The first is the division into culpable and penal passions, touched upon by the Doctor (*3.d.20.q.1.E.*). The former arise from defect and sin, as David intimates (*Ps.118.*): "My soul has grown faint in longing for your salvation." The latter are suffered for enduring punishment on account of one's own or another's faults: on account of one's own, as the brothers of Joseph (*Gen.42.*): "We deserve to suffer this, because we sinned against our brother"; on account of another's, as Christ, of whom Isaiah (*53.*) says: "Surely he bore our infirmities, and carried our sorrows."

The second division is into natural and animal passion, adduced and explained by Alexander (*3.p.q.17.m.2.art.2.*) and Durandus (*3.d.15.q.2.n.5.*). Natural passion, taken broadly, can belong to any subject receiving or casting off a form, whether that form is congruent or incongruent with it: thus the moon undergoes passion when it receives light, and fire when cold — which is contrary to its heat — is induced in it. Strictly speaking, however, natural passion is said to occur when the form received in a subject is discordant and contrary to it: thus water receiving heat into itself is properly said to undergo passion, and one who is ill

properly undergoes passion, not one who is being healed. Animal passion is a movement of the sensitive appetite arising from the apprehension of an object that is either uncongenial or congenial — broadly speaking; but strictly speaking it regards an uncongenial object, in which sense one who grieves and is saddened is said more properly to undergo passion than one who rejoices and is delighted. It is in this sense that the passions of Christ and the Martyrs are spoken of and celebrated. Although what has been said has the force of truth, usage has prevailed such that any form or quality received in a subject is called a passion, whether congruent or incongruent with it; and it is in this way that philosophers speak of the passions when they treat and pursue the subject.

The third division, from Augustine (*14.Civit.cap.3.*) and Jerome (*in comm.ad c.1.Ezech.*), is into joy, sorrow, hope, and fear. These four are considered the chief passions — as it were the ends and terminals of all the others — as Aristotle (*2.Eth.T.1.*) notes and Virgil (*6.Aen.*) sings: "Hence they fear and desire, grieve and rejoice." For just as the sea is stirred and agitated by four principal winds, so the heart of man — which is likened to the sea in Isaiah (*57.*): "The heart of the wicked is like a raging sea" — is troubled and tossed by these four passions, to calm and restrain which the four cardinal virtues were devised and given, of which the following book treats. This should be regarded rather as a subdivision of the passions than a primary division, as will be shown in the next partition.

The fourth division is into the concupiscible and irascible — that is, into passions corresponding to the concupiscible and irascible appetite. For just as virtue, as will be said, is divided into intellectual and moral, so nothing prevents the passions from being divided into those that belong to the concupiscible appetite and those accommodated to the irascible. These are then further subdivided into different members and various species. Some hold that there are twelve in total — six pertaining to the concupiscible and an equal number to the irascible. Others enumerate only eleven — assigning six to the concupiscible and five to the irascible, as (*the Conimbricenses, disp.6.q.5.art.2.*) and (*Raconius, disp.3.sect.1.q.2.*) hold, following (*Aureolus, 3.d.5.art.2.q.vn.*).

The sufficiency of these numbers can be established as follows. The concupiscible power or appetite tends, first and simply, toward good. If therefore a good is offered to it and is pleasing, there arises love; if displeasing, there arises hatred, which is contrary to love. If this good is not present to it in act but is absent, yet pleasing, desire arises; if displeasing, aversion arises, contrary to desire. If such a good is welcome to the concupiscible, joy or complacency arises; if unwelcome, pain or sorrow arises, opposed to joy. Further, the irascible tends toward what is punishable and offensive, as the authority of Scotus (*3.d.34.q.vn.¶.Notandum.F.*) teaches — its good is called arduous and difficult to obtain — so that the one who is angered may avenge the injury inflicted upon him by one who impedes or removes the good offered to him. If he hopes to obtain that good, hope arises; if he despairs of obtaining it,

despair arises. If he approaches and assails it in pursuit, boldness arises; if he withdraws and desists from what he had begun, fear arises. If he endures an evil inflicted upon him, that is tolerance; if he bears it with difficulty and resentment, that is intolerance.

If one prefers another way of compiling the said number of the division of the passions, one may proceed as follows. Since a passion, as stated, is a kind of unusual movement, the good proposed for acquisition through such movement is either, as it were, at the starting point — in which case it is love — and is diligently pursued along the way — in which case it is desire — or it is as it were at the terminal point, and there arises joy, or delight and complacency. Or the good is something to be refused, as it were at the starting point, in which case it is hatred; or it is avoided along the way, and aversion is born; or it is at the terminal point, and pain arises. These six passions belong to the concupiscible. The following belong to the irascible. An arduous good to be acquired: if it is at the starting point, it is hope; or if not, it is despair. If one moves toward assailing it, boldness flows forth; if one avoids the assault, fear emerges. If the injury is avenged by the angered person, intolerance emerges; if it is not avenged, tolerance proceeds. From this the number twelve of the mutually opposed passions is clearly established: to love, hatred is opposed; to desire, aversion; to joy, sorrow; to hope, despair; to boldness, fear; and to intolerance, tolerance are passions in mutual conflict.

Those who assign no passion as the contrary of anger number only eleven passions, with whom neither Aristotle (*2.Eth.7. and 4. of the same work, 5. and 1.Magn.Mor.c.21.*) nor Aegidius (*1.de regimine princ.p.3.c.1.*) nor Aureolus (*cited art.4. ad finem*) agree. For to anger, meekness is opposed: just as rest — understood as remaining in place — is opposed to movement, so meekness is opposed to anger, which we call tolerance, and anger, intolerance. For one who is angry seeks and desires vengeance, as the Stagirite (*2.Rhet.*) attests. This is intimated by the Savior (*Matt.5.*): "Blessed are the meek." For the meek, as the Doctor (*cited*) explains, are those who neither give offense, nor resist in evil. Therefore what others call meekness and we call tolerance appears to be named gentleness by Christ. Nor does it avail to argue from Aristotle (*as cited*) that the contrary of anger is emptiness or its cessation and defect, and that cessation, defect, and emptiness constitute a privation of anger, and therefore no real passion is opposed to anger. For by the word "emptiness" is understood a real, positive passion — just as "incorporeal" and "irrational" signify real, positive differentiae through those very negative expressions which designate and stand in for them. Moreover, in the same work (*1.Magn.Mor.c.21.*) the same author calls it meekness.

Against this, one may object, first, that ignorance is numbered among the passions, as is plain in Alexander (*passim cited*); but ignorance is not found in the series of the passions listed above — nor are illness, fever, hunger, thirst, and things of that kind. The number of passions given is therefore insufficient. I

distinguish the major: ignorance is numbered among the passions in the proper sense — this I deny; among passions in the broad sense of the term — this I grant, just as concepts and acts of understanding are called passions, as I observed in Article I near the beginning. To the minor I say that those passions are comprehended under the catalogue of the passions of the concupiscible. Hunger, indeed, is an appetite for what is warm and dry, and thirst is a desire for what is moist and cold, as I showed in (*Book 3. de anima*).

Against this, one may object, second, that pride is a passion of the irascible — which is why irascible animals are proud, as the lion — yet pride is not captured within the number of the passions listed. The partition of the passions is therefore defective and incomplete. I reply that pride is comprehended under boldness, which is a passion of the irascible, just as indignation and jealousy are comprehended under anger, as the Angelic Doctor (*ver. Indignatio*) suggests.

Against this, one may object, third, that a sound division is binary, as is plain (*in the Epitome 1.2.q.7.art.1.*); but the distribution of passions given above is fourfold and twelvefold, and is therefore faulty. I reply, granting the major, that passion taken generally is binary — being divided into that which belongs to the concupiscible and that which belongs to the irascible — and is then further subdivided into the members already enumerated. Or one may say that this is not a rigorous division but rather a kind of enumeration of the passions, just as four principal winds and eight collateral ones are enumerated, or twenty-eight according to those who hold there are thirty-two — of which elsewhere.

Against this, one may object, fourth, that the distinction of passions and acts is drawn from the distinction of their formal objects, as I treated at length in (*1.2. de anima*); but not from the ease or difficulty of obtaining a thing — especially since Plato (*9.de Rep.*) and Galen (*l. quod animi mores sequuntur corporis temperamentum*) assert that the object of the concupiscible is the good pleasant to sense and congruent with the body, and that the object of the irascible need not be arduous, as is clear when the Lord is angered at a servant whom he can punish at his pleasure. The division and distinction of the passions given above is therefore not rightly framed.

I grant the entire argument, together with Scotus and (*Ballus, 3.d.26.q.vn.*), against the Thomists with their leader (*1.2.q.23.art.1. and 4. and q.26.de veritate art.4.*). For although the object of certain passions — especially of the irascible — is called arduous, this is not because arduousness constitutes the formal ratio of that object, but only indicates and makes manifest that the object to be attained is arduous and surrounded by difficulties. (*Gabriel, 3.d.26.q.vn.art.3.dub.1.*) likewise holds that the object of the irascible is called an arduous good because its attainment and execution is arduous and difficult — for example, the will to avenge an injury.

Article III. Whether the Passions Are Acts.

Aureolus (3.d.15.q.vn.), Gregory, and others cited by Capreolus (1.d.1.q.1.) maintain that the passions coincide with acts. Scotus, however, (1.d.19.), together with Antonius Andreas, Lychetus, and the other Scotists (*ibid.*), denies that delight is identified with the act of the will which is fruition, as they also teach of the remaining passions (3.d.26.q.vn. and d.34. and also 4.d.49.q.7.). With them partially agree Ockham (*in 1. loc.cit. and Quol.2.q.17.*), Gabriel (*ibid.*), and Gervase (*Tract.de notitiis, c.de appetitu rationali q.ult.*), who affirm that joy and sorrow are distinguished from acts as something that follows upon them, while holding that the remaining passions — especially those of the sensitive appetite — do not differ from acts.

It is to be noted that act and action are commonly used interchangeably, but the Scotists, together with their prince (1.d.17.q.2.§. *Qui vellet ante N. and 9.Met.in cap.4.T.42.*), distinguish action of the genus of quality from action of the genus of action. The former is identified with the thing done and is the term of a power and its perfection, of which Aristotle (9.Met.T.16.) and Scotus (*ibid. and at length Quol.13.*) treat. The latter is the same as the elicited act, or production, through which the aforementioned perfection is produced, of which Aristotle (*cap.9.Predicam.*) and Scotus (4.d.13.q.1. and elsewhere not rarely) make mention. The present inquiry is whether the passions are elicited acts — that is, actions and productions of things produced — or whether they are the things or qualities produced and done through those acts, and something that follows upon the elicited and productive act: for example, whether delight is an act of the will elicited by the will itself, or whether it supervenes upon an act and follows it, being caused either by the same principle or by the object upon which the will itself vitally tends and in which it takes delight. For a fuller clarification and more exact resolution of this doubt, what I adduced and expressed (*in dub.9.art.2.q.4. 1.2. and in the Tract.de cognoscibilitate Dei, disp.3.q.19.*) and what I recently published (*in 1.1.Epitom.q.4.art.9.*) are relevant.

The first assertion is that the passions are not acts but rather things that follow upon acts. This is the position of the Doctor (*ubi supra*). It is proved, first, from (10.Eth.4.): delight supervenes upon the elicited act not as a habit that inheres in it, but as a culmination arising above it, just as beauty comes to those who are in the flower of their age. And shortly after: "for it follows upon the operation." Chrysostom agrees (*hom.15.*): "One who is angry or envious does not act, but undergoes passion." Second, it seems a contradiction in terms for a passion to be formally an action, since they are correlative terms: one correlative cannot, with respect to the same thing and at the same time, be the other correlative; and things belonging to different predicaments do not coincide. As I said in the Logic, action and passion constitute distinct predicaments; therefore the passions are not formally actions and causally passions. Third, one must philosophize about moral passions in the same way as about intellectual and natural passions — that is, whether both the former and the latter are acts or not. But intellectual passions are not formally acts, as is plain (*from 3.de anima*

T.1.): "To understand is to undergo passion," and understanding is a passion. The same must therefore be affirmed of love and the other moral passions. Fourth, the terminus of a movement is not the movement itself, nor is the way to the terminus the terminus itself; but passions are termini and perfections of the powers, as stated (*in 9.Met.T.16.*). An act, however, is the way to the terminus, as the Doctor astutely considers in his customary manner (*4.d.13.q.1. and Quol.13.*). Furthermore, we are neither praised nor blamed for passions, whereas we are deemed worthy of praise or blame for acts (*2.Eth.5.*). Moreover, the habit of virtue does not cause passion but act; and virtues regard the moderating of passions, not of acts. Therefore passions are not formally acts.

The second assertion is that all passions of both the intellectual and the sensitive appetite are distinguished from acts. The Doctor (*cited*) maintains this against the Nominalists (*cited above*). It is proved, first, by the same reasoning that applies to delight and sorrow as to the remaining passions; but delight and sorrow are passions distinct from acts — this is the Nominalist position; therefore the remaining passions likewise. The major is supported as follows: all passions are qualities and perfections of the appetitive powers, and the delight of the sensitive appetite follows upon its act just as does the delight of the rational appetite; therefore Aristotle (*10.Eth. cited*), speaking absolutely of delight, denies that it is an act or operation, but says it arises from the operation. Second, sensing is undergoing passion, as is plain (*from 2.de anima T.51.*); and likewise understanding is undergoing passion (*from 3.de anima T.10.*). Similarly, desiring, being angry, and the like are undergoing passion, as I inferred from Chrysostom (*cited above*). Since these passions belong to each of the two appetites named, it is evidently established that all passions are distinct from acts. Third, the acts of the sensitive appetite are commanded by the will, whereas the passions are not commanded, since they are natural and not fully subject to its law and authority — for which reason perhaps Paul (*Rom.7.*) says: "I perceive another law in my members, warring against the law of my mind." Fourth, there can be acts without passions — for example, an act of loving without delight: thus the demon loves himself without any delight, for the intense sorrow with which he is afflicted leaves no room for delight. And the blessed man hates sin, yet is so absorbed in glory that there is no place in him for grief over sin itself. Those among the Nominalists who admit this of the rational appetite must concede it of the material appetite as well. For a blessed man, after the day of judgment with his body resumed, can through the sensitive appetite in act avert from evil and harm without pain; and a damned man can through his sensitive appetite desire good without delight. The distinction between acts and passions of each of the two appetites named therefore stands.

Against this, one may object, first, that (*2.Eth.5.*) the Philosopher writes that in the soul there is nothing but power, habit, and passion; yet it is certain, according to the same Philosopher, that there is act and operation in the soul, as

is plain (*from 10.Eth.4.*) where he places happiness in operation, and also (*in 12.Met.T.51.*) and elsewhere frequently. By the name of passions, therefore, he understands acts, and passions and acts are thus the same. I reply that Aristotle is speaking of things that are permanent in the soul, not of those that are transient and quickly pass, such as acts are.

Against this, one may object, second, that the same Aristotle (*ibid.*) appears to call joy, pain, and the other affections and passions enumerated there by the name of acts; indeed they are commonly held to be acts, as is plain from the (*Predicamenta, cap.de qualitate*) and (*3.Eth.12.*): "Pleasure is more voluntary than pain." Passions and acts are therefore not distinguished. The reply is that passions are referred among acts of the genus of quality, not acts of the genus of action. The former are produced, and are the end of production; the latter are elicited and productive, as I made plain in the foregoing observation. To the final text I say that pleasure is voluntary, or free, not formally but prerequisitesly — insofar as the action which pleasure follows is presupposed, as is plain (*from 10.Eth.4.*).

Against this, one may object, third, that the passions are to be moderated and restrained; for this reason virtues are given to compose and repress them, as Aristotle (*just cited*) notes. But what is especially restrained are acts — those in our power — by reason of which we deserve credit or discredit. Therefore acts do not differ from passions. I reply, granting the major, and I distinguish the minor: as that by which — I grant; as that which — I deny. For it is acts by which we restrain passions; but passions are what we hold in check through acts, as their object and the matter with which those same acts are concerned.

Article IV. In What Subject the Passions Reside.

Some hold that the sensitive appetite alone is the subject of all passions, as can be seen in Ockham (*Quol.2.q.18.*) and Piccolomini (*gradu 1.c.9.*) and Gerson (*Tract.in Cant.3.p. principio primo symplafnatis*). But that both appetites — the intellectual and the sensitive — are the capable subject of all passions, the intellectual of spiritual ones and the sensitive of material ones, was maintained by Scotus (*just cited*), Ockham (*ubi supra*), and the disciples of both, who are supported by Augustine (*14.Civit.cap.6.*), Richard, and Aureolus (*named above*).

It is to be noted, first, that the subject of the passions is of one kind as a subject of denomination — which is the animal, for example a human being or a brute — and of another kind as a subject of inherence, which is subdivided into remote and proximate. The remote subject of spiritual passions is the soul; the proximate subject is the concupiscible and irascible of the will. Likewise the remote subject of corporeal passions is some part of the body of the animal — the heart, according to Aristotle, or the liver, according to others. The proximate subject of the same is the concupiscible and irascible of the heart or liver.

It is to be noted, second, and it is to be kept in mind from what was said in (*Book 4. de anima, q.11.art.1.*), that the sensitive appetite is divided into the concupiscible and the irascible. The Doctor (*3.d.34.*) offers a solid basis for this: some things are primarily appetible, toward which the concupiscible appetite tends; others are secondarily appetible, and these pertain to the irascible. As for whether the concupiscible and the irascible are two faculties distinct with respect to their respective appetible objects, or one power that regards those same objects in different modes, see the passage just cited and (*Majoris, 3.d.33.q.2.art.4.*).

The first assertion is that the subject of material passions is the sensitive appetite. The Doctor (*cited*) holds this. It is proved, first, from (*1.Eth.ult.*) and (*1.Magn.Mor.c.9.*), where Aristotle writes that the moral virtues reside in the irrational part, or in the sensitive appetite. But where moral virtues are subjected, there the passions and acts also inhere; and the moral virtues in some manner reside in the sensitive appetite, as Scotus (*3.d.33.q.vn.§.Ad argumenta*) agrees. Further testimonies are found in the writings of Aristotle, notably (*3.Eth.5. and 7. of the same work, T.14.*). Second, intellectual passions reside in the intellect as acts of understanding (*from 3.de anima T.2. and following*); therefore the material passions too reside in the irrational part, as Aristotle (*cited*) says — which part his interpreters attest is the sensitive appetite. Third, a perfection resides in that of which it is the perfection — just as form resides in matter and science in the intellect; but certain passions are perfections of the sensitive appetite, such as delight; therefore those passions named reside in it.

The second assertion is that the rational appetite, or will, is the seat of spiritual passions. The principal patron of this view is Scotus (*ubi supra*), preceded by Augustine (*1.de moribus Ecclesiae, cap.15. and 14.Civit.cap.5.*). It is proved, first, from (*1.Eth.3. and 6. of the same, 2. and 5.cap.1. and 1.Magn.Mor.q.*), where the Stagirite acknowledges there is a rational appetite — namely the will — in which spiritual passions reside. It is remarkable therefore that Gerson (*cited*) and some others should suppose the Philosopher attributed passions to the sensitive appetite alone, since in the passages cited, and elsewhere not rarely, he affirms that the will is a spontaneous and free power, not without its concupiscible and irascible, in which the spiritual passions immediately reside. Second, the will is capable of love, hatred, delight, and sorrow; for it tends toward good and evil — pursuing the one and fleeing the other — as we experience daily. Therefore the will is a fitting subject of those passions. Third, the soul separated from the body, if blessed, rejoices in the eternal reward; if wretched, grieves at the punishment of hell. But joy and sorrow are passions of the soul, not of the sensitive appetite — which, being separated from the body, is absent — therefore they are passions of the intellectual appetite, which is the will. The remaining matters, regarding the subject of the virtues, will be treated in the following book.

Against this, one may object, first, that Gregory of Nyssa (*de hominis opificio*, c.18.) removes passions from man as man, and holds that only those passions belong to him which are common to brutes; but what is participated in by both man and brutes is the exclusive property of the sensitive appetite. Therefore the adequate subject of the passions is the sensitive appetite. I reply that Nyssa is not speaking absolutely of man, but of man given over to reprobate sense and entirely indulging in pleasure — as is plainly clear from his words in that place. Sometimes reason itself becomes so brutalized that, overcome by affection toward the brute part, it overwhelms by the force of the inferior what is most excellent in man.

Against this, one may object, second, that passion, taken generically, is an agitation and disturbance of the animal — as its very name indicates; but disturbance belongs only to the sensitive appetite, as is plain from anger, which is defined as a rising of blood about the heart, from shame, which causes a blush in the face, and from fear, which causes pallor in that same face. I grant the major and deny the minor. For beyond corporeal and sensitive agitation, there is also spiritual and rational agitation. The instances adduced are valid only of material passions, as is clear to anyone who runs through them.

Article V. Whether Passions Fall Upon the Wise Man.

The Stoics steadfastly maintain that the wise man succumbs to no passion — as the common run of historians and philosophers attest; but the Platonists and Peripatetics oppose this with one voice and one accord, teaching that the wise man is not wholly immune and removed from passions.

It is to be noted, first, that passions can be viewed in two ways. One way is precisely as movements of the sensitive appetite — in which mode they acquire no moral goodness or badness, only transcendental and entitative goodness, as is plain from the passions of brutes, which also belong to man, as Gregory of Nyssa (*ubi supra*) agrees. The other way is insofar as they are subject to the command of the will and to the right dictate of reason — in which mode they participate in moral goodness or badness, not intrinsic but extrinsic, depending, that is, upon the will and reason, as Augustine plainly sets forth (*14.Civit.cap.8.*): "The good and the evil desire, fear, rejoice, and grieve — but the former well, the latter ill, just as men's will is right or perverse." The Doctor likewise (*1.d.17.q.2. §. Quantum ad istum art. and Quol.18. §. De primo*).

It is to be noted, second, that some suppose this impassibility — which the Greeks call *apatheia* — to be what is at issue.

The assertion is that the wise man is not wholly free from passions. This is deduced from the Doctor (*3.d.15.q.vn. §. Quantum ad 2.sub H.*): Christ the Lord, most holy and most wise of all, was moved by passions. (*John 2.*): "He made as it were a scourge of cords and drove out those who were buying and selling from the temple." And (*11.*): "He groaned in spirit and troubled himself." And then:

"Jesus wept." And (*Matt.26.*): "My soul is sorrowful even unto death." Add (*Isa.53.*): "Surely he bore our infirmities, and carried our sorrows." Second, Jerome (*Dial.2.adversus Pelag.*) and Augustine (*14.Civit.cap.8. and 9. and Tract.60.in Ioan.*) say: let the arguments of the philosophers perish who deny that disturbances of soul fall upon the wise man. Third, where there is the principle and cause of passions, there the passions reside — as is plain from the intellect, which is the principle and subject of intellectual acts. But in the wise man the principle and cause of passions is found — namely the will, the sensitive appetite, and the irascible and concupiscible of each — to which there are frequently and almost always offered and set before them objects both congenial and uncongenial, which cause passions. Hence Stobaeus (*serm.1.*): "So too it is necessary that a man be imbued with joy and grief and all the remaining affections." The wise man is therefore not free from passions. Fourth, where the moral virtues shine, there the passions are found; but in the wise man the moral virtues shine, since they are his bright mirror — therefore passions are also in him. The major is plain: for the virtues tend to curb and restrain the passions. Hence St. Basil (*homil.10.*) says particularly of anger: "If by chance anger come to mind or fall upon it, let us hold it in check as a horse in harness, obedient to us through reason as through a bridle, not exceeding its proper order and entering upon the path directed by the right counsel of the mind." And Chrysostom (*hom.30.ad populum*): "Anger is a shameless dog, but let it learn to hear the law." All the more so since these affections take their origin from God, as Lactantius (*lib.6.cap.15.*) attests: "He instilled in man these emotions so that he might be capable of virtue — just as the earth is capable of cultivation — and he set the material of the vices within the affections of virtue." And Damascus (*orat.de duabus Christi voluntatibus*): "Desire was given to man by the gift of God, that we might obey God and his commandments; and anger, that we might resist the Devil and sin and confirm desire." Add the passions of Christ and the Martyrs, which are praiseworthy and meritorious — for which reason St. Peter (*1 Ep.cap.4.*) says: "Arm yourselves with the same thought as Christ, who suffered." The controversy between the Stoics and the other philosophers named is one more of name than of substance, as Epictetus (*apud Arrianum, lib.2.c.26.*), Seneca (*in consol.ad Helviam, cap.16. and Epist.9. and ad Polyb.cap.37.*) intimate, as Augustine (*9.Civit.cap.4.*) touches upon and as Cicero (*libro de finibus*) indicates. They resolve and settle it by this distinction: if one is speaking of vehement and inflamed passions that cast a man down from right reason and drive him toward vice, the Stoics maintain that the wise man is immune from such passions. But if one speaks of the remaining passions proceeding from the sensitive appetite that are regulated by right judgment and held in check by a sound will, the same philosophers hold that the wise man is not alien to these.

Whatever may be the case with this peace and concord — to which perhaps the said authors would not wish to come, since real philosophers usually contend not merely over words and intend more by their arguments and foundations,

seeking to impose the view that a man stripped of all such affections would be like a trunk or a Phidian statue, as someone excellently argues against the Stoics — and as Jerome (*epist.ad Ctesiphontem*) says: "A man who is unperturbed is either a stone or a God." And Augustine (*14.Civit.cap.8.*): "If any have so far advanced in that vainer and rarer vanity as to find in themselves no movement of mind, being stirred and excited by nothing, bent and inclined by nothing, they have lost all humanity rather than attained true tranquility."

Against this, one may object, first, that the wise man is healthy, while one imbued with passion is sick, as Chrysostom (*in Psalm.4.*) touches upon; therefore the wise man is abstracted and withdrawn from passions. I distinguish the first part of the antecedent: the wise man is healthy and free from turbulent passions contrary to right reason — this I grant; free from passions that are held in check and compressed and regulated according to right reason and the will — this I deny.

Against this, one may object, second, that what leads to sin is evil, from which the wise man recoils; but passions incite and impel to sin, as is plain (*from Rom.7.*) where the passions of sins are spoken of; therefore the wise man is alien from passions. I grant the major and distinguish the minor as I was saying a moment ago: of vehement passions that do not moderate the impulse of the soul — I grant; of passions directed by right reason and the will — I deny.

Against this, one may object, third, that what is not in our power brings us neither praise nor blame, since in matters of nature we neither merit nor demerit. For this reason the Doctor (*4.Rep.d.49.q.2.§.Dico.*) writes: "By passions alone we do not merit." But passions are not in our hand, as Augustine (*14.Civit.cap.9.*) implies; therefore passions do not prevail in the wise man. I grant the major. I distinguish the minor: of preceding passions that impede the use of reason — called surreptitious passions — I grant; of passions regulated by right reason and the will — I deny. Augustine is to be explained in this way where he says (*ibid.cap.16.*): "A certain vehement sensible delight impedes the use of reason, than which there is no greater in bodily pleasures, so that in the very moment when its extreme is reached, almost the entire keenness and, as it were, the wakefulness of thought is overwhelmed." And Aristotle (*7.Eth.9.*): "This delight robs the intellect of the wisest man." For this reason Scotus (*loc.cit.*) adds: "If the intellect of the Martyrs exposed to the greatest torments retained the use of reason, this happened by the special grace of the Creator."

Article VI. What Are the Causes of the Proneness to Passions.

It is well known to us and confirmed by experience that the young and the old are more prone and inclined to passions and to discrepant manners — as Aristotle (*2.Rhet.c.12. and following*) writes. And among those of the same age some are more prompt to anger, others slower; some more eager for joy, others for sorrow; and there are those who live in perpetual fear and those whom no

dread or panic seizes — as Aristotle rightly sets forth (*1.de anima T.4. and 2.de partibus c.4.*). And the wise man touches upon this (*Prov.27.*) according to the Greek translation: "As faces are not alike to faces, so neither are the hearts of men." It is therefore plainly evident that in human beings there is a proneness and diversity of passions. In investigating their causes, however, there appears to be no small obscurity and difficulty — in which Gerson (*Tract.de passionibus*) and others cited by the more recent writers are extensive. I will select the more important ones and briefly treat them, first noting that passions properly belong not to the soul nor to the body but to the whole composite — as Scotus (*4.d.49.q.7. ante §.Respondeo*) teaches, following (*Aristotle, 1.de anima T.64.*): "To say the soul is angry is like saying the soul weaves or builds. It is perhaps better not to say that the soul pities or learns or thinks, but that the man does so with his soul." Man therefore, according to the Philosopher and the Subtle Doctor, is the cause of the passions that are received in him; but he is not the only cause, and so other causes must also be examined. To do this aptly and conveniently, I divide the cause into intrinsic and extrinsic, and into natural and moral.

The extrinsic cause is manifold — for example, the heavens, the stars and their influences, the air, the region, and things of that kind. The intrinsic cause can be multiplied according to the multiplicity of temperament: one of choleric temperament is quickly moved, grows angry, and boils up; one possessed of a sanguine complexion is prone to joy and kindness; one constituted of phlegmatic temperament is timid and pusillanimous; and one endowed with melancholic temperament inclines toward sadness and ill will. Add to these the quantity, shape, and position of the heart. Those who are possessed of a large heart are timid — like hares — because a force spread out is weaker than one concentrated; while those who have a small heart are spirited and bold, because the vital spirits in a small heart are united and concentrated, and so strengthen the heart more. Milk, food and drink are not to be passed over, nor the habituation of acting: one who is often angry becomes prone to anger, and one who frequently grieves becomes inclined to sorrow. These are approximately the principal natural causes of the passions. The moral causes are exhortation, conversation, education, example, and things of that kind, which are found in abundance among the philosophers and historians.

Article VII. What Is the Order Among the Passions.

A twofold order may be investigated among the passions: the order of nature or generation, and the order of dignity. Likewise there may be a dispute about each of these orders — both among the passions of the concupiscible and the irascible, and also among the individual passions of each of these two powers.

The first assertion is that in the order of nature or generation the passions of the concupiscible precede those of the irascible. Scotus indicates this (*3.d.26.q.1.§.Alio modo. and d.34.q.1.§.Ad istam quest.*), and Richard expressly holds it (*d.26.q.3.*). It is proved, first, by the fact that those passions precede others in

nature whose objects are prior in nature — since the natural priority of passions, like the priority and distinction of powers, is derived from their objects, as is plain (*from 2.anima T.33.*). But the objects of the passions of the concupiscible precede those of the irascible: the former are goods simply and primarily congruent or incongruent, the latter are goods secondarily and in a restricted sense — as is plain from what has been said above and will be more fully clear when the subject of the moral virtues is treated. Natural priority therefore belongs to the passions of the concupiscible.

Second, what is born or generated before another is prior in nature, as is clear from the description of natural priority in the Postpredicaments; but the concupiscible precedes the irascible in emanating from man, because the irascible is for the sake of the concupiscible and its passions are for the sake of the passions of the concupiscible — as Ballus (*3.d.26.q.vn.*) notes — for if the passions of the concupiscible are impeded, the irascible strives for their attainment: if food is taken from a dog, it grows angry, attacks the one who took it, and, having driven away the thief, enjoys the food. For this reason someone adds that the irascible is the champion and reinforcer of the concupiscible. The concupiscible is therefore prior in nature.

Third, the first passion of the concupiscible precedes in nature the first passion of the irascible, just as the first operation of the intellect precedes the first operation of the will, because — as a thing is with respect to being, so is it with respect to operating — and the being of the intellect is prior to the being of the will, and therefore its operating likewise. The antecedent is plain: for simple love — which is a passion of the concupiscible — is caused before one desires to attain what is loved, as will be made more plain in the next question. The consequence holds by a similar mode of argument as that given (*3.Top.4.*): if the best man is better than the best horse, then man simply is better. If therefore one grants that the first passion of the concupiscible is prior in nature to the first passion of the irascible — which is hope — it must be admitted that the passions of the irascible are in nature inferior to those of the concupiscible.

The second assertion is that the passions of the concupiscible are nobler than those of the irascible. This is deduced from the Doctor (*cited*). It is proved, first: the nobility of a passion, act, and power is derived from the nobility of its object, as stated (*from 2.animae cited*). But the object of the passions of the concupiscible surpasses the object of the passions of the irascible in nobility: the former is the primary good, the latter is secondary; therefore the former are more excellent than the latter. Second, what exists for the sake of another is surpassed in nobility by that for the sake of which it exists (*as is plain from 1.Met.2.*); but the passions of the irascible are ordered toward the passions of the concupiscible, as I was saying in the first assertion. The latter therefore excel the former. Again, the first passion of the concupiscible — which is love — excels the first passion

of the irascible — which is hope — as I will show in the following assertion. Therefore the same must be affirmed of the rest.

The third assertion is that among the passions of the concupiscible love holds the first place. This is deduced from the Doctor (*in loc.cit. and also 4.d.49.q.4.*), who affirms that the will and its act are preferred to all other powers and acts. And in sacred Scripture love is above all commended — hence it is no wonder if the Poet sings: "Love conquers all." Augustine adds (*14.Civit.cap.5.7.8. and 9.*): "Love is the cause of all the other affections of the will." Further, that whose contrary is worse is itself more excellent, as is plain; but opposed to love is hatred, which is worse than sorrow — especially hatred of God, which is in no way to be admitted; therefore love is to be preferred to the remaining passions of the concupiscible. Moreover, the love of friendship perfects man most of all, since it is greatly acceptable to God and all things come about through his grace. Love therefore holds the first place among the passions of the concupiscible.

The fourth assertion is that hope in nature and dignity is placed before the remaining passions of the irascible. The Doctor hints at this (*ubi supra*), and Richard (*cit.art.2.q.1.*) treats and defends it systematically. It is urged, first: that passion excels the remaining passions of the irascible in nature and dignity which is nearest to love — since love is the root and most excellent of all passions, from what was said in the preceding assertion; and hope is of this kind. For it is caused from love through desire or concupiscence of attaining and possessing the good desired; therefore hope holds the citadel among the passions of the irascible. Second, approach toward a good is prior to recession from it — since desire for a good to be obtained is simply prior to recession from it, since the powers absolutely tend toward their object by which they are specified. Since therefore hope regards the good to be acquired and enjoyed, it is soundly inferred that hope holds the first place among the passions of the irascible.

Against this, one may object, first, that what follows another is posterior to it; but delight and sorrow follow upon the passions of the irascible; therefore the passions of the concupiscible — among which delight and sorrow are numbered — are subordinated to the passions of the irascible. The major is known. The minor is supported by the testimony of Aristotle (*2.Eth.3.*), who says that every passion is followed by delight or sorrow — as is plain from anger (*2.Rhet.2.*): "The anger of a man is like honey." I grant the major and distinguish the minor: per se — I deny; per accidens — I grant. For anger does not regard delight or pain but vengeance, because its object is what is punishable or chastisable — as Scotus (§*Ad istam quest.*) attests — and the passage of the Philosopher adduced is thus explained.

Against this, one may object, second, that a cause is prior to its effect (*5.Met.1.*); but hope is the cause of love — hence Augustine writes (*in Ench.cap.3.*): "Love is not without hope." Since therefore hope is a passion of the irascible and love of

the concupiscible, it follows that certain passions of the irascible are placed before certain passions of the concupiscible. I grant the major and deny the minor. To Augustine I say that he is speaking not of love as passion but of perfect elective love, as Richard (*cit.art.1.q.3.ad 2.*) rightly saw.

Against this, one may object, third, that what is prior in generation is posterior in perfection (*9.Met.T.15.*); but love precedes delight in generation; therefore love is subordinated to delight in perfection. The consequence holds: love does not bring rest to one who has it, as delight does — in which one ultimately rests who possesses it; therefore delight excels love. I reply that the major holds of those things that are of the same genus and one of which is essentially ordered to the other — as seed to the generation of man, as the Philosopher exemplifies there — but not of those that are of different genera, as is plain from accident, which is posterior in origin to substance and yet is nobler and more perfect than it, as the Doctor notes (*in 4. passim cited*). To the consequence I distinguish the antecedent: love does not bring rest to one who has it as something desirable for its own sake — I deny; as something consequent and ultimately supervening — I grant, with Aristotle (*10.Eth.c.4.*). And this can be illustrated by the case of the proper and common accident, which, although they follow upon the subject in which they inhere, are nonetheless surpassed by the subject in nobility and perfection.

Article VIII. What Are the Appropriate Remedies for Restraining the Passions.

Since immoderate passions are likened to the heads of the Hydra by Synesius (*orat.de regno*), denoted as Centaurs by Basil (*lib.de vera virginitate*), regarded as beasts by Nyssa (*lib.de hominis opificio cap.18.*), and reckoned as monsters by others — to appease these monsters, to vanquish these beasts, to tame these Centaurs, and to cut off the heads of the Hydra, the meditation upon death and upon the grave is of the greatest assistance. For one who forgets these is easily moved by passions and reduced to their harsh servitude, the misery of which Jeremiah rightly laments (*1.*): "Her filthiness is on her feet; she remembered not her latter end." And beforehand God had warned Adam (*Gen.3.*): "You are dust, and to dust you shall return." And (*Ps.90.*): "How long, Lord, shall the sinners glory? Until a pit is dug for the sinner." Armed with this thought, Leo I repressed the fury of Attila as he advanced on Rome and broke his boldness when he saw death threatening him if he did not obey the said Leo — as the Church records in his life and office. Nor do I omit Xerxes, who, beholding his enormous army and reflecting that within a hundred years not one of them would survive, wept, and restrained his vanity and pride through the meditation on death and the thought of the end of all things.

The remembrance of the presence of God everywhere existing and beholding all things lends force and urgency. For just as — so it is narrated in the life of Alexander — soldiers in his presence feared neither weapons nor enemies, so to

one who thinks upon and keeps in memory the presence of God, the turbulent movements of the passions cease, the great storms of the passions abate, and the raging tempests of the same subside. For then Christ commands the vehement winds of the affections and the troubled sea of the same, and a great tranquility of heart and soul comes to pass. Judith (13.) is a witness, who, adorned and strengthened by the presence of God, bore off the head of Holofernes, and running back victorious to the city said: "Open for me, for God is with us." Hence Augustine adds (*Serm.228.de tempore*): "She went forth secure, with the company of one maidservant, and hurried with sure steps into the enemy camp; she was anxious when she reached what was to be feared, but she was secure, because God was with her." To King Hezekiah ill (*Isa.38.*) perfect health was restored for no other reason than that he had God present in his mind, saying: "Remember how I have walked before you." And the Savior indicates this (*Matt.8.*), who, when asked to heal the servant of the Centurion, wills to be present to him: "I will come and heal him." Therefore one who labors under the poisonous sickness of the affections should think of God as present and assisting, and he will be healed of whatever infirmity of the passions holds him. Remember also that the guardian Angel is present to you, to whom God has given charge over you, to keep you in all your ways. Hence Bernard (*in Ps.90.*) writes: "In whatever lodging, in whatever corner, reverence your Angel; do not dare to do in his presence what you would not dare to do in mine."

I add that the presence of the Angel calmed the wanton movement of Valerian and preserved the virginity of Cecilia, as the chronology of each attests. I do not recount how much the company and example of the good and the bad avails, for (*Ps.17.*): "With the holy you will be holy, and with the innocent you will be innocent." And there is the ancient saying in Pindar: "If you dwell beside one who limps, you too will learn to limp." And Epictetus: "Draw near to Socrates and consider him." I add Christ (*John 13.*): "I have given you an example, that you should do as I have done." And (*Matt.11.*): "Learn from me, for I am meek and humble of heart." Nor do I mention habit, which is called a second nature: if someone has long been given over to his own concupiscences, he recedes from them only with great difficulty — since a habit is hard to move, as Aristotle (*lib.Predicam.cap.de qualitate*) attests. Hence one who is accustomed to play always wants to play, even in his sleep. Therefore the way to the passions must be blocked from the outset, and the commonly known warning must be heeded: resist beginnings.

The external and internal senses must moreover be guarded, for they are, as it were, windows or doors through which the kingdom of the soul is entered, conquered, and destroyed — as Ambrose writes grandly and elegantly (*l.de fuga saeculi cap.1.*): "If you look upon a woman to lust after her, death has entered; if you hear the words of a harlot, death has entered; if lust seizes your senses, death has entered." And the sacred text had previously warned (*Cant.6.*): "Turn away your eyes, for they have made me flee." Therefore if you wish freely and

fully to command your wild affections and to dominate them, and to preserve the kingdom of your soul intact and unharmed, take diligent and vigilant care that your senses — which are your guardians — do not allow evils to enter and goods to be expelled from your said kingdom. For if, with disturbances banished by the senses and the will conformed to the right dictate of reason, you live happily and tranquilly, you may thereafter — with the aid of divine grace — enjoy perpetual peace and eternal rest in the kingdom of God.

Question II. On the Passions in Particular.

Article I. On Love and Hatred.

