, has, according to itself, an order of place in the universe; from which it is not yet gathered that this order is existence in place, of which we shall treat hereafter.

But this does not explain it. Therefore the aforesaid Doctors, in opposition to the preceding opinions, pronounce that an angel is not in a place by reason of a quality communicated by God, nor by reason of a transitive operation, or one that has the manner of a transitive operation; the same men would also say against Cajetan that it is not by reason of application; and finally against Durandus, that it is not by reason of his substance in every place, but by reason of his substance, as a body by reason of quantity, to be in a determinate and finite place; thus in angels there arises from their substance without anything else existence in a place, as in bodies from quantity alone; although it can vary at will. And in agreement with this opinion they teach consistently that an angel is never loosed from a place, nor passes from place to place without a middle. This opinion can be confirmed by three reasons. First, by refuting the other opinions, besides which none other seems to remain; second, because it cannot be understood that an angel ceases to be here until by motion he changes place: but if in some other way it were as the aforesaid say, or if the foundation of existence in place depended on the will, he could, as he pleased, determine to be here where before he was, without thereby being moved: therefore it is better to say that existence in this or that place arises proximally from the substance of the angel, even if at will it can be changed; for thus he would never determine to be here by the mere nod of the will without motion: third,

because from this alone, that the substance of angels, without anything else, is made a certain part of the whole universe of things, it follows that it, according to itself, has an order of place in the universe, without anything else.

Yet I - for all that I do not at all approve, together with the aforesaid Doctors fighting against the preceding opinions which I have hitherto reported, what they themselves affirm - I esteem the preceding opinion no less false, namely, that the foundation of existence in place is the naked substance. I show this not obscurely by the following reason. Either the existence of an angel in a place is taken for the mere relation of presence, whereby he is said to be present to some place; and this cannot arise from naked substance: for it would follow that an angel would always remain present in the same way, until the bodies to which he is present are moved; because from the same foundation on the part of one relative there always arises the same relation, the term of that relation remaining in the same way, whether it be intrinsic or extrinsic. Wherefore, the substance of the angel, unchanged according to its nature, which is said to be present, would make him present in the same way to the place, and thus he would remain in the same place - which is absurd, and it would abolish that local relation. But this is excluded: for local motion cannot change a relation, as I said, in itself, unless either the absolute term is changed or some prior absolute is changed; but if in place there is some mode, such a mode can arise, and thus local presence would arise from that mode in the angel, as in bodies it proceeds from quantity. Hence it will afterwards be proved that an angel is not present in every place, and thus neither can he pass from extreme to extreme without a middle.

Moreover, since there would always be in the angel the same foundation of existence in place, the angel would always be in an equal place for as long as by motion he varied it; it follows that the angel would always be in an equal place through the whole, and could never be constituted otherwise; for as long as the same foundation remains, the same existence in a place always follows. He would never be able to be contained by a greater or a smaller surface, unless perhaps by compression or rarefaction, which cannot befall a body in an empty space, nor can it befall the substance of an angel. From the existence of the angel it would follow that an angel would always be in an equal place, which these men do not dare openly to concede; and this is plainly false. Therefore we shall say below in disputation 191 that the foundation of local presence cannot be the naked substance of the angel; nor is it to be said that existence in a place simply is an absolute mode arising from the substance as from a principle, from which presence could not be said to vary by the will alone; for that would imply that existence arises from the naked substance of the angel, just as in bodies it arises from naked quantity; whence it would follow, first, that an angel could never be loosed from all place; second, that he could pass from extreme to extreme without a middle, which is false, as will be shown below in disputation 196, chapter 2. Moreover, since there is never wanting a foundation of existence in place in the angel, as in a body, the angel would always be in a place, although by motion it might be varied; therefore it follows that the angel will always be equal in place throughout, and will never be able to be differently constituted: for the same existence in a place always follows from the same foundation, unless perhaps by compression, which cannot happen in an equal place; thus he would be in an equal place. Scotus

might concede this, and, as will be said below in disputation 196, if to be in a place did not arise from substance but from quantity alone, it would follow that an angel could never be loosed from place: for to be present arises from the will; which the Doctors of this opinion do not wish to grant.

Now as to the first reason I answer that the arguments do not suffice to show it necessary that the foundation of existence in place be the naked substance. Second, I say that it can rightly be explained and understood that an angel ceases to be in a place without being moved therefrom by the mere nod of his will, as we shall say in the following chapter. But the third reason proves only this, that a spiritual nature, because it is a part of this universe of things, has, according to itself, an order of place in the universe; from which it is not yet gathered that this order is existence in place, of which we shall treat hereafter.

Vera Sententia.

Caput VII - The true opinion

With the other opinions now set aside, there seems to remain one alone more probable than the rest, namely, that an angel is in a place not by his naked substance as by a foundation, nor by any other reason from those set forth; but by a certain absolute mode added to the substance of the angel, depending wholly on his will as on an efficient principle. Henry indicated this opinion not obscurely when, after refuting other views, he said that an angel cannot be in a place by his naked substance: for he saw the inconveniences which followed therefrom; therefore he thinks that something must be added to that substance; and since nothing of those things which have been said can be proved to him, what else remains than some absolute mode, which can be the foundation of the relation of presence according to place, and of union with a body, depending wholly on the will of the angel; so that thus we may defend that he can be placed in a greater and a lesser place, pass from extreme to extreme without a middle, and at some time be wholly loosed from every place.[1369]

However, in the explanation of this opinion two things must especially be noted. One is that a body, by reason of its quantity, is in a place circumscribed, not because it is only defined by the place, but because the surface of the place embraces, surrounds, and measures it. These things, therefore, first befit a body insofar as it is a quantum and capable of measure; from the fact that it can receive the measure of another quantity there arises in it a certain mode, which we may call its own, not of the predicament of situation (situs), like lying, sitting, etc.; for that seems to be merely an extrinsic denomination with respect to another, but of the predicament of where (ubi), by which name it is commonly designated. Toward this mode, as toward an intrinsic term, local motion tends; then from this mode it follows that a body is distant from another or is near to it and can be contained by something; thus, even outside the heaven and in a vacuum - which is the same thing - it can be distant from another and approach it, and therefore be moved, as we noted in disputation 29, chapter 3.

1369. Henry of Ghent, Quodlibet II, q. 9.

The second thing to be noted is that this mode which we call "where" (ubi) befits bodies thus by reason of quantity, which can receive measure, so that of necessity this or that mode befits them; nor does it depend on the will of the body to free itself from every such mode, but only by the will of the angel can it be brought about that a body be moved from one body into another. It also befits a body by quantity itself that it have neither a greater nor a lesser mode, and hence that it cannot be contained by a greater or a lesser surface.

Therefore concerning the existence of an angel in a place we must by no means philosophize in entirely the same way. First it must be said that the existence of an angel in a place is not the mere relation of presence or of distance, whether this be called intrinsic and real, or extrinsic and of reason alone: for this, like any relation whatsoever, cannot be changed at will unless some prior absolute change has been made, as was shown in the preceding chapter. Moreover, it must be said that the foundation of this presence in a body, or in a place, is some absolute mode added to the substance of the angel by his will, as by an efficient principle, by reason of which he is united to a body and is present to it; wherefore, since this mode does not arise proximately from the substance, it can be greater and lesser; indeed it so befits an angel that he can wholly lack it. Whether by reason of that mode there also befits an angel the ratio of distance and motion according to place, we shall say in disputation 195, chapter 4, where also we shall assign some difference between this mode of the angel and that of a body.

Objicitur: Someone will object against this opinion, By what reason can it be that a mode produced in the substance of an angel constitutes him in a divisible place, since the substance of the angel itself, and therefore that mode received in it, are indivisible?

Respondetur: This can easily be understood. For just as the mode which a rational soul has in a body, when it is united to it, is in itself indivisible, as the soul itself is, yet makes it to be united to a divisible body; so also a mode of an angel can unite him to a divisible body, even if it is in itself indivisible. From the fact, however, that in itself it cannot be divided, there follows only this, that the angel is whole in the whole body and whole in any part of it, as the rational soul is. I say, moreover, that this mode is indivisible, as also is the mode of the soul with the body, with respect to quantitative division, because it is received in a spiritual substance; nonetheless I assert that it is divisible in the way in which a habit is said to have division, when it is extended to several conclusions, which they call virtual extension. For the mode of an angel also makes him to be in a divisible and extended place. Whether indeed that mode can be varied successively, we shall see below in disputation 191, chapter 3. Wherefore I cannot but marvel at the theologians and philosophers of our time, who, while conceding to an angel a presence which they call local by reason of the angel's own substance, affirm it to be some mode of the substance of the angel, indivisible indeed in comparison with the angel, yet divided and extended with respect to the place in which it constitutes the angel; so that that mode have in itself parts formally distant from one another, and one part correspond to one part of the place and another to another part. These Doctors, then, I strongly wonder at, that, when discoursing about spiritual angels, they do not yet lay aside these corporeal and material things, and in a spiritual and utterly indivisible subject they

constitute some accident formally extended to a place and, as the phrase goes, commensurate with a place, whose parts are distant among themselves and distant in place. For this seems proper to a body and to a bodily accident, for which a spiritual substance is not a capable subject.

Therefore philosophical reason teaches that, if there is any mode which an angel has by reason of which he is constituted in an extended body or in a place, that mode is in itself formally indivisible and lacks all extension commensurate with a place; and accordingly by reason of that mode the angel is constituted whole in the whole body or place, and whole in any part; and he has only that extension which above we called virtual. But if he had that extension which the aforesaid Doctors invent, it would in truth be brought about that the angel would be whole in the whole body or place and a part of him in a part; for he would have to be extended, just as the mode itself is extended.

And by this reason we can interpret the holy Doctor, since in the present article he asserts that an angel is in a place by application of power, if by application we understand that mode by which he is conjoined to a body: for this conjunction ought to precede, that his power operate in a body and in a place, as we shall see in the following disputation. Nor should it seem marvelous to anyone if we interpret the mind of St. Thomas in this way, when Thomists explain that application of power in so many different ways, as we reported above. If indeed there are any arguments against this opinion, they will be answered in the following disputation, where we shall treat of place and of the motion of an angel.

Nevertheless, some, not sufficiently understanding this mode of the union of an angel with a body, attack it in this way: Either that mode is the union of form with matter, or of nature with supposit, or of a continuous part with a part, or finally it is a conjunction of propinquity according to place. But an angel is not united as a form, nor as a nature, nor as a part, as is manifest: it remains, therefore, that the mode of his union with a body be only a conjunction of propinquity according to place; and by this same argument they contend that the body of Christ is united to the species of bread by the propinquity of place alone. From this they infer that an angel is proximately in a place by his substance; because from his substance there arises proximately this mode of union.

I answer that an angel is united or conjoined to a body, and the body of Christ to the species, by none of these modes. Not indeed by the first three, as is manifest; nor by the fourth: for the mode of conjunction according to propinquity of place has of itself a respect of distance from fixed points, by an order to which the place is constituted; because place cannot be without immobility. But an angel, and the body of Christ as it is in the Eucharist, do not of themselves have a respect of distance from fixed points, but they have this distance by reason of quantity to which they are conjoined: for no spiritual thing, or one having a spiritual mode, as the body of Christ in the Eucharist, has according to itself a respect to fixed points, as I showed in that disputation 29, chapter 3. It remains, therefore, that there is some mode of conjunction of the angelic substance with a body as it is substance, not as it exists here or elsewhere; and of the body of Christ with the species, not as it is here or elsewhere, but according to itself: so that, the same body remaining, the angel retains the same mode of conjunction even if the distance varies; and, the same species

remaining in the body of Christ, the same mode remains even if the distance varies; and this conjunction, which is prior, is prior than the distance according to place from fixed points in each body, rather than that they be conjoined to one another by propinquity.

Disputatio CLXXXIX - Whether an angel is necessarily where he acts

Angel can act where he is not, as many theologians teach, chapter 1.

That an angel needs propinquity of place or conjunction in order to act is a more probable opinion, chapter 2.

The arguments of the former opinion are satisfactorily answered, chapter 3.

Caput I - That many theologians teach that an angel can act where he is not

There are various modes of existing in a place; but the operation of an angel is not in him as in a place, as was made clear in the preceding disputation; therefore he can act where he is not: for it can be that at least his operation be connected to this by the nature of the thing, even if operation is not the foundation of presence. Wherefore among the Scholastics another difficulty and disagreement on this matter remains; among whom not a few, and not unlearned, both ancients and moderns, hold that an angel can act where he is not present by his substance. This is the opinion of Gabriel on the First Book, dist. 37, q. 1, art. 3, dub. 8; and Ockham in the same distinction and question judges midway that a corporeal agent acts at a distance. Against this stands Hervaeus in the treatise De motu Angelorum, question 1, ad 3, when he objects against his own opinion; and not a few recent authors follow him, who for the same opinion allege Durandus on the First Book, dist. 37, a parte q. 1, num. 26, and Cajetan in the commentary on this article, because they teach that between an angel and a body there is necessary only the presence of order, not substantial presence, so that angels, when they operate, should not be wrongly thought to be present substantially. For as both of them, as we saw in the preceding disputation, plainly affirm, an angel is placed present according to his substance to a body before he operates: Cajetan to a particular body, Durandus indeed to all bodies: Durandus alone added that an angel is not present to this, that by the quantity of this he be estimated as proper habitat of a body; nevertheless he does not deny a real presence of substance, as those words clearly show.[1370] Many also think that Scotus, in the above-cited question, adheres to the first opinion; for since the agent seems to act proximately from within, the agent ought to be proximately conjoined to the patient, and act by touching it, as if to remove that which is in the middle; and sometimes he adds an action diverse from proximity, but not a distant one: thus, for example, the celestial body generates in the lower things forces of their matter, which it produces in other bodies as mediate; and fishes emit their spawn into the arms of fishermen, not into the net, cord, or hook. But here, says Scotus, one is

1370. The cluster summarizes Durandus on the First Book of the Sentences, dist. 37, a parte q. 1, num. 26; and Cajetan's commentary on this article. The report also notes Gabriel in I Sent., dist. 37, q. 1, art. 3, dub. 8; Ockham in the same distinction and question; and Hervaeus, De motu Angelorum, q. 1, ad 3.

deceived by two causes, as if there were a twofold power in acting conjoined, of which one at the same time acts in the proximate thing and at a distance, the other in the remote thing, although not at a distance: for the agent is imperfect, and suffers because the power of the agent departs from the perfection of its form; hence he grants first perfection: then he makes a generating form pass to the matter of the subject through various accidents, then to the substantial, and he corrupts the contrary. Hence some take Scotus in this way, as if in acting the two powers were not conjoined, and so that they do not together act, which acts in the remote thing, and not that the agent imperfectly exercises the power in the remote, without any good reason, as if it always acted in the remote. But truly it is not a consequence: for in fact no one of sound intellect denies that the agent is necessarily conjoined to the created efficient cause by two powers, and that by these two imperfect modes of acting it does not follow: hence from this I also strive to prove that to God it is not repugnant to act through such powers at a distance, as though as a principal or as a dependent cause he were to act because of such a mode of acting imperfectly, which is not necessary, as in disputation 28, chapter 1 and chapter 3 we have already said. Wherefore I do not see that Scotus' opinion in this matter must be referred to the present question, because in the second distinction of that same question, he teaches the contrary conclusion; for he plainly affirms that an angel is placed present according to his substance to a body ...

Caput II - The contrary opinion seems to be embraced

The sentence plainly pronounces that an agent of limited power must necessarily be present in order to operate; and hence that an angel is by nature first in a place before he operates in it. Nevertheless, Avicenna in the book On the Soul, section 4, chapter 4, and Alexander of Aphrodisias on the Metaphysics, commentary 18, have followed this earlier opinion.[1371]

Finally, more recent authors so embrace this sentence that, nonetheless, they assert that the power of an angel is limited, and that by its own nature it requires a certain sphere within which it can operate at a distance, but beyond which it is not able. They confirm this sentence by appeal to corporeal agents, among which they think there are some that within fixed bounds act at a distance without a medium; therefore much more ought this to be granted to an angel, who operates by intellect and will. In corporeal agents, moreover, this seems to be established. First, because some produce a better effect at a distance than in the proximate, as fire in tow or in some other well-disposed matter, rather than in the nearby air; for it does not kindle the latter, but it does burn the tow or other matter; and the sun generates minerals in the bowels of the earth, not in the air; and a fish sends numbness and torpor into the fisherman's arm, not into the hook, the line, and the rod: whence the fish has also received its name and is called the Torpedo; Pliny attributes this effect to this fish, book 32, chapter 1; Aristotle also reports, book 9 of the History of Animals, chapter 7, that this fish sends torpor and numbness into the fish which it aims at, so that it may seize them and feed on them, although it does not send it into the water that is interposed.[1372] Finally, if one were

1371. Avicenna, De anima, sect. 4, c. 4; Alexander of Aphrodisias, In Metaphysica, comm. 18.
1372. Pliny, Naturalis historia, 32.1; Aristotle, Historia animalium, 9.7.

to bring a bronze vessel full of water up to a fire, it always happens that the water shut up within, into which the fire acts at a remove, becomes very hot, while the bronze, upon which the fire acts immediately, remains cold: by such examples they do not hesitate to establish that twofold power in one agent which Scotus devised. And although in reality they are not separated, yet there is some force which operates at a distance, even if another, which acts only in the proximate, accompanies it: wherefore it will not be absurd to grant this alone in the angel, by which alone, at his will, he can operate. Then too, because a natural agent acts more perfectly upon the part in front of it, before which there is no impediment, even if it be more remote, than upon the nearer part, before which it has some impediment: therefore there is some force which acts at a distance without a medium, although not so perfectly - just as fire heats better the fore-part which it has before it without obstacle than that part before which there is some impediment.

But a special reason is proved for angels: for if in bodily agents nearness of place is required, that comes from matter and quantity, by which they seem determined so as to operate only by contact; but spiritual beings, since they lack matter and operate by the mere nod of the will, do not seem to require presence or nearness; or it will suffice that they be in some part of the body which they move, even if they are not in every part upon which they operate: and thus sometimes they will act where they will not be.

The more probable opinion, however, holds that an angel needs nearness of place and continuation for operating.

But the opposite sentence seems to be embraced, which all the Scholastics adduced in the preceding disputation, as is evident, seem to suppose; and Scotus, as we recounted in the previous chapter, namely, that an angel always operates upon what is remote by an effect continually derived and diffused through a medium. This sentence I will try to show by a threefold reason.

First reason: If an angel could operate at a distance without a medium, no terminus could be assigned within which he would necessarily have to operate at a distance; for if once the action of the angel must not be continued all the way to a terminus, then certainly that distance which is empty of the angel's effect contributes nothing and in no way harms that power for operating: for it is altogether per accidens that it is greater or less, since the power of the agent is not infused into it. For in the case of other agents, distance limits the operation for this reason, that through it the effect of the power is continuously diffused, and the greater the distance, the greater is the effect continued through it by the action of the operator. Wherefore, if an angel, for example, can move a weight of one hundred pounds, and he can move this when it is a thousand paces distant from him - not by a power diffused through a medium, but by the mere nod of his will - certainly the effect seems altogether the same if he moves the weight at twice the distance: since the distance itself neither augments the effect nor in any way hinders or contributes to the action, but has an entirely negative bearing. But to concede that an angel can move at any distance is absurd.

Second reason: If an angel could operate at a distance, he would not always be where he operates; therefore neither in an assumed body would he necessarily be according to substance, which seems to be against the common sentence, and openly against St. John Damascene, book 1 On the Orthodox Faith, chapter 17, where he says of an angel: "Nor is he elsewhere, but he is intellectually circumscribed there where he operates."[1373]

Third reason, taken from bodily agents, proves the point: for by experiment it has been found that no agent operates upon distant matter without some operation of this or that kind diffused through a medium: therefore it is a sign that an operation upon what is distant depends upon that which is carried out through a medium, whatever that may be. For if those two powers - the one which operates upon the distant, the other which operates upon the proximate - were conjoined per accidens in the same agent, it would be altogether accidental that one should operate before the other, and hence sometimes the one would operate without the other: for that which in no way depends upon another and is conjoined to it per accidens is sometimes found without it. But in fact no agent operates anything at a distance without operating upon what is near by some action: therefore it is a sign that the action at a distance depends upon the action upon the proximate. And if some body could act at a distance without a medium, then even if a vacuum intervened, it could operate: for the medium in no way helps toward operating upon the remote. But who would say that a fish would send its torpor into the arm, that fire would send heat into distant matter, that the sun, finally, would produce minerals in the earth, if the medium were a vacuum? Therefore there is some operation, even if minimal, diffused through the medium, which helps that action derived into the distant matter; otherwise, the fish would harm the arm without the line, hook, and rod, or even by means of the rod would harm the fisherman, even if he did not hold it with his hand; or surely the sun would illuminate the air in a closed room; for if he did not need a medium in order to operate, neither would an opaque body placed opposite hinder his operation: for it could hinder only for this reason, that since illumination must be continuous and an opaque body cannot receive it, it cannot proceed beyond. Since therefore it is impossible that these things happen, who will deny that an agent's operation is gradually diffused through the medium? But if we see that this is so in corporeal agents, no reason is available to us to assert the opposite about angels. Let us therefore speak of them in the same way as of bodies, namely, that they cannot operate at a distance without a medium; such that at least the angel must be in that part according to substance from which his power and effect are continually diffused into the remote parts - although it is not necessary that he be in every part of the body to which his power reaches: for if bodies existing in one part continually derive their power through the rest, in which they are not, much more should this be granted to angels.

Let the arguments of the prior sentence be enough.

1373. St. John Damascene, De fide orthodoxa I, 17: "Nec alibi est, verum intellectualem inmodum illic circumscribitur, vbi operatur." (Nor is he elsewhere, but he is intellectually circumscribed there where he operates.)

Caput III - The foundations of the prior opinion are easily overturned

Now indeed to overthrow the foundations of the prior opinion is not laborious. To the first I answer that certain agents therefore produce a better or a different effect in remote matter than in proximate, not because their power and proper operation reaches into the remote without a medium, but because the matter is not in the same way capable or disposed. Wherefore the action continually derived from fire through the air does not produce fire in the air, but great heat; whereas in tow and in denser matter, which is more apt for combustion, it produces fire. And although the specific physical reason might be unknown to us, it would yet suffice in general to know that the matter is not disposed in the same way or capable of the effect. The same must altogether be said of the sun, which produces minerals in the bowels of the earth, not in the air, though with the same light diffused through the air into the earth. In the same way the fish sends numbness into the arm, not into the hook, the line, and the rod, by some quality derived through that medium all the way to the arm; and similarly it sends numbness into other fish, but not into the water that is interposed, by some quality derived through the water, as we have manifestly recounted above. Nor do I think it difficult to assign the particular reason for this diversity. First, as to numbness and the effect of poison, which occurs in an animal - the hook, the line, or the rod is not capable of it: for the effect is...

That effect is a kind of sickness; but this is an affection of animals: therefore it is not surprising if one and the same quality does not wound the reed, nor does a sensible effect appear in it, yet it wounds the hand holding it. But minerals, since they require a great and dense multitude of matter, cannot come to be either in air or in water, but in earth; and the same light which illuminates the air and the water, and also works other effects in these, by heating the earth through reflection, generates minerals therein.

Here, however, it must be observed in passing that the heaven, by a light diffused continually through the medium as far as the earth, generates animals and minerals in the earth, not because it is itself a proximate agent introducing a substantial form, but because it preserves light in the medium, and the preserved light brings about heat and other qualities which proximately dispose to the substantial form. For if light were preserved in the absence of the sun, the very same effect would naturally be produced as if the sun were present and the light were derived continuously from it: therefore its presence is not necessary for the introduction of a substantial form, just as a severed seed, in the absence of the animal that emitted it, generates an animal, and heat without fire generates fire in some suitable matter. For I think that either the seed, or the accidents that proximately dispose to a substantial form, do not need the aid or elevation of another agent in order to introduce the substantial form: and yet these are called instruments for this only reason, that they are powers derived from such a substance, by reason of which they have a native power of producing substance - about which the philosophers dispute more at length.

Next, concerning that effect of fire in tow (stupa), or in some other distant matter that is burned, no less a true account can be given, although it may seem difficult; and it is this, that in order for fire to kindle flame and burn, it needs a certain material of exhalation: for flame is

nothing other than kindled smoke; and thus we often see in furnaces the flame smothered by some denser matter, and then that matter resolved by the heat of the coals into a smoky exhalation and, lifted on high, set aflame. Therefore, since fire does not find in the air matter suitable for a smoky exhalation, but from tow or from some denser matter it easily resolves it, for that reason an excessive heat of fire does not inflame the contiguous air, yet it kindles tow or some denser matter. For all these, then, the same reason holds, why the same effect does not occur in the proximate and in the remote matter, namely because the proximate and the remote are not equally apt and disposed for the same effect.

As to the example about water enclosed in a bronze vessel and placed near the fire, I say that it is false that the vessel itself remains cold when the water itself is very hot; but experience only shows that that part of the full vessel, where it is touched by the water, is less hot than the boiling water enclosed within, so that a person can handle the vessel itself with his hand longer than the water. The reason for this difference does not come from the fact that a physical agent acts on a remote matter without a medium: otherwise in no way would it heat the bronze itself: but because, as some say, from the water by resolution a certain substantial vapor is formed, which is much hotter than the grosser parts of the water that remain; and this heat ascends to the upper part of the water, by whose ascent the water itself boils, but the parts below remain not so hot, and these cool the parts of the vessel which they touch, and somewhat retard the action of the fire upon the bronze itself.

But since not only the lower parts of the vessel, but even all around are less hot than the water itself, something else must be said.

I answer, therefore, that throughout every part the grosser parts of the water remain in contact with the vessel, and thus the vessel itself is somewhat cooled by them: but the subtler parts, namely vapors, do not adhere to the vessel, but immediately exhale through the water: and so by reason of them the water can be handled by us less than the vessel: hence, if some other denser heated matter were contained by the vessel itself, such as molten lead, we could not easily handle the vessel itself - just as neither molten lead, nor that denser matter. Moreover, that the vessel itself is somewhat cooled by the grosser parts of the water can be proved from the fact that, if that vessel have handles which the water does not touch directly, they are much hotter than the parts of the vessel itself that the water does touch closely, because the handles cannot be cooled by the water. Add also that because water penetrates more the organ of touch, it is much more easily perceived than the heated bronze itself: hence, even if I were to say that the water and the parts of the vessel are equally heated, it would not follow that they could be handled by us equally well with the hand, because an even heat is more felt in a liquid and flowing body than in a dense one.

Finally, as to fire, why it heats more quickly a remote part along a straight line that is not impeded than that which is impeded; and why it heats along a reflected line; this is manifest: for when there is an obstacle along the straight line, it cannot emit into it the hot exhalations by which it diffuses its heat; and therefore it is necessary that it first heat the remoter part by sending along a straight line those hot exhalations, which are diffused by reflection into those parts into which from the fire along a straight line they could not arrive; and thus, when the route along which the

exhalations tend is rightly considered, the parts which seemed nearer are farther away. And certainly no other reason can be assigned why fire does not act so quickly upon that part which has an opposite impediment, unless because heat must operate continuously along a straight line. But if it could operate without a medium, it would immediately and more quickly operate upon that impeded part, as we were deducing in the preceding chapter.

By the same reason said above, that is, on account of the diversity of matter, it happens that the magnet attracts iron and not another material, even a nearer one - not because its power and effect reach iron without a medium: for the power of the magnet is diffused through the air continuously as far as the iron, indeed even through wood; and an evident sign of this is that if between the iron and the magnet, at the same distance at which previously the iron was being drawn, some obstacle of denser matter be placed, which the power of the magnet could not penetrate, it would not draw the iron: but if the magnet did not need a medium, but only a certain distance, as the adversaries contrive, it would in the same way draw the iron with the obstacle interposed as it drew it before.

To the last reason, which tries to prove only about Angels, I answer that Angels do not need proximity of place and continuation of power to operate because of quantity and matter, but because of the power which they have as finite: for otherwise, if proximity and continuation were not necessary, they could operate at any distance to infinity, which implies an infinite power for operating. Moreover, it is not necessary that an Angel be present according to substance in every part of a body in which he operates; but it suffices if he be next to it, and from it the effect be derived and diffused continuously, as also happens in corporeal agents: yet, in the opinion of those who say that an Angel is in a place by operation, it must be granted of necessity that an Angel is in the whole body which he moves, and thus that the Angel, the mover of the heaven, is in the whole heaven - which seems false, as we shall say in Disputation 192, chapter 3.

Articulus II - Whether an angel can be in several places at the same time

It is argued procedurally as follows. It seems that an angel can be in several places at the same time. For an angel is not of less power than the soul; but the soul is at once in several places, because it is whole in each part of the body, as St. Augustine says.[1374] Therefore an angel can be in several places at the same time.

1. Further, an angel is in an assumed body; and when he assumes a continuous body, it seems that he is in any of its parts. But different places are considered according to its parts. Therefore an angel is at once in several places.
2. Further, St. John Damascene says that where an angel operates, there he is. But sometimes he operates at the same time in several places, as is clear of the angel overturning Sodom. Therefore an angel can be in several places at the same time.[1375]

1374. St. Augustine.
1375. St. John Damascene, De fide orthodoxa, cap. 30.

But on the contrary: St. John Damascene says that when angels are in heaven, they are not on earth.[1375]

I answer that an angel is of finite power and essence (*essentia*). But the divine power and essence are infinite, and God is the universal cause of all things, and therefore by his power he reaches all things, and is not only in several places, but everywhere; whereas the power of an angel, because it is finite, does not extend to all things, but to one determinate thing. For whatever is compared to one power must be compared to it as some one thing. Thus the whole universe of being is compared, as one thing, to the universal power of God; and likewise some particular being is compared, as some one thing, to the power of an angel. Hence, since an angel is in a place by the application of his power to a place, it follows that he is not everywhere, nor in several places, but only in one place.

Around this point, however, some have been deceived. For certain men, not being able to transcend their imagination, conceived the indivisibility of an angel after the mode of the indivisibility of a point. And therefore they believed that an angel could only be in a punctual place. But they are clearly deceived. For a point is something indivisible having position; but an angel is indivisible outside the genus of quantity, and existing apart from position. Hence it is not necessary that one indivisible place according to position be determined for him, but either a divisible or an indivisible one, greater or smaller, according as he voluntarily applies his power to a greater or a smaller body. And thus the whole body, to which by his power he is applied, corresponds to him as one place. Nor yet is it necessary that, if some angel moves the heaven, he be everywhere. First, because his power is not applied except to that which is first moved by him. Now there is one part of the heaven in which motion is first, namely the part of the East. Whence also the Philosopher in Physics VIII attributes the power of the mover of the heaven to the part of the East.[1376] Second, because it is not held by the philosophers that one separate substance moves all the spheres immediately; whence it is not necessary that it be everywhere. Thus, then, it is clear that to be in a place belongs in different modes to a body, to an angel, and to God. For a body is in a place circumscriptively, because it is commensurated to a place; but an angel is not circumscriptively, since he is not commensurated to a place, but definitively, because he is thus in one place that he is not in another. But God is neither circumscriptively nor definitively, because he is everywhere.

Conclusion: An angel, since he is of finite power, can be neither everywhere, nor in several places, but only in one.

Concerning the text of the article there is nothing to note, except those things which are to be said in the disputations.

1376. Aristotle, Physics VIII.

Disputatio CXC - Whether an angel can be in diverse places at the same time

Caput I - Status of the controversy

The present controversy is not about the absolute power of God; as Scotus, Gabriel, Gregory, and Bassolis rightly noted, since, when it is said that an angel could, at least in a sacramental mode, be posited in diverse places - and faith does not teach the contrary - one ought not to deny that an angel could be placed by God in the same way. Therefore Goffredus is in error, as Bassolis reports from Quodlibet 12, when he asserted that an angel could not, by the absolute power of God, be in diverse places. Nor is the difficulty about "adequate" places; rather, the question is whether by his own proper power an angel can be at once in several places, whether adequate or not. Some, indeed - among whom Scotus and Gabriel reckon it at least as probable - hold that an angel can be in several non-adequate places by his own power. Then others, who deny that an angel can be in adequate places, are compelled to admit the same concerning non-adequate places, if by "adequate places" I mean those proportioned to an angel's power, namely the greatest among the places that by his proper power he can occupy; and so, if such a place is not adequately occupied, they hold he cannot at the same time, by his own power, be placed in another. They argue by reason thus: since an angel is in a place by the application of an efficient power - whether this be by operation or in some other manner - he requires for himself a place determined and adequate to his power, beyond which he could not have a greater; therefore he could not at the same time be in another place, since in the former his power would already be as it were consummated. And certainly, if he were in a place by his substance proximate to it, that remaining unchanged could not at the same time be in two places.

Just as the same quantity of a body, as body, cannot be in two places, so too does this reason proceed in the opinion of all, except Durandus, who says that an angel is in a determined place; for since Durandus affirms him to be everywhere, he will consequently also say that an angel cannot be in several different places, because he will claim for himself all bodies as if they were one place. Therefore the difficulty remains, whether an angel can be in several non-adequate places, that is, smaller than what by his own power he could occupy.

Caput II - That some taught an angel can be at once in several non - adequate places

Concerning non-adequate places the Scholastics do not feel the same way: some judge that an angel can at the same time be in several non-adequate places which, when taken together, do not exceed an adequate breadth. Thus Cajetan on this article, and the Ferrarian, book 3, cap. 68, § Ad evidentiam primi dubii.[1377] With them seem to agree Marsilius on II - II, quaest. 2, art. 2, after the second conclusion, and Bassolis on II, dist. 2, quaest. 4, a. 2, 3, in the body and at the end, although this latter author speaks of contiguous places, about which the reason is different, as we shall say in

1377. Cajetan, on this article; Ferrariensis, 3, cap. 68, § Ad evidentiam primi dubii.

the next chapter. Scotus, however, on II, dist. 2, q. 7, and Gabriel, quaest. 2, art. 3, dub. 3, teach that by no effective reason can anything be proved for either side; they explain their view thus, that the diverse places are not only contiguous but also separated, yet such that, if they were to become contiguous or continuous, they would not exceed one adequate place.[1378]

Cajetan adds that this can be done only within a certain breadth, the measure of which we do not know, lest we say that the angel's power - either for operation or for constituting himself in a place - can be diffused into any distance without limit. This opinion can be proved by no other reason than that it does not seem in any way to repugn the natural power of an angel. For although it is repugnant that an angel operate where he is not, yet to be and to operate in different places within a certain measure certainly seems to have nothing absurd. For that an angel who was in one body four palms in size should leave in it two palms of space, and, retaining two, begin to occupy two others in a different and distant body, does not seem to exceed the power that could occupy four palms; similarly, that an angel assume two smaller bodies, who could assume one larger, and appear in each - what would be repugnant in this?

Caput III - The truer opinion: an angel cannot be in several places, even non - adequate, in any way

Much more probable is the opinion of those who assert that an angel cannot be constituted in different places. By different places they understand different bodies not contiguous but separated, even if they teach that the places are not adequate and lie within a certain breadth which the angel could fill entirely by his presence. In my judgment, the holders of this view were Alexander on II, p., quaest. 32, memb. 3; St. Bonaventure on the Second Book, dist. 2, p. a., art. 2, quaest. 2, in the body and to the arguments; Aegidius on the Second Part, dist. a. 1, quaest. 2; Thomas of Argentina on the First Book, dist. 37, quaest. 1, art. 2, concl. 2; Richard, art., quaest. 3, when they absolutely pronounce that an angel cannot be at the same time in different places.[1379] St. Thomas clearly felt thus in this article, who never concedes in any way that an angel can be in several places at once - although he does not absolutely deny it when he replies to the arguments brought in the contrary. For he asserts that when an angel operates in several parts, he is not in all, but in that in which he first applies his power. In the same way he concedes that the angel who overthrew Sodom was not in several parts of the city, as the argument contended, but only in that by which he applied his power; which certainly would not have been necessary if he could be in several non-adequate places: he could, however, have been in several within the city, since that whole operation and subversion answered adequately to the angel's power; wherefore within that there could be designated several non-adequate places.

In the same opinion was Gregory of Rimini on the Second Book, dist. 2, q. 3, although elsewhere he taught the opposite, as we shall report in the next disputation. For he says there first that an angel can be constituted in several places, which he calls partial, not such as are at once

1378. Scotus, in II Sent., dist. 2, q. 7; Gabriel, quaest. 2, art. 3, dub. 3.

continuous, as in the same body, or contiguous, as in different contiguous bodies; for in either way they can compose one integral place. Then he asserts that he cannot be in several places which he calls total; and since he opposes total to partial, total places will be, if the bodies are mutually separate and joined neither by continuation nor by contact. And that with him total places are the same as places in no way conjoined is clear from the solution of a certain argument, where he is unwilling to concede that the demon was at the same time in the serpent tempting Eve and in Eve herself, whereas within that space two non-adequate places within a due breadth and figure could rightly be assigned to the demon.[1380]

This opinion is proved first from the doctrine of St. John Damascene, book 2 On the Faith, cap. 3, about the middle, and of the other Fathers whom we have noted in disputation 187, cap. 1, who assert that an angel is in a place definite and circumscribed; for if he could be at the same time in several places, he would not be said to be defined by one. Hence Damascene infers that when he is sent to earth, he does not remain in heaven: he did not say this on account of excessive distance, but because he is always bound to, and defined by, one place. Moreover, in the first book On the Faith, cap. 17, he says: "Nor indeed can he operate at the same time in several and different places."[13811382] Didymus also, in the book On the Holy Spirit, far at the beginning, after he establishes the distinction between the Holy Spirit and a created spirit - that the former is everywhere, the latter, however, is defined by a determined place - says: "The angel, namely, who was present to the Apostle praying in Asia, could not at the same time be present to others constituted in the other parts of the world."[1383]

If someone should interpret all these things of adequate places, so that in small places within a certain sphere an angel could be, let him note, I beg, that "to be defined by one place" is the same as "to be in one place only," whether that be great or small: for never did the Fathers care to distinguish this.

But let us show by reason that an angel cannot be in several places set at whatever distance, and so could not remain in heaven when he is sent to earth, if once we grant that he can be placed in two places a little distant. First: if he could apply his power and himself to several places not continuous nor contiguous, so that a small distance would not hinder, by the same reason a great distance would not prevent, as above, in the preceding disputation's chapter, we proved of his action at an instant. By this reasoning Hervaeus, in the Treatise on the motion of an angel, quaest. 1, to the third, ...[1384]

1381. St. John Damascene, De fide orthodoxa, II, cap. 3.

1382. St. John Damascene, De fide orthodoxa, I, cap. 17.

1383. Didymus, De Spiritu Sancto.

1384. Hervaeus, Tractatus de motu Angeli, quaest. 1, ad tertiam.

Objicitur: As Christ, being in the same host, if it be divided, remains in each part of it, even if those parts are not contiguous, so also will an angel be able to remain, and thus he will persist in two non-adequate places.

Respondeo: The ratio is different. For the body of Christ is in the host by the power of God, not because it is bounded, or because it is one, but because the whole substance of the bread is by the power of the words converted into the body of Christ; wherefore, if the parts of the host be separated and placed at any distance whatever, the body of Christ always remains. But an angel, since he is present by his own power, can so be in one continuous body, or in two contiguous ones, that, if they be separated, he cannot be in them; otherwise, like the body of Christ, he could remain at whatever distance. And hence it is shown what repugnance there is on account of which an angel cannot be in two non-contiguous places; and the reasons of the former opinion remain solved.

Further it is to be observed that for this reason an angel can be in several bodies, if they are contiguous, in the same way as in one great continuous body; but not in several of the same quantity if they are not continuous, because, just as the contact of bodies contributes very much to the operation even of a corporeal agent's being diffused from one into another and thus its power works in both - which, if they were separate, could not act without a medium - so also contact, like continuity, contributes very much, that the angel's power establish his whole substance in two bodies or in two parts, which he could not place in several separated ones without a medium.

Since it has been established that an angel can be in only one place, it remains to see whether he can constitute himself in a greater and a lesser place without a limit. The question, however, is to be understood of a lesser place within a divisible latitude; for the following disputation will concern an indivisible place. In the present controversy the first opinion is that of Durandus in the First Book, distinction 37, second part of the distinction, question 1, no. 26, who, following the mode he adopted about the angel's existence in a place (as we saw in disputation 188, cap. 5), was driven to say that an angel is everywhere; a position which we showed there to be contrary to the sense of the Fathers. For this reason alone it is also to be rejected by us. For Gregory Nazianzen, in Oration 34 near the end, and St. Jerome, in Epistle 53 against Vigilantius on that place of the Apocalypse 14, "And they follow the Lamb whithersoever he goes," affirm that angels and demons are everywhere upon the earth; they only mean to teach that they traverse all things, not simultaneously, but straightway by a swift motion. Jerome said they are everywhere with the utmost speed; Nazianzen, that they are present diligently to all, both because of the promptness of their ministry and because of the lightness of their nature; by which words they wished to signify the greatest celerity of motion. Tertullian likewise denoted the same in the Apology against the Gentiles, cap. 22, when he says: "Every spirit is winged: thus angels and demons; therefore in a moment they are everywhere." From these Fathers also the opinion of Durandus is refuted, since they clearly say that angels are moved - something Durandus in his opinion cannot concede; it is also refuted by the testimonies of others who teach that angels are moved, whom we listed in disputation 194, cap. 2.[1385]

1385. St. Gregory Nazianzen, Oration 34, near the end; St. Jerome, Ep. 53 contra Vigilantium, on Apoc. 14 ("Et sequuntur agnum quocumque ierit"); Tertullian, Apologeticus contra gentes, cap. 22.

The second opinion is that of the Irishman, in the First Book, distinction 8, question the second, in the solution of the fourth, as Gregory reports. He used to assert that an angel demands for himself such a determinate place that he can be neither in a greater nor in a lesser; nay more, that the angel's place is of circular figure. He adds, moreover, that if it should happen that an angel at some time assume a smaller body, some part of his substance must of necessity be outside it; and likewise if he assume a figure other than circular. This opinion seems to have been followed by Bassolis in the Second Book, dist. 2, q. 4, art. 1, and especially in the solutions to the arguments.[1386]

The third opinion is that of Scotus in the Second Book, dist. 2, q. 6, who, although in that article he said there is a place determined to the angel indeterminately - that is, a maximum, than which he cannot be in a greater, and a minimum, than which he is not in a lesser - yet subsequently admits that this opinion is doubtful, and that the opposite likewise - that the angel has a place determined determinately, that is, such that he is never either in a greater or in a lesser - is doubtful; for on neither side is there any reason that clearly convinces.[1387]

The fourth opinion is that of those who say that an angel demands for himself a maximum place determinately, in which he can be and not in a greater; yet not a minimum place, but that he can be placed in a lesser, and in a lesser ad infinitum. I speak of a divisible minimum, for of the indivisible there will be another question. This is the position of St. Bonaventure in II Sent., dist. 2, part 2, art. c., q. 3, ad tertium; of Gabriel, dist. ..., q. 2, art. 3, dub. 2; of Maior, q. 9; and of Marsilius in the Second Book, q. 2, art. 2, after the sixth conclusion; and of Ockham, Quodlib. 1, q. 4, which Gregory deems more probable in the same dist., q. 2, art. 2, in a certain doubt on this matter, although he says the opposite is not sufficiently impugned. The same is handed down by Aegidius in the First Book, dist. 37, second part of the distinction, art. 1, q. 2; by Richard, art. 2, q. 2; and by Cajetan in the commentary on this article. As to the maximum place, this will be sufficiently proved below; as to the minimum, it is shown thus: As one approaches a minimum there is no least divisible place; therefore an angel will be able to place himself in a lesser and lesser. For since he has no body, and is whole in any lesser and lesser part of a body just as he is in the whole, it follows that he can remain in a lesser and lesser.

The angel's place is maximally determined; but as to the minimum nothing is certain to us - this is more probable.

The angel's place is maximally determined; about the minimum nothing is certain, which is more probable.

I for my part think, first, with the Doctors just cited, that there is some maximum place of an angel, in which he can be such that he cannot be in a greater. Secondly, with the same I assert that an angel can be in some lesser place. Thirdly, that nothing is known to us whether there is a least place such that he cannot be in a lesser, or whether he can be placed in the lesser and lesser divisible place to infinity.

1386. Bassolis, In II Sent., dist. 2, q. 4, art. 1.
1387. Scotus, In II Sent., dist. 2, q. 6.

The first part, against Durandus, is easily proved. For if there were not a maximum place in which he could be, it would follow that he could be placed in the whole universe - which we have already said is absurd. Now this argument not only proves that there is some term beyond which an angel cannot be, which term philosophers call extrinsic; but also that there is an intrinsic term, that is, that there is some place of determinate quantity, in which, according to all its parts, the angel can be, and in a greater he cannot. For since the angel's power is determined in itself, it demands an effect defined by an intrinsic term.

The second part, against the Irishman, is shown thus. First, it is certain that an angel can assume some small body, less indeed than a greater which he can assume. But it is ridiculous what that author used to say - namely, that then some of the angel's substance must necessarily be outside that body. For since an angel with his substance is whole in the whole and whole in any part, why cannot it be that he remain whole in one part of it and not in another? A substance that does not determine for itself a site according to the measure of quantity, as the substance of Christ does not, is not said to be straitened if it is placed in a lesser place; who then would say that an angel must be in a large body such that he cannot be in a lesser? Then it is proved more efficaciously: the same rational soul, which is more intrinsically present to a body than an angel is, can, wholly unchanged, be in a greater and a lesser body by animating it; therefore an angel also, who contributes to a body no power or life, will with much greater reason be able to be located in a greater and a lesser body. The rational soul indeed is not present according to its own will, but according to the diverse dispositions of the body, because it is not present to the body by its will; but an angel, at his pleasure, because he freely constitutes himself in any body whatever. About the souls of other animals the case is different: for if they are extended, they grow with the body itself; but if they lack any extension, in the same way as a rational [soul] they can be in a greater and a lesser. And what that author said about the circular figure of the place which an angel demands is plainly fictitious. For since an angel is indivisible, whole in the whole and whole in any part, and since together with the body he does not compose some animal which would require such a figure for its operations, it follows that he can be located in a body of any figure whatever.

The third part of our position about the angel's place as one tends toward a minimum is proved because no reason can make anything certain for us. For that an angel is indivisible does not seem sufficient for us to infer from it that he can be constituted in the lesser and lesser to infinity. For since his substance stands in need in some way of being applied to a body, nor is it present by itself alone, it is not sufficiently certain whether that mode requires a determinate quantity to which it makes the angel present, or not. And indeed, if it were certain that an angel can be in an indivisible place, that is, in a point, it would thence be confidently inferred that he can be in any lesser and lesser place to infinity - for the same reason would hold; but since this is not manifest, as the following disputation will show, nothing can be proved from it. On the other hand, I see nothing to prevent an angel from being able to be placed in the lesser and lesser divisible place to infinity. For although the rational soul cannot animate a lesser and lesser body to infinity - as St. Bonaventure most rightly noted - that comes from this, that its formal effect in matter requires some determinate quantity, or at least one bounded by some extrinsic term; but an angel, since he does

not inform the body in which he is, but only assists it, will not on this account be hindered from being present to a lesser and lesser body. Yet from this it is not lawful to infer, as St. Bonaventure contends, that an angel can be in a lesser and a lesser place to infinity; for although no repugnance appears, it does not forthwith follow that we can affirm that this is possible for an angel, otherwise I could assert of any herb whatever that it can cure this or that sickness, if no contradiction appears to us - which no one will concede. This alone we concede to divine power: that if no contradiction appears, we say that it can be done by God.[1388]

How Scotus proves that an angel cannot be in a smaller, and still smaller, place to infinity.