Augustine sets down in writing (*Epist.52.*) that from good or bad loves, as from two fountains, good or bad morals flow. These moreover are the two loves which, according to the same Augustine (*14.Civit.*), "have built two cities: the city of God, love of God even to contempt of self; and the city of the Devil, love of self even to contempt of God." Of these Scotus treats at length (*2.d.6.q.2. §. In ista quest.*) and Aristotle touches upon them (*2.Magn.mor.c.11.*). We therefore treat first of love and hatred, as the chief affections, investigating their natures, causes, properties, effects, and remedies.

It is to be noted, first, that the words love, dilection, friendship, and charity are sometimes confused and used interchangeably, though there is some distinction among them; they appear to stand in the relation of the more common to the less common. Love is broader and wider than the rest. For every charity is love, but not every love is charity, since charity is generally used for the grace by which man is made acceptable to God. Dilection is the special and singular love of someone — thus John the Evangelist is called the beloved disciple of Christ the Lord above the others. In this sense a certain orator rightly said before Alexander: "One can never say enough of a beloved." Friendship, properly speaking, is the mutual goodwill of certain persons, as Aristotle (*8.Eth.5.*) indicates.

It is to be noted, second, that from Gabriel (*3.d.27.q.vn.*), following Augustine (*14.Civit.cap.7.*), love is divided into natural, animal, and rational. Natural love is a propensity toward something that by its own nature is congruent to it — thus a stone is said to love the place below and fire the place above. Animal love is a passion by which the sensitive appetite, after prior cognition, tends toward a good congruent to it — in which sense a horse is said to love oats and an ox hay. Rational love is a passion by which the will tends toward some good which it pursues, and this is the proper love of the rational and intellectual creature, of which both man and the Angel are capable.

It is to be noted, third, that from the Doctor (*2.d.6.q.2. §. In ista q.A. and 3.d.15.q.vn.*) the famous partition of love into the love of friendship and the love of concupiscence is celebrated. The love of friendship is that by which one loves

something for its own sake — that is, not for the sake of another but for itself; and it is with this love that the saints love God. The love of concupiscence, on the other hand, is that by which one loves something for the sake of another — that is, for the sake of something else; as when someone loves money for the sake of obtaining honors. Furthermore, love is divided into true and venereal: the former is that by which man loves the right and true good, by reason of which he abstains from unjust and illicit pleasures; the latter is that by which man indulges in foul and venereal delights, inflamed and wounded by which he is said to be set ablaze by Cupid — of which Ovid, his teacher, Petrarch, and very many others have written, whose dreams and fictions those who love know better than anyone.

Love can moreover be divided into love as an elicited act — defined (*2.Rhet.4.*) as the will of a good for someone — and love as a virtue, of which the Tyrian (*differt.11.*) and Platina (*Dialogo contra amores*) treat. The definition of the latter is given by Dionysius (*4.de divinis nominibus.*): "Love is a unitive power joining the lover with the thing loved." Augustine seems to hold the same (*8.Trin.cap.10.*): "What is love but a kind of life joining two things together?" Hence Aristotle — according to Diogenes in his life — when asked what a friend is, is said to have replied that he is one soul in two bodies. Sidonius adds (*lib.9.Epist.5.*): "Two souls, one mind." Love is also divided into love as passion — of which we are speaking in the present — whose definition we now adduce.

The assertion is that love is a passion of the appetitive power by which it tends toward a good congruent to it as apprehended by reason or imagination. The Doctor defends this (*2.d.6.q.2.¶.In ista.q.4.*). It is explained before it is proved. Passion is placed as the genus. The appetitive power is added — that is, the sensitive or intellectual appetite. Hence Raconius errs (*sect.2.de passionibus q.3.*) in saying that love is a passion of the sensitive appetite only, since it belongs also to the will — which is a power of intellectual nature. Otherwise neither the rational soul, nor the Angel, nor indeed God would be capable of love, since God is without a sensitive appetite. The remaining terms serve as the differentia. For love tends toward a true or apparent good represented to it by the intellect — if it is the love of the will and spiritual love — or proposed by the imagination — if it is the love of the sensitive and material appetite.

The assertion as thus explained is easy to prove by the common medium: that definition is apt and fitting which participates in genus and differentia, as is plain from what has been said — and the definition of love given above is of this kind. I add that it contains nothing deficient or superfluous, and possesses all the laws of a sound definition; it is therefore the genuine and legitimate definition.

Against this, one may object, first, that it is commonly said that fire is cast into the thing loved by which the lover is inflamed and burns, and that the god of love Cupid is said to have a bow and quiver with which he wounds the lover. But these and similar things are adapted only to the sensitive appetite; therefore

love is a passion of the sensitive appetite alone. The reply is that all these things have no place in spiritual love — such as the love of the will — but only in material and venereal love, as Zeno (*libro de fide, spe, et charitate*) shows admirably and elegantly: "There is another love, truly contrary to our salvation, to which it is right that the form of a man be attributed, because it is recognized as temporal and fragile. Hence it is depicted with the features of a child, because its wanton licentiousness is not tempered even by the years of old age. Hence it is naked, because its will is shamelessness. Hence it is winged, because it rushes swiftly toward whatever it has conceived. Hence it is equipped with darts and torches, because unlawful arms are always joined to unlawful trees. Hence it is blind, because when it is inflamed it considers neither age nor beauty nor sex nor rank nor even that most sacred affection of piety."

Against this, one may object, second, that love is an act of the will, and therefore is not a passion. The antecedent is Aristotle's (*2.Rhet.4.*), who says: "Love is the willing of good for someone"; but willing is an action, not a passion, as is plain — therefore love is wrongly defined as a passion of the appetitive power. I distinguish the antecedent: if love is taken for the elicited act of willing — I grant; if it is taken for the complacency of the will following upon that very elicited act of the will, as it is taken in the present — I deny.

One may ask, first, how many causes of love there are. I reply that there are principally five. The first is the good that shines forth in the beloved object, by reason of which the lover is enticed and invited to pursue it with love. Hence Augustine (*8.Trin.cap.3. and 4.*) adds: "Nothing is loved unless it is good." The second is the beautiful, at whose sight and contemplation the lover is captivated — as someone sings: "As I saw, I perished." In this way Eve in (*Gen.2.*) was captivated beholding the tree of life, beautiful to sight and delightful to look upon. The third is cognition of the lovable object — which is not a cause that flows into love, but a cause *sine qua non*, or presuppositive, since for love to arise the cognition of the lovable object is presupposed, because love does not tend toward what is unknown, according to the adage: "It must first be known before it can be loved" — though the intellect contributes nothing to the will, as the Doctor (*2.d.25.q.1. §.Alia est.*) maintains. The fourth is resemblance among those who love, and also sympathy — Aristotle affirming (*1.Magn.Mor.c.18.*): "Like things rejoice in like things, and man is most delightful to man." But if it happens that like hates like — according to the saying that one potter hates another — this is *per accidens*, insofar as one impedes the other in gaining more. The fifth cause of love is being loved, according to the saying: "If you wish to be loved, love." For we think that one by whom we are loved is good; for that reason we are prompt to love him. Ambrose agrees (*2.off.cap.7.*): "For the increase of common charity it is of great profit if one returns affection to those who love him, and proves himself no less in returning love than he is loved." Again, we love more what we have obtained with greater effort and toil: thus mothers love their offspring more ardently than fathers, because they have expended more

labor in begetting and raising them. Similarly, parsimony is keener in the old than in the young, because the old have sweated far more in acquiring things, which an heir sometimes treats as trivial and squanders and dissipates, reducing himself to poverty.

One may ask, second, how many effects of love there are. I reply that they are as many as its principal causes. The first is the union of the lover with the beloved object. Hence Dionysius (*4.de divinis nominibus*) says: "The soul is more where it loves than where it animates." And the lover is said to be transformed into the thing loved. Hence Augustine adds (*4.conf.cap.4.*): "If you love the earth, you are earth." And Paul had previously warned (*1.Cor.6.*): "One who cleaves to a harlot becomes one body with her." And the celebrated saying (*2.Magn.Mor.c.18.*): "A friend is another self." And (*9.Eth.9.*): "One soul and all things in common among friends." The second effect is that love makes the beloved present everywhere and thinks of it always. Hence Chrysostom preaches (*hom.86.in Ioan.c.10.*): "So great is love that we seem to see every day not only those who are present but even those whom we love when absent; for the great force of love neglects all things in order to win the soul of the beloved." The third is ecstasy. For the lover is carried away into the beloved object. Hence Dionysius (*just cited*) writes that God suffered ecstasy on account of love for man when he became man — as is plain (*John 1.*): "The Word was made flesh." For the impassible became passible, the immortal mortal, and God a creature — as St. Bonaventure learnedly and eloquently sets forth (*in Comm.Luc.4.*). The fourth is zeal — which is the great ardor of love by which one expels from the beloved whatever might impede him from possessing and enjoying it. Thus Christ was zealous for the honor of the Father and of the Church (*Ps.68.*): "Zeal for your house has consumed me." The fifth is infirmity, by which the lover is weakened in the beloved object, having and wishing nothing in mind but it, so that he is deprived of food and drink and the other necessities of life, flees not what is harmful, avoids not dangers, and shuns not evils — for which reason Zeno (*just cited*) writes elegantly and learnedly: "This one set Eve's breast on fire with his torches. This one slew Adam with his darts. This one attempted either to subject Susanna to the monstrous fires of two elders, or to slit her throat with a parricidal sword. He importuned Joseph to be violent to a woman, whom, even when he stripped him, he did not find unchaste. This one overcame the Synagogue when he granted her his arms. Turbulent everywhere, frenzied everywhere: he promises, gives, takes away — now sad, now cheerful, now humble, now proud, now drunk, now fasting, now accuser, now accused. He jests, plays, grows pale, wastes away, sighs, hides, serves, or tempts, or deceives, and flatters more sweetly than he rages."

One may ask, third, how many remedies for love there are. I reply that they can be comprised under five headings. The first: the eyes — which, as the master of love attests, "are in love the leaders" — must be guarded and restrained, lest they see frequently vain and lovable objects that can induce the lover to love them.

Hence David (*Ps.118.*) sings: "Turn away my eyes lest they see vanity." And (*Cant.6.*): "Turn away your eyes, for they have made me flee." And Ambrose confirms this (*lib.de fuga saeculi, cap.1.*): "Death has entered through a window. Your window is your eye. If you look upon a woman to lust after her, death has entered." The second is a long and distant absence from the beloved object. For love is like fire, as is plain (*Job 31.*): "It is a fire that devours even to perdition." If one draws near to fire, he grows warm or is burned; if he stands far from it, he suffers neither warming nor burning. So one who is near to the thing loved is burned — as a certain madman used to say: "I am made of wax and I return to the fire." But one who is far from the fire is immune from burning. Love of this kind is overcome not by persisting but by fleeing. The third is sobriety and frugality in food and drink — especially wine, in excess of which there is licentiousness. Hence the frequently chanted saying: "Without Bacchus and Ceres, Venus grows cold." The fourth is continual occupation and assiduous labor in serious and honorable matters. Hence the celebrated saying: "Remove idleness and Cupid's bow is broken." The fifth is that vain talk and excessive familiarity must be avoided. "For evil communications corrupt good morals" (*1.Cor.15.*). Finally a new love must be found — namely the divine and heavenly love, inflamed by which a man abhors earthly love, destined to enjoy eternal blessedness. It would remain to treat of hatred — the opposite of love — but since from what has been said about love it is plain what must be said of hatred, since the same reasoning and knowledge holds of opposites, I therefore pass over it.

Article II. On Desire and Aversion.

Desire, libido, and cupidity are sometimes confused among authors — Augustine (*cap.15.*), Aristotle (*1.Rhet.cap.11.*), and Plutarch (*8.de Reportat.*) using them interchangeably — though some note a certain distinction among them which, being of little moment, I willingly omit. I observe, however, that desire is taken in three ways.

First, for the natural inclination of each thing — thus a stone is said to desire the center and matter to desire form. Second, for the act of willing and enjoying — in which sense (*1.Pet.1.*) reads of the Angels: "into which the Angels desire to look." Third, for the movement of the appetitive power regarding an absent good — and it is desire understood in this third way that is our present subject, which by the authors cited above is principally divided into common or natural desire — belonging to the sensitive appetite, such as the desire to eat and drink — and rational desire — belonging to the will, such as the desire to see God and to enjoy him. Further, into good desire — of which (*Ps.118.*): "My soul has yearned to desire your justifications at all times" — and bad desire, of which (*Prov.21.*): "The soul of the wicked desires evil."

Desire is described as a passion of the appetitive power regarding an absent good. Passion is placed as the genus. The appetitive power — that is, the will or

the sensitive appetite — is added: for both powers are capable of desire. An absent good is subjoined, so as to differentiate it from delight and joy, which regard a good that is present, attained, and possessed. According to the twofold desire of the sensitive and intellectual appetite there is likewise a twofold capacity: the capacity of the former is finite, because it follows sense — of which it is the appetite — and since sense is finite and bound to a singular object, desire too is limited, though it can in some sense be called infinite, because it reaches to singulars which, being innumerable, are therefore called infinite — for which reason perhaps Ecclesiastes (1.) says: "The eye is not filled with seeing, nor the ear with hearing." The capacity of the latter, however, is infinite, as (1.Pol.6.) says — which Philo (*libro decal.*) compares to the thirst of Tantalus: the reason is that it follows reason, which is not satisfied with finite things. Hence it is that since finite things cannot fill its desire, having attained one thing it does not rest but desires another; and having attained that, it then desires yet another, and so on to infinity. Therefore only the infinite good can be sufficient and more than sufficient for it — as Maximus Tyrius (*differt.19.*) maintains. And the Psalmist announces (Ps.16.): "I shall be satisfied when your glory appears."

From good or bad desire, as from a twofold fountain, all good or evil proceeds, as is plain from the sacred text. The mention of good desire is made (Ps.102.): "He will fill your desire with good things." And (Ps.10.): "You have given him the desire of his soul." Of bad desire (Ps.111.): "The desire of the wicked will perish." And (James 4.): "From where come wars and quarrels among you? Are they not from your concupiscences?" And Christ the Lord indicates both (Matt.7.): "A good tree produces good fruit, and a bad tree produces bad fruit."

Care must therefore be taken that desire does not transgress the limits of the divine commandments; and if it leaps beyond them, it must be restrained and curbed, since it is in our power to do so — as is touched upon (Gen.4.): "Your appetite will be subject to you, and you will have dominion over it." Do not pursue what is vain and harmful. (2.Tim.2.): "Flee youthful desires" — especially the delights and enticements of the flesh. (Gal.5.): "Walk in the spirit and you will not fulfill the desires of the flesh." Finally, let every desire of ours be fulfilled in God, who is wholly desirable and the end of all goods; and let each one of us say with David (Ps.41.): "As the deer desires the fountains of waters, so does my soul desire you, O God."

Against this, one may object, first, that desire is directed not only toward an absent object but also toward a present object; therefore desire is not aptly described as a passion regarding a future good. The antecedent is urged from (1.Pet.1.): "Into which the Angels desire to look." Scotus (1.Met.q.2.§.Ad secundum) and Antonius Andreas (2.Met.) — preceded by St. Bonaventure (3.d.26. in *expositione lit.*) — considering this text, say that desire also regards a present good, lest satiety arise, as the Gloss explains there, and as Gregory clearly shows (18.Mor.c.39.). I deny the antecedent. To its proof I say that the testimony is to be

taken of desire in the broad sense, not of desire in the strict sense of which we are presently speaking. For strictly taken, desire regards only an absent good — as Augustine attests (*in Ps.118.concione 8.*): "Desire is the concupiscence of absent things."

Against this, one may object, second, that there is a limit to desires; therefore desires do not increase to infinity but, one being removed, another fails. The antecedent is supported by (*Ps.111.*): "The desire of the wicked will perish." I deny the antecedent. To its proof I explain that text as being about the desire to inflict evil upon the blessed — which the wicked wish to execute; for since the saints enjoy eternal glory, the torment of malice will not touch them and they will not fear evil tidings. Hence it is added: "The sinner will see and be angry, he will gnash his teeth and waste away; the desire of the wicked will perish."

Of aversion — the opposite of desire — roughly the same must be said. For it is a passion of the appetitive power regarding an absent evil from which it recoils. It is explained in much the same way as the preceding definition of desire, with only this difference — that aversion regards an evil apprehended by reason or imagination. Nor is it necessary to add the other things that could be said about aversion, both because they are easy and because they can be conveniently understood from its opposite, desire.

Article III. On Joy and Sorrow.

Rainaud (*d.3.Mor.q.2.art.4.*) notes above all others that joy, delight, pleasure, and fruition are received indiscriminately. For this reason what I said of joy in (*Book II, q.4.art.2.dub.9. and Book IV, q.1.art.3. and q.2.art.1.*) must be recalled. For joy taken precisely is a passion of the soul following upon an act enkindled by love, as (*Vorrlong, d.11.art.1.*) attests. And it is described as a passion of the appetitive power regarding an attained and possessed good. By the prior terms joy has in common with the remaining passions; by the posterior terms it differs from the same.

Joy and delight are divided into natural — which follows upon the act of the natural and sensitive appetite, and is common to humans and brutes — and rational — which accompanies the act of the rational appetite, which is the will; and this latter belongs to man and all intellectual beings. It is then further divided into good joy and delight — which concerns licit, honest, and divine things (*Ps.36.*): "Delight in the Lord and he will give you the petitions of your heart," and (*Prov.15.*): "Delight in his love always." Hence Augustine adds (*22.Civit.*): "He himself will be the end of our desires — he who will be seen without end, loved without satiety, praised without weariness. This gesture, this affection, this act will be shared by all, as eternal life is common to all." And Christ invites his disciples to this joy (*Matt.5.*): "Rejoice and be glad, for your reward is great in heaven." And (*John 16.*): "Your joy no one will take from you." Or it regards created things — as (*Judith 16.*): "Joy of victory for three months."

And (2.Cor.2.): "My joy is yours." More clearly (Ps.91.): "You have given me delight, Lord, in your handiwork, and in the works of your hands I will exult." Therefore one who makes good use of created things is affected with delight — especially through the virtues, which wonderfully adorn and perfect man, as Nemeseius (*lib.de homine cap.18.*) learnedly sets forth.

Joy and delight are caused by an object that is a congruent and pleasant good to the appetitive power — cognition or knowledge of reason having preceded — as the Doctor (*1.d.1.q.3. and 3.d.15.q.vn. §. Aliter*) maintains, against Ockham (*1.d.1.q.3.*). It is urged, first, from (*10.Eth.cap.4.*) and (*1.Rhet.*): what is delightful is the cause of delight, and from the opposite what is sad is the cause of sadness. Second, when the appetitive power is not operating, if a beautiful and pleasant object is presented to it, delight is produced in it — as is plain from Eve, who in (*Gen.3.*) was captivated and delighted in beholding the tree of life, which was beautiful to sight and delightful to look upon. And this holds also of surreptitious delights, to which the will does not effectively concur; and also of vehement sensible delight, which impedes the use of reason, as Augustine (*14.Civit.cap.16.*) and the Stagirite (*7.Eth.9.*) attest. Third, sorrow is not caused by the will, because it befalls the will against its wish, as Augustine (*just cited, cap.15.*) notes. Therefore the same must be affirmed of delight. Furthermore, delight is either produced by the willing appetite or by the delightful object: if the former, then the appetitive power can always rejoice when it pleases, which is contrary to truth and experience; if the latter, the intended conclusion is had. It is therefore steadfastly to be maintained that joy and delight are produced by the object. Moreover, greater delight and more intense joy are generated by an object that is more pleasant and delightful and more difficult to obtain — as Augustine (*lib.contra mendacium, cap.10.*) and Seneca (*lib.5.de benef.cap.12.*) agree. This surely shows that delight is produced by the object; otherwise it would not be apparent why greater or lesser delight should be caused from this rather than from that object, since the appetitive power is equally disposed and prompt to receive delight from whatever delightful object is offered and presented to it.

The effects of joy and delight are numerous, significant, and great. For joy stirs laughter, expands the heart, preserves health, dispels anxiety, puts sadness to flight, removes anguish, and performs nearly all other excellent works. Hence Philo (*lib.de agricult.*) writes: "The common run of men, traversing various regions all the way to the ends of the earth, crossing the sea too and penetrating its inlets, leaving no part of this universe unsearched, always and everywhere gather those things that conduce to the heaping up of pleasure." And this is no wonder, since both the brute and man by the guidance of nature tend toward delight — as Aristotle (*7.Eth.c.13.*) teaches — without which all things would languish, rot in idleness, and cease to be, as the same Aristotle (*just cited, cap.1.*) suggests and Tyrius (*differt.33.n.190.*) confirms.

In the capture of joys and delights, however, a due measure must be kept and the appetite rightly restrained, lest it transgress its proper bounds and the just laws of God. Above all, the delights and immoderate, unrestrained pleasures of created things are to be avoided. For this reason Chrysostom (*homil.12. ad Timot.1.*) excellently says: "God created bread — its immoderate use is prohibited; and God created wine likewise, and prohibited its immoderate use. He therefore does not bid us shun delights as something unclean, but so that if any measure is abandoned they may dissolve the vigor of the soul." Then they are to be thought upon and weighed as unstable, vain, and quickly passing goods — as the Preacher testifies (*Eccles.cap.1.*): "I saw all the things that are done under the sun, and behold, all is vanity and affliction of spirit." For those who indulge in them too much openly confess afterward — though reluctantly — that they were overwhelmed by the darkness of error and ignorance, as the same Ecclesiastes writes (*Sap.5.*): "We therefore erred from the way of truth; the light of justice did not shine upon us, and the sun of understanding did not rise for us." Hence Nyssa aptly warns (*orat.de pauperibus amandis*): "Let not pleasures so overwhelm you that you fling yourself about in excessive joy and run riot in mad delights." I add that sorrow cleaves to pleasure and mourning is mingled with delight — as the Tyrian (*differt.31. and 32.*) and Basil (*homil.de paradiso*) declare beautifully: "What is pleasant to you, O men, is mingled with sadness." Therefore these sublunary and earthly pleasures are to be cast aside and heavenly and divine ones pursued, so that having attained these we may always rejoice in the Lord and delight in him. The Savior intimates this (*Luke 10.*) to his Apostles who were glorying and saying: "Even the demons are subject to us." He replies: "Rejoice rather because your names are written in heaven." And David had prefaced (*Ps.103.*): "But I will delight in the Lord." And Habakkuk (3.): "I will exult in the God, my Jesus."

Against this, one may object — against what was asserted above, that delight is caused by a pleasant and delightful object — that every positive cause causing a real positive effect must exist, as is plain (*from 2.Phys.T.38.*): "A cause in act has its effect in act"; but sometimes the object does not exist, and sometimes it is impossible — such as the equality with God which the Demon desired and in which he took delight: now what does not exist or is impossible cannot cause a real positive effect, such as delight. Therefore delight is not produced by the object.

This is confirmed, first: if the position of Scotus were true, delight would be produced in any passive subject by the object that causes it in it — which is absurd, since delight inheres in no other subject than the sensitive or intellectual appetite. It is confirmed, second: someone sometimes takes delight in a scientific act, whether speculative or practical; therefore delight is caused by the act, not by the object.

I reply, granting the major and distinguishing the minor: sometimes the object does not exist from the part of reality — I grant; the object does not exist in apprehension or reason — I deny, as is plain from science, which is caused in part by the object, even though the object has no existence outside reason or imagination. For a science of the rose is had in the intellect even when the rose does not exist in the nature of things, as I clearly showed (*in Log. book I, q.2. and book V, q.4.art.5. and in Phys. book de causis, q.5.art.2.*). To the first confirmation I distinguish the antecedent: in a fit and capable subject — I grant; in an unfit and incapable subject — I deny. Beyond the two appetites named, there is no other power properly capable of delight, since delight presupposes cognition and love, of which only each appetite is capable. To the second confirmation I distinguish the antecedent: immediately — I deny; mediately — I grant. For cognition and love are presupposed, and upon them delight follows and supervenes — as I was showing above.

Against this, one may object, second, that delight is meritorious or demeritorious. For if someone loves God and delights in him, he merits; but if he loves a forbidden object and takes pleasure in it, he demerits. But if delight were produced by the object, it would be a natural act, not in our power, and through it no one would merit or demerit. It is therefore better to assert that delight is not produced by the object. I distinguish the major: formally and immediately — I deny the major; materially and mediately — I grant, insofar as delight in some way falls under the command of the will, by reason of which it can be turned away from the continuation of delight and its sweetness — as is plain from a woman violated by force, who is afflicted with sorrow if any delight arose in her, and who merits insofar as she afterward detests this action and passion, and the pleasure, if any followed from them in waking or sleep. Hence the Doctor adds excellently (*1.d.1.q.3. §.De 2.principali.*): "Delight is not corrupt unless the act is corrupt." I add that the passions are absolutely meritorious: for Christ redeemed the human race through his passion, and the holy Martyrs attained glory — for which reason the Church sings: "All the saints, what great torments they suffered, so that they might arrive safely at the palm of martyrdom."

Of sorrow — the opposite of joy — something remains to be said. I am not unaware that pain and sorrow are often used interchangeably, as Orbellis (*3.d.15.*) and Rada (*ibid. controuers.10.art.2.*) carefully observe — though if taken properly and specifically they differ from one another, as Augustine (*14.Civit.T.15.*) teaches, whom the Doctor follows (*3.d.15.q.vn. §.Ad solutionem.*). For pain taken strictly is a passion of the sensitive appetite caused by an incongruent, offensive, and injurious object to the flesh, cognition preceding. Sorrow, on the other hand, is a passion of the intellectual appetite caused by an incongruent object, following upon the act of not willing. From this it is plain that pain taken narrowly pertains to the sensitive part, and sorrow to the intellectual part. For if the object injures the flesh, this injury is called pain —

which can be manifold according to the multiplicity of the injury of the multiple appetite. But if the object displeases the will and the will does not will it, there is born a passion called sorrow — which is about things that happen to us against our will. For this reason the said passions proceed from the incongruence of objects, acts of the said appetites having preceded — just as joy and delight flow from the congruence of objects. And as the latter are multiplied, so too are the former — since from what has been said not once, the same reasoning and learning holds for opposites. Finally, they arise both from within — such as from the intemperance of the animal — and from without — such as from heat, cold, and the other things that injure sense, or from the will on account of unwilled things.

Scotus (*cited*, §. *Praeter illum*, and §. *Praeter duos*, *art.1.*) recounts four principal modes in which sorrow is caused. First, if something happens to the will contrary to its natural inclination. In this way the will, naturally inclining toward happiness, grieves if misery befalls it — hence Augustine says (*in Ench.cap.164.*): "We will so much to be happy that we cannot will to be miserable." For just as the will, naturally receiving happiness, rejoices — since it is its perfection — so when not receiving it, it grieves. Second, if the sensitive appetite is injured by a motivating object, on account of the connection and bond which the will has with the sensitive appetite, the will also grieves — as if someone's body is wounded, the sensitive appetite grieves at the wound, and the will, pitying it, is saddened. Third, if the will does not will some object and it is nevertheless presented and given to it against its not-willing, sorrow follows — as the damned in hell would not have the fire, and contrary to their not-willing God wills the fire to be there to torment them; therefore they grieve. Fourth, if someone absolutely does not will some thing and yet on account of an imminent danger to life wills it conditionally — as a merchant in peril at sea throws overboard his goods, which he would not throw if he could avoid the danger to life and shipwreck. From this sorrow follows, since he would simply not throw them and he throws them under compulsion; hence sorrow comes to him — as the Doctor rightly and fully sets forth (*ubi supra*).

The effects of this dark and poisonous affection are many, and Chrysostom narrates them no less brilliantly than eloquently (*orat.2.de providentia and epist.7.*): "Sorrow is a cruel torment of souls, a certain inexplicable gnawing pain, worse than any judgment and punishment. For it is like a venomous worm that destroys not only the flesh but the soul itself. It is like a moth — reaching not only to the bones but to the heart itself — a perpetual executioner, not rending the soul asunder but consuming the soul's forces, and an endless night and deep darkness, and a storm and tempest, and a fever not apparent but burning more intensely than any fire, and a battle that has no rest, and a sickness that obscures the sight of many." And before him the wise man (*Prov.25.*): "As a moth injures a garment and a worm injures wood, so sorrow injures a man's heart." Counsel must therefore be taken from Ecclesiasticus (30.), who says: "Drive sorrow far

from you, for sorrow has slain many and there is no profit in it." Therefore let each one of us serve God not in sorrow but in joy; and if sorrow occupies the heart and soul, let it be not on account of the evils and losses inflicted on oneself, but on account of sins committed, let one be sorrowful and do penance — which is the end implanted and intended in us by God, as Chrysostom judges (*hom.7.ad populum*): for in this way, when a man does so, sorrow will be turned into joy, as Christ foretells to his Apostles (*John 16.*).

Article V. On Hope and Despair.

After the affections of the concupiscible, next come the passions of the irascible, among which hope holds the first place and despair — which is opposed to it — the second. The Seraphic Doctor warns (*3.d.36.q.1.*) that the name "hope" is equivocal, whose several acceptations (*Vorrlong, Arretinus, and Gabriel ibid.*) adduce and express; I bring forward and explain those more suitable and fitting for illuminating our subject.

First, hope is taken for the expectation of a good or evil future event. In this sense Cicero (*lib.1.ad Atticum*), Augustine (*in Ench.cap.8.*), and Virgil take it: "If I could have hoped for so great a sorrow."

Second, for the thing hoped for, mention of which is made (*Ad Tit.2.*): "Awaiting the blessed hope" — that is, blessedness, which is the object or terminus of hope.

Third, for the theological virtue, which is a habit infused by God into the rational soul concerning the possession of the highest good — of which Scotus (*3.d.26.q.vn.*) and the other Scholastics treat.

Fourth, for the movement of the appetitive power following upon the act of hoping concerning a future good to be attained. It is hope understood in this fourth way that is our present subject. Its object is a future good, as Cicero (*4.Tusc.*) and Augustine (*ubi supra*), following Aristotle (*1.Rhet.cap.11. and 2. of the same work, cap.12.*), observe. The future good to be hoped for being twofold — created and uncreated — hope is directed toward each. Excessive affection for the former is forbidden (*1.Tim.6.*): "Charge the rich of this world not to be haughty, nor to trust in the uncertainty of riches." The latter, however, is to be pursued with all effort and ardor (*Ps.36.*): "Hope in the Lord and do good." Involved in hope are the possibility and credibility of attaining the future good — not as a motivating cause but as a presupposed condition. For in order to hope for something, one presupposes and foreknows that it is possible and future. For what is impossible of attainment is hoped for by no one; and what is believed never to be future and never to be attained does not appear to fall under hope — as Seneca (*Epist.10.*) and the Philosopher (*ad finem libri de execratione*) agree.

I add that hope must not be confused with desire, as some cited in Scotus and Basil suppose — both because they are distinct passions (for desire pertains to

the concupiscible and hope to the irascible), and because it is plain that there can be desire without hope. For the damned desire happiness with their natural appetite, which they do not hope to obtain. And desire sometimes regards the impossible — as was the desire of the demon seeking equality with God, which is impossible. Hope, on the other hand, tends only toward what is possible and future, as I was saying a little above.

Nor is hope divided as into two species — into moderate hope, which does not exceed the powers of the one hoping and the aids for obtaining the hoped-for good, and immoderate hope, which surpasses the faculties of the one hoping and whose external supports are not suitable, opportune, and sufficient for obtaining the good. I say hope is not thus divided into two species, as Rainaud holds (*d.3.q.3.art.1.n.285.*). For such a division is drawn from the measure and excess of hope, and is therefore accidental. Furthermore, more and less do not vary the species, as I said in (*the Logic, q.de qualitate.*); therefore moderate and immoderate hope do not constitute a specific distinction of hope. The distinction of the species of hope is rather to be derived from the distribution of the objects to be hoped for — as is the case with the other movements and affections enumerated above.

As much as hope can accomplish and effect, achieve and produce, is sufficiently well known. For it is, as it were, a savory and pleasant nourishment and seasoning by which the one who acts is fed, supported, and preserved — as Ovid beautifully sings (*lib.2.Eleg.5.*): "Hope nourishes farmers." It increases his forces, strengthens the heart and spirit, rouses to undertaking and completing tasks — to such a degree that nothing illustrious and praiseworthy would be accomplished without the hope of attaining a good. Hence Tertullian rightly establishes (*lib.de pudicitia*) that hope is the doorkeeper of the house of the virtues — so that, having gained and possessed it, everyone may enter broadly and boldly into the dwelling of whatever virtue. Therefore, spurning and dismissing all vain and futile hope of corruptible goods, let us be armed with the hope of incorruptible goods and fortified with the hope of divine aid, so that we may attain and enjoy the happiness we seek and hope for.

Against this, one may object, first, that hope includes faith as its genus, as the Doctor (*cited*) indicates and Majoris (*ibid.art.8.*) attributes to him; since therefore faith pertains to the intellect, the same must be affirmed of hope. I distinguish the antecedent: presuppositively — I grant, that is, the one hoping believes that the good he hopes for exists and believes he will attain it; formally — I deny. For although faith is prior to hope as genus is prior to species, it is not therefore affirmed that faith is the true genus of hope. Especially because faith is a virtue and a habit, whereas hope — of which we are speaking here — is a passion.

Against this, one may object, second, that the Doctor (*in loc.cit.*) seems to want hope to pertain rather to the concupiscible than to the irascible, since it regards an absent good, like desire. Therefore hope is not subjected in the irascible, nor

is its passion. I reply by explaining the Doctor: insofar as hope and desire regard the same object — that is, an absent good — they are in some sense said to pertain to the irascible; but because they tend toward it in different modes, for this reason they are not both considered to inhere in the concupiscible — as Basil and Vorrlong (*named above*) rightly teach. For to desire is an act of love with respect to an absent thing, by which the lover tends toward union with the thing loved; whereas to hope is an act of the will by which the one hoping raises himself and tends toward attaining and possessing, by way of a suitable means, the object hoped for.

Many hold the nature of despair to be difficult to know — especially on account of the variety and multiplicity of the opinions of the philosophers. Setting these aside, I adduce its definition, which is as follows: despair is a passion of the appetitive power following upon the act of not pursuing a good which is apprehended as impossible of attainment. This is intimated by the Doctor (*3.d.16.q.vn.H.*). The prior terms are common to other passions; the posterior terms distinguish despair itself from the remaining affections. For just as hope presupposes the act of pursuing the hoped-for good, so on the contrary despair — which is opposed to it — presupposes the act by which someone no longer wishes to devote effort to pursuing and following up that good which he judges he can in no way obtain and possess. From this it is plain that despair is not an act of the intellect judging the good to be impossible of attainment, as Almain holds (*Tract.2.Mor.cap.7.diff.3.*). For although despair presupposes an act of the imaginative or intellectual power, it is nonetheless not an act of it but a passion of the irascible — which pertains to the will — as the common opinion of the philosophers holds. All the more so because despair is called the last of evils. Hence Chrysostom (*libro de reparatione lapsi*) writes: "Despair closes the doors of that heavenly city which hope opens and piety throws wide." And it gravely harms — as is plain from Cain and Judas. Despair therefore does not suit the intellect. It is also established that despair is not aversion or recession from a good, because aversion is a passion of the concupiscible appetite, whereas despair is established as a passion of the irascible appetite — and also because it is not a not-willing but presupposes a not-willing to pursue any further the good which the despairing person judges he can never attain. The rest, who think despair is a falling of the will from good, a breaking of spirit, and a defection — these expose and assign rather its effects than its nature.

Despair can arise from several sources. First, from weakness of powers — as one feeble in spirit and infirm in body despairs of completing a long journey. Second, from the magnitude and difficulty of the thing to be obtained — as a poor prince despairs of winning victory over a great and powerful king. Third, from sloth, avarice, or lust — as (*Eph.4.*): "Despairing of themselves, they have given themselves over to all uncleanness and covetousness." Fourth, from the insufficiency of means or the gravity of the offense — as (*Gen.4.*): "My iniquity is greater than that I should deserve pardon." Fifth, from an evil will by which one

wishes to persist in evil — as is plain (*Jer.2.*): "Despairing, I will not do otherwise." Sixth, from black bile strongly predominating — and thus some, wearied of life, hang themselves.

Just as there are many causes of despair, so many effects are assigned to it. For despair breaks the spirit, weakens the forces, desists from the pursuit of good, neglects, abandons, and plunges man into the depths of vices — to such a degree that the lost and damned are called desperate. Hence for despair scarcely any remedy is given, unless the intellect is illuminated and the possibility, facility, sufficiency, and abundance of efficacious means of attaining good are shown, and the will is raised and rises eagerly and willingly to attain it — with all impediments removed and overcome. For as long as man lives and breathes, he ought to hope — especially for the forgiveness of sins — since the mercy of God is great and his mercies have no end. Let the good man therefore beware lest he presume upon his virtues and merits, and let the evil man beware lest he despair on account of his crimes — as Augustine piously and learnedly warns (*lib.de Symbolo*).

Article V. On Boldness and Fear.

A certain modern author observes that the diversity of conflicting opinions has obscured and darkened this difficulty concerning the nature of boldness and its properties — as in a similar matter the Song of Songs (*1.*) says: "I am dark" — adding the reason: "The sons of my mother have fought against me." Setting aside those positions therefore that do not conduce to illuminating and explaining the quiddity of boldness, I put forward its definition, which is as follows: boldness is a passion of the appetitive power following upon the act of daring, consisting in an eager and spirited assault upon difficult things and grave dangers. The preceding terms signify its genus, the following ones its differentia, through which it is distinguished from the remaining affections. It is divided into good and bad. The former designates constancy and firmness of spirit in undergoing dangers — hence it is said: "The just man is unafraid." And Aristotle (*2.Rhet.5.*) adds that those are bolder who stand rightly with respect to God and think they have the divine favor on their side, for they hope to be helped by his power and virtue. Hence Joseph of Arimathea (*Mark 15.*) "went in boldly to Pilate and asked for the body of Jesus." And (*Rom.15.*) St. Paul: "I have written to you more boldly." And the celebrated saying is commended: "Fortune favors the bold and repels the timid." The latter — bad boldness — designates arrogance, presumption, and temerity. Hence Ecclesiastes (*8.*) warns: "Do not go on the road with a bold man, lest his evils weigh heavily upon you." And the same adds (*cap.22.*): "An impudent man puts his father and husband to shame." Its subject is the irascible. Its cause is held to be twofold: an abundance of heat in the heart, and a firm hope of eagerly attaining the good and winning victory over dangers. Its effects are seen with the eye and are so manifest that it would be tedious to enumerate them.

Lest anyone act rashly, however, dangers must be weighed and meditated upon lest one perish in them, and one's own forces must be measured, lest overcome, one be exposed to everlasting reproach — as often happens to one who falls wretchedly and is buried with ignominy through inconsiderate and improvident recklessness in dangers.

Against this, one may object that a definition adapts to one thing and not to another, as the laws of a good definition require; but the definition of boldness given above fits fortitude, which differs from it. Therefore the definition stated is not correct. The major is known. The minor is urged: fortitude consists wholly in steadfastly and eagerly assailing arduous and difficult things — just as boldness does. I grant the major and deny the minor: for fortitude is a virtue whereas boldness is a passion — therefore they do not coincide.

Of fear I find four principal usages. First, for any flight and recession from all evil. In this sense Aristotle (*3.Eth.6. and 2.Rhet.5.*) takes fear. Second, for humility and depression of spirit, of which David makes mention (*Ps.110.*): "The beginning of wisdom is the fear of the Lord" — that is, humility, as Scotus (*3.d.34.q.vn. ante §.Ad argumenta*) interprets. Third, for dread by which we fear an imminent evil — in which sense Augustine says (*lib.83.qq.q.35.*): "Fear is of a future and imminent evil." Fourth, for the passion of the appetite following upon the act of fearing, caused by the apprehension of a future evil. The definition of Aristotle (*2.Rhet.c.alleg.*) amounts to the same: "Fear is a disturbance of a future and imminent evil inflicting pain or sorrow." It is called a disturbance — that is, a passion of the appetite — as the genus; and the remaining terms are added as the differentia, by which fear differs from the remaining passions. Whether the evil included in the definition of fear is certainly and necessarily future or uncertainly and contingently future is disputed among the Scholastics: some, like Vasquez (*3.p.d.62.cap.3.*), suppose the evil of which there is fear to be certainly and infallibly going to come about; others, like Richard (*3.d.15.q.3.art.3.ad 4.*), establish that fear properly regards an evil that is uncertainly going to come about.

I hold, however, that both evils are comprehended under the said definition — both because the evil to be feared is placed in it absolutely, and what is universally understood comprehends all evil, whether it comes about infallibly or fallibly, just as when "animal" is said simply, both rational and irrational is understood; and also because an evil necessarily going to come about is feared, as each of us fears death, even though it comes about necessarily. For this reason Christ also feared death itself, as is plain (*Mark 14.*): "He began to grow sorrowful and to be very heavy."