Scotus, more cautious, does not dare to define anything about the angel's maximum or minimum place; yet he proposes certain arguments in that question 6 to our purpose, by which he strives to prove that an angel cannot be in a lesser and a lesser place to infinity.

First argument. If an angel could be in a lesser and a lesser place to infinity, he could be in a more and more acute place to infinity, that is, in a more narrow quadrangle; therefore an angel could be in a longer quadrangle to infinity, and thus at once in heaven and on earth; the reason is that he could also be in a greater length. For from proposition 35 of Euclid, book 1, by an evident demonstration it is established that the same body which is in one place can be in any other equal [place]; for example, if a body fills a square place, it will likewise fill an equal quadrangle, however much the sides are narrowed - this, however, is to be understood unless the figure hinders; for some liquid can be so thick by its nature that it cannot be placed in a quadrangle too narrow. Therefore, since an angel has no figure that would hinder this, he could rightly be in an ever narrower and more constricted quadrangle to infinity.

Cajetan replies to this in two ways. First, he understands Euclid's propositions only of bodies which by their own quantity fill a place, not of angels, because they are said to be in a place solely by the presence of their substance. And indeed the demonstrations proceed about quantity only as filling the sides of a square and quadrangle. Then he replies that, even if they be understood of spirits, it does not follow from this that an angel can be in an infinite place, and thus no absurdity follows; for even if the sides of the quadrangle are narrowed, it does not follow that one arrives at an infinite quadrangle. Moreover, although one grant that an infinite quadrangle cannot be given - as, whether true or shown by Euclid there - yet that quadrangle can be such as to exceed in length the heavens; whence it would follow that an angel could be at once in heaven and on earth, which the Fathers judge to be absurd, as was said in the preceding chapter. Therefore I will say that the case of bodies is one thing, that of spirits another, and that Euclid's demonstration has place only in bodies. Hence Maior is deceived in the place cited, who asserts that, by contracting that quadrangle, an angel can so remain in it as to be at once in heaven and on earth.[1389]

1388. St. Bonaventure, In II Sent., dist. 2, part 2, art. c., q. 3, ad tertium.
1389. Cajetan, on this article; Maior, loc. cit.

Second argument. It is one thing, he says, to place oneself in some place and to remain there; another to place oneself in a lesser. If he could be in a lesser to infinity, he would have an infinite power to effect this. Cajetan answers that to be able to apply himself in a lesser place does not bespeak a greater power in an angel, but depends on his own will; whence it is clear that he can constitute himself now in one, now in another place.

Third argument. When an angel is in some place adequate to him, he is whole in the whole and whole in any part; therefore he can remain whole in any lesser part - otherwise he would abandon the rest. I answer: even though it be granted that he is whole in any part, I say it does not therefore follow that he can be in just any lesser place; if, however, an angel requires a certain lesser quantity to which he may be applied by reason of the mode which his substance ought to have, then, by a like reason as the rational soul, from the exigency of animation, cannot apply itself to any least part, even if it is whole in each when it is whole in all at once, so neither could an angel. I admit the reasons more strongly suggest that an angel can, by his own power, be in a lesser and a lesser place; yet this is not sufficiently clear to us. About the body of Christ in the Eucharist, the case is different: since he remains there not by his own power but by the power of God, he will remain in a lesser part and to an ever lesser extent, in which the whole substance is conserved. But that an angel likewise, if placed by the power of God in one body, could apply himself to a lesser and a lesser place, is not manifest.

Whether an angel can be in an indivisible place. Disputation 192.

Although Scotus does not dare to define anything about a greater or a lesser place of an angel, nevertheless he proposes certain arguments in that question 6.5 ad propositum, by which he tries to prove that an angel cannot be in a lesser and a lesser place to infinity.

First argument. If an angel could be in a lesser and a lesser place to infinity, he could be in an ever more straitened place to infinity, that is, in an ever narrower rectangle; therefore an angel could be in an ever longer rectangle to infinity, and thus at once in heaven and on earth; indeed he could be in a greater length as well: because from proposition 35 of book 1 of Euclid it is established by evident demonstration that the same body which is in one place can be in any other equal place - for instance, if a body fills a square place, it will also fill an equal rectangle, however much the sides be narrowed; and this is to be understood unless the figure should stand in the way: for some liquid can be so thick by its nature that it cannot be placed in a rectangle that is too narrow. Therefore, since an angel has no figure which would impede this, rightly will he be able to be in an ever more and more narrow rectangle to infinity.

Cajetan answers in this article in two ways. First, that Euclid's proposition is to be understood only of bodies which fill place by their quantity, not of angels, who are said to be in a place solely by the presence of their substance. And indeed the demonstrations proceed about quantity alone filling the sides of a square and of a rectangle. Then he answers that, even if it be understood of spirits, from that it does not follow that an angel can be in an infinite place, and thus no absurdity follows; because, even if the sides of the rectangle are narrowed, it does not follow that one arrives at an infinite rectangle. Moreover, although an infinite rectangle cannot actually be given,

nevertheless, as Euclid shows there, that rectangle can be increased so that the one which would be two feet long would exceed the heaven in length; whence it would follow that an angel could be at once in heaven and on earth, which the Fathers judge absurd, as was said in the preceding chapter. Therefore it must be said that the case of bodies is one thing, that of spirits another; and Euclid's demonstration has place only in bodies. Wherefore Major is deceived in the place cited, when he asserts that, with that rectangle narrowed, an angel can persist in the same, so that he would be at once in heaven and on earth.[1390]

Second argument. It belongs to some power to establish itself in some place, and, the greater, to place itself in a lesser: therefore, if he could be in a lesser and a lesser place to infinity, he would have an infinite power for bringing this about. Cajetan answers that to be able to apply himself to a lesser place is not a greater power in an angel, but depends upon his will, by which he can equally establish himself in one place as in another.

Third argument. When an angel is in some place commensurate to himself, he is whole in the whole, and whole in any part; therefore he can remain whole in any least part, the others being left aside. I answer: even if he is whole in any part, and so it is not repugnant that he be in some lesser place, nevertheless from elsewhere a certain lesser quantity is required, that he be applied to it, by reason of the mode which the substance of that [body] ought to have; just as the soul, by reason of animation, cannot be in any least part, even if it is whole in any [single part], when it is at the same time in all, as the rational soul. I admit the reasons more strongly suggest that an angel can, by his own power, be in a lesser and a lesser place; yet this is not sufficiently clear to us. About the body of Christ in the Eucharist, the case is different: since he remains there not by his own power but by the power of God, he will remain in a lesser part and to an ever lesser extent, in which the substance of bread can be conserved; and an angel likewise, if placed by the power of God. But that he by himself can apply himself to a lesser and a lesser place is not manifest.

Whether an angel can be in an indivisible place. Disputation 192.

Scotus's sentence. Chapter 2.

Why the angel who moves the heaven is not in the whole, but in some part of it. Chapter 3.

Disputatio CXCII - Whether an angel can be in an indivisible place

Caput I - On the opinions of the theologians

About an indivisible place, that is, about the mathematical point, theologians also disagree. The first opinion is that of St. Thomas in this article, asserting that an angel can be in an indivisible place, that is, in a point. After whom follow Richard in the Second Book, distinction two, article two; Capreolus, question one, article one; conclusion two; Bassolis, question four, article two; the

1390. Cajetan on this article; John Major, loc. cit.

Ferraran Master, 3 Contra gentes, chapter 68, 9; to the principal argument Cajetan; and many recent theologians on this article; yet they do not agree in the foundation and in the reason of it.[1391] Richard, since he asserts that an angel is in a place by his own substance as by a foundation, as we saw in Disputation 188, chapter 6, for that reason teaches that an angel can be in an individual place, because he is in himself simple, that is, indivisible, and without extension; what wonder, then, if his substance answers only to an indivisible place and a point? But St. Thomas and others, who teach that [an angel] is in a place by operation, or by the application of his power, as we reported there in chapter 2 and 4, therefore assert that an angel can be in an indivisible place, because he is not in the whole body which he moves, but in that part to which first he applies his power, that it may be derived to the others. And because he can apply it by a point and by a divisible part, therefore he can rightly be located in a point, just as one body could move another through a point, if it should touch it only at a point.

The second opinion, more common among those who affirm that an angel cannot be in the point of a body. This was Alexander, part 2, question 32, member 3; St. Bonaventure on the Second Book, distinction 2, part 2, a. 1, question 3; Gabriel, question 2, article 3, doubt 2; Gregory, question 1, article 2, before the doubt which he proposes there; Major, question 9; Aegidius on the First Book, distinction 37, second part, article 1, question two; Ockham, Quodlibet I, question 4; Marsilius on the Second Book, question 2, article 2, after the fifth conclusion; yet neither do these Doctors rely on the same foundation.[1392] Alexander and St. Bonaventure so taught, because they thought the corporeal place must be divisible, and they consider "to be somewhere" and "to be in a corporeal place" the same: but to be in a point and to be nowhere, not to differ. The rest, whom I cited besides Aegidius, followed that sentence, because they judged that indivisible points do not exist really in a quantitative body, but only by assignation and imagination; and assignation can be made only by the contact of some body. Since therefore here we are disputing about the real existence of an angel, and this cannot be except in something real, it follows that he is not in a point, when neither can his substance touch a body so as to assign a point in it. Finally, Aegidius, since he teaches that an angel is in a place by operation, for that reason asserts that he is not in a point, because in a point he cannot operate. Then, even if he were not in a place by operation, he affirms that he cannot be in a point. For something is said to be in another in two ways: either because it is within the ambit of that; and in this way an angel cannot be placed in a point, because a point has no ambit; or because it is in the essence of that conserving it; and thus God alone is in things: wherefore in this manner an angel will not be able to be in a point.

Caput II - The view of Scotus

Scotus, moreover, in Second Book, distinction 2, question 6.5, says to the point that nothing in this matter is ascertained. For the thing is very far removed from sense, and we have no knowledge from revelation; and as for physical reasons, which are asserted on either side, they are weak. First, indeed, the reasons by which the Doctors of the first opinion try to prove that an angel is at some time located in a point do not sufficiently persuade, especially if we stand by their principles. For either an angel is constituted in a place by a transitive operation, or by the application of his power to act, or by something which has the mode of a transitive operation, or by his mere substance, or by a mode added to it; for by one of these modes he could be located in a point. For if he were in a place in the manner in which Durandus thought, by no means could he be in a point, since from his opinion it openly follows that an angel is in the whole universe; but that in no way, from the things said, can he be in a point, is sufficiently proved; therefore we can have nothing certain for this opinion.[1393]

First, if an angel were in a place by operation, or by application to operate, that is, by a power derived for operating, it rather follows that he would necessarily have to be in a divisible part; for no operation, or power derived from an angel, can be received in a point; and if an operation cannot be derived in a point, neither can the angel's application to operate be referred to a point. By this reasoning Aegidius argues against those who think that angels are present in a place by operation.

Some reply that, even if an action cannot be received in a point, nevertheless by a subterfuge a point can move a body; and because an angel can apply his power to the whole body through a point, so that through it the body is said to be moved, therefore an angel can be in a point, whether he is in a place by a transitive operation, or by an application to operate. But although a mover of bodies can move another body through a point or through a surface - because, in order to move, it ought to touch the mobile, so that by a touch of quantity it imprint motion or an impetus (impetus), which is the cause of motion; and the touch of quantity either can be in an indivisible point, or of necessity ought to be in a surface, because a touch according to depth cannot be made - nevertheless an angel cannot move a body through a point. For if that could be done, it would be chiefly because he would touch through a point; but he cannot touch in a point: first, not by a touch of quantity, because an angel does not have quantity; further, not by a touch of power, or operation, because none of its effects can be received first in a point, so that through it they be derived into the rest of the body. Therefore neither can an angel move a body through a point; or else let them explain to us how a power or operation of an angel can be communicated to a whole body through a point.

By this reasoning it is proved not only that an angel cannot be in an individual point of a body, but also not even in some determinate part of the whole which is moved, unless we should say that a body is moved by an angel by some impressed quality which is called impetus (impetus). For if an angel moves a body to a place by his sole will - add, if you please, a mediating executive power,

1393. Durandus's opinion that an angel is in the whole universe excludes location in a point.

which some, without cause, distinguish from the will - the motion of the whole mobile, neither earlier in time nor earlier by nature nor by causality, is received in one part than in another. I speak of a solid and permanent body; for if it is fluid, one part can easily first be moved in time and then move another. And thus, even though the body be solid and permanent, it cannot first receive motion in one part than in another, but it is diffused equally into all; or else let them show us how one part moved is the cause of the motion of another. I grant indeed that, when the mover is corporeal, it moves the rest through one part, either because by the touch of one it impels the others, or because by that touch it impresses some quality in the others, if it first produces it in some determinate [part]; for if it creeps, like heat, of necessity the first part of the mobile is affected by that quality - just as the first part heated will not be said, also by reason of the quality, to move through some determinate part, but indeterminately. But motion according to place certainly is not diffused in this way: for it is not received first in some determinate part, nor does it creep little by little like heat, but equally in all the parts of the mobile it begins, as appears in an orb which is turned in a circle, and in any other body that is projected.

Moreover, that an angel, besides motion according to place, can impress some impetus (impetus) which can be the cause of motion, is to me most probable. For what else can he do in a heavy body which he holds suspended in the air? Since it is held back by no impediment, nor would that being held back cease by the mere negation of concurrence, as by God it could be hindered - since an angel cannot deny any concurrence necessary for the motion of a heavy thing - it follows that by some positive operation of the angel it is held back: but this is not motion according to place, because we suppose it to be held at rest. What then can it be, except an impetus (impetus), so moderated that it neither overcomes the heaviness and moves the body upward, nor is overcome by it so that the body be moved downward, but [the body], suspended, rests? Nevertheless I think it is not necessary that there be an impressed impetus distinct from the motion, in order that an angel may be able to move a body.

This supposed, it is difficult for me to see on what reasoning St. Thomas said that the angel, the mover of the heaven, is in that determinate part in which he impresses motion upon the whole body; for this cannot be done unless an angel be in a place by the impression of an impetus in a determinate part: and much less do I understand how what Aristotle says in De caelo II, in the chapter on this matter, can be true, namely, that that very part of the heaven is the one in which the mover is present and to which he gives the motion.

Moreover, that besides motion according to place an angel can impress some impulse which can be the cause of motion, seems to me hardly probable. For what else is it that he can do in a heavy body which is held suspended in the air? For since it is held back by no impediment, nor does that motion cease by the mere negation of concurrence - so that it could be impeded by God alone, because an angel can only deny the concurrence necessary to the motion of the heavy thing - it follows that it is held back by some positive operation of the angel: but this is not motion according to place, because we suppose it to be held at rest: what then can it be, except an impulse, so moderated that it neither overcomes the heaviness and moves the body upward, nor is overcome

by it so that the body is moved downward, but the body rests suspended? Nevertheless, it is not necessary that there be some impulse distinct from motion itself, in order that an angel be able to move a body.

On this supposition, however, it is difficult for me to see for what reason St. Thomas said that the angel, the mover of the heaven, is in that determinate part in which he impresses motion to the whole body: for this can be done only if the angel be in place by the impression of an impulse in that determinate part. And much less do I understand in what way that can be true which Aristotle says in On the Heavens, book 2, chapter 6, namely, that that part in the heaven would be the right, where the heaven had begun to be moved, if the motion had not been eternal: for in the motion of the sphere it does not appear which part could have been moved first, not only in time, but neither in causality and nature, unless we suppose intelligences animating the heavens, and impressing in some part a peculiar power for motion, which Aristotle himself seems to have thought, as we noted in disputation 183, chapter 1; or else let us affirm that an assisting angel first impresses an impulse in one part of the sphere, that it may move, rather than in another

Second, if an angel is in place by something that has a mode like a transient [operation], as if he presided or kept guard for some reason unknown, he could not be in a point: for to what end would custody, or the attention of one presiding, or anything of this sort, be directed only to a point, or be able to be directed? For although an angel can think about a point without thinking about the remaining parts, nevertheless he cannot keep guard, or preside, or effect anything similar, unless around the whole body: or else let them explain to us this mode of operation about a point, which is assimilated to a transient operation.

Third, if an angel is present by his bare substance, as others were saying, even if he be indivisible, it does not therefore follow that he can be located in a point placed in continuous quantity: for as St. Thomas most aptly noted in this article, the indivisibility of each is of a different kind, and in no way do they mutually correspond: therefore it need not be that the indivisibility of the angel can be constituted in a point of a line. And if the existence (*esse*) of the angel in place arose from bare substance, as some think, and because substance is indivisible he could be in a point, it would follow that he ought always to be located in a point, just as because existence in a foot-place follows the foot-measure, therefore he must always necessarily be in so much place. Either, then, the indivisibility of the angel's substance cannot demand a point as its place, or it must always demand it. For this reason Scotus, who said that an angel is in place through his bare substance, thought it not proved thence that he can be constituted in a point: because, says he, the indivisibility of the angel is not limited, as the point is in the continuum. Thus far we have shown that it is not sufficiently demonstrated that an angel can be in a point, even if we follow the opinions which we have above refuted concerning the foundation of the angel's existence in place. Nay more, although from some of those opinions the existence of the angel in a point might rightly follow, yet this should not be affirmed absolutely, because it would be gathered from a false foundation.[1396]

1396. Scotus holds that an angel is in place by his bare substance, yet from this it does not follow that he can be constituted in a point; see the discussion above on the foundations of the angel's existence in place.

But if we follow our own position, which we set out in disputation 188, chapter 7, namely, that an angel is constituted in place by reason of some mode added to his substance at his nod and will, it is still not clear to me that he can be located in a point. For who can know whether that mode ought to have a limited nature with respect to a part of a divisible body, and unite to it only the angel's substance, or even be able to unite it to a point? For neither side do I indeed see a contradiction; for that reason, however, I have no foundation to assert anything.

Thus far I have shown the foundations of the first opinion to be weak. Next it remains that we show the same about the foundations of the second, so that that third opinion of Scotus may remain approved, which affirms that the matter is doubtful and cannot be sufficiently defined. I show, then, that the reasons of the second opinion are of no moment as follows. First indeed, the foundation of Ockham, Gabriel, and Marsilius, denying points in the continuum, is false: and even if it were true, the question proceeds only on the supposition that points exist. But that they do exist I now briefly show. No one up to now has doubted about the extreme surface of any body: but some have denied the intermediate surfaces and the points of lines which are within the continuum (for every line is within a surface). Therefore at least it could be doubtful whether an angel could be on the whole surface, which is indivisible according to depth: and I judge the same about this for the same reason. But let us show that there are also points in the middle of a body: for if a perfectly plane surface be given, upon which there is a perfectly spherical [surface], it will touch without doubt really: it will touch the plane not according to the whole of itself, as is manifest: therefore [it will touch] by some part of itself, either by some indivisible or by some divisible part. Not indeed by any divisible part according to the width and length of the plane: for the mathematicians prove that otherwise not all the lines drawn from the center to the circumference would be equal; and the same likewise follows whether you say that the contact is in some determinate divisible according to the width and length, or in some indeterminate, and then the sphere would touch according to some of its divisible part in width and length along the periphery. Then that contact, with respect to the depth of each body, is not by any divisible part: we have therefore something indivisible with respect to every part; or it would demand for itself a place adequate to itself, which is a point. Now what some say, that that contact is made through some indeterminate part, is ridiculous: for since the contact is real and determinate, and is not made according to the whole body, it must be made by some determinate part thereof: therefore points are not by designation alone, but are real, so that by such contact they can also be designated: for the contact is real, nor is that by designation and contact effected by which bodies touch, but that which was there is designated.

Second, the argument of Alexander and St. Bonaventure proves nothing: for these Doctors suppose what they ought to have inferred, namely, that that which is in place ought to be in some divisible space: although this is manifest if we speak of existence in surrounding place; but about a simple presence somewhere, such as is the angel's, this is not so manifest, but is the very thing we now dispute.

Third, the argument of Aegidius likewise proves nothing, if once we say that an angel is in place not by reason of operation: for he did not rightly enumerate the modes of being in another when he said that something is in another either within its circumference, or as conserving it: for an angel is

in place by the simple presence of his substance, nor is it necessary to operate in order to be in it: hence by this reason it is not rightly shown that an angel cannot be located in an indivisible. Therefore each side remains uncertain: although I freely confess that no contradiction is inferred if we follow the affirmative side.

Caput III - Why the angel who moves the heaven is not in the whole, but in some part of it

It remains that we explain whether the angel who moves the sphere of heaven is in the whole, or in some part of it. The common opinion holds that he is in some determinate part of the sphere: so St. Thomas in this article, St. Bonaventure in the second book, distinction 2, second part, article 2, question to the second, and Scotus in question 3, s., and the others, and the philosophers commonly: for it seems incredible that an angel should be in the whole heaven: for if the whole heaven were the adequate place of the angel, since that angel who moves is of the lower order, the Archangels who are sent, and the other higher angels would demand a greater place for themselves, which is a point: whence it would follow that they could be in heaven and on earth at the same time, against the doctrine of St. John Damascene handed down above in disputation 190, chapter 3. For the greater length and breadth is that of the whole heaven than that which is between heaven and earth.[1397]

Yet it is difficult to explain how an angel, if he is in a determinate part of heaven, remains fixed, nor is moved with the heaven: but much more difficult according to the opinion of those who affirm that an angel is in place by operation: for besides the fact that, as we were saying above, he would rather be in the whole heaven equally first than in a determinate part, it would be difficult still to explain how the angel would be in some part in which he would continuously impress power and motion, and would not be moved with it. We say, therefore, that by reason of that mode added to his substance he is united to the body, so that we do not place him in the whole world: nevertheless he operates in the whole world, but not by impressing some influx through one part, nor is this to operate at a distance and remote, without a medium; for it is not repugnant that an angel, in the place in which he is, should operate continually through a long interval. But it seems necessary to say that the angel continually and successively changes in himself that mode by reason of which he is united to the body, so that he may remain fixed while nevertheless the parts of the heaven pass by successively, to which within the same quantity - four or five palms, for example - he continually and successively responds, either to the part of our east, or elsewhere: just as if an angel were in some part of a certain river, and the parts of the water were continually succeeding, so that they would continually and successively come to him while he remained at rest, he would have to change successively in himself the mode [of union]. Wherefore there is in the angel a mode, by which he is successively and continually present to the body, and by which he remains located in it: a matter which will be more elucidated in the disputation on the motion of angels.

1397. St. John Damascene, doctrine cited above in disputation 190, c. 3.

Articulus III - Whether several angels can be at the same time in the same place

The third proceeds thus. It seems that several angels can be at the same time in the same place. For several bodies cannot be at the same time in the same place, because they fill a place. But angels do not fill a place, because only a body fills a place so that there is not a vacuum, as is evident from the Philosopher in Physics IV. Therefore several angels can be in one place.

1. Moreover, an angel and a body differ more than two angels. But an angel and a body are together in the same place: because there is no place which is not full of a sensible body, as is proved in Physics IV. Therefore much more can two angels be in the same place.
2. Moreover, the soul is in every part of the body, according to St. Augustine; but demons, although they do not enter into minds, nevertheless sometimes enter into bodies. And thus the soul and a demon are in the same place. Therefore for the same reason any other spiritual substances whatsoever.

But on the contrary, two souls are not in the same body. Therefore by equal reason, neither are two angels in the same place.

I answer that two angels are not at the same time in the same place. And the reason for this is that it is impossible that two complete causes be immediate to one and the same thing. This is clear in every genus of causes. For there is one proximate form of one thing, and there is one proximate mover: although there can be several remote movers. Nor does the instance hold of several men drawing a ship. For none of them is a perfect mover, since the power of each one is insufficient for moving. But all together are in the place of one mover, inasmuch as all their powers are aggregated to effect one motion. Whence, since an angel is said to be in place by this, that his power immediately touches the place after the manner of a perfect container, as was said, therefore only one angel can be in one place.[1398]

Reply to the first: That several angels be in one place is not hindered by the filling of the place, but by another cause, as has been said.

Reply to the second: That an angel and a body are not in place in the same way. Whence the argument does not follow.

Reply to the third: That neither are a demon and a soul compared to a body according to the same causal relation, since the soul is a form, but a demon is not. Whence the argument does not follow.

An plures Angeli simul in eodem loco esse possint? Disputatio 193.

- Several angels cannot be in the same place, even not an adequate one, St. Bonaventure and others said. Chapter 1.
- The preceding opinion is refuted. Chapter 2.
- That several angels cannot be in the same adequate place, the Thomists taught. Chapter 3.

1398. Physics IV, text 58.

• The truer opinion is that several angels can be in the same place. Chapter 4.

Plures Angelos non posse esse in eodem loco, etiam non adaequato, St. Bonaventure, and others said.

Caput I - There arise also Doctors on this question, indeed many who are brought forward to the same opinion by various arguments.

Thus think St. Bonaventure in the second book, distinction 2, part 2, article 2, question 4; Richard in the first book, distinction 37, article 2, question 4; Aegidius in the same distinction, part 2, article 1, question 3: in which opinion St. Thomas seems to have been in this article, and Capreolus in the second book, distinction 2, question 1, article 1, conclusion 3, and Bassolis in question 4, article 4: for this author only ...[1399]

1. Further, angels do not fill a place. But only a body fills a place, lest there be a void, as is clear from the Philosopher in Physics IV. Therefore several angels can be in one place.
2. Further, an angel differs from a body more than two angels differ from each other. But an angel and a body are together in the same place: there is no place which is not full of a sensible body, as is proved in Physics IV, text 58.[1400] Therefore, much more can two angels be in the same place.
3. Further, the soul is in every part of the body, according to St. Augustine in the Sermons; although they do not slip into minds, nevertheless they sometimes slip into bodies. And thus the soul and a demon are in the same place. Therefore, by the same reasoning, any other spiritual substances.

But on the contrary: Two souls are not in the same body. Therefore, by parity of reason, two angels are not in the same place.

I answer: Two angels are not together in the same place. The reason is that it is impossible for two complete causes to be immediate to the same thing. This is clear in every genus of causes. For there is one proximate form of one thing, and there is one proximate mover: although there can be several remote movers. Nor does the instance of several men dragging a ship avail; because none of them is a perfect mover, since the power of each one is insufficient for moving. But all together are in the place of one mover, inasmuch as their powers are aggregated for making the motion. Hence, since an angel is said to be in place by this, that his power immediately touches the place, after the manner of a perfect container, as was said above, there can be only one in one place.

Reply to the first: That several angels are in one place is said on account of the filling of place, but by another cause, as was said.

1399. St. Bonaventure, In II Sent., dist. 2, pars 2, art. 2, q. 4; Richard of St. Victor, In I Sent., dist. 37, art. 2, q. 4; Aegidius of Rome, In eadem dist., p. 2, a. 1, q. 3; St. Thomas, in this article; Capreolus, In II Sent., dist. 2, q. 1, a. 1, concl. 3; Bassolis, q. 4, a. 4.

1400. Physics IV, text 58.

Reply to the second: An angel and a body are not in place in the same manner. Hence the argument does not follow.

Reply to the third: Nor, again, are a demon and a soul related to a body according to the same causal habitude, since the soul is a form, but a demon is not. Hence the argument does not follow.

The conclusion is: Only one angel can be in one and the same place. He himself deduces this conclusion from his own foundation, namely that an angel is in place because his power touches the place. Both points, however, must be examined in the following disputation.

Disputatio CXCIII - On whether several angels can be in the same place

Several angels cannot be in the same place, not even in a non-adequate place, as Bonaventure and others said. Caput 1.

The preceding view is refuted. Caput 2.

That several angels cannot be in the same adequate place, the Thomists taught. Caput 3.

The truer view is that several angels can be in the same place. Caput 4.

Caput I - That several angels cannot be in the same place, even if not adequately

There are also differing Doctors in this question; indeed, many are brought to the same opinion by various arguments. First, some assert that several angels cannot be in the same place by their own power. And, as their reasons indicate, they are speaking about a place even when it is not adequate. Thus think Bonaventure in the Second Book, distinction 2, part 2, article 2, question 4; Richard in the First Book, distinction 37, article 2, question 4; Aegidius in the same distinction, part 2, article 1, question 3. In this view St. Thomas too seems to have been in this article, and Capreolus in the Second Book, distinction 2, question 1, article 1, conclusion 3, and Bassolis in question 4, article 4: for this author only grants that it can be by the absolute omnipotence of God. [1401]

Bonaventure proves this first by the following reason. Since an angel is a certain part of the universe, and therefore in the whole he ought to have some order, it is necessary that naturally each angel be established in his own peculiar place: for if in the same place, however it be taken, there were several, the order of the universe would be perturbed. He admits, however, that on the part of the angel there is no repugnance, since one does not so occupy a place that his substance is an impediment to another, as one body is to another body; nor on the part of place: for since place does not need the presence of an angel, nothing on the part of place prevents it from receiving

1401. St. Bonaventure, In II Sent., dist. 2, pars 2, art. 2, q. 4; Richard of St. Victor, In I Sent., dist. 37, art. 2, q. 4; Aegidius of Rome, In eadem dist., p. 2, a. 1, q. 3; St. Thomas, in this article; Capreolus, In II Sent., dist. 2, q. 1, a. 1, concl. 3; Bassolis, q. 4, a. 4.

several angels into itself. He therefore thinks the whole repugnance to be on the part of the order which they ought to preserve in the whole universe, an order which he judges cannot be set aside by the power of the angel himself.

Second, Richard proves: things that are in the same place necessarily penetrate one another, as if there were two bodies; therefore if two angels were in the same place, they would mutually penetrate. Richard, moreover, supposes as known that two angels cannot penetrate one another.

Third, Aegidius argues: Whenever several things are compared to something one in the same way, they cannot be together in it, as two forms in the same matter; because they are related to it in the same way, they cannot be together. But an angel and a soul in the same body, and a body and an angel in the same place, can be together without repugnance, because they have regard to the matter or to the place in a different way; but two angels are compared to the place in the same way: therefore they cannot be together in the same place. All these reasons strive to prove this even about a place that is not adequate, as is sufficiently clear; and for that reason I said that these authors clearly think that several angels cannot be in the same place, even when it is not adequate.

Caput II - Refutation of the preceding opinion

And this view, in my judgment, can be refuted by Scripture and by reason, as I shall show clearly in caput 3; for now let it be enough to show that the reasons of these doctors are weak, whereby I shall also in some way indicate the falsity of their doctrine.

The first reason of Bonaventure proves only that an angel, together with the whole universe, has some order, not according to situation and place, but according to his substance and nature; this, however, would not be taken away even if several angels were placed in the same place. But order according to place is attended to only in bodies, which by their quantity necessarily must occupy different places.

The second reason of Richard has no force. Rather, the common doctrine of the Scholastics must be supposed, who assert that one created substance cannot be within another by illapsus (a substantial slipping-in), but only according to presence, as in a place. Thus teach the Master in II, dist. 8; Herveus in II, dist. 9, in the principal reply to the second reason; Bonaventure in II, dist. 8, part 1, art. 1, q. 2, In corpore, and on the second; Argentina in II, dist. 7, q. 1, art. 2; and the Ferraran in Contra gentiles, c. 18, at the end. For that a substance be said to be in another by illapsus, it is necessary, as the aforesaid Doctors noted, that it be in it in the mode of conserving that substance; but one created substance cannot conserve another: therefore neither can it be in it by illapsus, but only by the presence of place. And since one angel cannot be the place of another (for place is taken according to situs), nor can he slip into him, because he does not conserve his substance, it follows that in no way can one angel be in another. But God, who is of Himself omnipotence, since He conserves all things by the nod of His will, is in all things, even spiritual things, in such a way that He slips into their substances. And this is the doctrine of Augustine in the book On Ecclesiastical Dogmas, c. 83, where he writes thus: We do not believe that demons, by an energetic operation, slip substantially into the soul, but that they are joined by application and

oppression; but to slip into the mind is possible to Him alone who created. By these words he grants that an angel is united or conjoined to the soul, because he is together with it in the same body; yet he is not within the soul, because he cannot slip into it. The same was said most clearly by Bede on that passage of Acts 5, "Ananias, why hast thou tempted...," when he says that the mind and soul of man cannot be filled, as existing within his substance, by any creature, except by the whole Trinity. Fulgentius on the Faith to Peter, cap. 3, is also usually cited, where he says: There is, nevertheless, in each (namely, in angels) a natural boundary by which they are distinguished from one another; because none of them is in another. He said this, however, because he thought angels to be corporeal, although their bodies would not be from the elements: in which view St. Augustine also seems to have been; wherefore it is not surprising if, even in the place cited, he said that angels cannot slip into the substance of the soul. But since he concedes that they are within the human body, he denied that they are within souls by that peculiar reason already explained. I do indeed see that the book On Ecclesiastical Dogmas is ascribed by many not to Augustine, but to Gennadius.

Now then, how little Richard's reason proves, I show thus. Although it is true that one angel cannot be within the substance of another angel, nevertheless the opposite does not follow, even if we say that several angels are in the same body together; for just as an angel can be together with a rational soul in the same body, yet not within it, so too he will be with another angel, yet not within him. For one substance cannot be in another save by a substantial illapsus, or as in a place: in the former way God alone can be, as we said; in the latter way, however, an angel can only be in a corporeal substance which has situs; but within another angel he cannot be, rather with him together in the same body. From the fact, moreover, that two angels are together in the same body, it does not follow that they must mutually penetrate and that one substantially slip into the other; otherwise an angel would also slip into the rational soul when he is in the body of the possessed, or conversely the soul of the possessed would slip into the angel possessing: which is absurd. Richard therefore infers badly.

The third reason also of Aegidius is no less weak. For although some things cannot be in the same place in the same mode - just as two forms in the same matter, or two quantified bodies within the same surface - yet on the contrary some can be in different modes, as an angel and a soul within the same body. From this, however, it does not follow that two things cannot be within the same body in the same mode: from particulars one ought not to draw a universal. And if Aegidius assumes in his reasoning a universal proposition - namely, that never can two or more be in the same place in the same mode - he assumes what ought to be proved. Besides, from those particulars it is not permitted to infer by parity the thing he contends; for two forms cannot therefore be in the same matter because they are present not only by the presence of place, but they bestow a formal effect upon the matter, and that effect by its nature clashes with the other. Next, two bodies cannot therefore be within the same surface, not because they are there in the same mode, but because each of them is such as to occupy the space of that surface by its quantity; but what has once been occupied and filled cannot be filled by a body. But an angel is in a body in such a way that he attributes no formal effect to it, but is present only by presence, nor does his

substance fill or occupy a space. Therefore nothing prevents his being with another angel within the bounds of the same body; unless something else were assigned that could be an impediment. And if it were sufficient for being in a different mode that some things could be together, it would follow that in the same matter there could be two quantities together, penetrated, one informing the matter, the other only present; because then they would be in different modes. But this is impossible. Therefore it matters little whether they be in the same or in a different mode for some things to be together, if something else prevents it; just as, on the contrary, in the same mode nothing hinders, if from elsewhere there is no impediment. This same point will be confirmed more in caput 4, where we shall also examine the reasoning of St. Thomas and Capreolus.

Caput III - That several angels cannot be in the same adequate place, as the Thomists teach

As for the force of St. Thomas's statement in this article - that several angels cannot be in the same place - the Thomists commonly understand his view to be about an adequate place; and they grant that nothing repugns several angels being in the same non-adequate place. Thus Cajetan in the commentary on this article, and the Ferraran in Contra gentiles, cap. 68, in the solution of the second doubt. They call a place non-adequate one that does not correspond to the whole operative power; for since these hold that an angel is in a place by operation, or by the application of his power to act, they rightly say that place is adequate in which an angel is established with the whole of his operative power; but that place is non-adequate in which he is situated by his operative power only in part. For if two angels move the same body, since each does not contribute adequately to the motion, he will be in that body as in a non-adequate place. They nonetheless grant that St. Thomas spoke also of a place that is not adequate, and denied that several angels could be in the same place even when it is non-adequate: for his reason clearly indicates this - not because it repugns the power and virtue of angels, but, as the Ferraran says, because it would seem superfluous.

Caput IV - The truer opinion: that several angels can be in the same place

I certainly judge that several angels can at the same time be in the same place. Thus absolutely teach Scotus in the second book, distinction 2, question 8; Gabriel, question 2, article 3, doubt 3; Gregory, question 3; Marsilius on the second book, the questions on the articles, conclusion 8; Major in question 10; and Ockham in Quodlibet 1, question 4.[1402] And when there is talk of a place that is not adequate, we agree with Cajetan and the Ferraran, inasmuch as he affirms that it does not repugn the power of an angel, but that either it is superfluous, or rare. Yet I say not only with them and with others now alleged that it does not repugn; but also that it is neither superfluous nor rare. And this opinion is commended to me not only because no contradiction seems to follow from it (for that would not suffice for me to assert it without doubt), but also because it is plainly

1402. Scotus, In II Sent., dist. 2, q. 8; Gabriel, q. 2, a. 3, dub. 3; Gregory, q. 3; Marsilius, In II, quaestiones super articulos, conclusio 8; Major, quaestio 10; Ockham, Quodlibet I, q. 4.

contained in Scripture: Luke 8. From which passage Richard of St. Victor, in book 4 On the Trinity, chapter 25, infers that angels are not bodies, because they can be at the same time in the same place.[1403] We also frequently see in the possessed that there are many demons: therefore it is sufficient that we grant that several can be in the same place.

The reasons adduced in the first chapter about the non-adequate place prove nothing, as we saw in the chapter. The reasoning also of St. Thomas, which seems to tend to the same conclusion, is not efficacious: for since he posits that an angel is in a place by a transitive operation, or by an application of power to act, he argues in this way, that one effect can have only one cause, as is clear in every kind of cause (he speaks of the proximate cause). Therefore, since the application of power constitutes an angel in a place, and this cannot be except from one agent, it follows that in one place only one angel can be. For if it sometimes happens that the same effect is from several causes, as appears in those who drag a ship, that happens only from the imperfection of the movers, whose power can be mutually aided: as if to say that such a thing in no way befits angels, because they are perfect movers. But this reasoning does not prevent that, even if an angel is in a place by a transitive operation, several can be located at the same time in the same place, at least in a place that is not adequate.

First, because it does not repugn the perfection of an angel to be helped by another angel for some effect: and for this reason we see that sometimes there are several demons in the same human body, that they may torment more. Then too, one angel can move a body with rectilinear motion, but others with circular motion: therefore it does not repugn that in the same body there be a reason for diverse operations. I say diverse operations, not because, as Cajetan thinks, one angel could move according to place and another illumine (for an angel can imprint no quality), but because by different motions according to place different angels can move the same body.

Moreover, it is proved much more easily that two angels can be in the same place from the mode in which we said an angel is constituted in a place: for since he is there by a certain mode added to his substance, by reason of which he is joined most nearly to a body according to the presence of his substance, nothing prevents that two be in the same body. For just as at the same time an angel is with the soul in the same body, and they do not impede each other, so too at the same time one angel can be with another. For what Ægidius said, that the soul and a demon can exist in the same body because they are in it in a different way, is trifling (as I have already shown in chapter 2): for the soul by its presence does not prevent the angel's presence, not because it informs the body but the angel does not; but because its substance, since it is spiritual, does not fill nor occupy a place like quantity does: and so it ends that spirits can be together. But this same thing holds for one angel with respect to another: therefore he can well be with him in the same body.

Up to this point I have proved absolutely only that two angels can exist in the same body and place, defining nothing about an adequate place. But about this I say that they can indeed be in the same place adequate to each, unless inequality of power on their part stands in the way: that is, from elsewhere it by no means repugns, whether we say that they are there by operation, or we say

1403. Richard of St. Victor, De Trinitate, IV, c. 25.

that they are there by that mode of substance. But if all are unequal in power to operate and to constitute themselves in a place, for this reason two will not be able to be in the same place adequate to each, as is sufficiently manifest.

Refutation of that position

This position thus explained does not commend itself to me. First, it does not please me that he asserts it to be superfluous for many angels to be in the same place physically, and that for the most part this does not happen: since it is clear to us that frequently within the same man there are many demons, as in Luke 8 there was a legion; which ought to be judged neither superfluous nor rare and unusual. Nor indeed ought one to say that they are individual demons in the individual parts of the body, especially since the demons of that legion would have had to be in the smallest parts. We see also frequently in the possessed that there are many demons: therefore it is enough that we admit that many can be in the same place.

And then that which Cajetan and the Ferraran teach about material and formal place does not please me. For if once they grant that two angels can be in the same body adequately, even if it be not by reason of the same operation, nonetheless they must be said to be in the same formal place adequate. For to the formal account of place does not belong a foundation in that which exists there, which is operation. But the angel's material place is the very breadth and length of the body; but its formal account is the relation of distance to fixed points: just as the material place of bodies is the surface, and that relation is the formal account of that; wherefore, if the same body adequately corresponded to two angels, they would be said absolutely to be in the same adequate place.

Cajetan, however, in order to explain in what way by its very nature it repugns that several angels be in the same adequate place, notes first, that this is not to be understood of the absolute power of God; for in this way no one denies that it can be. Second, that it is to be understood according to the angel's natural power, because naturally the same effect cannot be from two causes which they call total, although it can be by the power of God and his absolute potency, so that two created total causes also concur totally to the same effect. If therefore God permits that an angel by his natural power be constituted by himself alone in a place, he will not be able at the same time to be with another in a place adequate to both, although he can indeed be in a place that is not adequate.

He adds, however, third, that two angels by their natural power, with God supplying nothing, can be in the same place materially, but not formally, to each a non-adequate place: he says materially, that is, in the same body of quantity and mass adequate to the virtue of each. He says moreover formally, in respect of the same operation and foundation: and thus, as he would say, two angels could be in the same bodily mass adequate to each by the mode of place, not by reason of the same, but of different operations, as if one, he says, moved according to place, but another illumined. The Ferraran agrees with Cajetan in this third point; for of the first he says nothing; but in the second he is of a contrary opinion. These two things, however, are nothing to the present subject: for now the difficulty is about existence in a place by the angel's own power, with God

alone concurring according to what his nature itself requires. Whether indeed the same effect can be from two total causes must be deferred to the third part, question 3, article 6, against this same Cajetan.

Quaestio LIII - On the local motion of angels

Consequently it must be considered concerning the local motion of angels.

And about this three things are asked.

Articulus I - Whether an angel can be moved locally

Objicitur primo. It seems that an angel cannot be moved locally. For, as the Philosopher proves in Physics VI, no impartible thing is moved, because while something is in the term from which, it is not moved; nor even while it is in the term to which, but then it has been changed. Whence it follows that whatever is moved, while it is moved, is partly in the term from which, and partly in the term to which. But an angel is impartible. Therefore an angel cannot be moved locally.

Objicitur secundo. Moreover, motion is the act of the imperfect, as is said in Physics III; but a blessed angel is not imperfect. Therefore a blessed angel is not moved locally.

Objicitur tertio. Moreover, motion is only on account of indigence. But in the holy angels there is no indigence. Therefore the holy angels are not moved locally.

Sed contra: It is of the same account for a blessed angel to be moved, and for a blessed soul to be moved. But one must say that a blessed soul is moved locally, since it is an article of faith that Christ according to his soul descended into hell. Therefore a blessed angel is moved locally.

Respondetur: I answer that a blessed angel can be moved locally. But just as to be in a place belongs equivocally to a body and to an angel, so also to be moved according to place. For a body is in place insofar as it is contained under a place, or is commensurated to place. Whence it is necessary that even the motion of a body according to place be commensurated to place, and be according to its exigency. And from this it is that according to the continuity of magnitude there is continuity of motion; and according to the prior and posterior in magnitude there is the prior and posterior in local motion of a body, as is said in Physics IV. But an angel is not in place as commensurated and contained, but rather as containing. Whence the motion of an angel in place does not have to be commensurated to place, nor be according to its exigency, so as to have continuity from place; but it is a non-continuous motion. For since an angel is not in a place except according to contact of power, as was said above, it is necessary that the motion of an angel in place be nothing other than diverse contacts of diverse places successively, and not simultaneously, because an angel cannot be simultaneously in many places, as was said above. But it is not necessary that contacts of this sort be continuous. However, in contacts of this sort a certain continuity can be assigned: for an angel can be assigned a divisible place by the contact of his power, just as a divisible place is assigned to a body by the contiguity of its magnitude. Whence just

as a body successively and not simultaneously leaves the place in which it was before, and from this is caused continuity in its local motion, so too an angel can successively leave the divisible place in which it was before. And thus its motion will be continuous. And it can also leave a whole place at once, and apply itself at once to an entire other place. And thus its motion will not be continuous.

Reply to the first: To the first, therefore, it must be said that that reasoning fails in two ways in the present case. First, because Aristotle's demonstration proceeds about what is indivisible according to quantity, to which by necessity there corresponds an indivisible place. Which cannot be said of an angel. Second, because Aristotle's demonstration proceeds about continuous motion. For if the motion were not continuous, it could be said that something is moved while it is in the term from which, and while it is in the intermediate to which: because the very succession of different "wheres" about the same thing would be called motion. Whence in whichever of those "wheres" the thing were, it could be said to be moved. But the continuity of motion prevents this, because no continuum is in its term; as is clear, because a line is not in a point. And therefore it is necessary that that which is moved not be totally in the other term while it is moved, but partly in one, and partly in the other. Therefore, insofar as the motion of an angel is not continuous, Aristotle's demonstration does not proceed in the present case; but insofar as the motion of an angel is posited to be continuous, thus it can be conceded that an angel, while it is moved, is partly in the term from which and partly in the term to which: yet so that the partiality be referred not to the substance of the angel, but to the place, because at the beginning of his continuous motion the angel is in the whole divisible place from which he begins to be moved; but while he is in the very being-moved, he is in part of the first place which he is leaving, and in part of the following place which he occupies. And thus his motion will be continuous.

Disputatio CXCIV - Whether an angel can be moved from place to place

And indeed, that he can occupy the parts of two places, belongs to an angel from this, that he can occupy a divisible place by the application of his power (virtus), just as a body by the application of its magnitude (magnitudo). Whence it follows of a body movable according to place (locus), that it is divisible according to magnitude; but of an angel, that his power can be applied to something divisible.

Reply to the second: Motion (motus) of what exists in potency (potentia) is the act (actus) of the imperfect. But the motion which is according to the application of power is of what exists in act, because a thing's power is according to that by which it is actually.

Reply to the third: The motion of what exists in potency is on account of its own indigence; but the motion of what exists in act is not on account of its own indigence, but on account of another's indigence. And in this way an angel, on account of our indigence, is moved locally, according to that in Hebrews 1: "Are they not all ministering spirits, sent for service, for the sake of those who are to receive the inheritance of salvation?"

The conclusion is affirmative, and in my judgment it is as certain as that an angel is in a place: yet for its elucidation certain things must be said in the following disputations.

Caput I - What Hervaeus and Durandus think

Among the Scholastics there is no one, besides Hervaeus and Durandus, who asserts that angels are not moved according to place: and this was taught by Hervaeus in the treatise On the Motion of an Angel, question 1, especially articles 1 and 2, which begins "Ad secundum principale"; and by Durandus in the First Book, distinction 37, in the second part of the distinction, question 1, number 26, and question 2; Aegidius also is reported for this view in the Second Book, distinction 37; and Cajetan, in his commentary on this article, plainly maintains that angels are moved, although he differs from others in the account by which motion is explained, as we shall see in the next disputation, cap. 2.[1404]

Now Hervaeus and Durandus are led to the aforesaid opinion about motion by different reasons. For they also held different opinions about the angel's being in a place. Durandus therefore teaches that an angel is not moved from place to place, because he thinks that an angel is always everywhere present, or at least simultaneously in all those places in which he can be and operate; and since for motion according to place it is necessary to leave one place and acquire another, it follows that an angel is not moved. Indeed, from this he even proved that an angel is simultaneously everywhere, or in every place in which he can be, because he says it cannot be understood how in the substance of an angel there could be some change according to place by relinquishing a prior place and acquiring another.