One may say, in objection, that Aristotle (*passim cited*) expressly says that those who hope for no salvation do not fear; therefore fear contains only an uncertain future. I say that Aristotle is to be interpreted of effective and absolute fear, not of ineffective fear — just as effective desire is about what is possible of

attainment, and ineffective desire can be about the impossible, as the Doctor (2.d.6.q.2.§.per hoc.) maintains.

Many divisions of fear are current from (*Vorrlong, 3.d.14.art.1.*), (*Brulifer ibid.d.34.part.2.*), and (*Damascus, 2.fidei cap.15.*). I adduce and explain the principal one, which is into filial, servile, and worldly fear. The first is called reverential fear, by which man fears to offend God whom he loves and dreads to be separated from him — as the Angelic Doctor (*ver. Timor*) notes — mention of which is made (*Ps.18.*): "The fear of the Lord is holy, enduring forever." The second is servile fear, by which man fears God lest he be punished and condemned — of which (*Luke 21.*): "Men withering away from fear." The third is that by which one fears to lose his goods if he does not comply with the prince — as (*John 11.*): "If we let him alone, the Romans will come and take away our place and our nation." And more clearly (*John 7.*): "Yet no one spoke openly of him for fear of the Jews." Aristotle mentions this division of fear (2.com.cap.2.).

The cause of fear is a future or apparent evil, as Aristotle (3.*Anima.T.154.*) and Epictetus (*apud Arrianum lib.2.cap.1.*) maintain. Its effects are plain — especially the pallor of countenance, the agitation of mind, and the like. If a man finds no way to escape the impending evil and imminent danger, he fears and is more greatly terrified. To drive away fear, trust and confidence in God avail greatly — according to (*Ps.124.*): "Those who trust in the Lord will be as Mount Zion." And a right conscience and good work — hence the celebrated saying is commended: "Do good and you will not fear the king." And the Proverb excellently adds (*Prov.28.*): "The just man, like a confident lion, will be without terror."

Article VI. On Anger and Meekness.

Anger can be taken in three ways. First, for the act of avenging an injury — in which case anger can be without sin, as is plain (*Ps.*) "Be angry and sin not." And (*John 2.*): "Christ, moved by anger and led by zeal for the Father, made as it were a scourge of cords and drove out those who were buying and selling from the temple." Second, with respect to its effect — by which, namely, an offense is punished: in this sense anger is attributed to God when he chastises the evil and impious, as one reads (*Ps.77.*): "Their food was still in their mouths, and the anger of God ascended upon them." And (*Ezech.7.*): "I will pour out my anger upon you." And more expressly (*Micah 7.*): "I will bear the anger of the Lord, for I have sinned against him." Third, with respect to its effect — and thus it is defined as a passion of the appetitive power following upon the act of avenging an injury inflicted on oneself or another. Passion is placed as the genus; the remaining terms are subjoined as the differentia. The last two senses of anger are drawn from the Doctor (4.d.46.q.2.§.Respondeo.), who establishes that mercy in God is not with respect to affection but with respect to effect — not the proximate but the remote effect. Similarly anger is adapted to God not as it is a passion and disturbance but in that an evil or offense is punished by God himself. But it belongs to both appetites — sensitive and intellectual — hence perhaps Aristotle

(1.*Anima T.16.*) adds that anger can be defined in two ways: dialectically, as it has just been defined, and physically — in which mode anger is defined as an inflammation of blood about the heart. And this latter definition belongs only to the sensitive appetite, as Scotus (3.d.34.q.vn.§. *Notandum ante H.*) agrees.

Against this, one may object, first, that Aristotle (*just cited*), defining anger, says: "Anger is an appetite for vengeance." He writes (2.*Rhet.2.*), to which Cicero (*cited by Lactantius, lib.de ira Dei, cap.17.*), Augustine (14.*Civit.T.15. and Epist.115.*) agree. Therefore anger does not differ from desire. I reply that the testimonies cited are to be taken not formally but presuppositively — that is, the desire for vengeance is presupposed for someone to be moved by anger on account of an injury inflicted on him. For as I showed above, the passions of the concupiscible precede the passions of the irascible. This is touched upon by the Doctor (*just mentioned*).

Against this, one may object, second, that the same Philosopher (5.*pol.10.*) adds that we should regard anger as a certain particle of hatred; therefore hatred and anger are confused. I reply that Aristotle there only wishes anger and hatred to have some affinity with one another, not identity — just as, according to the same Philosopher, Rhetoric is a certain particle and offshoot of Dialectic (1.*Rhet.1. and following*), though they are distinct habits. Therefore anger and hatred are discrepant passions. For hatred is a passion of the concupiscible regarding an evil that it averts; anger, on the other hand, is a passion of the irascible regarding a good that it pursues — namely vengeance, which is thought to be good. Hence the Stagirite (2.*Rhet.2. cited by Scotus ubi supra*) writes: "The anger of a man is like honey." And this occurs when one actually avenges himself. For thus, the Doctor (*cited*) affirms, that act is perfect, is likened to fruition, and great delight follows.

Anger is then divided into good anger — which is directed by right reason, such as anger at sins committed — and bad anger, which is contrary to right reason, such as anger at God and neighbor. Other members of anger are adduced by Aristotle (4.*Eth.T.5.*), Gregory (30.*Mor.*), and the Angelic Doctor (*ver.ira*). Among them are numbered strife, swelling of mind, contumely, clamor, indignation, blasphemy, war, malediction, and sedition — of which Seneca (*lib.de ira, cap.4.*) and the Angelic Doctor (*just cited*) treat.

The motivating and inciting cause of anger is principally held to be twofold: a slight and the sorrow conceived from it, of which Aristotle (*just cited*) makes mention and (4.*Top.cap.6.*): "The angry man is distressed and thinks himself slighted." And (6. *of the same work, cap.3.*): "Anger is sorrow with the opinion of being slighted." The Doctor (*at the passage just cited*) affirms the same. Add a fiery temperament, those possessed of which — choleric persons — are easily moved to anger. Its effects are many, and these horrible and foul — such as palpitation of the heart, ebullition of blood, trembling of the members, precipitousness of tongue, inflammation of countenance, disturbance of mind, and things of that

kind — which are reported and described by Nyssa (*hom.2.de beatitudine*), Seneca (*lib.de ira, cap.36. and 37.*), and Gregory (*1.Mor.c.30.*). Hence Cyril adds (*serm.de temerario*): "What beast is so savage and fierce as one who is angry and yields as to some tyrant to unrestrained anger? Or what sea, so violently driven and hurled by the winds against the rocks, as an unrestrained and harsh man who cannot be held back from obeying anger and letting all the reins loose to his disturbance." And Basil (*hom.10.contra irascentes*): "When once the disturbance of anger, rushing headlong upon the mind, has seized the command of the soul, it turns the man entirely into a beast and no longer allows him to be a man possessed of reason." Hence a certain philosopher, struck by anger, approaching an enemy — so as not to become brutish — could have but would not kill or harm him, saying: "I would kill you, so as not to be angry at you." The warning of Paul (*Eph.4.*) must therefore be received: "Let not the sun go down upon your anger, and give no place to the Devil." To which Isidore of Pelusium (*lib.1.epist.280.*) subscribes: "Put a bridle on anger as quickly as possible, lest it drive you headlong into ruin." I add Ambrose (*ad Vercellensem*): "Man cannot forestall anger, but he can mitigate it. Therefore even if we are angry, let the emotion of our affections receive its impulse according to nature, and let it not be sin beyond nature." And finally — as Nyssa (*named above*) attests — the subjection of oneself greatly avails: "For if you remove pride from the soul, the vice of anger will have no occasion to grow." And the countless evils that arise from anger — cited by Seneca (*3.de ira, c.5.*): "Lest we be angry, we will achieve this if we continually set before ourselves all the vices of anger and accurately appraise it."

From what has been said of anger, it is plain by opposition what must be said of gentleness, of which the Doctor (*3.d.34.q.vn.§.His suppositis.*) makes mention. Some call it tolerance, and others — such as Aristotle (*1.Magn.mor.c.21.*) — meekness. If taken as a virtue, it is defined by Cicero (*1.de off.*): "A virtue of spirit weighing each condition of the world with equal scale." But if taken as a passion, it is described as an affection of the appetite following upon the act of growing gentle, sparing an offense inflicted on oneself or another. Hence Jerome adds (*in Matt.5.*): "The meek or gentle person is one who neither gives offense nor resists evil, nor thinks of doing harm, and who is affected neither by anger nor fury." Its master is the Savior (*Matt.11.*): "Learn from me, for I am meek and humble of heart." It is enjoined by Paul (*Eph.4.*): "Walk worthily, with all humility and meekness." And before by Ecclesiastes: "Son, perform your works in meekness."

Book V. On Habits.

The treatise on habits is ample and rich — encompassing habits taken generally and specifically, intellectual and moral, spiritual and material — and concerning all and each of these, for a fuller and more exact doctrine, I am pleased to

subjoin the following questions, articles, and disputed points, and to decide them to the best of my ability.

Question I. On Habits Taken Universally.

Article I. Whether Habit Exists.

The name "habit" is equivocal, as I noted (*in Log.1.3.q.7.art.2.*). In the present context it is taken principally for an adventitious quality acquired through art and labor, difficult to remove from its subject, by which the one who possesses it operates easily, promptly, and with delight.

The assertion is that habit is given, by which one is rendered easy and prompt in operating through practice and exercise. This is the common position, which the Doctor presupposes (*1.d.17.q.2. and 2.d.17.q.vn. and 3.d.26.q.vn. and 34.q.vn.*), supported by Augustine (*1.de distinctionib. and in Ench.cap.82.*) and Gregory (*4. and 11.Mor.*) and others frequently — who warn that a good habit is to be retained and a bad one repelled. Aristotle concurs (*2.Eth.5.*), dividing the things that are in the soul into power, passion, and habit; and (*2.Eudem.T.1.*), (*same l.predicam.c.de qualitate*), (*5.Met.c.de qualitat.*), and (*9. of the same work c.5. and 8.*).

Furthermore, it is urged that experience confirms that a man not yet practiced in some art and discipline operates only with difficulty — but afterward, when furnished with practice and custom, acts easily and with delight, and cannot even be pulled away or distracted from it. This ease, aptitude, and delight in operating, acquired through use and custom, is what common usage calls habit; and one who lacks such ease is said not to have the habit — as (*1.Reg.17.*) David says of bearing arms that he has no use and custom of them. Habit must therefore be admitted. Moreover, a power that is indifferent and undetermined to acting with difficulty or easily must be determined by something, so that it may operate promptly and easily — just as the will is determined, through the practice of frugality and abstinence, toward producing acts of sober and chaste living; but such practice and facility of operating is commonly called habit. I add what I compiled together with Scotus (*3.d.24.q.vn.D.*) in (*Epit.1.1.q.4.art.7.*): a catalogue of all habits, both speculative and practical — of which in their own place. The conclusion is therefore beyond doubt: habit is given.

Against this, one may object, first, that a power clothed and imbued with a habit is still indifferent to acting — as is plain from the will, which, however possessed of any habit, still remains indifferent and undetermined to opposite acts and opposite objects; therefore a habit that constitutes a facility determining the power to act is not to be granted. Raconius replies (*disp.ult.de virt.Sect.1.art.1.*) that a power made firm by habit is indifferent contradictorily — that is, to acting or not acting — but not contrarily — that is, to contrary acts; so the will at that point is not indifferent to willing and not-willing. Against this: habit does not remove the power but only assists and facilitates it; but the will before habit was

indifferent both contradictorily and contrarily; therefore also after habit it remains indifferent in both ways. Again, what is posterior does not change what is prior, since the prior, as prior, does not depend on the posterior; but the power is prior to habit, and in that priority is indifferent and undetermined both contrarily and contradictorily; therefore after habit it remains indifferent in the same manner. Hence it must be stated that habit determines the power not absolutely but in a certain respect — that is, to operating easily and with delight. Hence habit is necessary for the power only in a certain respect, for its better being and easier operating; the acts of the power of which it is the habit follow upon it, as will be shown below.

Against this, one may object, second, that if habit is admitted, it is either as a dispositive and passive principle of the subject, or as an active principle assisting the subject in which it resides toward operating. Not the first, because the subject — or the power — by its own nature and immediately is disposed toward receiving any perfection. Nor the second, because — as the Doctor probably holds (*1.d.17.q.2.*) — it is not necessary that a habit be given as an active principle, but as inclining the power toward acting, just as gravity is posited for bearing a weight downward. I reply that habit must be admitted whether it is posited for operating or for inclining the power toward acting. For it can be defended in either way, as is plain from the Doctor (*at the passage just mentioned*). Although the power is simply operative and inclined toward acting, habit is nevertheless given to it so that it may act easily and with delight, or that it may incline toward acting.

Article II. How Many Kinds of Habit There Are.

Many divisions of habits exist; I explain the principal ones.

First, into infused and acquired habit. The former is infused by God into the creature — such as faith, hope, and charity — of which the Theologians treat, notably Scotus (*3.d.34.q.vn. and 1.d.17.q.2.*). The latter is produced by art and labor, by which the agent operates promptly and readily — as I said and explained in (*the Log.q.de qualitate.*). One may inquire what this said division of habit is: whether it is essential and intrinsic, or accidental and extrinsic; and likewise whether it is adequate and sufficient, or whether some other member is wanting to it.

As to the first, we assert it to be extrinsic — derived from the order of the efficient cause — just as the partition of habit into natural and supernatural, which appears to coincide entirely with this one, is extrinsic — as I showed from Scotus (*2.1.prol. and 4.d.6.q.vn. and d.10.q.8. and d.43.q.4.*) (*in Tract.1.summae Theolog.disp.2.q.3.*). There I noted that something can be called supernatural in two ways. One way — properly — is what can be produced by God alone, such as grace. Another way — improperly — is what is indeed produced by God, but can be produced by a creature, such as infused science given by God, which

could have been acquired by a rational creature by its own ability. Therefore just as a habit is called supernatural because it is produced by a supernatural agent, or natural because it arises from a natural agent — as I noted (*in Phys.1.de natura et arte q.1.art.2.*) — so a habit is called infused because it is infused by God the supreme agent, and acquired because it is acquired of its own accord by a created agent. This division therefore is extrinsic, derived from the different respect of the agents — as Suarez (*disp.44.Met.Sect.1.n.5.*) also acknowledges. Though between these habits there is an intrinsic and essential distinction — whether produced by the same or by a different agent — as faith and charity differ essentially from one another, though both proceed immediately from God.

As to the second, we establish that the named distribution of habit is adequate and immediate. For no habit properly so called is innate and connatural. For, as is plain from the definition of habit given in the Logic, every habit taken strictly is begotten by art and acquired by labor. If from the beginning of its creation someone received some habit divinely — as the Angel, who had from God all scientific habit and species of things bestowed upon him — that habit is called infused and natural, because it was created and produced together with the nature, even though it is truly supernatural, because it is from God the supernatural agent, as I was warning above. All the more so because the habit of which we are speaking in the present is generated from frequently repeated acts; and therefore no habit is given that is innate and inborn. And thus habit is sufficiently divided into infused and acquired — as Scotus (*1.d.17.q.2. and 3.d.34.q.vn. §.Not.D.*) agrees.

One may say that the intelligible species innate in the Angel at the beginning of his creation are called habits by Scotus — as I observed (*in Log.1.3.q.7.art.2.*) — and that such species were given and innate together with his nature. A middle habit is therefore admitted between infused and acquired — namely congenital and connatural. The reply is that although intelligible species are not properly habits, and yet are reduced to the series of habit — as I said at the passage mentioned — this kind of habit is contained under the infused habit, insofar as it was infused by the author of nature into the Angel at the same moment as he was created. It is therefore not necessary to constitute a middle habit between infused and acquired.

Second, into cognitive and appetitive habit — derived from the material cause, or subjects, in which habits inhere, which are principally the cognitive and appetitive powers, as (*Vorrlong, 3.d.36.Term.2.art.1.*) notes. Into this comes fairly the distribution commonly adduced as into intellectual and moral habit — touched upon by the Doctor (*9.Met.q.11.q.*) and from what has been said and handed down (*in 1.Eth. at the end*) — which encompasses all habits of both intellect and will; except that the former is wider and broader, insofar as it contains material and spiritual habits, while the latter is narrower and more

confined, in that it takes in only spiritual habits. It is adduced, however, by Scotus (*1.d.17.q.2.§.sed tunc. and 3.d.34.q.vn.§.Notandum.D.*) and by the entire assembly of Scholastics — perhaps because most do not grant habits in material powers, or if they admit them, as Scotus does, they reduce these to those; or because cognitive, broadly understood as intellectual, do not differ. Hence it is not considered a twofold but only a single division — though in truth some distinction is interposed between them. For moral derives from custom, and custom pertains to the will, whose act is formally free alone, and customs are placed in free acts. Hence moral designates the elicited act of the will properly, and improperly the commanded act — by reason of which the acts of other powers can be called moral by participation — as the Doctor writes (*q.4.prol. and expresses in Rep.3.d.33.q.1.§.Oppositum.*). One may also investigate whether this named division is essential and quidditative, and likewise whether it is sufficient and adequate.

As to the first, one may say that it is essential with respect to its formal and intrinsic rationes through which its members are essentially constituted and distinguished — since the same principle is constitutive and distinctive of a thing, as is plain in *Metaphysics*. There is therefore no doubt that the habits just named formally differ among themselves, and hence the said division is essential. Furthermore, one may call it an accidental and extrinsic division — or a division of subjects into their accidents — insofar as intellectual habits are subjected in the intellect and moral habits in the will, from which they receive their denominations.

As to the second, one may likewise say that it is in some sense a sufficient and adequate partition, insofar as nearly all and principally all habits reside in the cognitive or appetitive power. This is to be discussed below.

One may say that a certain habit is both intellectual and moral — as prudence is an intellectual habit (*from 5.Eth.4.*) and also moral, since it is the proximate rule of moral acts. This division is therefore neither essential nor sufficient nor fitting. I distinguish the antecedent: formally — I deny; regulatively and mensuratively — I grant. For prudence is formally a habit of the intellect — namely, the deliberative intellect, as I will show in its own place — but is in some sense the rule of the other virtues, as the Doctor (*3.d.33.§.Ad 1.M.*) notes.

Third, into virtue and non-virtue: this is hinted at by Scotus (*coll.6.*). To understand it, I observe with Vorrlong that virtue is taken in three ways. First, for the power or faculty of operating — in which sense (*7.Phys.T.3.*): "Virtue is the disposition of the perfect toward its best." And (*1.Caeli T.116.*): "Virtue is the ultimate of power." Second, for that perfection by which the subject in which it is is perfected and adorned — in which sense (*2.Eth.cap.5. and 6.*), cited by the Doctor (*1.d.17.q.2.§.Ad ista. ante E. and 3.d.3.q.vn.§.Ad quast.*): virtue is defined as a habit that perfects its possessor and renders his work good. Hence Augustine adds (*lib.83.qq.q.31.*): virtue is a good habit, conformed to the mode, reason, and

nature. Third, for the theological virtue or what is associated with the theological virtue — in which sense Augustine (*l.solilog. and 2.de lib.arb.cap.18.19.*) writes: "Virtue is right reason reaching the highest end, or a good quality of mind by which one lives rightly, which no one uses badly, which God works in us without us." Fourth, and properly, it is thus described by the Doctor (*coll.1. and 3. just cited*): virtue is an elective habit determined by right reason. The same Aristotle intimates (*2.Eth.6. and 6. of the same work, T.3.*). Since election belongs to the will (*6.Eth.3.*), it is inferred that virtue properly taken pertains to the will — and thus the named division encompasses only habits of the will, whose second member is non-virtue: since, as has been said, an indifferent act is given that is neither good nor bad, so also a habit is admitted that is not a virtue. For from indifferent acts frequently repeated, a neutral or indifferent habit is generated that is neither good nor bad. And thus virtue and vice are not immediate opposites — just as just and unjust have between them what is not unjust; and between friend and enemy there intervenes the non-enemy — as the Doctor (*1.d.17.q.2.§.De Secundo.*) notes.

One may say, with Aristotle (*7.Phys.T.17.*), that he divides habits explicitly into virtues and vices; therefore the division given above conflicts with the Stagirite. The reply is that by and large, habits that are not virtues are vices, since man by and large is either just or unjust. Yet speaking universally, between virtue and vice there is non-virtue. Or one may say that the said division of the Philosopher is valid — taking vice privatively — just as between an act that is good and an act that is bad positively and contrarily, there mediates an act that is bad privatively — as Scotus (*Quod.18.art.1.I. and K.*) maintains.

One may also doubt in the present case, as in the preceding, whether it is an essential and adequate division. I know that some — among whom Scotus is cited (*Quol.alleg. and 1.d.17.q.2.*) — consider it to be a distribution of the subject into its accidents, and one member to differ from the other by a certain relation. Yet nothing seems to prevent us from asserting that the said division is essential — as in the preceding one — since habit taken universally is an intermediate genus of quality (*3.d.34.q.vn.§.Notandum D.*), undergoing several intermediate divisions, among which this said division is found. Quality, whether supreme, intermediate, or lowest, essentially includes no relation and proportion to another, since it is essentially an absolute entity contradistinguished from relative entity. Again, a genus is essentially divided into its differentiae and species, as is plain in the Logic. And this partition of habit is a division of genus into its species — as can be seen in the Philosopher (*cap.de Qualitate*) and Scotus (*ubi supra*); therefore the said division is essential.

One may say, with Scotus (*just cited ante I.*), that circumstances are relations; and (*7.Phys.T.17. and 20.*): "Every virtue and vice is relative." This division is therefore had through a relation. I say that it does indeed designate a relation — just as science denotes a respect to the knowable; yet this does not prevent virtue from

being essentially a quality and belonging to the genus of absolutes. For it imports quality per se primarily and connotes a relation — as the Doctor (*1.d.17.q.2. ante S.*) maintains. The same can be said of health and beauty — of which in (*the Log.lib.3.q.7.art.3.*) I would say, however, that the opposite is not without probability — as can be seen in Scotus and Suarez (*there cited*), and its probability is shown and defended there by Gadius (*Quol.18.*) from the Doctor (*ibid. and coll.1.*). Moreover, this distribution is adequate. For every habit is either a virtue or a non-virtue, as has been established above.

Fourth, the division into speculative and practical is handed down by the Doctor (*3. just cited §.Ad istam q.B.*). For the human intellect is either perfected concerning what is speculative — of which the speculative habit is had, which is fourfold: Metaphysics, Physics, Mathematics, and Logic — of which treatment has been given in their own places; or concerning what is operable — of which the practical habit is had, which is bipartite: active and productive — of which I treat at length (*in Log.lib.1.q.2. and Tract.1.summae Theologicae q.6.disp.3.*). Whether this distribution is essential and sufficient is there carefully and exactly examined, (*in libs.q.4.art.6.*).

One may say that Theology is a habit of the intellect which is not, however, enumerated among those adduced above; therefore this partition is defective and insufficient. I say that we have enumerated natural habits acquired through the ministry of the senses — of which kind Theology is not. For it is supernatural and is not placed in the series of proper sciences — as I made plain (*in the Tract.mentioned*).

Article III. What Habit Is.

The definition of habit has already been given by us and explained (*in Log.lib.3.q.7.art.2.*) and touched upon by the Doctor (*1.d.3.part.3.q.1.*) in these words: habit is an adventitious quality difficult of removal from its subject. In this definition the genus is placed along with the differentia — which are required for an apt definition. Its genus is quality, which — from what has been said in the Epitome — is distributed into quality of soul and body, material and spiritual, cognitive and appetitive. That habit is a quality is plain from the very definition of quality adduced at the passage just cited — for by habit we are denominated such and such, and it resides in that category, as is seen with the eye there. Its differentia is adventitious — through which it differs from the remaining qualities, especially from the second species of quality, which is had from within and from nature. Below is subjoined difficult of removal from its subject — on account of disposition, which is easily removed from a subject, as is illustrated there with an example; and also on account of act, which quickly passes and flows, whereas habit remains and persists in the subject in which it is found. Under the definition given, infused habits can be comprehended — which are also adventitious, being infused by the author of nature into the souls of the Faithful. Others add — like Suarez (*cit.num.6.*) — to the said definition: per

se primarily ordered toward operation, and not providing the first faculty of operating but facilitating it. But these terms are not necessary if one defends — as the Doctor probably defends (*1.d.17.q.2.*) — that habit is not an active principle but only an inclining one. The remaining terms, moreover, do not adapt to infused habits, which, as Scholastics commonly hold, grant no promptitude or facility. Therefore that is not a true definition fitting both infused and acquired habits — which Suarez accommodates to them at number 8 — but fitting only acquired habits; and yet the common definition of both kinds of habit would still have to be advanced; otherwise it would be deficient, applying only to one species of it.

One may say that Aristotle (*2.Eth.5. and collected from cap.de qualitate and 7.Phys.cap.2.*), defining habit in the plural, says: "Habits are those by reason of which we are well or badly disposed with respect to the effects themselves." Therefore our definition conflicts with Aristotle, who defines habit differently. I reply that the Philosopher there does not describe every habit but a good or bad habit. For since habits are given that are neither good nor bad but indifferent, and since some habits are intellectual and others moral, we have therefore adduced a common and general definition of all habits. All the more so because that is rather a partition of moral habit into good or bad, into virtue or vice, than a definition — as is plain from the disjunctive particle or. Furthermore, given the definition of the genus of habit, the definitions of its species can conveniently and easily be investigated — and these will be plain from what is said below, especially the definition of the acquired habit, whose nature is better known to us than that of the infused; and the investigation of the latter is specially entrusted to Theologians.

Article IV. Whether the Intellect Is the Subject of Habits.

Most of the Thomistic school — among whom are Soncinas (*5.Met.q.9.*) and Arriaga (*disp.9.sect.2.subsect.1.*), from St. Thomas adduced in many places by Hurtado (*disp.16.de anima sect.2.*) — deny that in the intellect there are habits distinct from the intelligible species. The opposite, however, is defended by Scotus (*3.d.33.q.vn.§.Ad quest.H.*), Vorrlong (*ibid.*), Raconius (*disp.ult.de virtutibus, art.3.prop.3.*), and Suarez (*disp.44.Met.Sect.4.*), with whom agree Cajetan (*1.2.q.54.art.4.*) and Ferrara (*1.contra Gentes, cap.56.*) — affirming that the intellect is capable of habits distinct from the intelligible species.

It is to be noted, first, that the receptive subject of any accident can be twofold: one remote and mediate — commonly called the subject which — such as substance, which is called the subject which of quality, say whiteness; the other proximate and immediate — commonly called the subject by which — such as quantity, which is the proximate subject of whiteness, since whiteness immediately inheres in quantity itself. In the present and in the following articles, what is investigated is not the remote subject — which is the soul, or the animated body, or the whole composite of soul and body — but the proximate

subject, which is the intellective power — now at issue — or the rational appetitive power, or the sensitive one, or the locomotive, or any other — each of which is to be debated separately in the next articles.

It is to be noted, second, that the intelligible species — of which in the book on the soul — holds itself on the side of the intelligible object. For it is its vicarious similitude and natural image, effectively and partially concurring in producing the act of understanding. Hence it precedes the act of the intellect, since it is its cause; whereas habit follows upon the act, being caused by its repetition and frequency. And it is called a habit because it takes on the character of a permanent form, as the Doctor (*1.d.17.q.2.¶.Qui vult.Y.*) notes: "A species, when it has been rooted, can be called a habit." And (*2.d.3.q.10.¶.Ad q.F.*) he holds the same.

The first assertion is that habits of the intellect are not the species residing in it but facilities rooted in the intellect itself, following upon its acts. The Doctor holds this (*at the passages just cited*). It is proved, first: infused faith is subjected in the intellect, just as charity is in the will — as the Scotists and the other Scholastics affirm (*ibid.*) together with Scotus (*3.d.22.q.vn.¶.Ad quast.F.*). But no one maintains that faith is an intelligible species of God; otherwise through that species we could know God — which no one finds in himself, nor does Scotus attempt to show that such a species is given (*ubi supra*). Therefore habits are not the intelligible species received in the intellect. Second, from (*6.Eth.4.*) five habits of the intellect are enumerated — which are certainly not intelligible species, since these are incomplexes whereas those are complexes, or about complexes. And those precede habits as caused by them, while the latter follow as their effect follows its cause. Moreover, species partially cause acts, and acts cause habits — according to the celebrated saying: from frequently repeated acts, habit is formed. Habits therefore do not coincide with intelligible species.

Arriaga (*cit.subsect.2.*) replies, denying that species are not produced by acts. For he thinks the intension of habit is produced by the species. Against this: species — since they are preceding and numerically the same — cannot be caused by acts, which are subsequent; otherwise they would be caused twice — once by the objects and once by the acts — which is repugnant. Hence Scotus adds (*passim cited ¶.Aliter potest ante F.*): "If the object were not present through the species, habit would still stand — just as if the species could be deleted, science would stand." If therefore there can be a species without habit, surely the species is not the habit, and vice versa. Just as: if man can be without the irrational, surely man is not irrational, and vice versa. Furthermore, between species and habit an act mediates, because habit is caused through the act. Hence the Stagirite (*lib.de somno et vigilia, cap.1.*) adds: "Of whom is the act, of the same is the habit."

Therefore the species is not the immediate cause of the act but only the mediate cause — and hence habit does not coincide with species. Third, from (*1.d.17.q.2.¶.Tenendo sub R.*) we experience that one who is habituated differs from

one who is not, because the former acts more easily and promptly than the latter. But such ease and promptitude of acting, acquired through the frequency of acts, is not the species — because one has the species without that promptitude and facility of operating. Hence Aristotle (*at the beginning of the Ethics cited by Vorrlong, 3.d.37.concl.2.*) writes that virtues arise in us from nature and are perfected by habituation. Again, by nearly the same things each thing is generated and preserved. We observe that the moral virtues are preserved in us by habituation and habit — hence they are called moral, from custom, which is the same as habit, as the same Vorrlong notes (*ubi supra*) after (*Aristotle, 2.Eth.cap.1.*). But what is generated by acquisition and habituation is also abandoned and lost. Moreover, Arriaga (*cited*) himself grants that through supernaturally infused habits an acquired habit can be obtained — namely a facility of operating or eliciting supernatural acts; but such a facility is no intelligible species, as is plain. I add that a power lacking habit does not easily and with delight operate, as the Doctor argues (*in Reportat.1.d.17.q.1. §. Ad rationem dicitur.*). And after a few words he adds: a habitual power cannot operate as perfectly without habit as with habit — otherwise habit would be useless. But it is supposed that such a power has an intelligible species but not the habit. Therefore habit differs from intelligible species.

Arriaga replies (*ubi supra*), granting the hypothesis that it has the species but not so intense and perfect ones — hence it cannot operate so promptly and perfectly. Against this: even after acquiring and possessing species, the intellect still has not a little difficulty in understanding and judging about things proposed to it. But the use of the species and their facility is habit, not the species — whether clear or obscure, intensive or remiss. Hence what Arriaga accumulates in defense of his position collapses.

The second assertion is that the intellect is a fitting subject of habits. This is handed down by the Doctor (*at the passages cited above*) and deduced from the preceding, and is supported, first, by the testimony of Aristotle (*7.Eth.4.*) who places five habits in the intellect as in their subject. Second, by reason: just as moral habits are subjected in the will — as will be shown in the next article — so intellectual habits inhere in the intellect as in their subject. Third: every power that is indifferent and undetermined with active indetermination is determined through habits facilitating it toward acting — hence if it previously operates with difficulty, afterward through habit it operates easily. But the intellect is a power indifferent and undetermined with active indetermination toward knowing any knowable and intelligible objects whatsoever, as is plain from the agent intellect, whose function is to make everything (*3.Anima T.18.*). Therefore the intellect is an apt subject for receiving habits. This reason is touched upon by the Doctor (*3.d.33.q.vn. §. Ad rationem D.*).

Against this, one may object, first, that a power necessary and determined to operating does not need a habit: but the intellect is a power necessary and

determined to understanding; therefore beyond the species of objects it does not need a habit by which it understands them. The major is plain: a natural and necessary power, all requisites for acting having been posited, immediately and necessarily acts — as is plain from fire, which, given combustible material suitably approximated and disposed, necessarily burns, no habit being interposed. The minor is admitted: for the intellect is a natural and necessary power, which — having the species of objects and with no difficulty interposed — understands. Therefore no habit is necessary for it, inclining and necessitating it to understand those things. The consequence holds: there is no impediment to producing the acts of understanding of objects — neither on the part of the intellect, which of itself is sufficiently capable and disposed, nor on the part of the objects, which by their own nature are knowable and intelligible. Therefore no habit distinct from the intelligible species is necessary for the intellect.

I grant the major. I distinguish the minor: absolutely — I grant; the intellect is simply and by its own nature determined to understanding any intelligible object whatsoever: in a certain respect — that is, to operating easily and promptly — I deny; for in that sense it needs habit. To its proof I say this holds of a natural power not living — such as fire tends upward and earth downward, as Scotus (*cit. §. Ad 1. sub M.*) indicates — but not of a living power, which uses means for knowing objects, with respect to which, in order to operate more quickly and conveniently, habit is needed — as we experience in the sciences, in the use and exercise of which we are rendered more prompt and swift in producing scientific acts and in passing judgment on the same objects. To the consequence I say with the Doctor (*1. d. 17. q. 2. §. Qui vult. sub X. and coll. 7. §. secundum principale.*): although the intellect is disposed through the negation of the contrary, it is not however disposed through the ratio of a congruent disposition. An example illustrates this: wood of itself privatively is disposed — by the absence of the opposing disposition — to undergo heating; but positively it is disposed through a congruent disposition, which is dryness; hence dry wood is burned more quickly than green and moist and sodden wood.

Against this, one may object, second, that the intellect evidently and without any obstacle interposed understands first principles and assents to necessary propositions without any presupposed habit, and provides assent to dialectical propositions without the command of the will. Therefore no habit is necessary for the intellect. The consequence holds: there is no impediment to producing the acts of understanding of objects — either on the part of the intellect, which of itself is sufficiently capable and disposed, or on the part of the objects, which by their own nature are knowable and intelligible. Therefore no habit distinct from the intelligible species is necessary for the intellect.

I grant the antecedent and distinguish the consequence: absolutely — I grant; in a certain respect — I deny. For those who possess habit and exercise are

rendered quicker and more swift in their works than others who lack habit and exercise. For the principles must be perceived and applied — and the understanding of them is easier and more convenient for those furnished with the habit of principles than for those who lack it — as is especially evident in those who possess the habit of Logic. To the consequence I grant the major and deny the minor — as is plain from astronomers, who have the habit of observing the stars, and others who more quickly and easily behold them than others who lack that habit. Therefore the Doctor (*in 3. passim mentioned*) appears to deny habit only in inanimate things alone that are without cognition.

Article V. Whether Habits Reside in the Will.

Some, cited by Scotus (*3.d.33.q.vn. §. Hic dicitur.*) — among whom the Marginists cite St. Thomas (*3.d.alleg.q.4.art.2.*) and Aegidius (*Quol.4.q.18.*) — think that according to Aristotle and truth, moral habits reside in the sensitive part — except for justice, which from (*5.Eth.c.1. and 3. of the same work c.6.*) they locate in the intellectual part. And there are not lacking in this age certain moderns — whose names Arriaga (*disp.9.de anima.sect.3.subject.1.*) passes over — who consider the will to be without any habit. The common position, however, is that of Scotus (*cited §.Ad quast.H.*), Vorrlong (*ibid.conc.2.*), Orbellis, and the rest of the theologians and philosophers, whom Ockham (*3.q.10.*), Hurtado (*disp.16.de anima sect.3.*), and Suarez (*disp.44.Sect.1.*) follow — teaching that habits are subjected in the will.

It is to be noted from the Doctor (*at the passage mentioned §.Hac opinio.A.*) that Aristotle sometimes takes "persuadible by reason" for the will — and sometimes for the sensitive appetite, which is obedient to reason. For since the will is free, it is indeed persuadible by reason, but not obedient. The sensitive appetite, on the other hand — since it is not free — is therefore not persuadible but obedient to reason, for it is subject to the command of the will, as the sacred text (*Gen.4.*) intimates: "Your appetite will be subject to you, and you will have dominion over it." Similarly, rational is used in two ways: one way strictly — and in this sense it belongs only to the intellect, which alone reasons, understands, and discourses; another way broadly — and thus it belongs to the will, both because the will commands the intellect and can turn it away from the consideration of one object to the contemplation of another, and also because it is really identified with the intellect, which is first and simply rational. One may also call the sensitive appetite broadly and participatively rational, insofar as it obeys reason and the will — and in it virtue is improperly said to reside, as the same Doctor (*ubi supra in fine §.Ad quast.*) observes.

The assertion is that in the school of Aristotle and truth, the will is the capable subject of receiving habits. This assertion is divided into two parts. The first part is proved, first, from (*2.Eth.6.*): "Virtue is an elective habit" — but election is an act of the will (*6.Eth.3.*). And in that (*lib.de somno et vigilia.*): in that in which is the act, in that is the habit. The will therefore, according to Aristotle, is apt for

receiving habits. Second, from (*1.Pol.T.1.*): it is necessary that the ruler have virtue in order to rule rightly, and the one ruled more than the slave, so that the latter may rightly be subject to the former. Therefore in the intellectual part — in which the will presides and is eminent, as the mistress of the kingdom of the soul — reside the habits that are called moral. Third, the same Philosopher (*1.Eth.9.*), in seeking the definition of happiness, separates the sensitive part from the intellectual, and locates it in the rational part — especially in that which is persuasible by reason, which is the will, as I explained in the preceding observation. Augustine (*14.Civit.cap.5. and 6. and lib.de moribus Ecclesiae c.15.*), Avicenna (*9.Met.cap.ult.*), and St. Bonaventure (*3.d.33.art.1.q.3.*) affirm the same.

The second part is urged, first: the will receives infused habits — such as hope and charity; therefore also habits produced by art and acquired by labor, which are the moral virtues. The antecedent is the common position of Scholastics; the consequence holds, for they are of the same genus and predicament, as I observed above. Second, intellectual habits are in the intellect (*6.Eth.4.*); therefore moral habits inhere in the will. For the will is perfectible by habits, just as the intellect is. And it is likewise determinable and inclinable to operating well or badly, promptly and easily. Indeed it is more indifferent and undetermined to performing an act — since it is free — than the intellect, which is a natural power. If therefore the latter is not without habits, neither is the former stripped of them. Third, in that remains virtue and moral habit which is the principle of credit or discredit (*2.Eth.5.*). But the will is the origin and cause of praise or blame, merit or demerit. The will alone is free, in whose power it is to act well or badly; the other powers are natural and necessary: but in natural and necessary things we neither merit nor demerit. Fourth, habit was devised to facilitate the power — as the Doctor (*in Rep.3.d.33.q.1.*) notes — in its acts and works: and it is established that through the repetition of acts the will operates more quickly and easily than without their frequency. Finally, justice is located in the will by the adversaries; therefore the will is not to be exempted from other habits, since the same reasoning applies equally to each kind of habit — as the Doctor (*ubi supra*) wisely and acutely sets forth.

Against this, one may object, first, against the first part of the assertion: (*1.Eth.cit.*) the moral virtues are established in the irrational part, where the commentator says that part is the sensitive appetite — which mediates between the vegetative and the ratiocinating. And (*3.Eth.9.*): fortitude and temperance are located in the sensitive appetite. Therefore in the Peripatetic school, habits have no place in the will. The first consequence holds: the named virtues are in the irascible and concupiscible, which are adapted not to the will but to the sensitive appetite — for the arduous good and the delightful, as the object of the sensitive appetite. The second consequence holds: (*1.pol.3.*) reason dominates the inferior appetite with political dominion, to such a degree that the latter can resist it. Habits must therefore be placed there, so that it may operate easily and with delight according to the right dictate of reason.

I reply with Scotus, interpreting those testimonies: there are indeed habits in the sensitive appetite, but they are not virtues — except improperly and participatively. For (*2.Eth.6.*) virtue is defined as an elective habit, which belongs only to the will, as is indicated (*1.Eth. ad medium.*). To the first consequence it must be denied: for it was shown in the preceding that the irascible and concupiscible are adapted to both the sensitive and the intellectual appetite. To the second consequence this is true in the state of corrupt nature — which Aristotle alone recognized — but not in the state of established nature, in which through original justice the lower forces were subject to the higher, and the sensitive appetite obeyed the will and reason — and all agreed with one another concordantly.

Against this, one may object, second, against the second part of the assertion: if moral habit had its seat in the will, it would be nobler than prudence — since the nobler the perfectible, the nobler the perfection. But this consequence conflicts with Aristotle (*6.Eth.T.6.*). Therefore also the antecedent. The consequence holds: virtue is more perfect than the quality of silver, from which it is said to be more excellent (*as in the Ethics cited*). I grant the sequence of the antecedent. To its proof I say that prudence is nobler than the remaining habits in a certain respect — that is, in the ratio of directing and regulating — but not simply and absolutely, as the Doctor (*cit. §. Ad 1.M.*) maintains. To the consequence I say that this holds with respect to the divine good, not with respect to the remaining goods by which the will is also perfected. For just as the intellect is adorned with both divine and created habits — such as the arts and sciences — so the will is adorned with both infused and acquired habits.

Against this, one may object, third: supernatural acts do not produce supernatural acts facilitating the power toward producing similar acts; therefore neither do natural acts generate natural habits. The antecedent is clear in one who has only an infused habit, from which supernatural acts and habits do not appear to proceed. I reply that this argument — which militates both against us and against the adversaries — has no weight. For the infused habit differs from the acquired, because the latter facilitates the power in which it is, whereas the former does not. And acts of the acquired habit generate habit — which is denied to the infused habit — as will be shown abundantly in the following question.

Article VI. Whether Habits Inhere in the Sensitive Appetite.

Some, who dismiss habits from the will and from the sensitive appetite — which is natural and necessary — also remove habits from it, supported by this foundation: that since the will by its own nature is indifferent and undetermined, it need not be determined by habits; and since the sensitive appetite is a natural power determined to one thing, it does not appear to need habit — unless that appetite is regulated by reason and governed by the will, which is not the case for the appetite of a brute, but only for the appetite of a

man. These seem to be partially favored by Ockham (*Quol.2.q.16.*) and Gabriel (*3.d.23.q.1.art.3.*) — who hold that it cannot be sufficiently and evidently shown that habits reside in the sensitive appetite. The common position, however, is that of Scotus (*3.d.33.q.vii. §.Ad quast.Sub H. and §.Ad argumenta principalia ante N. and collat.6. in fine §.Ad quest.*), Ballus (*ibid.*), and others — who consistently and willingly defend that habits of any kind reside in the sensitive appetite.

It is to be noted that a power possessed of habit is called active and passive under different respects: it is called passive insofar as it receives in itself the habit — which is an accident of the genus of quality — and active because it is the cause and partial principle actively concurring in the production of acts, as will be plain in the next question.

The assertion is that the sensitive appetite is a fitting subject for receiving habits. So Scotus (*at the passages cited above*). It is proved, first, from (*1.Eth.cap.ult.*): the moral virtues are located in the irrational part, by which the commentator and other interpreters understand the sensitive appetite. And (*3.Eth.cap.9.*) it is subjoined that fortitude and temperance — which are habits — are located in the sensitive appetite, though they are not properly virtues except in a certain respect and less principally — as Ballus (*named*) asserts with Scotus. Second, the sensitive appetite indifferently regards appetible objects and is capable of being subjected to reason and amenable to the command of the will; it can therefore be habituated through the repetition of acts with respect to food and drink and any other appetible and pleasant object — as is plain from holy and just men devoted and habituated to fasting, abstinence from flesh, and similar practices. But such habituation and exercise is habit, as is plain from its description given in the present question, art.III. Therefore the sensitive appetite is the subject of habit. Third, habit is established to make apt and facilitate the power in which it resides, from what has been said above; but the sensitive appetite is facilitated and made apt through the frequency of acts concerning appetible, arduous, and difficult things to be borne and overcome — as is established from Religious men in the observance of the vows they have professed and in the acquisition of virtues, whose sensitive appetite at the beginning resists and opposes reason and the will; but afterward promptly and easily conforms itself and is regulated by moderating reason and obeys commanding will — to such a degree that it no longer inclines toward the opposite prohibited things. Habits are therefore subjected in the sensitive appetite.

As for the appetite of the brute, what will be said below will make this plain. The reasoning touched upon at the beginning of this article against this, is of no weight — since it is not because the appetite is determined toward appetible things, as the intellect is toward intelligibles, that it is capable of habit, but for other reasons adduced for proving the assertion given, especially because through the frequency and exercise of acts it is rendered easier and more prompt in operating.

Against this, one may object that all things we experience to be in us through the repetition of acts can in fact be produced without frequency of acts — through bodily qualities and through medical art. Therefore no habit is to be posited in the sensitive appetite. The antecedent is urged: every inclination toward gluttony and coition is induced through the generation or corruption of heat or cold; and through medical art concupiscence is diminished and one is disposed to sobriety and chastity. I deny the antecedent. To its proof I say that habit always assists and facilitates the power in which it is. For if there were two equally disposed and inclined toward appetible things through the said qualities, yet the one who possessed the habit would more quickly and conveniently tend toward them than the other who lacks habit — and therefore habit must be given in the sensitive appetite.

Article VII. Whether Habit Resides in the Body and Its Members.

Several — notably St. Thomas (*1.2.q.50.art.3.ad 3.*) and Almain (*3.d.23.q.2.*) — allege that the animated body and its members are not capable of habits, whom Suarez (*disp.44.Met.sect.2.n.3.*) follows. Scotus, however, (*3.d.33.q.vn.§.Ad 1.sub M.*), the Scotists (*ibid.*), and the Nominalists with their prince (*Quol.2.q.17. and 3.q.10. and 11.*), with whom Raconius (*disp.ult.de virtutibus q.1.art.3.*) subscribes, hold that habit resides in the body and its parts.

The assertion is that in the animated body and its members habit can be acquired. So the Doctor (*ubi supra and coll.6.§.secundum principale.*). This can be urged from Aristotle (*2.Eth.c.1. and 1.Magn.Mor.c.7.*), who denying habit to inanimate things seems — from the opposite — to grant it to animate things, namely those capable of being taught and instructed. Second, certain arts — called mechanical — are exercised by the members of the body: the art of playing the cithara by the hands, and the art of singing by the tongue; and by exercise the said members are more made apt, as experience attests. Since therefore habit is the facility and promptitude of acting, it follows that habit resides in the said members. Third, habit facilitates and makes apt those members that are moved — as is plain from painters and players, who by painting and playing are rendered more capable and prompt to paint and to play; but neglecting such exercise, they become slower and have more difficulty producing those works. I add that if someone has mastered the rules of an art but does not practice them, he does not possess the promptitude and facility of acting that constitutes habit. Habit is therefore aptly located in the members of the body.

Suarez replies (*loc.cit.*) that these things only prove that through the exercise of said acts, habit is acquired — not indeed in the body or its parts but in the faculties of the soul commanding and directing the motion of the body and its members. Against this: such facility remains in the body — say in the foot, or the hand, or other parts of the body — and although the said powers were present, unless the aptitude and facility were in those members, there would be

no habit in them. Moreover, such facility can be produced in the members even if it is not produced in the internal powers, because it is produced through acts that are transient and concern external matter. Furthermore, in brutes there is not the said directing of acts, yet in them habit is found — as I will show in the next article. For habit to exist, therefore, the direction of art need not intervene.

One may say, with Suarez (*cit.sect.2.num.4.*), that in the external instruments of art we sometimes experience that they become through use and exercise more apt to act — either because they are perfected with respect to shape, or because they are rendered more polished or soft: thus the members of the body by use can be made more fit for movement, either because the joints are relaxed or more contracted, or for some other reason. Similarly, the nutritive forces by custom become accustomed only to abstinence, because the qualities are remitted or parts of the body are desiccated and resist more. Against this: artificial instruments — since they are without soul — are not capable of habit, like any other inanimate things, as I said and forewarned from Aristotle. Therefore it is no wonder if, when polished and refined, they have nothing of habit. But if two men by their own nature are equally disposed in their bodily parts, and one of them has been furnished with habit, surely the one who possesses habit acts more easily and promptly than the other stripped of habit. Habit is therefore subjected in the bodily members. And what Suarez subjoins about the nutritive faculties openly conflicts with himself. For if by custom they become accustomed to abstinence, surely they become accustomed through habit — since habit and custom coincide, as will become known in the following article.

Against this, one may object, first, that the fitting subject of habit is that which alone is receptive of an immanent act — for since habit facilitates the power, it is received in it and resides in it; therefore neither the body nor its members are apt subjects of habit. I reply that the antecedent is insufficient. For the subject of habit receives not only immanent acts but also transient acts, and internal and external acts — through whose repetition and exercise the agent operates quickly and with delight.

Against this, one may object, second, that if habit is admitted in the members of the body, either this habit is received immediately in the local motive power — or not. Not the first, because that power would then not be active but passive. Nor the second, since that quality would not be a habit — since habit is in a power facilitating it toward acting. Therefore no habit is to be located in the body and its parts. I grant the major. To the minor I say that the motive power — as it receives the habit — is called passive; but as it produces acts, it is called active. Nothing prevents the same power from being called active and passive under different respects, as is plain from the intellect, which is called agent and patient (*3.de anima T.18.*).

Article VIII. Whether Habit Resides in Brutes.

Several Scholastics — to whom Suarez (*just cited Sect.3.*) and Arriaga (*disp.9.de anima sect.2.subsect.1.*) adhere — hold that brutes lack all habit and that every sense — both internal and external — is wholly unfit to be its subject. Scotus, however, (*3.d.33.q.vn. §.Ad 1.Sub M.*), Raconius (*disp.ult.de virtutibus q.1.art.3.*), and all the Scotists and Nominalists consistently and willingly defend that habit exists in brutes.

It is to be noted from Scotus (*just cited*), following Aristotle (*2.Eth.1.*), that in inanimate things no habit can be generated — because through the repetition of their acts they are not rendered more apt and easy than by the cessation of those acts: just as a stone, if it falls a hundred times downward, is not carried to the center more quickly through the first than through all the other descents. And if fire tends upward a hundred times, it is not elevated there more quickly and easily on the later occasions than on the first. But with animate things — capable of being taught and instructed — things go otherwise, as is plain from experience and the history of the elephant, lion, dog, and others.

The assertion is that brutes are distinguished by habit. The Doctor (*ubi supra*) hands this down, and it is urged, first, from Aristotle (*cited*) who excludes inanimate things from the participation of habit; therefore — from the opposite — since brutes are possessed of a soul, they can acquire habit for themselves. Second, the powers of brutes are determinable by habit, as is plain from the horse, which when first rounded with difficulty, afterward — after repeated circles — is easily driven in a circle; but such facility acquired through the repetition of acts is habit — and (*6.Eth.T.3.*): "In children and beasts, natural habits are implanted." And this can be illustrated by countless examples and experiences — especially of the elephant forming characters, as (*Athenaeus*) attests, and of the raven saluting Caesar, as (*Pliny*) records. Third, certain animals possess memory and are capable of experience (*1.Met.c.1.*) and also of facility of acting after they have been taught — as is plain from the dog, who carries in his mouth a handkerchief thrown by his master to that same master, when he has been instructed in carrying it several times; but such facility and promptitude is habit, as is plain from its notion and description. Augustine agrees (*1.83.qq.q.36.*): saying that the most ferocious wild beasts become tame and gentle through custom; but custom coincides with habit. Habit is therefore rightly established in brutes.

Suarez (*named above*) replies that this custom is not a habit inclining the power of the brute toward operating easily and with delight, but a phantasm — say a species representing in this or that manner more firmly and tenaciously inhering in the memory or phantasy. Against this: custom and habit sound the same — as Suarez himself noted from Augustine (*cited*) and Aristotle (*2.Mor.Eudem.cap.4.*). If therefore brutes have custom — as the same author grants — surely they are possessed of habit. Furthermore, species or phantasm is not custom but rather the cause of custom and habituation — as I said above

of the intelligible species, which is not habit but its partial cause. But a cause cannot be an effect with respect to the same thing. Moreover, Suarez himself (*sect.4.loc.cited*) argues against the Thomists who hold that the intellectual habit does not differ from the habit of the intellect; but the same thing would happen here — according to Suarez himself, who thinks that custom and facility of brutes in performing acts is intelligible species. Furthermore, (*sect.3. of that disputation, num.4.*) he wants to hold with the Thomists that the cogitative faculty of man, as well as the phantasy, is capable of habit; therefore so too is the cogitative of the brute — since they are of the same genus and ratio. Nor does it avail to say that the cogitative of man is directed by the intellect and commanded by the will. For that is extrinsic and does not make it capable of habit. For either the cogitative is precisely capable of habit or not; if not, then the cogitative of man is unfit to receive habit; if so, then so is the cogitative of the brute — which can likewise be directed by something extrinsic, namely by man through sensible signs, insofar as by habituation the brute has learned through the performance of such signs to obtain delight or avoid pain — as (*Richard, 3.d.33.q.1.art.1.ad 2.*) wisely hands down. Moreover, if the reasoning of Suarez who holds that habit is not to be posited in brutes — because every power of theirs is natural and determined to one thing — were valid, it would be retorted against himself: the intellect of man, his phantasy, and the other powers — with the exception of the will — are natural, necessary, and determined to one thing. But this notwithstanding, habit is posited in the intellect and in the cogitative of man; therefore it is also to be located in the cogitative of the brute and in the rest of its faculties — which are rendered more prompt and swift through habituation in operating.

Against this, one may object, first, that Averroes (*3.de anima com.18.*), defining habit, says: "Habit is that which we use when we will"; but brutes — since they lack will — cannot use habit when they will; therefore habit is not found in them. This is confirmed from Damascus (*2.fidei cap.22.*): "Brutes are not led but lead themselves"; therefore they obtain no habit. I reply that Averroes there speaks only of the moral habit pertaining to the will, the use of which remains in our freedom; not of the natural habit, the use of which sometimes does not remain in our power — as Paul (*Rom.7.*) agrees: "For what I would, that I do not." To the confirmation I say that testimony does not harm us. For even if brutes are led, they can nonetheless be made apt and facilitated in their acts. Hence Scotus (*1.d.17.q.2.§.Hanc viam.*) adds: "The sensitive appetite does not lead, because it does not have dominion over its action as does the free appetite, but is led — that is, determined to a certain operation by an agent."

Against this, one may object, second, that the powers of the brute — both external and internal — are necessarily determined to one thing by the objects themselves offered to them; therefore habit is not found in them. The consequence holds because habit inclines and determines the power to one thing. The antecedent is plain of the external senses — no one doubts whether

any habit is given in these, since it is clearer than light that they have no need of habit. Of the internal senses it is shown as follows: the object being present, there is no indifference in these senses but they are wholly directed toward it, in the same manner at the end as at the beginning — unless greater force is applied from without, as when a horse is spurred it runs faster. But if the object is absent and represented only through a species, the internal sense is determined to it — and through custom such a species adheres more firmly to it; therefore habit is not to be sought in it, since none can exist beyond the species residing in it, which — as has been said — do not participate in the proper ratio of habit.

I reply, distinguishing the antecedent: equally difficult or equally easily — I deny; more difficultly or more easily — I grant. For we see that a horse when first being tamed at the beginning only with difficulty moves and allows a taming rider; but afterward — through the frequency and exercise of acts — it easily moves at the direction of the rider and horseman. To what is subjoined about the external senses, one may say that in some perhaps there is habit — as is plain in Perspective and Astronomy. For an astronomer sees and observes the stars more clearly and distinctly because he has been exercised in them, than another who has looked at them once and is inexperienced in their study. And likewise in beholding images and other things — which are seen more conveniently and easily by one who has seen them many times than by another who has seen them only once. Of the internal senses the reply is more convenient: since the phantasy of the brute passes judgment on what is harmful and profitable to it — and we sometimes observe brutes, with no external impulse and spur, halting on a path and then proceeding. And if it should happen that the same beast traverses the same path where it previously halted, and does so afterward without any hesitation — even though before that place was a difficult passage for it — this occurs through habit, not through a species adhering to it more tenaciously.

Question II. On the Efficiency of Habit.

Article I. Whether Habit Is an Effective Principle of Acts.

The first position is that of Aureolus (*1.d.17.art.4.§.Restat. ergo.*), Durandus (*3.d.23.q.2.*), Vasquez (*1.2.disp.83.cap.2.*), and Hurtado (*d.16.de anima, sect.7.*) — who deny that habit effectively concurs in the production of an act. The second position is that of St. Thomas (*1.2.q.49.art.3.*), Cajetan (*ibid.*), Ockham (*Quol.3.q.20.*), and others — who affirm that habit flows effectively into the act. Scotus, however, (*1.d.17.q.2. and Coll.6.*) defends each of the two positions named as probable — but inclines more toward the second, as can be seen (*passim cited §.Ad solutionem huius quest.sub GG. and 4.d.49.q.2. §.Ad argumenta propè finem. and from 3.d.33.q.vn. §.Ad rationem.sub E. and in the Reportatio*). Vorrlong (*2.d.3.*), Viguerius, Lychetus, and others hold the same.

It is to be noted, first, that these three are ordered among themselves as follows: the object — or its species, which takes the place of the object; then the act, which is caused by the cognitive power and its object as by two partial causes constituting one total cause; and then habit, which is generated from repeated acts and flows actively into the subsequent acts. Although the species is sometimes called habit because it is permanent and rooted in the subject — as a habit is — it is nonetheless not properly a habit. For, as the Doctor (*2.d.3.q.10.§.Ad quest. ante G.*) notes, the species differs from habit. For one can have an intense habit and a remiss species — for example, if someone were of slow intellect and devoted to much study, he will have an intense habit and a remiss species; but if another were of sharp intellect and little devoted to study, he will enjoy a remiss habit and an intense species. Hence we experience that those slow of intellect arrive at greater learning than others of outstanding intellect who devote little time to study. The reason is that the former labor much and the latter little in acquiring learning — as Vorrlong (*ubi supra*) observes.

It is to be noted, second, from the Doctor (*1.d.17.q.2.§.Tertio modo. ante H.*) that habit is a partial cause — together with the power, which is the other partial cause — producing perfect and subsequent acts. For the power is indeed the total cause of the acts preceding the generation of habit; but the acquired habit and its power are two partial causes integrating and constituting one total cause producing at once the subsequent acts — just as the cognitive power and the object — or its species — are two partial causes constituting one total cause that produces the cognition of the object. Though between these there is some distinction: since the cognitive power without the object or its species cannot generate cognition; whereas the power absolutely — without any habit — can produce an act: namely the act that precedes habit and is itself the cause of habit.

It is to be noted, third, from the same (*ibid.*) that the power is the principal cause of the subsequent acts — by which the agent is said simply to be able to act — such as the intellect, by which man can understand, and the will, by which he can will; whereas habit is the less principal partial cause of those same acts. For habit is given not for acting absolutely but for acting easily and with delight. Hence it is not necessary simply but only in a certain respect — so that the agent may operate more easily and promptly. Moreover, the power uses the habit, not the reverse; and what uses another is principal — as is plain from the principal cause using an instrument. Furthermore, grant the opposite and it follows that there is no free cause — because since habit is a natural cause, if it were principal it would necessitate the free cause toward acting. Again, habit would be that by which the one who has it could first operate. And in what is ordered, the prior cause is more principal than the posterior — as is plain from God and the creature.

The assertion is that it is probable that habit concurs actively in the production of subsequent acts. Scotus holds this (*at the passages named above*). It is proved, first, from (6.*Eth.*6.): the practical habit is divided into active — such as prudence, described as an active habit with right reason — and productive — such as art, described as a productive habit with right reason. Hence the following argument can be formed: the prudent man is an agent, therefore prudence is active. Similarly, the craftsman is a producer, therefore art is productive. Hence Aristotle (2.*Phys.*T.28. and 5.*Met.*T.2.): art and craftsman belong to the same genus of efficient cause. Moreover, (3.*Eth.*6.): "Virtue is a habit by which a good man is made good."

One may say that prudence is called an active habit not because it is an active principle of its proper operations but because it directs moral actions; and art is called a productive habit not because it is the productive principle of its proper acts but because it directs transient operations concerning external matter. Against this: such direction is practical; therefore its principle is truly effective. The antecedent is plain — since from such direction craftsmen are denominated effective, not for any other reason than because they have a productive principle. Furthermore, the practical habit differs from the speculative in that the latter does not have an effective principle tending toward work — as I explained elsewhere when I treated of praxis — whereas the former possesses an effective principle, whether concerning manual things or otherwise.

Second, habit — from what was said in art.II. of the preceding question — is distributed into infused and acquired; but the infused habit is an active principle — for grace is the productive principle of the meritorious operation, and the light of glory is the active principle of the beatifying operation; therefore the acquired habit is also an active principle. The consequence holds because each is of the same subalternate genus of quality.

One may say that the infused habit does not act by its own force but only inclines the power toward acting — thus for meriting, grace is required so that the one who has grace is accepted by God, not so that grace brings anything about with him. Against this: besides the fact that this conflicts with the torrent of Scholastics who admit that the infused habit is truly active and infused by God into man so that with it he may actively concur, it contradicts Scripture — especially (1.*Cor.*15.): "Not I but the grace of God with me." And (*ibid.*): "The grace of God in me was not empty." (*James* 2.): "Faith without works is dead." And (*Heb.*10.): "The just man lives by faith." Moreover, everything that has an end has a principle of operating toward attaining that end — otherwise it would strive in vain to attain such an end; but the infused and acquired habit regards an end with a view to whose attainment they tend; therefore they possess proper operations concerning it — and hence every habit is productive and effective.

Third, form differs from matter principally in that form is an active principle whereas matter is a passive principle (*1.Phys.T.66.*). But habit is an absolute form — for it is of the genus of quality; therefore it is an active principle.

One may say that the substantial form is indeed an active principle, but not the accidental form — such as quantity, which is not of the genus of actives, as Averroes (*1.Phys.com.41.*) notes. Against this: quality is an active form, as is plain from the first and second species of the predicament of quality; but habit is of the first species of quality, as is plain in the Logic; therefore it is an active principle. Furthermore, that to which the effect is assimilated is its active principle; but the effect produced by the power together with habit is assimilated to the habit itself — as the grateful work is assimilated to charity, and the morally good work to the morally good habit; therefore habit is active.

Fourth, experience confirms that habituated men operate more than the non-habituated — as one who has the habit of Logic produces more and readier arguments than one who lacks it. But this comes from no other source than from habit — for it does not come from the power, which operates in the same manner if it is natural. Since therefore that effect depends on some cause, and this cause is not the power alone, it is plainly inferred that it comes from habit — together with the power concurring and cooperating.

One may say that this proceeds from the fact that habit inclines the power toward acting — just as gravity inclines the heavy toward the place below — not because habit is an active principle but only an inclining one. Similarly, because through habit all impediments are removed that can retard the power from work — and so the power itself operates promptly and readily. Against this: an agent of greater effort now than before — all other things being equal — has greater power, by which it produces a greater and more perfect effect. For that excess must flow from something — not from the inclination of habit, because inclination is not active, since it is of the genus of relation, and natural powers by their own nature are inclined — for example, the intellect is inclined toward understanding. Therefore from some active principle newly coming to it — which plainly is nothing other than habit. Nor is the power impeded from its work — since when the obstacle has been removed, we still experience that the habituated person operates more than the non-habituated. Moreover (*8.Phys.T.32. and 2.anima T.55.*): a man before science is in essential potency, and one who has science is in accidental potency. But what reduces from essential potency to accidental potency is an effective principle — because it is that by which the one who has it operates. Hence at the place last cited it is said: "As the soul is that by which we live, so science is that by which we know." But it is plain that the soul is the effective principle of its acts; therefore similarly habit is the cause of similar acts — from which it was produced. Finally, the moral habit is the active principle of moral acts — as justice, by which a just man operates

justly, and virtue, by which the one who has it is well disposed (*2.Eth.3.*); it is therefore concluded that habit cooperates in causing acts.

Against this, one may object, first, that a relation is not an active principle — since it is of the genus of sterile things; but habit is a relation (*7.Phys.T.17. and 5.Met.T.20.*); therefore habit does not actively concur in the production of acts. I grant the major and distinguish the minor: formally — I deny, because habit is quality, which is an absolute form; really — I grant; for just as science formally is an absolute being and designates a relation to the knowable, and just as a creature is an absolute entity and exhibits a relation to the creator, so habit formally signifies an absolute entity and connotes a relation to the power and also to the object about which the habit is.

Against this, one may object, second, that the power is the adequate principle of its acts; therefore habit is not necessary for the production of acts. The antecedent is plain: one power is a sufficient principle of those acts and does not require another power for producing the same — otherwise it would not be an adequate power. Habit is therefore uselessly admitted as another active principle concurring together with the power in producing those same acts. I distinguish the antecedent: absolutely — I grant; in a certain respect — that is, for easily and promptly eliciting acts — I deny. For habit avails and profits in that respect, and its usefulness and utility is seen therein.

One may press further: the power — without any cooperating with it — acts conveniently and readily: for in one instant it elicits an act. But what happens in a moment does not require facility and promptitude — which is expressed through habit; therefore habit is of no profit for the performance of acts. I deny the major. For although one admits that the power elicits one act in an instant, it does not elicit the remaining acts in the same way. Therefore habit conduces to their easy and delightful production.

Against this, one may object, third, that an accident is not an active principle in its proper subject — as whiteness does not act upon the wall in which it is subjected; but the act which is said to proceed from habit is often received in the power in which the habit resides; therefore it is not its active principle. I deny the major, which is not universally true — as is plain from the intelligible species, which partially causes the act of understanding, received in the same intellect in which the species inheres. Scotus, attending to this (*1.Met.q.6.*), explains that text of Aristotle (*l.de somno et vigilia, c.1.*): "Of whom is the potency, of the same is the act" — understanding "subjectively."

Against this, one may object, fourth, that things that differ in species cannot be equivocal causes of one another, because the equivocal cause is more perfect than its effect — since it contains it virtually and eminently. But the same thing with respect to the same cannot be more perfect and less perfect, more eminent and more depressed. But habit and act differ in species and are equivocal causes.

Therefore habit cannot be the effective principle of act, and vice versa. I distinguish the major: of total equivocal causes — I grant; of partial equivocal causes — such as habit is — I deny. As is plain from the intelligible species, which is a partial equivocal cause of the act of understanding, which is nobler and more excellent than it.

Article II. Whether a Habit Is the Active Principle of the Moral Character of an Act

Those who hold that the moral character of an act is an absolute entity caused by a habit assert that the habit is its efficient principle. The Doctor mentions these thinkers without naming them (*Collationes*, 6, §. *Secundum principale*), saying that some suppose the power to be the cause of the substance of an act and the habit to be the cause of its moral character. Those, however, who maintain that the moral character of an act is a relation of conformity or disconformity — a matter we treated in (*Book II, Question I, Article III*) — deny that a habit exercises an active influence on the moral character of an act by an influx distinct from the influx by which it concurs in the substance of the act. This is the position of the Doctor, to be cited below.

There is found in an act a twofold being: the being of nature and the being of conduct. The former is physical and absolute being — namely, a quality — whose efficient principle, if it precedes the habit, is the power alone; but if it follows upon the habit, we hold its active principle to be the power and the habit concurring together. The being of conduct, however, is that which follows upon the natural being of the act — that is, its physical being as either conformable or disconformable to the right dictate of reason. Hence a distinction may be drawn between the material being and the formal being of one and the same act, as the Doctor indicates (*Book I, dist. 17, q. 2, §. Ad arg. alia adducta ante Z*). The material being is the physical act, and is called the substance of the act; the formal being is conformity to right reason, or disconformity from it. For moral goodness is the integrity of all the due conditions and circumstances. The question now under examination is whether a habit concurs efficiently toward this moral being of the act, or not.

For moral goodness to exist, the right dictate of reason to which the act is conformed must precede it, as the measured precedes its measure and the regulated precedes its rule. Such a dictate, however, need not come from an intellectual habit — namely, from prudence — nor need the act conforming to the right dictate be elicited from a moral appetitive habit. For the right dictate precedes prudence, just as a cause precedes its effect, since through it the first degree of prudence is generated. Similarly, right election antecedes the moral habit, because through it moral virtue is generated in its first degree. Therefore, in the first act, reason dictates rightly without prudence, and the will chooses rightly in a moral sense without moral virtue. Prudence, however, once generated from the first act or from many other right acts of reason, inclines

more strongly toward eliciting similar dictates — that is, toward drawing the right conclusions of practical syllogisms concerning all the circumstances that are said to be present in the act to be elicited. Likewise, moral virtue, once generated after the first act, tends more readily toward producing acts similar to those from which it was generated than toward other acts.

What is generated by moral virtue is a certain quality whose essence, precisely speaking, does not include conformity to prudence, since it can be generated from similar acts of the same species without prudence — indeed, from erroneous reason, if such were present. This quality, however, which is generated from acts in general, is not a virtue by reason of being a quality. For it to be a virtue, conformity to prudence is required — or rather, its coexistence with prudence in the same agent to whom this habit is joined, as to a rule and prior cause. Although an act or that quality is of itself conformable to right reason, nevertheless such an act is not morally good in act unless it is actually conformed to right reason and to prudence coexisting in the same agent.

First Assertion. The moral goodness of an act does not have an efficient cause distinct from the cause that produces the substance of the act. So holds the Doctor (*ibid.*, §. *Quantum ad istum, sub P.*).

It is proved first: the moral character of an act is nothing other than a relation of conformity or disconformity, as is clear from the foregoing foundations. But for a relation, precisely as a relation, there is no proper cause distinct from the cause producing its extremes, since it arises from the positing of those extremes. Therefore, and so on.

Second: an act is not moral except through its habitude and conformity to the right dictate of reason, as I explained in the second note. If, therefore, a proper principle were given for the moral character of an act, it would be that relation of conformity; but a relation is not active, as I noted above. Therefore there is no proper principle of the moral character of an act distinct from the principle that produces its substance.

Second Assertion. Nor does a habit concur efficiently toward a moral act by an efficiency distinct from that by which it concurs toward its substance. So the Doctor teaches (*ibid.*).

It is proved in the same way as the preceding assertion, with the name of the act changed to that of the habit. For the moral character of a habit is a relation, just as the moral character of an act is a relation. Since, therefore, a relation is not properly produced but co-produced and emerges from the positing of its foundation and term — and since a relation is not an active principle — it follows that a habit acquires no efficiency distinct from that by which the substance of the act is caused. I add further: what gives being also gives what follows upon being, just as what produces the soul is also said to produce its powers and faculties. Likewise, what produces a corporeal substance is held to

produce also its quantity and the other accidents that follow upon it. In the same way, a habit that exercises efficient influence on the substance of an act exercises that influence also on its moral character, which follows from and accompanies the substance.

One may object first: virtue is that which perfects its possessor and renders his work good; but it does not render the work good through a passive principle, since it is not a receptive principle; therefore it does so through an active principle, and accordingly a habit is the active principle of the moral character of an act. Confirmation I, from (*Physics VII, 17; Topics V*): virtue is the disposition of a perfect thing toward what is best — not passively, since it is not a receptive principle; therefore it actively co-produces the moral character of the act. Confirmation II: the best stands to the best as the good stands to the good; but the principle of active production is best; therefore, since virtue most perfectly perfects its possessor, it follows that it is an active principle. I respond by expounding that testimony and drawing the distinction at the major: by an efficiency that is distinct, I deny; by the same efficiency that follows upon the substance of the act, I grant — as has been explained and proved above. The same distinction resolves the two foregoing confirmations.

One may object second, from the same (*Ethics II, 3*): virtue moderates the passions, not through a passive principle. For since an object is a natural cause, it produces effects to the ultimate extent of its power unless an obstacle is interposed; therefore, if virtue restrains the passion caused by the object, it follows that it is its sole principle. I distinguish the antecedent: virtue moderates a passion already present, I deny; one that is about to arise, I grant — insofar as it inclines the power, together with coexisting prudence, to shun immoderate pleasures that produce immoderate delight, not by diminishing pleasures already present but by forestalling those that could arise.

One may object third, from the same (*ibid., ch. 4*): one who does not have justice, even if able to perform just acts, cannot act justly; but moral goodness requires acting justly; therefore virtue is the active principle of the moral character of an act. I respond by interpreting the Philosopher and distinguishing the major: one who does not have the habit of justice cannot act justly absolutely speaking, I deny — for whoever elicits a first act of justice acts justly, even though he is not endowed with the habit of justice. In a qualified sense, I grant — that is, one who does not have the habit of justice does not perform just acts easily and with delight, as one who possesses the habit of justice does.

Article III. Whether a Habit Concurs Efficiently toward the Substance of an Act

Some thinkers — among whom Marsilius is numbered (*in Book I, dist. 17, q. 2, §. Ad 2. quaest. ante E*) and Henry (*Quodlibet IV, q. 10*) — hold that an infused habit produces the entire substance of a supernatural act, while an acquired habit

concurr only toward its ease. Others, such as Godfrey (*Quodlibet IX, q. 4, cited by the same authors ibid., §. Alio modo, ante G*), think that a habit concurs toward the mode or intensity of the act, but not toward its substance. The common opinion, however, is that of Scotus (*loc. cit., §. Quantum ad istum art., sub Q; and Book IV, dist. 49, q. 2, §. Ad argumenta FF*), Suárez (*Metaphysics, disp. 44, sect. 6, n. 8*), and others, who teach that a habit is the active principle of the substance of an act.

It is to be noted first, from the Doctor (*in Book I, loc. cit., G*), that the mode or intensity of an act is not an extrinsic accident of the act but an intrinsic degree of the act itself, so that an intrinsic degree is not one thing per accidens but one thing per se, just as an individual of a single species is one thing per se. Mode or degree is described as that which, when added to a thing, does not alter the thing. In this way, whiteness, whether of three or of four degrees, does not change in its essence but is intensified and perfected, because a quality admits of more and less. Hence mode or degree does not alter the nature of a thing — whether in divine things, such as infinity, or in created things, such as finitude. Difference, by contrast, does alter the essence of a thing, because it constitutes the thing in a determinate essential and quidditative being.

Assertion. A habit concurs not only toward ease and intensity but also toward the substance of an act. The assertion is threefold and is defended by the Doctor (*loc. cit.*).

The first part, found at the cited place at the beginning of question II, B, is evident: a habit is given for the purpose of facilitating the power in its operations. Hence stands that saying of Victorinus, cited by Vorrillon (*Book II, dist. 3*): "Nature makes one apt, art makes one easy, and practice makes one capable." And Aristotle (*Ethics II, 1*): habits bring delight in the affective faculty, ease in operation, and readiness and dispatch in the executive faculty, through the removal of obstacles. So to one who possesses a habit four conditions are attributed: (I) acting with delight; (II) acting easily; (III) acting with dispatch; and (IV) acting with readiness. Therefore a habit concurs toward the ease of an act.

The second part, which militates against Suárez (*loc. cit., sect. 6, n. 2*), is shown thus: whenever two partial causes concur simultaneously in producing a common effect, the production and perfection of that effect are attributed to both, as is clear in natural things. But the power and the habit concur partially in producing a perfect act, as I said in Article I of this question. Therefore the habit is the cause of the intensity of the act. Furthermore, when a cause that by itself alone produces an effect with less effort is joined by another assisting cause, the effect is produced with greater effort and rendered more perfect, as experience makes clear. Therefore, since the power alone does not produce an effect as intense and perfect as it does when the habit cooperates with it — as Suárez himself seems to suggest (*loc. cit., n. 6*), for a power with a habit can accomplish more than one without it — it follows that the habit co-produces the intensity of

the act. This is corroborated by that common saying, "United virtue is stronger" — an insight perhaps behind what Ecclesiastes says (4): "If two lie together, they warm each other; how can one alone keep warm?"

The third part is proved first: a cause that concurs toward the intensity of an act certainly concurs toward its substance as well, since, as I noted above, the degree of intensity is intrinsic and of the same character and species as the thing of which it is a degree. But the habit co-produces the intensity of the act, as even the authors of the opposing opinion concede. Therefore it also co-produces its substance. Second: if the habit caused only the intensity and the power caused the substance of the act, the act would be equally intense whether the power operates with lesser effort or with greater — just as a free power, which can operate intensely or weakly according to its own pleasure, produces equally intense acts. But the habit, being a natural cause, always operates necessarily and in the same way. Yet it is false that an act is equally intense whether the power operates with lesser or greater effort, as is evident and plain to everyone. Therefore, and so on. Third: if the habit were to supply intensity to an act, it would do so in some determinate degree — say, in the fifth degree. Suppose then a power more perfect than the habit, namely one of the sixth degree. This power, without a habit, would have a more intense act than a less perfect power with a habit. Therefore the substance and intensity of a perfect act are to be sought not from the habit alone nor from the power alone, but from both together.

One may object first, against the second part of the assertion: a habit is no more intense than the act from which it is generated, since an effect is not more perfect than its cause. Therefore a habit does not concur efficiently toward acts more intense than those from which it was produced, and accordingly the habit does not assist the power in producing more intense acts. I grant the antecedent and distinguish the consequent: by itself alone, I grant; together with the power, I deny. For although the habit alone cannot intensify an act, it can do so when joined with the power — just as one man who cannot drag a boat by himself can do so when joined with another.

One may object second: if the habit actively influences the substance of an act, then the habit is a power. The consequence holds because the principle of producing a thing as to its substance is a power, as the Doctor indicates (*Book III, dist. 34, q. un., ante §. His suppositis, sub H*). I grant the antecedent and deny the consequence, since, as Scotus notes (*Book I, loc. cit., §. Tertio modo, sub H*), a power is that by which its possessor can first operate and is the prior cause; a habit, by contrast, is that by which its possessor operates easily and is the posterior cause. For the power uses the habit, and not the reverse, and the power is more unlimited and universal than the habit.

One may object third: either the power and the habit are total causes or partial causes of an act. Not the former, because then one of them would be

superfluous. Not the latter, because the power is a sufficient cause for producing an act, as is clear in the case of the first act, which proceeds from the power alone. Therefore the habit cooperates in no way toward the substance of an act. I respond that they are partial causes of different orders and characters, concurring toward the same perfect act. Although the power would be simply sufficient for the production of an act, the habit is nonetheless given as another partial cause, so that the power may produce its acts easily and with delight.

Article IV. Toward Which Acts Does a Habit Exercise Influence

The acts of a power either precede or follow upon a habit, and are either similar or dissimilar, belonging to one power or to another. It is certain, however, that a habit does not concur efficiently toward first acts, because the posterior presupposes the prior and can supply no influx to it — just as an effect cannot give being to its cause, from which it itself received being. Since a habit is posterior to the prior acts from which it is generated, those acts share nothing of its being. This is affirmed by the Doctor (*Book I, dist. 17, q. 2, §. Tertio modo, ante H; and Book III, dist. 33, q. un., §. Ad quaest. H*).

It is likewise certain, in the common view, that a habit co-operates with the power toward acts that are posterior to the habit itself, since a cause precedes its effect and for that reason the habit is posterior to them. And a habit cooperates only with the power that it informs, since a habit is granted in order to assist the power in acting easily — just as the soul vivifies not any body whatsoever but only the body it informs. Furthermore, two partial causes concurring in producing a single common effect are united together so that they can produce that effect, as is clear in the case of matter and form, and of intellect and intelligible species. Now the power and the habit are two partial causes concurring simultaneously toward a perfect act, as I showed above. Moreover, habits must influence the production of acts similar to those from which they are generated, because the end of a habit is to confer strength on the power in which it resides. Since it is a necessary and natural cause, it cooperates accordingly toward those acts of the power that it informs. All the more so because a habit must be proportioned to the power it determines, and therefore a habit inclines a power toward acts similar to those from which it was generated. Furthermore, a habit is the less principal cause of an act, and the power uses it to cooperate with itself; therefore a habit operates only in the power in which it inheres.

It is equally certain that a habit does not cooperate toward all posterior acts of a power, but only toward acts similar to those from which it was generated. The first point is clear because there is not just one habit of a power but many habits, multiplied in proportion to the multiplicity of objects — so that the intellect is endowed with speculative and practical habits, and the will with moral habits. Again, someone may possess the habit of logic but not the habit of medicine. The reason is that a habit determines a power toward one thing, being a natural

cause. Therefore a habit does not concur toward all acts of the power in which it resides. The second point is also clear because a habit has no other power of acting beyond what it participates from the acts through which it was engendered. For a natural effect does not exceed the power of its cause; and the acts from which a habit is generated have only the power of producing acts similar to themselves, since they have a determinate and limited power. Therefore a habit is founded solely upon acts similar to itself. Moreover, habits are specified by the objects with which they are concerned — for instance, physics by the natural body, medicine by the curable body — and from those same objects they derive their unity, as was stated in my (*Logic, Book V, final question*). Therefore a habit produces only acts similar to those from which it was generated, as the Doctor confirms (*Book III, dist. 33, q. un., §. Ad argum. N; and dist. 34, q. un., §. Notandum ulterius, following Aristotle, Ethics II, end*).