Hervaeus, however, asserted in the same way that an angel is not moved according to place, as he had said that he is not in a place: for, in order that something be moved in a place and to a place, it must be in a place. Since therefore Hervaeus asserts that an angel is not in a place, consistently with his principles he teaches that he is neither moved in place nor to a place; for that presence does not seem sufficient for motion according to place, which Hervaeus grants to an angel not according to substance, but as a cause is said to be in its effect. For this view, besides the foundations which the aforesaid authors employed in the opinions which they taught about the angel's place, there seems to be St. Augustine, On Genesis to the Letter, chapters 20 and 26, where he says that a corporeal creature is moved through places and times, but a spiritual creature only through times.[1405]

Caput II - The true opinion: that an angel is moved with respect to place

The common sentence of the Scholastics and established by the reckoning of the Fathers is, that an angel is no less truly moved locally than truly is in a place. Among the Scholastics, all the rest follow this view, whom we shall report in the following disputations, who also, against Hervaeus,

1404. Hervaeus, Tractatus de motu Angeli, q. 1, especially arts. 1 - 2 (incipit "Ad secundum principale"); Durandus, In I Sent., dist. 37, pars 2, q. 1, n. 26, and q. 2; Aegidius (Giles of Rome), In II Sent., dist. 37; Cajetan, Commentary on this article.

said that an angel is in a place, as we saw in Disputation 187. And I for my part hold it to be catholic, as can be manifestly deduced from Scripture, as we shall show shortly. Of the Fathers, those recalled in the aforesaid disputation, cap. 1, who affirmed that an angel is in a place so as to be defined by a determinate place, also transmitted this doctrine: for thus it is necessary that he be able to be moved from there. And thus Durandus and Hervaeus would plainly confess it, if they had supposed that angels are in a place in that way: for they denied the motion of angels either because they are not in a place, or because they are not defined by a determinate place.

There are also several other Fathers who clearly teach that angels are moved from place to place. Gregory Nazianzen, Oration 34, which is the second "On Theology", at the end, says this concerning angels: "They pass through all places, and are vigorously present everywhere, both on account of the promptness of their ministry and on account of the lightness of their nature." For if, as Durandus said, they were everywhere at once, they would neither be said to pass through places, nor to be everywhere vigorously present on account of the lightness and promptness of their nature; just as a body is not present to all the parts of the place which it simultaneously occupies because of the lightness and promptness of its nature, but because it is simultaneously in them. This Dionysius had already said earlier, in the last chapter of the Celestial Hierarchy, before the middle, when he said that the feet of angels are painted winged, on account of the swiftness of their motion.[1406] St. John Chrysostom expressly, Homily 3 on the Epistle to the Hebrews, on those words "Are they not all ministering spirits?" says that among the angels who are sent, this is the difference, that they who are sent change places, but the Son of God does not. With him agrees St. John Damascene, De fide orthodoxa, book 1, cap. 17, where he says: "The angel by nature's swiftness, and because he passes promptly and swiftly, works in diverse places"; and in book 2, cap. 3, he teaches that when angels are sent from heaven to earth, they do not remain in heaven.[1407] Among the Latins also of the ancients, Tertullian in the Apologeticum against the pagans, cap. 22, writes: "Every spirit is winged; such are angels and demons: therefore in a moment they are everywhere."[1408] St. Ambrose, On the Holy Spirit, book 1, cap. 10, establishes a difference between created and uncreated spirit, that the created passes from place to place because it does not fill all things; and thus, he says, it has a descending motion; but the uncreated Spirit has no such motion, nor, when he is sent, does he depart from the Father. St. Jerome, Epistle 53 against Vigilantius, on that of Apocalypse 14, "They follow the Lamb wherever he goes," plainly teaches that angels are everywhere at hand on account of the swiftness of their nature. St. Gregory the Great, Homily 34 on the Gospels, when a little before he had said that angels who are sent from heaven always stand by God, gives the reason in these words: "Because although the angelic spirit is circumscribed, yet the supreme Spirit, who is God, is not circumscribed" - as if he were saying: although the angelic spirit is in a particular place and thus, when he is sent from heaven, he leaves the former place, yet because the uncreated Spirit is everywhere, wherever the angel goes, he is present to the supreme Spirit. If the angel remained in heaven, Gregory would adduce this reason in vain. The Master cites

1405. St. Augustine, De Genesi ad litteram, c. 20 and c. 26.
1406. Pseudo-Dionysius, De caelesti hierarchia, cap. ult., ante medium.
1407. St. John Damascene, De fide orthodoxa, I, c. 17; II, c. 3.
1408. Tertullian, Apologeticus contra gentes, c. 22.

this testimony in the First Book, distinction 34, cap. Sunt ergo, from Bede on Luke; but in truth it is from Gregory in that homily which is on the Gospel of Luke 15, about the ninety-nine sheep. The very same was taught by Gregory himself, Moralia, book 1, cap. 5. Finally, Bernard, Sermons on the Canticle, although he remains in doubt whether angels are corporeal, nevertheless proves them to be corporeal because they are moved; for it was indubitable to him that angels are moved locally, even if he doubted whether they are corporeal or incorporeal.

The same opinion is also openly handed down in Sacred Scripture, although certain testimonies are also commonly alleged for it which prove nothing at all. Omitting therefore those testimonies Luke 10, "I saw Satan fall like lightning from heaven," and Apocalypse 12, "Nor was their place found any longer in heaven," about which we shall speak in the disputation, cap. 3 and 2, some people prove from these that angels are said in Scripture to ascend and descend (John 1 and elsewhere). Yet not everything that is said there can be proved to pertain to local descent and ascent. For it befits the divine persons to be said to descend without local motion; for the Spirit is said to have descended upon Christ because in that place he began to appear in a new manner. More effectively is the first point proved from Job 1, where it is said that Satan "went round about and walked through the earth": for although it is also said of God in Genesis 3 that he "walked at the breeze after midday," nevertheless that is said of God by reason of the assumed body in which he deigned to appear; but it is not credible that Satan walked and went around the earth in an assumed body: demons, or angels, assume bodies as often as they appear to men. Then from Matthew 8, where the demons asked of the Lord that he send them into the swine: for although from this alone, that they are said to be sent by God to us, it is not sufficiently proved that there is motion according to place, as we shall see presently, nevertheless from that passage alleged it is rightly proved, because there they are said not only to have been sent into the swine, but also to have been sent from that body which they possessed into the swine. But for someone to be sent from one place into another cannot be done without local motion. Therefore I said that from those places where angels are said simply to be sent by God, it is not proved that they are moved locally, because, as was said in Disputation 171, cap. 2, although to be sent ought to include some "going out" on the part of the one sent, nevertheless it ought not to be according to place, but it suffices if the person who is sent, from the sender, according to substance, begins to appear in some place. And since an angel is made by God to be present, even if he did not go out from that place nor depart, he would be said to be sent by him; but he will not be said to be sent from one place into another unless he is said to go out from one into another. Thus the divine person proceeding is also said to be sent by the producer, but is not said to be sent from one place to another. Here also pertain all those places in which the demons were said to go out from bodies, which we shall report in the following chapter.

Moreover, what we have said hitherto about angels is to be understood also of the rational soul (anima), namely, not only while it is in the body, but also when separated, that it is moved: by which account the soul of Christ is said truly to have descended to the lower regions, and in Luke 16 the soul of Lazarus is said to have been carried to the bosom of Abraham. But what some say, that that was only a parable, is absurd. For in parables proper names are not commonly

introduced. And it is of faith both that the soul of Christ according to substance descended to the lower regions, and that the souls of the damned are truly there, as will be said in its own places. Wherefore Durandus errs in the First Book, distinction 37, second part, question 1, to the sixth, and in the Third Book, distinction 22, question 3, number 5, when he says that a separated soul, according to itself, is nowhere, and that it is present in hell or in purgatory only by deputation.

Caput III - That an angel moves himself

If the testimonies of the Fathers alleged in the previous chapter are rightly considered, they prove not only that an angel is moved from place to place, but also that he is moved by himself; as Gregory of Rimini very well observed, in Second Book, distinction 6, question 1, article 4; that they also move themselves is taught by Scotus, in Second Book, distinction 2, question 10; and by Major, question 11 near the end; and the holy Fathers indicate this when they assert that, on account of the swiftness of their nature, they are present everywhere. For if they were not moved from an internal principle, the fact would be attributed not to the swiftness of their nature but to the efficacy of another mover.[1409]

From Scripture too it is plainly gathered, wherever demons are said "to go out": Mark 1; Luke 4; Acts 8. For to "go out" is not said - just as neither to "go" - unless of one who is moved by his own power. For who would say that a stone which is carried "goes" or "goes out of the house"? Wherefore I do not know why Gregory said in that same place that nothing certain is had in this matter; for he seems to understand it from Scripture.

It is also proved by reason: since living things which are much more imperfect move themselves, why shall we not grant this to a most perfect substance, such as a spiritual one is? For what some contend - that in anything moving itself it is necessary to distinguish the moving part from the part moved - can in no way be shown by reason.

Capreolus to no purpose, in the Second Book, dist. 6, question 1, conclusion 1, teaches that angels cannot move themselves by a motion per se, because in them one cannot distinguish a part that moves per se and a part that is moved per se; yet that they are moved well enough by an accidental motion, as he teaches in the second conclusion - a kind of accidental motion on account of the lack of the aforesaid distinction, which indeed I do not understand. However he may be moved, one ought not to deny that he is moved by his own proper power. But to dispute about a moving part and a moved part our plan does not require.

As to the separated soul, whether it moves itself, this is not so well established from the doctrine of the Fathers and of Scripture. Only on this ground does it seem to me probable that the soul moves itself: because, since it is a most noble substance, such a power as we grant to living things ought not to be denied it.

Two things, however, seem to stand against this position. One is that the separated soul cannot move any body, as St. Thomas teaches below, question 117, article 4; therefore neither can it move itself. I answer that, first, it is much more probable, as the holy Doctor taught, that no body can be

moved by a separated soul; because, as he proves, it would have to move it by the mere nod of its will; it could move no less in the body than outside it; for there would be nothing lacking in the body to the power of the soul's will that it would have outside the body; for a different mode of existing would derogate nothing from the aforesaid power. That the separated soul understands in a different way than when conjoined is not surprising: for when it is in the body, being conjoined with the senses, it receives from them the species by which it understands; by these too it is helped to the act of cognition, by which when separated it cannot be helped; but to be able, by the nod of its will, to operate, nothing in the way of conjunction with the body stands; for, in order that it move, it does not need any quantitative contact. From this, however, there seems to follow, against the opinion of those who say that a spiritual substance is in a place by way of operation, that the separated soul is not in a place, and therefore cannot be moved: for since it cannot operate upon any body, seeing that it cannot even move it in place, in no way will it be able to be in it by way of operation. But in our opinion, which we set forth in Disputation 188, that an angel is in a place without operation by reason of that mode by which it applies itself to a body, it can very well happen that a soul be in a place and be moved from a place. Next I answer that the soul can move itself even if it cannot move other bodies: for a greater power seems necessary to move other things than to move itself.

A second thing that stands in the way of the aforesaid position is this, that the soul, while it is in the body, cannot tear itself away from it; therefore neither can it, outside the body, move itself from one place to another. I answer that the account is different: for just as the substance of a demon can in such a way be joined to one body that it is bound to it, nor does it subject to its own will that mode so as to change it, and consequently cannot be moved from that place (for the motion from that place must be by carrying off the body, the mode by which it is united to the body being left intact); so also, much more, the soul, naturally united to the body, has such a mode of union with the body that it cannot be separated from it, because it cannot leave that mode which it has not by its own will, but by the nature itself of generation; but the mode which, outside the body, by its own will it communicates to itself - by which it is joined to some body, as in a place - it is in accord with reason that by its will it can also change.

Finally observe that it is frivolous what certain men invent, that some angels are of such power that by some, as it were, impressed impulse they either bind another angel to a place or move him from it by force: for this seems proper to bodies. Those who philosophize in this way seem to be led by imagination rather than by reason, when they philosophize about spirits in the same way as if they were bodies. Wherefore, if one angel, however excellent, drive another from a place, he does not do this except by the power of God and command, as also holy men effect it; otherwise, one good angel could not bind a demon of a higher species, since by natural power he would rather be overcome by it.

Disputatio CXCV - Whether the motion of an angel is something in the angel himself

- That the motion of an angel is something intrinsic to him, Lichetus taught. Caput 1.[1410]
- That an angel is moved only to an extrinsic form, the majority have taught. Caput 2.[1411]
- Notes for the explication of the truer view. Caput 3.
- The middle position is more probable. Caput 4.
- The arguments which are opposed to our position are answered. Caput 5.
- An angel can be moved with continuous motion. Caput 6.

Caput I - That the motion of an angel is something intrinsic to him, taught by Lichetus

Although all the Scholastics, with one voice against Horushus and Durandus, admit that an angel is moved, yet they differ among themselves and hold different opinions about the nature of the motion itself. Some judge that the motion of an angel is toward some intrinsic form, which they call "where" (ubi), just as also happens in bodies. This view is followed by certain more recent authors, and expressly by Lichetus in II, dist. 2, q. 5, art. 2, where he reports Gregory's position and replies to his arguments.[1410] They also allege Scotus in II, dist. 7, q. 9, in the response to the question toward the end, when he says that when angels are moved in an assumed body, their motion is something formally distinct from the motion of the body itself; with greater reason, therefore, he ought to assert the same when an angel is moved by himself without an assumed body.[1412] Among the other Scholastics I could find none who would give support to the aforesaid opinion. For Alexander, II, q. 33, memb. 1; St. Bonaventure on I, dist. 37, art. 1, q. 1; Richard, art. 3, q. 1; Gabriel on II, dist. 2, q. ...; Capreolus, q. 1, art. 1, teach only that an angel is moved from place to place; what, however, he acquires by such motion - whether something intrinsic, or something extrinsic - they do not explain.[1413] The others, however, embrace the opposite view, as we shall see in the following chapter.

The reasons for this opinion are chiefly three. First: motion must be in the mobile; therefore real motion must really be in the mobile. But the motion of an angel is real, as was proved in the preceding disputation; therefore it must be real, and consequently intrinsic, in the mobile itself; otherwise, if it were only an extrinsic denomination, which is something of reason, it would be said by reason alone and not in reality itself that an angel is moved.

Second: an angel is not only moved per accidens by the motion of another, as in an assumed body, but also per se, so that it is by him per se primarily that it is true to say "is moved"; therefore in him there must be some real variation, in order that he be said to be moved per se. But this

1410. Lichetus, In II Sent., dist. 2, q. 5, art. 2, reporting Gregory and replying to his arguments.
1412. Scotus, In II Sent., dist. 7, q. 9, ad quaestionem dico, toward the end.
1413. Alexander of Hales, II, q. 33, memb. 1; St. Bonaventure, In I Sent., dist. 37, art. 1, q. 1; Richard of Middleton, art. 3, q. 1; Gabriel Biel, In II Sent., dist. 2, q. ...; Capreolus, q. 1, art. 1.

cannot come about unless there be in him some intrinsic change: for by an extrinsic respect to other things a real change cannot come about. For an extrinsic change does not arise unless by some real change made in one of the extremes; and since an angel is moved with no other thing changed or varied, it is necessary that some intrinsic change take place in him; if by the variation only of other things an angel were said to be moved locally, it would be not so much he as other things that would be said to be moved.

Third: an angel is in a place by some real and intrinsic mode added to his substance; but to be moved is to change place; therefore there must necessarily be a change of that intrinsic mode by which an angel is constituted in a place. For motion is nothing other than the coming-to-be of the very form that is acquired; just as whitening is nothing other than the coming-to-be of whiteness.

Caput II - That an angel is moved only to an extrinsic form, taught by many

Many other theologians affirm that an angel is moved only to some extrinsic form. In this position were Aegidius on I, dist. 37, part 2, art. 2, q. 1; Ferrariensis, III Contra gentiles, cap. 102, especially at the paragraph "Respondetur"; Caietan in this article, no. 9; on these points Gregory, in II, dist. 6, q. 1, art. 5, judges that the same is true in the motion of a body as in the motion of an angel.[1411][1414][1415][1416] For this cause some recent writers, not having well grasped Cajetan's view, supposed that he taught that an angel is not moved; although many grave authors think that a body is not moved according to place to an intrinsic form, yet for this do not assert, nor are they compelled to hold, that a body is not truly moved. This opinion has no slight foundation in St. Thomas and in Aristotle. First, St. Thomas below, question 100, article 3, teaches that angels can move bodies according to place, yet not by any other motion; for a body moved according to place is not in potency to anything intrinsic.[1417]

Next, Aristotle, Physics VIII, cap. 7, text 59, says that local change alone befits the more mobile; whence he gathers that local motion is nobler than the others, because by it nothing of those things that are intrinsic to the mobile itself is changed; and therefore it is more fitting to a nobler body, whose other changes are not ad intra. Wherefore, if nowadays bodies by motion according to place are moved by something extrinsic, much more should this be asserted of angels.[1418]

Moreover, as to bodies, reason itself confirms this very point: for in this kind of motion a body is said to be moved to a place; but place is an extrinsic form of the located thing; therefore to be moved to a place, that is, motion according to place, is only to an extrinsic form. I add that the last predicaments are commonly designated only by extrinsic denomination; thus "to be in a place," which is called the predicament "where" (ubi), and is said to be the terminus of motion according to place; whence it follows that if the terminus of this motion is an extrinsic form, the motion itself

1411. Aegidius (Giles of Rome), In I Sent., dist. 37, pars 2, art. 2, q. 1; Ferrariensis, In III Contra gentiles, cap. 102, § "Respondetur"; Caietan, on this article, no. 9; Gregory of Rimini, In II Sent., dist. 6, q. 1, art. 5.

1414. Aegidius (Giles of Rome), as above.

also will be a denomination only extrinsic to the mobile. Some, to be sure, assert that motion according to place is something intrinsic, but the form toward which it tends is extrinsic; but philosophy rightly opposes this. For this reason Aristotle, Physics III, in the first and second chapters, defining motion, says that it is the act of a being in potency, as in potency; because motion is an act of the mobile; but by this very fact it leaves the mobile in potency to the term, whereas the act which is called perfect leaves it in potency to other forms; and so motion itself is called by Aristotle in Greek an imperfect act; thus heating is an imperfect act; such an effectible act, which by the very fact that it is the act of what is to be heated, makes the thing be in potency to the heat by the form which is the term of the motion. If therefore an imperfect act and motion is intrinsic to the mobile, it leaves the mobile in potency to the terminus and to an intrinsic form: for how could it be that being moved is intrinsic to the mobile, and yet the motion be extrinsic? And so rightly Aristotle, Physics III, cap. 3, said that motion is action and passion, and that the work, or term, of action is the fact done; but the work, or term, of passion, is the effect produced. If therefore the effect is extrinsic to the mobile, it follows that the action will also be extrinsic; and if the fact is extrinsic, the action likewise will be extrinsic. Gregory has heaped up many other reasons to prove that local motion is to an extrinsic form, and that the motion itself is also extrinsic. Of which I choose this one alone: If the terminus of motion according to place is an intrinsic form which is called "where" (ubi), then either it is acquired in an instant - then it would be acquired at the first instant and not be at the prior - or it is acquired successively. But succession cannot come about in an instant; and if the motion were successive in an instant, the form would already have parts, which seems absurd.

Some have held this opinion when an angel is only moved with a bodily motion, as when he is carried in an assumed body; since the angel moves some body whole and entire, and along with it the angel himself is moved; then they say that an angel is moved by an extrinsic respect by reason of the motion existing in the body itself. But when he is moved per se, because he himself of himself changes presence without the motion of any body with which he might be moved, then he is said to be moved by a motion intrinsic and inherent to himself.

Caput III - Notes for the explication of the truer view

In order that, between these extreme opinions, we may assign a kind of middle one which seems to us more probable, some notes must first be premised. The first is that whatever is moved is said to be moved either per accidens, which is by the motion of another; or per se, which is by ...

But by another motion; because a body set in motion according to place is not in potency to anything intrinsic. Next, Aristotle in Physics VIII, chapter 7, text 59, says: "By locomotion alone nothing of the things which are in the subject itself is changed, as when something is altered." From this he gathers that motion according to place is more noble than the others, because by it nothing of the things which are in the mobile itself is changed; and therefore it suits a more noble body, which is not capable of the other motions: and if bodies are set in motion according to place toward something extrinsic, much more does this seem to be asserted of the Angels.[1419] Moreover,

with regard to bodies he confirms this very point by reason, because in this kind of motion a body is said to be moved to a place, but place is an extrinsic form to the thing placed which is moved to a place: therefore motion according to place is only toward an extrinsic form. Add that the last predicaments are commonly assigned through extrinsic denomination only; among them indeed one is "to be in a place," which is called the predicament "where" (*ubi*), and it is said to be the terminus of motion according to place: whence it comes about that, if the terminus of this motion is an extrinsic form, the motion itself also will agree to the mobile by extrinsic denomination only. Hence what some assert - that motion according to place is indeed something intrinsic, but the form toward which it tends is extrinsic - openly clashes with good philosophy: for this reason Aristotle in Physics III, chapters 1 and 2, defining motion, says that it is the act (*actus*) of a being in potency (*potentia*), insofar as it is in potency; because motion is such an act of the mobile that by this very fact it leaves the mobile in potency to those other forms which are called perfect act: and so motion itself by Aristotle in Greek is called ἐντελέχεια, endelecheia, that is, imperfect act. Such is heating, as heating, which, by the very fact that it is the act of what is heatable, makes that subject to be in potency to being hot through the form which is the terminus of the motion. If, therefore, motion, as imperfect act, is intrinsic to the mobile, it will leave it in potency to an intrinsic terminus and form: for how can it be that to be moved is intrinsic to the mobile, and that motion should be extrinsic to it? And therefore Aristotle, Physics III, chapter 3, said that motion is action and passion, and that the finished product is the terminus of action, while the state of being affected is the terminus of passion. If, then, to be affected is extrinsic to the mobile, to suffer will also be extrinsic; and if the product is extrinsic, action too will be extrinsic.[1420] Gregory heaps up many other reasons to prove that the motion of bodies is toward an extrinsic form, and that the motion itself is extrinsic. Of these I have chosen this one alone: If the terminus of motion according to place is an intrinsic form, which is called "where" (*ubi*), either it is lost in an instant by a first not-being, and another is acquired in the same instant, or it is acquired successively. It cannot be acquired in an instant, otherwise motion would be made in an instant; nor can it be acquired successively, because then that form would have parts, which seems absurd.

Some defend this view when an Angel is moved only by the motion of a body, as in an assumed body; or when an Angel moves some body whole at once, and together with it the Angel himself is moved: for then they say that the Angel is moved by an extrinsic respect on account of the motion existing in the body itself; but when the Angel is moved per se, because he of himself changes his presence without the motion of any body with which he is moved, they say he is moved by a motion intrinsic and inhering to himself: and thus Ferrarensis taught in the chapter cited. Yet although in the ninth [place] he asserts that an Angel is moved in two ways, per se and per accidens, as has been said, nevertheless about an inhering motion he teaches nothing. However, their opinion can be recommended in this way: When an Angel is moved by the motion of another, he does not have

1419. Aristotle, Physics, VIII, chapter 7, text 59.
1420. Aristotle, Physics, III, chapters 1 - 3.

a motion proper to himself, therefore neither one inhering to himself; but by respect to the motion of another, in which he is, he is said to be moved. Conversely, when he is moved per se, he is moved by a motion proper to himself: therefore by a motion intrinsic and inhering to himself.

Notations for explaining the truer opinion

Between these extreme opinions we assign a certain middle one, which seems to us more probable; certain notations must be premitted. The first is that whatever is moved, is moved either per accidens or per se. Per accidens everything is said to be moved which is moved by the motion of another; per se, however, that which is moved by a motion proper to itself. But motion per accidens is assigned by Aristotle in Physics, chapter 1, in three modes. The first is of those things which are conjoined per accidens with that which is moved per se; in this way the "musical" is said to be moved, and motion can extrinsically befit that which is moved per accidens. The second is of the part with respect to the whole. The third is of the whole with respect to the part. And in these two modes that which is moved per accidens receives per se a motion formally inhering; it is nevertheless said to be moved per accidens, that is, not adequately; and thus it is moved by a motion that is adequate to another.

The second notation is that to be moved per accidens, that is, by the motion of another, happens in a twofold way. First, by the motion of another as efficient cause: and in this way Aristotle said in Physics VI, text 86, chapter 10, that a man in a ship is moved per accidens, because the motion of the ship causes motion in the man, not because by the motion of the ship, and not by a motion proper to himself, the man is moved. For since the ship and the man are two subjects of motion, it is necessary that each be moved by its own proper motion, and thus that each also be in a place peculiar to itself. Next, to be moved per accidens happens by the motion of another formally, when something is denominated as being moved by the motion of another, as the "musical" is said to be moved by the motion of the man in whom it is.[1421]

Third notation. About the presence of an Angel in a place, or in a body, one must philosophize in the same way as about the presence of the body of Christ in the Eucharist, and of the rational soul in the body: for although the foundation is not the same for all these, so that they exist in a place or in a body, yet in this they agree, that by a certain absolute mode they are said to be conjoined to a body, and to have a relation of presence to it: just as Christ also is conjoined to the quantity and accidents of bread. And although any body, by force of the proper passion of quantity, always has some mode which we call "where" (*ubi*), which by the will can be changed into another of the same genus by motion, nevertheless there is a difference between this mode of a body and the mode of an Angel, of the rational soul, and of the body of Christ in the Eucharist. First, because the mode of a body is of such a nature that of itself it entails a relation of distance to fixed points, even if it be in a vacuum or outside the heaven, as was noted in disputation 29, chapter 3: and therefore a body can by itself alone be moved according to place even in a vacuum and outside the heaven, because to be moved with respect to place is nothing else than to change a mode of

1421. Aristotle, Physics, VI, text 86, chapter 10.

distance; but a body can change this mode anywhere. But the mode which we attribute to an Angel, and which the soul has so that it may be in a body, and which the body of Christ has so that it may be contained under the species of the Sacrament, does not of itself ordain the Angel, or the soul, or the body of Christ to any relation of distance, but to the thing and body to which they are conjoined and united: for spiritual things, or things having the mode of spirituals, cannot of themselves have situation, except by reason of the body or quantity to which they are conjoined: and thus they cannot be or be moved in a vacuum, as was there proved.

If, moreover, these three had of themselves situation with a relation of distance, as any body whatsoever has, it would follow that they could not be moved from an extreme to an extreme except through a middle; which we will show to be false in disputation 195. Whence it follows that an Angel, the soul, and the body of Christ, with that same mode intrinsically in no way varied, can be moved with a body: for since that mode only unites these substances with a body, or with a quantity and accidents, the same mode being retained, they can be moved with the body, and change distance along with it. For since of themselves these three do not have distance except by reason of the body or quantity to which they are conjoined, of themselves also they cannot change that distance, except by reason of the change which is made in the body or in the quantity to which they are conjoined: but, contrariwise, for the body of Christ to begin to be under other species, and the rational soul, if it could, and an Angel to be in another body under exactly the same distance in which another was, it must necessarily change mode, but not distance; for neither the Angel nor the soul, remaining in the same mode, can be conjoined to diverse bodies. It is therefore a sign that that mode by which it is united to a body does not of itself entail distance, but only an order with the body to which it is conjoined, whether it be in this place or in another.

I now suppose, moreover, that the rational soul is united to the body by reason of a spiritual mode which it has in itself. Nor do I approve the opinion of those who say that the soul is united to the body by some material mode existing in the matter itself, so that thus a man should be defended to attain the terminus of generation, which he thinks to be a certain mode of union: for if the mode of union were in the soul itself, it could indeed be spiritual, and therefore a man could not by his generation attain that terminus. Their opinion for this reason does not please me: both because it cannot be understood that a soul newly informing matter should not in itself be otherwise disposed, and therefore should not have some mode of union; for by the mode of matter alone it cannot be changed in itself so as to inform what according to itself it would not inform. Next also because the terminus of generation is neither a mode of union existing in the soul, nor existing in matter, but the whole composite according to the existence (*esse*) of the whole, as will be proved below in article 7.

Objection. Yet someone may say, if an Angel can have a mode by which he is present to some body, he could also have a mode by which he would be absent from it; for it seems to be the same subject of contraries.

Solution. I answer: the presence which an Angel has to the body to which he is conjoined is not a presence with respect to immobility and distance to fixed points, but only to the substance and quantity of that body, wherever it may be; and thus he can have not a mode opposed to distance from a body with respect to immobility and fixed points, but a negation of conjunction with it.

Someone will then ask further, if an Angel were in the same body, and a body were placed by the absolute presence of God in two places, could he by his own power remain in them; just as by his own power he can in diverse places move the same body, as the rational soul can move the same body in diverse places? - what indeed commonly is said of bodies existing in two places, namely, that while it suffers in one place from some agent, it suffers this in the other also, even if in the other place it has in effect that action and passion; for action and passion denote an order to a place, and those things which by an order to one place befit a body existing in two places, do not befit it, even though in another place. I reply that it can remain; and that the whole point is to be established of Angels not by their own power, but by the divine. For if by his own power an Angel were in that body, his conjunction being supposed, then by this very fact that by the power of God the body were placed in diverse places, the Angel also would be placed; nor would the Angel by this be compelled to leave the body to which he was conjoined; because his conjunction would only regard the body according to itself absolutely, not as in this place or that: for that miracle does not of necessity dissolve the natural bond of conjunction between spirit and body; otherwise by this very fact without a new miracle the bond of the soul with the body would be dissolved, and the bond of accidents with a subject, which is false. Just as, therefore, a fourth agent cannot act upon a body, except through its original situation; nevertheless, while it acts upon it in this place, its effect naturally impressed upon the body results in that other place in which by the prior power of God that body has been placed: so too, even if while an Angel by his proper power were in that body in this place, he would remain united to the body in the other place in which by the divine power that body existed; the unity of the body would persist in that place, because this union does not regard that or this distance and fixed points, but this body, wherever it be. Wherefore, although an Angel by his proper power cannot be in several non-contiguous bodies, because he cannot have diverse modes of union with diverse bodies, yet he can by his own power be in the same body existing in several contiguous places, because to have diverse modes with diverse bodies is one thing, but to persevere in one and the same mode in the same body is another; and so an Angel in that case would be in the same body by the same mode in both places.

The middle opinion is more probable.

Caput IV - The more probable middle sentence

I judge the middle sentence to be much more probable, which is partly the first, partly also contains the second, and consists in three points. The first is, when an Angel is moved in place, not by the motion of a body, but by himself, there must be in the Angel some power by which he has an intrinsic mode. The second is, that motion according to place does not formally consist in the variation of that mode, but in a certain extrinsic denomination of distance from fixed points; and

consequently the terminus of the motion is not that real mode, but that distance. The third is, that an Angel is moved per accidens by the motion of the body in which he is, and no intrinsic change is made in him. These points must be proved from their proper foundations. The first part is easily gathered from what has been said in disputation 188, chapter 7: for since an Angel is in a place by reason of some mode by which he is united to the substance of some body, it is necessary that the mode be changed, so that the Angel be placed in a different body, just as if the soul were to unite to a different body it would require a different mode; and ...

The second part is proved from the third note: for since the mode of the Angel by which he is united to a body does not of itself induce a respect of distance from fixed points, but only unites the substance of the Angel to this body or to that, wherever that be; therefore, whenever the body is moved and the Angel remains united to the same body, he will not vary the mode, just as, while the soul is in the body, wherever it accompanies it, it retains the same mode of union. Thus the formal notion of motion does not consist in the change of that mode which the Angel has in himself, but in the variation of an extrinsic respect of distance, which he receives by reason of the body. For motion according to place is formally ordered to a new distance from fixed points, or to such a mode as by itself necessarily entails that distance: but that mode of the Angel cannot of itself have distance from fixed points, except by reason of the body in which he is; therefore motion according to place does not consist in the variation of that mode which the Angel has. Therefore, when the Angel, the bodies not being moved, is himself moved because he is successively united to diverse bodies, he is not formally moved in that he changes in himself that mode of union with the body, but in that he changes a different distance which he has not primarily from himself nor from that mode, but from the bodies to which he is united; and hence in him there is only an extrinsic respect.

For the difference between the mode which a body has from its quantity and the mode which an Angel has by his will is manifest, as we noted in the places cited: because the mode of a body from itself necessarily induces a respect of distance from fixed points, but not the substance of the Angel of itself, except by reason of the body to which he is conjoined, as was shown in disputation 29, chapter 3. But the mode by which he is conjoined to a body is entirely the same at diverse distances, if he always adheres to the same body, as we were saying of the rational soul in that third note.

Objection. Yet someone will object in this way: Whenever in some mobile there is motion by an extrinsic respect, it is necessary that that motion be intrinsic in another; for nothing is denominated extrinsically except from a form formally existing in another subject. But in this case there is nothing that is moved by a motion inhaerent to itself; therefore neither will the Angel be said to be moved extrinsically.

It is answered: Many things are denominated extrinsically, not from a form of the same kind existing in another, just as a wall is denominated right from the right-handedness of an animal; but some things are extrinsically denominated from an opposite form, as a creator from a creature, and a visible from sight; and sometimes even an extrinsic denomination is taken from circumstances wholly absolute, as we said in disputation 115, chapter 2. It is always true, however, that every

extrinsic denomination is taken from something real. Thus, then, an extrinsic denomination of motion according to place befits the Angel from the various distances of the bodies to which he is successively conjoined, because from those distances he is also said to successively be distant: for since in himself he does not have the posture of distance, but by reason of the body to which he is conjoined, and since he is successively united to various bodies or to various parts of the same, it comes about that he is also said successively to be distant, and therefore to be moved.

The third part of our position can also easily be proved from what has been said; for an Angel, that he may be conjoined to some body and be said in some way to be in it, must have over his substance some mode, as has been said, so that as often as he remains conjoined to the body, wherever that be or wherever it be moved, he always retains the same mode, as the soul does while it is in the body, and as Christ does in the Eucharist. Therefore, if the body in which the Angel is should be moved, and he himself should always remain in it, he will indeed be moved with no intrinsic change made in him, not only not with that in which motion according to place formally consists, but not with any prior change either, as we said in the second part. For since the Angel does not have distance from himself, nor from any other mode intrinsically his, but only extrinsically from the body in which he is, as Christ in the Eucharist and the soul in the body; and since he changes this distance along with the body and by this very fact is moved according to place; it follows that motion according to place, by which he is said to be moved extrinsically, only denominates him. And since he always retains the same mode by which he is conjoined to the body, when he remains in the same, as it is moved along with it, there is made in him no intrinsic change either which is prior to local motion, as there is in the case of the second part.

Therefore, in this kind of motion the Angel, by the motion of the body, is moved per accidens, not only efficiently, but also formally; that is, he is denominated to be moved by the motion of the body itself, in the very way in which the soul, when it is moved with the body, is said to be moved. For who would say that the soul acquires in itself a peculiar mode of place and distance? For thus it would be moved not per accidens but per se, that is, by its own proper motion, and it would be moved neither by itself nor by the mover of the body, but by him who preserves it present to the body; as some wrongly think of Christ, when he is moved in the Eucharist, as we shall say presently.

Therefore the things which we have said can be confirmed and more fully unfolded by the example of the body of Christ in the Eucharist, which must necessarily be said to be moved per accidens only by the motion of the species and by the mover of the species. Thus taught St. Thomas, III, question 76, article 6, and Cajetan, and more recent Thomists there, Paludanus on the Fourth, distinction 10, question 3, article 3, Richard, article 4, question 1, Soto, question 6.[1422] The reason, however, is manifest: for the words of consecration, and God by their ministry, effect only this, that Christ be present to the species, not as present in this place only or in that, but as those species are such. Therefore the mode intrinsically by which Christ is united to the species does not of itself entail distance from fixed points, but by reason of the species themselves Christ is said to

1422. St. Thomas, Summa theologiae, III, q. 76, a. 6; Cajetan; more recent Thomists there; Paludanus, In IV Sent., dist. 10, q. 3, a. 3; Richard, a. 4, q. 1; Soto, q. 6.

be distant. When, therefore, someone moves the species themselves, by this very fact he necessarily confers efficiently on Christ the distance of the species; therefore he is said to be moved per accidens, not per se, but per accidens by the motion of the species in which he is.

Likewise, he who were to move a ring in which a demon or an Angel were would necessarily move the Angel by this very fact, because the Angel himself would preserve the mode of union with the ring. But if the motion of the species of the Sacrament, or of the ring, were not derived extrinsically into the body of Christ or into the Angel, but they were moved by a proper motion inhering in themselves, it would follow that Christ is not moved by the priest, nor the Angel by him who carries the ring; but that the body of Christ is moved by God alone, who preserves him in the species, and that the Angel is moved by himself, who continuously keeps himself in the body: which things Scotus in the Fourth, distinction 10, question 6, Maior, question 6, and Gabriel, question 1, article 2, conclusion 10, and on the Canon, lecture 47, letter H, willingly assert, because he thinks that Christ in the Eucharist has a proper distance in which he is proximately preserved by God. But that this follows is manifest: for motion is effected by that by which distance is also effected; but the distance in the body of Christ is effected by God alone, if he has some proper distance, as is manifest; therefore he is moved by him alone. But who does not see that this is absurd? For hence it would follow that a priest, when asked what he is carrying, could not answer, "the body of Christ," because he himself does not move, nor carry, the body of Christ; but Christ himself carries himself: the same, in the case of an Angel present in a ring which is moved along with someone, must be said. Since therefore he who moves the species or the body is said to move Christ or the Angel, it follows that Christ and the Angel are moved per accidens by the motion of the body or of the species, by an extrinsic denomination only derived therefrom.

Satisfaction is given to the arguments that are opposed to our position.

Caput V - Answers to the arguments opposed to our position

Moreover, since our position has proceeded by a certain middle way between opposing views, it must needs refute the arguments of each opinion which seem to be opposed to it.

To the first argument I answer that not every real motion must be intrinsic in the very mobile which is said to be moved really; but a mobile can undergo such a denomination by an extrinsic denomination only. For many other extrinsic denominations are attributed to things denominated along with this particle "really": we say, "God really creates," and yet he is said to create not by a creation intrinsically in himself but in the creature existing; for that particle "really" does not denote an intrinsic inherence of a form, but a real foundation from which the denomination is taken. Thus also in our case, the things which are said to be moved per accidens are said to be moved really and to change distance, as music is in the soul and the soul is in the body: although in themselves they receive neither motion nor distance intrinsically, but are said to receive them by an extrinsic denomination; which many learned men, whom I cited in chapter 2, judge to be true even of the motion of bodies which are moved per se; and Aristotle has not obscurely indicated this.

To the second argument I answer that indeed the Angel is moved per se and per accidens, as has been explained in the second and third part of our position; but in neither way is he moved by a motion intrinsically inhering in him, because the distance to which local motion is ordered is in no way intrinsically -

But on the contrary to the second argument I answer, the Angel indeed is moved per se and per accidens, as was explained in the second and third part of our position; but in neither way is he moved by a motion intrinsically inhering in him, because the distance to which local motion is ordered in no way intrinsically befits the Angel, neither by reason of himself, but by reason of the body in which he is, and extrinsically: yet there is always some intrinsic change, from which that extrinsic denomination of motion according to place proceeds. First, when the Angel is moved per se, he is always varied intrinsically in that mode by which he is united to bodies; then, when he is moved per accidens by the motion of the body in which he is, intrinsically the body is always changed, by whose motion secondarily, that is, per accidens, the Angel is said to be moved.

But you might say: If the Angel, when he changes different bodies into different distances, is said to be moved by an extrinsic denomination only, and is never moved by a motion intrinsically inhering, it follows that he is always moved per accidens: for that which is moved per se first ought to have in itself an intrinsic motion. I answer, to be moved per se first is not to be moved by an intrinsic denomination, nor is it to be moved per accidens to be moved by an extrinsic denomination: for sometimes something is moved by an intrinsic denomination which yet is moved per accidens, as an integral part in the whole; but to be moved per se first is to be moved, not by the motion of another, nor after something else is first moved, but by one's own motion, whether that be denominated intrinsically or extrinsically: and because, when the Angel is moved in the aforesaid manner, he is not moved by another's motion, but by his own proper motion, even if by an extrinsic denomination only, he is said to be moved first and per se; but when he is moved by the motion of a body, he is said to be moved per accidens, because the motion of the body secondarily denominates him.

Reply to the third argument is clear from what was said in chapter 4, in confirmation of the second part, namely that, while the Angel is moved per se, a certain real intrinsic mode is indeed changed, but the motion does not formally consist in its mutation, because that mode of itself is not the cause of the distance, in the variation of which is placed the formal notion of motion according to place; but the whole distance befalls the Angel secondarily from the body to which he is conjoined.

Second. The arguments adduced in the second chapter for the opinion of Giles and others can prove nothing against ours: for we grant that the Angel's motion according to place, whether per se or per accidens, befits the Angel as placed in an extrinsic denomination. However, because we do not think true what they assume and teach universally about bodies, satisfaction must be given to them also. First, therefore, we say that bodies are moved to a form which we call where (ubi): for this arises from the proper passion of quantity, which it has from comparison to another body, as we noted in chapter 3 in the third notation; I grant indeed that St. Thomas and Aristotle, in the passages alleged in the second chapter, strongly incline to the opinion which says that motion

according to place in bodies is not effected toward an intrinsic form, unless we are willing to interpret them of an inhering form which is a disposition to corruption; nevertheless, it seems more probable to posit in the very body that is moved an intrinsic form which is called where (ubi), and to locate in its variation the motion according to place. The reason brought there proves nothing, because motion according to place is not toward the containing place, which is the ultimate surface of the surrounding immobile body, but toward that intrinsic mode of the body which is called where (ubi): otherwise neither outside the heaven nor in a vacuum could a body be moved, nor the first moved according to Aristotle's own opinion, since he thinks there is no place there; but that a body can certainly be moved in a vacuum and outside the heaven, we showed above in disputation 29, chapter 3.[1423]

I add, however, that those who say that motion according to place is toward an extrinsic form, but the motion itself intrinsically inheres in the mobile, teach things mutually repugnant, as I proved above in chapter 5.

And to the argument of Gregory of Rimini brought in the same chapter I reply, that whenever a body rests at some point, it has that mode of where indivisible indeed, which, when it begins to be moved, it leaves by the last being in the place, which is the last not-being-in-motion; and in any instant - mutatis mutandis - that is, when the Angel is moved per se, it has in the same way an indivisible form, which in the same way it leaves, which can be called proportioned to the quantity of the body; but in the succession of motion it certainly acquires a form of where successive, which has latitude, and is said not to be proportioned to the mobile itself; nor is it absurd, as Gregory falsely supposes, to concede successive parts to this mode of the body which we call where.

Moreover Gregory argues this also thus: A body, when it rests, does not have any mode: therefore neither when it is moved will it have one: for if when it rests it had a mode, God could remove it from the body, nor would it be evident under what other mode then the mobile would remain: therefore it is a sign that such a mode is altogether fictitious. I answer, just as figure follows determined quantity, which Aristotle places in the predicament of quality, which is a positive mode of quantity, and God cannot remove all figure from a quantity, but it will always retain this or that figure, indeed with the quantity unchanged he cannot remove the very figure which it now has; so too that form of where, which is called a mode of commensurable quantity, cannot altogether be removed from the mobile, but of necessity it has one or another; lastly, that very one which it now has while resting at this point it will always have, unless it be moved from there. From what we have said here and in disputation 188 one may gather that existence in place, which befits Angels and bodies, is not under the same predicament nor does it agree under any one univocal concept. For the where of bodies is an intrinsic form, but that of Angels is only an extrinsic denomination, as has been said. Nor indeed ought the theologian or philosopher be anxious in assigning the various species and genera of the predicament; for there are other things among the last six in which they can scarcely or in no way be assigned, as happens in when and

1423. Aristotle, Physics VI, chs. 4 and 10; see above, Disputation 29, ch. 3.

having. For when Aristotle assigned these last six predicaments, he did not wish them to come under the laws of all the others; rather he assigned them, as it were, as principal heads along with the others, to which all the things about which men are wont to dispute might be reduced.

Furthermore, since everything that is moved by a continuous and successive motion must be partly at the terminus whence and partly at the terminus whither, as Aristotle teaches in Physics VI, chapters 4 and 10, St. Thomas most fittingly explains this of Angels in this article in solution to the first: not that the Angel according to some part of himself is partly at the terminus whence and according to another part at the terminus whither - this would be repugnant to him, since he has no parts - but because he has a part of the terminus whence and a part of the terminus whither; to each he is likened and approaches.[1424]

On the occasion of this doctrine Scotus more at length disputes in II, distinction 2, question 9, article 4. To the argument, in solution 3 of the principal, whether a point, if it could exist separately, could be moved continuously, and against Aristotle he proves that it could be moved continuously along a line, and he dissolves all his reasons, some of which do not militate against the Angel's motion, except this one: "Everything that is moved is partly in the terminus whence, partly in the terminus whither." For Aristotle clearly understands it of the part of the mobile, not of the part of the terminus whence and whither; yet it suffices, as St. Thomas expounded, that the mobile have on its part something of each terminus, even if it have no parts in itself, as an Angel. Let the question about the motion of a point be left to philosophers for debate: to me it does not seem impossible that it be moved, if it were separate, just as it is moved when conjoined; and by the same reason, if an Angel could be in an indivisible place, he could be moved continuously along a line in the same way. Here men are wont to dispute about the measure of the Angel's motion, about which enough was said in disputation 36, chapter 1; whether indeed the Angel is said to be moved discretely, when he is at the terminus whence, or when he is at the terminus whither, we shall see below in disputation 197, chapter 4

Caput VI - An Angel can be moved by a continuous motion

St. Thomas in I, distinction 37, question 4, article 1, seems to have taught that the Angel's motion is not continuous; this opinion was followed by the Hibernian, whom Gregory reports: yet all the Doctors alleged suppose that the Angel can be moved with this kind of continuous motion, which the same holy Doctor expressly taught in this article, together with Cajetan and all more recent Thomists there; likewise the Ferrarienis in Contra gentiles, book 3, chapter 102.[1425] For the clearer understanding of the first doubt: Scotus in II, dist. c., question 9; Maior, question 12, conclusion 2; Marsilius in II, question 7, conclusions 3 and 4; and Gregory at length in II,

1424. Aristotle, Physics VI, chs. 4 and 10; St. Thomas, Summa theologiae I, q. 53, a. 1, ad 1.
1425. St. Thomas, Summa theologiae I, q. 53, a. 1; Cajetan there; "Ferrarienfis" (Contra gentiles, III, c. 102).

distinction 6, question 2.[1426] Nor do I see by what reason this can be denied, if we shall have said that the Angel is in a place by a transitive operation, or by some other reason, in whatever way we shall have said that he is in a divisible place.

Articulus II - Whether the Angel passes through the middle

Objicitur: On the contrary it seems that the Angel does not pass through media.

1. For everything which passes through a middle, first passes through a place equal to itself, greater than the middle. But the place equal to an Angel, which is indivisible, is a point-like place. If therefore the Angel in his motion passes through a middle, it must be that he numbers infinite points by his motion. Which is impossible.
2. Moreover, an Angel is of a simpler substance than our soul. But our soul by its thinking can pass from one extreme to another without passing through a middle. For I can think of Gaul, and afterwards Syria, thinking nothing of Italy, which is in the middle. Therefore much more can an Angel pass from one extreme to another without a middle.

But on the contrary: If an Angel is moved from one place to another, when he is at the terminus whither, he is not being moved, but is changed. But before every being-changed there precedes a being-changed-in-process. Therefore while existing somewhere he was being moved. But he was not being moved when he was at the terminus whence. Therefore he was being moved while he was in the middle. And thus it is necessary that he pass through the middle.