On the third point, I maintain physically that one power does not cause an act in another power, and that the habit of one power does not cause a habit or act in another power. This follows from what has been said, since a power acquires a habit in order that the habit may assist it in operating easily and readily, and habits are diversified according to the diversity of powers. The habit of the intellectual power is one thing, the habit of the volitional power another, as the Doctor treats (*Book III, dist. 34, q. un., §. Ad istam quaest. B*). Therefore one power does not cause an act or habit in another power. Furthermore, for acts and habits to arise, the power and the habit must be simultaneously united, and the habit must inform that very power in which the habit inheres, as I showed above. Since, then, a habit does not inform any other power than the one in which it resides, it clearly follows that one power causes neither an act nor a habit in another power — except by way of direction, as the intellect shows the will what is to be done and what is to be omitted, and right reason dictates what is to be embraced and what avoided. Likewise, the will can command the intellect to consider this or that object and can divert it from speculation. It can also command the sensitive appetite to conform itself to the right dictate of reason and to abstain from forbidden foods during Lent. But this is not to act physically, only morally — as Suárez notes (*loc. cit., sect. 7, n. 3*) regarding certain moral philosophers who spoke in this way.

One may object first: Scotus (*Book III, dist. 33, q. un., §. Ad argumenta, ante N*) concedes a certain virtue in the sensitive appetite that can be caused only by the will, which is mistress of the powers, both higher and lower, as I said in (*the final question of Book I on the soul, on the will*). Therefore one power can cause an act and a habit in another power. I respond that in that passage Scotus is speaking of moral causality, not physical efficiency, which is what is at issue here. For there he posits a virtue in the sensitive appetite insofar as it conforms itself to the right will.

One may object second: fortitude and temperance are moral habits and are said to reside in the irascible and concupiscible appetites, and they bear upon the arduous good and the pleasurable good respectively; yet the same virtues are held by the Doctor (*loc. cit.*) to reside in the will. Therefore one and the same habit can produce an act in several faculties. I respond that the aforesaid virtues reside differently in the sensitive appetite and differently in the intellectual appetite. For in the sensitive appetite they reside improperly, insofar as the sensitive appetite is regulated according to the right dictate of reason and obeys the right will and acts according to its command. But properly they reside in the will, in which the irascible and concupiscible are also distinguished, as the Doctor writes (*Book III, dist. 34, q. un., §. Notandum, sub G*).

Article V. How Acts Concur toward the Generation of a Habit

Durandus (*Book III, dist. 33, q. 2*) holds that a habit is produced by the power, given the prior disposition of acts — that is, the habit naturally proceeds from the power, which however would not proceed at all unless the power were first disposed through acts. Others, such as Buridan (*Ethics II, q. 3*), hold that the power produces the habit through acts — that is, that acts are the path toward generating a habit. Scotus, however, (*Book I, dist. 3, q. 9, §. Ad I, ante P; and dist. 17, q. 2, §. Contra istam opinionem, ante L*), Vorrillon (*Book II, dist. 3*), Faber (*ibid., disp. 26, n. 32*), and Suárez (*Metaphysics, disp. 44, sect. 8, n. 6*) teach that acts are the efficient principle of a habit.

The cause of something can be twofold: remote or mediate, and proximate or immediate. For example, the proximate cause of an intellection is the intellect, while its remote and radical cause is the rational soul. So also in our matter: the proximate cause of a habit is acts; the remote cause is the power. This is not obscurely indicated by the Doctor (*loc. cit., Book I, dist. 17, q. 2, at the end of §. Tertio modo, H*), who says: "The power is the cause of the habit, at least through acts as intermediaries, and in no way the reverse." And (*Book II, dist. 42, q. un., §. Ad arg. D*): "From similar acts a similar habit is generated." For as he had said (*Book I, dist. 3, q. 8, §. Ad I, sub E*): "The formal effect is more assimilated to the lower proximate cause than to the remote and principal cause." Now it has been said above that the power is the primary cause and the habit the secondary cause of an act; and therefore, conversely, the immediate and proximate cause of the habit is acts.

Assertion. The efficient cause of a habit is not a disposition or a path toward causing a habit, but acts. The assertion is threefold and is defended by the Doctor (*loc. cit.*).

The first part, against Durandus, is shown thus. First: there is often no indisposition in a power toward the production of a habit — as is clear in the case of the intellect, which by its very nature is aptly disposed toward acquiring the habit of principles and of science, just as the heavens are rightly disposed to

receive the light of the sun. Therefore the efficient cause of a habit is not to be attributed to a disposition. Second: a natural cause that is rightly disposed and properly approximated to its object necessarily produces its effect — as is clear in the case of fire properly approximated to a combustible. But when a power is posited with every obstacle and indisposition removed, the habit is not thereby posited; yet when repeated acts are performed, a habit is acquired. Therefore the cause of a habit is not the aforesaid disposition.

The second part, which militates against Buridan, is proved thus. First: the action that is a path toward generating a habit belongs to the category of action, while the action that is the efficient cause of a habit belongs to the category of quality, as Scotus notes (*Book I, dist. 3, q. 9, toward the end*). Therefore the efficient cause of a habit is not the path toward producing a habit. Second: an action in the category of action has a term — for instance, the act of speaking has an intellection as its term, since through the act of speaking an intellection is produced, as I showed in (*the final question of Book I on the soul, on the intellect*). But an action in the category of quality has no term; rather, it is itself the term of the power (*Metaphysics IX, T. 16*). I add further that a habit is an absolute being, since it belongs to the category of quality; therefore it cannot proceed from a relation, which is a path toward an effect.

The third part is proved first from Aristotle (*Ethics II, 1*), who affirms and says that just as builders come to be by building and lute players by playing the lute, so by doing just acts men become just, by doing temperate acts temperate, and by doing courageous acts courageous. Scotus adds (*Book I, dist. 3, q. 9, at the end of Q*) another analogy: just as the light of the sun in a medium is the reason for generating heat there, so an act is the cause of a habit. Now it is clear that light is the efficient cause of heat; therefore an act is likewise the efficient principle of a habit. Second, from the common maxim of the philosophers: from frequently repeated acts a habit is generated — where the preposition "from" denotes efficient causality, as Vorrillon (recently cited) observes. This is confirmed by (*Romans XI*): "From him" — and (*Genesis XXV*): "Two young ones from your womb." Third: that to which an effect is assimilated is its efficient cause. But a habit is assimilated not to the power but to the acts from which it is generated, as Scotus testifies (*Book II, dist. 41, q. un., §. Ad arg. D; and Book III, dist. 33, q. un., §. Haec opinio, D; Ma.*) — and it is at hand that a cause strives to assimilate its effect to itself, as I said in (*Book I on causes*). This is clear also in the case of father and mother, to whom the son is similar.

One may object first, on behalf of Durandus, from (*Physics VII, ch. 3, T. 17*): there is no motion per se toward a habit; therefore a habit is not produced by acts. For if it were produced by acts, it would be an absolute form — like quantity, toward which, according to Aristotle, there is motion per se — and it would come about through an act or action. I respond by exposition and by distinguishing the antecedent: if "habit" is taken in the sense of the relation it designates — as when

science includes a relation to the knowable — I grant it; if it is taken as a quality and absolute form, I deny it, as I sufficiently explained in Article I of this question in the response to the first objection, and as the Doctor suggests (*Book I, dist. 17, q. 2, §. Hanc viam, S*).

One may object second, on behalf of the same, that a vicious habit is actively preserved by the will — for it is not preserved by an act that has already perished, nor by God who hates evil. Therefore it is preserved by the will, and consequently produced by it — which must be said of the other powers and habits as well. I grant the antecedent and deny the consequence. For air preserves light, which it does not produce. Likewise, the intellect preserves a species that it does not produce. Therefore, although a habit is preserved by a power, the power is not on that account its proximate cause.

One may object third, on behalf of Buridan: an active principle does not produce anything except through an action — just as fire does not heat except through the action of heating. But a habit does not produce an act through an action distinct from the act itself, because an act is an action, and there is no action of an action, nor a place of a place. Therefore the proximate cause of a habit is the path toward producing a habit. I respond that the argument works against action in the category of action, which is in no way the efficient cause of a habit — but not against action in the category of quality, which, along with Scotus (*loc. cit.*), we hold to be productive of a habit.

Article VI. Whether One Act Can Cause a Habit

The prior opinion is that of Durandus (*Book I, dist. 17, q. 8, ad 2*) and Hurtado (*De anima, disp. 16, sect. 5, §. 45*), who hold that a habit is produced by a single act. The posterior opinion is that of Scotus (*Book I, dist. 3, q. 6, §. Ad q., sub H; dist. 17, q. 2, §. Qui vult, sub Y; and Book III, dist. 33, q. un., §. Haec opinio, B; §. Ad rationem, E; §. Ad q.; and §. Ad I, I*), Vorrillon (*Book II, dist. 3*), Faber (*Book II, disp. 26, n. 32*), Racon (*final disp. on virtues, sect. 4, q. 2*), and Suárez (*Metaphysics, disp. 44, sect. 9, n. 12*), who teach that a habit is acquired from several acts.

It is to be noted first, recalling what was said in the (*Logic, question on quality*), that the first species of quality is given two names: disposition and habit, which, as was established there, differ accidentally — as the perfect from the imperfect, the inchoate from the consummated, the transient from the permanent, the weak from the firm — as I explained and proved at length in the passage now recalled. A disposition is easily removed from its subject; a habit is difficult to uproot from it. Ease or difficulty, brevity or length of time, do not make an essential difference, as is clear from (*Ethics I, ch. 6*), cited by the Doctor (*Book IV, dist. 49, q. 6, near the beginning, ante A*). Hence, although a disposition can be called a habit in an imperfect and inchoate sense, yet "habit" in its proper and common usage denotes a quality rooted in a subject, difficult to move, fixed and permanent, produced from repeated acts — as the Philosopher indicates in the

(chapter on quality), saying that a disposition becomes a habit through long duration.

It is to be noted second that a habit is intensified and perfected through many degrees, as I said elsewhere regarding the intensity of quality — so that through the first act of an agent operating in a power the first degree is acquired, through the second act the second degree, and so on in turn, in the manner I explained at the passage now cited and which the Doctor shows (*Book I, dist. 3, q. 7, §. Quidquid fit, ante Y*), and which Gabriel expresses distinctly (*Book III, dist. 23, q. 1, dub. 4*). For this reason certain thinkers are to be refuted who suppose that nothing is acquired in a power through the first act, but only through the last act by virtue of the preceding acts. For since the same reasoning applies to the first act as to the subsequent ones, it follows that just as nothing is acquired in the power through the prior act, so likewise nothing is acquired through the posterior acts — which those same authors do not concede. Therefore they ought not to admit the former either. Hence those who are zealous for virtue are said to advance from virtue to virtue, from degree to degree of greater perfection. For this reason theologians enumerate three states of those who strive for virtue: the beginners, who have not yet attained virtue; those making progress, who are advancing in its acquisition; and the perfect, who possess it in a perfect state. The last are said to have a perfect and consummated habit; the former have a disposition and imperfect habit. For this reason Aristotle (*Ethics VII, 7*) distinguishes the continent man from the temperate man — because the former, although he acts virtuously, still feels some difficulty, while the latter acts without difficulty, readily and with dispatch — as Scotus approves (*Book III, dist. 33, q. un., ante §. Ad rationem, B*).

Assertion. A habit absolutely speaking is acquired not through one but through several acts. So the Doctor holds (*loc. cit.*).

It is proved first from Aristotle (*Ethics I, 7, and Ethics II, ch. 1*), where the Philosopher, discussing both intellectual and moral habits, says that these are acquired by use, time, experience, and practice. He makes this clear (*Ethics I, loc. cit., ch. 8*) with this analogy: just as one swallow does not make a spring, nor one day, so neither does one act make a habit. Second, from the celebrated and common maxim of the philosophers, adduced by the Doctor (*Book I, dist. 17, q. 2, §. Qui vult, sub Y; and Book III, dist. 33, q. un., §. Haec opinio, B*): "From frequently repeated acts a habit is generated." And the reason is, as the Doctor argues (*at the last-cited place*), that a habit is placed in a power not merely so that the power may act through it, but also and principally so that it may operate easily and with delight. For someone can act rightly without an acquired habit — as is clear in the case of a man addicted to vices and habituated to them who has recently converted to the good. Such a man, although by the right dictate of reason he can act well, does not do so easily and readily but experiences difficulty. Third: if a habit were acquired through one act, one who possessed the habit would

undergo no difficulty or struggle in acting virtuously — the contrary of which is evident from experience. Third: if the entire habit were generated through one act, since one habit is opposed to another and they cannot coexist — as I said in (*Logic, Book V, final question*) — it would follow that the contrary habit is destroyed through one act, as the habit of lust would be destroyed through one act of chastity and continence. But that this is false, no one fails to see. Fourth: through one act a disposition is produced which, as Aristotle testifies (*at the end of the chapter on quality*), becomes a habit through practice. But if through such an act the entire habit were acquired, this would not be necessary; rather, as soon as there was a disposition, there would also be a habit. Furthermore, the habit would be a simple quality, and all of science would be acquired by us through a single demonstration — which I showed to be false in the (*Logic, at the place just cited*). Hence I am surprised at Suárez, who, while holding with the Thomists (*loc. cit., sect. 4, n. 15*) that the habit of science is acquired through one act, now teaches that a habit is not acquired except through a frequent repetition of acts. For if science, which is a habit, is produced by a single act, then a habit absolutely and simply speaking is also acquired through one act — which the same Suárez denies.

One may object second: if a habit is not generated by one act, then neither is it generated by many acts. For the same reasoning seems to apply to one as to many. If the first act does not cause a habit, neither does the second, and so on through the rest, since they are of the same character and concur successively in producing a habit. I deny the consequence, as is clear from the example of someone cutting wood: he does not cut the wood with one blow, but with many. I add that often-cited saying: "A drop hollows the stone not twice but by falling often."

One may object second: a very intensely exerted act has as much force as many weakly exerted acts have together — as is clear from experience in the case of someone cutting wood with an intense blow, which he could not have achieved with many weak blows. But weak acts cause a habit; therefore the single act that equals them also causes a habit. I respond that a habit is most often caused through a frequency of acts; but it cannot be denied that at times a very intense act produces a habit, as may be seen in the Doctor (*Book III, dist. 33, q. un., §. Ad q., H; dist. 36, q. un., §. Licet, infra K; Book I, dist. 3, q. 9, at the end of Q; and Book IV, dist. 49, q. 9*).

One may ask first, whether there is mutual causality between an act and a habit. I respond affirmatively. For as is clear from what has been said, prior acts cause the habit; then the habit concurs partially in causing posterior acts — just as vapors drawn by the power of the sun into the middle region of the air become drops of rain, and subsequently rain is the cause of vapors: not the same vapors numerically, but specifically.

One may ask second, whether acts and habits are of the same species. I respond negatively, with Scotus (*Book I, dist. 17, q. 2, §. Tertio modo, H; and §. Contra istam, K*). For an act is vital, whereas a habit is not; and there can be an act without a habit, and conversely, as is clear in the case of a sleeping person. Again, an act is the term of a power (*Metaphysics IX, T. 16*), whereas a habit is not.

One might say: both acts and habits are species of the first genus of quality, as can be seen from its enumeration given in the Logic; therefore they are of the same species. I say that they are of the same subalternate species, but not of the same lowest species, which is what the objection concerns.

Article VII. Whether an Act Is More Perfect Than a Habit

Alemán (*part II, q. 96, m. 2*) and others hold that a habit is nobler than an act. Scotus, however, (*Book IV, dist. 49, q. 1 and 2, §. Ad arg. GG*) and many others hold that an act is more excellent and eminent than a habit — which Suárez candidly acknowledges is more probable with respect to acquired habits (*loc. cit., sect. 8, n. 20*).

It is to be noted that a habit and an act can be regarded in two ways. In one way, as causes: in this regard, an act, which is the cause of a habit, surpasses in nobility the habit produced by that act; and conversely, a habit is nobler than the act caused by the habit. Although one might say that a habit is only a partial cause of an act, which is not wont to surpass in nobility the effect produced by it — as is clear in the case of the intelligible species, which although it is a partial cause of an intellection, is nonetheless subordinate to the intellection itself. In the other way, they may be regarded as entities — and in this sense the present question debates whether an act excels a habit in nobility.

Assertion. An act is simply more excellent than a habit, whether acquired or infused. The assertion is twofold and is defended by the Doctor (*loc. cit.*).

The first part, concerning an acquired habit, is proved by the Doctor (*loc. cit., q. 1*), arguing against the opposing view: first, from (*Ethics I, ch. 8 and 9 and following*), where the Philosopher places happiness in the best and ultimate act. The same is read in (*Ethics X, 10*). It is gathered also from (*Metaphysics IX, ch. 7, and book XII, ch. 6*), where the Stagirite, speaking of God, says: "If he does not understand, what will be distinguished and venerable in him? He would be like one asleep." And he holds this expressly in (*Magna Moralia I, ch. 18*). Augustine favors this view (*On Christian Doctrine I, ch. 6*), placing beatitude in the act of enjoyment. Second: a vital act excels what is not vital, just as the animate is ranked above every inanimate thing, as has been said elsewhere. But the act of a vital power is vital, whereas a habit is not at all. Therefore the former excels the latter. Third: an act is the total cause of a habit, but not the reverse; for a habit is only a partial and less principal cause. Now it is clear that a total cause is more eminent than a partial and less principal cause. Therefore, and so on. Fourth: the ultimate formal end of something is nobler than those things directed

toward its attainment, since an end is superior to the means to the end, as I said in the (*question on the final cause*). But the most perfect beatific act is the ultimate formal end of a beatifiable creature, as is clear from the authorities cited above. A habit, however, exists for the sake of the attainment of such an end, since a habit exists for the sake of a perfect act — for a power informed by a habit produces a more intense and excellent act than it would if deprived of a habit, as the Doctor writes (*in Book I, loc. cit., §. Concedo, I*). Finally, an act proceeds from a nobler principle — namely, the power.

The second part, concerning an infused habit, is shown in the same way. For the authorities cited above and the reasons adduced clearly demonstrate the same thing, even though Suárez (*loc. cit.*) on infused habits is unwilling to affirm this openly.

One may object first: a good that is lasting and permanent is better and more perfect than a good that is instantaneous and fleeting. But a habit is permanent and lasting, being difficult to move; whereas an act quickly passes and immediately flows away. Therefore an act is inferior to a habit. The major is supported by (*Aristotle, Topics III, ch. 1*). Confirmation: a habit is the equivocal cause of an act — not univocal — and such a cause is more excellent, since it contains its effect virtually and eminently. Therefore a habit excels an act. I expose and distinguish the major: in terms of simple and absolute nobility, I deny it; in a qualified sense, I grant it. Hence Aristotle (*Ethics I, 6*) goes on to say that a white thing of one day is equally as perfect as a white thing of one year — for duration, whether greater or lesser, is accidental to those things, as Scotus explains (*Book IV, dist. 49, q. 6, §. Hic duo*). To the confirmation I say that this would conclude regarding a total equivocal cause, not a partial and less principal one — which is what a habit is with respect to an act, as Scotus notes (*in Book I, loc. cit., §. Contra, sub H; and in Book IV, loc. cit., q. 2, GG*).

One may object second: infused habits are created by God and infused into the rational soul, while acts proceed from the faithful human being. But it is nobler to come immediately from God than from a creature. Therefore at least infused habits surpass acts in dignity. I respond that the argument concludes only to a qualified nobility, not a simple one — as is clear from the case of a composite substance, which is produced by a creature and yet simply excels any accident produced immediately by God.

Article VIII. How a Habit Is Perfected Through Acts

It is certain among philosophers that a habit is perfected by the acts from which it is produced. For just as it is generated through acts, so through those same acts it is perfected, as the Doctor teaches (*from Ethics II, 2*) in (*Book II, dist. 3, q. 1; and in the Reportatio, Book I, dist. 17, q. 3*). Since it is a quality that can be perfected and intensified, it tends from the imperfect toward perfect and consummated being. This being presupposed as true and demonstrated in (*Book on Intension*

and Remission), the present inquiry is whether a habit is perfected and intensified through all acts, or only through more perfect ones.

Thomas (*Summa I-II*, q. 52, art. 7; *II-II*, q. 24, art. 5 and 6) and his disciples hold that a habit is not intensified through a remiss and equally intense act, but only through a more intense act. Scotus, however, (*Book I*, dist. 17, q. 2; *and more expressly in the Reportatio*, same distinction, q. 6), Durandus (*ibid.*, q. 8), and Gabriel (*Book III*, dist. 23, q. 1, dub. 4) affirm that a habit is intensified and perfected through every act, whether intense or remiss.

It is to be noted, recalling what was said at the cited place, that intensification is achieved through the addition of degree to degree. Degrees, moreover, are of the same species and character, from which a unity arises — the unity of homogeneity, as will be clear in the following article. It is also to be recalled from that same passage that there is a twofold augmentation: intensive and extensive. With these points presupposed and recalled:

First Assertion. A habit is intensified through more intense and more perfect acts. This is the common opinion among scholastics. It is proved first: what is capable of being perfected is perfected by a greater perfection suited to it — as the luminous is perfected by greater light, and the blessed by greater glory. But a habit is capable of being perfected and intensified, as none deny, and a more intense act is its greater perfection. Therefore through a more intense act a habit is perfected. Second: what tends from the imperfect to the perfect is first perfected by a lesser perfection, and afterwards by a greater — as daily experience shows. But a habit progresses from the imperfect to the perfect — namely, from the state of disposition to the state of habit, as is clear from what has been said. Third: a thing receives its perfection from the same source from which it receives its being, because perfection follows upon the thing whose perfection it is — just as a mode follows upon the modified thing and a degree follows upon the graduated thing. But a habit receives its being from acts, as was proved above. Therefore it also draws its perfection from the same source, and principally from more intense acts, which are more perfect. Therefore a habit is perfected through more intense acts.

Second Assertion. A habit is perfected through every act, whether remiss or equally intense. So Scotus (*loc. cit.*) holds. It is proved first from (*Physics VIII*, T. 80): a power that is in a greater magnitude is greater and has greater efficacy. For if two fires are brought near a combustible, they burn it more quickly than one fire alone; and if the power of both were in one, it would be stronger and more efficacious than if distributed between two. In the same way, therefore, several equal or unequal and remiss degrees of the same order and character intensify and perfect the same habit. Second, Augustine (*On the Trinity XII*, ch. 6) seems to argue thus: every form and specific ratio is more perfect in several individuals than in one, because it is in them by participation — so that if the aforesaid ratio of one individual were in another, it would be more perfect. In the divine things,

however, since the divine nature is wholly and entirely in all and each of the Persons without division, being infinite, there is no specific difference among them. Therefore, likewise, several degrees even if remiss intensify a habit. The consequence is proved by two examples: one of two equal or remiss lights, or one more intense than the other — if placed together in the same hall, they illuminate and clarify it more, because they are intensified. The other example is of two gravities: if they are in the same weight, it is clear that the weight weighs and is heavier for no other reason than that they intensify each other in the same subject — just as water added to water, and earth added to earth, whether more or less, always increases that to which something is superadded. Therefore, if any act is performed by the same power with respect to the same habit, whether intense or remiss, it intensifies and perfects the habit. Furthermore, every perfection perfects its perfectible, just as every form perfects matter. And the degree caused by an act is some perfection of the habit. Again, degrees are of the same species; therefore if one act intensifies a habit, another act also in its own way intensifies the same habit. For if heat heats, then every heat, whether great or small, heats in its own way. In the same manner, every degree of whatever kind perfects a habit. Add the evidence of experience: if someone exercises himself in some art with remiss acts, he will become more skilled and ready than another who does not exercise himself in the same art with such acts — and this can arise from nowhere other than the intensification produced in the habit through such acts.

One may say, with Suárez (*loc. cit.*, *sect. 10, n. 11*), that this arises from a disposition that one act has and another does not. Against this: a disposition does not intensify a habit — since even according to Suárez intensification occurs through the addition of degree to degree. But a person becomes more ready and disposed to act through the use and exercise of several similar acts. Therefore it is not through a disposition but through intensification that a person becomes more ready and disposed to operate. Furthermore, God augments grace in those who merit and act well — both through intense acts and through remiss acts. For to every good work grace is due. If, therefore, through a greater or lesser good act the habit of grace always grows, the same must be affirmed of acquired habits, since each is augmented through the addition of degree to degree, as Suárez himself also admits (*loc. cit.*).

One may object first: action proceeds from a proportion of greater inequality — that is, the power of the agent is always greater than that of the patient. But if a habit were intensified through equal or remiss acts, this would not be true. Therefore a habit is not intensified and perfected through just any acts. I distinguish the major: concerning a destructive action of a contrary upon its contrary, I grant it — for fire to act on water, it must be stronger and more powerful than the water, as I said in (*Book on Action*). Concerning a perfective action, I deny it. For light is augmented even when the light added to it is more remiss than the preceding light.

One may object second: an equal does not act upon an equal, nor a remiss upon an intense; for action proceeds from the victory the agent has over the patient, and there is no proportion of a remiss agent upon an intense one. Therefore a habit is not augmented through equal or remiss acts. I distinguish the antecedent: concerning perfective action, I deny it; concerning depletive and destructive action, I grant it — as has been sufficiently illustrated in the case of light and similar things, which if added to equal or more intense things are themselves thereby intensified and perfected.

Article IX. Whether a Habit Coalesced from Several Degrees Is One

This difficulty has no place among the Thomists, who hold a habit to be a simple quality; but it does arise among the Scotists and Nominalists, who teach that a habit is a composite quality coalescing from many similar degrees. All agree, however, that a habit is one, since it is one species of quality, and every species enjoys its own proper unity. The question is how, given that a habit participates in perfective degrees, all those degrees existing in the habit can make one habit.

It is to be noted and recalled from (*Physics, Book II, q. 5, art. 1*) that a thing can be one in many ways: (I) by unity of aggregation, as a heap of stones; (II) by unity of order, as an army; (III) by unity per accidens, as white wood; (IV) by unity of real identity, as a nature and its property; (V) by unity of composition, as a physical body; (VI) by unity of similar parts — in which sense a continuous quantity is one by the unity of parts of the same character. And a habit is one by homogeneous and gradual unity.

Assertion. A habit is one by homogeneous and gradual unity. So Scotus holds (*Reportatio, Book I, dist. 17, q. 6, dub. 2*). It is proved first: just as a continuous quantity having parts of the same character is one by the unity of continuity or homogeneity, and a material substance having entitative parts is one by homogeneous unity — as I taught with Scotus in (*Book on Quantity*) — so a habit having several degrees is one by homogeneous and gradual unity. Second: a whole body of water gathered in one place is said to be one by homogeneous unity, and a homogeneous body is called one by singular and homogeneous unity. Therefore, by the same reasoning, a habit compacted from several degrees is one by homogeneous and gradual unity.

One may object first: from two things a composite one is not constituted unless one stands as potency and the other as act (*Metaphysics VII, T. 2*). But this is physical composition from matter and form, which is said to be one by unity of composition — and such is not the union of degrees in a habit. Therefore a habit composed from degrees is not one. I distinguish the major: concerning unity of composition, I grant it; concerning homogeneous and gradual unity, such as is the unity of a habit, I deny it.

One may object second: the first degree of a habit is less perfect and stands in potency with respect to the second degree, which is more perfect and stands as

act with respect to the first. Therefore in a habit there is the unity of physical composition. I deny the antecedent: all degrees of a habit are of the same character, just like all parts of a continuous quantity. Therefore they possess not a unity of composition — whose parts are of different character — but a homogeneous and homogeneal unity.

Article X. Whether and How a Habit Is Corrupted

Experience teaches that a habit can be diminished, corrupted, and lost — and reason confirms it. Experience does so in the case of some who, through forgetfulness or some other cause to be assigned below, have lost the habit of an art or science with which they were endowed — notably Albert the Great, whom common report says had lost the habits of the arts and sciences before his death. Reason confirms it because what can be augmented can also be diminished, and what is capable of intensification is also capable of remission and loss — as is the case with a habit. For I said above that a habit is intensified through acts; consequently it is remitted and lost through the cessation of acts or through some other cause to be given presently. Scholastics debate and inquire what the corrupting and destructive cause of habits may be.

It is to be noted first that this difficulty is not raised concerning infused habits, which, since they are produced through creation, are not properly corruptible but only annihilable. For what can be created can likewise be annihilated, as the Doctor notes (*in the Reportatio, Book I, dist. 17, q. 7, §. Dico ad q.*). Such habits are said to be corrupted by us in a demeritorious way, as the same Doctor testifies (*Book II, dist. 35, §. Ex ista solutione, ad 2*). But this discussion concerns acquired habits, which are both generated and corrupted within us. Their generation is called a positive and acquisitive movement, while their corruption is called a privative and depletive movement, as is evident in (*Physics, Book on Motion; and Book on Generation and Corruption*). Furthermore, note that the subject of a habit is either corporeal and corruptible — in which case, when it is corrupted, the habit is corrupted along with it, according to that common saying: "When the subject is corrupted, all things in the subject are corrupted"; or it is incorporeal and incorruptible — in which case, from the side of the subject itself, the habit is not corruptible. Nor is it corruptible from the side of its formal cause, which is the habit itself, since a habit is a permanent quality. Nor is it corruptible from the side of its conserving cause, since it does not require a continuous influx from its efficient cause — for it depends on that cause in its becoming, but not in its being, given that it is permanent and rooted in its subject.

It is to be noted second, recalling from (*Book on Causes, q. 1*), that there are two kinds of cause: per se and per accidens, or positive and privative cause. A positive corruptive cause is one that applies force to something and destroys it — as great heat destroys small cold. A privative corruptive cause is one by whose absence or non-operation something perishes — as by the absence of a helmsman a ship is wrecked, and through non-exercise of an art the art is lost.

Tatarets (*Book on Length and Brevity of Life, sub 3*) gives four ways in which something can be corrupted: (I) by its contrary, as heat by cold; (II) through the corruption of its subject — as Aristotle says in the work just cited, ch. 2: "When animals are destroyed, both science and health, which reside in animals, are destroyed"; (III) through the corruption of what conserves it — as light is extinguished when the luminous body is destroyed; (IV) through the corruption of its natural and fitting disposition — as when heat and dryness are removed, fire is destroyed. Or through the approach of what is opposite — as science is corrupted by the advent of error.

First Assertion. The cessation of acts is not a per se cause of the corruption of a habit but a per accidens cause. The assertion contains two parts. The first part is proved first from (*Ethics I, ch. 5*): sleeping persons possess the same habits that they have when awake; yet when they sleep they cease from the acts of those habits. Therefore the cessation of acts is not a per se cause of the corruption of habits.

Nor does it avail to say that brief cessation does not remove the habit, while prolonged cessation does — as iron does not immediately corrode, but only after a long interval of time. For this is said gratuitously, since time is not per se a cause of corruption, as I showed in its proper place, but only per accidens. All the more so because a habit does not depend on acts in its being, but only in its becoming — otherwise, one who possesses a habit would necessarily always be acting and producing acts, which is false. This is like a house, which does not decay or wear away from the builder, even if the builder is absent, especially if the house does not depend on a bodily organ or faculty, nor is it assailed by contraries. Second: a positive effect does not depend on a privative cause in its being, nor is it corrupted by such a cause. For a corrupting cause must positively influence the effect to be corrupted, if it is per se permanent and difficult to remove. But the cessation of acts is a privative cause, as Aristotle indicates (*Ethics II, 3, and ibid. book III, 5*): to cease from acts is not to act and not to exercise influence. Third: for a contrary habit to be introduced into a subject, the habit previously existing must be expelled. But it cannot be expelled except through a positive action — as is clear from the case of heat expelling cold from the same subject.

The second part is proved first from Aristotle (*On the Length and Brevity of Life, ch. 2*), who affirms that science is corrupted through forgetfulness. Augustine writes the same (*On the Immortality of the Soul, ch. 4*). This is to be understood per accidens — that is, because a man forgets the middle term of a demonstration by not exercising himself in the science he possesses, and therefore sometimes lapses into error, which destroys science. Second, experience confirms that a habit is lost through idleness and non-exercise. But this deficiency or cessation from acts is not a per se cause, as I showed in the first part; therefore it is a per accidens cause, since a cause is sufficiently divided into per se and per accidens,

as I noted in (*Book on Causes*). Moreover, the corruption of a habit can sometimes arise from ill health of the body — as Sabellicus relates that Messala Corvinus, the orator, through a severe illness forgot even the names of his slaves and his own name. Or from injury to an organ — as Valerius Maximus reports that a certain philosopher, struck by a stone, lost the memory of letters. See what I said in (*Logic, Book V, final question*).

Second Assertion. The per se efficient corruptive cause of a habit is opposing and contrary acts; the formal corruptive cause is the contrary habit. The assertion is divided into two parts and is defended by the Doctor (*Book III, dist. 36, q. un., §. Per hoc, sub C*).

The first part is proved first: a habit is generated from similar acts; therefore it is corrupted by contrary acts. The antecedent was proved above, for the efficient cause of a habit is acts of the same character, repeated. The consequence holds from opposites — just as heat makes and conserves heat, so if it is stronger it expels from the same subject and corrupts cold, which is contrary to it. Second: contraries mutually expel each other from the same subject, from Aristotle (*in the chapter on opposites*). Therefore opposing and contrary acts expel the opposing habit from the subject into which they strive to introduce the contrary habit. The consequence holds because two contraries in the extreme cannot coexist in the same subject simultaneously.

The second part is proved first: two forms opposed to each other are impossible in the same subject — as the form of fire and the form of water in the same matter. But habits are accidental forms. Therefore they formally expel each other from the same subject. Second: an active principle acts through acts as intermediaries — as fire heats through heat and the act of heating. But a habit is a partial active principle of similar acts, as was established above. Therefore one opposing habit formally excludes another, by itself, and efficiently through dissimilar and contrary acts. Thus virtue expels vice, and science expels error, as the Philosopher just cited affirms.

Third Assertion. Remiss opposing acts cannot corrupt the entire opposing habit. This is deduced from the Doctor (*Book III, dist. 33, q. un., §. Haec opinio, B*). It is proved first: a weaker and feebler cause cannot overcome a stronger and more powerful cause, as is plain to all. But remiss opposing acts are a weaker and more feeble cause than the opposing habit, which is intense and acquired from more intense acts. Therefore, and so on. Second: for something firmly rooted in a subject to be corrupted, the corrupting cause must have greater power and effort than the resistance of that thing — because the corruption of a patient comes from the victory the agent has over the patient, as was proved in the (*question on action*). But a habit adheres tenaciously to its subject, being difficult to move. Therefore a remiss and feeble act cannot destroy the opposing habit — as is clear in the case of one steeped in a habit of vice who, upon

converting, elicits an act of virtue: such an act is remiss and is accompanied by difficulty, as Scotus notes (*Book III, at the passage previously cited, B*).

One may object against the first assertion by experience: those who possess habits, if they do not persevere in their exercise, little by little lose the habits they possess — indeed, if they lack the use and exercise of them for a long time, they are entirely without them, as if they never possessed them. This is admitted in the case of intelligible species, which are in some sense called habits and sometimes fall from the memory — on account of which a person is said to forget what he previously learned. Therefore cessation of acts is the per se corruptive cause of a habit: for given the cessation of acts, the habit is taken away. I grant the antecedent and deny the consequence. For the cessation of acts is a cause not per se but per accidens of the corruption of habits, as was explained above.

One may object second: a contrary habit so occupies the subject in which it inheres that it does not permit a contrary act to be received in the same subject — an act seeking to introduce a new habit opposed to it. Therefore through an opposing act a habit is not per se corrupted. The antecedent is shown thus: for a new habit to be introduced, the prior habit must be corrupted, since two contrary habits cannot coexist in the same subject; or at least, so that the posterior degree introduced through the new act may destroy some degree of the prior habit — yet this cannot happen, since the lesser force that the recent act possesses cannot overcome the greater power with which the pre-existing habit is endowed. I deny the antecedent. To its proof I say that the prior habit is not corrupted but remitted through the contrary act — just as when a little water is thrown onto a great fire, it remits the heat to some extent, and if mixed with wine, it weakens its power. So through a remiss opposing act a new disposition or opposing degree is caused in the subject possessing the contrary habit — a degree opposing the preceding habit. All the more so because through an act a new degree of the contrary habit is introduced by the power, which is the absolutely productive and principal principle of acts and habits. Therefore the contrary habit cannot prevent the introduction, through the power and its act, of a new degree into the subject opposing the contrary habit pre-existing in the same subject. However one may try to respond otherwise (*Arriaga, De anima, disp. 9, sect. 6*). Finally, opposing habits can coexist in the same subject in remiss degrees, as I showed regarding primary qualities in (*Book on the Elements, q. 2, art. 5*).

Article XI. Whether a Supernatural Habit Is Intensified Through Acts

What a supernatural or infused habit is appears from (*q. 2, art. 2 of this book*). It is a quality infused per se by God into an intellectual creature for the production of supernatural and meritorious acts. Although all scholastics concede that acts proceeding from an infused habit intensify the habit meritoriously, certain thinkers — such as Arriaga (*De anima, disp. 9, sect. 1, subsect. 2*) — hold that an

infused habit is physically intensified and perfected through acts. The common view of the remaining doctors, however, is that such acts do not physically augment a supernatural habit.

This is proved first: a habit is intensified through degrees of the same character, as is clear from what was said in (*Book on Intension and Remission*). But acts elicited from a natural power informed by a supernatural habit produce degrees of a different character from the degrees of the infused habit. For the former are acquired, the latter infused — and that there is a difference between them, no one denies. Therefore the infused habit does not grow through acts elicited by the natural power. Second: the degrees of an infused habit — such as charity or grace — are created, as the Doctor maintains (*Book I, dist. 17, q. 3, §. Sexto propter opinionem; and Book II, dist. 34, A*). But from the same source (*Book IV, dist. 1, q. 1*), no creature can create anything, because creation belongs to the independent alone (*Book I, dist. 17, q. 2, §. Ad argumenta, sub PP, in resp. 3*). Therefore neither can it physically influence the intensification of an infused habit. Third: if an act could physically intensify an infused habit, a creature could, through its act as intermediary, produce grace in itself — because those degrees are grace, being homogeneous with it, just as any part of water is water. But grace is created by God alone, according to (*Psalm 83*): "The Lord will give grace and glory." Therefore, and so on. Fourth: an infused habit, according to the adversaries, is a simple quality. But if an act were to physically intensify it, it would not be a simple quality but a composite one, like an acquired habit. Moreover, the degrees of the infused habit could be separated from the degrees produced by acts. Given this hypothesis, I ask: would those degrees render a person acceptable to God, or not? If the former, then without an infused habit a person can be pleasing to God — which those same authors rightly deny along with other theologians. If the latter, then those degrees are not of the same character, since they do not produce the same effect; and therefore they do not intensify the habit — since a habit is intensified and perfected through acts of the same character.

One may object first: intelligible species are intensified through acts that partially proceed from them, and become more perfect. Therefore an infused habit is also physically intensified and perfected through its acts. Confirmation: a natural habit is intensified through supernatural acts. Granting the antecedent, the consequence is denied: for the species and their acts are of the same character and natural order; not so the infused habit and its acts, from (*Book I, dist. 17, q. 2, sub PP*). For the habit is infused, the act is acquired; and between infused and acquired there is a wide difference, as assigned in (*q. 2 of this book, art. 2*). To the confirmation I grant the antecedent and deny the consequence — both because they are of different orders, and because a creature through its acts cannot physically attain to them, since it cannot create.

One may object second: a more perfect cause can produce a more imperfect effect — for what can do the greater can do the lesser. But an act is more perfect than a habit, as was shown above. Therefore it can intensify the habit. I respond that the antecedent is true if the cause is capable of it and the effect falls within its range — as one who can carry ten pounds can certainly carry five. But it is false if the effect is not within its power — as a man who can generate a man cannot therefore generate a dog or a frog, since these animals are not within his generative power. In the same way, although a habit is ranked below an act, it does not therefore follow well that such an act can attain to the intensification of an infused habit.

Article XII. Whether an Infused Habit Can Produce an Acquired Habit

Arriaga (*loc. cit. in the previous article*) and Hurtado (*De anima, disp. 16, sect. 1, subsect. 2*) defend that infused habits produce acquired habits specifically distinct from them. All other scholastics disagree with them, denying that acquired habits — which facilitate the power toward readily and promptly producing acts — are in any way produced by infused habits. This is deduced from the Doctor (*Book I, dist. 17, q. 2, §. Ad arg., sub OO, in resp. 1; and in the Reportatio, ibid., q. 1; and Book IV, dist. 6, q. 10, §. Ad q., sub P*).

It is proved first from the distinction established between an infused and an acquired habit — acknowledged by the Doctor just cited and conceded by Arriaga (*loc. cit., subsect. 1, n. 4*) and Hurtado (*loc. cit.*): namely, that an infused habit does not facilitate the power, as is evident in a baptized adult who certainly possesses infused habits but does not thereby have ease and readiness of operation with respect to the objects of those habits. But an acquired habit renders the power easy and delightful in operation. Therefore, and so on. Second: a habit does not immediately cause a habit, but acts are the immediate generators of a habit, as I have repeatedly insisted. But an infused habit is not generated from acts, as the Doctor notes (*in the Reportatio, loc. cit., q. 1*). Therefore, and so on.

One may say by denying the consequence: just as the acts of a natural habit cause a natural habit, so the acts of a supernatural habit cause an acquired supernatural habit. Against this:

Things of a different nature and order do not produce the same effect — as is clear from fire, which heats, and water, which cools. But an infused and an acquired habit are of a different nature and order. Therefore, and so on. Third: a person cannot be pleasing to God without an infused habit, as is clear from (*Hebrews XI*): "Without faith it is impossible to please God." But if an infused habit were to cause another acquired habit, a person could, with the infused habit removed while the acquired habit remains, be acceptable to God through that acquired habit — so that through acquired grace he would be pleasing to

God — which appears to be false. Fourth: there would be two graces — an infused one and an acquired one — which is at odds with the Council of Trent, which decrees and defines one faith and one grace only.

One may say that this in no way contradicts the said Council. For the aforesaid Council establishes one infused habit of grace, but does not deny the existence of another acquired habit of grace — leaving this to scholastic debate. Against this: an acquired habit of grace is either a proper grace or it is not. If not, then it is not produced by the infused habit, which is supposed to produce true grace. If yes, then it is of the same order and character as the grace of the infused habit, and it intensifies it — which was rejected in the preceding article. Furthermore, it would not be a distinct habit but the same habit intensified and perfected. Moreover, a sinner through that acquired habit would be pleasing to God even though in mortal sin. Furthermore, there would be three causes concurring toward an act — namely, two habits and one power — whereas an infused habit suffices according to orthodox doctrine. Therefore an acquired habit is superfluous. For things are not to be multiplied without necessity (*Physics I, tit. 50*). Moreover, the ability simply speaking is presupposed for acting easily: but according to the supporters of the opposing opinion, an infused habit is given to complete the power in first act for producing supernatural acts. Given then that the infused habit is taken away through demerit, there would still remain the acquired habit — that is, the ease of acting — without the power to act, which is absurd. Finally, someone through that acquired habit and ease of acting could know with certainty that he is in God's grace — which is false, according to (*Ecclesiastes IX*): "No one knows whether he is worthy of love or hatred."

One may object first: natural acts produce a natural habit — for from repeated acts a habit is generated. Therefore supernatural acts also produce a supernatural habit. For there seems to be no stronger reason for the one than for the other, since all are active and operative. Confirmation: someone imbued and practiced in the habit of piety and devotion, if he chances to fall into mortal sin, loses the infused habit and yet still retains the ease of eliciting acts of piety and devotion. Therefore he retains an acquired habit generated from frequently repeated acts — and accordingly through supernatural acts an acquired habit is generated for producing supernatural acts. I grant the antecedent and deny the consequence. The reason for the disparity is drawn from their very nature: for the nature of an infused habit is such that it assists the power in operating but does not facilitate it — as is evident in a baptized adult, who has infused habits but not the ease and readiness of operating with respect to their objects. An acquired habit, by contrast, is for facilitating the power in eliciting acts. No further cause need be sought — just as one does not ask why fire heats and water cools. To the confirmation I say that such a person participates in an acquired habit that derives from the side of the power, which through the repetition of acts produces a habit — not from the side of the infused habit. Thus a heretic can, without infused faith, acquire a habit concerning certain things to be

believed; and a studious unbeliever can acquire for himself the habit of scholastic theology.

One may object second: a habit facilitates a power toward the acts from which it is generated — for acts as it were leave behind their seed, that is, ease. Therefore supernatural acts produce an acquired habit for producing similar supernatural acts. Confirmation: the beatific vision is said to be supernatural from a supernatural habit — namely, the light of glory. But if through supernatural acts a supernatural habit is not generated, the way to showing that acts elicited from an infused habit are supernatural is blocked — for one could say that the act proceeds from a naturally entitative habit. I respond that all of this holds for an acquired habit, but not for an infused one, which is of a different order and character from the former. To the confirmation I say with Scotus (*Book I, dist. 17, q. 2, §. Ad arg., sub PP*): an act is called supernatural from the supernatural habit concurring toward its production. But supernaturality and naturality are not intrinsic and essential differences of acts and habits, but extrinsic ones — with respect to a natural and supernatural agent — from (*Book IV, dist. 10, q. 8, G*). I have shown this at length in (*Treatise I of the Theological Summa, disp. 2, q. 3*). Hence, according to Scotus in the first passage just cited, an act is not properly supernatural — because even if the presupposed habit was produced by a supernatural cause, yet this act, immediately posited in being, is a natural cause with respect to its own act. And therefore the act produced through that habit is not properly supernatural. For a form can stand in as natural a relation to its act as one that is produced supernaturally as a form that is merely natural does to its act. Hence, a difference in the production of forms does not cause a distinction between them in comparison to their effects — just as a vision caused by God in a blind man and a vision caused by a sighted man are of the same character and species.

Question III. On the Habits of the Intellect

Since the most important division of habits is into intellectual and moral habits — the former preceding the latter — it follows that, having now completed the inquiry into habits in general, we must discuss habits in particular: first the intellectual, then the moral. Five intellectual habits are enumerated in (*Ethics VI, 3*): understanding, wisdom, science, prudence, and art. Art and science have been treated in (*Logic, Book I, q. 2; and Book V, final question*). It remains now to discuss the other three, of which the first is the habit of understanding.

Article I. On the Habit of Understanding

Disputation I. Whether the Habit of Understanding Is Distinguished from the Intellective Power

It is certain that there is a habit of the first principles, which is called by the name of understanding. The reason is this: just as a habit is conceded with

respect to a conclusion deduced from principles — which is called science — so a habit must equally be admitted with respect to the principles from which the conclusion is deduced. For there are certain first, immediate, and self-evident principles, open to the intellect once their terms are made explicit — called the "gateways of the sciences" (*Metaphysics II, I*) and "dignities" (*Posterior Analytics I, 2*). The present inquiry is whether this habit coincides with the intellective power or differs from it. Some thinkers — such as the Doctor (*Book III, dist. 33, q. 1*) and Racon (*sect. 2, on virtues, q.*)* — deny that the habit of understanding is distinguished from the intellect itself, holding it to be the same intellect insofar as it is occupied in the cognition of first principles. Others, however — such as Scotus (*Reportatio II, dist. 23, q. un.*), the Complutenses (*Disputationes, Book II of Logic, q. 1*), Ruiz (*ibid., tract. I of principles*), and Suárez (*Metaphysics, disp. 2, sect. 4, n. 15*) — affirm that the habit of first principles differs from the intellect or intellective power.

The habit of principles is called understanding perhaps for this reason: the intellect perceives those principles without any medium. For just as when it perceives things by means of discursive reasoning it is called reason, so what it knows without discourse and is called a moving cause is called understanding, or is given that name by antonomasia on account of its excellence, as the Complutenses note (*loc. cit.*). It is also called intelligence, because just as an intelligence — that is, an angel — immediately knows things presented to it, so the intellective power, once the terms of principles have been perceived and made explicit, immediately and without any ratiocination acquires evident knowledge of them.

Assertion. The habit of principles is distinguished from the intellect. So Scotus (*loc. cit. in both works*) holds. It is proved first from Aristotle (*Ethics VI, 3*), who numbers the habit of principles among the habits of the intellect. But other habits are distinct from the intellect, as is clear; therefore this habit too differs from the intellect. And in (*Posterior Analytics II, final chapter*), the same Philosopher writes that the habit of principles is generated in us through experience and memory. But the intellect, as an understanding power, is not generated from memory and experience but emanates from the soul and intellective nature, as I said in (*Book II on the soul, q. 2*). Therefore, and so on.

Second: things that are entirely the same — whatever is predicated of one is also predicated of the other — as because man and rational animal are entirely the same, whatever is affirmed of man is also affirmed of rational animal, and conversely. If, therefore, the habit of principles and the intellect coincided, whoever had the intellect would also have the habit of principles. But that this is false is clear from experience: all possess an intellect, yet not all enjoy the habit of principles.

Third, it is confirmed by experience that one who exercises himself in the knowledge of principles assents to them more easily and readily than one who

lacks such exercise. But this ease is a habit and a quality distinct from the intellect. Furthermore, I showed above that the intellect is capable of a habit that renders it ready and easy in operating; and in grasping and learning principles, it is adorned with such a habit. Therefore the habit of principles differs from the intellect by a real distinction — since it can be stripped of it, and can be diminished and corrupted in it, for the causes assigned in (*the preceding question, art. 10*).

One may object first: a habit is attributed to a power in order to determine it toward operating, and is generated in powers that are of themselves indeterminate toward an act, through an act frequently elicited — so the Doctor holds (*Book II, dist. 3, q. 10, §. Ad argumenta pro 1. opinione, K*). But the intellect is maximally determined toward the cognition of first principles, since once their terms are made explicit it immediately knows them. Therefore the intellect has no need of a habit by which it may know them more easily and quickly. Confirmation: the intellect is as disposed toward the knowledge of first principles as sight is toward seeing color. But it is clear that sight does not require a habit distinct from itself by which it sees color. Therefore neither does the intellect need a habit in order to survey first principles. I grant the major and distinguish the minor: with respect to specification, I grant it; with respect to exercise, I deny it. For in (*Metaphysics IV, 2*), some deny first principles — against whom the Philosopher advises against disputing (*Physics I, tit. 8*) — especially because the intellect is not maximally determined, like a stone toward downward motion (with respect to which no one denies a habit is unnecessary), but is indeterminate in passing judgment on an object presented to it and can pass correct or incorrect judgment. Therefore a habit is necessary to determine it to judge correctly and to operate easily. Hence I said above that one practiced in principles assents to them more quickly and easily than one unpracticed — because even when the principles are offered to him he perceives them, yet not so well and readily as the other. To the confirmation it may be said that even sight, in seeing objects more readily and easily, needs a habit — as is clear in the case of astronomers who contemplate the stars more easily, and in the case of those skilled in optics who discern visible objects more quickly and readily. Especially because sight judges in its own way about color, and conversely a blind man does not judge about color. Therefore, since sight can judge well or poorly, a habit inclining it toward correct judgment seems necessary for it.

One may object second: the same philosophical treatment applies to the practical intellect as to the speculative — since, from (*Physics II, tit. 8*): "As the principle is in speculative matters, so the end is in practical ones." But the practical intellect does not need a practical habit in order to assent to practical matters, such as "good is to be embraced" and "evil is to be avoided." Therefore neither does the speculative intellect require a habit in order to assent to speculative matters. The major is evident and admitted by the Doctor (*Book I, dist. 1, q. 4*). The minor appears to be the view of Augustine (*On the Lord's Sermon*

on the Mount, Book II) and Jerome (*Epistle 8, to Demetrius*), who assert that there is in us a natural light by which we flee evil and approach the good. For there is in us a certain synderesis, or spark of conscience, by which we turn away from evil and are inclined toward good. Confirmation: in the will no habit is posited for the universal good and the ultimate end willed, because the will by its own nature tends toward it without any addition. Likewise, then, no habit is required for speculative principles that are per se known and indemonstrable. I grant the major and deny the minor. For the will has more need of a habit than the intellect, being a free and altogether indifferent and undetermined power, as is clear from what was said above. To the argument based on the authorities of Jerome and Augustine I say they do not trouble us — for those Fathers concede that there is in us a power by which we can turn away from evil and turn toward good, which we also admit; but they do not deny that such a power is devoid of a habit or incapable of one. They affirm the one thing without denying the other. To the confirmation I deny the antecedent. For the will is not compelled to will the common good and the ultimate end, since it can by its own choice will, not will, or refuse to will — as I showed at length in the proper place.

Disputation II. What the Habit of Understanding Is

Ruiz (*Tract. I, on the habit of principles, art. 2*) defines the habit of principles in these words: "The habit of principles is an intellectual virtue by which the intellective power is determined to a self-evident assent to principles and to the easy production of the same." But this definition of principles does not appear exact: for it places "intellectual virtue," which is equivalent to "intellect" — which the same Ruiz (*loc. cit., art. 3*) acknowledges to be distinguished from the habit of understanding. Therefore it seems better and more aptly described thus: the habit of principles is an acquired quality by which the intellect is rendered easy and ready to assent to first principles. This is explained with respect to all its parts. "Quality" is placed as genus; "acquired," to distinguish it from an innate quality, which belongs to the second species of quality. The remaining words are added to distinguish it from other habits of the intellect. For through the habit of science we assent to a scientific conclusion; through the habit of opinion to a probable conclusion; and so with the rest. Since, then, the said definition consists of genus and difference and correctly explicates the nature of the thing defined, we judge it to be legitimate. One might ask which principles are defined here — the first and universal ones, or also the particular ones? And whether complex or incomplex principles?

For the understanding of this question, I observe that universal principles are common to all sciences and are called "dignities" (*Posterior Analytics I, 2*) and "gateways of the sciences" (*Metaphysics IV, 1*), in which no error can occur. Particular principles, by contrast, belong to one science and not to another, and are called by the same Philosopher "positions." Incomplex principles are simple principles apprehended through the first operation of the mind — such as

"God," "Heaven." Complex principles are axioms or propositions per se known, immediate and evident from their terms — such as "Everything either is or is not" and "Every whole is greater than its part." It is certain that the aforesaid definition does not apply to incomplex principles, which, being simple terms from which a proposition is composed, do not admit of affirmation or negation. The difficulty, then, concerns complex principles — and since some of these are common and others particular, the inquiry is whether the said definition applies to both or only to the one sort. For Vásquez (*Summa I-II, disp. 74, ch. 3*) attributes it only to universal principles; other doctors, among whom is Suárez (*Metaphysics I, disp. 1, sect. 4, n. 23*), include both universal and particular ones under that definition.

It is proved first from Aristotle (*Posterior Analytics I, c. 2, 67; Topics I, c. 2; Physics I, c. 2; Metaphysics I, c. 1 and 2; and Metaphysics IV, T. 7*), where, in assigning the distinction between the habit of principles and the habit of science, he says that the habit of principles is occupied with propositions that are per se known and immediate; and all first principles, whether common or particular, are propositions per se known and immediate. Therefore the aforesaid definition is applicable to all principles. Second: the habit of principles is that which is produced without a medium through the mere explication of terms, as is clear from what has been said. But both universal and particular principles are grasped without any medium and through the mere knowledge of terms, as is clear by induction. Therefore that definition applies to all principles.

One may object: the habit of principles can be demonstrated. For Metaphysics, from (*Posterior Analytics I, c. 7; Physics I, c. 1; and Metaphysics IV, c. 3*), defends and confirms first principles — not only its own, but those of the remaining sciences as well. Therefore first principles are not immediate and known from the mere explication of terms. I respond first: the function of Metaphysics is to defend first principles with respect to transcendental and common reasons. For since it is the first science in the order of distinct cognition — because it distinctly contemplates being and the other transcendentals which are presupposed in the other sciences and are known confusedly — it is for this reason that the office of defending first principles is attributed to Metaphysics, as Fonseca indicates (*Metaphysics III, c. 2*). Second, Metaphysics demonstrates principles not by demonstratio ostensiva but by reductio ad impossibile, through that principle: "It is impossible to simultaneously affirm and deny the same of the same" — which is deployed against the contentious, as may be seen in (*Epitome, Book II, q. 1, art. 11*), and is also presented by Suárez (*Metaphysics, disp. 1, sect. 4, n. 22*).

Disputation III. Whether the Habit of Principles Is Instilled by Nature

There are three opinions, diverging among themselves. The first is that of Báñez (*Summa I, q. 1, art. 6, not. 3*) and Conradi (*Summa I-II, q. 94, art. 1*), who hold that the habit of principles is natural — a view favored by Thomas (*Book II, dist. 24, q. 2, art. 3, ad 3*) and in other places cited by recent authors. The second is that of

Scotus (*Reportatio II, dist. 23, q. un., §. Dico tamen*), the Complutenses (*Posterior Analytics I, q. 1, art. 4*), Ruiz (*Tract. I on the habit of principles, n. 11*), and Suárez (*Metaphysics, disp. 1, sect. 4, n. 14*), who teach that the habit of principles is acquired. The third is that of Cajetan (*Summa I-II, q. 51, art. 1*) and the Complutenses (*Logic, disp. 20, q. 2*), who affirm that the habit of principles is partly from nature — that is, from an intrinsic principle, which is the agent intellect — and partly from an extrinsic principle — that is, from the intelligible species of the principles themselves — so that when the knowledge of terms is acquired through the senses, mediated by intelligible species, the habit of those very principles naturally flows from the intellect; much as nutrition and growth arise from food digested by natural heat in the nutritive and augmentative faculties.

It is to be noted first, for present purposes, that something is called natural in two ways. First, because it is concreated and congenital with something — in this sense the powers of the soul are connate to it, since once the soul exists they naturally emanate from it, and the species of angels are called natural to them because they were instilled by God in their intellects from the moment of their creation. Second, because without any intermediate it is evidently cognized by the natural cognitive power — in this sense the habit of principles is called natural, because given prior sensory knowledge, through intelligible species, with only the terms made explicit, it is grasped by the intellect and acquired through repeated acts. All of this is clearly stated by the Doctor (*loc. cit.*), who says: "For principles are not so innate to the intellect as to be concreated with it; but they are called innate for this reason: because, as (*Metaphysics II, c. 1*) holds, they are like gateways, in that they arise immediately from sense once the terms are known, from the very light of the intellect."

It is to be noted second, from (*Posterior Analytics II, c. 18; and Metaphysics I, c. 1*), that sense is given to us by nature, and from sense comes memory, from memory experience, and from experience the cognition of the universal — which is the principle of science. For science is of universals (*Metaphysics VII, §. 3*). Hence it is clear that the cognition of principles is not instilled in us by nature, nor is it produced from any prior knowledge of the intellect, but takes its origin from sense — which is concreated in us by nature. Therefore Ruiz (*loc. cit., n. 14*) is mistaken in reading "from assent" in the text he cites, when it should read "from sense" or "from the senses" — as the Doctor and the other interpreters there supply, and as the explicit text of the Philosopher shows, as appears to any reader. For although the intellect gives assent to principles, the origin of that assent comes from sense, as the Stagirite shows (*ibid. and Metaphysics I, c. 1*).

First Assertion. The habit of principles is not instilled by nature. So Scotus (*ibid.*) holds. It is proved first from (*Posterior Analytics II, T. 27*), where it is explicitly stated: "It is impossible that a habit should exist in us without our knowing it." As

was said (*Posterior Analytics I, T. 4*): science is not in us through recollection, but is newly acquired by us. Since, therefore, according to Aristotle the habit of science is not innate to us, so likewise the habit of principles is not instilled in us by nature. Second, from (*On the Soul III, 14*): the intellect is like a blank tablet on which nothing is written. Therefore the habit of principles is not concreated with us. The consequence holds because if the habit of principles were congenital, there would be some cognition of things impressed upon and existing in it from the very beginning — and it would therefore be falsely likened to a bare tablet on which the images and likenesses of things are to be formed. Third: all our cognition takes its origin from sense, as the Philosopher testifies (*loc. cit.*) and in (*On Sense and the Sensible, c. 6*): "Nothing is in the intellect that was not first in the senses." But cognition acquired through the ministry of sense is not from nature. And since the habit of principles is had through sense presenting simple terms to the agent intellect — with which, once explicated, assent is given with no intervening cause — it is plainly deduced that the habit of principles is not innate to us.

Second Assertion. The habit of principles is not partly natural and partly acquired in the manner expounded by the authors of the third opinion. This follows from the Doctor (*loc. cit.*). It is proved first: for apart from the apparent implication in saying that the same habit is in part innate and in part acquired — since a habit is sufficiently divided into natural and acquired, and no intermediate habit between them is to be invented — even if their explanation seems to remove that contradiction, it in fact does not remove it. For that cognition which is acquired through sense and is caused by the intellect, over the course of time, is entirely acquired and not congenital, as is plain from the terms. But the habit of principles is produced by sense and the intellect over the course of time, as the Philosopher clearly shows (*Posterior Analytics II, loc. cit.*). Second: what naturally flows from something is found in all things from which it flows — as is clear in the case of risibility, which, since it naturally proceeds from human nature, is found in all its individuals. But the habit of understanding is not in all persons — indeed, some deny it, as is clear from (*Metaphysics IV, 2*) and as Averroes declares (*Metaphysics II, com. 15*). Third: what is acquired through induction is acquired — since induction is a progression from sufficiently enumerated singulars to the universal. But principles depend on sense, and sense is of singulars while the intellect is of universals. For a necessary universal proposition to be gathered, necessary premises must be premised — which are the principles of a scientific conclusion — and it is necessary to know beforehand the singulars of that conclusion; once these are known, the universal is inferred, as the Stagirite excellently pursues (*Posterior Analytics II, loc. cit.*).

Third Assertion. The habit of principles is acquired. This follows from the preceding assertions. For since it was proved in the first assertion that it is not innate, and in the second that it is not composed of the innate and the acquired,

it is sufficiently and necessarily deduced that it is acquired. Furthermore it is shown: for we experience that we first perceive one principle, then another, and so on in succession. Again, at the outset we do not grasp them so easily, but afterwards through exercise we know and use them more easily and delightfully in inferring conclusions — therefore such a habit is acquired. The antecedent can be illustrated by example: if someone proposes this principle — "Every whole is greater than its part" — it is not easily understood unless it is shown specifically that this whole is greater than its part — say, this whole table, or this whole body of water — and once these are known, when later such a pronouncement is made, the intellect is rendered easy and ready to assent to it: namely, "Every whole is greater than its part." Moreover, nature grants being and ability sufficient to attain what is necessary and beneficial for itself. For (*On the Heavens II, 17*): "Being is for the sake of operating." For this reason it gave the soul an intellect by which it could acquire intellection, and a will by which it could elicit volition. But from the beginning the intellect is not adorned with intellection, nor the will with volition. For nature provides only what is necessary for simply acting, not for acting more easily — which is what a habit is for. Therefore the habit of principles is acquired through the intellect, by the frequent repetition and multiplication of its acts. Furthermore, the intellect is indifferent toward any cognition, whether of principles or conclusions, and is moved by species and objects presented through the ministry of the senses. For of itself it is capable of every cognition and understands first what moves it earlier and more efficaciously, retaining it more tenaciously. Therefore it needs a habit in order to understand more conveniently and readily what it encounters — and if these are principles, they cause the habit of principles; if conclusions, they produce the habit of science. Therefore the habit of principles is acquired.

One may object first: God, in creating things, so arranges them that the summit of a lower nature reaches the first level of a higher nature. But among natural habits the habit of principles holds the primacy. Therefore if God granted all habits to the angels at the moment of their creation, he likewise bestowed on human beings the habit of principles — which is supreme among all habits. Confirmation I, from (*Ethics VII, c. 8*): virtue is acquired by nature or by practice. Confirmation II: God did not create a nature entirely stripped of principles of operation; but the habit of principles is concerned with the principles of all the sciences. Therefore it is congenital to us. I respond that the major holds with respect to essential perfection of natures — that is, that natures are so ordered and arranged that one surpasses another in perfection; say, that earth is essentially inferior to water, water to air, and so on ascending to the last. But this does not hold with respect to other perfections. For it is not necessary that if the supreme creature excels in some perfection, an inferior creature possesses the same or a similar perfection. Therefore it does not follow that because the intelligible species of things were concreated with the angels at the outset of their creation, the habit of principles was also instilled in human beings at the

moment of their creation. To Confirmation I: Aristotle there speaks not assertively but doubtfully and problematically, as is clear from the particle "or." To Confirmation II: I say that God created nature with its powers necessary simply speaking for operating, but not with those others that pertain to better and easier operating — such as the habit of principles and of other things.

One may object second: a habit is given to remove difficulty and induce ease of operating, as is clear from its definition. But the intellect has no difficulty in assenting to principles: it assents to them equally easily the first time as if it had assented to them many times. Therefore an acquired habit is not necessary — a natural habit suffices. I grant the major and deny the minor. For we experience that through use and exercise there is generated in us an easier cognition, and the indifference which the intellect previously had in knowing and assenting to things is removed.

One may ask first, whether the habit of principles is one in genus or in species. Those who think the habit of principles is congenital respond that it is one in species — like the habit of faith and other infused habits — on account of one formal specific reason, which consists in the mere explication of terms, without any medium. But those who think such a habit is acquired maintain that it is one in genus. So Ruiz holds (*Tract. I on the habit of principles, n. 19*). For the same philosophical treatment applies to the habit of principles as to the habit of science: both are acquired and depend on acts and objects — with this difference, however, that the former is without a medium, while the latter requires a medium. But the habit of science is one in genus, since it comprehends speculative and practical sciences, which differ in species, as is clear in (*Logic, Book V, q. 4*). Therefore the habit of principles regarding speculative and practical principles is likewise one in genus. Again, there is one assent in genus for common and particular principles alike — as is clear from the assent by which we assent to this common principle, "Everything either is or is not," and by which we give assent to this particular principle, "Every whole is greater than its part." Therefore the habit of principles is one in genus. The motive noted above does not trouble us — for the cognition of principles, consisting in the mere explication of terms, is not a specific but a generic reason, inasmuch as it is common to specifically different principles, such as speculative and practical principles, just as the conclusions deduced and caused from those principles are also specifically different.

One may ask second, whether the first principle exists on the side of reality, or is it a fiction devised by the intellect — regarding every possible affirmation or negation? I distinguish: if taken logically — that is, for second intentions signified by the names "affirmation" and "negation" — I grant that it is fabricated by the intellect. But if taken metaphysically — that is, for the intrinsic and formal reasons by which one thing on the side of reality is connected with another or separated from it — I say it exists on the side of reality,

independently of any intellect thinking about it. For things are so ordered and connected that some are necessarily joined to each other — as man and rational animal — while others are separated from one another — as man and stone.

Article II. On Wisdom

Disputation I. What Wisdom Is

Wisdom has a twofold etymology: either from "savoring" (*sapiendo*), because it illuminates the mind, or from "tasting" (*saporando*), because it inflames the will — in which sense it is called savory knowledge. For this reason Scotus notes (*Book III, dist. 34, q. un., §. His suppositis, sub O*) that in Sacred Scripture wisdom is taken for charity or grace, which "savors" for its possessor. In this sense Solomon says (*Wisdom I*): "Wisdom will not enter a malevolent soul." Brulifer observes (*Book III, dist. 35*) that wisdom is used in four ways. First, for the divine attribute common to the three Divine Persons — as Alphonsus shows against Abailard (*Against Heresies, vol. 6, verb. Deus*). Yet it is appropriated to the Son, as is clear from (*Ecclesiasticus XXIV*): "I came forth from the mouth of the Most High, the firstborn." The Church sings in Advent: "O Wisdom, who came forth from the mouth of the Most High." And (*I Corinthians I*): "We preach Christ, the power of God and the wisdom of God." And since God is true wisdom, the true philosopher is consequently a lover of God — so that since philosophy tends toward the blessed life, one who has loved God is made happy by enjoying God, as Augustine subjoins (*City of God XVIII, ch. 18*). Plato holds the same view, and Scotus does not dissent, as appears in Plato's Dialogue on Philosophy.

Second, for the gift of the Holy Spirit, as is read in (*Isaiah XI*). It is a spiritual sweetness in the minds of pious men, inclined toward loving God — for the attainment of which three things are required: first, humility, which is the fear of God, according to (*Psalms 110*): "The fear of the Lord is the beginning of wisdom"; second, charity, by which a person is dear and pleasing to God, as (*Ecclesiasticus I*) suggests: "The love of God is honorable wisdom"; third, an interior savor of the whole person, who finds pleasure in God alone. Hence (*Psalms 118*): "How sweet are your words to my palate, sweeter than honey to my mouth."

Third, for eminence and excellence in some art or science, as is touched upon in (*Metaphysics I, 1; and I Corinthians III*). Thus an architect is called wise who provides the laws and precepts for building well; likewise, one who gives the norm for rightly administering the commonwealth is called wise. To this Socrates perhaps referred when he said that commonwealths would be happy if either kings philosophize or philosophers administer the commonwealth.

Fourth, for the knowledge of all things insofar as possible — whether of principles or conclusions — and it signifies a certain intellectual rectitude for judging well about all things. In this sense seven wise men flourished in Greece. And through the knowledge of the highest and eternal things, theology is called

wisdom — as Alensis (*part I, q. 1, m. 1*) and Scotus (*prol., q. 5*) acknowledge. So too Metaphysics, which also treats of God, angels, and other things — as the Stagirite acknowledges (*Metaphysics I, 1; and Metaphysics III, c. 2*), to which the same Philosopher attributes six conditions. The first is that it be a knowledge of all things, universally — for knowledge of all things with respect to particular and singular reasons seems impossible. Hence Aristotle adds (*ibid.*) that it belongs to the wise man to know objects not singly but insofar as possible. The second is that it concern difficult things remote from the senses — for what treats of easy things obvious to all does not merit the name of wisdom. The third is that it proceed from the most certain principles — from which judges, astrologers, planetarians, and magicians are excluded. The fourth is that it be sought for its own sake and be desirable in itself, acknowledging no superior or worthier (*Metaphysics IV, c. 3, T. 7*). The fifth is that it direct and command others — with a speculative direction and command, as Fonseca pursues (*Metaphysics II, q. 5*). The sixth is that it be fit for teaching. For wisdom must teach causes and the principles of knowing, resolve and decide everything — including first principles and first causes. Hence Aristotle writes (*Metaphysics I, 1*): "A sign of the wise man is to be able to teach, and it pertains to the wise man to know and assign the causes of things."

One may object first: Aristotle (*Sophistical Refutations I, 2*) says: "It is the function of the wise man to speak well about all things and to refute the ignorant." Hence in ancient times certain philosophers flourished who, according to Fonseca (*loc. cit.*), were ready to dispute about all things. Therefore wisdom is a full knowledge of all things — not only universally but also in particular. I respond that Aristotle there merely means that the wise man can discuss all things insofar as possible and insofar as human wisdom allows, as the same Philosopher declares (*Metaphysics I, 2*): "The wise man in a certain sense knows all things." Otherwise it would not be wisdom but vanity and presumption of spirit. For it belongs to divine wisdom alone to attain all universals and singulars, as is evident from (*Hebrews IV*): "All things are naked and open to his eyes."

One may object second: the mathematical disciplines are more certain and evident than the other sciences — proceeding as they do from the most evident principles and those most remote from the senses (*Metaphysics II, c. 3, T. 16*). Therefore wisdom is not supported by the most well-known principles, since that pertains to mathematics. I respond that this holds for proper and particular principles, not for the first and most universal principles of all — such as the principles of Metaphysics. All the more so because those are confirmed and corroborated by Metaphysics, whose function it is to defend all the principles of the particular sciences against those who deny and resist them. Furthermore, Metaphysics is first in the order of distinct cognition; therefore no science more clearly and distinctly explicates and illustrates principles than Metaphysics. Hence it is called in (*Ethics VI, 8*) the head of all the sciences, and in (*Metaphysics*

I, 2) the goddess of the sciences. Miranda (*On the Overturning of Single Certitudes*, 20) places it before others, following Bonetus (*Metaphysics I*, c. 1).

One may object third: practical science, which labors around the operations of the will — especially political science, which provides rules for living well and governing the commonwealth, and by which a person commands others — seems to be more wisdom than speculative science, as is clear from (*Deuteronomy IV*). For it is directed toward the love of God and beatitude, which Aristotle locates in the contemplation of abstract substances (*Ethics VI*, 10). Confirmation: Scotus (*prol.*, q. 4) makes theology practical, and both the Doctor himself and other theologians (*ibid.*) affirm that it is most eminently wisdom. Therefore wisdom commands and directs not by speculative but by practical direction. Hence Socrates, abandoning natural science, converted himself entirely to moral science. Likewise, pious men devote themselves to divine love, in which is found true wisdom — and the other disciplines, without it, are considered foolishness. I respond that Aristotle and the other philosophers did not acknowledge true wisdom and happiness — which, as I said at the beginning of this article, following Augustine, is located in the love of God. Therefore it is not surprising if they posited only speculative wisdom. We, however, illumined by the light of faith, know that God can be attained by us through vision and enjoyment, and accordingly we assert that that science which concerns God and tends toward his love is more excellent and truer wisdom. Whatever Suárez may say (*Metaphysics*, *disp. 1*, *sect. 5*, *n. 44*). By this the confirmation drawn from Scotus is also answered. I have pursued this at length in (*Physics*, *Book I*, *q. 1*, *art. 4*).

Disputation II. Whether Wisdom Is Nobler and More Certain Than the Habit of Understanding

Báñez candidly acknowledges (*Summa I*, *q. 1*, *art. 6*) that he is ignorant of this difficulty. Suárez (*Metaphysics*, *disp. 1*, *sect. 5*, *n. 30 and following*) touches on it at length and confusedly. Some hold that wisdom is more certain and noble than the proper principles of the particular sciences, but not than the most universal principles and causes from which it is caused. Other authors deny that wisdom is to be preferred to the habit of understanding in certainty and evidence.

It is to be noted first that wisdom is taken in two ways: (I) insofar as it comprehends the knowledge of principles and conclusions — in which sense Aristotle seems to speak (*Ethics VI*, 8): "Wisdom is a kind of head having understanding and science"; and (*Metaphysics I*, 1): "The wise man in a certain sense knows all things"; (II) insofar as wisdom is the knowledge of conclusions grasped through the highest causes — and it is of wisdom so accepted that the present debate moves, namely whether it surpasses the habit of principles in certainty, evidence, and nobility.

It is to be noted second that something can be more certain and evident than another without being nobler. For the accidents of a corporeal substance are to

us, insofar as concerns sense, more known and manifest than the accidents of an incorporeal substance; yet the knowledge had of the latter surpasses the knowledge acquired of the former, as Aristotle teaches (*On the Parts of Animals I, c. 5*) and Scotus (*Book I, dist. 3, q. 2*). Therefore knowledge of God and angels is more excellent and worthy than knowledge of being and the other transcendentals and predicamentals.

Assertion. Absolutely speaking, the habit of principles surpasses wisdom in certainty and evidence — not only with respect to proper principles and conclusions deduced from them, but also with respect to common principles and conclusions collected from them. This is drawn from the Doctor (*loc. cit.*) and (*Reportatio II, dist. 23, q. un., §. Dico tamen*). It is proved first: all the certainty and evidence that wisdom participates proceeds from principles. For demonstration, through which wisdom is generated, proceeds from things prior, better known, and the causes of the conclusion (*Posterior Analytics I, c. 2*). In support of this Aristotle there adduces that axiom: "On account of which each thing is such, that very thing is more such." The conclusion is true, known, and evident through principles; therefore principles are more known and more evident. Second: what is immediately evident and certain surpasses in certainty and evidence what is known and evident through a medium — as is clear from the sun, which is immediately luminous, and from God, who is being by essence. But principles are of themselves known and evident once their terms are made explicit, immediate and indemonstrable; wisdom, by contrast, is generated through a cause and produced through demonstration. Therefore, and so on. Third: first principles are independent and irreducible — for everything else is resolved into them, as is clear from this principle: "Everything either is or is not." Hence the intellect cannot err concerning principles and the conclusions it beholds following demonstratively from principles, as Scotus notes (*Posterior Analytics II, loc. cit.*). And the Philosopher in (*Metaphysics II, 1*) calls principles "gateways," which are more open than what is inside the house. Similarly, principles are more manifest than conclusions deduced from them — and therefore the habit of principles surpasses wisdom in certainty and evidence. I add further: a cause is nobler than its effect, as was proved in (*Book on Causes, q. 1*). But principles are the causes of conclusions, as was said above. Finally, the knowledge of God, which is without medium and discourse, surpasses in nobility created knowledge, which is generated through medium and discourse. Therefore it is concluded that the habit of principles surpasses and excels wisdom in nobility, certainty, and evidence.

One may object first: wisdom is the most noble habit (*Ethics VI, 8; and Ethics X, c. 8; and Metaphysics I, 1*). Therefore wisdom is more excellent than understanding — both in certainty and in evidence. I respond that the antecedent is true among discursive and ratiocinative habits — such as the other habits are, except the habit of understanding. Or say that in those passages and others cited, Aristotle takes wisdom as comprehending the habit of principles and

conclusions, as Fonseca (*Metaphysics III, c. 2, §. 5*), following Vorrillon (*loc. cit., in the note*) and Tatarets (*Logic, q. 1, scibile 3*), observes — as Suárez reports (*loc. cit., n. 31*). All the more so because this is suggested in Scripture: (*Ecclesiasticus XV*): "He filled him with the spirit of wisdom and understanding"; (*Isaiah XI*): "The spirit of wisdom and of understanding"; and (*Colossians I*): "In all wisdom and understanding."

One may object second: wisdom judges not only of principles but also of conclusions. Therefore it is nobler and more certain than principles — just as the container is nobler and more certain than the contained. The antecedent is at hand: for conclusions are inferred from principles, and it is first necessary to know the principles as causes from which conclusions arise. But wisdom accomplishes this; therefore it excels the habit of principles. Confirmation: wisdom does not only regard principles by a simple, direct act, as the habit of understanding does — which by a simple and direct natural light contemplates principles — but also regards them by a reflexive act, taking them as media and causes to deduce its demonstrative conclusions. And this mode of knowing and judging seems more excellent and eminent. Therefore wisdom excels the habit of principles. I respond: if wisdom is taken precisely insofar as it is a caused cognition through a supreme and highest cause, I deny it; if taken for a knowledge of conclusions and principles, I grant it — as I made abundantly clear above. For there are different habits: one concerning principles, which is the habit of understanding; another concerning conclusions, which is wisdom. To the confirmation I grant the major and deny the minor. For a more noble mode of knowing things immediately than mediately is evident from God, who immediately knows all things in his essence with no medium or cause intervening; and perfect knowledge, which is without discourse, excels knowledge that involves discourse — since it immediately perfects the intellect. Therefore, since such a reflexive act of wisdom is discursive, it denotes not perfection but imperfection.

Disputation III. How Wisdom Differs from Science

That some distinction is held between wisdom and science is clear from (*Ethics VI, 3 and 8*), where Aristotle, enumerating the quintet of habits of the intellect, places wisdom among them as a habit distinct from the others. For the understanding of this, two acceptations of wisdom noted in the preceding disputation are helpful — namely, that wisdom is taken for the knowledge of principles and conclusions, and for the knowledge alone of conclusions caused through first and supreme causes. Furthermore, the acceptance of science offered by our colleagues (*q. 3, prol.; and Book III, dist. 24, q. un., §. Ad q., D; and in the Reportatio ibid.*) is not to be despised — namely, for science in the sense of (*Ethics VI, 3*), which is a habit by which someone determinately speaks the truth; and for science in the sense of (*Posterior Analytics I, 2*), which is a certain and evident cognition of a necessary thing through its proper cause. Furthermore, I

observe that every wisdom is indeed a science — as is evident from (*Metaphysics II, c. 1 and 2; and Metaphysics XI, book I and II*). But not every science is wisdom. For physics is a science, but is by no means wisdom, according to the same Philosopher (*ibid.*). Hence wisdom seems to differ from science as the less common from the more common, and as the most excellent species from its genus.

Assertion. Wisdom is distinguished from science. This follows from Scotus (*loc. cit.*). It is proved first from Aristotle (*Ethics VI, 3*), who lists wisdom as a habit distinct from science and the other habits recited there. Second, from Augustine (*On the Trinity XII, 15*), who assigns the distinction between wisdom and science thus: wisdom is the intellectual cognition of eternal things, and science is the rational cognition of temporal things. Vorrillon (*loc. cit.*) also acknowledges this same distinction — which appears to be the same as this: wisdom regards the highest things and things of the superior portion or more excellent order; science regards lowly things and things of the inferior portion or lesser order. Third: the conditions and attributes of wisdom, recalled in the preceding disputation, are not applicable to science. For not every science meditates on things separated from matter, nor is it sought for its own sake, nor does it direct and command others as wisdom does. Therefore wisdom is distinguished from science. Third: young men for the most part can be learned but not wise. Hence Aristotle adds (*Topics III, 2*): "No one chooses young men as guides, because they are not wise." Hence Rehoboam (*III Kings XII*), accepting the counsel of young men and spurning the counsel of the elders, lost the kingdom of Israel.

One may object first: wisdom is used for the habit of understanding and science, acquired through demonstration — as is clear from what has been said. Therefore there are only three habits of the intellect: wisdom, prudence, and art — which is at odds with Aristotle (*Ethics VI, 3*), who enumerates five habits of the intellect. I respond that given that acceptance of wisdom, the quintet of habits of the intellect adduced by the Philosopher (*loc. cit.*) is still preserved. For wisdom so taken is not formally or identically understanding and science, but a habit formally distinct from them — although materially and objectively it is the same — as Tatarets (*recently mentioned*) rightly notes. And this follows from (*Ethics VI, 7*).

One may object second: one species of a genus is not made from another — as man is not composed from brute. For species are opposed through opposing differences that constitute them. Therefore it is wrongly asserted that wisdom coalesces from the habit of principles and science. I distinguish the antecedent: formally, I grant it; materially, I deny it. For as I said in (*Book on Quantity*), from a line a surface is made, and from a line and a surface a body — which are distinct species of continuous quantity. Again, from continuous quantity discrete quantity arises, as I noted (*ibid.*).