Respondetur: I answer that, as was said above, the local motion of an Angel can be continuous, and not continuous. If therefore it be continuous, an Angel cannot be moved from one extreme to the other without passing through the middle: because, as is said in Physics VI, the middle is that into which that which is continuously changed first comes, rather than into that which is changed last. For the order of prior and posterior in continuous motion is according to the order of prior and posterior in a magnitude, as is said in Physics IV.[1427] But if the motion of an Angel be not continuous, it is possible that he pass from one extreme to another without passing through a middle. This is clear thus. Between any two extreme places there are infinite middle places, whether divisible places be taken, or indivisible. And of indivisibles it is manifest, because between any two points there are infinite points in the middle, since no two points follow upon one another without a middle, as in Physics VI is proved. But about divisible places it is necessary to say this. And this is demonstrated from the continuous motion of some body. For a body is not moved from place to place except in time. But in the whole time measuring a body's motion it is not possible to take two "nows" in which the body that is moved is not in a different place. For if it were in one and the same place in two "nows," it would follow that it also rested there: since to rest is nothing else than to be in the same place now and before. Since, therefore, between the first now and the last of

1426. Scotus, In II Sent., dist. 2, q. 9; Maior, q. 12, concl. 2; Marsilius, In II, q. 7, concl. 3 - 4; Gregory (of Rimini), In II Sent., dist. 6, q. 2.

1427. Aristotle, Physics VI, ch. 6; IV, ch. 11.

the time measuring the motion there are infinite "nows," it is necessary that between the first place whence it begins to be moved and the last place at which the motion is terminated there be infinite places. And this also appears to sense. Let there be one body of one palm, and let the road along which it passes be two palms: it is manifest that the first place whence the motion begins is of one palm, and the place at which the motion is terminated is of the other palm. But it is also manifest that when it begins to be moved, it gradually leaves the first palm, and enters the second. Therefore, insofar as the magnitude of the palm is divided, according to this the middle places are multiplied: because every point marked in the magnitude of the first palm is the beginning of one place; and a point marked in the magnitude of the second palm is the terminus of the same. Whence, since a magnitude is divisible to infinity, and points are also infinite in potency in any magnitude, it follows that between any two places there are infinite middle places. But the mobile does not consume the infinity of middle places except through the continuity of the motion: because, just as the middle places are infinite in potency, so also in a continuous motion there are certain things to be taken as infinite in potency. If therefore the motion is not continuous, it is not necessary to traverse all those infinite middles, but it can pass from one extreme to the other without going through every intermediate.

If the motion is not continuous, all the parts of the motion will be numbered in act. If therefore any mobile whatever is moved by a non-continuous motion, it follows that either it does not traverse all the middles, or else that it actually numbers infinite middles. Which is impossible. Therefore, according as the angel's motion is not continuous, he does not traverse all the middles. But this - namely, to be moved from an extreme to an extreme and not through the middle - can befit an angel, but not a body: because a body is measured by, and contained under, place. Hence it must follow the laws of place in its motion. But the substance of an angel is not subject to place as contained, but is superior to it as containing. Hence it is in his power to apply himself to a place, as he wills, either through the middle or without the middle.

Reply to the first: The place of an angel is not taken as equal to him according to magnitude, but according to the contact of power. And thus the place of an angel can be divisible, and not always a pure point. Yet, as has been said, the middle places also, even divisible ones, are infinite. But they are consumed through the continuity of the motion, as is evident from what has been said.

Reply to the second: When an angel is moved locally, his essence is applied to diverse places; but the essence of the soul is not applied to the things it thinks of - rather the things thought are in it. And therefore it is not similar.

Reply to the third: In continuous motion, "to have-been-changed" is not a part of the motion, but its terminus. Hence "to be moved" must be prior to "to have-been-changed." And therefore such motion must be through the middle. But in non-continuous motion, "to have-been-changed" is a part, just as unity is a part of number. Hence the succession of diverse places, even without a middle, constitutes such a motion.

Explication of the Article.

The conclusion is: When an angel is moved by a discrete motion, he does not pass through the middle. Concerning the doctrine of this conclusion, we must dispute in the following disputation: for it is entirely the same controversy, whether an angel can be moved from extreme to extreme without the middle, and whether he can be moved by a discrete motion. Therefore St. Thomas supposes that an angel can be moved discretely (which below we have to examine), and he teaches that when he is moved discretely, he does not pass through all the places, and he proves this by the following reason: between any two assigned places there are infinite others - whether the discussion is about indivisible points (which is most well known), or about divisible places mutually communicating, whose multitude is taken according to the multitude of respects of immobility to fixed points; which are plainly infinite. Therefore, if an angel, while he were moved by a discrete motion, were to traverse the whole space and the middle, he would number all those places, which are infinite - an absurdity. This reason, which to some seems to prove nothing, in my judgment is efficacious and evidently demonstrates what it contends. Therefore, to confirm it, certain points must be noted.

They object, then, in this way: Even if a mobile, while it is moved by continuous motion, traverses all those indivisible places which we said are infinite, nevertheless on that account it is not said to number them: so also an angel, even if he were to traverse them by discrete motion, would not number them. For it is not impossible for an infinite to be traversed; but that an infinite multitude be numbered is repugnant. For, as Aristotle says in Physics VI, chapter 2, texts 18 and 19, something is said to be infinite in two ways: one, by division, because it can be divided, although it is finite in extremes; and an infinite of this sort can be traversed: another is infinite in extremes, which lacks end and beginning; and an infinite of this sort cannot be traversed. But the space, even if it contains infinite places by division, is not infinite in extremes but by division; therefore it can be traversed in infinite instants of time, which also make an infinite, not in extremes but by division.[1428]

But those who attempt in this way to impair St. Thomas's argument do not advert that the ratio of continuous and of discrete motion is altogether diverse; and hence that in continuous motion infinite places, which constitute an infinite only by division, can be traversed - in infinite instants of time also - but not in discrete motion, as St. Thomas's reason contends. For in continuous motion, even if the mobile traverses infinite places, it does not number them, because number consists in discreteness, and nothing can be numbered except discretely. Wherefore, if an angel were to traverse those infinite places that communicate, not by continuous motion but by discrete, he would not only traverse them, but also number them: for that motion would be as it were by leaps; and thus it would be necessary that there be a first leap and a last, and consequently that, traversing discretely, he number all.

Then it must be observed that the continuous motion of an angel ought to be made through all the places that communicate and are in the space. For if an angel were moved in such a way that he left, at once, the ten-foot place, for example, which he first occupied, and occupied another ten-foot

1428. Aristotle, Physics VI, ch. 2, texts 18 - 19.

place which follows next and does not communicate with the first, he would not be moved continuously, but his motion would be discrete - in which some have been deceived, thinking that then too the angel's motion would be continuous if he were moved in continuous time. For the continuation of time does not suffice for the continuation of motion; the continuation of the space in which he is moved is also required. For since in bodies the continuation of motion is taken from the continuation of the form which it acquires, according to the opinion of those who say that bodies, when they are moved according to place, acquire some intrinsic form, as the Ferrariensis noted,[1429] and, on the opinion of others - which he himself follows - who teach that by motion according to place a body does not acquire an intrinsic form, the continuation is taken from the continuity of the extrinsic space which the body is said to traverse; in the same way one must philosophize in the case of angels. And since they are moved according to place and only an extrinsic form, as we proved above, it follows that the continuation of motion in angels is taken from the continuation of the extrinsic space which he traverses; and the continuation of this space consists in this, that he leaves, little by little, the places that communicate. The same must be said even if, by motion according to place, the angel were formally to acquire something intrinsic. Add also that if the angel were to leave, in the manner we described, places that do not communicate, he could not be moved in continuous time. For he would have to leave the first place by a first "not-being," and acquire the following by a first "being"; and then the third by a first "being" of itself, and leave the second by a first "not-being." Therefore it would be necessary for him to rest in the second place for a time, because he could not have that by a first being, and leave it by a first not-being, unless time intervened between these two instants. For in the same instant he could not be by a first being, and not be by a first not-being, as is quite clear. Therefore the reason of St. Thomas rightly proves what he contends.

Disputatio CXCVI - Whether an angel can be moved from extreme to extreme without the middle

Caput I - Various opinions of the Scholastics

Since the Doctors of the Schools have held various views about the manner in which an angel exists in a place, it was necessary that they opine variously also in this present controversy. Let us therefore set out the opinions of individuals in their order, so that we may at length subjoin our own. The first is that of those who absolutely teach that an angel cannot be moved from extreme to extreme without the middle. Thus teach Alexander in the second question 33, second member; Albert in II, distinction 37, article 23; St. Bonaventure in the second part, distinction 2, article 2, question 2; Richard in article 3, question 2; Giles in the second part of distinction 2, article 2; Henry in Quodlibet 13, question 7; of whom only Albert follows this opinion in such a way as to

1429. The "Ferrariensis," Contra gentiles, III, c. 102.

assert that an angel must indeed traverse the middle, and never be moved without it, yet that he traverses it in an instant. The others hold that the middle must necessarily be traversed in time; about which we must dispute below.[1430]

The first foundation of this opinion is that there seems to be no reason why a body could not be moved from extreme to extreme except through the middle, whereas an angel can be moved; for the mind cannot conceive that something is now in this place which before was at a distance, and has not come through all the intermediate places.

A later foundation is that of Giles in this way: although an angel is in a place by operation, as he himself teaches, and by voluntary activity, and thus it may seem that it belongs to his freedom to exist in the extremes and not in the middle, nevertheless since an angel is a certain part of the universe, he can never be without order in it. Therefore he ought to have some status; otherwise he would not pertain to this universality of things. This reason also seems to prove in the opinion of those who say that an angel is in a place voluntarily by mode or by application to operation: because in no way can an angel be absolutely away from every place, and thus of necessity he must pass through the middle. For according to the opinion of those who say that an angel is by his substance proximately in a place, if this is proved for a body by its quantity, by a much better reason is the earlier point proved.

The second opinion is that of Scotus in II, distinction 2, question 12, who plainly concedes that an angel can be moved from extreme to extreme without a middle participating in the extremes, yet not without a middle not participating. For, says Scotus, a double middle is posited: one, which participates in the extremes, that is, which of itself has the magnitudes of either extremity, and this is commonly called a communicating middle. As if there be posited a place of four feet, in which the angel is first and whence he begins to move, and next after this place there be posited another also of four feet: between these two one can assign infinite places of the same magnitude that communicate. All these are called a participating middle; and without this, says Scotus, it is possible for the discrete motion of an angel to occur - by leaving the first place, not little by little, but wholly at once, and by acquiring the second in the same way at once. The other middle, not participating, is that which is between distant extremes and has nothing in common with the extremes: for example, if there be a place of four feet, then another, and another of the same magnitude, which do not communicate among themselves; continuous, however, until one comes to another extreme place. Scotus says, then, that an angel cannot be moved from the first place to the last, unless he first be in all the others that do not participate; and this is not to be moved without a non-participating middle.[1431]

This opinion he proves thus. That order which is previously established by the author of nature among inferior agents does not seem necessary for a superior agent; just as the order of forms succeeding one another, which has been established by the author of nature, ought to be observed

1430. Alexander of Hales, Summa, II, q. 33, memb. 2; Albert the Great, In II Sent., dist. 37, a. 23; St. Bonaventure, II, dist. 2, a. 2, q. 2; Richard of St. Victor (as cited), a. 3, q. 2; Giles of Rome, II, dist. 2, a. 2; Henry of Ghent, Quodlibet XIII, q. 7.

1431. Scotus, In II Sent., dist. 2, q. 12.

by any agent whatever; and thus a man cannot first induce a rational form unless he first induce the form of an embryo, so as to preserve the mode of forms which the author of nature has constituted. Since therefore by God there has been defined an order for things which are to come among themselves according to their status, whenever an angel is moved, he ought to observe the same.

But if you say (adds Scotus) that this argument also proves about the participating middle that without it there cannot be motion from extreme to extreme - which is against his own doctrine - he replies that the argument proves nothing about that middle: because, while an angel passes from one extreme to the other through a non-participating middle, in the instant he has all those participating places in a certain order of nature, although he does not have them in an order of duration; that is, he does not have the beatitude of motion by successive passing through them. But if an angel were to pass from extreme to extreme without a participating and without a non-participating middle, he would have neither in an order of duration nor in an order of nature all those intermediate places. This same opinion is explained in the same way by Licheto in II, distinction 2, question 12, after the fifth conclusion.[1432]

The third opinion is that of Gabriel in II, distinction 2, question 2, article 3, in the first doubt, who asserts two things. The first is that motion according to place is not properly said of that which is only a change without continuous succession; that an angel can be moved to a place without a middle in this manner: if an angel is in a place not adequate to him - as if in the one of a stadium - and he wishes to be in a place adequate to himself - say, of one cubit - he can in an instant set himself there without a middle; not, however, abandoning the prior place, but as it were by occupying a larger extension. He proves this because no resistance seems to be present, which is the cause of succession, so that the angel would little by little extend himself into a smaller place than he had. The other thing he asserts is that from an adequate place to an adequate place he cannot be moved in an instant without a middle; and he judges the same if the motion is from a place not adequate to an adequate place, when it is necessary to leave the prior place. He proves this because, if without a middle he could leave the prior place and acquire the other, it would follow that there are two instants without a middle: for he would leave the prior place in the same instant and likewise arrive at the other (for what is wholly together is in an instant), and he would acquire the other also in an instant; and so either they would be the same instant as the prior, or different - which cannot be: because in the same instant an angel cannot be in both...

...in each extreme; therefore it would be different. Then moreover, either there would be some middle between them, or none: if none, it follows that those two instants would be without a middle, which is absurd. Therefore it is necessary that a middle time intervene, and thus that the motion through the middle be effected in that time.

1432. Licheto, In II Sent., dist. 2, q. 12, after the fifth conclusion.

Caput II - The more probable opinion

A fourth opinion has seemed to me more probable, namely, that an angel can be moved from place to place without a middle, whether participating or not participating; I mean, from place to place, leaving the prior. In this sentence were St. Thomas, Cajetan, and more recent Thomists on this article; Capreolus in II, dist. 6, q. 1, art. ..., concl. 3; Ferrariensis, cap. 102; Hervaeus in the treatise On the Motion of an Angel, q. 1, a. 1, 3, and 4, and on the First Book, dist. 37, q. 1, a. 2; although this author, since he says that an angel is in a place not according to substance but according to effect, as we saw in Disputation 187, chapter one, must not think about motion without a middle in the same way as the others. Marsilius also agrees in the Second, q. 7, a. 3, after the first conclusion; and St. Gregory in the Second, dist. 6, q. 3, a. 1, concl. 2.[1433]

This opinion, taken from the doctrine set forth above, can easily be established by reason; in the following chapter, by refuting the others, it will also be confirmed. The reason is of this sort. If an angel by his own substance (substance: substantia) were in a place, as a body is said to be by its quantity (quantity: quantitas) when it is capable of measure, then without doubt by himself he would always be in a place in such a way that he could never be released from it. But as a body cannot be moved by a created power unless it move successively and pass continuously through the middle, so neither could an angel; for his substance by itself would continuously present existence (*esse*) in a place. But since an angel by his substance is not in a place, except by the mode (mode: modus) whereby he is conjoined to a body, by reason of which he is said secondarily to be in a place, as was concluded in Disputation 188, chapter 7, and since an angel by his will can conjoin himself to this body and not to another as he wills, he can certainly conjoin himself to an extreme body even if he is not united to the middle, and thus be moved from extreme to extreme without any middle. The same follows if we say that an angel is in a place by operation, or by an application to act externally, and thus this sentence of St. Thomas accords with the principles of many opinions.

Whence it follows that, although God can place the same body at once in diverse places, or in one, leaving the prior without any transition through a middle - and thus on this account it is certain that the body of Christ could have been placed in the Eucharist while remaining at the same time in heaven - yet, according to the mode which it has in the sacrament, without a new miracle it could be moved from extreme to extreme without a middle. For there it exists in an indivisible mode, and not according to commensuration to a place; and of itself it does not necessarily entail a mode of existing in place, but is in a place by reason of the species, and thus only by reason of the body to which it is conjoined. Therefore, without a new miracle, just as an angel could be moved from extreme to extreme without any middle, so too could it be.

Let this suffice for the arguments of the other opinions.

1433. Capreolus, In II Sent., dist. 6, q. 1, art. ..., concl. 3; Ferrariensis, cap. 102; Hervaeus, De motu Angeli, q. 1, a. 1, 3, 4; Id., In I Sent., dist. 37, q. 1, a. 2; Marsilius, In II, q. 7, a. 3, post primam concl.; Greg., In II, dist. 6, q. 3, a. 1, concl. 2.

Caput III - Rebuttal of the arguments

It remains to dissolve the arguments of the other opinions, and at the same time to refute what they teach.

Reply to the first argument for the sentence of Aegidius: according to the opinion of those who say that an angel is in a place by reason of his bare substance, as a body is by reason of quantity, I grant that it cannot be understood that an angel is by his own power disengaged from a place, just as neither can a body by some created power; and therefore we admit that in this way he cannot be moved from extreme to extreme without a transition through a middle, unless by divine power. But if an angel is in a place either by reason of the mode whereby he is conjoined to a body, or by operation, as Aegidius himself posits, or by application to act, as others teach, this is certainly easy to understand and to explain, as we saw in the preceding chapter. Wherefore, Aegidius does not use this rationale, but other more recent men, who philosophize about spiritual things almost in all respects after the fashion of corporeal things - men to whom it was necessary to leave sensibles and to investigate a higher mode of contemplating spiritual things.

Reply to the latter argument, which Aegidius employs: with Hervaeus in the treatise On the Motion of an Angel, q. 1, a. 1, to the second difficulty, as I also responded in Disputation 193, chapter 3, at the beginning, I answer that the order which an angel has in the universe with the other parts is not one of position and place, but of nature, perfection, and ministry. Who does not see this? Wherefore an angel can rightly retain his order in the universe without being in any place. [1434]

Rightly, then, does Hervaeus mock those who think it dangerous to affirm that an angel can be disengaged from every place; for thus it is best understood that he stands in his proper liberty, to pass from extreme to extreme without a middle.

What we have said of an angel must, in the same way and for the same reason, be held of any material substance (*substantia*) stripped of its quantity, or at least with the mode of quantity removed, which they call commensuration in order to place, which the body of Christ lacks, although it has quantity and extension in itself. For, first, a substance stripped of its quantity remains without any extension, and therefore has no extremes from which distance can be taken, as we noted in Disputation 29, chapter 3; therefore it cannot be in a place, for this cannot be understood without distance. Next, a substance with quantity but without that mode of quantity in order to place, although it be extended in itself, nevertheless, because it cannot be commensurated to a place, no measure of distance can be taken from it to fixed points, which yet would be necessary in order for it to be said to be distant, according to the doctrine set forth in the aforesaid disputation. Therefore, in neither way can a material substance, whether with its quantity but without that mode in order to place, or without the quantity itself, be in a place by reason of itself.

But that some in the substance itself of matter contrive a certain extension and figure and surface, such that it occupy a place, that they may thus defend its remaining in a place, either clearly includes a contradiction or removes the true manner of philosophizing. For what else, I ask,

is the extension of parts than quantity itself, or an effect of quantity? What they answer who, over and above the extension of quantity in material substance, defend another extension which they call substantial, adding something common to the definition of quantity which the philosophers have handed down - this must on no account be admitted; nor, if we defend new opinions, is it permitted us to fabricate new definitions of things: for thus nothing would remain fixed whence our disputation might begin. Definitions too must be drawn from the common mode of conceiving: now it is the common definition of the ancient philosophers, which they hand down to us of quantity, that by reason of it something is extended and divisible; why then shall we exchange this ancient definition for another new one?

Add that the proper property of quantity, as Aristotle attests in the chapter On Quantity in the Predicaments, is that according to it things are said to be equal or unequal. But according to that extension which the aforementioned Doctors ascribe to substance, one thing is equal or unequal to another; therefore that is truly quantity. But on this matter we shall speak more fully in the topic on the Eucharist.

Now with this truth premised, in the manner of philosophizing that we have hitherto followed, it must be said that neither an angel nor a material substance without quantity, or without that peculiar mode of quantity which we have said, can be in place and at a distance, for exactly the same reason. Wherefore it must not be said that, quantity or that mode having been removed from a substance, the result would be that the substance would of itself flow to a point because it would remain indivisible; for there would be no greater reason on account of which it should of itself be placed at this point rather than at that: wherefore neither would it remain at a point, because then it would be somewhere; but it would remain nowhere, nor would it have in the universe an order of position, but only an order of its substantial rank, as we said of the angel.

That a substance without quantity is indivisible matters little to placing it of itself at a point, as we shall say; for the indivisible that a substance has is of another genus than the indivisible of a point. The latter has a position in a continuum; the former does not, nor is it in quantity, but in substance. For this reason we showed above in Disputation 192, chapter two, that even if an angel is indivisible, it does not follow that he must or can be in an indivisible place; for the indivisibility of the angel and of place are of diverse genera, and consequently of themselves the one does not answer to the other, nor is it commensurated to it.

But the adversaries say: if God were to take away quantity from a corporeal substance, and then were to will that it produce its quantity again, by that quantity it would be placed somewhere; yet there would be no greater reason on account of which it should be constituted in this place rather than in another, if that quantity had remained nowhere. Therefore, that we may say that it must be placed by its quantity in that place in which it previously was, it is necessary to assert that the substance remained in that place. I reply that quantity in a substance is conserved and produced by God alone and not by the substance's own nature; and thus, when taken away by God alone, it can be restored only by him...[1435]

1434. Hervaeus, De motu Angeli, q. 1, a. 1, ad 2; cf. Disputatio 193, cap. 3, in principio.

To the argument of Scotus's opinion I answer, first, that he assumes what he ought to have inferred; next I say that, if his reasoning has any force, it can be retorted upon himself as well. First, then, when he assumes this proposition, that an order preestablished by a higher agent must be observed by a lower, if he speaks of the order which is constituted by nature itself for acting, it is true. But when he adds that there is determined by God an order of the parts of the universe among themselves, such that one part of the medium be prior to another, he either understands this of the situation of those parts among themselves only, or of the manner of passing through them. If he understands it of their situation, it is true; and thus an angel cannot pervert them, unless by changing the bodies themselves according to place, so that he make to be in the one what was in the other; he can never, however, make that there not be the same distance, if so many bodies of the same quantity are interposed between the extremes. But if he understands it of the manner in which the mobile must pass through those parts of the medium, so as, leaving the extreme, first to hold the middle rather than the other extreme, he is adding what he ought to have inferred; and that is false. For God has not necessarily established this order in an angel, as was proved in the preceding chapter.

Moreover, I retort the argument against Scotus himself in this way: if the order of the parts in the medium must be observed, why must there not be observed that order of the medium which participates in the extremes, if indeed that is prior to the medium which does not participate in the same? But what he himself answers can scarcely be understood; for he says that he who passes from extreme to extreme without a participating medium does indeed have all those places in an instant, not in an order of duration, but in an order of nature, which, however, he would not have if he were to pass from extreme to extreme without a non-participating medium. How this is true, or can be understood, he does not explain, nor can any difference be assigned. For what else can it be to have had all those middle places in an order of nature and not in an order of duration, than thus to have passed from extreme to extreme as if he had really been in them and passed through them? But the same can be said even if the passage were made through a non-participating medium. Therefore Scotus's argument can rightly be turned back upon himself.

To the argument finally of Gabriel I answer that an angel indeed left the former place all at once, not by parts, as happens in continuous motion; nevertheless he left it by a first not-being in it, not by a last being, and in the same instant he had the latter place in the opposite extreme. Therefore the first not-being in the former was the first being in the latter, which by no means repugns; rather, in substantial generations it so happens that the first not-being of the one is the first being of the other. Nor indeed is to cease to be altogether at once the same as to have the last of one's being; but not-being of that which formally is to cease to be is altogether at once, and thus in an instant. I grant indeed that sometimes even the last being of a thing is called its cessation, because in it its being comes to an end; yet this is only in those things whose not-being is the being of something successive by motion, as indivisible places, which cease when a successive motion begins immediately after them. But since in the present case the former place of the angel ceases not by a successive motion but by the acquisition of the extreme place, which happens in an

1435. The continuation of the reply follows in the subsequent text.

instant, it ought to cease by a first not-being. Whence it is that that place which ceases by a first not-being of itself ceases altogether at once and not little by little by parts; whereas, on the contrary, a place which ceases by a succeeding motion through the last of its being ceases little by little, not altogether at once, that is, it begins little by little not to be the place itself, not altogether at once - the opposite of which Gabriel supposes. His opinion, therefore, in that wherein he asserts that an angel cannot leave a place and acquire another without a medium, is not proved by us; yet in that wherein he teaches that he can acquire a new place with the former retained without a medium, in part he agrees with us.

Articulus III - Whether the motion of an angel is in an instant

Objection 1. It seems that the motion of an angel is in an instant. For the stronger the power of the mover is, and the less the mobile resists the mover, the swifter is the motion. But the power by which an angel moves himself incomparably surpasses the power that moves any body. Now the proportion of velocities is according to the diminution of time. But every time is proportionable to every time. If therefore some body is moved in time, an angel will be moved in an instant.

Objection 2. Further, the motion of an angel is simpler than some bodily change. But some bodily change is in an instant, as illumination: both because a thing is not illuminated successively as it is heated successively, and because a ray does not first reach the nearer before the more remote. Therefore much more is the motion of an angel in an instant.

Objection 3. Further, if an angel is moved in time from place to place, it is manifest that in the last instant of that time he is in the term to which; but in the whole preceding time either he is in the immediately preceding place, which is taken as the term from which, or partly in one and partly in another. But if partly in one and partly in another, it follows that he is partible, which is impossible. Therefore in the whole preceding time he is in the term from which. Therefore he rests there, since to rest is to be the same now and previously, as has been said. And thus it follows that he is not moved except in the last instant of time.

But on the contrary: In every change there is a before and an after. But the before and after of motion is measured according to time. Therefore every motion is in time, even the motion of an angel, since there is a before and after in it.

I answer that it must be said that some have said that the local motion of an angel is in an instant. For they said that when an angel is moved from one place to another, in the whole preceding time the angel is in the term from which; but in the last instant of that time he is in the term to which. Nor need there be any medium between two terms, just as there is no medium between time and the term of time. But between two "now"s of time there is a middle time. Hence they say that there is not to be given a last "now" in which he was in the term from which; as in illumination and in the substantial generation of fire there is not to be given a last instant in which the air was dark, or in which matter was under the privation of the form of fire. But there is to be given a last time, such that in the last of that time there is either light in the air, or the form of fire in matter. And thus illumination and substantial generation are called instantaneous motions.

But this does not hold in the present case, and this is shown thus. Of the notion of rest it is that one at rest is not otherwise disposed now and before; and therefore at every "now" of the time measuring rest, the one at rest is in the same - both in the first and in the middle and in the last. But of the notion of motion it is that what is moved is otherwise disposed now and before; and therefore at every "now" of the time measuring motion the mobile is in another and another disposition. Whence it must be that in the last "now" it has a form which previously it did not have. And thus it is clear that to rest during a whole time in something, for instance in whiteness, is to be in that at every instant of that time. Whence it is not possible that something rest during the whole preceding time in one term and afterwards in the last instant of that time be in another term. But this is possible in motion, because to be moved during some whole time is not to be in the same disposition at every instant of that time. Therefore all changes of this sort which are instantaneous are terms of a continuous motion: just as generation is the term of the alteration of matter, and illumination the term of the local motion of the illuminating body. But the local motion of an angel is not the term of some other continuous motion, but exists of itself, depending on no other motion. Hence it is impossible to say that during the whole time he is in some place, and in the last "now" he is in another place. But one must assign a "now" in which last he was in the preceding place. But where there are many "now"s succeeding one another, there of necessity there is time, since time is nothing other than the numbering off of the prior and the posterior in motion. Whence it remains that the motion of an angel is in time: indeed in continuous time, if his motion be continuous; but in non-continuous time, if the motion be non-continuous. For in either way it happens that there be the motion of an angel, as has been said. For the continuity of time is from the continuity of motion, as is said in the Physics. But that time, whether it be continuous time or discrete, is not the same as the time which measures the motion of the heaven, and by which all corporeal things are measured which have mutability from the motion of the heaven. For the motion of an angel does not depend on the motion of the heaven.

Reply to the first: If the time of the motion of an angel be not continuous, but a certain succession of "now"s, it does not have proportion to the time which measures bodily motion, which is continuous, since it is not of the same notion. If, however, it be continuous, it is indeed proportionable - not indeed by proportion of the number of mover and mobile, but on account of a proportion in the magnitudes in which the motion is; and besides, the swiftness of an angel's motion is not according to the quantity of his power, but according to the determination of his will.

Reply to the second: Illumination is the term of a motion, namely of alteration, not of local motion - so that one understand the illuminating body to move first to the nearer and then to the more remote. But the motion of an angel is local and is not the term of a motion. Hence it is not similar.

Reply to the third: That objection proceeds on continuous time. But the transitions of an angel's motions can be such that, if an angel in one instant can be in one place and in another instant in another place, with no intermediate time existing. But if the times of an angel's motion be continuous, then in the whole preceding time the last "now" is varied through infinitely many

places, as was explained above. He is, however, partly in one place and partly in another - not because his substance is partible, but because his power is applied to a part of the first place and to a part of the second, as was also said above.

Conclusion: The motion of an angel is in time: if it be continuous, in continuous time; if it be discrete, in non-continuous but discrete time. The explication of this true doctrine will be the subject of the following disputation.

Disputatio CXCVII

Caput I - Whether the motion of an angel through the medium can be in an instant

That an angel can be moved through the medium in an instant, not a few have thought. cap. 1.

That an angel cannot be moved through the medium in an instant, the truer opinion concludes. cap. 2.

Further treatment of the difficulties of the present question, and of the next, will be given in what follows.

Caput II - That an angel cannot be moved through the medium in an instant; the truer opinion concludes

With the position set forth, that sentence seems to be embraced which affirms that an angel cannot be moved from one extreme to the other through the medium without succession and a continuation of motion. Thus teach St. Thomas, Cajetan, and the more recent authors commonly in this article. Bonaventure in the First Book, distinction 37, second part, article 2, question 3; Richard in the same place, article 3, question 3; Aegidius in the same distinction, part, question 3; Scotus in the Second Book, distinction 2; Gabriel [Biel], shortly before the solution of the arguments, question 3, article 3, if he be read attentively; Capreolus in the Second Book, distinction 6, question 1, article 1, conclusion 4; the Ferrarian in Contra gentiles, book 3, chapter 10.[1436]

But in truth St. Thomas, whom Cajetan follows, wished to confirm this sentence by a certain peculiar reasoning; yet if the opinion of the Ferrarian were true, which teaches that an angel cannot be in a place except by a transitive operation, since an angel can have no power over bodies by his own proper virtue except motion according to place - and here he begins by an ultimate non-being - it would follow that by his proper virtue an angel could not be moved in place nor alter a place in any way except through time. But since it has been said that an angel is in a place by the mode of a substance, and thus can in an instant begin to be in a place, and, according to the many ways of opining in this matter, the angel may begin to be in a new place, the former way, by a first

1436. Bonaventure, In I Sent., dist. 37, pars 2, art. 2, q. 3; Richard, ibid., art. 3, q. 3; Aegidius, ibid., part., q. 3; Scotus, In II Sent., dist. 2; Gabriel (Biel), q. 3, art. 3; Capreolus, In II Sent., dist. 6, q. 1, art. 1, concl. 4; Ferrarien. (Ferrariensis), Contra gentiles, III, cap. 10.

non-being which is the first being of the subsequent, ought to be set aside; and yet very many nevertheless assert that he cannot from extreme to extreme pass through the medium in an instant, but that necessarily the passage must be made in time. Another reason therefore is to be sought: for at present we are not inquiring whether he can abandon one place and acquire another in an instant, but whether from extreme to extreme he can in an instant pass through the medium.

Reason of this sentence. The reason, indeed, which Bonaventure, Richard, and Scotus have intimated - no matter what opinion be held concerning the mode by which an angel exists in a place - does, in my judgment, manifestly demonstrate that neither by the angel's own proper power nor by the power of God can it be brought about that an angel, or a body, be moved from extreme to extreme through the medium in an instant. The reason is of this sort. Either in the same instant the angel is at once in the middle and at the end, that is, at the extreme of the space; or there is some succession. For no other mode of being at once among these two modes can be devised. If you say that he is in an instant in such a way that by a first non-being he ceases to exist in the one extreme, and by a first being he is constituted in the other extreme simultaneously and in the middle - this indeed can happen without repugnance, if the middle and the posterior extreme are a place adequate to the angel's power, according to those things which we said in Disputation 191, chapter 2. Yet this certainly is not to be moved from extreme to extreme through the medium, but from one place into another without a transit through the medium: for since in the same duration the mobile is constituted in the other extreme and in the middle, it cannot be said to be moved through the medium, since the particle "through" denotes some genus of priority; but in the present case it could signify none.

Truly this reason not only proves that an angel cannot be moved from extreme to extreme through the medium without succession by his proper virtue - of which alone Scotus speaks - but even not by the absolute power of God: for it shows the clear implication of a contradiction. By the same argument it is proved that the motion of bodies through a vacuum cannot be without succession; for, since a body cannot at once fill the whole emptiness, but only a certain part corresponding to its own quantity, it follows that only successively can it fill up that emptiness by motion. For example: if at the top of a two-foot empty tube there be placed one foot of water, that water will not be able at once to fill the whole tube; for thus it would correspond to a larger quantity than its own weight and measure, which is absurd: therefore it must by successive motion little by little fill up the entire emptiness, and hence it would not move in an instant.

But Gregory responds to this reasoning by saying that in the same instant an angel is in heaven and on earth and in places however distant, not permanently (so he says) but transiently; and thus that an angel can through a plenum, and a body through a vacuum, be moved from extreme to extreme through the medium in an instant. Yet in this reply he seems rather to play with words than to explain the thing: for if the angel is at the same instant in the beginning, the middle, and the end - even if there be only a slight duration in those places, and he persists only for an instant - no reason can be given why it could not be said that he passes through the middle transiently. Add

that when the Fathers cited in Disputation 190, chapter 3, affirm that, while the angel is in heaven, he is not on earth, they also understand "according to the instant"; for if in the instant he were in both, then it would follow that, while he is in heaven, he could also be on earth.

Moreover, one might reply to the foregoing reason in this way: that the particle "through," when we say "through the medium," denotes not succession of duration but some order of causality; and thus, even if the angel is not first in duration in the middle than in the end and extreme of the space, nevertheless he is said to be moved "through the medium," because existence in the middle has the account of a cause with respect to existence in the extreme. Thus, for example, the sun is said to illuminate the water through the air, not because the air is first illuminated in duration than the water, but because in this order the sun's light illuminates diaphanous bodies, so that as by way of a cause it first illuminates the medium than the extreme.

This reply, however subtle it may seem, nevertheless has not a firm foundation: for the example adduced is not similar. A natural agent, such as light, even if in an instant it produces in the subject submitted to it the whole effect, still acts in that order that it stands in need of a continuation of the subject in which its effect is received, so that, by spreading itself from the prior part, it may act upon the remaining parts; and therefore it is rightly said that the sun illumines the extreme through the medium. But the light produced is not said to be moved according to place from the extreme of the diaphanous body through the medium, if it is at once everywhere. But a body that is moved through a vacuum, or an angel through a plenum, is not said to operate within a receiving subject in a spatial continuation, but to receive in itself motion according to place; wherefore, unless first in duration they are in one distance than in another, they are not said to be moved from one to another. For if they are at once in the middle and at the extreme, an indivisible distance arises in them: how then will it be said that they are moved from one to another through the medium?

Furthermore, the very thing can be done, and the virtue of some agent can operate in continuous space; and yet, on account of the account of the parts in what follows - namely that the same effect cannot at once be diffused equally with the prior part - this indeed is impossible: but to an adequate extent through the whole middle, so that one part cannot be produced in some mode unless another part depend on it; as experience shows, that one foot of water at once in a vacuum cannot be diffused to a greater quantity, it being impossible that it at once be in the whole, unless by God's absolute power, if God were to constitute the same thing replicated in different places and distances at the same time through a vacuum - something which nature cannot do, since by its distance in an instant it would be carried across great distances without transition and without permanent standing. This resistance, therefore, we must grant also in the angel; for since by the foregoing reasoning he is determined to a certain place, so that he cannot be in a greater one, it follows that by succession he must be in the middle and in the extreme; and if by God's absolute power he were placed at once in the middle and in the extreme, he would not be said to be moved through the medium to the extreme, but to remain in both.

I add, moreover, that the resistance of the medium is not the reason of the succession of motion, nor does it of necessity have to be equaled by time; but the succession from extreme to extreme through the medium - which some call "continuous on account of the space," even if in itself it have no parts - those affirm can be in an instant. From the Doctors cited, the Irishman alone said that not only can it in no way be done in an instant, but also that it must necessarily be so done; the rest, however, assert only that it is free for the angel to traverse infinite places in succession, yet not to do so in an instant. But the speed of the angel's motion is not according to the quantity of his power, but according to the determination of his will.

Caput III - The arguments of the former sentence are dissolved

The argument, however, that is taken from the vacuum on behalf of the former sentence can easily be dissolved: for it does not prove that any body can be moved through a vacuum from extreme to extreme without succession, or that it can at once be in the middle and the extreme, but only in that part of the vacuum which, according to its quantity, it could adequately fill. Wherefore, either we do not approve the sentence of Aristotle when he says that a body would necessarily be moved in an instant through a vacuum, or it must be asserted that he spoke not from his own position, but against those who were asserting that the whole cause of the succession of motion comes from the resistance of a plenum, and yet that in a vacuum a body can be moved. We say, therefore, according to true philosophy, that the succession of such motion does not come from the resistance of the plenum, but from the nature of the quantity of the mobile; which is of such a sort that it must first be in a place prior and adequate to itself than in a posterior, nor can it fill up just any emptiness. And this is what the philosophers commonly call the internal reason of the mobile, from which it is said that the succession of motion is necessary. For it is not according to the proportion of mover and mobile, but according to the proportion of the magnitudes in which the motion is; and, moreover, the speed of an angel's motion is not according to the quantity of his power, but according to the determination of his will.[1437]

But the argument drawn from a vacuum on behalf of the prior opinion can easily be dissolved: for it has been proved that no body can be moved through a vacuum from one extreme to the other through the middle without succession, indeed neither can it be simultaneously in the middle and at the extreme, but only in that portion of the vacuum which by its own quantity can be adequately filled. Wherefore either we do not approve the sentence of Aristotle, when he said that a body is necessarily moved in an instant through a vacuum; or it must be asserted that he did not teach that from his own settled opinion, but contrariwise, since he affirmed that the whole cause of the succession of motion proceeds from the resistance of the plenum, and nonetheless he held that a body can be moved in a vacuum. We therefore say that according to true philosophy the succession of motion does not proceed from the resistance of the plenum, but from the nature of the quantity of the mobile, because such is its nature that it must first be in the prior place proportioned to it,

1437. Compare the common argument from Aristotle, Physics IV, text 61, concerning motion in a vacuum; and see Disputation 190, cap. 3, on the Fathers' statement that while an angel is in heaven he is not on earth.

before being in the posterior, nor can it fill up just any vacuum whatsoever. And this resistance the philosophers commonly call the internal resistance of the mobile, from which they say the succession of motion necessarily arises. And although God by His absolute power could place the same body, as it were, replicated in diverse places and distances within a vacuum, nevertheless He cannot make it so that a body thus posited is said to pass from one distance into another in an instant, since in reality it does not pass over, but remains simultaneously. We must concede this resistance also in an angel: for since by his very nature he is determined to a certain place, so that he cannot be in a greater, it follows that there must be succession in the middle and at the extreme; but if by the absolute power of God he were placed simultaneously in the middle and at the extreme, he would not be said to be moved through the middle to the extreme, but to remain simultaneously in both. I for my part would add, that the resistance of the medium is not the cause of the succession of motion, nor should it in any way be referred to that, but only to its speed. For since the succession of motion consists in this, that it has a before and an after, and with every other extrinsic thing removed, these are sufficiently provided for either by the quantity of the body, or by the nature of the angel determined to a certain quantity of place and space, and with these removed, every other thing being posited, succession does not follow, it follows that this is the whole cause of succession; but speed proceeds from the virtue of the mover per se, and from a lesser resistance of the space per accidens: and since the angel has no resistance in the middle, so as to be moved, speed must be taken solely from his virtue; but speed is proved to differ from succession, because with the same succession there can be a greater and a lesser speed.

If, however, someone were to inquire concerning the speed of the angel's motion, whether it be determined and require a determined time, or whether the angel can be moved in the same space in a lesser and lesser time: some answer that he can always be moved within the same space in a shorter and shorter time; thus Alexander seems to have taught in the second part, question 35, member 1, to the first,[1438] and those are forced to say this who teach that he can be moved through the medium in an instant. Capreolus also agrees, In II, distinction 6, question 1, article 3, to the third, against the second conclusion.[1439] And it seems to be the doctrine of the Fathers whom we alleged in Disputation 194, chapter 2,[1440] who assert that an angel is promptly present where he will, and of St. Augustine, whom Gregory of Rimini reports for his own opinion in the questions on the resurrection, where he affirms that a glorious body passes through both intervals with the same speed with which a ray of the sun passes.[1441] I, however, think that the speed of an angel is great, and such as cannot easily be discerned by corporeal sight, and similarly that of the glorious body; but it is not so great as to be in an instant without motion, even if the ray of the sun were to pass through intervals without succession. For the speed of a glorious body, or of an angel, is compared by St. Augustine, so that by some visible example it might set forth the matter to us, not as though it were in an instant; for the other motions which are seen by sight are slower than that they could

1438. Alexander of Hales, Summa, pars 2, q. 35, memb. 1, ad 1.

1439. Capreolus, In II Sent., dist. 6, q. 1, art. 3, ad 3, contra secundam conclusionem.

1440. See above, Disputation 194, cap. 2.

1441. Gregory of Rimini, Quaestiones de resurrectione, reporting St. Augustine on the glorious body passing intervals with the speed of a solar ray.

enable us to explain the speed of the motion of an angel and of a glorious body. In this same sense the Fathers said that angels are promptly everywhere present and without delay: for what happens so suddenly, even if it be placed in some succession, seems to us momentary; and St. Augustine, in the last book of the City of God, last chapter, for this same reason said that the motion of the glorious body is at the beck of its soul.[1442]

I add moreover that this great speed of an angel, if it be compared to his proper power, is determined: for it is impossible that a power be finite and determined, and not have an effect of determined speed. By this very reason we proved in Disputation 113, chapter 2, that the power of God is infinite, because He can move more and more swiftly ad infinitum.[1443] Wherefore an angel cannot be moved in ever briefer and briefer time ad infinitum as he pleases, but there will be a maximal time proportioned to that power of his, even if that very great speed depends on his motion. The same must be said, for the same reason, of a glorious body, if it is moved from within by some created power communicated to it: for if it is moved by God according to His will, the speed will not be determined: for God can move any body more and more swiftly ad infinitum.

Furthermore, some philosophers, combined with the reason which we adduced in the preceding chapter, concede that a body cannot be moved in a vacuum in an instant, nor be at once in the middle and at the end of the vacuum, if the body in some way touch the surface of the vacuum, as in that example of the empty bucket which we brought forward in the preceding chapter; but if a body be within a vacuum not touching the extreme surface of the vacuum, it must be said with Aristotle that the motion in a vacuum would be in an instant. But this evasion is useless: first, because motion could not be in an instant, therefore it would rather have to be said that the mobile remains in some indivisible distance, than that it is moved from one to another. Next, there is no doubt that within a vacuum, or above the heavens, where properly speaking there is no vacuum, as we noted in Disputation 29, chapter 3, from Aristotle,[1444] a body cannot be broader, deeper, and longer in itself than in the plenum, and thus by its own quantity cannot prevent other bodies from being placed in some order, so that they fill up more than it alone by itself could fill; therefore, as for other bodies, the mobile itself, that it may fill and be extended, must necessarily do this with succession: for it cannot at once answer to the quantity of the others which together with it were filling, nor does anything stand in the way to prevent its doing this by succession. From which it follows that a body can rightly be moved either within a vacuum, or beyond the heavens, as was proved in that disputation, chapter cited, and that it must necessarily be moved successively.

Caput IV - On the discrete motion of an angel

In the preceding disputation, chapter 2, it was shown that an angel can be moved from place to place without a medium. This opinion being supposed, St. Thomas, Cajetan, and some more recent authors in this article teach that then indeed an angel is moved by a discrete motion.[1445] They call

discrete motion as it were a number consisting of the units of the angel's existences in each of the places with that succession; for example, if an angel is first in A, then in B, and finally in C, which are diverse non-communicating places, he is said to be moved discretely in the whole time in which he is in all of them. Wherefore, in their opinion, the first place is not an extrinsic terminus a quo for the discrete motion, but is a part of the motion itself, just as the second and third place are. In the same opinion, and for the same reason, it must be said that the mobile is not moved when it is precisely in one of those places, but when it is in all of them, or in each one of them with respect to the others: just as a number is not in the individual units by itself, but in all together, or in any one with respect to the others: thus Cajetan noted in his commentary around the solution to the first.

Although this opinion is true, nevertheless it could be said that there are many changes according to place, when after one place many are acquired without continuation, each of which would be instantaneous, since the terminus ad quem is produced in an instant. Nor does the succession which is there between the terminus a quo and the terminus ad quem hinder anything; for this in all changes which are made in an instant must necessarily be, since change is nothing other than the acquisition of the terminus ad quem, which is done in an instant, even if it looks to the terminus a quo. But that there could be said to be many changes is proved from this, that in any place from which an angel passes discretely to another there must be rest for a time; therefore the rest in that place does not pertain to the motion, otherwise, when someone is moved from one quality to another, and in each of those he rests, he would be said to be moved by one discrete motion; and similarly in motion according to place, when it were interrupted by rest for a time. Moreover, that an angel rests for a time in any place from which he passes discretely to another is shown thus: before an angel acquires the second place, he must be in the first in such a way that to be in the one is not to be in the other; but in the second, and in the third, and so on with the others, he begins to be in an instant of our time, and by the first being, therefore that first being of the second is the first not-being of the first, and the first being of the third is the first not-being of the second, and so with the rest: therefore in any place in which the angel has ceased to be by the first not-being, necessarily he was for a time, as is manifest, and consequently for a time he rested. But existence in a place by rest cannot pertain to motion as a part, but as a terminus also; therefore there will be many changes, not one motion.

Some reply that the discrete motion of an angel is distributed into different states of discrete time, which they suppose to be of a different kind from ours, which is continuous, and thus that he is in the several places for the instant of that time, and consequently that existence in any place pertains per se to the motion; and that nothing hinders the instants of that time from being immediate then: for this is peculiar to discrete time, that it is composed only of instants. Granted, however, the intrinsic duration of that existence to be in those different places, and that the so-called discrete time be different from our time, which obtains in motion or consists of the body: nonetheless we must not concede that duration of that angelic existence to measure itself by the places, as was shown exactly in Disputation 36, chapter 1,[1446] where we proved that our time measures even these operations of an angel, or at least, although it is not their measure, it cannot

1446. See Disputation 36, cap. 1.

be denied that they coexist with our time, and thus that an angel necessarily remains in any place for the duration of our time as has been proved, which is sufficient for the existence in any place to be called rest, and by no reason to pertain to motion. Besides, in this matter it matters little to speak in this or that way.

Quaestio LIV - On the knowledge of the angels

After considering those things that pertain to the substance of an angel, we must proceed to his knowledge. But this consideration will be fourfold. For first it must be considered about those things that pertain to the angel's cognitive power (*virtus cognoscitiva*). Second, about those things that pertain to his medium of knowing. Third, about those things that are known by him. Fourth, about the mode of their knowledge.