One may ask whether wisdom is univocal with created and uncreated wisdom. I say they are univocal with transcendental univocity — just as divine and created substance participate in the common transcendental notion of substance. I add: being is univocal to substance and accident, to God and creature, as Scotus holds (*Book I, dist. 3, q. 2, §. Secundo, ad B; and dist. 8, q. 3, §. Teneo, F*). Likewise, uncreated and created wisdom are univocal in the common notion of wisdom, as Scotus expressly defends at the end of his question.

Article III. On Prudence

Disputation I. What Prudence Is

That prudence exists is evident to all, plainly shown from its effect. For some act prudently and some imprudently — as is clear from (*Matthew XIV*) concerning the five prudent and five imprudent and foolish virgins. Aristotle warns, at the end of (*Topics II, c. 4*), that no one is by nature prudent — as will be made clear from what follows. What prudence is, however, is taught by the same Philosopher (*Ethics VI, 5*) and explained there by his commentators.

It is to be noted first that prudence is taken in two ways. First, broadly — that is, for a natural sagacity and circumspection in preserving and maintaining life. In this sense ants are called prudent, because in summer they gather and store grain on which they afterwards feed in winter (*Proverbs VI*). Likewise among animals, serpents are said to be prudent, as our Savior teaches us (*Matthew X*): "Be therefore wise as serpents." Hence the Stagirite (*Metaphysics I, 1*) notes that certain animals are capable of prudence and discipline. Second, strictly — for an active habit in finding opportune and efficacious means, regarding things that can be done, for the attainment of a proposed end. It is prudence in this sense that is the subject of the present discussion — which the Philosopher (*Ethics VI, 12; and Ethics X, c. 8*) asserts to be the steward of wisdom. And the virtuous one in (*Proverbs VI*) says to wisdom: "You are my sister, and I have called prudence my friend."

It is to be noted second that many things are required for perfect prudence — chiefly memory, without which there can be no prudence. Hence Aristotle, at the passage just cited, selected, among those endowed with memory, certain ones possessing prudence and others that are teachable — though those that are prudent need not be teachable, as bees and serpents. Furthermore, the knowledge of singular things that can be done is necessary, so that with prior knowledge of those things, prudent animals may be able to operate toward the attainment of their end. Moreover, astuteness (*solertia*) is required, by which the prudent person quickly tracks down the means that are sufficient and opportune for attaining the proposed end. Likewise foresight (*providentia*) is required — hence Vorrillon notes (*Book III, dist. 33, term. 2*), following Isidore (*Etymologies*), that prudence is the equivalent of foresight or far-seeing. For the prudent person must foresee what is to be done in the future, provide for what is

necessary in the present, compare the past with the present and the future, and pass judgment on all of them so as to attain the intended end. Add circumspection of all circumstances, and the caution by which a prudent man must remove all obstacles, impediments, and attacks — and with these removed and necessities applied, may hold and possess the desired goal. Hence the Doctor subjoins (*Book III, dist. 34, §. His suppositis*): "Prudence is a deliberative habit, since it is the habit of reasoning correctly in a practical manner." To this the Angel of the Schools refers (*verb. prudentia*), from Aristotle (*Ethics VI, 7*), assigning three acts or functions of prudence: good deliberation, judgment, and commanding of execution. To these three contribute most greatly: recollection of the past, ordering of the present, and meditation on the future — which Seneca enumerates (*On Morals*): "If your mind will be prudent, recall the past, order the present, foresee the future."

Assertion. Prudence is rightly defined as an active habit in conjunction with right reason, concerning what is good or evil for a human being. So Aristotle (*Ethics VI, 5*) holds, and Scotus (*loc. cit.*) concurs, as does Augustine (*On Free Will II, ch. 15; and Book 83, Questions, q. 31*). It is explained with respect to all its parts before being proved. "Habit" is placed as genus — for prudence is a quality of the first species of the genus of quality. "In conjunction with right reason" is added so as to distinguish it from an erroneous habit and other habits that are false or doubtful. "Active" is placed to distinguish it from art, which is a productive habit concerned with manual works, while prudence concerns moral matters that are good or evil — as the last words clearly signify. The foregoing definition being thus explained, it is easy to prove. For that definition is adequate and legitimate which consists of genus and difference, as I said in (*Epitome, Book II, q. 7, art. 2*). But the aforesaid definition of prudence participates in the genus, which is "habit," and the differences, which are the remaining particles already made explicit. Nor does it contain anything superfluous or deficient. Nor does anyone I have read despise or reject it; rather, all readily and constantly receive and defend it. Therefore the said definition is apt.

One may object first: prudence is a right habit, as is clear from its definition. But the objects around which prudence labors are uncertain, changeable, and susceptible to deviation — since they are singulars, which undergo perpetual change. Therefore prudence is not well defined as an active habit in conjunction with right reason. I grant the major; to the minor I say that prudence is a true and right habit, even though its object is changeable and susceptible to deviation — as is clear from art, which concerns contingent things, yet art itself is certain and right according to its rules and measures, which it prescribes concerning the work to be done. Likewise, since prudence provides the norm and rule of acting well, even though things to be done are changeable and defective, prudence itself is nonetheless right, certain, and infallible — as the Doctor rightly notes (*in the Reportatio III, dist. 36, q. un., §. Per hoc, §. Ad I, arg.*), expressly adding that

"virtue is not deviated, but the one possessing virtue, through deficiency of another," and so on.

One may object second: Aristotle (*Ethics VI*, 6) writes that prudence is the most noble among the moral virtues. But if prudence were a certain and right habit, it would not be the most noble of virtues — for charity would excel it among the moral virtues, and wisdom would surpass it among the intellectual virtues. Therefore prudence is not rightly defined as an active habit in conjunction with right reason. The Doctor responds (*Book III*, *dist. 33*, *q. un.*, §. *Ad I, M*): prudence is nobler than the other virtues not absolutely but in a qualified sense, because prudence is in a way the directive rule of the other virtues, insofar as it deliberates, judges, and directive commands what is to be done.

Disputation II. Whether There Is One Prudence for All Things That Can Be Done

The Thomists — cited by Ruiz (*Disputationes on virtues*, *art. 4*, *m. 1*) — hold that there is only one prudence specifically for all things that can be done, just as there is one faith for all things to be believed. Against them the Scotists, with Scotus (*Book III*, *dist. 36*, *q. un.*, §. *Quantum ergo L*; and *Metaphysics VI*, *q. 1*; and *Collationes I*), oppose themselves; and the Nominalists, with Ockham (*Book III*, *q. 13*, *art. 2*), along with Richard (*ibid.*, *q. 3*, *art. 2*) and Aureolus (*art. 5*), affirm that prudence is one in genus, distributed into diverse species according to the diverse specific reasons of things that can be done.

It is to be noted that a habit is generated through repeated acts — from what was said above — and is distinguished from without and posteriori through similar acts. In the same way, acts are distinguished from without through the objects to which they bear, as I showed at length in (*Book II on the soul*, *q. 2*). So that, in accordance with the generic or specific distinction of objects, a generic or specific distinction of habits is inferred. And this is to be maintained not for infused but for acquired habits, as the Doctor urges (*Book III*, *dist. 35*, *q. un.*), giving the reason that infused habits are supported by the sole authority of the revealing God, which is one for all things to be believed; but acquired habits rest on complex objects, of which some are evident from their terms — as the habit of understanding — and some from principles — as the habit of conclusions. The same is to be affirmed of the objects around which prudence labors, of which some differ from one another specifically and some generically.

Assertion. Prudence is one in genus. So the Doctor holds (*loc. cit.*). It is proved first from (*Politics III*, 2; and *Ethics VI*, 9): the virtue and prudence of the good man and of the ruler is one — understood by unity of its subaltern genus, as Basil excellently expounds (*Book III*, *dist. 36*, *q. un.*, *art. 2*, *at the end*). Second: the unity of a habit is derived from the unity of its formal subject, from (*Posterior Analytics I*, *T. 43*; and *On the Soul III*, 33). According to what it is occupied with: but the object of prudence is one by unity of genus — namely, the doable

(agibile), which is divided into three specifically distinct things: monastic, economic, and political. Therefore prudence is one in genus. Third: the same philosophical treatment applies to the unity of prudence as to the unity of science and art — as Ockham (*loc. cit.*) preeminently notes, and Aristotle does not dissent (*Ethics VI, 4*). The reason is that just as art is the right reason of things to be made, so prudence is the right reason of things to be done. But science and art obtain the generic unity of their generic subject, and are divided into many species — as I clearly showed in (*Logic, Book V, final question*). The same is therefore to be held of prudence. Fourth: as a principle is in speculative matters, so is an end in practical matters (*Physics II, T. 89*) — which the Doctor accepts (*Book I, dist. 1, q. 4*). Of speculative matters there are many specifically distinct habits, and also one habit in genus containing many habits specifically different — as Metaphysics, which is about being, comprehends the habit concerning substance and the habit concerning accident. And likewise physics, which concerns natural body, contains the habit concerning celestial body and the habit concerning sublunar body, animate body, and the like. Therefore prudence, which regards things doable, contains under itself the habit of prudence concerned with the doable matters of temperance, fortitude, and things of that sort — which are known to differ specifically from one another. For experience testifies that some are prudent in judging what belongs to each — such as a prudent jurist — yet imprudent in discerning and commanding what pertains to waging war. Again, some are prudent in governing themselves but not in governing a household and family, and one who prudently presides over a family does not do so over a kingdom — and conversely, some conduct themselves prudently in the administration of a kingdom and principate but do not know how to preside over their own household, or are improvident in their own actions. Therefore there is one prudence in genus comprehending under itself many prudences specifically different.

One may object first: what possesses only one formal objective reason concerning doable things has only one prudence specifically — since habits are specified according to distinct formal objective reasons. But prudence participates in only one specific formal objective reason of doable things, namely the human good orderable according to right reason to the due end. Therefore there is only one prudence in species directing all acts of the moral virtues. I grant the major and deny the minor: for there are several formal objective reasons specifically different — such as the formal reason of temperance, the formal reason of fortitude, and similar ones — which are manifestly different from one another in species. And so the argument proves rather the opposite of what was proposed, as what I presented above evidently demonstrates.

One may object second: prudence extends itself to as many things as its first practical principle does — since a habit that is maximally discursive, like prudence, does not seem to extend further than its first principle. But the first

practical principle of doable things does not extend beyond one specific reason of doable things. Therefore there is only one prudence in species. I grant the major and deny the minor. For the first principle regards many things that are plainly specifically different from one another. For whatever prudence directs concerning one moral virtue is specifically different from what it directs concerning another moral virtue — for some are prudent with respect to justice but not with respect to temperance, as I was deducing above.

One may object third: all doable things, even though they differ among themselves, nonetheless regard one ultimate end toward which they ultimately tend. Therefore since all doable things participate in one reason of attribution with respect to one end, according to that specific reason of attribution only one prudence in species is constituted. Granting the antecedent, I deny the consequence. For although all creatures tend toward God, the ultimate end of all things, it does not follow that they are of the same species. Likewise, although one ultimate end of all doable things is posited, it does not follow well that there is one prudence in species — since the doable things that prudence regards are many and specifically different, as is sufficiently clear from what was said.

Disputation III. Whether Prudence Concerns Means and Ends

Thomas (*Summa II-II*, q. 97, art. 6), Cajetan, and others there assert that prudence regards only means, directing the moral virtues concerning means alone — which are ordered toward attaining their ends. Scotus, however, (*Book III*, dist. 36, q. un., §. *Licet I*) and his followers at the same place teach that prudence is occupied not only with means ordered toward obtaining the ultimate end, but also with dictating concerning a particular end at least — such as chastity and other particular ends.

It is to be noted first that prudence is formally an intellectual habit perfecting the intellect, and is called moral from without because it dictates and directs the operations of the moral virtues. Before every moral virtue, a prudence that regulates that same moral virtue is required, because there is no virtue unless it conforms to the right dictate of reason — so that afterwards the will may readily and promptly choose what right reason determines ought to be chosen. But the habit of virtue is generated from repeated right choices — as the habit of chastity from repeated choices of continence — while prudence is caused from repeated right dictates concerning doable things.

It is to be noted second that three commonly enumerated parts of prudence are usually listed: subjective, integral, and potential. The subjective parts — which are also called species of prudence — are: monastic, which directs a person toward his own good; economic, which regulates a person toward rightly governing a family; and political, which orders a person toward the common good of the commonwealth. Under this last are comprehended legislative and military, of which Aretinus, Aureolus, and Richard speak (*loc. cit.*, q. 8). The

integral parts, mentioned in the present article, disputation I, number eight: six from Macrobius (*On the Dream of Scipio I*): reason, understanding, circumspection, providence, docility, caution; a seventh is added by Cicero (*Rhetoric II, 5*) — namely, memory; an eighth by the Stagirite (*Ethics VI, 10*) — namely, astuteness. The reason is that prudence is considered in two ways: as cognitive, and as preceptive. Considered in the first mode it has five of the said parts: memory, understanding, docility, reason, and astuteness. Considered in the second mode it has three of the listed parts: providence, circumspection, and caution.

Memory is the recollection of past things that we have seen, heard, and experienced — for these greatly assist in establishing what is to be done in the present. Understanding, which is also called intelligence, is the cognition of moral principles from which, once rightly perceived and fully known, right conclusions concerning things to be done are deduced. Reason is the good disposition by which a person aptly disposed reasons from known things to the knowledge of others. Providence is the foreknowledge of future things that can arise and follow from what is being done, toward the attainment of the proposed end. Docility is the natural capacity for receiving knowledge of what is to be done. Astuteness is sagacity or the prompt subtlety of finding in a short time the means for acting. Circumspection is the careful attention to, weighing of, and consideration of all the conditions and circumstances required for the work to be done fully and perfectly. Caution is the care by which someone removes obstacles that can impede the attainment of the intended end. The potential parts are contained in a threefold number: eubulia, synesis, and gnome. Eubulia is good deliberation and apt arrangement of what is to be done. Synesis judges rightly about deliberated matters in accordance with common laws. Gnome renders right judgment about things to be done in matters not sanctioned by common law. Hence Aristotle (*Ethics VI, 9, 10*) records three acts of prudence. The first is inquiry and deliberation of means. The second is judgment about the means found to be most apt for attaining the end. The third is command, by which the deliberated and found means are applied to the work to be performed and put into execution. The last act is the principal one, since the first two are ordered to this third, as Richard holds (*loc. cit.*, q. 6).

It is to be noted third that, these things having been explained, the intellect shows the will what is to be done and pursued and what is to be rejected and fled — not by commanding and compelling the will absolutely to execute them, since command is not an act of the intellect but of the will, as I taught in (*Book III, q. 2, art. 4*) — but by dictating and directing, as a counselor does for a king, or a jurist for a prefect and judge. This can be called commanding in a qualified sense, as Richard notes (*loc. cit.*). Therefore the intellect does not properly command the will — since the will is as a king in the realm of the soul, as Anselm testifies (*On the Conception of the Virgin, ch. 4*) — but shows and dictates

what is conformable to the right dictate of reason. It is in the power of the will to choose or not choose these things, to put them into execution or not.

Assertion. Prudence concerns not only means but also the end. So the Doctor (*loc. cit.*) holds. It is proved first: there is no moral virtue without prudence, since virtue conforms to the right dictate of reason, without which it cannot be. But prudence is the habit that reasons rightly about doable things, toward the attainment of an end. For no one abstains from forbidden foods during a time of fasting unless the ultimate end to be obtained has been set before him — which is written even of Christ (*Hebrews XII*): "For the joy set before him he endured the cross." Therefore prudence regards both the end and the means apt for attaining it. Second: a moral virtue is one by unity of its object and end, as is established of the other habits. But prudence, which is occupied around that virtue, is likewise one. For someone is prudent in making war but not in restraining himself from illicit pleasures. Therefore prudence is one, just as the virtue it directs is also one. But it is not one by the unity of means — since means are many. Therefore it is one by the unity of the end, and consequently prudence regards means as well as the end. Third: a relation is not cognized unless its term — by which it is specified, since a relation depends on its extremes, one of which is the term — is cognized. But the means about which prudence is concerned pertain to prudence itself; therefore so does the end to be acquired through those means — since the means carry forward an ordering and reference to it, and to its end. All the more so because the end is prior in the intention of the prudent person to those things that are for the end. Therefore prudence bears upon both the means and the end proposed and intended.

One may object first: prudence is a deliberative habit, being the right reason and rule of doable things. But deliberation concerns means, not the end (*Ethics III*, 6): for the physician does not deliberate whether the patient should be healed, nor the rhetorician whether he should persuade his audience, nor the politician whether he should grant peace to enemies. Therefore prudence regards means only. I grant the major. I distinguish the minor: more principally, I grant it — thus the Philosopher is expounded; less principally, I deny it. For prudence dictates concerning the proper ends of virtues, by discoursing from the practical principle taken from the universal end down to particular ends — and this discourse is the first deliberation, as the Doctor teaches (*loc. cit.*).

One may object second: prudence must be in accord with right appetite; otherwise it will not be prudence, which is the right reason for acting. But this agreement of prudence with right appetite is achieved through means selected for obtaining the end. Therefore prudence regards means only. I deny the antecedent. For since prudence is prior to appetite, it does not depend on it — just as the prior does not depend on the posterior. Therefore prudence can exist even though right appetite is absent. For the regulated conforms to its rule, not the rule to the regulated. Thus there can be prudence even without the

consequent virtue. Indeed, sometimes while prudence stands, vice follows — as is evident from (*Luke XVI*): "The children of this world are more prudent than the children of light in their generation."

Disputation IV. Whether Prudence Can Exist Without Moral Virtue

Godfrey (*Quodlibet*, q. 12) and Henry — cited by the Marginists of Scotus — hold that prudence is so necessarily joined with moral virtue that the one cannot exist without the other. The opposite, however, is taught by Scotus (*Book III, dist. 36, q. un., §. Quantum G; and in the Reportatio ibid.*), Orbelli, Vorrillon, and Basil (*ibid.*), who assert that prudence can exist without moral virtue — but not moral virtue without prudence.

It is to be noted first that an act of the will is not right or good unless it conforms to the right dictate of the intellect. For right reason is the rule and measure of the rectitude of an act of the will, as the Doctor teaches (*q. 4, prol.; and Book III, loc. cit., §. Licet istud K*). Therefore there cannot be moral virtue without prudence — which, as has been said more than once, is the right reason of doable things. But prudence can perfectly well exist without moral virtue, just as the prior can exist without the posterior, and the rule without what is regulated — as I was deducing in the preceding disputation.

It is to be noted second, from the Doctor (*in Book III, loc. cit., §. Quantum ad istum G*), that malice can blind the intellect in two ways: privatively and positively. Privatively, by diverting the intellect from right consideration. For when the will chooses the opposite of what the intellect dictates, it consequently diverts it from remaining in such a dictate, and turns it toward considering the opposite — finding dialectical or sophistical reasons by which it is not displeased to have abandoned that dictate. Positively, by commanding the intellect to find, around the evil end established by the will, the necessary means apt for attaining it — and persisting in this and pursuing that same end with evil means applied to its attainment. Hence an evil will is said to blind the intellect — not that the will leads it into error about complex matters, but by compelling it through a habit formed around the evil end, with evil means employed for its attainment. Thus error occurs not in speculative matters but in doable things.

This is further shown from the same author (*ibid., §. Contra*): terms are the total cause of the knowledge of a first principle, both speculative and practical (*Posterior Analytics I, 6*). We know principles insofar as we know their terms. But the syllogistic form is evident to every intellect, as appears from the definition of the perfect syllogism (*Prior Analytics I, 1*). Therefore, once the terms are apprehended and composed and arranged in the right mode and figure, the intellect necessarily assents to the conclusion deduced from the principles. And the will cannot lead the intellect that is thus evidently and demonstratively reasoning into error, nor blind it — except in the way said above.

Assertion. Prudence can exist without moral virtue. So Scotus (*loc. cit.*) holds. It is proved first from Augustine's exposition of the words of (*Psalms 123*): "Perhaps they would have swallowed us up alive." These are: "Those are swallowed up alive who know the evil and consent with their tongue — they die absorbed." (*Psalms 68*): "What is it, those consenting to vices, except those who know they ought not to consent? Behold, they know the mousetrap, and place their foot in it." And (*Psalms 118*): "Understanding goes first, affection follows slowly, or not at all." Second, from Aristotle (*Ethics II, 4*): reason avails little or nothing toward virtue. But if virtue necessarily followed upon prudence, reason would contribute greatly — indeed, would accomplish everything — because through it virtue would remain in the will. And consequently the learned and the prudent would be morally good and free from fault and vice — yet the opposite sometimes occurs, as some are entangled in sins and crimes. Nor would they need to be exhorted and persuaded to will what is right and just; rather, it would suffice that they look at and consider what is right — since from that right looking and consideration they would participate in the virtue annexed to it. Third: the University of Paris so decrees: "That the will, with knowledge present both in the universal and in the particular, cannot will the opposite — is an error." Therefore, while prudence stands, the will can fail to act well — and accordingly fail to have virtue. Fourth: someone from right dictates about doable things possesses the habit of prudence, which dictates to the will what is to be embraced and what avoided. But the will can choose the opposite of what is rightly dictated, and do evil — as the wise and prudent men of this world do, against whom truth cries out (*I Corinthians I*): "I will destroy the wisdom of the wise, and the understanding of the prudent I will reject." And (*Romans VIII*): "For the wisdom of the flesh is death." Fifth: the will does not necessarily will the good but can absolutely will evil, as was proved above. Therefore even if prudence dictates that good is to be done, the will can recoil, choose evil, and put it into execution. Sixth: one who has the habit of imprudence and error, as long as he remains on the way, can be corrected and saved. For as long as a person is in transit, he can leave the wrong path and travel the right one, because his will always remains free. But if, while prudence stands, virtue necessarily accompanies it — then correspondingly, while imprudence stands, vice would persist necessarily — as is clear from opposites. But while imprudence remains, someone can act rightly and operate well by not following the deviant dictate of reason. Therefore prudence can exist without moral virtue.

One may object first: Aristotle (*Ethics VI, 15*): "If the will chooses badly, the intellect dictates badly." And in (*On the Motion of Animals*) he concludes that the will, unless impeded, follows the right or deviant dictate of the intellect. Therefore while prudence remains in the intellect, virtue persists in the affective power. Confirmation I: Dionysius (*On the Divine Names III, ch. 9*): "No one, looking at evil, performs good." Confirmation II: Augustine (*on Psalm II*): "A

darkening of mind follows those who transgress the law of God." Confirmation III: "Their malice blinded them." Therefore if prudence exists, so does virtue — and conversely. If imprudence exists, so does vice. I respond that the Philosopher is to be interpreted indefinitely, as in (*Physics I*, 48): "Principles are contraries" — supply: indefinitely, not universally. Therefore our assertion is not universal but indefinite: that is, while right reason stands and prudence rightly dictates about doable things, the will can choose and pursue the opposite. Hence having prudence in the intellect, virtue in the will does not necessarily follow — but there can be not only virtue but also its opposite, namely vice. By this the first confirmation is also answered. For as I asserted in (*Book II*, q. 3, art. 3), the will can be borne toward evil as evil. To Confirmation II: I say that this is achieved through the diversion of the intellect around evil concupiscence, according to (*Psalms 57*): "Fire fell upon them, and they did not see the sun." According to Angerius's commentary on the word "blindness." To Confirmation III: I say this happens privatively or positively, as is perspicuous from the second note.

One may object second: the damned in (*Wisdom V*) complain and say: "Therefore we erred, and the light of justice did not shine upon us." If therefore this light — that is, right reason for acting — had shone upon them, they would not have erred. Therefore if prudence is in the intellect, virtue is likewise in the will. I respond that they complain wrongly and conclude ineptly — since they had whatever was needed for their salvation, but they abused it, as is clear from (*Psalms 35*): "He did not wish to understand so as to act well." And they preferred to indulge in illicit pleasures, as they themselves confess (*Wisdom II*): "Let us crown ourselves with roses before they wither; let no meadow go without our debauchery." Hence at the end of that chapter it is subjoined: "These things they thought, and erred. Their malice blinded them."

Question IV. On the Habits of the Will

Since habits are divided into intellectual — of which we treated in the preceding question — and moral — of which we are to treat both in general and in particular in the present question.

Article I. On Habits or Moral Virtues in General

Disputation I. What Moral Virtue Is

That moral virtue exists is established among those who, having relinquished wealth and cast aside their faculties, strive with all effort to acquire it. Indeed, such is the power of moral virtue that Cicero said: "If virtue could be seen with our eyes, it would excite a wondrous love of itself." Samuel writes the same (*to Sixtus VIII*). Hence Horace (*Book I, Epistles*): "The good hate sin out of love of virtue." And Seneca (*Epistle 88*): "Virtue raises a person up and places mortals

above the stars, and neither greatly covets nor greatly fears what are called good or evil things."

Moral virtue, however, is not congenital to us but is acquired through labor, as the Stagirite shows (*Ethics II, 1*). For those things that are instilled by nature can be changed neither by art nor by practice — as a stone, no matter how many times it is thrown upward by one throwing it, cannot by such practice tend upward. But moral virtue by practice changes a person from bad to good, from intemperate to temperate, and from the dissolute to the chaste. I add further: what belongs to us by nature is prior to acts — as the powers precede acts, since the intellect precedes intellection and the will precedes volition. But what is acquired by study and labor — we have an act of these things before we have a habit; and therefore we elicit an act of virtue before acquiring its habit. Therefore moral virtue is not instilled by nature.

It is to be noted and recalled from (*q. I, art. 2 of this book*) that many acceptations of virtue are found in Vorrillon (*Book III, dist. 27*), Aretinus (*ibid., dist. 33*), Gabriel (*dist. 13, q. 1, art. 1*), and Berchorius (*Moral Part III*). I present and explain the principal ones. The first is for power, vigor, and strength — in which sense the intellect and the will are called the virtues of the soul, as are the virtues of herbs, stones, and the like. Hence is derived that axiom: "Virtue is the ultimate of power" — adduced by the Doctor (*in the Reportatio IV, dist. 1, q. 4*) and drawn from Aristotle (*On the Heavens I, T. 131 and following*). The second is for a good disposition ordered toward an end — in which sense (*Physics VII, 17*): "Virtue is a disposition toward what is best"; and so moral and intellectual habits are called virtues (*Ethics II and VI*). The third is for a theological habit — in this sense virtue is defined by Augustine (*Soliloquies; and On Free Will I, ch. 18*): "Virtue is right reason arriving at the supreme end." And in (*On the Spirit and the Soul*) — to which the commentary on Augustine adds (*verb. virtus*): "A good quality of the mind by which one lives rightly, of which no one makes bad use, which God works in us without us." The fourth is for moral virtue alone.

Assertion. Virtue is rightly defined as an elective habit consisting in a mean, determined by right reason, as a wise man will determine. So Aristotle (*Ethics II, 5 and 6*). The Doctor appears to hold the same (*Book III, dist. 33, q. un., B; and dist. 36, q. un., §. Dicitur aliter, sub A*). It is explained with respect to all its parts. "Habit" is placed as genus — for habit is a subalternate genus in which intellectual and moral habits agree. "Elective" is placed to distinguish it from intellectual virtue, since election pertains to the will. "Consisting in a mean" is added because of vicious habits, which concern extremes — not arithmetic but geometric ones. The remaining words are added to distinguish it from prudence, which is dictating and directive, to which, unless the virtue conforms, there is no virtue. The definition being thus explained, it is easy to prove. For that definition is legitimate which consists of genus and difference, as I have often insisted. But the aforesaid definition is of this kind: for the genus is "habit," while the

remaining particles are the differences. Add further that all accept it, and no better or more exact definition has yet been found. Therefore it is to be retained.

One may object first: prudence is counted among the moral virtues, yet is not an elective habit. Therefore moral virtue is wrongly defined as an elective habit. I respond that prudence is formally an intellectual virtue, and is called moral in a directive and extrinsic sense, because it directs the moral virtues — as Orbelli rightly notes (*Book III, dist. 33, q. 2*).

One may object second: certain moral virtues pertain to the sensitive appetite — such as fortitude and temperance (*Ethics III, 9*). Therefore moral virtue is not an elective habit, which belongs to the will alone. I respond with Scotus (*Book III, dist. 33, q. un., §. Ad argumenta principalia, ante N*): those qualities that reside in the sensitive appetite are not properly virtues in the way that those residing in the will are — as is to be decided below according to the plan.

Disputation II. Whether Goodness Is of the Intrinsic Nature of Moral Virtue

Thomas (*Summa I-II, q. 55, art. 1 and 4*) and Gabriel (*Book III, dist. 23*) assert that moral virtue intrinsically and formally includes moral goodness. But the subtle Doctor (*Book I, dist. 17, q. 2, art. 3, §. Quantum ad istum*), Lychetus, and others there deny that moral virtue requires goodness as its intrinsic and quidditative reason.

It is to be noted first, recalling from (*Book II, q. 1, art. 2*), that moral goodness is the conformity of an act to right reason fully dictating concerning the due circumstances of the same act, and is formally a relation — which per se has no active principle, since it follows only from the positing of its extremes. In the same way, moral virtue is the habitual conformity of the will to right reason, as the Doctor rightly notes (*loc. cit., sub Q*). And it adds nothing above the substance of the habit except the relation of the said conformity — as is clear from what was said at the passage cited.

It is to be noted second that in moral virtue two things are distinguished: the quality, which is an absolute being — called its material being with respect to the aforesaid relation — and its conformity to right reason, which is its formal being. Therefore moral virtue materially is a quality, while formally it is the relation of the said conformity. Hence Scotus (*Quodlibet XVIII, §. De I, infra H*), when it was objected from Aristotle (*Ethics X, 3; and the Book of the Predicaments, chapter on quality*) that the good is a quality and that virtue too is a quality, responds from (*Physics VII, 10, cc. 10, 20*) that every virtue and malice designates a relation, but has the mode of denominating or predicating quality — just as "healthy" and "beautiful."

It is to be noted third, from the same Doctor (*loc. cit., §. Hanc viam, ante S*), that even though a relation is not formally an active principle — being of the genus of sterile things — yet that with which the relation is really identified is an active

principle. Thus a moral habit, precisely insofar as it denotes a relation of conformity to right reason, is not active; but it is active insofar as it is a quality — just as a relation that is really identified with a creature is not active, but the substance of the creature is truly an active principle. Therefore since virtue derives its name from "power" (*vis*), it receives this denomination not from the said relation but from its entity, which is a quality.

Assertion. Moral virtue is not intrinsically and formally good. So the Doctor holds (*loc. cit.*, §. *Sed oppositum*, O; and §. *Quantum ad istum*, Q; and *Book II*, *dist.* 36, *q. un.*, §. *Dicitur aliter*, sub A). It is proved first: what is adventitious and accidental to something is not intrinsic and essential to it. But goodness is adventitious and accidental to moral virtue. Therefore it is not intrinsic and quidditative to it. The major is clear from the distinction between intrinsic and extrinsic, essential and accidental. The minor is at hand: the same habit of abstaining from wine for the sake of Jupiter — which is not good — if the one who has such a habit converts to the true God and exercises acts of the same habit, which he retains, that habit becomes good and meritorious. Therefore goodness is accidental and extrinsic to moral virtue.

The Complutenses respond (*Ethics*, *disp.* 7, *q.* 1, *art.* 2): one who is imbued with the habit of abstinence and has converted from the idol of Jupiter to the true God performs two functions — namely, abstaining from the drinking of wine, and restraining the disordered appetite. By reason of the latter function, not the former, he feels ease in abstaining religiously, whereas before he abstained superstitiously. Against this: the same habit of abstinence remains, and what was previously superstitious is now religious, previously bad, now good. Therefore intrinsically virtue does not import goodness — otherwise it would always be good, since what belongs to the intrinsic reason of something cannot be changed without its essence being destroyed. Therefore, although by reason of the prior function it is not good, while by reason of the latter it is, it does not well follow that goodness enters the essence of virtue.

Racon responds (*Tract. on virtues*, *m.* 3): they are distinct habits. Against this: that habit is productive of the same acts of abstinence. Therefore it is not a distinct habit whose acts are not distinct. Second: a relation is not of the essence of an absolute being — since absolute being and relation are two members of being, from one another distinct, into which being itself is divided, as is clear from the (*Tract. on Formalities*). But goodness is formally a relation, and a habit is an absolute being — being a quality. Therefore, and so on. Third: a moral habit is of itself indifferent to goodness and malice. For there are neutral and indifferent acts, as I proved in (*Article III*, *Question II*, *Book III*). Furthermore, moral virtue is not good unless it conforms to prudence; therefore since it can be conformed or disconformed to it, it is clearly not essentially good.

One may object first: Augustine (*On Free Will II*, *ch.* 18; and *On the Customs of the Church II*, *ch.* 6) defines virtue in these words: "Virtue is a good quality of the

mind." Therefore goodness is intrinsically contained in the essence of virtue, since it is placed in its definition. I respond that Augustine there speaks of infused and theological virtue — as his subsequent words indicate and Vorrillon (*loc. cit.*) notes. But we are speaking of moral virtue and habit, as is clear from the title of this article.

One may object second: "Virtue is that which perfects its possessor and renders his work good" (*Ethics II*, 5). And "Virtue is the good disposition of a perfect thing toward what is best" (*Physics VII*, 17). And "Virtue and vice are opposed as contraries" (*Book of the Predicaments, chapter on opposites*). But vice is intrinsically evil. Therefore virtue is intrinsically good. I respond that Aristotle is to be expounded as speaking of virtue conjoined with and coexisting with prudence, not of virtue as a quality. For in itself virtue involves no intrinsic moral goodness, as Scotus suggests (*loc. cit.*, §. *Ad illas*, *BB*).

One may object third: what is placed in the definition of something is contained in its intrinsic reason — for a definition grasps and expresses the essence of a thing. But moral goodness is posited in the definition of virtue, which is "an elective habit consisting in a mean, as a wise man will determine." Therefore goodness is not to be removed from the essence of virtue. I distinguish the major: what is placed in a purely quidditative and essential definition, I grant; what is placed in a definition given by way of addition, as in the present case, I deny. This solution is indicated by the last words of the definition adduced — namely, "as a wise man will determine" — where it is signified that virtue depends on prudence, to which it is conformed and without which it would not be virtue. Therefore absolutely speaking, virtue as a quality exhibits no moral goodness; insofar, however, as it regards prudence, to which it is conformed, it includes goodness.

One may say: virtue formally, as virtue, imports a relation of conformity to right reason. But such conformity is a relation through which, according to Scotus, virtue is formally constituted in the being of virtue. Therefore virtue intrinsically contains in itself moral goodness. I respond that the argument proves this of virtue as it is virtue formally — not of virtue taken materially, which is what the present difficulty concerns.

One may object fourth: the habit of playing the cithara tends only toward harmonious sound according to the precepts and rules of the art. Therefore likewise the virtue of, say, temperance inclines only toward abstinence with the due circumstances that render it formally good — and therefore goodness is intrinsic to moral virtue. Granting the antecedent, the controversy still remains whether those circumstances and the relation of conformity enter into the nature of virtue as a quality — which we deny — or are extrinsic and adventitious to it — which we concede. For just as a surface is of itself indifferent to receiving whiteness or blackness, so moral virtue is indifferent to goodness or malice.

Disputation III. Whether Moral Virtue Consists in a Mean

That moral virtue consists in a mean is the common view of the philosophers. I say "moral virtue" — for scholastics teach that theological virtue is without a mean, notably Thomas (*Summa II-II*, q. 17, art. 5) and Báñez (*ibid.*, q. 27, art. 6). The reason they give is that it is measured by an infinite object — although from the side of the one possessing it and with respect to circumstances it can have a mean, as the same authors note.

It is to be noted first, from (*Ethics II*, 6), that there are two kinds of mean: arithmetic and geometric. The former is called the mean of the thing, which always preserves equality between extremes — as the number six mediates between ten and two, since it is equidistant from both by four units. The latter is called the mean of reason and with respect to us, in which equality is not preserved but proportion and fittingness, according to the right dictate of reason. Furthermore, two kinds of mean are commonly assigned, recalled by Scotus (*Book II*, dist. 15, q. un.) and Orbelli (*Metaphysics IV*, q. 4): one is called the mean by participation in the extremes, which participates something from each extreme — as tepid water mediates between hot and cold. The other is called the mean by negation of the extremes — as virtue is said to mediate between two extreme vices (*Ethics II*, 8), because it recedes from both. Say, liberality is the mean between prodigality and avarice, because it turns away and flees from them.

First Assertion. Moral virtue is situated in a mean — not arithmetic but geometric, and not in the mean by participation but by negation of the extremes. The assertion is comprised in three parts and is deduced from Scotus (*Book III*, dist. 33, q. un.; and dist. 36, q. un.).

The first part is expressed explicitly by Aristotle (*Ethics II*, 7). It is proved first by induction: liberality mediates between prodigality and avarice; fortitude between audacity and timidity; and so for the remaining virtues. Therefore virtue is in the mean. Second: virtue is defined as "an elective habit consisting in a mean." And it is on everyone's lips: "Extremes are always vicious." Therefore virtue is rightly said to exist in the mean.

The second part is shown: what mediates between things by arithmetic mean is equidistant from its extremes, as is clear from the note set down above. But moral virtue is closer to one extreme than to the other (*Ethics II*, 8) — as fortitude is closer to audacity than to fear. Therefore it does not obtain an arithmetic mean.

The third part follows from the preceding: since, as was proved, virtue is in a mean — not arithmetic — it plainly follows that it is in a geometric mean, since no other mean is found besides the two named.

Second Assertion. Justice admits of a mean. This is maintained against Racon and certain others who do not acknowledge a mean in justice, and is collected from the Doctor (*loc. cit.*), which Orbelli explicitly defends (*both in Metaphysics IV, q. 4; and Book III, dist. 33*). It is proved first: (*Ecclesiastes VII*): "Do not be overly just." Where a sin through excess is denoted as occurring sometimes in justice. Second: one who gives another more than is due sins against justice, and one who decrees excessive punishment for the guilty also opposes justice. I add: distributive justice consists in an arithmetic mean, distributing rewards according to the merits of each (*Ethics V, 2*). And commutative justice preserves the geometric mean, giving to each what is his according to the proportion and dignity of persons. I conclude therefore that justice is placed in a mean — which Orbelli (*loc. cit.*) explains thus: between the just and the unjust, the not-just mediates — just as between seeing and blind, not-seeing mediates.

One may object first against the first assertion: certain moral virtues hold extremes. Therefore not every virtue has a mean. The antecedent is shown: magnanimity regards great honors, magnificence great expenditures, and virginity great abstinence from venereal pleasures. I deny the antecedent; to its proof I say that these hold a mean — since they perform their functions not rashly but prudently and with caution, as right reason dictates. With respect to that rule the mean of virtue is taken, not with respect to the quantity of the thing — as is clear from (*Ethics I, 6*).

One may object second: virtue and vice are two extremes opposed to each other, as is clear in (*Postpraedicamenta, chapter on opposites*). Therefore virtue occupies not a mean but an extreme position. The antecedent is shown: between good and evil there is no mean. Therefore neither between virtue and vice — since virtue is good and vice is evil. I deny the antecedent; to its proof I say that virtue is not compared to vice as an extreme. For in that case it would not hold a mean — since the mean presupposes extremes between which it mediates. But it is compared to two extreme vices, between which it obtains the mean — as I made plain above in the case of liberality, which mediates between avarice and prodigality.

Disputation IV. Whether the Moral Virtues Are Connected with One Another

Thomas (*Summa I-II, q. 65, art. 1*), Richard (*Book III, dist. 36, q. 1*), and the Complutenses (*Ethics, disp. 6, q. 4, art. 2*) embrace the affirmative part, asserting that the moral virtues are necessarily connected with one another as to their genera and their species. But the negative part is followed by Scotus (*Book III, dist. 36, q. un., §. Quantum ad istum, B*), Bonaventure (*ibid.*), Brulifer, Vorrillon, and the remaining Scotists and Nominalists, who say that the aforesaid virtues are connected with each other.

It is to be noted that the moral virtues can be regarded either as imperfect or as perfect in their genus, or simply and with respect to the end attainable by a

person. According to these distinctions, some say that moral virtues are connected in the perfect state but not in the imperfect state — which the Doctor refutes (*loc. cit.*, §. *Contra hoc*). For if one virtue can exist in the second and third degree, it can certainly exist in the eighth and last degree, if the exercise is performed only in it and not in another. For someone can exercise acts of temperance without exercising acts of justice, and consequently can acquire the habit of temperance in its perfect state, even without acquiring the habit of justice — because he is occupied in the one and not in the other. Again, he may not think about another virtue — either because he so wills, or because no occasion presents itself for eliciting acts with respect to its matter, or because he can only do what his acquired habit inclines him toward and not what he has no habit for nor any inclination toward. Therefore, neither in the perfect state are the moral virtues joined. Nor does it avail to say with others — whom the same Doctor pursues (*ibid.*, §. *Dicitur aliter*) — that one habit, even if perfect, does not enjoy the reason of virtue unless the union and connection of the other virtues accedes. For since virtue is an elective habit determined by right reason, prudence can dictate about things pertaining to temperance and not about things pertaining to justice. Therefore given this hypothesis, the habit of temperance is acquired without the habit of justice — and thus one virtue does not require the union and connection of the other virtues.