Concerning the first, five things are asked...

Existence in place by rest cannot pertain to motion as a part, but only as a terminus from which; therefore there will be many changes, not one motion.

Some reply that the angel's discrete motion consists in distinct states of a discrete time, which they suppose to be of a different kind from our time, which is continuous; and thus that in individual places the angel exists only for the instant of that time, and so his existence in any place per se pertains to the motion; nor, they think, does anything hinder those instants of that time from being immediate, for this is proper to discrete time, that it is composed solely of instants. Yet, even granting to them an intrinsic duration of existence in those diverse places, and calling it a discrete time different from our time (which consists in the motion of the heavens or of a body), nonetheless we ought not to say that that duration of the angel's existence in diverse places measures itself, as is clear from what was said in Disputation 36, chapter 1, where we proved that our time measures even these changes of angels, or at least that, even if their duration be denied to cohere with our time, it cannot be denied that they are nevertheless connected with our time; and thus it is necessary that the angel in any place should continue for a span of our time, as remains proved. Therefore existence in any place is rest, and in no way pertains to motion. Besides, in this matter it makes little difference one way or the other.[1447]

Having considered those things which pertain to the substance of angels, we must proceed to the consideration of their knowledge. And this consideration is fourfold. First, about those things that pertain to the angel's cognitive power (*virtus cognoscitiva*). Second, about those things that pertain to his medium of knowing. Third, about those things that are known by him. Fourth, about the mode of their knowledge. Concerning the first, five things are asked.

1447. See Disputation 36, cap. 1.

Articulus I - Whether the angel's understanding is his substance

Objicitur. It is objected first as follows. It seems that to understand (the act of understanding) in an angel is his substance. For an angel is more sublime and simpler than the agent intellect of the soul. But the substance of the agent intellect is its action, as is evident in the third book of On the Soul through Aristotle and his Commentator.[1448] Therefore, much more is the substance of an angel his action, which is to understand.

1. Further, the Philosopher says in the eleventh book of the Metaphysics that the act of the intellect is life.[1449] But for living things to live is to be, as is proved in the second book of On the Soul. Therefore life is essence. Hence the act of the intellect is the essence of the understanding angel.
2. Further, if the extremes are one, the mean does not differ from them, because an extreme is more distant from the other extreme than is the mean. But in an angel the intellect and the thing understood are the same, at least insofar as he understands his own essence. Therefore to understand, which falls as a mean between the intellect and the thing understood, is the same as the substance of the angel who understands.

Sed contra. But on the contrary: The action of a thing differs more from its substance than does its very existence: but in no creature is its existence (*esse*) its substance. For this is proper to God alone, as is clear from the foregoing. Therefore neither in an angel nor in any other creature is its action its substance.

Respondeo. I answer: It is impossible that the action of an angel, or of any other creature whatsoever, be its substance. For action is properly the actuality of a power (*actus virtutis*), just as existence is the actuality of substance or essence (*essentia*). But it is impossible that something which is not pure act be its own actuality: because actuality is repugnant to potentiality. Now God alone is pure act. Hence in God alone is His substance His existence and His acting. Further, if an angel's understanding were his substance, it would follow that the angel's understanding is subsistent. But a subsistent "to understand" cannot be more than one, just as no abstract subsistent can be multiplied. Hence the substance of one angel would not be distinguished either from the substance of God, which is subsistent understanding itself, or from the substance of another angel. Likewise, if an angel himself were his own understanding, there could not be degrees of understanding more and less perfect, whereas this difference arises from the diverse participation of understanding itself.

Ad primum. Reply to the first: When it is said that the agent intellect is its action, this is a predication not per essence, but by concomitance: because when its substance is in act, straightway, so far as it is in act, its action concomitantly accompanies it. This is not the case with the possible intellect, which has no actions unless and until it has been made actual

1448. Aristotle, De Anima, III; the Commentator (Averroes) ad loc.
1449. Aristotle, Metaphysics, XI.

Ad secundum. Reply to the second: Life does not relate to living as essence to existence, but as course to running; of which pair one signifies the act in the abstract, the other in the concrete. Hence it does not follow, if to live is to be, that life is essence. Although sometimes life is put for essence: according to which St. Augustine also says in the book On the Trinity that memory, understanding, and will are one essence, one life; but in this way the Philosopher is not speaking when he says that the act of the intellect is life

Ad tertium. Reply to the third: An action that passes into something extrinsic is a mean between the agent and the subject receiving the action. But an action that remains in the agent is not really a mean between the agent and the object; it is so only according to the mode of signifying. Really, rather, it follows upon the union of the object with the agent. For from the fact that the understood becomes one with the understanding, there follows understanding as a certain effect different from both

Conclusio. The conclusion is that an angel's understanding is not his substance. Concerning this, a brief controversy will be had with Aristotle and Durandus.

Disputatio CXCVIII - On whether intellection in an angel is his substance

Caput I - The opinion of Aristotle and Durandus

This controversy with Aristotle and Durandus is indeed easy, and we shall also dispatch it briefly. Therefore, Aristotle, in book 12 of the Metaphysics, chapter 7, after he had taught that God is one immortal and perpetual substance, always understanding, whose essence is to understand, seems to affirm the same also of the other separate substances in chapter 9.[1451] He shows first that the intellection of these substances is not changed, because otherwise they would grow weary in understanding; then he proves that their substance is their understanding: because, if it were some accident, they would not be the most noble substances, as he supposes.

This opinion in that very place is embraced by the Commentator, Alexander of Aphrodisias, and Philoponus.[1452] Of our own Scholastics, however, only Durandus, on the Second Book, distinction 3, question 5, to the first, asserts that the cognition by which an angel knows himself is his substance: for he says in these words, Although to understand is the act of the angel's intellectual power, really different from it when he understands a thing other than himself; nevertheless his being is not an act of the essence really different from it. Where, since he grants that intellection is really distinguished from the intelligent power when the angel understands other things besides himself, he does not seem to grant this concerning that intellection by which he knows himself; and since he says that the intelligent power is the same as the essence, he clearly seems to think that understanding is not distinguished from the essence and substance of the angel when he understands himself.

1451. Aristotle, Metaphysics XII, chs. 7 and 9.
1452. Averroes (the Commentator), Alexander of Aphrodisias, and John Philoponus, ad loc.

Caput II - The truer opinion: that intellection in an angel is not his essence

The common opinion of the Scholastics is to be embraced, on the Second Book, distinction 3 (whom we will cite singly below), who assert with St. Thomas in this article that intellection in an angel, whether by which he understands himself or other things, is not his essence and substance, but is a certain accident added to him.[1453] This is gathered also from Leo, epistle 91, chapter 5, where he speaks thus: As it is proper to God alone to be uncreated, so also no man is Truth, no man is wisdom, no man is justice; but many are partakers of truth, and of wisdom, and of justice; God alone, however, needs no participation.[1454] But what Leo defines of men he understands of any creature whatsoever, even a spiritual one, since he says that it is proper to God alone to be uncreated being, to be wisdom, etc. Pseudo-Dionysius likewise, chapter 11 of the Celestial Hierarchy, says that all the heavenly minds are divided into essence, power, and operation; which three Anselm also distinguishes, chapter 3 of On the Fall of the Devil.[1455] Besides this, it is clear from Scripture that many things were revealed to the angels in the course of time after their creation: the knowledge of these therefore was not their substance, for then it would have been with them always.

All these things rightly prove that Aristotle's opinion is not only false, but also worthy of the note of error; and since there is no greater reason regarding the intellection of other things than of the angel's own self, and since the Fathers, being intent, speak universally of intellection without any distinction, the opinion also of Durandus will be absurd; against which St. Gregory disputes on the Second Book, distinction 7, question 2, and on the Second Book, distinction 3, question 2, article 2, first conclusion; and Marsilius on the Second [Book], 9.7, article 1, second part, second conclusion.[1456]

The reasons of Aristotle are frivolous and empty. For the first does not rightly prove that an angel would need to be wearied if he always understood: for if men grow weary in contemplation, this is not because the intellect and the soul work greatly, but because they are helped in contemplation by the ministry of a bodily instrument; but the body is wearied by an excessive dissipation of vital spirits. The second reason likewise proves nothing: for although an angel's substance is perfected by the knowledge of himself, it does not follow that that cognition is the perfection of the substance itself, but rather that the substance of the angel, together with that operation, is disposed in a more perfect way - just as every substance is more perfect with its accidents than by itself alone. I pass over the many things which Cajetan wastes here in explaining St. Thomas's arguments, in which it is not necessary to linger.

1453. St. Thomas, In II Sent., dist. 3, art. on this question.
1454. Pope Leo (the Great), Epist. 91, c. 5.
1455. Pseudo-Dionysius, De coelesti hierarchia, c. 11; Anselm, De casu diaboli, c. 3.
1456. St. Gregory, In II Sent., dist. 7, q. 2; and In II Sent., dist. 3, q. 2, a. 2, concl. 1; Marsilius of Inghen, In II Sent., 9.7, a. 1, second part, second conclusion.

Articulus II - Whether the angel's understanding is his existence

Objicitur. It is objected to the second as follows. It seems that the angel's understanding is his existence (*esse*). For to live for living things is to be, as is said in the second book of On the Soul. But to understand is a certain living, as is said in the same place. Therefore the angel's understanding is his existence.

1. Further, as the cause stands to the caused, so the effect to the effected. But the form by which an angel is, is the same as the form by which he understands, at least himself. Therefore his understanding is the same as his existence.

Sed contra. But on the contrary: The angel's understanding is his motion, as is clear from Pseudo-Dionysius, book 4 On the Divine Names; but existence is not motion. Therefore the angel's existence is not his understanding.[1457]

Respondeo. I answer: The action of an angel is not his existence, nor is the action of any creature. For a twofold action is posited, as is said in book 9 of the Metaphysics. One, namely, which passes into something external, inducing a passion in it, as to burn and to cut. The other action, however, is that which does not pass over into an external thing, but rather remains in the very agent itself: as to sense, to understand, and to will. For by an action of this sort nothing extrinsic is changed, but the whole thing is done in the agent itself. Regarding the first action, therefore, it is manifest that it cannot be the very existence of the agent. For the existence of the agent is signified as within the agent; but such an action is an efflux into a patient from the agent. The second action by its very notion has infinitude either simply or in a qualified way. Simply indeed, as in understanding, whose object is the true; and in willing, whose object is the good; and each of these is convertible with being. And thus understanding and willing, so far as of themselves, are disposed to all things, and each receives its species from its object. In a qualified way, however, sensing is infinite, in that it is ordained to all sensibles, as sight to all visible things. But the existence of any creature is determined to one thing according to genus and species. Only the divine existence is simply infinite, comprehending all things in itself, as Pseudo-Dionysius says in the fourth chapter of On the Divine Names.[1458] Hence it is only the divine existence that is its own understanding and its own willing.

Ad primum. Reply to the first: Living is sometimes taken for the very existence of a living thing, and sometimes for the operation of life, that is, by which it is shown that something is living. And in this way the Philosopher says that to understand is a certain living. For there he distinguishes different grades of living things according to different operations of life

Ad secundum. Reply to the second: The essence of the angel is the ratio of his whole existence; but it is not the ratio of his whole understanding; for the soul cannot understand through its essence. And therefore, according to its proper notion, inasmuch as it is such an essence, it is compared to the very existence of the angel. But the act of understanding is compared according to

1457. Pseudo-Dionysius, De divinis nominibus, IV.
1458. Pseudo-Dionysius, De divinis nominibus, IV.

the notion of a universal object, namely, of the true or of being. And thus it is clear that although it is the same form, nevertheless it is not according to the same notion the principle of existing and of understanding. And on this account it does not follow that in an angel there is the same thing to exist and to understand

Conclusio. The conclusion denies [the identity]. Cajetan spends much here in order to explain the mind and reason of the holy Doctor; but I have judged it worthwhile to forgo them. For from the doctrine of the preceding article it easily stands out that the angel's understanding and his existence differ, especially because the angel's existence is not distinguished from his substance and essence by the nature of the thing, as we shall say in the third part of St. Thomas, question 17, article 2; since it has already been proved that the angel's understanding is not his substance, it follows also that it differs from his existence.

Articulus III - Whether the angel's intellectual power is his essence

Ad tertium sic proceditur. It is argued to the third as follows. It seems that the virtue, or intellectual power, of the angel is not other than his essence

It is objected:

- For mind and intellect name an intellective power. But Pseudo-Dionysius in many places of his books calls the very Angels "intellects" and "minds." Therefore an angel is his intellective power.[1459]
- Further, if the intellective power in an angel is something besides his essence, it must be an accident. For we call that an accident of something which is besides its essence. But a simple form cannot be a subject, as Boethius says in the book On the Trinity. Therefore an angel would not be a simple form: which is against the premises.[1460]
- Further, St. Augustine says in Confessions XII, near the end, that God made the angelic nature near to himself, but prime matter near to nothing. From which it seems that an angel is more simple than prime matter, as being nearer to God. But prime matter is its own potency. Therefore much more is an angel his own intellective potency.[1461]

But on the contrary: Pseudo-Dionysius says in De coelesti hierarchia, c. 2, about the middle of it, that angels are divided into substance, virtue, and operation. Therefore in them substance is one thing, virtue another, and operation another.[1462]

I answer: Neither in an angel, nor in any creature, is the operative virtue or power the same as its essence. This is clear as follows. Since power is said with respect to act, there must be, according to the diversity of acts, a diversity of powers. Whence it is said that a proper act answers to a proper

1459. Pseudo-Dionysius, De divinis nominibus, chs. 7 - 9; De coelesti hierarchia, c. 2.
1460. Boethius, De Trinitate.
1461. St. Augustine, Confessions, XII.
1462. Pseudo-Dionysius, De coelesti hierarchia, c. 2.

power. Now in every created thing essence differs from its existence (*esse*), and is compared to it as potency to act, as is clear from the above. But the act to which an operative power is compared is operation. In an angel, however, to understand is not the same as to be, nor is any other operation either in him or in any other created thing the same as its being. Hence the essence of the angel is not his intellective power, nor is the essence of any created thing its operative power.

Reply to the first: An angel is called "intellect" and "mind" because the whole of his cognition is intellectual, whereas the cognition of the soul is partly intellectual and partly sensitive.[1459]

Reply to the second: A simple form which is pure act can be the subject of no accident, because the subject is compared to the accident as potency to act. And such a form is God alone; and of such a form Boethius is speaking there. But a simple form which is not its own existence, but is compared to it as potency to act, can be the subject of an accident, especially of that which follows the species. Such an accident pertains to form; but an accident which belongs to the individual not following upon the whole species follows upon matter, which is the principle of individuation. And such a simple form is an angel.[1460]

Reply to the third: The potency of matter is to substantial being itself, and not an operative potency, but to accidental being. Hence the case is not similar.

Note on the doctrine of the article. The conclusion is: In an angel, and in every created thing, power is not the same as its essence. St. Thomas understands this not to be the same by nature of the thing, but universally that it is an accidental form added to the substance. With St. Thomas agree his disciples, and Alexander,[1463] and this opinion harmonizes with the doctrine of Pseudo-Dionysius who, as we cited in the preceding disputation, cap. 1, assigns three things to the angel: essence, virtue, and operation - which, since they are enumerated in the same way by him, must in the same way be distinguished. Anselm too adds his support, in De casu diaboli, cap. 8, where he teaches that conversion and the will toward the good or toward the evil is a certain essence, yet not a substance; therefore he holds it to be an accident distinct from substance. By the name "will" moreover he does not understand the act, but the very faculty; for he distinguishes will from its conversion, while conversion is an operation. And in the book De conceptu virginali, cap. 4, he distinguishes these three just as Pseudo-Dionysius does: essence, virtue, and operation.[1464]

Articulus IV - Whether in an angel there are an agent intellect and a possible intellect

It is objected:

- It seems that in an angel there is an agent and a possible intellect. For the Philosopher says in De Anima III that, just as in every nature there is something by which all things become and something by which all things are made, so also in the soul. But an angel is a certain nature. Therefore in him there is an agent and a possible intellect.[1465]

1459. Pseudo-Dionysius, De divinis nominibus, chs. 7 - 9; De coelesti hierarchia, c. 2.
1460. Boethius, De Trinitate.
1463. Alexander of Hales, In I, q. 21, memb. 1.
1464. Anselm, De casu diaboli, c. 8; De conceptu virginali, c. 4.

- Further, to receive is proper to the possible intellect; but to illuminate is proper to the agent intellect, as is clear in De Anima III. But an angel receives illumination from a superior, and illuminates an inferior. Therefore in him there is an agent and a possible intellect.[1465]

But on the contrary: In us the agent and possible intellect are posited with respect to phantasms, which are compared to the possible intellect as colors to sight, and to the agent intellect as colors to light, as is clear from De Anima III. But this does not hold in an angel. Therefore in an angel there is not an agent and a possible intellect.[1465]

I answer: The necessity of positing a possible intellect in us was because we are found sometimes understanding in potency and not in act. Hence there must be a certain power which is in potency to intelligibles before the very act of understanding, but is reduced to the act of them when one becomes a knower, and further when one becomes a considerer. And this power is called the possible intellect. But the necessity of positing an agent intellect was that the natures of material things which we understand do not subsist outside the soul as immaterial and actually intelligible, but are only potentially intelligible while existing outside the soul. And therefore there had to be another power which would make those natures actually intelligible. And this power is called in us the agent intellect. But both of these necessities are lacking in angels: for neither are they at some times understanding only in potency with respect to the things which they naturally understand; nor are their intelligibles intelligible in potency, but in act. For they understand first and principally immaterial things, as will appear in the following question. And therefore in them there cannot be an agent and a possible intellect, except equivocally.

Reply to the first: The Philosopher understands those two to be in every nature in which it happens that there is being generated or made, as his very words show. But in an angel science is not generated, but is naturally present. Hence there is no need to posit in them an agent and a possible intellect.

Reply to the second: It belongs to the agent intellect to illuminate, not indeed another intelligent subject, but intelligibles in potency, inasmuch as by abstraction it makes them actually intelligible. But it belongs to the possible intellect to be in potency with respect to naturally knowable things, and sometimes to be made in act. Hence that an angel illumines an angel does not pertain to the notion of agent intellect. Nor does it pertain to the notion of possible intellect that he is illumined about supernatural mysteries, to the knowing of which he is sometimes in potency. But if anyone wishes to call these an agent and a possible intellect, he will be speaking equivocally, nor ought one to stand upon the usage of names.

Conclusion: In angels there is neither an agent intellect nor a possible intellect - a point which in the following disputation will be briefly examined.

1465. Aristotle, De Anima, III.
1465. Aristotle, De Anima, III.

Disputatio CXCIX - On whether there is in angels an agent and a possible intellect

Caput I - Various opinions

Although certain Scholastics concede an agent intellect to the angel, yet they vary in assigning the reason on account of which they say it to befit him. They agree in this opinion: Albertus in the fourth book De causis, part 1; Scotus in the Second Book, dist. 3, the last question; Bassolis in question 4, article 3; Richard in question 2, to the first; indeed Alexander in the second part, question 22, member 3.[1466]

Scotus first proves simply that this faculty must be granted to the angel by these arguments. First, this faculty has nothing of imperfection; therefore it is not to be denied to the angel. Second, in the angel there is a possible intellect; therefore also an agent intellect, for these refer to each other mutually. Third, even if the angel had been created from the beginning with all the species of things, nonetheless he ought to have an agent intellect: for Christ too had knowledge of all things from the beginning of his conception, and yet he did not lack an agent intellect; it is enough, namely, that the angel by his nature be able to receive species from things, so that this power by its very nature befit him.

For this same reason Richard also grants it to the angel; and all who assert that the angel receives species from things are compelled to grant it.

Others indeed, for many reasons frivolous and of no weight, say that the agent intellect is in the angel, which I deliberately pass over; it suffices to add only the opinions of Alexander and Albertus: Alexander holds that the agent intellect is in angels, not so as to abstract species from phantasms, but so as to elicit intellection; Albertus, not so as to elicit cognition, nor so as to produce species, but so as to illuminate them and render them suitable for the possible intellect to be able to understand, indeed so as even to illuminate the possible intellect itself.

About the possible intellect Scotus says that it is indeed in the angel in the same way as it is in men: for since he thinks that no species is inborn in the angel, but that he receives all from things, he consequently affirms that the angelic intellect is possible to become all things, as Aristotle said of ours in De Anima III, c. 4; for it becomes all things by the species which it receives; and since of itself it is without them, it is called "possible" because it can receive them. Richard agrees with Scotus that "to become all things" befits it; and he also teaches that the angel begs species from the things themselves. Scotus further adds that even if we were to concede that species had been infused to the angel at the beginning of his creation, nonetheless his intellect would be possible or passive - which he confirms by this argument: whatever thing that receives a form in itself is the subject of that form...

1466. Albertus Magnus, De causis, IV; Scotus, In II Sent., dist. 3, q. ultima; Bassolis, q. 4, a. 3; Richard of Middleton, q. 2, ad 1; Alexander of Hales, II, q. 22, memb. 3.

Conclusion: In angels there is neither an agent intellect nor a possible intellect; which conclusion is to be briefly examined in the following disputation.

The true opinion

The opinion of St. Thomas in this article is the one we embrace, which Cajetan and more recent Thomists follow: namely, that in an angel there is not an agent intellect nor a possible intellect; although concerning the possible intellect the question may be merely about the word.

Here, however, we must suppose what, in the following question and article, St. Thomas teaches, and we shall there prove, namely, that an angel does not receive species from things, but either has them ingenerate in himself from the beginning, or at least understands without them.

First, then, as to the agent intellect, I show the aforesaid position thus. Either the agent intellect is posited for the sake of illuminating the species, as Albert said; and since such an illumination is superfluous and cannot be explained, the agent intellect ought not to be granted for this effect. That that illumination is superfluous is clear, because the species alone, conjoined of itself with the possible intellect, is a sufficient principle of cognition; or let them explain to us, if they please, what that illumination is, and what it does in the species and in the intellect; for we can scarcely understand it, much less explain it. Or the agent intellect is posited so as to be a principle of eliciting intellection together with the species, as Alexander said; and in this mode it ought not to be a distinct power, even according to formal account, from the possible intellect: for the possible intellect has, together with the species, the power of producing intellection. If it pleases to name that very possible intellect, as it is such a principle, by the title of "agent," then the question will be about the word, and no other power besides the single intellect will have to be constituted, which is what we now contend.

Nor does the agent intellect seem necessary for anything else, if that is true which we suppose, namely, that an angel does not receive species from things. For if in any way it seemed necessary, it would be chiefly for this, that it produce those species and abstract them from things, as in us it abstracts them from phantasms; therefore it remains that it is useless to concede an agent intellect to the angel.

Wherefore the reasons of Scotus, which we adduced in the preceding chapter, are easily dissolved from what has been said. To the first I answer that this power of the agent intellect supposes some imperfection in that in which it is, namely, an indigence of species which by its nature it must receive from without; for to this alone can the agent intellect serve, to abstract species from things or from phantasms. Since, therefore, the angel cannot receive species from things, in no way does he need an agent intellect, and hence he is not endowed with such a faculty, because in nature there ought to be nothing superfluous.

To the second I say that in the angel there is not a possible intellect for receiving species, as we shall immediately say, but only for receiving intellection.

To the third we grant that in a man there would be an agent intellect, even if from the beginning he received all the species of things; because by his nature he would not have them infused, but otherwise by his nature he ought to receive them from things and senses. Wherefore the faculty of the agent intellect in man would not be useless, even if de facto it did nothing, especially since from things he could always acquire new species.

Concerning the possible intellect, moreover, the dissension among the doctors is rather about the word than about the thing itself. For although it cannot be denied, as Scotus contends, that in the angel there would be a possible intellect for receiving a species even if he had it infused in himself by nature, nevertheless this is not what Aristotle calls a "possible intellect" in De Anima III, chapter 4, but because first it is a bare potency in the genus of intelligibles, and then it becomes all intelligibles by the reception of species. In this sense St. Thomas in this article rightly denies a possible intellect in angels. Thus Cajetan answers Scotus on this article, for which reason I see that the question is rather about the word than about the thing, and therefore there is no need to dwell longer on it.[1467]

Articulus V - Whether in angels there is only intellective cognition

Objicitur: It seems that in angels there is not only intellective cognition.

1) For St. Augustine says, in the City of God, that in angels there is a life by which they understand and feel. Therefore in them there is a sensitive power.[1468]

2) Further, Isidore says that angels know many things by experience, which arises from many memories, as is said in the first book of the Metaphysics. Therefore in them there is also a memorative power.[1469]

3) Further, Pseudo-Dionysius says in the fourth chapter of On the Divine Names that in demons there is a perverse phantasy. But phantasy pertains to the imaginative power. Therefore in demons there is an imaginative power; and by the same reason in angels, because they are of the same nature.[1470]

But on the contrary: St. Gregory says, in the Homily on the Ascension in the Gospels, that man feels with the beasts and understands with the angels.[1471]

I answer that in our soul there are certain powers whose operations are exercised through bodily organs, and such powers are acts of certain parts of the body, as sight is in the eye, and hearing in the ear. But there are certain powers of our soul whose operations are not exercised through bodily organs, as the intellect and will; and such are not acts of any parts of the body. Now angels do not have bodies naturally united to themselves, as is clear from what was said above. Hence, of the powers of the soul, none can belong to them save intellect and will. And the

1467. Aristotle, De Anima, III, c. 4; Cajetan, In Iam partem, q. 79, a. 2.
1468. St. Augustine, De Civitate Dei, VIII (cf. also VI, c. 10 - 12).
1469. Isidore of Seville, De summo bono, II; Aristotle, Metaphysics I (on experience arising from many memories).
1470. Pseudo-Dionysius, De Divinis Nominibus, c. 4.
1471. St. Gregory the Great, Homilia de Ascensione in Evangelia.

Commentator also says, in the twelfth book of the Metaphysics, that separated substances are divided into intellect and will. And this agrees with the order of the universe, that the supreme intellectual creature be totally intellective, and not according to a part, as our soul. For this reason also angels are called intellects and minds, as was said above.[1472]

To what, however, is objected on the other side, one can answer in two ways. In one way, that those authorities speak according to the opinion of those who posited that angels and demons have bodies naturally united to them. Which opinion St. Augustine frequently employs in his books, although he does not intend to assert it. Whence he says, in the City of God, that over this sort of investigation one ought not to labor much.[1473]

In another way it can be said that those authorities, and the like, are to be understood by a certain likeness: because, since sense has a determinate apprehension of the proper sensible, it is in common speech that even according to a certain apprehension of the intellect something is said to be "felt." Whence also opinion is named "feeling." Experience, moreover, can be attributed to angels by a likeness of the things known, and not by a likeness of the cognoscitive power. For there is in us experience when we know singulars through sense. But angels know singulars, as will appear below, yet not through sense. Still, memory can be posited in angels, according as it is posited by Augustine in the mind, although it cannot belong to them according as it is posited a part of the sensitive soul. Likewise one must say that "perverse phantasy" is attributed to demons from the fact that they have a false estimation concerning the true good. Deception, however, is in us properly according to phantasy, by which sometimes we adhere to likenesses of things as though to the things themselves, as is clear in sleepers and madmen.[1474]

Conclusion is affirmative and without any controversy.

Quaestio LV - On the medium of angelic cognition

Consequently, the question is asked concerning the medium of angelic cognition. And about this three things are inquired.

1472. Averroes, In XII Metaphysicorum.
1473. St. Augustine, De Civitate Dei (cf. the remark that one should not labor much over such an inquiry).
1474. St. Augustine, De Trinitate X, c. 1 - 3 (on memory in the mind).

Articulus I - Whether the angels know all things through their own substance

Objicitur: It seems that the angels know all things through their own substance. For Pseudo-Dionysius says in the seventh chapter of On the Divine Names that the angels know the things that are on earth according to the proper nature of the mind.[1475] But the nature of an angel is its essence. Therefore the angel knows things through his own essence.

1. Further, according to the Philosopher in Metaphysics II and in De Anima III, in those things which are without matter, the intellect and what is understood are the same.[1476] But that which is understood is the same as the knower by reason of that by which it is understood. Therefore in those things which are without matter, as angels are, that by which something is understood is the very substance of the knower.
2. Further, whatever is in another is in it according to the mode of that in which it is. But an angel has an intellectual nature. Therefore whatever is in him is in him in an intelligible mode. But all things are in him: for the lower beings are essentially in the higher, and the higher are in the lower by participation. And hence Pseudo-Dionysius says in the fourth chapter of On the Divine Names that God gathers the whole into the wholes, that is, all things into all things.[1477] Therefore the angel knows all things in his own substance.

But on the contrary: Pseudo-Dionysius says in the same chapter that angels are illuminated by the reasons of things; therefore they know by the reasons of things, and not by their own proper substance.[1475]

Respondeo: I answer that that by which the intellect understands is compared to the understanding intellect as form, because the form is that by which an agent acts. But in order that a potency be perfectly completed by a form, it is necessary that all the things to which the potency extends be contained under the form. And hence it is that in corruptible things the form does not perfectly complete the potency of matter, because the potency of matter extends to more than is contained under the form of this or that thing. But the intellectual potency of an angel extends to the understanding of all things, because the object of the intellect is being, or common truth. Now the angel's very essence does not comprehend all things within itself, since it is an essence determined to a genus and to a species. But this is proper to the divine essence, which is infinite, to comprehend all things in itself simply and perfectly. And therefore God alone knows all things through his essence; but an angel cannot know all things through his essence, and so his intellect must be perfected by certain species for the knowing of things.

1475. Pseudo-Dionysius, De Divinis Nominibus, c. 7 (and cf. c. 4).
1476. Aristotle, Metaphysics II; De Anima III.
1477. Pseudo-Dionysius, De Divinis Nominibus, c. 4.
1475. Pseudo-Dionysius, De Divinis Nominibus, c. 7 (and cf. c. 4).

Ad primum: To the first it must be said that when it is said that the angel knows things according to his nature, the word "according to" does not determine the medium of cognition, which is the likeness of the thing known, but the cognitive power, which belongs to the angel according to his nature

Ad secundum: To the second it must be said that, as the sense in act is the sensible in act, as is said in De Anima II, not as though the sensitive power itself were the very likeness of the sensible which is in the sense, but because from both there is made one thing as from act and potency; so too the intellect in act is said to be the understood in act, not because the substance of the intellect is the very likeness by which it understands, but because that likeness is its form. And it is the same thing to say that in those things which are without matter the intellect and what is understood are the same, as to say that the intellect in act is the understood in act. For from this it is that something is understood in act, namely that it is immaterial

Ad tertium: To the third it must be said that those things which are below the angel and those which are above him are in a certain manner in his substance: not indeed perfectly, nor according to their proper notion, since the angel's essence is finite and, according to its proper notion, is distinguished from others, but according to a certain common notion. But in the essence of God all things are perfectly and according to their proper notion, as in the first and universal operative power, from which proceeds whatever is in any thing whatsoever either proper or common. And therefore God has through his essence a proper cognition of all things; not, however, the angel, but only a common one

Explicatio Articuli: The conclusion is: An angel does not know all things through his essence as through a proximate principle and intelligible form. For in the preceding question, Article 1, we proved that the very act of understanding in the angel is not his essence, and in the second that his existing is not his understanding; now indeed he shows that his essence is not the proximate principle of understanding, as is the form or intelligible species by which the intellect is informed. Moreover, in this article he speaks of the intellection of other things besides God and the angel himself: for concerning the cognition by which he understands himself he treats in Article 1 of the following question; but of the cognition which he has of God, in Article 2. When, moreover, he says in this article that not all things are known by the angel through his essence, he does not mean that the angel does not know some things through his essence, but that he does not know all things through it; by what, indeed, he understands those things, the following article declares. Wherefore the doctrine of the present article will be better examined together with the following.

Articulus II - Whether the angels understand by species received from things

Objicitur: To the second, this is how one proceeds. It seems that angels understand by species received from things. For whatever is understood by some likeness of itself in the knower is understood in the knower. But the likeness of something existing in another is either there by the mode of exemplar, so that that likeness is the cause of the thing; or it is there by the mode of image, so that it is caused by the thing. Therefore it is necessary that every science of an intelligent being

either be the cause of the thing understood, or be caused by the thing. But the science of an angel is not the cause of things existing in nature, but the divine science alone. Therefore it is necessary that all the species by which the angelic intellect understands be received from things.

1. Further, the angelic light is stronger than the light of the agent intellect in the soul. But the light of the agent intellect abstracts intelligible species from phantasms. Therefore the light of the angelic intellect can abstract species even from the very sensible things. And thus nothing forbids saying that an angel understands by species received from things.
2. Further, species which are in the intellect are indifferent to what is present and what is distant, except insofar as they are received from sensible things. If therefore an angel does not understand by species received from things, his cognition would be indifferent with respect to what is near and what is distant. And thus it would be pointless for him to move according to place.

But on the contrary: Pseudo-Dionysius says in the seventh chapter of On the Divine Names that the angels do not gather divine cognition from things divisible or from sensibles.[1475]

Respondeo: I answer that the species by which angels understand are not received from things, but are connatural to them.

For thus one must understand the distinction and order of spiritual substances, as there is a distinction and order of corporeal things. Now the highest bodies have a potency in their nature totally perfected by form. But in lower bodies the potency of matter is not totally perfected by form, but receives now one, now another form from some agent. Likewise also the lower intellectual substances, namely human souls, have an intellectual potency not naturally complete; but it is completed in them successively by the fact that they receive intelligible species from things. But the intellectual potency in higher spiritual substances, that is, in angels, is naturally complete through connatural intelligible species, insofar as they have connatural intelligible species for understanding all the things which they can naturally know. And this also appears from the very mode of being of substances of this sort. For lower spiritual substances, namely the soul, have something akin to body, inasmuch as they are the forms of bodies; and therefore from their very mode of being it befits them that they should obtain their intelligible perfection from bodies and through bodies; otherwise they would be united to bodies in vain. But higher substances, that is, the angels, are altogether separated from bodies immaterially, and subsist in intelligible being; and therefore they obtain their intelligible perfection through an intelligible efflux, whereby from God they received the species of the things known together with their intellectual nature. Whence St. Augustine says in the second book On the Literal Meaning of Genesis that the creatures which are below the angels are thus caused that first they come to be in the cognition of the rational creature, and afterwards the very constitution of the creature exists.[1478]

1475. Pseudo-Dionysius, De Divinis Nominibus, c. 7 (and cf. c. 4).
1478. St. Augustine, De Genesi ad litteram, II.

Ad primum: To the first it must be said that in the mind of the angel there are likenesses of creatures, not indeed received from the creatures themselves, but from God, who is the cause of creatures and in whom first the likenesses of things exist. Whence Augustine says in the same book that, just as the ratio by which a creature is made exists first in the Word of God than the creature itself which is made, so the cognition of that same ratio exists first in the intellectual creature, and afterwards there is the very constitution of the creature

Ad secundum: To the second it must be said that from extreme to extreme one does not arrive except through a middle. Now the being of a form in the imagination, which indeed is without matter, yet not without material conditions, is the middle between the being of a form which is in matter and the being of a form which is in the intellect by abstraction from matter and from material conditions. Hence, however powerful the angelic intellect may be, it could not reduce material forms to intelligible being unless it first reduced them to the being of imagined forms - which is impossible, since it lacks imagination, as was said above in the preceding article. Granted also that it could abstract intelligible species from material things, nonetheless it would not abstract them, because it would not need them, since it has connatural intelligible species

Ad tertium: To the third it must be said that the cognition of an angel is indifferent with respect to what is distant and what is near according to place. Yet on that account his local motion is not pointless. For he is not moved locally in order to receive cognition, but to operate something in a place

Conclusio: The angels do not understand by species received from things, but by species innate and connatural to them; the truth of which will be more fully explained in the following disputation.

Disputatio CC - Whether the angels understand by species

Caput I - That Durandus and the Nominalists held that angels, by their essence alone and their intellect, understand all things

The controversy stands on the principle by which an angel understands, namely, whether it is his very essence and intellect alone, or whether he needs some species added to the intellect; and, further, by what rationale such species befit an angel. On this question theologians vary in their positions, and since the matter is most remote from sense, scarcely any firmly certain conclusion can be obtained. Nevertheless, for our part we shall examine the dispute among all the opinions, so that at least it may appear to us which of them is less in accord with philosophy and reason.

The first opinion is that of those who say that an angel, without any species - either innate or acquired - by his essence alone and by his intellect, suffices for understanding whatever he understands with proper and even judicative cognition. Thus taught Durandus and the Nominalists.[1479]

1479. Durandus; and the Nominalists (as cited in the scholastic literature ad loc.).

Communis sententia: The common opinion will be treated in the second chapter.

Iudicium: A judgment concerning both opinions will be treated in the third chapter.

non final, not material, not formal: therefore efficient.

Third, they teach that the knowledge which they call abstracted (abstract knowledge) is produced in angels from the very intuitive knowledge, or from a habit effected by it: thus teach Ockham, Gabriel, and Gregory. For, as Gabriel says in the first question of the Prologue, article 2, notation 2, there is a twofold abstract knowledge: either it is of a universal predicate abstracted from singulars, and this arises from the intuitive knowledge of singulars, from which it is abstracted; or it is of a thing abstracted from existence, that is, of a non-existent; and this does not arise from intuitive knowledge, but from a habit which abstract knowledge effects in us.[1480] Now that this abstract knowledge exists in angels, no one will doubt. But that it is produced not through species implanted in the angel, but through a habit which the intuitive knowledge effects in them, they prove in this way. If now an angel were created, even with species of all things, whence could he understand that this or that thing was past, unless he had first seen it as present, and from that knowledge something had been effected in the intellect, which would be a principle of understanding that thing as past?

Caput II - The common opinion

The common opinion among the Scholastics is that an angel understands all things through species, likenesses, or qualities added to the intellect (intelligible species). Thus hold St. Thomas, Cajetan, and more recent authors in these two articles; Albert, Alexander, St. Bonaventure, Richard, Scotus, Aegidius, Hervaeus, Maior, Capreolus, Thomas of Argentina, Marsilius, the Ferrarian, Henry.[1481] And although Henry does not grant many species, he nevertheless asserts that a certain one habit of science is necessary with respect to all the things that the angel knows. He also teaches that this habit can be considered in two ways: in one way, as it is a quality of the first species of quality; in another way, as by its power it is the very knowables, and it makes them present to the intellect. In the latter way, he says, it can be called a species; and thus the angel understands all things by a single species. He grants only one for this reason, because if there were many, the angel would always actually understand any given thing by its species; which does not follow if one posits one habit or only one species for all things, as he himself at some length, and rather obscurely, shows. Therefore the common opinion is that an angel understands all things through species added to his intellect, whether these be more or fewer; about which it is not now to be disputed.

This, moreover, was the opinion of Proclus in the book of Causes, which is circulated among the works of Aristotle; where, in proposition 10, he says that intelligences are full of the forms of things, that is, of the intelligible species of things.[1482] It can truly be proved from Aristotle, De

1480. Gabriel, In I Sent., Prologue, q. 1, a. 2, not. 2. The position is attributed here also to Ockham and Gregory.

Anima III, chapter 1, or, according to another division, chapter 4, where he praises Plato for saying that the intellect is the place of forms.[1483] And although he is speaking of the human intellect, nevertheless the same reason seems to hold also of the angelic. St. Thomas also asserts it in the argument But on the contrary to Pseudo-Dionysius, De Divinis Nominibus, chapter 4, a little from the beginning; yet if that place be attentively read, nothing favors this opinion.[1484] By what reason this opinion can be proved, we shall see in the following chapter.

Caput III - A judgment concerning both opinions

I, for my part, think there are efficacious reasons at hand to prove that the human intellect is furnished with species for understanding (intelligible species); but that scarcely any exists which openly convinces the same thing of the angelic intellect in like manner. First, indeed, concerning the human intellect it is proved from the senses, in which it is ascertained by experience that there are species. Passing over the external senses - whose species not a few reasons drawn from experience confirm - concerning the internal senses, which are more similar to the intellect, it is shown thus. For in our internal imagination we often retain likenesses of things; when things absent and past we make present to ourselves, as if we were beholding them; which could not be recognized unless some species and likenesses of them were preserved in our imagination. For why is it that things which we have never seen we cannot remember; whereas of those things, however...

But those things we have seen we easily remember, unless it be because these left in us some image of themselves impressed, whereas those left none. Therefore, since in these faculties we say that there are species in addition to the very potency and power of the faculty: we must grant the same also to the human intellect, which is so bound to the senses in this state that it understands nothing without them. But of an intellect altogether separated from the body this reason does not prove.

Yet someone could, concerning every cognoscitive faculty, and concerning the angelic intellect likewise, persuade the same thing by this argument. For a cognoscitive faculty according to itself is a certain universal principle of this and that cognition; nor is it determined of itself to know this rather than that: therefore it needs some peculiar form by which it may be determined to understand this or that; and no form seems more fitting than the species of the object. For every quality which together with the faculty itself is a principle of knowing something is rightly called a species of that thing, that is, a species in first act representing, because it has the power of producing the actual and express likeness which is the very cognition itself, as was shown above, disputation 43, chapter 7.

1481. St. Thomas; Cajetan; Albert, tract. 4, q. 19, a. 11; Alexander, p. q. 24, memb. 2 - 3; St. Bonaventure, in II, dist. 3, par. c., art. 2, q. 1; Richard, art. 6, q. 1; Scotus, q. 10, 9; Aegidius, ead. dist., par. 2, art. 1; Hervaeus, q. 4, art. 2; Maior, q. 6 - 7; Capreolus, q. 2, art. 1, concl. 4; Thomas of Argentina, q. 2, ar. 4, I p., art.; Marsilius, in II, q. 7, art. 1, II p., concl. 5 - 6; Ferrar., II Contra Gent., cap. 96; Henry, Quodl. 5, q. 14, lit. S.

1483. Aristotle, De Anima III, cap. 1 (or, according to another division, cap. 4).

1484. St. Thomas, in the argument But on the contrary to Pseudo-Dionysius, De Divinis Nominibus, c. 4, a little from the beginning.

But someone will object, that even if the intellect, or the cognoscitive faculty, receives the species of singular objects, nevertheless it remains indifferent of itself to understanding this or that; and it must be determined by some extrinsic principle: therefore by this reasoning it is not sufficiently proved that species must be conceded to an Angel. But this objection does not stand against the foregoing reason. For although an intellect furnished with a species needs some principle by which it is determined to the exercise about this object - something which in us proceeds from the senses and from the will - yet on the part of the universal agent principle there seems necessary some form which should physically modify the very faculty to act this rather than that. For the intellect and the faculty of knowing of themselves seem only to be the physical principle of knowing in general, and with this or that species it is completed in the notion of an integral principle, so as to understand this or that.

I answer: Nevertheless, although this reasoning proves something of man's intellect, it does not likewise of the angelic intellect. For one could say that the universal efficacy of the angelic intellect, for understanding this or that, is not necessarily determined by an intrinsic form. For it seems proper to cognoscitive and appetitive faculties to be determined by objects, not as efficient causes, but as concurring in a peculiar way to the operation and having, in some manner, the ratio of cause; yet so that the appetitive faculty is determined by the object as existing in cognition, but the intellect by the very object existing externally as present, past, or future, according as it is accommodated to the intellect. For by the very fact that it lies within the latitude of its proper object, already the intellect can be determined by it. And this, in Angels, can be defended without any inconvenience; whereas to concede species to an Angel certainly is not without some difficulty.

First, because if the angelic intellect of itself were not sufficient, without some species added to it, to elicit cognition, then either it ought to receive it from things, or to have it produced together with it from the beginning. If we say the former, many absurdities follow, which we shall see in the next disputation. Then too, if it be said that an Angel receives species from things, we could say that the very things concur with the intellect of the Angel to the cognition of themselves without any species; therefore it must not be said that the Angel receives species from things. But the latter has no less difficulty. For either those species produced from the beginning and infused with the Angel are from God alone, not as due perfections of angelic nature, or as forms due and flowing from the Angel by way of passion. The former is difficult: for it would follow that God could deny species to an Angel without inflicting any force on angelic nature; wherefore it would not be violent for an Angel to have the cognition of nothing, just as it is not violent for him not to see God, although he can see Him by a light not due to him being communicated. For even those who say that an Angel now understands by species added to the intellect must plainly admit that the species of some possible natures have not been conceded to him, nor are these known by the Angel, without the Angel suffering some force. For no one suffers force unless some form be denied to him against his internal impulse, or a contrary form be infused.

Further, if in this manner species were infused into an Angel, they would be supernatural forms, just as is the light of glory. For all such forms would be infused immediately by God, as is the light of glory; and on the part of the Angel there would be only passive potency, as there is for receiving

the light of glory; nor would such forms be infused by God through any required disposition or created cause, as the rational soul is infused. Therefore nothing would be lacking for them to be called supernatural forms no less than the light of glory, according to the definition of what is supernatural which we shall hand down in disputation 214. But if you say that for this reason these species are natural forms, because they are from God acting naturally, whereas the light of glory is a supernatural form because it is infused in a supernatural way, that is, beyond the common course: this difference is not sufficient. For a natural form must be distinguished from a supernatural form not only on the part of the efficient cause, but by itself, as we noted above, disputation 44, chapter 1, against Scotus, and we shall also show below in disputation 214, chapter 2. For God is not said to do something supernaturally except in one of two ways: either because He alone produces that which otherwise is wont to be produced by a created agent, although, because of some impediment, it now could not be produced by a natural agent; or because He produces some form which is by its own nature supernatural. But in no other way can a distinction be made on the part of the very mode of operating, naturally and supernaturally.

Wherefore it would be easier, as I think, to defend that evident cognition, which they call intuitive and proper, proceeds from the sole power of the angelic intellect in such wise that, in proportion as the power of the Angel's intellect is a universal cause, and needs some determination that it may operate in this or that mode, it is determined by such and such an object, proper to it and equal to its native power - not because the object concurs with the intellect as an efficient cause, but because, in the mode of object and terminus, it itself modifies and determines it to such an operation, so that, concerning such an object, it cannot have any but such an operation; yet not because it is excited by the object to consider this rather than that - for this comes from another cause, as we shall say below, disputation 236, chapter 4 - nor because the object can concur with the intellect as efficient cause for intellection, as will be evident from what we shall say in the next disputation. And hence can be solved the argument of Scotus and the Nominalists, whereby they contended that the object is the efficient cause of intellection. For the fact that, the object being posited, intellection is posited, and, it being removed, intellection is removed, is not sufficient for us to say that it is an efficient cause; but it is enough to allege that it is a cause in another way, as has been explained. What objects are proper to it and wholly accommodated to its native power we shall note in disputations 208 - 209 and 225 - 226.

This, however, does not hinder that the Angel may need some form added to him for understanding objects not accommodated to his native power: for seeing God, and the mysteries of grace, and future contingents; because for these he does not have a complete power of understanding, but an inchoate one. For he has the power of understanding, as understanding is, which under its latitude includes understanding this and that; but he does not have the fully complete power so as to understand or see certain objects which are above his power, such as God, and the like. Yet his power is completed for seeing these, when some supernatural form is added, as we have philosophized about the light of glory above, disputation 43, chapter 6 and the following.

Someone will say that from what has been said it follows that the infused species which were communicated to the soul of Christ for knowing natural things are also of a supernatural order. For we were also inferring that against the species of Angels. I answer: this does not follow in any way. For since we suppose that created natural things can already be understood and known as they are by Angels with intuitive (as they say) cognition, it is not surprising if in another intellect, which by itself is not able to know them, species can be given, infused, of a natural order for knowing those same things. I said, for knowing those same things: because for supernatural objects, such as grace and the beatific vision, species infused of a natural order are not given, but of a supernatural order according to their substance, just as the things themselves are which are known. For if the Angel's intellect could behold created things without species, then to no intellect would those species and that intuitive cognition be connatural, but they would be supernatural to all. It remains proved, therefore, that these species are not infused into the Angel from God's mere will.

Next, it cannot be said that these species arise from the very nature of the Angel as its passions, as some think - of whom we shall speak in disputation 201, chapter 3. For since the nature of the Angel and of his intellect are determined according to themselves, they demand determinate passions and perfections connatural to them. But the species of intelligible things are not determinate; therefore they cannot be according to the Angel's natural inclination. That these are not determinate is clear. For either the Angel's intellect requires only the species of the things which God has created or is going to create, or also the species of possibles which He is not going to create. As to the species only of things which He has in fact created or is going to create, the Angel cannot have a natural inclination; because these are not determined naturally, but only by the will of God. But a natural inclination, especially to passions, must be determined naturally. Nor can he have it to the possibles; for there would be no greater reason why to these rather than to those, and hence he would naturally incline to all. Therefore either the Angel would have all those species, which would be infinite; or he would lack some, indeed infinitely many, against his natural propensity. Both are absurd. Therefore it would be easier to defend that an Angel, without species, understands all created and natural things.

But against this opinion someone will object in this way: If the bare power of the Angel together with the object sufficed, the Angel could indeed understand possibles and future things; for the possible and the future, as such, are intelligible objects. I answer: concerning future things there is nearly the same difficulty in the opinion of those who assert that the Angel understands through species. For the Angel neither has the species of future things, nor does he receive them from future things when they are present, as we shall prove below, in the next disputation, chapter 3. However, in either opinion an easy reply can be made. Therefore I say: whether the intellect have the species of possible and future things, or have none but by its bare power understand all things, it does not therefore understand the possibles which are contained in the power of God alone, and the future contingents which depend on free choice (for these alone do we deny to angelic cognition), because these are not objects which correspond to the power itself according to its natural virtue and are equal to it. Wherefore about those it will not be able to operate by its own proper power.

But, to defend the common opinion, certain difficulties must be examined, that we may somewhere be able to rest and to philosophize consistently. Furthermore, someone can defend that the species infused into Angels are from God, and nevertheless that they are of a natural order: because, although they could have been produced by God alone, no other efficient cause or disposition requiring it, which seems to be required by the ratio of a supernatural entity which we handed down in disputation 154; yet, because such species are about objects of a natural order, and - as it were - are infused by God at the demand of the very objects, that they may be understood, therefore the species themselves too are of a natural order. This reasoning, however, is not without difficulty. For although the objects of the intellect are of a natural order in the genus of being and of thing, nevertheless in the genus of object they can be of a supernatural order. For many future things from the freedom of the will are natural entities in the genus of thing; and yet, in the genus of object, they are supernatural, so that, as future, they are not known naturally by Angels; nor can their species of a natural order be infused into Angels; otherwise there would be no cause why such species were not conceded to them from the beginning of creation.

Further development on the determination of the intellect by the object

It is asked whether the Angel receives species from things.

Disputatio CCI - Whether the Angel receives species from things

Opinio Scoti, et aliorum, cap. 1. - That the Angel receives no species from things; and so on. The opposite opinion of the adversaries. How the Angel had these species in the beginning in his mind, cap. 3.

Caput I - The opinion of Scotus and others

Nor do those who concede species to the angelic intellect, that by them it may be furnished so as to understand, agree among themselves about the mode in which such species befit an Angel. The first opinion is of those who teach that an Angel receives species from things in the same way in which our intellect abstracts them from the senses. Thus affirms Scotus in II, dist. 3, question 11; Richard, article 6, question 1; Major, question 6 - 7; Bassolis, question 4, article 8; Marsilius in II, question 7, article 1, part, conclusions 5 - 6; and Alexander in the Preface to the second question, article 2; and others, as is gathered from them: all, with no distinction made, seem to assert that all the Angel's species are received from things, and that none were infused from the beginning of creation; and he speaks in one place about the species of spiritual things, in another about the species of material things in general; but other authors say the species of incorruptible and universal things...[1485]

1485. Scotus, In II Sent., dist. 3, q. 11; Richard, art. 6, q. 1; Major, q. 6 - 7; Bassolis, q. 4, a. 8; Marsilius, In II, q. 7, a. 1, pars, concl. 5 - 6; Alexander, in praef. ad secundam quaestionem, art. 2; and others as cited in these loci.

They say that the species were connatural to the Angel from the beginning of his creation, but that the species of singular and corruptible things were later derived from the things themselves. Yet, in my judgment, they understand only the species of incorruptible things to have been created together with the Angels themselves, and to have been connatural to them from the beginning of their creation; whereas the species of incorruptible things that were to exist after the Angels, such as souls, were, in the lapse of time, received from the things themselves in the same way as from other corruptible things. For, in their opinion, the very same absurdity would follow if the Angel had had from the beginning the species of future incorruptible things, namely, that he would rightly know other future things by them.

Therefore they prove that the species of singular things not yet present to the Angels are drawn from the things themselves; otherwise it would follow that all future things, even contingent ones, are known by the Angel before they exist, if from the beginning of his being he had had the species of all those things. By this line of reasoning the aforesaid Doctors proceed - except Scotus, who asserts that indeed Angels could have had the species of all singular things and of future contingents, and nevertheless would not know future contingents, because by those species Angels would not know the connection of actual existence with such a thing. He therefore employs another reason, namely, that there would be infinite species in the Angel, if he had from the beginning the species of all future things, because future contingents are infinite. For he thinks, as we shall see below, that there cannot be one species which represents many things, but that to singular things and operations singular species also are to be assigned.

How Scotus defends his opinion.

Scotus, however, adds two points. One is that, if the Angel did not have some connatural species from the beginning, he could receive singular ones from things; in which point the other authors would not dissent from Scotus, for if he could receive some, why could he not also receive all? He nevertheless says that in fact God infused certain species into the Angels, so that He might create him adorned and perfect; which Bassolis and Major expressly noted with Scotus in the places cited. The second is that, even if the Angel had the species of singular future things, nevertheless for intuitive knowledge he would receive something from things. Major taught the same in the place cited, for they think that intuitive knowledge is not had by the species alone and the proper concept of the thing, but is the knowledge of the thing as actually existing and present, and therefore for it the proper species of the thing previously infused does not suffice, unless then the Angel receives something from things. Gabriel agrees, in 2, Question on the Prologue, article 2, notation 2, from the doctrine of Ockham.[1486]

But in this Scotus does not altogether agree with the others. For others teach that the Angel receives intelligible species from things, by which he afterward elicits intellection; Scotus, however, asserts that Angels receive intuitive knowledge itself from things in such a way that the intellect together with the very singular present thing produces the intuitive cognition of it, although from this knowledge (as Scotus says) a species is left behind for abstract knowledge, that is, for the

1486. Gabriel Biel, In II Sent., Prol., q. 2, a. 2, not. 2, drawing on Ockham.

knowledge of a thing not existing, or considered without existence. Thus he taught in Question 10, to the Question, near the end of it. How Scotus differs from Gabriel, Ockham, and Gregory, we said in the preceding disputation, chapter 1. For those grant that there is no species in the Angel; Scotus, however, says there are many, and that only intuitive knowledge is received from things; wherefore Cajetan does not seem to have accurately reported Scotus's opinion below, question 57, article 2.

For this opinion Augustine is usually brought forward, 12 On the Trinity, chapter 7: for he says that God does not see temporally, nor does anything new occur in His vision when something is newly done in time, just as (he says) the senses are affected thereby, whether the carnal senses of animals and men, or the heavenly senses of Angels. To this testimony we first reply that it is not surprising if Augustine held this opinion, who, as we saw in disputation 179, chapter 2, did not hesitate to assert that Angels are corporeal. But those who teach that they are spiritual, as Scotus affirms, ought to deny that they can suffer anything from a body. Then I say that this can be understood, not because the Angel is changed by the present thing as by an efficient cause, but because he does not understand future things until they are present, as we showed in disputations 106 and 107.

Caput II - That the Angel receives no species from things: the common and truer opinion is established

We must embrace the common opinion, which teaches that the Angel does not take any species from the things themselves; which St. Thomas, together with Cajetan and others, hands down in this article; likewise St. Thomas, Contra Gentiles II, chapter 96; and Ferrariense likewise; Albert the Great in various places; Thomas of Argentina in II, distinction 3; St. Bonaventure; Capreolus; Aegidius; Hervaeus; to whom Henry agrees in the place cited in the preceding disputation; for although he says that the Angel understands all things not by various species but by one habit, nevertheless he teaches that that habit is not acquired from things, but was created together with the Angel.[1487]

Setting aside many others, this opinion is proved by a single, efficacious reason, and the opposite is refuted.

If the Angel were to receive species from present things, it would have to be done in one of three ways: either the present things alone would have to be the entire and perfect cause of the species in the angelic intellect; or the things themselves together with the intellect would have to concur to produce the species, so that the things would be causes which they call partial; or, finally, the angelic intellect alone would have to be the cause of the species. But in none of these ways can it be done: therefore it must not be asserted that the Angel receives species from things.

1487. St. Thomas, this article; Cajetan ad loc.; St. Thomas, Contra Gentiles II, c. 96; Ferrariense idem; Albert the Great in several places; Thomas of Argentina on II, dist. 3; St. Bonaventure; Capreolus; Aegidius; Hervaeus; and Henry in the place cited in the preceding disputation.

First, the things themselves existing outside the intellect cannot be the whole and entire cause of the species. For if the things are material, because the material and corporeal cannot act upon what is spiritual, which is more noble; for nothing corporeal can by its own power produce a spiritual form, of which only the Angel and a spiritual substance is capable. Then also, because even if the things themselves and the objects are spiritual, species cannot proceed in this way: for, as we will show in disputation 217, the Angel by his own power can only imprint motion according to place in bodies; but to produce some quality he certainly is not able: therefore neither can he produce a species of himself in another Angel.

Second, the things themselves and the objects cannot produce species as a partial cause. For either they would in this way be the cause of the species by their own power, or as instruments elevated by the power of the Angel's intellect, not by their own power, for the reason given above. Not as instruments: for although we say that the phantasm, which is material and corporeal, is in us an instrument for producing species in our intellect, we ought not to assert the same of things which are outside the angelic intellect, when compared with it. For the phantasm, because it is conjoined to us, can be naturally elevated by our agent intellect by a certain natural ordination, whereby it is placed under it by the very fact that it is conjoined; but a thing is separated - how could they be elevated as instruments by the angelic intellect, since even with respect to God such an elevation of things to produce higher effects is rather difficult? Add that, by whatever reason instruments could be assumed for producing intelligible species, they could be assumed for producing intellection itself, as Scotus wished. Therefore it would be pointless that they should first be assumed for producing species rather than intellections themselves.

Third, a species cannot be produced by the efficacy and power of the intellect alone without any cooperation of things and objects; for by the same reasoning someone could say that, with things and objects present, cognition is effected and there is no need of an impressed species by which the intellect is rendered potent in first act. Then also, in order that the agent intellect, which is of itself a common and indifferent power, be determined to the production of this or that species, it would need another particular cause or an instrument by which it would be determined: therefore of itself it would no more abstract this species than that one. But a particular cause or an instrument it would not have, as we suppose: therefore intelligible species cannot be abstracted by its power alone. You will say: it would be determined by the things themselves as by an object, or matter. This is surely impossible. For although an efficient cause may be determined by the subject, or matter, about which it operates, by reason of which it produces various effects, and a knowing faculty may also be determined by the object which it knows, nevertheless the agent intellect cannot be determined by things as by matter, because it does not operate upon them; nor as by an object, because they are not its object: therefore neither in this way can it be determined by them. By this reasoning it is proved that the Angel cannot receive species from things, and hence that there is not in the Angel an agent intellect. For if for any reason it ought to exist, it would be chiefly for the production of species; for to no other effect is it necessary, as we showed in disputation 198.

From what has been said it also follows that the opinion of Gabriel and Gregory, Ockham, and Bassolis is false, who assert that the things themselves existing outside the Angel's intellect are the efficient cause of the species in the angelic intellect.

Caput III - In what way the species which the Angel has were from the beginning inborn in his intellect

Likewise it is gathered that the claim of Scotus is false, namely that the intuitive cognition of singular things is proximate from the object, if he understands it to be from the object as from an efficient cause. But if he understands it to be from the object after the manner of a formal cause, bestowing the species and terminating the cognition, he ought to have said this of every cognition: therefore this would not be something peculiar to intuitive cognition.

Finally, I also judge false what Scotus asserts, that even if an Angel were to know future things, and through proper species and a concept according to the existence which they will have at the time when they are future, nonetheless, when those things are already present, his knowledge of them must be changed, so that what was abstractive would become intuitive, and that it must be derived from the things themselves. For he holds that abstractive and intuitive cognition differ according to substance. He defines intuitive cognition in Quodlibet 3, article 2, around the second question, and in the second book, distinction 3, question 9, in the section that begins "Secundo quaero...." To the question, he wishes intuitive cognition to be the knowledge of a thing as actually existing and present. Gabriel says the same in the first question of the Prologue, article 2, note 12. Therefore I judge this false. For if the Angel had proper knowledge of future things for that time, nothing of the presence of those very things would ever be changed in the cognition. That, when things are present, the cognition is changed, is for this reason, that previously he did not have any proper knowledge of them as they were to be future. But if such knowledge be had, certainly the presence of the thing would change nothing, as we said above in disputation 64, chapter 4, about an eye which would see in the absence of the object, as if it could be done: wherefore Maior rightly noted, in second distinction 3, question 10, that an intuitive knowledge of future things can be granted by God before they are present. But when in the same distinction, question 7, in the third proof of the conclusion, he says that something is changed in the cognition which the Angel previously had, when now he beholds the thing, he asserts this because he thinks that the Angel now does not have proper knowledge of future things before they exist.

In what way the Angel has these species inborn from the beginning in his intellect, among later Doctors there is a dissension of opinion. Some say that the species are, as it were, passions naturally proceeding from the essence: thus Cajetan, I - II, question 50, article 6, where he says that the Angel receives habits "from without" in a twofold way, in one way as an adventitious quality (such as supernatural habits), in another way as a quality congenite by the Author of nature, just as heaviness and lightness have their motions from the generator; and in this manner Angels have the intelligible species of things. But by "congenite quality" he does not understand "generated together with the Angel," for thus he would also think that grace and supernatural

habits were communicated to the Angels in this latter way; rather he understands a quality which they call connatural, and, as it were, a passion of the Angel himself, which he compares to the motion of heavy and light bodies, which also flows from the heavy and the light themselves. Capreolus asserts the same in the second distinction, question 2, article 3, in replying to Aureolus's argument against the third conclusion. And it seems to have been the view of the author of the Book of Causes, as proposed among Aristotle's works, proposition 10.[148814891490]

And this indeed can be confirmed by the reasoning set down in the preceding disputation: because, since the Angel's intellect has a natural power for understanding, it ought also to have either a species naturally conjoined from within, or some force by which it might be able to acquire it for itself; otherwise the faculty of understanding would be in vain, since from its natural principles it would not have whereby it could operate, unless from God alone it were freely to receive a species. Others, however, think that intelligible species do not arise from the nature of the Angel himself as from a natural efficient principle, but are infused by God alone and freely given; for if they flowed naturally from the intellect, or from the Angel's nature, there would be no greater reason on account of which he would have the species of those things which are future and not of possibles; but if of possibles, there would be no greater reason on account of which he would have these rather than other things, as we were inferring in the preceding disputation, chapter three; and that the Angel does not have the species of all possible things, indeed that he has only those of future things, is the common teaching, which St. Thomas sets forth below in question 56, article 2, reply to the fourth.[1491] Ferrariensis, however, who is cited for this latter opinion in Contra Gentiles, book II, chapter 96, seems rather to have followed the former. I for my part confess that, on either side, the matter is difficult, nor can the arguments of either side be fully satisfied. Yet it has seemed to me easier for understanding, that the Angel does not need species in order to understand, but by his own power alone is able to understand something by the very fact that it is contained within the bounds of his object. But what is placed within the breadth of that object will become clear from what follows.

Articulus III - Whether the higher Angels understand by more universal species than the lower

To the third, it proceeds thus. It seems that the higher Angels do not understand by more universal species than the lower. For to be universal seems to be what is abstracted from particulars. But Angels do not understand by species abstracted from things. Therefore it cannot be said that the species of the angelic intellect are more or less universal.

1488. Cajetan, In I - II, q. 50, a. 6, on two ways of receiving habits "from without."
1489. Capreolus, In II Sent., dist. 2, q. 2, a. 3, ad argumentum Aureoli contra tertiam conclusionem.
1490. Liber de causis, prop. 10, ascribed among Aristotle's works.
1491. St. Thomas, I, q. 56, a. 2, ad 4.

Further, what is known in the specific is known more perfectly than what is known in the universal: because to know something in common is, as it were, a mean between potency and act. If therefore the higher Angels know by more universal forms than the lower, it follows that the higher Angels have a more imperfect knowledge than the lower. Which is incongruous.

Further, the same cannot be the proper ratio of many. But if a higher Angel were to know different things by one universal form, which a lower Angel knows by many specific forms, it follows that the higher Angel would use one and the same form for different things. Therefore he will not be able to have a proper cognition of each. Which seems inconvenient.

But on the contrary: Pseudo-Dionysius says, in the twelfth chapter of the Celestial Hierarchy, that the higher Angels participate in knowledge more universally than the lower. And in the Book of Causes it is said that the higher Angels have forms more universal.[1492][1493]

I answer that, from this it is that there are some things higher in reality, that they are nearer and more like to the One First, which is God. Now in God the whole fullness of intellectual cognition is contained in the One, namely in the divine essence, by which God knows all things. But that fullness of intelligibility is found in created intelligibles in an inferior mode and less simply. Hence it must be that the things which God knows through the One, lower intellects know through many, and the more through many the more the inferior intellect shall be. Thus therefore, the higher the Angel, the more through fewer species he will be able to apprehend the universality of intelligibles; and therefore it is necessary that his forms be more universal, as it were each one of them extending itself to more things. And of this an example can in some manner be seen clearly in us: for there are some who cannot grasp intelligible truth unless it be expounded to them in particular detail one by one, and this happens from the weakness of their intellect; others, however, who are of stronger intellect, are able to grasp many things from a few.

Reply to the first: It befalls the universal to be abstracted from singulars insofar as that intellect which knows receives its cognition from things. But if there be some intellect not receiving cognition from things, the universal known by one universal form will not be abstracted from things, but will in a certain manner pre-exist things: either according to the order of cause, as the universal reasons of things are in the Word of God; or at least according to the order of nature, as the universal reasons of things are in the angelic intellect.

Reply to the second: To know something universally is said in a twofold manner. In one way, on the part of the thing known, so that there is known only the universal nature of the thing. And thus to know something universally is imperfect. For he would know man imperfectly who would know of him only that he is an animal. In another way, on the part of the medium of knowing. And thus it is more perfect to know something universally. For that intellect is more perfect which, through one universal medium, can know singulars properly, than that which cannot.

Reply to the third: The same cannot be the proper and adequate ratio of many. But if it be excellent, the same can be taken as the proper ratio and likeness of diverse things. Thus in man there is universal prudence with respect to all the acts of the virtues, and it can be taken as the

1492. Pseudo-Dionysius, De coelesti hierarchia, c. 12.

proper ratio and likeness of particular prudence which is in the lion for acts of magnanimity, and that which is in the fox for acts of caution, and so of the others. Similarly in the divine essence there is received, on account of its excellence, the proper ratio of singular things which are effects. Whence singular things are assimilated to it according to their proper ratios. And in the same way it must be said concerning the universal ratio which is in the Angel's mind, that by it, on account of its excellence, many things can be known by a proper cognition.

Conclusion: the higher Angels know the same things through fewer species.

Disputatio CCII

Caput I - Whether there can be one species, or quality, in Angels representing many things

That there is one species, or quality, in Angels representing many things, many authors have said; see chapter 2. That there are singular species of singular things was said by Scotus and others.

Since, with the common opinion, we suppose that the Angel understands through species, to see whether the higher understands through fewer, it is necessary first to examine whether one individual species of many things can be; in which difficulty the prior opinion is that of those asserting that one and the same species cannot be of many things. Thus taught Scotus on the Second Book, distinction 3, question 10, in the sections "Ista propositio" and "Ad quaestionem"; Bassolis, question 3; another opinion is in Richard, article 6, question e, in the second argument "Sed contra"; Maior, question 6, conclusion 2.[1494] And since the aforesaid authors think that the species of all natures were from the beginning inborn in the Angel, but that, in the course of time, the species of individuals and singulars are taken from the things themselves, they teach that the singular species of singular natures and of singular individuals are in the Angel.

They prove, first, because from the opposite sentence it would follow that infinite things could be represented by a single species: for now, in the highest Angel, either there is one species representing all the possible natures different in species, or at least many of them; therefore that species could represent all the natures of the lower species; but these are infinite, because under any species infinitely many others can be made: therefore one species could represent infinite things. Likewise about individuals one can argue thus: if there is some intelligible species representing the nature itself, and some individuals of it, it will be able to represent infinite individuals. Moreover, that infinite individuals, whether of the same nature, or of natures of the same genus, cannot be represented by the same species, Scotus proves, because where a plurality according to number requires greater perfection, an infinity according to number will require

1493. Liber de causis, on higher Angels having more universal forms.

1494. Scotus, In II Sent., dist. 3, q. 10, §§ "Ista propositio" and "Ad quaestionem"; Bassolis, q. 3; Richard, art. 6, quaest. e, in 2, argumento "Sed contra"; Maior, quaest. 6, conclusio 2.

infinite perfection: for if, that someone carry so many pounds, it is necessary he have strength so great that he can carry infinite, it is necessary he have infinite strength; add that if there were one species representing infinite individuals, the Angel could by his own power understand all at once.

Therefore the conclusion is that the higher Angels know the same things through fewer species.

Whether there can be one species of many things.

Singular species of singular things were said by Scotus and others, in chapter 1.

Secondly Scotus proves that one quality cannot represent many, by this argument: a single ratio of knowing has one adequate object under which the rest are included; but one species, or quality, cannot have one adequate object containing the rest under itself, if through it all creatures are represented, as some affirm: therefore neither can there be one species of all creatures, nor one habit for understanding all created things, as Henry asserted, can there be.

Thirdly, nothing is a principle of knowing another unless it be the ratio of that thing, or contain its ratio; but one species cannot be of this sort, because it cannot contain in itself the ratios of so many natures; therefore it cannot be a principle of knowing many.

Fourthly, the same cannot be assimilated to many different things among themselves; therefore one quality cannot be the likeness and species of so various natures.

One species, or quality, in Angels representing many things, many authors have said.

Caput II - The more common and truer opinion: that one and the same numerically species can represent many diverse things, and that such species were granted to Angels

A still more common and truer opinion is that which teaches that one and the same numerically species can represent many diverse things, and that species of this sort were granted to Angels. The authors of this opinion were Albert in the book On the Four Co-causes, part 1, quaest. 5, art. 12, after the middle; Aegidius in the Second Book, dist. 3, second part of the distinction; Capreolus in II Sent., quaest. 2, art. 2, dub. 3 and 4, and quaest. 2, art. 1, concl. 7, and art. 3, to the arguments of Scotus against that conclusion; Thomas of Argentina, quaest. 2, art. 4, in the second part of the article, in the conclusion; the Ferrariense, II Contra gentes, cap. 98, § Tertia conclusio; Henry also in Quodlibet V, quaest. 14; St. Bonaventure likewise in the same distinction, in the third part of the distinction, article 2, question 1, to the third, where he admits that by one species the specific nature and all the individuals are known. The principal foundation of this opinion is of this sort: if there is no manifest contradiction, there is no reason why we should say it cannot be done, namely, that by one quality and species many things are represented; and if it can be done, we ought not deny it to an Angel, that which is of greater perfection, as Henry asserted, so that, the more perfect the Angels are, the fewer species they may understand by. For although this reasoning does not prove that it is necessary, nevertheless it shows it to be most congruous and fitting to the most perfect spiritual nature.

Moreover, that what we have said does not imply a contradiction will clearly appear if we dissolve the arguments of Scotus. By doing so, we shall also remove the foundations of that opinion. The first argument was that it would follow that by one species infinite natures could be represented. I answer, however, first, that although we concede that by one quality many natures can be represented, it does not therefore follow that infinite natures can be represented; because although it represents three or four, it does not follow that it can represent all the possible inferior natures, which Scotus says are infinite; for a species can be adequate to three or four natures, so as to represent them only: but it would follow that it can represent infinite inferiors, if from the very fact that it represents a superior, it represented an inferior; which does not happen.

Secondly, I say, it is not established whether there are infinite possible species toward the lowest, as we noted above in Disputatio 106, cap. 4; nor would anything absurd follow if we were to say that toward that side there are infinite possibles. Thirdly, for now I declare that it is not impossible that by one created quality and finite according to essence there be represented infinite natures of things specifically diverse, or individuals of the same nature. For just as by one species, or created quality, God is represented, who is infinite according to essence - namely, either by the light of glory, or by an impressed species, which can come to be, or by the very vision, which is an expressed representation, all of which are deduced from what was said above in the whole of question 12 - so too it does not imply a contradiction that by one simple quality there be represented an infinite multitude either of individuals in the same nature, or of diverse natures.

And if you press this by reasoning that, in order that a quality represent one nature, some perfection is required; in order that it represent two, a greater is required; therefore, in order that it represent infinities, an infinite is required, which cannot occur: I answer that by this form of arguing one only gathers an infinite increase whenever the increase is univocal in the same form according to the intensity or extension of quantity. But if the increase occurs in a different nature, certainly it does not follow; rather this alone is finally gathered, that for representing an infinite multitude a species of a different nature, or property, is required - which we do not deny, as I also showed above, Disput. 50, cap. 5. I said, of a different nature or property; because even if we did not say that they are of a different nature according to species, it would suffice to say that it is numerically different from that which represents finite things, but has a different mode; although this would have to be understood of a species which would represent infinite individuals of the same nature.

Also what I added to the first argument proves little: because although some intelligible species represented infinite things, it would not be possible to conclude that it is of infinite perfection, as is clear from what has been said. And indeed it does not repugn that things actually infinite be known at once, as we showed above, Disput. 49. Moreover, even if one granted a species actually infinite, representing in first act, it would not therefore have to be conceded that all those things could at once be known in act. For the representation of that species would not be of such a nature that, as if in a mirror, all things would be seen in it. For neither does the intellect, as it were, turn directly to the intelligible species and behold in it the things that are said to be represented in it; rather that species would be said to represent things in first act, or, as others speak, by the mode of a habit

(*habitus*), because it would be a principle with the intellect for eliciting the cognition of singulars, and thus would be distinguished from the very word or cognition, for a word or cognition is, as it were, an actual representation; but a species would be, as it were, habitual: and since the cooperation of the intellect with the species is limited, hence it happens that an impressed species represents more things by the mode of a habit than the intellect actually knows by it. Cajetan nevertheless concedes in this article that an Angel can by one species (*species intelligibilis*) understand many things at once, but not all. Whether truly he can understand all or not, we cannot so easily define. This, however, is certain, that only so great a number of things can be understood together as the power of the intellect to use the species permits.

The second argument for Scotus's opinion was that one species ought to have one adequate object, etc. I answer that it is not necessary that one species have one adequate object according to some univocal ratio; but as an adequate object there can be that whole multitude of things which are represented by the species, just as sight has as its object color and light, which do not agree in one adequate and univocal ratio, as we noted above, Disputatio 7, cap. 5. The same holds for being (ens), which according to the whole latitude of its analogy is the object of the intellect. Wherefore I do not see why Cajetan should concede in this article that, with respect to any intelligible species, there is one formal ratio of the adequate object in which all the things that are represented by that species agree. He does, however, very well teach that there is one object which is chief among the rest and containing them - something Capreolus had also said in article 3 cited in the solution to Scotus's first argument, against the seventh conclusion. Wherefore the Ferrariense, II Contra gentes, cap. 98, § Ad evidentiam eorum, plainly asserts that there can be one species representing many things which do not agree in one adequate ratio; and then, Ad huius, he merely affirms that it can also happen that many objects represented by one species agree in one common ratio - which we do not deny. Furthermore, although we were to concede that the many things which are represented by one species ought to agree in one common ratio, the argument of Scotus would prove only against Henry that there cannot be one species, or quality, with respect to all intelligible things; because all cannot agree in one common ratio. But the foregoing reasoning certainly does not prove that many things cannot be represented by the same species, because many could agree in one common ratio.

The third argument of Scotus also proves nothing: for one and the same can be a ratio of knowing another in a twofold manner. First, insofar as it is known before; and in this way Scotus rightly teaches that that, by which another is known, ought to be either by the ratio of that thing, or formally contain that thing; but in this way the species is not the ratio of knowing the object which it represents, because it contains neither the object, nor anything else, formally in itself. Then, one thing is the ratio of knowing another not previously known, to wit, as the species of that thing, insofar as it is a principle for eliciting the cognition of that thing, or insofar as it is the very actual representation of the cognition; and in this way it ought not formally to have in itself that which makes the thing be known, nor ought it to be the ratio of that thing, but it is enough if it represent it. Wherefore, even if one species, expressed or impressed, be of many things, it does not follow

that it formally contain in itself the ratios of diverse things, or be the same formal ratio of them; and this, moreover, is manifest in every opinion. For who would say that the species of man is a man, or of the same ratio with man? - and so of the rest.

Hence also the reason adduced in the fourth place for the confirmation of the prior opinion is solved. For in two ways can one thing be the likeness (*similitudo*) of another: in one way by a quality or a form of the same ratio, which is said to be the likeness of the second genus of relation, such as exists between two whites; in another way one and the same can be the likeness of another, although they be altogether of diverse natures, for this sole reason, that the one represents the other, by cognition, to be sure, or by a principle of cognition. In the first way it repugns that one quality, or form, be assimilated to many; and thus it repugns that one likeness bear the similarity of many things, since the same cannot have the same quality, or form, as the form and quality of many. In the latter way it does not repugn that the same quality be a likeness of many: because the same quality can represent many things either actually, as an expressed species, or habitually, as an impressed one, since this representation is not according to an identity in form.

Disputatio CCIII - Whether, the higher an Angel is, the more he understands by fewer species

Scotus and Bassolis thought that higher Angels do not understand by fewer species.

- Thomists said that the higher Angels, not only by hierarchy and order, but also by nature, understand by fewer species.
- Two other Scholastic opinions.
- What ought to be judged in this matter.

Caput I - Scotus and Bassolis deny that higher Angels understand by fewer and more universal species

There are certain Scholastic positions in the present controversy, although none of them rests upon any certain foundation. I will therefore set them forth one by one, and finally will show that nothing certain can be defined in this matter. The first opinion is that of Scotus and Bassolis in the places cited in the preceding doubt, who affirm that higher Angels do not understand by fewer and more universal species; and the same must be asserted by Richard, who holds that by one species many cannot be represented. They are also brought forward for this opinion, all who said that Angels receive species from things - although, from their very position, it does not follow; for they only said that the species of singular things and of future things are received from things, and that of those which Angels do not know from the beginning; yet they conceded that there were connate to Angels the species of those natures which they know from the start, among which they could have thought that some are universal, namely in respect of thought, or of a principle of cognition. The foundation of this opinion can be nothing else except that by one and the same quality many

cannot be represented. For if they can, I do not see by what certain reason it can be denied that higher Angels understand by fewer species. Moreover, since in the preceding disputation it was shown that by the same quality many individuals can be represented at once, I do not see anything to stand in the way whereby superiors should not understand by fewer species. Whether, however, some reason also demonstrates that this is so, we will say below.

Angels superior not only in hierarchy and order, but also by nature, understand by fewer species, the Thomists said.

Caput II - Thomists affirm that higher Angels understand by fewer species

The opinion common among the Thomists is that which St. Thomas indicated in this article in the reasoning of his conclusion, and which Cajetan and more recent theologians plainly follow. [1495]

Many theologians in this article, and Capreolus in the second book, distinction 3, question 2, article 1, the eighth conclusion, hold that Angels not only by higher hierarchy and order, but also by a more excellent nature within the same hierarchy and order understand by fewer species; and they confirm this opinion from Pseudo-Dionysius, chapter 12 On the Celestial Hierarchy, where he says that the higher Angels have a more universal knowledge than the lower; and from the Book of Causes, cited under Aristotle, where in the tenth proposition this opinion is expressed. And finally by reason: for either one must say that all Angels have equally universal species, which seems false, since the more perfect Angel ought to understand more perfectly than the inferior, and therefore by more universal species; or, if some ought to have more universal species than others, they ought to be superior not only in order and hierarchy, but also in nature. And this is likewise confirmed by the reasoning of St. Thomas: for, the more perfect any intellectual nature is, the more it is like God in the mode of knowing and in the perfection of intellection; but the perfection of intellection chiefly consists in this, that by one simple essence diverse things be known; therefore the perfection of an Angel will also consist in this, that by fewer species he understand more things.[1496]

Cajetan furthermore adds that this is so true that the highest Angel, who now exists, by one single species understands all the things that by his natural power he can know.

Judgment on the preceding opinion. So far as concerns the earlier part of this opinion, it contains nothing absurd; yet it does not rest on any firm reasoning. First, because it is not sufficiently certain whether all Angels differ in species, as I discussed in Disputation 181 and proved. But if Angels do not differ in species, it cannot be certain that Angels more perfect according to the degree of individual nature should understand by fewer or by more perfect species. If, however, we concede that individual Angels differ in species, it still does not follow that more perfect Angels understand by more perfect and fewer species: for either such species are

1495. Albert the Great, De quatuor coaequaevis, part 1, quaest. 5, art. 12; Aegidius of Rome, In II Sent., dist. 3, second part of the distinction; Capreolus, In II Sent., quaest. 2, art. 2, dub. 3 - 4; quaest. 2, art. 1, concl. 7; art. 3, ad argumenta Scoti; Thomas of Argentina, quaest. 2, art. 4, in the second part of the article, in the conclusion; Ferrariense, II Contra gentes, cap. 98, § Tertia conclusio; Henry of Ghent, Quodlibet V, quaest. 14; St. Bonaventure, in the same distinction, second part of the distinction, article 2, quaest. 1, ad tertium.

1496. Capreolus, In II Sent., dist. 3, quaest. 2, art. 1, concl. 8.

communicated to Angels solely by the will of God, and then who could know whether different species, or species of the same kind, have been granted to individual Angels? For that Angels of a more perfect nature understand more perfectly does not of necessity proceed from more perfect intelligible species; for a more perfect intellect with an equal species understands more perfectly than an inferior.

But the later part, which Cajetan added, is very well refuted on this sole ground, that he asserted it without any foundation or reason. First, because there is no one who could rightly measure the proportion which one Angel bears to another with respect to all intelligible things, so as from that to infer that the supreme Angel in that proportion so exceeds the rest as to embrace all intelligibles by only one species, which others understand by many species. Next, because by that reasoning we ought to assert that the supreme Angel by his own power could, whenever he wished, contemplate all things by a single intuition; which seems so difficult that it is not to be affirmed without great foundation and reason. Furthermore, if another Angel superior to the one who is now supreme were created, then, according to Cajetan's opinion, he would have to be of another species; therefore he ought to understand by fewer species than he who is now supreme; and yet he could not understand by fewer than by one; therefore it is not to be said that the supreme Angel who now is understands all things by only one species. Cajetan replies that in that case a certain new species would have to be added to each of the inferior Angels by which they would know; but that in the absolutely highest there would be one species only, by which he would know all things; whereas in him who before was supreme, there would remain one species with respect to all the things inferior to him, both spiritual and corporeal, and another would have to be added to him by which he might know the Angel then created superior to himself. But this is no less a fiction and fabricated at Cajetan's pleasure. By what reasoning could anyone commend such a division of species? Moreover, if the Angel who is now supreme knows all things inferior to himself, both spiritual and corporeal, by a single species, and only a new species would be added to him, that he might understand him who is superior, by the same reasoning we ought to say the same of the rest who now exist, namely, that by one single species they understand both all corporeal things and spiritual things inferior to themselves, and that species are multiplied in them only that they may know superiors. Wherefore, the more someone is superior, the less will he understand material and spiritual things below himself by fewer species, as this opinion seems to assert, so that in this respect the superior Angel is more like God. But if with respect to these things it is not fitting to assign to the superior Angel fewer species, neither will it be fitting with respect to other things. Read Aegidius in the place to be cited in the next chapter, who at length pursues how it is not necessary that the supreme Angel understand by one species only, even if Angels who are higher understand by fewer species than those who are inferior.[1497]

From what we have said it is evident that it is not necessary that the greater perfection of an Angel resemble God in this, that he understand all things by fewer intelligible species than an inferior; but it is enough if he understand them more perfectly. As for the testimony of Pseudo-Dionysius, if it be rightly inspected, it proves nothing: for he only maintains that the knowledge of

1497. Aegidius of Rome, In II Sent., dist. 3, part 2, q. 2, a. 2, ad 4.

more things inheres in the higher Angels themselves, and this is what he said, that their knowledge is more universal. The words of Pseudo-Dionysius according to the translation of Perionius are: "The order of the holy Cherubim is a partaker of higher wisdom and knowledge; but the orders of those essences which are subjected to them are also themselves partakers of wisdom and knowledge; yet they are a part which is with respect to those who hold the higher place." Therefore Dionysius wishes to teach that the lower Angels know fewer things, and for this reason called their knowledge a "part" of the knowledge of the higher Angels, which the ancients called particular knowledge.

But concerning the species which the Scholastics attribute to Angels as the principle of knowledge, Pseudo-Dionysius indeed has not a word. I confess, however, that that Book of Causes had the mind to assert that higher Angels understand by fewer species; yet that book is of lesser authority for confirming and establishing the opinion of the Thomists, for it is not Aristotle's, but either Proclus's, or Avempace's, or Alfarabi's.[1498] Of another testimony of Pseudo-Dionysius, which is thought to favor this opinion, we shall speak in the last chapter.

Caput III - Two other Scholastic opinions

The third opinion is of those who say that Angels of a higher order understand by fewer species than Angels of a lower order; yet Angels of the same order, even if they differ in species, have altogether the same species of things, and differ only among themselves in that Angels of a superior nature within the same order understand more perfectly the same things by the same species, because they are of a more perfect intellect. Aegidius defends this opinion as probable in the second book, distinction 3, part 2, question 2, article 2, to the fourth doubt; but Ferrariense expressly embraces it in Contra gentiles, book 2, chapter 98, near the conclusion. Herveus likewise favors it in that distinction 3, question 4, article 4, where he asserts that all Angels who agree in the same proximate genus have equal intelligible species; and thus, the higher they are in genus, they have fewer intelligible species, yet not, however, the higher they are in nature according to species. Whether indeed all who agree in the same proximate genus are of the same order he does not explain. Moreover, in any Angel of a more perfect nature even according to species he grants clearer intelligible species than in another of an inferior nature.[1497][1499][1500]

Ferrariense confirms this opinion, first from Pseudo-Dionysius, chapter 12 On the Celestial Hierarchy. Then, because we see many brute animals diverse according to species; among which those that are more perfect do not have fewer sense-faculties: therefore, by the same reasoning, it is not necessary among Angels that, the more perfect they are in nature, the fewer be the intelligible species; which reason he seems to have drawn from Aegidius.

1498. Liber de causis, attributed in the schools under Aristotle's name; in the tenth proposition this opinion is expressed; the work is commonly ascribed to Proclus, Avempace, or Alfarabi.

1497. Aegidius of Rome, In II Sent., dist. 3, part 2, q. 2, a. 2, ad 4.

1499. Ferrariense (Franciscus de Ferrara), II Contra gentiles, cap. 98, circa conclusionem.

1500. Herveus Natalis, that same distinction 3, q. 4, art. 4.

But by the same reasoning it could be proved, that neither in Angels of a higher order ought there to be fewer species; and the testimony of Pseudo-Dionysius scarcely proves anything, as we showed above; wherefore this opinion too of Ferrariense has no firm foundation.

The fourth opinion is that of Henry, Quodlibet 5, question 14, who says that Angels understand all things by one quality or habit. He supposes, indeed, as Scotus affirms, that if intelligible species are posited in an Angel, they would be as many as are the objects; but he denies multiple species in an Angel, and concedes only one habit: because, if there were many intelligible species, they would simultaneously move the Angel's intellection to understand all objects; for if in us the many species which we have were to move the intellect all at once, we would at the same time be understanding all the diverse things to which they are ordered; but since intellection is determined to one here and now, there must be in an Angel not a multitude of distinct species, but a single cognitive habit, from which, as from a primary form, the Angel directs himself, according to the order of objects, now to one intellection, now to another.[1501]

Caput IV - The fourth opinion (Henry of Ghent)

But by the same line of reasoning it could also be proved that neither in Angels of a higher order ought there to be fewer species; nor does the testimony of Dionysius, which proves little, avail here, as was shown above: therefore this opinion of Ferrariense likewise has no firm foundation.

The fourth opinion is that of Henry in Quodlibet 5, question 14, who teaches that any Angel whatsoever understands all things through one quality or habit, not through many species; although he affirms that that habit can in a certain manner be called a species. He presupposes what Scotus asserted, that, if intelligible species were given in an Angel, there would be as many as there are objects to be known; but he denies that there are many species in an Angel and concedes only one habit: because, if there were many intelligible species, they would simultaneously move the Angel's intellect to understand all objects. For if in us the many species which we have do not do this, but now we are moved to one object, later to another, the reason is manifest: since we also need sense for understanding, and sense is not moved all at once to all things, but now to one, then to another object, neither, therefore, is the intellect moved all at once to all things; but this has no place in Angels. If, however, one habit be posited in individual Angels, which Henry calls the habit of knowledge, the aforesaid inconvenience does not follow, because that habit inclines first to one primary object, and then to the rest; nevertheless, this author does not show what that primary object is, nor how afterwards the Angel is moved successively, and not at once, to the rest.

Refutation. Yet I for my part do not see why Henry does not concede many species to Angels, and attribute to them only one habit. For granted that an Angel have many species of many things, nevertheless he is not thereby determined to a first cognition: not to a first, I say, only that which he had at the beginning of creation; but to that from which he begins to set some kind of business in motion in such wise that that cognition did not arise from another, as happens in us; but to this he is determined by God, as we shall say below in Disputation 212, question 9, article 10, last, and

1501. Henry of Ghent, Quodlibet V, q. 14.

as Aristotle teaches in the seventh book to Eudemus near the end, where he said that our first cognition is from fortune, yet supported, instructed, and directed by divine aid.[1502] It is also difficult to show how from one habit an Angel is determined to this object rather than to another, or to another object than to this, unless he be determined by some other cause than by that habit alone; in Angels of a higher order, as we were often saying against the same Henry, there would have to be fewer species; yet in truth we were saying that on this reasoning one ought not to deny more species to an Angel.

What is to be held in this matter

But what is to be thought in this matter.

I for my part judge that this matter is so far removed from human sense and reason that we can establish nothing certain about it, not only by some sure and manifest reasoning, but not even by a probable conjecture. For although in one or another way of philosophizing we cannot detect a manifest contradiction, nevertheless on that account we ought not to assert that species exist in Angels in this or that manner, unless we are induced to it by some other reason. But I consider that this reason is not sufficient to procure that we should philosophize in this way rather than in that. Wherefore, in a matter so removed from sense and human philosophy, it is more fitting to affirm nothing than to assert something without a sure reason. Therefore I pass over many other things which recent Theologians, each in defense of his own opinion, have invented from their own sense; for they divide species in Angels as they please.

But someone will object to us again with Dionysius, in the last chapter of the Celestial Hierarchy before the middle, where he seems to assert that higher Angels understand by fewer species: for as he sets forth how the individual members of our body are in some likeness and metaphor attributed to Angels, about the teeth he says that they divide nourishment for digestion: "For each nature that has mind receives one intelligible understanding handed down by a more divine nature, and with a certain power, whereby it exercises care over others by nature, it divides and amplifies it according to the capacity and guidance of the inferior. If, therefore, the higher Angel distributes into many concepts to the inferior that which he himself had understood by one most simple concept, so that he may adapt what he knows to the capacity of the inferior, it is a sign that the higher understands through fewer species than the lower."

I answer that Dionysius is not speaking about the knowledge of things which a higher and a lower angel knew naturally - as if he thought that the lower Angel understands through more species - but he is speaking about those things which higher Angels know solely by divine revelation, and he says that these are known by the higher by one most perfect concept, and are distributed to the lower into many, that each according to his capacity may understand them better. Of these mysteries there are no proper species in an Angel. But if the discourse be about natural things, since any Angel whatsoever naturally knows them as they are, it cannot be that the

1502. Aristotle, Eudemian Ethics, book 7, near the end. See also Vázquez's own Disputation 212, question 9, article 10, last.

higher ought to divide them into more concepts so as to hand them on to the lower to be better understood. Wherefore below, Disputation 217, chapter 1, by the same reasoning we shall show that lower Angels cannot be illuminated by higher in those things which each of them naturally knows, but only in those which they receive by divine revelation.[1503]

Quaestio LVI - On the knowledge of Angels on the part of immaterial things

Hence there is inquiry about the knowledge of Angels on the part of the things which they know. And first, about the knowledge of immaterial things. Secondly, about the knowledge of material things.

Concerning the first, three things are asked.

Articulus I - Whether an Angel knows himself

To the first we proceed thus. It seems that an Angel does not know himself. For Dionysius says, in Ecclesiastical Hierarchy, chapter 6, that Angels are ignorant of their proper powers. But once the substance is known, the power is known. Therefore an Angel does not know his own essence.[1504]

1. Further, an Angel is a certain singular substance; otherwise he would not act, since acts belong to singular subsistents. But no singular is intelligible. Therefore it cannot be understood. And thus, since there is in an Angel only intellectual cognition, no Angel will be able to know himself.
2. Further, the intellect is moved by the intelligible; for to understand is a kind of being-passive, as is said in On the Soul III. But nothing is moved or suffers from itself, as is clear in corporeal things. Therefore an Angel cannot understand himself.

But on the contrary: St. Augustine says, On the Literal Meaning of Genesis, book 2, that the Angel, in his very confirmation - that is, in the illumination of truth - knew himself.[1505]

I answer that, as is evident from what has been said above, the object stands differently in an action which remains in the agent and in an action which passes into something external. For in an action which passes into something external, the object, insofar as the act passes to it, is separated from the agent, as the heated from the heater, and the edified from the builder. But in an action which remains in the agent, it must be the case, for the action to proceed, that the object be united to the agent; just as it is necessary that the sensible be united to the sense in order that it sense actually; and thus the object, as united to the power for such an action, stands as a form which is the principle of action in other agents. For just as heat is the formal principle of heating in fire, so the species of the thing seen is the formal principle of vision in the eye. But it must be considered that the species of the object of this sort is sometimes only in potency in the cognitive power, and

1503. Below, Disputation 217, chapter 1.
1504. Pseudo-Dionysius, Ecclesiastical Hierarchy, c. 6.
1505. St. Augustine, On the Literal Meaning of Genesis, book 2.

then it is only a knower in potency; and for it to know actually, it is required that the cognitive power be reduced to act by the species. But if it have it always in act, nevertheless through it it can know without any preceding change or reception. Whence it is clear that to be moved by the object is not of the notion of the knower insofar as it is a knower, but insofar as it is a cognitive potency. Nor does it make any difference for this, that the form be the principle of action, whether the form itself be at some time inherent, or be of itself subsistent. For heat would not heat less if it were subsistent of itself than it heats when it is inherent. So too, therefore, if something in the genus of intelligibles stand as a subsistent intelligible form, it understands itself. But an Angel, since he is immaterial, is a certain subsistent form, and by this he is actually intelligible. Whence it follows that by his own form, which is his own substance, he understands himself.

Reply to the first: That text is from the ancient translation, which is corrected by the new, in which it is said: "Moreover even they, namely the Angels, knew their proper powers," in place of which in the other translation there had stood: "and even these are ignorant of their proper powers." Yet the letter of the ancient translation can be saved as to this, that Angels do not perfectly know their power insofar as it proceeds according to the order of the divine wisdom, which is incomprehensible to Angels.

Reply to the second: It is not because of singularity that there is no intellection of singulars among us in things corporeal, but because of matter, which is in them the principle of individuation. Whence, if some singulars subsist without matter, as Angels do, nothing prevents their being actually intelligible.

Reply to the third: To be moved and to suffer belong to the intellect insofar as it is in potency. Whence this has no place in the angelic intellect, especially as regards that by which he understands himself. For the act of the intellect is not of the same notion as the action which in corporeal things is found to pass over into external matter.

Conclusion: An Angel knows himself by his own substance.

- Opinion of Scotus and others, cap. 1: That an Angel understands himself by his essence is the truer opinion, but not understood in the same way by all. cap. 2.
- Opinion of Scotus and others.

In the present controversy there is no difficulty whether an Angel understands himself. For who is ignorant of himself? nor is there any doubt whether the cognition by which an Angel knows himself is an operation distinct from the substance of the Angel; for about this we have already treated above in Disputation 198. The present question, therefore, is set in expounding the mode by which an Angel has cognition of himself - namely, whether a species or quality added to the intellect is the principle of the cognition of himself, or whether his very substance moves the intellect without any species of himself.

In this difficulty the first opinion is that of Scotus,[1506] Distinction 3, question 10, at the end, because he asserts that an Angel knows himself in two ways: first, by the knowledge which he calls intuitive of the thing as it is; and in this way he understands himself through his very essence without another intelligible species of himself; then by the knowledge which they call abstractive, which is a certain inferior cognition; and in this manner he knows himself through a certain intelligible species added to his intellect. The same is taught by Maior in the same Distinction, question 4, the single conclusion, and in the solution of the third argument; by Bassolis in question 3, to the second argument; and Gabriel seems to agree in the same Distinction, question 2, article 3, conclusion 10; for with Scotus, question 8 of that Distinction, he says that when he says that an Angel understands himself through his essence, he understands it of the knowledge which they call intuitive.[1507] Scotus leaves the former part of this opinion - namely, that an Angel can know himself through his essence by that intuitive knowledge - as known and manifest. But the latter - namely, that an Angel can also understand himself by that abstractive knowledge and through a species, which is more difficult - he proves by this reasoning: Every cognition which, in its kind, is imperfect and befits a superior Angel, can also befit an inferior; for it cannot be that to the superior, who is more perfect, an imperfect cognition befit, but not to the inferior; but the superior Angel...

Caput II - The common sentence: that an angel understands himself through his essence without any added species as a principle of understanding

But if you ask for what a species of himself is required in an Angel, since he is present to himself: Bassolis answers that a species is given on account of that abstractive and imperfect knowledge.

Impugned. But, leaving aside this opinion, as to its former part, of which we must speak below: as to the latter part, it is not approved by me. For either abstractive cognition is called by Scotus the knowledge of a thing through alien species, such as we have when we know a thing in the likeness of another and not as it is; or abstractive is called the knowledge of a thing not existing, even if it be through a proper species and concept, such as is the knowledge of a rose in winter: but in neither way can an Angel understand himself by abstractive knowledge. Not in the first way, because an Angel does not know himself through species and concepts of other things, that is, he does not know himself after the manner of other things, as we conceive spiritual things after the manner of corporeal things; for he has a proper and quidditative concept of himself; nor does he shape himself after the manner of any other thing: for if he did not know himself by a proper and quidditative concept, he could not know anything else in that way. Not in the latter way, for when he understands himself, he understands not only himself according to essence, but also himself according to existence; nor can he so consider himself as to understand himself without his existence. The Doctors of this opinion seem indeed to concede in the Angel this abstractive

1506. Scotus, In II Sent., Dist. 3, q. 10, ad quaestionem in fine.

1507. John Maior, In II Sent., Dist. 3, q. 4, conclusio unica, and in the solution of the third argument; Bassolis, q. 3, ad secundum argumentum; Gabriel Biel, In II Sent., Dist. 3, q. 2, art. 3, conclusio 10; and cf. Scotus, the same Distinction, q. 8.

knowledge of himself, yet through a proper species. For who would say that an Angel understands himself through the species and concepts of other things? But by the foregoing reason it has been proved that it cannot be that an Angel have this abstractive knowledge of himself in this way: because existence is so manifest to him that no knowledge of himself can be had by the Angel without considering his existence.

Objection. Yet someone will say that nothing hinders the Angel from having abstractive knowledge of himself together with intuitive knowledge, just as the blessed know all created things by a proper and quidditative knowledge, that is, through the proper species and concepts of things, and at the same time by an abstractive knowledge, that is, through alien species and concepts of other things.

Answer: In the case of man the ratio is different: because he, by the ministry of the senses, receives the species by which he understands all things; and these he retains as his own proper work; in beatitude he understands by them, even if a quidditative cognition of things be communicated to him by God through the proper species of things. But the Angel, since by his nature he has a proper knowledge of himself, it does not seem by what reason the same nature should communicate to him that imperfect intellection through alien species with respect to those things which he naturally knows by a proper concept. And although we should concede that one Angel can know other things - even spiritual ones - through alien concepts, nevertheless it could not be said that he knows himself after the manner of some other thing: since by his nature he understands himself perfectly and by a quidditative concept. Wherefore also the authors of this opinion do not strive to attribute to the Angel this imperfect knowledge of himself, which they do not call abstractive but quidditative and proper; yet in such wise that he understand only himself as to essence, with no consideration at all of his existence: which we have already noted above cannot be done. In neither way, therefore, can we say that the Angel knows himself by abstractive knowledge; and so for this effect it is not necessary to grant him an intelligible species of himself.

That an Angel understands himself through his essence (*essentia*) is the truer sentence, but it is not understood in the same way by all.

Common is the sentence among the Scholastics that an Angel understands himself through his essence without any other species added as a principle of understanding. Thus they teach with St. Thomas in this article, Cajetan and more recent Thomists, and the Ferrariensis; and the same holy Doctor in the same book, Against the Gentiles, chapter 98; and the Ferrariensis there as well, "Quantum ad secundum," and in what follows; Richard in the Second, distinction 3, article 6, question 1; Thomas of Argentina in the same distinction, question 2, article 4, in the first part of the article, the first conclusion; Capreolus in question 2, article 1, the fifth conclusion; and Henry too in Quodlibet I, question 12, when he asserts that the separated soul understands by its essence without any other species; concerning angels, and concerning creatures separated from matter universally, he taught the same in Quodlibet IV, question 7. But what in Quodlibet V, question 14 he said - that angels know by a certain habit added to the power of understanding with respect to other objects which are outside the angel - hence falsely did Scotus in the place alleged think Henry to have been in the same sentence as to assert that an angel cannot understand himself without a

certain habit added to the intelligent faculty: whereas in truth Henry only said that a habit is necessary for understanding other objects, not, however, for understanding himself, as is manifest from the places cited above. Lastly, this sentence which we have hitherto reported seems to be presupposed as probable by St. Bonaventure in II, distinction 3, second part, article of the distinction 2, question 1. Yet they do not all explain it in the same way.[1508]

Some understand it thus, that the angel's substance and essence is per se intelligible by the angelic intellect without any other species of itself, not because it moves efficiently to elicit its vision, as an intelligible species does with the intellect, but because the intellect of the angel by its apt nature is sufficiently in first act to elicit the intellection of the substance and essence of itself; and the substance of the angel of itself is sufficiently intelligible and present, so as to terminate the act of intellection. This mode of explaining the aforesaid opinion is commonly attributed to Cajetan; but in my judgment he did not so teach; I will report his mode below. From this, however, which we have set down as common, it follows that intelligible species are not necessary for understanding other material objects, or even spiritual ones; but that the intellect is of itself powerful and in first act for understanding all intelligibles: for since all things are of themselves intelligible to the angelic intellect, that is, they have of themselves the ratio of object, just as the angel's essence has with respect to the intellect of that same angel, nothing seems to hinder that, without a species of them, they be understood by the angel, if the essence of the angel himself is rightly understood by him. For the essence of the angel, which is an intelligible object, according to this opinion does not in any way concur with the power by way of a principle. That the remaining objects are not conjoined with the intellect of the angel matters little; for conjunction according to place, or any other conjunction whatsoever of the object with the power, seems necessary only for this, that the object concur with the power by way of a principle to intellection. Wherefore, in this opinion, it does not approve itself to me, what he says, namely, that therefore the essence of the angel, which is of itself intelligible, is known by the angel himself because it is present and conjoined to the intellect, as if that presence contributed anything, once it is conceded that the object does not concur with the intellect to intellection by way of a principle. Yet that which seems to follow from it - namely, that species of other things are not necessary in order that they be understood by the angel - I do not think absurd in an angel, as above in Disputation 200, chapter 3, I noted. And if our intellect in this life understands the essence of our soul through species, this is not a wonder: because the mode of understanding which befits us in this life is with the aid and ministry of the senses; and therefore we need species received from the senses out of corporeal things, by which we understand all spiritual things and our soul after the manner of corporeal things. But if our intellect did not depend upon the senses in its mode of understanding, it would understand the substance of our soul and other things without species, like the angels.

1508. St. Thomas, in this article of I, q. 56; Cajetan (on I, q. 56); Ferrariensis; St. Thomas, Contra Gentiles, c. 98; Richard of Middleton, In II Sent., dist. 3, art. 6, q. 1; Thomas de Argentina, In II Sent., dist. 3, q. 2, art. 4, pars prior, conclusio prima; Capreolus, In II Sent., q. 2, art. 1, conclusio quinta; Henry of Ghent, Quodlibet I, q. 12; Quodlibet IV, q. 7; Quodlibet V, q. 14.

Others, however, explain and defend the aforesaid sentence in another way. They say, therefore, that the very substance of the angel stands in the place and stead of a species for eliciting intellection by way of the proximate principle, and is not only a common cause in the manner in which it concurs to other operations of the angel himself. This mode of philosophizing I judge to have been Cajetan's in this article; the Ferrariensis on Contra Gentiles, chapter 98, to the evidence which Aegidius had taught earlier in II, distinction 3, part 2, question 2, article 1, in the body, and in the little work On the Knowledge of Angels, question 3; and Capreolus in the same distinction, question 2, article 3, in the solution to the arguments against the fifth conclusion; and commonly the Thomists follow it.[1509]

Their single reason is of this sort: Species are therefore posited in the place of objects in a knowing power, in order that, conjoined with the faculty itself, they may constitute one integral principle for eliciting intellection: for object and power beget knowledge: and since the object, as such, cannot by nature's order be conjoined to the faculty, it has been provided that a species be substituted in the place of the object. But on the contrary, when the object is by nature conjoined with the intellect, a species would be superfluous; but the object itself, by itself, together with the faculty itself, can be the principle of cognition. Therefore, since the essence of the angel, which is of itself intelligible, is by nature conjoined to its intellect, without any other species it will by nature move to the cognition of itself as a proximate and proper principle.

This mode of philosophizing is difficult. For since the essence of the Angel is not some form added to the intellect, but the substantial form from which the intellect is born, by what reason can it come about that it be itself the form determining the intellect by way of a proximate and proper principle? For a principle that determines to this action must be in the intellect itself. Rather, therefore, it seems one should say that the intellect is of itself determined in such wise and is moved by the essence as the first root, that it have in itself a complete power of understanding the essence itself and the angel's substance. By a like reason Scotus argues against this opinion in II, distinction 3, the eighth and ninth questions, the Objections; supposing in this sentence that St. Thomas posited that the whole principle by which an angel understands himself is his essence. He argues thus: for something to be the principle of an immanent operation, it must be the act of the faculty eliciting that operation. But the essence of the angel is not the act of the intellect, but only assists it: therefore it is not the principle of such intellection, which is an immanent action. He adduces the example of heat, which, unless it were in wood as its form, but only assisted it from without, could not be the reason and principle of acting for the wood.

Some reply that the essence of the Angel can be considered in the genus of thing and in the genus of intelligible; in the genus of thing, however, it is the object of the intellect, and thus rather the intellect is in that as in its form than that in the intellect; but in the ratio of intelligible the essence is in the intellect as the intelligible is in the intelligent; and in this way it is the proximate principle of intellection, at least in part, if it cannot be the whole principle: and hence nothing

1509. Cajetan, on this article; Ferrariensis, on Contra Gentiles, c. 98; Aegidius (Giles of Rome), In II Sent., dist. 3, pars 2, q. 2, art. 1, in corpore; Opusculum De cognitione angelorum, q. 3; Capreolus, In II Sent., dist. 3, q. 2, art. 3, ad argumenta contra quintam conclusionem; and the common Thomists.

hinders that one say that the intellect is in the essence, and again the essence in the intellect, in diverse ways; and that the intellect, which is of itself an indifferent principle to all intelligibles, is determined to the intellection of the Angel's essence by it as by the species and proximate principle of such intellection. Thus Capreolus answers in the article there cited in the solution to the first argument against the fifth conclusion; and the Ferrariensis in the chapters there and the ninth that are alleged.[1510] He seems, moreover, to have drawn forth that solution from the doctrine of St. Thomas, On Truth, question 8, article 6, to the second objection. The Thomists moreover establish a distinction between a natural form ordered to operation, like heat, and an intelligible form ordered to intellection, in order to satisfy Scotus's argument, namely, that a natural form does not determine an agent and a faculty as a proximate principle unless it inhere in reality; but an intelligible form determines by this alone, that it assist: wherefore thus also it can constitute the intellect in first act for understanding in that way in which some assert that the divine essence, by mere assistance, supplies the place of a species and of a proximate principle in the blessed for their vision. In the same way, therefore, the essence of the Angel will be able to be a principle. And (as Cajetan noted in replying to this argument) for this reason especially the essence of the angel, even if it does not inhere in the intellect, can be to the Angel a proximate principle of understanding himself, because, although it does not inhere in the angel's intellect as forms and intelligible species inhere, nevertheless it is substantially conjoined to it. Nor does Scotus abhor this sentence, when he teaches that an Angel understands himself by a perfect and intuitive knowledge through his very essence as through a principle. Thus he taught in that question, 8 and 9, to the Question.[1511] But when there he strives to prove that the essence of the Angel is not the principle whereby he understands himself, he does not wish to exclude the essence altogether from the ratio of principle, but only to show that it is not the whole principle of understanding, but, as he himself calls it, a partial one, so that together with the intellect it constitute an integral principle in the Angel of understanding himself: the opposite of which he unjustly attributes to St. Thomas, whereas in truth he never thought that the essence of the Angel is the whole and integral principle of understanding himself - a view which neither the doctors cited for this opinion, nor, so far as I know, any other, has taught.

To me, however, this sentence is difficult. First, because it seems to me to lack the foundation which Cajetan contends for, namely, that it is enough, in order that something be the principle of understanding, if it assist the intellect and not inhere in it. For that which does not inhere cannot be a determining principle by way of an efficient cause: I speak of a created principle; for the divine essence could do so, although in fact it does not inhere.[1512]

... nor is it so, as I have already disputed above, Disputation 43, chapters 3 and 4, where I have expressly shown it. Then, even if the essence of the Angel is conjoined with his intellect, indeed is the subject of the intellect, that nevertheless does not suffice for it to be the proper and proximate principle of intellection. For in that way it will only be a principle and a common principle, as it is

1510. Capreolus, loc. cit.; Ferrariensis, locis citatis.
1511. Scotus, In II Sent., dist. 3, qq. 8 - 9, Ad quaestionem.
1512. St. Thomas, De veritate, q. 8, a. 6, ad 2.

of other operations. Wherefore I rather judge that the intellect, as also any other faculty, is the proper and proximate principle determining the essence and substance of the Angel, rather than the converse. Wherefore I would philosophize in this way: that the essence of the Angel is the common and remote principle of his own intellection, but the proximate principle is the intellect; and that the conjunction of essence with intellect contributes nothing at all toward the essence being a particular principle in his intellection whereby the common efficacy of the intellect would be determined. And this I would the more readily concede, since I do not see it sufficiently proved either that intelligible species (species intelligibiles) are necessary in Angels for understanding other objects, or that the faculty of the intellect on the part of an efficient and eliciting principle, together with a thing intelligible on the part of the object which the intellect may regard, suffices. But in a matter so obscure to us and remote from sense, let it suffice to have said these things.

Articulus II - Whether one Angel knows another

It is proceeded thus to the second. It seems that one Angel does not know another. For the Philosopher says in De anima III that if the human intellect had in itself some nature of the number of the natures of sensible things, that nature existing within would prevent alien things from appearing. Likewise, if the pupil were colored with some color, it could not see every color. But as the human intellect stands with respect to knowing corporeal things, so the angelic intellect stands with respect to knowing immaterial things. Since, therefore, the angelic intellect has in itself some nature determined from among the number of those natures, it seems that it cannot know others.[1513]

1. Moreover, in the Book of Causes it is said that every intelligence knows that which is above itself insofar as it is its cause. But one angel is not the cause of another. Therefore one angel does not know another.[1514]
2. Moreover, one angel cannot know another through the essence of the angel who knows, since every cognition is according to the ratio of likeness. But the essence of the angel who knows is not similar to the essence of the angel who is known, except in general, as is clear from what was said above. Whence it would follow that one angel would not have proper knowledge of another, but only general; likewise, it also cannot be said that one angel knows another through the essence of the angel known, because that whereby an angel understands is something intrinsic to the intellect; but the Trinity alone slips into the mind. Likewise it also cannot be said that one knows another through a species, because that species does not differ from the angel understood, since each is immaterial. Therefore in no way does it seem that one angel can understand another.

1513. Aristotle, De anima III.
1514. Liber de causis.

3. Moreover, if one angel understands another, either this would be through an innate species; and thus it would follow that, if God now created some new angel, he could not be known by those who now exist. Or through a species acquired from things; and thus it would follow that superior angels could not know inferiors, from whom they receive nothing. Therefore in no way does it seem that one angel knows another.

But on the contrary: it is said in the Book of Causes that every intelligence knows things that are not corrupted.[1515]

I answer that, as St. Augustine says in the Literal Meaning of Genesis, book 2, the things that pre-existed in the Word of God from eternity flowed forth in a twofold way. In one way into the angelic intellect, by the fact that God impressed upon the mind of the angel the likenesses of things which He produced in natural existence. In another way, so that they subsist in their proper natures. Now they pre-existed in the Word of God from eternity not only as the rationes of corporeal things, but also as the rationes of all spiritual creatures. Thus, therefore, to each of the spiritual creatures from the Word of God were impressed all the rationes of all things, as much corporeal as spiritual: yet in such a way that to each angel there was impressed the ratio of his species according to natural and at the same time intellectual existence; namely, so that he might subsist in the nature of his species, and by it understand himself. But the rationes of other natures, as much spiritual as corporeal, are impressed upon him according to intellectual existence only, so that by means of such impressed species he might know both corporeal and spiritual creatures.[1516]

Reply to the first: The spiritual natures of angels are distinguished among themselves by a certain order, as was said above. And thus the nature of one angel does not prohibit his intellect from knowing other natures of angels, since both superiors and inferiors have an affinity with his nature, the difference existing only according to diverse degrees of perfection.[1517]

Reply to the second: The ratio of cause and caused does not conduce to this, that one angel know another, except by reason of likeness, insofar as cause and caused are similar; and therefore, if among angels a likeness be posited without causality, there will remain in one a cognition of the other.

Reply to the third: One angel knows another through a species of the latter existing in his own intellect, which species differs from the angel known, of whom it is the likeness, not according to material and immaterial existence, but according to natural and intentional existence. For the angel himself is a form subsisting in natural existence; but his species which is in the intellect of the other angel has there only intelligible existence; just as also the form of color has natural existence in the wall, but in the conveying medium it has only intentional existence.

1515. Liber de causis.
1516. St. Augustine, De Genesi ad litteram, book 2, chapter 8 (throughout).
1517. See above, q. 50, art. 4.

Reply to the fourth: God made each creature proportioned to the universe which He was disposed to make. And therefore, if God had resolved to make more angels, or more natures of things, He would have impressed more intelligible species in angelic minds; just as if a builder wanted to make a greater house, he would have made a larger foundation. Whence it is of the same ratio that God would add some creature to the universe, and some intelligible species to an angel.

The conclusion is, Each Angel knows all the others through the species of all spiritual things which he has had inborn from the beginning.

By what mode one Angel knows another. Disputation 205.

- That each Angel, through his own essence (essentia), knows any other whatsoever, some have held. Cap. 1.
- That one Angel knows another through that other's essence, others have said. Cap. 2.
- That, by the intellect's power alone or through a species, one Angel is known by another, the more probable opinion asserts. Cap. 3.

Caput I - How one Angel knows another

We suppose in this disputation that which ought to be without controversy, namely, that one angel is rightly known by another. For no reason seems why one angel could be hidden from another angel. For among men there are many manifest causes why one is not manifest to another. For man receives knowledge of those things which he knows from the senses; but the senses require the presence of the object according to place, which can be taken away by many causes; whereas the angelic intellect does not require the presence of place in order to understand; wherefore it can understand absence and presence and even past things.

I am amazed, however, by what reason Justin, in the book of Questions proposed by the Gentiles to Christians, question 76, said that angels and demons do not mutually know and understand one another; which also St. John Chrysostom teaches in a homily on Matthew, on those words, "Then he left him," when he asserts that by his will an angel becomes invisible to a demon. If this is true in any way, it is not from the nature of the thing, but has its origin from the will of God. For God can rightly prevent that demons know good angels. The controversy, therefore, is only about the mode by which one angel knows another. In which matter there is some variety among the Schoolmen.[1518]

Some said that one Angel, through his own essence, understands any other whatsoever. Whose opinion could be understood in a twofold way: first, that the essence of one angel is the eliciting principle of the cognition which he has of another Angel, as in the preceding disputation some said that the essence of each Angel holds the place of a species for eliciting the cognition of himself. For although we would say that there are not given species of other things in an angelic intellect, nevertheless it would be asserted that the essence of the angel holds the place of species, as a proximate principle for eliciting the cognition of another; or else for the reason which we set forth

1518. Justin, Quaestiones (question 76); St. John Chrysostom, Homily on Matthew, on "Tunc reliquit eum".

in the preceding disputation, that neither for the cognition of himself is there need of a species, nor does the cognition of himself hold the proximate place of a species. Then the aforesaid opinion can also be explained in this way, that one angel, through his own essence previously known, and after the likeness thereof, knows other angels; in which sense the author of the Book of Causes seems to have handed down this opinion, in Aristotle's school, proposition 8, when he asserts, "An intelligence understands what is under itself and what is above itself, after the mode of its own substance"; mention of which sentence St. Thomas makes in De veritate, question 8, article 7, and refutes it. Yet he refutes not this notion of a general and quidditative knowledge in the very way which St. Thomas himself explains it.[1519]

For I for my part would not deny that, in this mode, one angel is known by another: for as one angel knows God in the likeness of himself, and retains this knowledge even when he contemplates Him clearly with a proper and quidditative concept, so also when it is obscure, one angel can know another in this mode; not because through his own essence, as through a cause, or as through a superior effect, he understands another angel, but because in the likeness of himself he conceives another angel by intellect. For just as through corporeal things we understand spiritual things without any order of cause and effect, much more through one spirit and angel can another be known. Yet this cognition is not quidditative and proper, but through alien species or concepts, such as that whereby we have, through these corporeal things, knowledge about spiritual things and about God. For no one is able to conceive some thing by its own proper and quidditative concept, as it is, if he only understands it in the likeness of another. For this is to conceive only through analogy and a certain likeness.

Moreover, St. Thomas in the place alleged does not impugn this opinion for the reason that he thinks one angel cannot in this mode be known by another, but because the author of that Book of Causes seems to assert that one angel, through his own essence, is known to others either because he is the cause of the latter, or its effect. For Avicenna too thought that the superior intelligences are causes of the inferior; which opinion we have said to be heretical in Disputation 171, chapter 1. It could also, and ought rightly, to be refuted if it were to assert that one angel is known by another solely through his own essence, and in the likeness thereof: for thus he would deny in one angel a quidditative knowledge of another. We, however, approve this opinion only in that part by which it asserts that also in this mode one Angel can be known by another, and not by quidditative and proper knowledge alone.

Caput II - That one Angel knows another through that other's essence, as some said

Others indeed judged that one angel is thus known by another, that the essence of the angel known be present to the intellect of the other as that whereby he understands.

...that he might understand it. Mention of this opinion was made by St. Thomas in Contra gentiles II, chapter 98,[1520] and some more recent writers think it was Scotus's in II Sentences, dist. 3, q. 10; they affirm it to be probable and not as yet sufficiently impugned.[1521] But what is

commonly brought from the Fathers, namely that one Angel cannot enter into another Angel, as we said above in Disputation 194, chapter 2, is no obstacle to our saying that one Angel is of himself intelligible to another, and consequently can be united to the other's intellect after the manner of an intelligible form. For he is said not to be able to enter into another, because he has not the power of conserving that other in its own existence (*esse*), which is denoted by the name of entry (illapsus). Wherefore this is rightly attributed to God alone, by whom all things, both spiritual and bodily, are conserved. Yet one Angel can be alongside another and, as an intelligible form, assist him and with that other's intellect produce an intellection of himself. For there is a difference between spiritual and material things, that spiritual things are of themselves intelligible and suitable to the intellect, whereas material things are not so. But that one Angel can produce an intellection of himself in the intellect of another they prove by these reasons. First, because one Angel can move and impel another with local motion; therefore he can concur with him as an efficient principle to intellection. Next, one Angel can illuminate another; therefore he can concur with him to an intellection of himself.

Now Scotus taught this view in such wise that he not only said one Angel is a principle of knowledge of himself together with the intellect of the other Angel at once, but even extended it to all the things that are known by an Angel, granting this in the case of intuitive knowledge; for about this kind of knowledge he philosophizes that intuitive knowledge arises not only from the intellect of the Angel who knows those things, but also from the very things known as from a peculiar, that is, partial, agent, as he calls it. For he thinks abstractive knowledge to be effected through species imparted to the angels at the beginning of their creation, as we showed above in Disputation 207, chapter 1. Accordingly, this opinion, in the peculiar way in which those recent authors took it, is not to be attributed to Scotus. And since in that disputation, chapter 2, it has already been proved against Scotus that material things cannot concur with the intellect of an angel as an efficient principle for his knowledge, it remains that here, against the same Scotus and the aforesaid recent writers, we show that one angel cannot, for the knowledge of himself, concur with the intellect of another in that manner.

First, because it is said without foundation that one angel can effect in the intellect of another something for illumination, as we shall also show below in a disputation; otherwise, physical bodies too could move not only locally but to some quality, which is against the common view, as we shall see there. Next, what they assert - that one angel can be impelled by another and by an impulse be moved locally - is a fiction; and they who philosophize in this mode seem to feel the same way about angels as about bodies. Moreover, it is clear that one angel does not operate his own knowledge in another's mind as its instrument: for by what account would he be elevated so as to operate in it physically and in very reality? or on what foundation is that assertion made? Since a far easier way is at hand to show the mode in which one angel is known by another, we ought not to flee to these difficult and absurd devices. Add that if one angel had to move the intellect of another

1520. St. Thomas, Contra gentiles II, c. 98.

1519. Liber de causis, prop. 8; St. Thomas, De veritate, q. 8, a. 7; see also the censure of Avicenna's causality of intelligences in Disputation 171, cap. 1.

to the knowledge of himself, and could in no other way be known, it would follow that he would never be known by that other unless he were joined to him in place; for an angel cannot operate physically at a distance, as we proved in Disputation 190, chapter 2.

Caput III - That, by the intellect's power alone or through species, one Angel is known by another, as the more probable opinion holds

I for my part judge it more probable that each angel has in his own intellect a sufficient native principle whereby he may know any other angel without any other species of that one, and without the essence of the angel known supplying the place of a species. I would understand this according to the opinion of those who say that an angel does not need species of things in order to know them; for thus neither will he need a species of another angel to understand him - a view which above in Disputation 200 I called probable. But if, with other Doctors, we assert that an Angel understands things other than himself by species either innate or infused by God, we ought to say the same of the knowledge by which one Angel knows another, namely, that he is understood by a species of himself native to the knower or infused by another Angel. This opinion was handed down by St. Thomas and Cajetan in this article, by Ferrariensis in Contra gentiles II, chapter 98, and by all who assert that an Angel understands other things beyond himself by means of their species, whom I listed in that disputation; the other modes which we have so far reported seem to contain something absurd. Wherefore this last view ought to be confirmed by a refutation of the others.[1520][1522]

Here, however, it should be noted whether one Angel, especially a superior, is comprehended by another. Certain more recent theologians assert first that inferior Angels are comprehended by their superiors; they prove it by this reasoning. For if an inferior comprehends himself, much more will he be comprehended by a superior; since a superior has greater efficacy and power in understanding. Then they say that a superior Angel is indeed understood by an inferior with a quidditative and proper concept, yet not comprehended by him, so far as regards quidditative and proper knowledge. This view is, without controversy, as I think, true. But as to comprehension, they prove it thus: for an object to be comprehended by some intellect, it must be known by a knowledge as perfect as the thing itself is by its nature knowable. But the knowledge which an inferior Angel has of a superior is not so perfect in the genus of knowledge as a superior Angel is in the ratio of intelligible; and by this line also they defend the common doctrine of the theologians who say that God is comprehended by no blessed intellect save by Himself, because no knowledge can be so perfect in the genus of knowledge as God Himself is in the ratio of intelligible.

I, however, think that not only is a superior Angel not comprehended by an inferior, but that neither is any free creature at all, however perfect, comprehended by another, if by the ratio of comprehension it is required that the knowledge be, in its own genus, as perfect as the thing comprehended is in the genus of intelligible. That this is not necessary for comprehension I have

1520. St. Thomas, Contra gentiles II, c. 98.
1522. Cajetan, In Iam, q. 56, a. 2; and Ferrariensis, In Contra gentiles II, c. 98.

more than sufficiently shown in Disputation 53, chapter 2; but, as I showed there in chapter 4, for a thing to be said to be comprehended it is necessary, not only that all the things which formally are in it and belong to it be known, but also those which can be deduced from it as from a cause; for all these in some way pertain to it. Wherefore it is also necessary to know the decree of the will of an Angel or a man, for another to be said to comprehend him. Since, therefore, no Angel, even a superior, knows the free effects of another Angel, even an inferior, he will not be said in any way to comprehend him. Were this not an obstacle, we should have to say that a superior Angel is rightly comprehended by an inferior; since to the ratio of comprehension it is by no means required that the knowledge, in its own genus, be as perfect as the thing itself comprehended is in the genus of intelligible.

But against what we have said, there could be the difficulty which St. Thomas touched in the first argument: how the spiritual nature of one Angel existing within himself does not hinder him from knowing another Angel. For true is the doctrine of Aristotle, De anima III, chapter 4, text 4, that what exists within the sense, namely in the soul, prohibits and obstructs, that is, prevents something external from being known.[1523] In solving this, Ferrariensis in II Contra gentiles, chapter 98, and Cajetan on this article at solution 3, labor not a little; yet the conclusion and the solution are easy. For Aristotle did not mean that any and every quality and thing existing within the cognitive faculty impedes the cognition of what is similar; this is not even true in the external senses themselves. For one pupil that is bright and diaphanous does not prevent another bright and diaphanous pupil, or another luminous body, from being seen; indeed, if with a right temperament of the organ there should be some color in the pupil, it would not thereby follow at once that all visibles would appear of that color, or that vision would be impeded. Nor, again, in flies - whose eyes are full of blood - do they not for that reason see rightly and discern among visibles. For a quality existing within does not by its nature prohibit the reception of the visible species, which they call intentional, but it impedes some alteration and change according to an accidental form of the same nature; and thus in the senses, in which some alteration is necessary...

...some antecedent alteration to sensation is necessary, as in touch and smell a quality existing within prohibits the sensation of a like quality: therefore that the Angel's substance is spiritual and of the same nature with the substance of another Angel does not impede his understanding the latter; because the Angel's substance in itself is capable of spiritual cognition, and is in no way contrary to it. But when Aristotle in that book, chapter 4, says, "What is within obstructs," he means this of the human intellect, and signifies that the intellect must be spiritual and unmixed: for unless it were unmixed, it could not know all things, since it would be material - not that any and every substance existing within prohibits cognition of another substance of the same kind; but for the reason stated. Wherefore that an Angel is spiritual and of the same nature and substance with another does not hinder him from being able to understand that other in one of the aforesaid ways.[1524]

1524. Aristotle, De anima III, c. 4.

Articulus III - Whether an Angel can know God by his natural powers.

Proceeding to the third: It seems that Angels cannot know God by their natural powers.

1. For Dionysius says, in the ninth chapter of On the Divine Names, that God is set above all the heavenly minds by an incomprehensible power; and afterwards he adds that, because He is above every substance, He is separated from all cognition.[1525]
2. Further, God is at an infinite distance from the intellect of an Angel. But infinite distances cannot be reached. Therefore it seems that an Angel cannot by his natural powers know God.
3. Further, it is said in 1 Corinthians 13: "We see now through a mirror in an enigma, but then face to face." Whence it seems that there is a twofold cognition of God: one by which He is seen through His essence, according to which it is said that He is seen face to face; another according to which He is seen in the mirror of creatures. But the first cognition of God an Angel could not have by his natural powers, as has been shown above. And a specular vision does not befit Angels, because they do not receive divine cognition from sensible things, as Dionysius says in the seventh chapter of On the Divine Names.[1526] Therefore Angels cannot by their natural powers know God.

But on the contrary: Angels are more powerful in knowing than men. But men by their natural powers can know God, according to Romans 1: "What is known of God is manifest in them." Therefore much more Angels.

I answer: Angels can have some cognition of God by their natural powers. For the evidence of this, one must consider that a thing is known in three ways. In one way, by the presence of its essence in the knower: as when light is seen in the eye. And thus it was said that an Angel understands himself. In another way, by the presence of its likeness in the cognitive power: as a stone is seen by the eye insofar as its likeness results in the eye. In a third way, insofar as the likeness of the thing known is not received immediately from the thing itself that is known, but from some thing in which it is reflected: as we see a man in a mirror. The first cognition is assimilated to the divine cognition whereby God is seen through His own essence. And this cognition of God cannot belong to any creature by its natural powers, as was said above.[1527] But the third cognition is assimilated to the cognition by which we, on the way, know God through His likeness shining forth in creatures, according to Romans 1: "The invisible things of God are clearly seen, being understood by the things that are made." Hence we are also said to see God in a mirror. Now the cognition by which an Angel by his natural powers knows God is midway between these two, and is assimilated to that cognition by which a thing is seen through the species received from it. For since the image of God is imprinted upon the Angelic nature by its very essence, the Angel knows God insofar as he is a likeness of God. Yet he does not see the divine essence itself, because

1525. Pseudo-Dionysius, De divinis nominibus IX.
1526. Pseudo-Dionysius, De divinis nominibus VII.
1527. St. Thomas, Summa theologiae I, q. 12, a. 4.

no created likeness is sufficient to represent the divine essence. Wherefore this cognition is more akin to a specular one, since the very Angelic nature is a kind of mirror representing the divine likeness.

Reply to the first: Dionysius is speaking of the cognition of comprehension, as his words expressly show. And thus God is not known by any created intellect.

Reply to the second: From the fact that the Angel's intellect and essence are at an infinite distance from God, it follows that he cannot comprehend Him, nor see His essence by his own nature. Yet it does not follow that for this reason they have no cognition of Him: because just as God is at an infinite distance from the Angel, so the cognition which God has of Himself is at an infinite distance from the cognition which an Angel has of Him.

Reply to the third: The cognition which an Angel naturally has of God is midway between the two cognitions; and yet it is more akin to one of them, as was said above.

Notes concerning the Article. - The conclusion is that Angels by their natural power can have some cognition of God. The doctrine of this article, as regards the explication of this conclusion, is easy. Only two points are worthy of remark.

First, it must be noted how St. Thomas says that an Angel cannot through his own essence know God as He is, because there can be no likeness of God which makes Him be known as He is. Yet we said above in Disputation 39, chapter 1, on the mind of St. Thomas, that there cannot be given a species which, once seen beforehand, is the ratio of knowing God as He is; nevertheless, an intelligible species can be produced which, not being previously seen, but as an eliciting principle, is the cause of knowing God. In this article, however, St. Thomas is speaking of a species which, once previously seen, would make God be known; and this he says is not given in an Angel. For although the essence of the Angel himself is a certain likeness of God, and in it the Angel knows God, yet it is not so exact that God could be perfectly seen in it, and as He is. For this reason he does not here deny that an intelligible species can be given as an eliciting principle; and in this sense we have explained this passage, and others of the same St. Thomas, above in that disputation, chapters 1 and 2.

Next, the doctrine which the Holy Doctor has in this article is to be noted, namely, that the light existing in the eye is seen through itself, not through some species of itself. I, however, judge this to be rather difficult. For the light which is in the eye can be seen neither through itself nor through any species: otherwise the bodily organ of the pupil would be seen as luminous, and therefore its figure and quantity - which are as it were a common sensible that, by reason of the proper sensible, namely light or color, are always perceived. But no one sees the quantity, figure, and position of his own pupil; therefore neither the light. But on this matter the philosophers treat more fully in De anima II, chapter 7.[1528]

1528. Aristotle, De anima II, c. 7.

Disputatio CCVI - In what way an Angel naturally knows God

Caput I - Two Scholastic opinions

At this point one could dispute whether an Angel understands God through a natural species proper to Him - a certain proper and quidditative knowledge, which is not intuitive as is that of the blessed - but of this we have already said enough and more than enough above, in Disputation 40, concerning the vision of God in general, in which the beatitude of the rational creature consists, and we treated this in Disputation 36 and the following. Now, therefore, there will only be controversy about the mode by which an Angel on the way knows God with the knowledge of a wayfarer, not indeed with a proper and quidditative knowledge - for this can in no way be communicated to him, as we said in that disputation - but with an inferior knowledge, such as we too have of God. In this difficulty the Scholastics also vary.

Setting aside the opinion of Scotus, which we adduced in that disputation, asserting that on the way God is known by an Angel through a proper and quidditative species, the first opinion is that of those who say that God is so known by an Angel on the way that the essence of the Angel is the eliciting principle of cognition. This opinion is followed by more recent authors, and seems to be embraced by Cajetan in this article, in replying to the second objection; also by Ferrariensis in book II against the Gentiles, chapter 98, at the section "Ad huius evidentiam," and by Capreolus in II, distinction 3, question 2, article 1, conclusion 5, at the end of the proof.[1529] For they assert that the essence of the Angel is a principle, after the manner of a representing species, for eliciting together with the intellect the cognition of God: yet in such wise that it is itself also known; in which respect it differs from other species which the intellect uses as a principle of intellection, because the others are in such a way a principle that they are not known, whereas the essence of the Angel has both: not indeed because the essence itself, as known, is the ratio of knowing God, but because at once it is the principle of knowing God, as a species, and is known. In favor of this opinion Henry is also reported, in Quodlibet IV, question 7; yet I think he did not teach it. St. Thomas, too, is alleged in this article, who plainly asserts the opposite, as we shall see below.[1530]

Now the first can be proved as follows. Unless the Angel, through his own essence as an eliciting principle of cognition, knew God, he could not otherwise know Him than through that [essence], or through other effects known beforehand. Wherefore the Angel would know God in the same way as we too understand Him on the way. But we must assign to the Angel a more perfect mode of knowing God than to us; and no other appears than the one just stated. Therefore one must say that God is known by the Angel in that way.

A second reason. Further, if the Angel knew God in the same way as we know Him, it would follow that the Angel acquires the cognition of God by discourse, namely, by deducing knowledge of God from knowledge of himself or of other things. But an Angel does not discourse, as St.

1529. Cajetan, on this article; Ferrariensis, In Contra gentiles II, c. 98, at "Ad huius evidentiam"; Capreolus, In II Sent., dist. 3, q. 2, a. 1, concl. 5 (in fine).

1530. Henry of Ghent, Quodlibet IV, q. 7; and see St. Thomas in this article, below.

Thomas testifies below in question 58, article 3. Therefore one must say that God is understood by the Angel in another way than by us. Wherefore Scotus, to the question - supposing on the mind of St. Thomas that God is not known by the Angel through a species, but through the essence of the Angel himself as through an object known prior - infers against that same St. Thomas that the Angel in his cognition discourses.[1531][1532]

A second opinion is that of Marsilius, on the First Book, question 7, article 1, part two, conclusion 8, where he affirms that God is known by an Angel through an inborn species, not indeed a proper and quidditative one of God Himself, as Scotus asserts, but in some other way: and this opinion does not seem to be proved otherwise than because the same reason seems to hold for God and for other things, that they be known by an Angel.

Caput II - The more probable opinion

The opinion of those seems to me more probable who assert that an Angel, through his own essence as a reason priorly known, compares to himself a knowledge of God. Thus teach St. Bonaventure on Book II, distinction 3, part 2, article 2, question 2, in the solutions to the arguments; Bassolis, question 3, article 2. Against this, Richard in II, distinction 4, article 1, questions 1 and 2 (although Bassolis also concedes with Scotus that a quidditative knowledge of God through a proper species can be given to the Angel). St. Thomas also agrees in this article; for he says that a thing can be known in three ways: first, through its own essence, as the divine essence is seen by the blessed; second, through the likeness of the thing which is in the cognitive faculty, as color is seen by the eye through its species; third, through a species reflected in a mirror. For the Holy Doctor thinks that in a mirror one sees the species of a color reflected in it; and in this way, he says, God is known by an Angel through a likeness of Himself reflected in the very essence of the Angel as in a mirror - as if to say, God is seen by the Angel through the likeness of Himself refracted in the Angel's essence as in a mirror.

...by an Angel, when the Angel beholds his own essence as it were a species and likeness of God. We have, therefore, from the mind of St. Thomas, that God is known by an Angel while the Angel understands his own essence, which is a certain likeness of God, as a species in a mirror; which opinion indeed commends itself to us, even if the example does not please - about which we have already spoken above, disputation 38, the last chapter.

For the explanation, however, of this opinion, note that the present difficulty can be understood in a twofold way: first, from which things, or by what reason, the Angel knows that God is in the nature of things the author and governor of all; then, since the Angel does not have on the way a proper and quidditative concept of God, but understands Him in the likeness of other things, just as we understand spiritual things in the likeness of bodily things - by whose likeness the Angel knows God - whether by the concept of his own essence, or of other things. Concerning the former way, I judge that God is sufficiently known by the Angel from his own essence, or from the essence

1531. St. Thomas, Summa theologiae I, q. 58, a. 3.
1532. Scotus, In II Sent., dist. 3, q. 9.

of any other thing whatsoever; so that from any thing whatsoever he rightly understands that there is one supreme being, the author and governor of all - this, moreover, without discourse: for in seeing the essence of any created thing he sees that it depends not on itself but on another. For, as Capreolus rightly notes in the second, distinction 3, question 2, article 3, to the first argument against the sixth conclusion, and as St. Thomas indicates below, question 58, article 3, there is discourse when from one known item another, previously unknown, is inferred, or at least whenever from one piece of knowledge another is simply gathered. Therefore, since the Angel by one intuition knows his own essence and that of any other created thing, not depending on itself but on another, by that very fact he knows that there is a certain supreme being on whom all created things depend; nor does he need any new item of knowledge drawn from a prior one in order to know God; wherefore neither does he need any discourse.[1533]

Concerning the latter sense of the question: since the Angel does not see God as He is, nor by a proper species, it follows that he must have knowledge of Him by the species of other things, whether spiritual or corporeal, just as we know God and spiritual things by alien species. Whence it follows that the opinion of those is false who say that the essence of the Angel serves the Angel himself as an intelligible species (species intelligibilis), and not as a known thing, for eliciting the knowledge of God; for since the Angel does not know God by His own proper species and concept, but by the species and concept of another, it follows that he must first elicit the knowledge of that other thing, in the likeness of which he knows God; and therefore his own essence ought not to serve as a species for eliciting the knowledge of God, but as a known object, when, in its likeness, he understands God; he can also use other things for this knowledge.

Moreover, not a few theologians labor in the question whether the Angel knows God better by his own essence or by the natures of other things. Yet it can be easily answered with a distinction. For either the discourse is about the knowledge of God with respect to the question whether He is (an est), and in this way God seems equally well to be known by the Angel through the knowledge of other things and through his own essence first known; for since God is known with respect to the question whether He is by this, that it is known that any treated thing depends not on itself but on another, this is made known equally well to the Angel concerning other created things as concerning his own essence; in this respect the Angel does not know God better through his own nature than through the essences of other things, with respect to the question whether He is. Or he is speaking of the mode in which the Angel knows God in the likeness of created things; and in this way by far the Angel will know God better from many other creatures than from himself alone, for from many creatures he will conceive more perfections about God. And let this suffice concerning this whole question of St. Thomas.

1533. Capreolus, In II Sent., dist. 3, q. 2, a. 3, ad 1 contra sextam conclusionem; and see St. Thomas, Summa theologiae I, q. 58, a. 3.

Quaestio LVII - On the knowledge of Angels with respect to material things

Then inquiry is made about those material things which are known by Angels. And concerning this five things are asked.

Articulus I - Whether Angels know material things

Objicitur primo: It seems that Angels do not know material things. For the intellect is the perfection of the intelligent. But material things cannot be perfections of Angels, since they are beneath them. Therefore Angels do not know material things.

Praeterea: An intellectual vision is of those things which are in the soul by their essences, as is said in the Gloss on 2 Corinthians 12.[1534] But material things cannot be in the soul of man, or in the mind of an Angel, by their own essences. Therefore they cannot be known by intellectual vision, but only by the imagination, by which likenesses of bodies are apprehended, and by the senses, which are of the bodies themselves. But in Angels there is no imaginative and sensible vision, but only intellectual. Therefore Angels cannot know material things.

Praeterea: Material things are not intelligible in act, but are known by apprehension of sense and imagination, which are not in Angels. Therefore Angels do not know material things.

Sed contra: Whatever a lower power can do, a higher power can do. But the intellect of man, which is by the order of nature beneath the intellect of an Angel, can know material things. Therefore much more can the intellect of an Angel.

Respondetur: I answer that such is the order in things, that the higher in beings are more perfect than the lower, and that what in lower things is contained deficiently, partially, and multiply, in higher things is contained eminently and by a certain totality and simplicity. And therefore in God, as in the summit and vertex of things, all things pre-exist super-substantially according to His own simple existence (*esse*), as Dionysius says in the book On the Divine Names.[1535] But Angels among other creatures are nearer and more like to God. Whence they participate more in the divine goodness, and more perfectly, as Dionysius says in Celestial Hierarchy, chapter 4.[1536] Thus, then, all material things pre-exist in the Angels themselves, indeed more simply and more immaterially than in the things themselves, though more multiply and imperfectly than in God. Now whatever is in anything is in it according to the mode of that in which it is. But Angels according to their nature are intellectual; and therefore, just as God by His own essence knows material things, so the Angels know them by the fact that they are in them by their intelligible species.

1534. Gloss on 2 Corinthians 12.
1535. Pseudo-Dionysius, De divinis nominibus.
1536. Pseudo-Dionysius, Celestial Hierarchy, c. 4.

Ad primum ergo dicendum: The intellect is the perfection of the intelligent according to the intelligible species (*species intelligibilis*) which he has in the intellect. And thus the intelligible species which are in the intellect of the Angel are perfections and acts (*actus*) of the angelic intellect

Ad secundum dicendum: Sense does not apprehend the essences (*essentia*) of things, but only external accidents; nor does the imagination. Rather, it apprehends only likenesses of bodies. But intellect alone apprehends the essences of things. Whence it is said in De Anima III that the proper object of the intellect is the what - it - is (quod quid est); about which it does not err, just as neither does sense err concerning its proper sensible. Thus, then, the essences of material things are in the intellect of man, or of an Angel, as the intelligible is in the intelligent, and not according to its own real existence. But there are certain things which are in the intellect or in the soul according to each kind of existence. And each of these is an intellectual vision

Ad tertium dicendum: If the Angel were to receive the knowledge of material things from the material things themselves, it would be necessary that he make them actually intelligible by abstracting them; but he does not receive the knowledge of them from material things; rather, through species of things actually intelligible, connatural to him, he has the knowledge of material things - just as our intellect has it according to the species which it makes intelligible by abstracting

Conclusio est affirmans.

Articulus II - Whether Angels know singulars

Ad secundum sic proceditur. Videtur quod Angeli singularia non cognoscant

Objicitur primo: The Philosopher says in I Posterior Analytics that sense is of singulars, but reason or intellect of universals. But in Angels there is no sensitive cognitive power, as is clear from what was said above. Therefore they do not know singulars.[1538]

Objicitur secundo: Every cognition is through some assimilation of the knower to the known. But it does not seem that there can be any assimilation of an Angel to a singular as singular, since the Angel is immaterial, as was said above, whereas singularity is the principle of matter. Therefore an Angel cannot know singulars.

Objicitur tertio: If an Angel knows singulars, he knows them either by singular species or by universal species. Not by singular species, for then it would be necessary that he have infinite species. Nor by universal species; because the universal is not a sufficient principle of knowing the singular as singular, since in the universal singulars are known only in potency. Therefore an Angel does not know singulars.

Sed contra: No one can guard what he does not know; but Angels guard individual men, according to that of Psalm 90: "He has given his Angels charge over you," etc. Therefore Angels know singulars.

1538. Aristotle, Posterior Analytics I.

Respondetur: I answer that certain men have entirely denied to Angels singular cognition. But this, first, derogates from the Catholic faith, which holds that the things here below are administered by Angels, according to Hebrews 1: "Are they not all ministering spirits?" If, however, they did not have knowledge of singulars, they could have no providence over the things that are done in this world, since acts are of singulars. And therefore others say that indeed an Angel has knowledge of singulars, but that he uses it in universal causes, to which all particular effects are reduced; just as an astrologer indicates some future eclipse by the dispositions of the celestial motions. But this aforesaid position does not avoid the inconvenience: for thus to know singulars in universal causes is not to know the very true singular itself - that is, as here and now. For the astrologer, knowing a future eclipse by computation of the celestial motions, knows it in the universal, and not as it is here and now, unless he apprehend it by sense. But administration and providence and motion concern singulars precisely as they are here and now. And therefore it must be said otherwise, that just as man, by two genera of powers of cognition, knows all kinds of things - by intellect, indeed, universals and also immaterial things; by sense, however, singulars and corporeal things - so the Angel, by one intellectual power, knows both. For the order of things has this, that the higher a thing is, the more unified a power it has, and the more it extends to many; as is clear even in man himself, that the common sense, which is higher than the proper sense, although it is one power, knows all the things which are known by the five exterior senses, and also certain other things which no exterior sense knows, namely, the difference between white and sweet.

I answer that, a like consideration is had also in other cases. Wherefore, since by order of nature the Angel is above man, it is incongruous to say that man by any power of his knows something which the Angel does not know by his one cognitive power, namely the intellect. Hence Aristotle takes it as absurd that God should be ignorant of what we know, as is clear in De anima I and in Metaphysics III.[1539]

But the mode by which the Angel's intellect knows singulars can be gathered from this, that just as things flow forth from God so as to subsist in their proper natures, so also that they may be in angelic cognition. Now it is manifest that from God there flows into things not only that which pertains to the universal nature, but also those things which are the principles of individuation. For He is the cause of the whole substance of the thing, both as to matter and as to form. And according as He causes, so also He knows, because His knowledge is the cause of the thing, as was shown above.[1540] Therefore, just as God, by His essence by which He causes all things, is the likeness of all things, and by it knows all things not only as to universal natures but also as to singularity, so the Angels, by the species imparted by God, know things not only as to their universal nature, but also according to their singularity, inasmuch as these species are certain multiplied representations of that one and simple essence.

1539. Aristotle, De anima I; Metaphysics III.
1540. See above, on God's knowledge, q. 14, a. 8.

Reply to the first: The Philosopher speaks of our intellect, which does not understand things except by abstracting; and by that very abstraction from material conditions, that which is abstracted becomes universal. But this mode of understanding does not befit Angels, as was said above. And therefore the same reason does not apply.

Reply to the second: According to their nature the Angels are not assimilated to material things as something is assimilated to another according to a likeness in genus or in species or in accident, but as the superior has a likeness to the inferior, as the sun to fire. And in this mode too there is in God a likeness of all things, both as to form and as to matter, inasmuch as in Him, as in a cause, there pre-existed whatever is found in things. And for the same reason the species of the angelic intellect, which are certain derived likenesses from the divine essence, are likenesses of things not only as to form, but also as to matter.

Reply to the third: The Angels know singulars by universal forms, which nevertheless are likenesses of things both as to universal principles and as to the principles of individuation. How, moreover, by the same species many things can be known, was said above.[1541]

Notes regarding the Article. The conclusion is affirmative. In these two articles few things remain to be noted, besides those which we have noted in the preceding questions, namely, whether Angels understand by species; and whether these species are received from things, or are inborn in Angels and created together with them. Two points therefore are to be noted now.

One is this: although in the school of St. Thomas it is held that singulars are not directly known by us through the intellect, but only through sense, yet as to Angels there is no controversy, but among all it is certain that singulars, even material ones, are known by Angels directly and by a proper concept. What is to be said in this matter about our intellect is not to be examined in this place.

The other is this: an Angel can rightly, by one and the same species according to the thing, understand both universals and singulars, if nothing else stands in the way. For above, in Disputation 202, it was shown that by one and the same species according to the thing many things can be known by an Angel and presented to him.[1542] I said, if nothing else stood in the way: for, as we showed in Disputation 117, chapter 3, neither the Angel nor the intellect that sees singular things forms, by a proper and quidditative concept, the common notion either of genus or of species; since, as it penetrates the thing as it is, it cannot have a common and confused concept of it.[1543]

Articulus III - Whether the Angels know future things

It seems that Angels know future things. For Angels are more powerful than men in knowing. But some men know many future things. Therefore much more do Angels.

1541. See above, the discussion in Disputation 202.
1542. Disputation 202.
1543. Disputation 117, c. 3.

Further, the present and the future are differences of time. But the intellect of the Angel is above time; for Intelligence is compared to eternity, as is said in the Book of Causes. Therefore, as regards the Angel's intellect, past and future do not differ, but he indifferently knows each.[1544]

Further, an Angel does not know through species received from things, but through innate universal species. But universal species are equally related to the past and to the future. Therefore it seems that Angels indifferently know the past and the present and the future.

Further, just as something is said to be distant according to time, so also according to place. But Angels know distances according to place. Therefore they also know distances according to future time.

But on the contrary: That which is a proper sign of divinity does not befit Angels. But to know future things is a proper sign of divinity, according to that saying: "Announce the things that are to come hereafter, and we shall know that you are gods." Therefore Angels do not know future things.[1545]

I answer that, the future can be known in a twofold way. In one way, in its cause. And thus future things which from their causes proceed by necessity are known by certain knowledge, as that the sun will rise tomorrow. But those which proceed from their causes as in most cases are known not by certitude, but by conjecture, as a physician foreknows the health of the sick man. And this mode of knowing future things belongs to the Angels, and so much the more than to us, by how much they know the causes of things more universally and more perfectly; as physicians who see causes more acutely are better able to prognosticate concerning the future state of a sickness. But those which proceed from their causes as in fewer cases are wholly unknown, as things casual and fortuitous.

In another way future things are known in themselves: and thus it belongs to God alone to know future things, not only those which proceed by necessity or as in most cases, but also those that are casual and fortuitous. For God sees all things in His eternity, which, since it is simple, is present to the whole of time and encompasses it. And therefore one intuition of God is borne to all things that are done through the whole of time as to things present, and He sees all things as they are in themselves, as was said above when we treated of God's knowledge.[1546] But the angelic intellect, and any created intellect whatsoever, falls short of the divine eternity. Hence by no created intellect can the future be known as it is in its own being.

Reply to the first: Men do not know future things except in their causes, or when God reveals them. And thus Angels know future things far more subtly.

1544. Liber de causis.
1545. "Annuntiate quae ventura sunt in futurum, et sciemus quia dii estis vos" (Isa 41:23).
1546. See above, on God's knowledge, q. 14, a. 7.

Reply to the second: Although the Angel's intellect is above time by which bodily motions are measured, yet in the Angel's intellect there is a time according to the succession of intelligible conceptions; according to which St. Augustine says, in the work On the Literal Meaning of Genesis, that God moves the spiritual creature through time. And thus, since there is succession in the Angel's intellect, not all the things that are done through the whole of time are present to him.[1547]

Reply to the third: Although the species which are in the Angel's intellect, in themselves, are equally related to the present, the past, and the future, nevertheless the present, the past, and the future are not equally related to reasons. For those things which are present have a nature by which they are assimilated to the species which are in the Angel's mind. And thus through them they can be known. But those which are future do not yet have a nature by which they may be assimilated to those species. Hence through them they cannot be known.

Reply to the fourth: Distances according to place are in the nature of things, and they share in a certain species whose likeness is in the Angel. This is not true of future things, as has been said. And therefore the case is not similar.

Explanation of the Article. The first conclusion is: Future things which come about by necessity can with certitude be known by Angels in their causes. The second conclusion: Future things which happen frequently can be known by an Angel by way of conjecture, in the manner in which a physician knows from the evidence of some cause either health or death - yet more perfectly, by how much he more perfectly than a physician knows the causes. The third conclusion: Future things which happen rarely are altogether unknown to an Angel even in their causes, and in themselves can be known by no other intellect than by God alone: for He has all things present in His eternity.

Concerning the second and the third conclusion it must be observed that they are to be understood not only of contingent effects proceeding from free choice alone, but also of contingent effects proceeding from natural causes concurring per accidens. For in either way contingent events are wont to occur now frequently, now rarely. For from the mere concurrence of natural causes something can come about frequently; and otherwise, rarely. Likewise from free choice at one time something may occur rarely, at another time frequently. For men too by their will sometimes do certain things rarely, and certain other things frequently; a man, being disposed in one way or another in this or a like occasion, often acts in a like way from a like disposition. But regarding both conclusions, understood in either way, difficulties must be examined.

Disputatio CCVII - Whether future contingents proceeding solely from natural causes can be known by an Angel

These contingents cannot, with certitude, be known by Angels, as not a few have taught.

1547. St. Augustine, De Genesi ad litteram VIII, c. 20.

Caput I - Statement of the question and preliminaries

That we may examine the proposed question in due order, certain points must first be premised about future contingents that arise from natural causes. To this end we must recall what we said above,[1548] namely, that an effect can come about contingently without any intervention of the application or cooperation of free choice, from the mere concurrence of natural causes; for about those effects to which free choice concurs, either as a cause or as applying causes, we shall have to treat in the following disputation, since in both cases the same line of reasoning seems to apply. Now an effect is said to occur contingently from merely natural causes whenever it does not proceed from their necessary influx, but from an accidental concurrence; and from such a concurrence there sometimes arises an effect - for example, one is laboring under some bodily disposition which of itself is not yet a sufficient cause, and a change of air or of constellation supervening, the sickness gains strength and death ensues; in such a case the event is called merely contingent, because it did not follow from the per se concurrence of all the natural causes. Effects contingent in this way sometimes happen frequently, sometimes seldom, and sometimes indifferently either way; for as the concurrence and application of natural causes is variable, so now one mode of concurrence will be frequent, and another rare. Concerning all such effects, in which there is no cooperation of free choice, the present controversy is understood - namely, whether such can be known by an Angel with certitude.

That these contingents cannot be known with certitude by Angels, not a few have taught. Future events before they exist cannot be known with certitude by an Angel, just as the contingent effects of free choice; if, however, they come about frequently, they can indeed be known beforehand by some conjecture, as happens with works of free choice that are wont to occur frequently. Richard reports this opinion and defends it as probable in 2 Sentences, distinction 7, article c., question 2; indeed, St. Thomas seems to have embraced it in this article: for he speaks of all contingent effects, among which he numbers sickness - unless someone should interpret him in a more favorable fashion, as if that example had been adduced in order to show that future contingents from free choice are in the same way known by Angels as a physician knows the outcome of an illness.[1549] The same opinion the holy Doctor seems also to have handed down in Contra Gentiles III, chapter 154; and Ferrarienis in the same place, s. One could also say that, where he only teaches that these futures can be known by Angels much better than by men, he does not define whether they are known by Angels with certitude.[1550] From this, however, it is not sufficiently concluded that these Doctors were of the opinion we have reported; yet Bonaventure in 2, distinction 7, part 2, article 1, and Aegidius in the same distinction, question 2, and Hervaeus in that distinction 7, article 2, who interprets St. Thomas in this sense, and finally Dionysius Carthusian in the same distinction 4, 9, do openly teach that opinion. Moreover, Richard to that extent judges it to be true that he brands the opposite not so much an error.

1548. See above, Disputation 64.

1549. Richard of Mediavilla, In II Sent., d. 7, a. c., q. 2. St. Thomas is taken so to speak in this article.

1550. St. Thomas, Summa contra Gentiles III, c. 154; Ferrarienis in the same place, s., where he teaches only that Angels can know these futures much better than men, without defining certitude.

In the opinion, then, of these Doctors, natural events proceeding from the heavenly bodies, which in no way can be impeded, are known with certitude by Angels; but others proceeding from lower causes, which can be impeded by others per accidens, are known only by conjecture.

This opinion is proved, first, because even if effects of this kind are from natural causes determined of themselves to one side in operation, yet by accident and for the most part they come about as contingent, so that things which of themselves are in the class of certain and contingent cannot be known with certitude by a created intellect; therefore neither can such events be known with certitude by Angels. Then, because the opposed opinion seems to have been condemned by the Parisian School; for in a certain article, which Richard and Dionysius report as condemned, it is stated that whoever should say that nothing is by chance, nothing by fortune, but that all things come about by necessity, is to be condemned: for if things by chance and fortune sometimes occur, how could it be that they are known with certitude by an Angel?[1551]

Caput II - The more probable opinion: that contingent events not depending in any way on free choice are known with certitude by Angels

But here a much more probable opinion always commends itself, which asserts that not only the motions of the heavenly spheres and the encounters of the stars, but indeed all natural events which take place in lower matter - whether from the heavens or from other lower natural causes - where free choice in no way intervenes, are known with such certitude by Angels as eclipses of the sun and moon are known by mathematicians. What I have said about effects must in the same way be asserted about their impediments. Therefore an Angel knows with certitude future events - sickness, plague, or something of that kind - from natural causes, and indeed also whether such an effect will be impeded by some other stronger natural cause. I said, however: provided free choice does not intervene; for if some cause is to be applied by free choice - such as a drink, or some other medicine - the event of the illness cannot be known with certitude.

This opinion was handed down by Alexander, 2. part, question 26, member 4; by Durandus in 2, second, distinction 7, question 3, number 4; by Albert in distinction 3, question 8, number 9; Albert in that distinction 7, article 5; and Richard thinks it probable in the place cited. Moreover, Thomas of Argentina, in 1, distinction 7, question 1, article 3, when he says that futures which do not have an immutable and necessary cause cannot be known with certitude by an Angel, does not sufficiently explain himself, because he does not state plainly whether he is speaking of a cause immutable from the intrinsic side, or also from the extrinsic, such as are many natural causes which, although they operate necessarily, can be impeded from without. In the same way, Marsilius in 2, question 7, article 1, in the second part of the article, after the seventh conclusion, only teaches in general that future contingents cannot be known by an Angel.[1552]

1551. Richard and Dionysius report as condemned at Paris the statement: that nothing is by chance, nothing by fortune, but that all things happen by necessity.

1552. Alexander of Hales, II pars, q. 26, memb. 4; Durandus, In II, dist. 7, q. 3, n. 4; Albertus, dist. 3, q. 8, n. 9, and in that dist. 7, a. 5; Richard loc. cit. Thomas de Argentina, In I, dist. 7, q. 1, a. 3; Marsilius, In II, q. 7, a. 1, pars 2, post septimam conclusionem.

By one sole reason, in my judgment an effective one, this our opinion can be confirmed, namely this. An Angel knows with certitude future motions and encounters of the stars and of the celestial spheres, unless they are impeded by God; that is, the Angel knows evidently how the celestial spheres and the stars of themselves and by their natural course will be moved in the future and will meet one another, unless by the free will of God they should be impeded; therefore the other natural effects from lower natural causes, being future, are in the same way known with certitude and evidently by an Angel: because lower causes are no less naturally and necessarily inclined and determined to their effects than the celestial spheres and stars are to their own motions and various aspects and conjunctions; the only difference is that the celestial spheres, since they do not have any created cause more powerful than they except God alone, cannot be impeded by others, whereas other lower causes can be impeded by many causes, also lower. We have, therefore, that - considered at least according to the nature and inclination of the second cause, if there be no impediment from elsewhere - natural events can be known not less certainly and evidently by an Angel than the future motions and aspects of the stars. Such future events are plague, sickness, sterility, and other things of that kind, which are future from causes wholly natural. The rest, indeed, of the effects of lower causes can be impeded by other natural causes; nonetheless what, on account of such impediment, will be future or will not be future must be said to be known no less certainly by an Angel.

For lower causes - such as the cause of sickness, of sterility, and the like - can be impeded in two ways. First, by created free choice applying contrary natural causes, when it can; and in this way we do not assert that it is known by an Angel with certitude what will be future or not future from such an impediment: for this event is then reduced to free choice, and about it a judgment must be formed in the same manner as about other effects of free choice, of which we shall speak in the following disputation - unless after the remedy and impediment have already been applied by free choice, and it no longer depends upon it; then indeed the same judgment ought to be had about it as about an impediment applied wholly naturally. Then secondly, the effect of a natural cause can be impeded or varied by the intervention and opposition of a solely natural cause, no free choice intervening, but causes occurring to each other according to their natural course; and in this way a natural effect is called contingent, because such a concurrence is per accidens, and therefore is called contingent. Thus we also say that it is known with certitude by an Angel what from the impediment of a natural cause will be future or will not be future, and that in the Angel there is a no less certain judgment about what will arise from the concurrence of a contrary cause than if it would arise from the sole natural cause without impediment; so that just as the Angel knows with certitude that fire will burn, and that from such a constellation there will be a plague or barrenness in the future, and that from such a composition of humors an illness will be born; so also he knows whether, by the intervention of a contrary constellation, or of a material or efficient cause, such an effect will be impeded or not impeded: for, just as natural causes of themselves necessarily incline to one side, as fire to heating, so also, in this matter, unless something else hinders, they produce this effect and not another; so too the impeding causes naturally and necessarily so impede, that they cannot fail to impede. Since, therefore, an Angel knows evidently the forces of any natural

cause whatsoever, and - having exactly compared them with one another - will certainly and evidently know which cause will overcome another and in what way: therefore he will know with certitude what from such a concurrence will be future or will not be future. We, however, therefore neither evidently nor with certitude know these events, because we do not sufficiently weigh or understand the power and potency of causes; on that account natural contingent events are wont to be no less uncertain to us than contingents from free choice, so that we attain to them only by conjecture.

And what we have said about future effects from natural causes not knowing, must in the same way be asserted about future effects from brute animals, which - although they act by cognition and appetite - are nonetheless borne toward their objects no less naturally and necessarily, unless they are impeded, than natural causes which do not know; and therefore, since an Angel knows with certitude all future impediments from natural causes, as has been said: he will also know with certitude what brute animals will do or will not do. Now we understand this to be true whether knowing natural causes are determined and impelled to their actions by the stars, or from themselves: not indeed freely, but naturally. I have said this because some concede that future events from brute animals can be known with certitude, if the brutes are determined to them by the stars; although in either way the same reason holds. But whether these futures are known with certitude by proper knowledge, which they call intuitive, we shall see in the following disputation.

The arguments for the former opinion are refuted. Cap.

He evidently knows how the heavenly spheres and the stars by themselves and by their natural course will in the future move and meet one another, unless they be freely hindered by the will of God: therefore the other natural effects which are going to result from inferior natural causes are in the same way certainly and evidently known by an Angel. For inferior causes are no less naturally and necessarily inclined and determined to their effects than the celestial spheres and the stars to their motions and various aspects and conjunctions; only that the spheres, since they have no created cause more powerful than they, are impeded by God alone, whereas other inferior causes can be impeded by many other, even inferior, causes.

We have therefore, taking into account at least the nature and inclination of the second cause, that, if no impediment come from elsewhere, natural effects are no less certainly and evidently known by an Angel than the future motions and aspects of the stars. Such events are pestilence, sickness, sterility, and other things of this kind, which are going to be from causes wholly natural. And although other effects of inferior causes can be impeded by other natural causes, nevertheless one must also say that even what, in the presence of such impediment, will be or will not be, is known no less certainly by an Angel. For inferior causes, as the cause of sickness, of sterility, and the like, can be impeded in a twofold manner.

First, by created free will, when it can, applying contrary natural causes; and in this manner we do not assert that it is known for certain by an Angel what will or will not be out of such impediment. For this event must be reduced to free will, and about it the judgment is to be made in the same way as about the other effects of free will, of which we shall speak in the following

disputation, unless after the remedy and impediment has now been applied by free will and no longer depends upon it; then indeed there ought to be the same judgment of it as of an impediment applied wholly naturally.

Then, the effect of a natural cause can be impeded, or varied, by the intervention and opposition of a natural cause alone, with no free will intervening, but by causes meeting each other naturally; and in this way a natural effect is called contingent, because such a concurrence is per accidens, and therefore is called contingent. In this way we say that it is also known with certainty by an Angel what from an impediment of a natural cause will or will not be; and no less certain a judgment exists in the Angel concerning the effects of a natural cause set against a contrary natural cause. For just as natural causes are inclined to one side - for instance, to heating, as fire is to heating matter - unless something else stand in the way; so also, if something else obstruct, they work to another effect; and thus they are naturally and necessarily so as not to be able not to hinder. Hence, since the Angel plainly knows the power of each natural cause and, by exact comparison of them with each other, what cause will overcome another and by what proportion, therefore he will certainly know what, from such a course of contrary causes in the future, will or will not be.

We, however, neither certainly nor evidently know, because we do not sufficiently weigh or understand the strength and potency of the causes; and therefore natural events that are contingent are wont to be uncertain for us, so that we attain to them by conjecture alone.

And what we have said about the effects of natural causes must be asserted likewise about the effects that are going to arise from brute animals, which, by constitution and appetite, work naturally and necessarily - that is, unless they be impeded. Therefore the Angel will certainly know all those operations that from natural causes are going to proceed; and he will also know what brutes will do or will not do. I say this, whether the causes be determined to their actions by their own nature, or by the celestial dispositions; for in either case they act not freely but naturally.

On dissolving the arguments of the contrary opinion

Caput III - Dissolution of contrary arguments

By this same doctrine whereby we confirmed our opinion, we can dissolve the contrary arguments. To the first line of reasoning adduced we say that effects arising from a natural cause, with no intervention of free will, even applying it, are altogether necessary; and also when they are impeded by a second natural cause that occurs, they are impeded necessarily. Nevertheless both such events and such impediments are said to be contingent - not because they do not happen necessarily and with the determination of the natural cause to one side, but because it is per accidens that one cause is impeded by another. Wherefore the contingency of these effects - that is, their being able to be and being able not to be - must be taken on the side of the thing made, not on the side of the mode of efficiency in the cause itself, as I explained in Disputation 61, cap. 1, in accordance with Henry's mind. Wherefore Gabriel, in the First Book, distinction 38, question

unica, article, in the second part of the article, and Corduba, Book 1, question 55, doubt 4, do not call these effects contingent, but necessary; and they call only those contingent which are in some way from free will. Therefore, since this kind of contingency does not remove the necessary and determined mode of operation to one side of the efficient causes or even of the impedients, it follows that such events are known by an Angel with certainty and without any deception, because he attentively weighs the nature and power of all causes.

But some object thus: If an Angel certainly knows such effects, it follows that they are not contingent; which seems absurd. But this objection has no force. For such effects are not called contingent with respect to the Angel, but from themselves, that is, of such a nature as to be able to be and not to be; nor are they said to be contingent for the Angel because they are of uncertain truth and unknown to the Angel. And if this is assumed in the argument, it ought to be denied; for it assumes what had to be proved, and about which our controversy is.

To the definition of the Parisian article which was alleged afterwards, I answer that nothing is defined in that article against our opinion: for only those are condemned who assert that all things happen necessarily, as Wyclif said, even those which proceed from free will. Concerning natural causes, however, nothing is determined; nay rather, I do not see how, according to right faith and true philosophy, it can be said that the events of natural causes come to either side from liberty and the indifference of the cause.

Nevertheless, although we affirm that these events of natural causes, and of brutes, happen necessarily, or are necessarily impeded by other brutes or natural causes, yet chance cannot on that account be denied, although in these things fortune has no place. For chance is called an event which follows per accidens with respect to some other cause than a rational one, although it come about necessarily by the intervention of some other natural cause and of a necessary agent; but fortune is spoken of only with respect to man: for that alone is called an effect which happens to a man contrary to his intention, even if it come about by the intervention of some natural cause and of a necessary agent. Although, therefore, other causes which can occur act naturally and necessarily, nevertheless chance and fortune can still be spoken of.

Further, one could object first Tertullian in the Apologeticus, cap. 22, near the end, where speaking of the divination of demons, he says that they always answer ambiguously. He subjoins these words: "They have in the hollow of the air and from the nearness of the stars, and from commerce with the clouds, a celestial knowledge of things, so that they also promise rains which they already feel to be coming." I answer: it is no wonder if Tertullian attributed to demons no other kind of cognition of future natural events; for since he thought that they are corporeal and endowed with sense, it is not marvelous if he said that they only in this way foreknow future rain and other natural events; although the opinion which affirms that all Angels and demons are by their nature spirits and are wholly void of body is truer, as was proved in Disputation 178, cap. 3 and 4; consequently we ought to deny that future rain and other such events are foreknown by demons from some presence on account of the nearness of place, as is manifest; for the cognition of the intellect does not depend on the nearness of place, as sensible presence depends on the senses of the body.

I admit, nevertheless, that Tertullian probably felt the same as Athanasius in the book of Questions, question 27, where he says that rain and the inundation of the Nile cannot be foreknown by a demon; although he said, as we reported in Disputation 179, cap. 3, that all Angels are incorporeal. We have, however, against Tertullian and Athanasius, Augustine, who, although he thinks that Angels and demons are not spiritual and incorporeal, nevertheless judged otherwise concerning the mode by which they foreknow rains and other natural events. For in the book On the Divination of Demons, cap. 5, he teaches that they divine sicknesses or future tempests which they themselves are going to produce, because they receive the power of injecting diseases and of vitiating the air; which surely must be understood to be done by demons not by their proper power - because by this they can only move bodies according to place, as we shall say in Disputation 208, cap. 3 - but by the application of natural causes, which they can apply. He adds further below: "Certain things they do not themselves make, but by natural signs they foreknow future things (which signs cannot come within human senses), and they foretell them beforehand." And below, "What wonder if the demon, by an affection of the air and by an arrangement known to himself, should foresee tempests for us who are ignorant?" And in cap. 6 he shows by this sole reason that demons can be deceived in this divination - that these things are by Angels who serve God, that is, by the good [Angels], from another disposition unknown to the demons, suddenly and in a moment changed; and a little below he adduces the example when, Matthew 8, when the Lord was seen, there was made a calm: for what demon would not have thought that that tempest would last longer, if he had attended only to natural causes? We, however, have said that these futures are known certainly by Angels, if in no way free will intervene.

Another mode also of announcing future things to us is assigned by the same Augustine, On the Trinity, book 4, cap. 17, and in book 12 On Genesis according to the Letter, cap. 13: namely, on account of the highest swiftness and acuteness of seeing, because they perceive things which are far off, and announce them to us, they seem to predict things future, which are to them present.

Then, against what has been said, they adduce also the same Augustine, City of God, book 9, cap. 22, where he teaches that temporal futures are better known by the good Angels, who in their cognition cannot be deceived, because they see them in the Word, than by demons, who can be deceived for this reason, that they see only in causes. I answer: Augustine is not speaking about futures from causes merely natural, but also about those which depend on free will: and these are known to demons in causes only by conjecture, but by the good Angels in the Word, that is, with God revealing; and for that reason they are more certainly known by them.

Lastly, some argue from Wisdom 8, where, as if proper to God, it is said to be "to know portents before they happen": but these are effects natural from causes altogether natural. I answer first that this indeed is not assigned as proper to God in such a way that it does not also befit a creature: for there concerning the same Wisdom of which a little earlier it had been said, it is said, "He knows the past, about the future he conjectures"; but past things are rightly known by Angels: therefore the same must be believed concerning portents. Besides, I say that there there is a

sermon about created wisdom, which he says has always loved herself; and of this he says that it knows portents, knows past things, and about future things conjectures, in that mode alone in which to man in this life it is permitted.

Disputatio CCVIII - An future contingentia ex libero arbitrio propria virtute ab Angelis certo cognoscantur

- These futures cannot be known certainly by Angels: this is indubitable to Catholics. Caput 1.
- By what reason some try to prove that these futures cannot be known certainly by Angels. Caput 2.
- A difficult argument against the foregoing doctrine, to which various Doctors respond. Caput 3.
- The true solution of the foregoing argument. Caput 4.

Has futura ab Angelis certo cognosci non posse, Catholicis indubitatum esse.

Thus Justin, in the first book of Questions propounded by the Gentiles, questions 2 and 146; Eusebius, book 5 of the Preparation for the Gospel, cap. 10, where at length he discourses about the oracles of demons; Damasus, book 2 On the Faith, cap. 4; Anselm, book On the Fall of the Devil, cap. 1 - all of whom, although they speak only of demons (except Damasus, who also understands that doctrine about the good [Angels]), yet from thence the same must be proved about the good [Angels], if we attend only to their natural power. For on what foundation could we say that demons therefore do not understand futures from free will because they are impeded by God, when nevertheless by their natural power they could understand? For indeed from the doctrine of Pseudo-Dionysius, De divinis nominibus, cap. 4, part 4, not far from the middle, in demons all natural endowments remained intact: and if demons by their natural power cannot foreknow such futures, in the same way good Angels will not be able to do so, since they are of the same nature.[1553]

The same truth also is confirmed by Scripture. For in Isaiah 46 it is said: "I am God, and there is no God besides me, nor is there any like me, announcing from the beginning the last things, from the start the things that have not yet been done." When he says "nor any like me announcing future things, pointed out beforehand," he indicates that no one at all can be made like to him in this; where Jerome writes thus: "From the beginning you must consider that besides me there is no God, nor could another know the things to come, except I, who announce through the Prophets." And upon that in Daniel 2 about the dream, he adds: "Let the Magi confess, let the soothsayers confess, that all secular knowledge of literature does not have prescience of future things; but God has it; from which it is proved that the Prophets spoke by the Spirit of God." When he says that it is not of men but of God, he also excludes Angels; otherwise he would not rightly have said "but of God"; nor would he from that rightly have inferred that the Prophets, foretelling future things, spoke by the Spirit of God, if by the art of demons the future could be foreknown.

1553. Pseudo-Dionysius, De divinis nominibus IV, part 4.

From the same prediction of futures Isaiah gathers the true divinity: "Declare to us the things that are going to come, and we shall know that you are gods" (Is 41:23); where Jerome at length shows that the idols were not able to predict future things. He proves it, because they did not even foresee the ruin of their own temples. Wherefore Origen rightly says, Contra Celsum, book 6, at the beginning, that the character of divine discourse is the prediction of future things, which does not fall under human nature; and they judge by the events when it is evident that there has been a prediction by the divine Spirit. Therefore Damascene, in the place alleged above, denied not only of demons, but also of good Angels, according to the consideration of their nature, a prescience of future things from free will; but he taught that good Angels have a foreknowledge of these futures by the revelation of God, and evil ones only by conjecture.[1554] Moreover, since among the Schoolmen this is held as most certain, yet it is very difficult to assign the reason why these futures cannot be foreknown by Angels.

Caput II - Some Schoolmen attempt a priori to demonstrate that future contingents from free will cannot be known by Angels, by this reasoning.

These futures are either known by Angels in their causes, or in themselves: not in their causes, because free will is of itself indifferent to one side and to the other, and equally regards the one and the other; therefore from it no more is the future event understood than the non-future. Not in themselves, because this seems the proper [power] of God alone, who, as he is eternal, by his eternity has all things, as well future as past, as present: therefore in no way can future things be known certainly by Angels.

But this reasoning is weak. For that free will is indifferent to either side does not hinder that one part of a contradiction be determinately true and the other false, as we have shown at length in Disputation 66, cap. 2 and 3; for indeed the indifference and liberty of free will can be understood in that way which Aristotle thought, namely, that neither part be true nor the other false, but that both be true or both false, as we there more fully proved. Since, therefore, in future things one part is true and the other false, it follows that each in its own mode is knowable, that is, the true as true, and the false as false. Why, then, just as it is known by God, could it not be foreknown by an Angel? For what was said - that it is known by God on account of a real presence in his eternity - we have shown to be false in Disputation 66, cap. 2 and 3 and 4. Therefore by this reasoning it is not sufficiently shown that future things cannot be known by an Angel with certainty: in their cause, if, compared with it, they have truth. And even if it were proved that they cannot be known by an Angel properly and quidditatively (which we by no means grant), it would not yet be shown that it is not permitted also to gather, at least by another's concept, that they cannot be known with certainty by Angels; just as a future eclipse is evidently foreknown by astrologers.

1554. Tertullian, Apologeticus 22; St. Augustine, De divinatione daemonum 5 - 6; On the Trinity IV, 17; De Genesi ad litteram XII, 13; City of God IX, 22; St. Jerome, on Isaiah 46 and Daniel 2; Origen, Contra Celsum VI; St. John Damascene, De fide orthodoxa II, 4; Justin, Quaestiones et responsiones ad Orthodoxos, q. 2, 146; Eusebius, Praeparatio Evangelica V, 10; St. Anselm, De casu diaboli I.

But against this the philosophical argument adduced above would have no force, as is clear. Therefore I would judge that the aforesaid truth cannot be proved by an a priori philosophical reason; yet it is rightly proved by Scripture and by the testimonies of the holy Fathers, which ought to suffice for a theologian. There is also a convincing and manifest a posteriori philosophical reason: for the oracles of demons, as even the pagans and Gentiles attest, are full of lies; therefore it is a sign that future contingents cannot be known by them with certainty; for if they could foreknow them, God would not deny them this knowledge, nor would He perpetually hinder them from a natural operation. Add also that among the pagans and Gentiles it was held so divine a thing to predict the future, that those who predicted such things were reckoned by them among the number of the gods; and therefore to foreknow the future is called "divination," as though it were the gift of a god to foreknow the future. Although, therefore, by an a priori natural reason this truth cannot be made so clear, yet it is so known to philosophers - even pagans and Gentiles - that it seems, as it were, to be naturally instilled in their minds.

Another a posteriori reason is also commonly brought to prove the same: because if an angel could by his own power foreknow some future contingent, he could also foreknow all; which is absurd, for all things are infinite: but infinite things cannot be known by a finite intellect, since the future thoughts and motions of a created will are infinite. Yet someone could reply that an angel cannot foreknow all at once, yet he can foreknow them singly. Wherefore from the fact that he can know one, nothing absurd follows.

Nevertheless it must be observed what St. Thomas teaches in two propositions of the article, namely in the second and third, to be most true. In the second he teaches that future contingents which frequently come to pass can be known by an angel by some conjecture; he understands also those which depend on free choice, since men for the most part act according to the impetus of passions, there is some reason why such future things are known by some conjecture. In the third conclusion he teaches that those futures which happen rarely cannot be foreknown by any conjecture; which is manifest: for in those which rarely occur there is not some reason by which the future can be known; rather, from some conjecture a contrary opinion is more easily estimated as future.

Caput III - The difficult argument, to which the Doctors reply in various ways

Moreover, in the opinion of those who teach that angels know all things by species innate to them from the beginning of their creation, there is a difficult argument, by which it seems to be proved either that future things are foreknown by an angel by a proper and quidditative concept, or at least that at present they can be known by no reason; or finally that angels receive species from things, through which they understand. For either angels have from the beginning of their creation proper species of all things which afterwards will be future, or they do not have them. If they do not have them, we must say that an angel does not understand through species, but through his bare intellect, or at least that he receives species from the things themselves. But if from the beginning they have proper species of future things, it follows that futures, before they are, can be known by

an angel by his own power; for an intellect furnished with the species of some object can understand that object not only by another's concept, and after the manner of other things, but even quidditatively and properly. For this reason I said that this argument is difficult only in the opinion of those who think that species of all things, even of future things, were indited in angels from the beginning of their creation. Yet those who embrace the aforesaid opinion strive in various ways to satisfy it.

First, Cajetan answers in the preceding article, with respect to the second, that innate intelligible species in angels are related to future things in the same way as if there were in the eye an innate species of visible color. For just as through it the future color would not be seen, but only the present, so also through the intelligible species of future things an angel does not know them until they are present. And the reason is that between the representing and the represented there is required a real relation of likeness; but such a relation is only between actually existing things: therefore the existence of the object is necessary as a necessary condition in order that the species infused in the angel may be said to represent it; and when the thing exists, without any change in the species itself the representation begins, and therefore it can now be a principle of knowing that thing, because it now begins to represent it.

Since Cajetan plainly holds the same as Ferrara in Contra gentiles, book 2, chapter 96, to the second, and the solution seems to be taken from Giles in the Second Book, distinction 7, question 1, article 1, to the second, where he says that through species infused in the angel from the beginning of his creation future things cannot be known, but present things; because present things, without any change of species, begin to be represented, which before, when they were future, were not represented. St. Thomas also seems to indicate the same in this article in reply to the third, when he says that future things are not known by an angel through innate species, because they do not yet have the nature by which they are made like to the species. But we shall interpret the words of St. Thomas in the right sense.

However, this solution of Cajetan can be impugned in many ways. First, in sense-vision, in which, if there were a visible species of color before the color existed, there would be no less vision than if the color existed and were placed opposite: for as from departing sensibles sensation remains in the sight, as we proved above in disputation 38, chapter 2, from the doctrine of Aristotle, St. Augustine, and from experience, in the same way, before the color were produced, there could be vision, if its proper species in the eye were preserved by God: for what greater reason could there be why, when the color goes away, either by motion or by corruption ceasing, the sensation of it can remain in the eye as if it were present, and yet there cannot be sensation of a future color? Moreover, the same color's receding from sight by motion, or ceasing by its own corruption, can certainly occur; therefore if, when the sensible object departs by motion, the species can remain and, by reason of it, sensation be produced, a species can also remain when the object is corrupted, and likewise sensation be produced. Wherefore the example adduced by Cajetan is of no force. From which it also further appears that the real existence of the object is not necessary in order that it be actually represented. Next, this point is proved thus: the representation of the object is not a relation of likeness which is found between things that differ

generically according to themselves; for the species, which is an accident, represents the substance, and a spiritual species represents a body: what, therefore, hinders that this relation be able to be to a future object, or especially that it be able to be to a past object? otherwise no species could be a principle of knowing a past thing, if there could not be a relation to a past thing; and by the same reasoning there could not be one between past and present. But who will say that past things are not known by an angel? Why then will future things not be known, if angels have their species?

Second, others reply that some change indeed takes place in the species infused in the angel, from the fact that things begin to be present; so that in the species which belonged to a future thing there begins to be some new real mode from the presence of the object, for lack of which formerly it was not a species, so that by it that thing might be known when it was future. Yet this solution is opposed by a manifest reason. For the species of future things, which are said to have been infused in the angel from the beginning of creation, are either truly species of those future things, or they are not. If they are species of future things, it follows that futures are represented by them; but if they are not species of those things until they receive that new mode in time, we say in vain that from the beginning those formless qualities, which are not species, were infused in the angel. And it is much better to assert that the species of things are infused in time, when the things begin to be, than that from the beginning they be granted to him in such a way that it is necessary afterwards at some time for them to be changed by a real mode, in order that they have the true nature of species and be able with the intellect to be a principle of intellection. For what can that quality infused from the beginning serve, if it must, in time, be changed by some real mutation?

Third, others reply that by those species future things are not known as future; but those things which are really future are apprehended by a simple cognition, their existence not being considered; and, as if they were to say, that future thing is apprehended only as possible and according to its essence. This solution they seem to gather for themselves from St. Thomas in this article in the reply to the third, which nevertheless, as I think, he in no wise intended. But the reasoning can be impugned no less efficaciously. First, because those species granted to angels from the beginning of creation are species of future things according to every circumstance of time, place, and cause, so that by the same species they know "to be" at this time and in this place and from this cause, when they are present: if, therefore, they are a principle of knowing present things with all circumstances, no real change having been made in the species themselves, as this solution supposes, why could they not be a principle of knowing these same things with the same circumstances before they were present? For indeed these very things are properly species.

Again, it will be impugned thus. If species of things were indited to an angel, then, in the opinion of all, only species of future things were indited, not of possibles - at least not of those which can be effected by God alone; the angel indeed has from the beginning species infused of those things which will be future, or at least through the species of substances and of causes he can know their operations and their natural possible effects. But of things which can be effected by God alone and are not going to be future he has no species, as all admit; he has only those of things that will actually be future. Therefore they will not rightly say that by those species things are represented only as possible and not as future.

Fourth, others reply in the end, that angels indeed have innate species of things; yet in them things are represented not as future, but as possible. I say, even if this were true with respect to their own operations and the possibles of second causes, nevertheless it is not true of those things which God alone effects - such as the creation of souls - and likewise of men. For although man is generated by a second cause, yet it is plain that the rational soul, which depends upon God alone, is from Him; therefore an angel cannot know men as merely possible to be made by God, so as to know that that thing will be future: rather, as to such things he either knows them as present, or as past, or not at all as future by such species.

Caput IV - The true solution of the foregoing argument

But, that the foregoing argument may be satisfactorily resolved, two points must be noted. One is that the intelligible species is a likeness and representation of the object, not because it makes the thing actually known (for this is proper to the expressed species, which is the word and expressed species), but because the object is said to be represented in an intelligible species for this reason, that the species is the principle for eliciting an intellection or cognition, which is the expressed species of the future cognition, and a likeness to the act of the object. For this reason the intelligible species is said to represent the object habitually, that is, in first act.

The second point to be noted is that, just as in natural agents it does not suffice to have a sufficient principle for acting unless one also have the matter and an object duly disposed, wherein the operation be received and with which the efficient cause cooperate; so also in cognitive powers, besides the indited faculty and the species, which constitute the power complete in first act for operating, there is required a proper and natural object about which it may be able to operate. For sight does not operate around sound by an impressed species, nor hearing around color; hence there is of necessity required some real presence of the proper object, in order that cognition may be elicited about it: for the intellect cannot, in first act for operating, elicit its act without the presence of the object - indeed, it could not even, regarding itself, if the impressed species were preserved without that presence, as we observed a little above about sense. But I say that, besides the species, a certain and determinate object is necessary, about which the operation of the knowing faculty is terminated, in order that the act of cognition be elicited.

Since therefore future contingents do not fall within the range of the natural object of the angelic intellect, as we proved above, it follows that, so long as a thing is future, it cannot be known by an angel, even if he had the intelligible species of it; for that species is not an actual and expressed representation of the future thing, but only a habitual one, and, as it were, in first act for eliciting the expression; and since the future, as future, is not an object.

But the natural object of this species is not the future as future, but the same thing only insofar as it is past or present; it follows that, at the time when the thing is still future, by that species it is not represented except habitually: that is, that species is not a principle for eliciting cognition of that thing as future, but only as present or past. And this happens without any variation in the species itself, solely from this, that when compared with this thing it has that thing as its proper

object; whereas, compared with another thing, it does not regard that other as its proper object, and therefore it can be the principle for eliciting cognition of one thing and not of another; for the principle of cognition operates about a certain and determinate thing, which it has as its proper object. The difficulty of the proposed argument would have force, if the impressed intelligible species (species intelligibilis) represented the object in such a way that in it the intellect, as in a mirror, understood the thing, as some are pleased to say; but this I judge to be false. For the intellect is not converted to the species as to a mirror, in order that in it it may gaze upon the object - since such a conversion can scarcely be explained - but the intellect, instructed by the impressed species and, as it were, in first act, elicits the cognition of that object of which that is said to be the species. In the same way, even if we were to say that the angel understands created things without any species of them, by the native power of the intellect alone, one would still have to philosophize concerning the cognition of future things: for since knowing faculties do not operate except about their proper object, and future contingents are not the object of the intellect considered according to its proper power, it follows that they can never be known by it except by a special revelation. And hence is solved the difficulty proposed in Disputation 199, cap. 3 - namely, why the angel does not know future things if he does not need species for understanding, but understands them by the native power of the intellect alone. It is answered that the intellect alone can operate about its proper object; but future things, of themselves, are not the proper and natural object of the intellect, as has been proved.

In this sense we could interpret certain dicta of the Scholastics. First, that of Capreolus in the Second Book, distinction 3, question 2, article 3, ad primum Gregorii, against the third conclusion, near the end of the reply, where he says that future things are therefore not known by angels, not because angels receive cognition from things (he understands: after the mode of an efficient cause), but because the future things themselves are not capable of cognition, nor are they subjected to it; and so it would be clear that they are therefore not known, because they are not objects accommodated to the angelic intellect.[1555] In the same way St. Thomas seems to have spoken in this article in the third reply, when he said that the angel's species are indeed equally disposed toward present, past, and future things; yet the future and the past are not compared to the species in the same mode, because future things, since they are not yet, do not have a nature by which they may be assimilated to the species - as if he were saying: they are not yet suitable objects such that by those species they can be understood, although the species of themselves are of those things which are so future as the past and present can be. This is what the Holy Doctor seems to signify when he says that the species are equally related to present, past, and future. And if Hervaeus, when in a certain opinion which he judges more probable he says that future things are not understood by the species infused into the angel from the beginning, because the future things themselves do not determine the species, wished to teach only this, his doctrine is true. But if he wished to teach what the Doctors alleged in the preceding chapter said in the second mode of replying, his opinion must be impugned in the same way as their reply.

1555. Capreolus, in II, distinctione 3, quaestione 2, articulo 3, ad primum Gregorii, contra tertiam conclusionem, circa finem solutionis.

Objicitur: Someone will object: If God were to infuse into the eye the species of a future color, there would result a vision of it as if it were present, just as we said a little before, that when sensibles withdraw, sensations sometimes remain in the organs of the senses; therefore, in the same way, if the intellect of an angel had the species of a thing which is future, he would not only know it as present and as past when it is truly present and past, but also as future.

Respondeo: I answer that the notion of species in the eye and in the intellect is different. For a species in the eye affords only the vision of color or light according to itself, as if it were present, without any judgment of present, past, or future; but an intelligible species ought to be the principle of knowing a thing with the judgment of future, present, or past. Now the angel cannot have the judgment of the future; and therefore a species in the intellect of a thing which is truly future cannot serve for the intellection of the future, nor is it, with respect to that, a principle of understanding.

I grant that it would be much easier to answer all difficulties if we were to say that the angel does not understand by species given, but by the bare potency of the intellect; and therefore he does not understand future things, because they are not objects naturally accommodated to the intellect. Nevertheless, even if we defend that the angel is endowed with species from the beginning, to dissolve the difficulties, as above, will not be difficult.