Moreover, if the connection of virtues were necessary, there would be no order in their acquisition. For if, once temperance is had, it cannot exist without justice — and neither is a virtue without the other — then one is not prior to the other, since neither requires the other for its being. Or if it is conceded that one precedes the other, one could be without the other, and therefore no necessary connection exists between them. But speaking absolutely, no one can be morally good unless he participates in all the moral virtues — just as no one is simply and perfectly sentient without all the senses, as Scotus concludes (*loc. cit.*, §. *Quantum ad istum, sub B*) and as follows from (*Ethics VI, 13*): "The simply good does not happen to be separated. For when prudence exists in one, all will be present in him."

Assertion. The moral virtues are not connected with one another. So the Doctor holds (*loc. cit.*). It is proved first from Augustine (*On the Sentence of James, to Jerome, ante medium*): "This is not that divine sentence which says that whoever has one virtue has all, and that none exists for one who lacks any one." And (*ibid.*, *post medium*): "One and the same man has greater prudence than patience, and still does not have continence, even if he has greater mercy." Hence Vorrillon (*loc. cit.*) writes that this is the express opinion of Augustine and the Catholics, against the Stoics and Thomists. Second, from Aristotle (*Ethics VI*), cited by Orbelli (*here, art. 2*): "The same person is not best suited to all." Therefore one who exercises himself in things toward which he is inclined will acquire virtue concerning those things; but if he does not exercise himself in others toward which he is not inclined, he will not acquire virtue concerning those — as a

religious person can become accustomed to moderating and restraining his passions, but not to undertaking and engaging in military affairs. Third: parts can exist without the whole, because they are prior to it — and one precedes another, as form precedes matter, and the heart or liver precedes the other parts of an animal. But one virtue does not perfect a person totally and cumulatively, but only partially. Therefore, just as essential and integral parts are not necessarily connected, neither are accidental and perfective parts — such as the moral virtues. This is confirmed and illustrated admirably by the Doctor (*just recalled*) in the case of the sensitive powers: for who can have perfect vision without hearing, or the reverse? Therefore one can enjoy one virtue without another. Fourth: just as prudence is directive of the moral virtues, so is wisdom directive of the intellectual ones — for it is the head (*caput*) and mistress of the sciences (*Ethics VI, 8*). Yet who can excel in Metaphysics who lacks Geometry? And some can be endowed with Physics while lacking Mathematics. Therefore likewise one can be adorned with one moral virtue and deprived of another — especially if the habits are disparate, such as conjugal continence and virginity, or magnanimity and humility. Therefore there is no necessary bond between the moral virtues.

One may object first: Aristotle (*Ethics VI, 13*), Augustine (*On the Trinity VI, 3*), Gregory (*Moralia XIX, c. 3*), and others adduced by Richard and Basil — seconded by Cicero (*Tusculan Disputations II*) and Averroes (*Ethics VI*) — openly assert that the moral virtues are mutually joined and connected. I respond that these authorities are to be expounded of the one who is morally perfect and perfectly good — that is, one who enjoys every perfection. Just as one is said to be perfectly sentient who is endowed with all the senses, so one is simply and perfectly moral who is richly supplied with all the moral virtues on every side — especially for attaining the ultimate end. For although someone may be courageous and mild, yet if he is a fornicator, he will not possess the kingdom of God. For "whoever fails in one point has become accountable for all" (*James II*). To this Paul refers (*I Corinthians XIII*): "If I know all mysteries, and if I have all knowledge, and if I have all faith so that I can move mountains, but do not have charity, I am nothing." Nor does Jerome dissent (*on chapter 16 of Isaiah*): "As a cithara does not emit a harmonious sound if one string is broken, so the spirit, if one virtue is absent, will not resound with melody."

One may object second: there is no perfect temperance unless fortitude is annexed to it, and fortitude is not perfect without prudence, which directs all virtues. Therefore virtues are mutually bound. The antecedent is shown: if a temperate person is presented with death or fornication, and is not courageous, he will succumb to fornication rather than to death. But if he is courageous, he will choose death rather than fornication — as Cicero says: "I prefer to die than to be defiled." And (*Daniel XIII*): "It is better for me to fall without the deed into the hands of men than to sin in the sight of the Lord." I deny the antecedent; to its proof I say that this is per accidens. For temperance in its own genus is

perfect and does not labor around the matter of another virtue — such as fortitude, whose function is to endure terrible things. And it is not the function of one virtue to direct a person toward all things, but toward its own proper and peculiar end — just as sight in itself is perfect that perfectly discerns visible things, nor is it imperfect with respect to this sense if it lacks hearing or another sense.

Disputation V. Whether the Moral Virtues Are Connected with the Theological Virtues

One may ask not only whether the moral virtues are necessarily bound to the theological virtues, but also whether the theological virtues are joined to one another such that one cannot be separated from another. Both difficulties are raised and resolved by Scotus in both works (*3.d.36.q.un.*), Vorreux, Orbellis, and the other authors previously named, in the same place. Note from the Doctor in the passage of the third book now cited that each virtue, whether moral or theological, is perfect in its own species. For it has its proper object and end, as well as whatever is required for its specific being. But with respect to the common and ultimate end, all virtues are said to be unformed and imperfect. For the moral virtues presuppose the theological, and the theological virtues do not suffice to attain the end without charity. For this reason charity is called their perfection — not, indeed, an intrinsic perfection, but an extrinsic one, by reason of the end that can be attained. Note further that the theological virtues excel the moral, both by reason of their object, since the object of the theological virtues is uncreated and infinite being, whereas the object of the moral virtues is created and finite being, and also by reason of their end, since the end of the former is ultimate, while the end of the latter is not ultimate — that is, an end subordinate to an end. Moreover, they are not equal to one another. For among the theological virtues charity is preeminent, and among the moral virtues magnanimity and liberality excel.

First Assertion. The moral virtues have no bond of union with the theological virtues. So holds the Doctor in the place cited above. It is proved from Augustine's sermon on patience (*Serm. de patientia*), which is found in the Decrees (*d.49*) and in the section on penance (*d.3. §. Quamvis de haeretico*): if a heretic or schismatic who dies and denies Christ — shall we commend his patience? Here we have patience, which is a moral virtue, existing without charity, which is a theological virtue. Secondly, when one thing stands to another as a disposition to a form, the disposition can exist without the form — just as alteration can occur without generation, as was explained in the treatise on generation (*l. de generatione, q.1*). But a moral virtue stands as a disposition toward the theological virtues, just as natural happiness stands toward supernatural happiness. Therefore the moral virtues are not necessarily bound to the theological. Thirdly, even if there were no theological virtues, there would still be moral virtues, as is evident from Socrates and the other moral

philosophers, who possessed moral but not theological virtues. Again, what is prior can exist without what is posterior, provided there is no essential dependence or connection between them, as was shown elsewhere. But the moral virtues precede the theological in order and priority of nature. Therefore they are not necessarily connected with them.

Second Assertion. Nor are the theological virtues connected with one another. So holds the Doctor in the cited place (§. *Quantum ad 4. art.R.*). It is proved firstly from the fact that in heaven charity exists without faith and hope: *Charity never fails, though prophecies will be made void and tongues will cease (1 Cor. 13)*, and shortly after: *When that which is perfect has come, that which is in part will be made void*; and a little further: *We now see through a glass darkly, but then face to face*. Secondly, in this life a sinful believer who is in mortal sin has faith and hope but not charity, as the same Apostle indicates in the passage cited: *If I have all faith so as to remove mountains, but have not charity, I am nothing*. Therefore the theological virtues are not necessarily connected with one another by a necessary bond.

First Objection against the First Assertion. The formal being of a thing is necessarily connected with that of which it is the formal being, as is established both logically and in natural philosophy. For a genus cannot exist without its differences, nor matter without form. But the formal being of the moral virtues is charity, without which they are unformed, as Augustine testifies (4. *contra Iulianum*, c.2): whoever possesses them without charity does not perfectly glory in the Lord, as Paul confirms (Col. 3): *Above all these things, have charity, which is the bond of perfection*. Therefore the union between the moral and theological virtues is necessary.

I distinguish the major premise: if it is understood of intrinsic essential formal being, I grant it; if of extrinsic formal being, such as the theological virtues are with respect to the moral virtues, I deny it. For in their own species the moral virtues are perfect, although with respect to the ultimate end and to a further perfection they may rightly be called imperfect, because the ultimate end cannot be attained without charity. In this way the testimony of Augustine is to be explained, as well as any other passage adduced in opposition.

Second Objection. No form can exist without its prerequisite dispositions, since the form presupposes them and could not inform matter without them. But the moral virtues stand as dispositions toward the theological virtues. Therefore the theological virtues cannot exist without the moral virtues. The major is evident from natural philosophy. The minor is from Scotus in the cited place (§. *Contra hoc.N.*). I respond that the major holds in natural things but not in supernatural and gratuitous things, such as the theological virtues, which God bestows upon us by his will and generosity, as the Doctor indicates in the cited passage (§. *Quantum ad 4.R.*).

Third Objection. The theological virtues presuppose the moral, because the moral are ordered to the theological as the imperfect to the perfect and the lower to the higher, on the authority of the Augustine just mentioned. Therefore the moral virtues are necessarily bound to the theological. It follows further that just as faith and hope can exist without charity, yet charity cannot exist without faith and hope — since without faith it is impossible to please God (*Hebr. 11*) — so by parity of reasoning the theological virtues, being more perfect, cannot exist without the moral virtues.

I deny the antecedent. For a baptized infant or an unlettered adult possesses the theological virtues but not the moral, as is evident at least with respect to act, since they do not perform moral acts — and because the moral virtues are not infused per se but acquired, and beyond the theological habits there are no other per se infused habits; otherwise a man would be prudent, temperate, and just in the same way that he is a believer through infused faith. Likewise, in the blessed there is no need for infused knowledge in its own proper genus; the beatific knowledge in the Word suffices. Nor is it improbable that the blessed can acquire some knowledge in their own proper genus, as I said concerning the experimental knowledge of Christ the Lord in the treatise on the Incarnation.

One may say: the end requires and presupposes the means without which the end itself is not attained. But the moral virtues are as a means for achieving the end with respect to the theological virtues, because it is through moral means that charity attains the ultimate end, as the Doctor teaches in the place cited above (*Sub N.*). Therefore the theological virtues are not found without the moral.

I distinguish the major: if it is understood of a means that is necessary for the attainment of the end, I grant it; if of a means that is gratuitous, as the moral virtues are with respect to the theological, I deny it.

Disputation VI. In What Subject the Moral Virtues Are Seated

Although this difficulty is addressed and resolved in Articles V and VI of this book in the treatise on habits taken in general (*q.1. de habitibus generaliter sumptis*), it is nevertheless pleasing to examine and resolve here in particular the question of fortitude and temperance. For Saint Thomas (*1.2.q.56.art.4*) and his disciples assert that fortitude and temperance are seated in the sensitive appetite. But Scotus (*3.d.33.q.un.*), Ockham in the same place (*q.10*), and the followers of both — to whom Bacon also assents (*disp. de virtutibus, sect.3.q.2.art.2*) — firmly and vigorously maintain that fortitude and temperance, as virtues, reside in the will, just like the other moral virtues.

Note from the Doctor in the cited place (§. *Ad arg. principalia, ante N.*) that in the sensitive appetite a quality or habit can be generated by repeated acts in the matter of fortitude and temperance, by reason of which the sensitive appetite is able to obey reason more easily and readily. Yet this is not properly and

essentially a virtue, since it is not an elective habit, which belongs to the will alone; it can rather be called a path and disposition toward acquiring virtue in a man who is capable of virtue — not, however, in brutes, which have a sensitive appetite but lack a will. Thus in certain animals — a dog, for example — a habit of refraining from food set before it until its master judges that the food offered may be taken can be generated in its sensitive appetite through conditioning. Likewise habits of standing, jumping, and other such things that are acquired by habit and custom can be engendered in it, as I said in the previously named place (*art.8*). Note further, from what has been said elsewhere, that there is a twofold appetite — the sensitive, which belongs also to brutes, and the rational, which is proper to man and is called the will. Hence Scotus (*3 Rep. d.33.q.un. in fine*) and (*3 Oxon. d.34.G.&H.*), following Bonaventure in the same place, acknowledges in man a twofold concupiscible and irascible: one irrational, in which no virtue resides; the other rational, in which virtue inheres — namely, fortitude in the concupiscible and temperance in the irascible.

Assertion. Fortitude and temperance are located in the will as their subject. This is defended by Scotus in the passage just cited. It is proved firstly: a habit resides in the same faculty in which its act resides (*l. de somno et vigilia, c.1*). But the acts of fortitude and temperance are located in the will — since choice pertains to the will as the faculty that elects, whether in facing and enduring dreadful things or in renouncing the pleasures and allurements of the flesh and preserving sobriety. Therefore the habits of both reside in the will. Secondly, fortitude and temperance have the same subject as virtue itself and the definition of virtue — but the definition of virtue is accommodated only to a habit residing in the will, since virtue is an elective habit (*2 Eth. 6*), and choice properly belongs to the will alone. Since, therefore, temperance and fortitude are properly virtues, it is plainly concluded that they reside in the will. Thirdly, the said virtues are located in the power that endures difficulty in bearing their matter, since virtue concerns what is difficult (*2 Eth. 3*). But it is the will that endures difficulty in approaching dangers and in abstaining from pleasures — and is sometimes drawn and carried away by them, as indicated by James (*Iac. 1*): *Each person is tempted when he is drawn away and enticed by his own concupiscence*. And the well-known saying goes: *Each man is drawn by his own pleasure*. Furthermore, God and the angels are said to be strong (*Ps. 23*) — not on account of the difficult arousal of a sensitive appetite, which they lack — but therefore on account of the intellective appetite, of which they are capable. Moreover, the intellect is the common subject of all intellectual virtues, as no one denies; therefore the will is likewise the common subject of all moral virtues. For the same reasoning applies in Aristotle concerning justice as concerning the others, as the Doctor argues in the cited place (§. *Haec opinio*). But justice is placed in the will even by the adversaries — therefore the same holds for fortitude and temperance.

One may object with the Coimbrans (*art.2.q.5.disp.7 Eth.*) that there is a disparity here, since justice immediately directs the will toward the good of another,

rendering to each what is his own, whereas temperance and fortitude are ordered toward one's own goods. Therefore the former resides in the will, while the latter reside in the sensitive appetite.

On the contrary: fortitude and temperance can be ordered and directed toward the goods of one's country and other common goods — as when someone goes to war for his homeland against its enemies, or when someone abstains from base concupiscences out of love of God and neighbor. If, therefore, justice inheres in the will for the reason alleged, then surely for very nearly the same reason the said virtues are located in the same will. Moreover, it pertains equally to the will to live justly, to live temperately, and to act courageously. And if merit and the morally good pertain to the will, then without doubt its principle and its disposition also belong to the will itself — as Vorreux, mentioned above, elaborates following the Seraphic Doctor.

First Objection. Aristotle (*2 Eth. 10*) and the last chapter of the first book of the same work places fortitude and temperance in the sensitive appetite. Therefore the opinion of Scotus conflicts with Aristotle. It follows further that the said virtues are said to be in the concupiscible and irascible parts, which are not parts of the will but of the sensitive appetite; for they are occupied with the arduous good and the pleasant good, which belong to the sensitive appetite. Therefore the aforesaid virtues have their seat in the sensitive appetite.

I respond by explaining Aristotle through a distinction: concerning fortitude and temperance as virtues, I deny it — since virtues are properly elective habits — but concerning fortitude and temperance as certain habits and capacities with respect to the goods mentioned above, which can even be had in a dog, horse, and other brutes, I grant it. And Aristotle himself suggests this (*1 Magn. mor. cap.6*), placing fortitude and temperance in the irrational part, and likewise in the same work (*cap.1*).

One may say with the Coimbrans in the cited place: therefore there is a twofold fortitude and temperance, yet Aristotle mentions neither of them. On the contrary, over and above the fact that the argument is from negative authority, it is not obscurely derived from the passages already cited that according to Aristotle there is a twofold fortitude and a twofold temperance — one in the will, and another in the sensitive appetite, which does not merit the name of virtue. To the consequence I say that in the will too there is found a spiritual concupiscible and irascible with respect to the said objects, just as in the sensitive appetite there are a material concupiscible and irascible.

Second Objection. The will is fully perfected by the theological habits; therefore moral virtues ought not to be admitted in it. I distinguish the antecedent: with respect to the divine good, I grant it; with respect to the created good, I deny it. Similarly, the intellect is perfected by the light of glory and by consummated

glory, yet from it natural intellectual habits are not removed — they are its ornaments and natural perfections.

Third Objection. Medicine is applied to the part that is ailing, as we observe daily. But in the matter of fortitude and temperance, the sensitive appetite is the ailing part; therefore the medicine that fortitude and temperance constitute ought to be applied to it. I respond that the major premise is not universally true. For when the head is suffering, medicine is applied to the arm, the veins, and other parts. And this is evident from sympathetic powder and from agents acting at a distance. Or, granted the major, I say that to the sensitive appetite, as its remedy, there is applied the habit and quality already explained above — not, however, the habit that is a virtue.

Fourth Objection. Perfect temperance is had if the sensitive appetite is restrained and fully subjected so as not to resist right reason, as Sacred Scripture indicates (*Gen. 4*): *Your appetite will be subject to you, and you will rule over it*. Therefore temperance is located in the sensitive appetite.

I grant the antecedent and deny the consequence. For all that follows is that the will endowed with temperance restrains the sensitive appetite and holds back its impulse so that it obeys right reason.

Disputation VII. Whether There Are Moral Virtues in Angels

This difficulty has its origin in the resolution of the preceding disputation. For if the will is the subject of the moral virtues, as was established there, and the angel possesses a will, it is not unreasonable to inquire whether the aforesaid virtues reside in the will of an angel. On this question, the Thomists, followed by the Coimbrans (*q.5.disp.7.Eth.art.3*), deny that virtues of this kind exist in angels, since angels lack the sensitive appetite, which they consider to be the adequate subject. For once the subject is removed, all that belongs to the subject is removed. But Scotus (*3.d.33.q.un. §.Ad 1.*) appears to be undecided on the matter. In favor of the affirmative he adduces this argument: every will that does not necessarily lack some perfection befitting it can acquire that perfection for itself, as is evident in the other powers that tend to acquire their fitting perfections. But to will a practical good not only for oneself but for another is a perfection of the will, just as to understand some intelligible object is a perfection of the intellect. Therefore it can belong to the will of an angel to will for itself the good of temperance, and by repeated acts to generate within itself a habit of such practical goods — and such a habit is temperance. Hence there is no repugnance for an angel to possess this habit, whether for itself or for another, as the Doctor teaches concerning practical justice (*q.4.prol. infra N.*). Indeed, this is not denied even of God, insofar as it is considered apart from every imperfection, as Scotus indicates both here and in (*4.d.46.q.3.q. Ad arg. principalia. M.*): for charity, fortitude, justice, and mercy are attributed to God and to the angels. For God is called strong and mighty, merciful and just. And the angel Michael is called the

strength of God. I add further that certain choirs of angels are named principalities, powers, and virtues. Moreover, a more perfect nature participates not only in the perfections of a less perfect nature but in others that are nobler — as is evident in man, who not only enjoys the perfections of things below him but also possesses others that are greater and more excellent. Since, therefore, man, who is inferior to the angel, possesses moral virtues, so too does the angel, and in a nobler manner. See Mayr (*q.2.art.7*) and Aretus (*art.6*).

On the other hand, in favor of the negative the same Doctor in the same place puts forward this argument: virtue is concerned with the arduous and difficult good; but the good of temperance is not difficult of attainment except for one who has a sensitive appetite that tends toward what is opposed to that good, at least in some circumstance. Since the will of an angel is not joined to a sensitive appetite, it follows that the habit of temperance does not exist in it. Or one may say with the same Doctor in the same place that in an angel there is no effective will capable of commanding in the matter of temperance, since it lacks a sensitive appetite; there is only a simple and inefficacious volition, which is not fitted to command — and therefore the habit of temperance does not exist in an angel.

First Objection against the Affirmative Part. Aristotle (*10 Eth. 10*) excludes moral virtues from the gods; therefore the opinion affirming that moral virtues exist in angels contradicts the Peripatetic school.

I respond that the Philosopher excludes from the gods — or angels — accidental and adventitious habits, because he thought these were really identified with their substance and were innate to them. But since the said Philosopher is deficient in his principles, he is equally deficient in his conclusion. For it is false that intellectual and moral habits are identical with their substance, since they are the substance's accidental perfections, separable from it, as I showed at length in the treatise on angels (*tract. de Ang. disp.1*). Or one may say that he denied such habits to them in the sense of habits for taming the passions of the sensitive appetite, which angels lack. So the Doctor deals with the objection in the Reportata (*Rep. 3. d. praesenti, §.Contra in Deo*).

Second Objection. One who lacks the matter and objective grounds of fortitude and temperance likewise lacks the virtues of fortitude and temperance, as is evident. But the will of an angel lacks the matter and objective grounds of these virtues. Therefore it also lacks the virtues themselves. The major is evident. The minor is proved: the matter of fortitude is the arduous good concerning dreadful things, and the matter of temperance is the arduous good concerning pleasures that are agreeable to the sensitive appetite. The angel, however, is exempt from these, since it has no sensitive appetite.

I grant the major and deny the minor. For an angel can, when objects of temperance and fortitude are presented to it, rightly choose what is to be done

regarding these or those practical matters, and by frequent acts generate within itself a habit of such practical matters — and thus it would possess those virtues. The same must be affirmed of the blessed, who are endowed with all the virtues, as is clear from Augustine (*14 Trin. cap.9*) and the Master (*3.d.33*).

Third Objection against the Negative Part. If Scotus's argument were true — namely, that an angel desiring temperance for someone would cause the habit of temperance in that person — then an intemperate father and an immodest mother who desire the habits of temperance and modesty in their children would generate those habits in them. This Medina considered to be manifestly false and plainly absurd (*1.2.q.61.art.5*).

I deny the consequence of the antecedent, since the desire of wicked parents with respect to their children is not effective but simple and inefficacious — and therefore it does not follow that the aforesaid habits are produced in them. Thus Medina ineptly argues against Scotus in the cited place.

Disputation VIII. Whether There Are Virtues Other Than the Theological and the Moral

Henry of Ghent (*Quol.4.q.33*) established a distinction between virtues, gifts, and beatitudes as diverse habits, saying that virtues dispose in a human manner, the gifts of the Holy Spirit in a superhuman manner, and the beatitudes in an inhuman manner. Saint Thomas (*3.d.34.q.1. parte 1*) and Saint Bonaventure in the same place do not appear to diverge from this view — both of whom Scotus reports and refutes in that place (*q.un.*), reducing all other habits to the seven virtues, namely the cardinal and the theological.

Note firstly that the theological virtues are three — faith, hope, and charity — and the cardinal virtues four — prudence, fortitude, temperance, and justice. The gifts of the Holy Spirit, from Isaiah XI, are seven: wisdom, understanding, knowledge, counsel, fortitude, piety, and fear of God. The beatitudes, from Matthew V, are eight: poverty of spirit, mourning, mercy, nakedness, purity of heart, peace, persecution for justice, and patience. The fruits of the Holy Spirit, from Galatians V, are twelve: charity, joy, peace, patience, kindness, goodness, longsuffering, meekness, faith, modesty, continence, and chastity.

Note secondly that the objects of the virtues are either God or creatures. With respect to God there are three virtues, called theological because they regard God as their proper object — believing in him, which is faith; hoping in him, which is hope; and loving him, which is charity. With respect to the created object, virtues are ordered as follows: either a man moderates himself, and this happens in two ways — by restraining the irascible, giving rise to fortitude regarding dreadful things, or the concupiscible, giving rise to temperance regarding pleasurable things — or he moderates another, from which justice emerges; or he dictates what is to be done, from which prudence arises.

Assertion. The other aforementioned habits are to be reduced to the seven virtues enumerated. So holds the Doctor in the place cited above (§. *Ad istam, q.B. & §. His suppositis*). Gregory the Great favors this (*in Iob. l.1.cap.18. in 3. exp.*): *Seven sons were born to him — that is, the seven virtues*. And Isaiah IV: *Seven women shall take hold of one man — that is, the seven virtues*. This is urged firstly: through the virtues the wayfarer is perfected to the extent that perfection is possible in this life. Therefore the said seven virtues suffice, to which all other habits are to be reduced. The antecedent is clear from the second note: for either man is perfected in his ordering toward God, and then he requires the theological virtues; or in his ordering toward creatures, and then he is adorned with the moral virtues. Again, for the perfecting of the created intellect, beyond the speculative habits there is need of prudence, which deliberates about all practical matters; and for its effect — that is, for adorning the will — the remaining three moral virtues are necessary. Secondly, every multitude and plurality must be reduced to certain supreme heads, as is evident in the case of universals, which are reduced to five, and in the case of the predicaments, which are reduced to ten supreme categories. Therefore the plurality of the perfections of the wayfarer, since it can be reduced to the said seven virtues, is to be so reduced — lest a plurality be posited without necessity, contrary to the Philosopher (*1 Phys. T.52*). The consequence is proved: for either they are named with their own names and species, or they are named with other names and more contracted species, as Scotus works out and expresses individually in the cited place (*M. & inde*), and Richards in the same place (*d.35.art.3.quaest.4*).

First Objection. The number of virtues is different from the number of beatitudes, fruits, and gifts, as is clear from the first note. Therefore they are diverse habits — otherwise it is not clear why the latter should not be counted in the same number as the former.

I grant the antecedent and deny the consequence. For sometimes it is not the genus of a virtue that is listed but its species contained under that genus — as is evident with justice, which is expressed under the name of mercy and kindness, which are its species, and are enumerated among the fruits of the Holy Spirit. Sometimes, moreover, in sacred Scripture certain things are enumerated among the numbers listed above, and at other times omitted — as can be seen in I Corinthians XII, where Paul enumerates nine, while Peter in his second letter (*cap.1*) enumerates eight.

Second Objection. More and less in the domain of morals argues for a specific distinction. But the fruits stand to the gifts as the greater to the lesser, as the more perfect to the less perfect. Therefore they are distinct habits. The major is proved: magnificence differs in species from liberality, and magnanimity from euprepeia (*proper ambition*) (*1 Eth. 3*); and yet they differ only according to more and less — since magnificence consists in large expenditures, magnanimity in great honors, liberality in small expenditures, and euprepeia in small honors.

The minor is known: a fruit is called the end of the gifts, just as what is ultimately expected from a tree is called its fruit.

I distinguish the major: if the division is into species, I grant it; if into modes, as in the present case, I deny it. For the fruits are grades or more excellent modes of the gifts, just as intense heat is more excellent than remiss heat.

Third Objection. No fruit is incompatible with charity, since a fruit designates the rest and delight of the one who loves with the one who is loved. But fear contradicts charity, because charity casts out fear (*1Jo. 4*), to which Vorreux subscribes in this place.

I grant the major and distinguish the minor: servile fear, I grant; filial fear, I deny. And it is filial fear, not servile fear, that is numbered among the gifts of the Holy Spirit.

Article II. On Fortitude

Four moral virtues are enumerated — prudence, fortitude, temperance, and justice — which are called cardinal, because just as a door turns on its hinge, so the goodness of human life revolves around these four virtues. They are also called political virtues, because they order man toward living rightly in the commonwealth, just as the theological virtues direct him toward God. Prudence has already been treated above (*art.3.q.3.l.5*), since it is formally an intellectual virtue — yet it is numbered among the moral virtues because it directs and regulates them as their rule and measure.

Disputation I. What Fortitude Is

No one doubts that fortitude exists. There are indeed strong and mighty men, as Genesis VI says: *These are the mighty ones from of old, men of renown*. And II Kings II: *Be sons of fortitude*. And I Peter V: *Be strong in the faith and resist*. Hence the Church in the office for Apostles invites us to fortitude: *Be strong in battle*. From the concrete to the abstract the inference is valid, as Aristotle indicates (*4 Top. ult.*): for it follows well — he is strong, therefore there is fortitude — just as he is a philosopher, therefore there is philosophy. And Scotus adds (*3.d.34.q.un.¶.Notandum, sub F.*): just as temperance is given for moderating the concupiscible, so fortitude is had for regulating the irascible. The same Doctor notes in the same place (*¶.His suppositis*) that power is that by which a powerful being is powerful, and that by which a powerful being is strong. And in spiritual matters, to be powerful and to be strong are the same thing.

Note firstly that fortitude is given three principal senses. First, for bodily strength and robustness — thus a horse is said to be strong. *Issachar is a strong ass* (*Gen. 39*); *The strength of stones is not my strength* (*Iob 9*). Second, for the virtue by which someone acts firmly and robustly in good and honorable undertakings — Aristotle mentions this (*2 Eth. 4*) — and in this sense it is not a virtue but rather a condition of virtue, since the virtuous person, especially if perfect, adheres

firmly to the good. Third, for firmness and constancy in undertaking arduous and dreadful things and in enduring evils — and it is fortitude taken in this third sense that is under discussion here.

Note secondly, from the Doctor in the cited place (*3.d.34.q.un. §.Ad istam.B.*), that the virtues, both intellectual and moral, perfect and adorn man — the intellectual ones perfecting his intellect in speculative matters, as the speculative scientific habits do, and in practical matters, as the practical, active, and productive habits do. The moral virtues, for their part, adorn his appetite — that is, his will — with respect to desirable goods regarding himself, namely fortitude and temperance, and with respect to desirable goods regarding another, namely justice. Whether man is sufficiently and fully perfected and adorned by these virtues alone, without requiring others such as the theological, is a question to be consulted in Scotus in the cited place and in the other Scholastics there, since it is not within the scope of the present undertaking to discuss and decide it.

Note thirdly, from the same cited place (*§.Notandum*), that a habit comprehends under itself many subaltern and lowest species. For habit is first divided into intellectual and appetitive. The intellectual is subdivided into practical and speculative. The speculative into the real, which is threefold — metaphysics, mathematics, and natural philosophy — and the rational, which is subdivided into logic, rhetoric, and grammar. The practical into the active, such as ethics, and the productive, such as medicine. The appetitive is divided into the appetitive directed toward another, which is justice, and the appetitive directed toward oneself, which is an unnamed habit — perhaps best called a certain form of reason as a common name. And this latter is subdivided into the primarily appetitive, which is concerned with what are primarily fitted to agree or disagree, to be embraced or avoided first — and this is temperance — and the secondarily appetitive, which is occupied with what are to be embraced or avoided second — and this is fortitude. The first pertains to the concupiscible, the second to the irascible. For a clearer understanding of this:

Note fourthly, from the same Doctor in the cited place (*F.*), that the object of the concupiscible is the fitting or the disagreeable, from which pleasure or sorrow, embrace or flight, naturally first follows. For what is desired either suits or does not suit the appetitive power: if it suits, it causes delight and pleasure; if it does not suit, it brings sorrow and grief. But the object of the irascible is what provokes anger — what is punishable and offensive. For if what the concupiscible desires is removed or impeded, the animal that desires such an object becomes angry — as when a bone being gnawed by a dog is taken from it, the dog is moved to anger, bites the one who takes it, and drives him away. Therefore fortitude is discerned in repelling what must be repelled and in bearing evils, as will become clearer in the next article.

Assertion. Fortitude is rightly defined as the elective virtue consisting in a mean between fear and audacity. So says Aristotle (*3 Eth. 6*), and the Angelic Doctor

assents (*verb. Fortitudo*), and this is derived from the Doctor in the passage cited. It is explained through each of its individual terms. It is called a virtue as its genus. Elective is added to distinguish it from intellectual virtue, which is natural. The remaining terms are added to distinguish it from the other moral virtues and from vices — namely fear and audacity, which are its extremes. Once explained in this way, the assertion is easily proved. For a definition is fitting and adequate when it is composed of genus and difference, as I have frequently insisted in the foregoing discussion. But this definition of fortitude is composed of genus and difference, as has been shown above. Therefore it is proper and legitimate. Moreover, from (2 *Eth.* 3) and following, virtue is concerned with the difficult good; and it is good and difficult to approach dreadful things and to endure evils — which pertains to fortitude, which preserves the mean and moderation so as neither to fear dangers more than is right, which is the mark of the timid, nor to despise dangers excessively, which is the mark of the audacious and reckless. The definition given explains all these things; therefore it is well stated.

First Objection. Psalm XXIII calls God strong and mighty, and Psalm XII calls him fortitude itself. But God can neither approach dangers nor suffer evils; therefore either fortitude is not rightly defined, or it does not belong to God.

I respond that fortitude is attributed to God stripped of every imperfection, just as knowledge and charity are attributed to him, as I explained in the treatise on the knowledge of God and in other places.

Second Objection. A definition is coextensive with the thing defined, according to the laws of good definition. But the definition given exceeds the thing defined. The major is evident. The minor is shown from (3 *Eth.* 6): fortitude is concerned with dreadful things that arise in war, such as death, which is the greatest of dreadful things, as the same Philosopher notes in the same place.

I grant the major and deny the minor. To the proof, I explain the testimony of Aristotle as follows: fortitude is most properly concerned with the dreadful things that present themselves in war, as Aristotle himself declares near the end of that chapter — yet this does not exclude from the object of fortitude other arduous and dreadful things that the courageous man also approaches outside of war. Hence Aristotle concludes at the end of the cited chapter, and in (1 *Magnorum moral.* 19): the strong moreover conduct themselves manfully in those situations where valor is expected or where death is glorious. This is consonant with the Canticle (*Cant.* 8): *Love is strong as death.*

Disputation II. How Many Kinds of Fortitude There Are

Fortitude is divided into two parts — integral and subjective — which are exhausted by its two acts, namely the assault upon dreadful things and the endurance of them. To the former belong magnanimity and magnificence: magnanimity pertains to undertaking great things, so that someone prepares

himself with a confident and great spirit to overcome difficult obstacles. For magnanimity, as Cicero testifies (*2 de inventione*), is that by which the mind has placed great confidence with certain hope in great and honorable matters. For the assault upon difficulties, magnificence is also necessary, which, from the same Cicero, is described as the carrying out and management of great and lofty things with a certain large and splendid purpose of mind. For it is necessary that one who girds himself for an arduous task and undertakes it be of a lofty spirit, lest he collapse in heart. To the second act — which is the endurance of great labors — belong patience and perseverance. Lest someone succumb and be overwhelmed by sorrow on account of impending and pressing evils, patience is necessary for him, defined by Tully in the cited work as the voluntary and prolonged endurance of arduous and difficult things for the sake of what is honorable or useful. To this is joined longsuffering. Hence of the holy Patriarchs it is said that they were longsuffering — that is, as Orbellis interprets in the cited place (*3.d.34. post Scot. ibid. ante §.Ad arg.P.*), as though longanimously awaiting the coming of the Lord. For the same act, perseverance is also required — lest the strong man desist from what he has begun in the endurance of arduous things — and it is defined as a stable and perpetual permanence in rightly considered reason. Hence the Savior says (*Matt. 10*): *But he who has persevered to the end shall be saved*. And the often-repeated saying goes: not the one who has begun but the one who has persevered shall receive the crown of glory. For many began well and ended badly, not persevering in the good. To this is joined constancy, which appears to differ only slightly from perseverance.

From all this are gathered four integral parts of fortitude, which as it were compose it, namely magnanimity, magnificence, longsuffering, and perseverance. But there are two subjective parts, namely belligerence and patience. For in assaulting dreadful things there is belligerence, and in enduring them there is patience. For just as there are two acts of fortitude — assault upon and endurance of dreadful things — so there are two corresponding species. For the strong man appears and shines forth both in assaulting and in sustaining dreadful things. Which of these two is the nobler and more excellent, Scotus decides in the cited place (*§.His suppositis, ante L.*), saying that the most noble form of fortitude is patience, because it is harder not to repel what offends than to repel it. For this reason Persius sings: *Patience is a noble form of victory, my son*. Therefore, if you wish to conquer, learn to suffer. And of the Martyrs the Church says: *A mind with a good conscience preserves patience*. And finally: *In your patience you shall possess your souls*.

Hence the Coimbrans are refuted (*disp.9.Eth.q.2.art.2 in fine*) in claiming that there are no subjective parts of fortitude, on the grounds that fortitude is concerned with a very contracted and narrow matter. For, as argued above, fortitude consists either in the assault upon serious dangers or in their endurance; and since the evils and impending dangers are of diverse kinds — pertaining to honor, death, and the like — consequently there can be many

species of fortitude. Again, the said Coimbrans themselves admit that magnanimity and magnificence are potential parts of fortitude — if magnanimity is considered with respect to great honors, and magnificence with respect to great expenditures. And the same they admit for longsuffering, perseverance, and constancy. Therefore the many species of fortitude are not to be denied, even though Scotus does not expressly enumerate them, as is evident from the passage cited above (*ante L.*).

First Objection. Distinct acts and diverse functions do not argue for distinct species of things, as is evident from man, who is of one species yet performs diverse functions and produces diverse acts. But to assault great and dreadful dangers and to sustain heavy and serious ones are distinct functions and diverse acts. Therefore they do not constitute distinct species of fortitude.

I respond that diverse functions do not indeed argue for diverse agents, but they do argue for distinct powers and faculties, whose specific distinction is manifested by the specific difference of acts and objects. Similarly in our case, those acts of fortitude do not indicate different strong agents, but distinct species of fortitude — since those acts and objects differ from one another in species.

Second Objection. To bear labors and to suffer evils is not to act. Hence Scotus adds in the passage just cited that to suffer is a kind of permitting, and to permit is not to act positively. For God indeed permits sins but does not commit them, as was said above. Therefore there are not two acts or two species of fortitude.

I respond that although suffering evils is not to act by an external action, it is nevertheless to act by an internal action. For it is to will to endure dreadful things, as the Doctor suggests (*in Rep. 3.d.34.q.un. §. Ulterius*). And the Angelic Doctor explicitly says (*verb. Fortitudo*): to sustain is the more principal act. And willing is a positive act of the will. Now, although God permits sins, he nevertheless does not will them — indeed, he prohibits sins. Therefore there is no parity here. Whether permission is a positive act of the will or not, see the treatise on the will of God (*quaest. de praedestinatione*).

Article III. On Temperance

Disputation I. What Temperance Is

No one who is temperate doubts that temperance exists. For just as a knowledgeable person cannot exist without knowledge, so a temperate person cannot exist without temperance. I am well aware that temperance is signified by the name sobriety, as the Angelic Doctor notes (*verb. sobrietas*). And that sobriety exists is held as certain by all, to which Saint Peter invites us in his first letter (*cap. 5*): *Brothers, be sober and vigilant*. Moreover, just as fortitude avails for moderating and governing the irascible, so temperance in like manner conduces to ruling and perfecting the concupiscible.

Note firstly, from Orbellis (*3.d.33.q.2*), that temperance is taken in two ways. First, strictly, for pleasure or delight of taste and touch, concerning which Aristotle discourses (*3 Eth. 10*) — by reason of which those are most properly called temperate who abstain from venereal pleasures, food, and drink. Second, for the habit of the will as well as of the sensitive appetite, with respect to what is primarily concupiscible — and temperance taken in this sense is numbered among the moral virtues, to which Andronicus asserts that humility belongs, as Orbellis reports in the cited place.

Note secondly, from the same Doctor in the same place (*post Scotum alleg. §.Notandum ante H.*), that there is a twofold concupiscible and a twofold irascible — one in the sensitive part or sensitive appetite, and the other in the intellective part or will. In the sensitive part they have diverse organs, because the same thing cannot be moved simultaneously by different motions. For the sorrow of the concupiscible comes with contraction, while the delight opposed to it comes with dilation of the heart; but the pain of the concupiscible is effected with heating, because as was said, anger is an enkindling of the blood around the heart. In the intellective part, they have an affinity of the distinction of objects that they participate in from the sensitive part. For the will can desire the good that is fitting either to itself or to the sensitive appetite, with which it is joined in the same suppositum. The will can also have an offensive object and regard it as offensive by an act of repulsive willing — although the distinction in the will is not as great as in the sensitive appetite, since the will is not organic as the sensitive appetite is. Nor are the irascible and concupiscible in the will distinct powers and faculties from one another; rather, just as the same power is called the higher portion and the lower portion with respect to different objects, so the same will is called irascible insofar as it regards an offensive object, and concupiscible insofar as it regards a fitting object — in much the same way as the same intellect tends toward principles and toward the conclusions drawn and gathered from them.

Assertion. Temperance is an elective habit consisting in the mean with respect to what is primarily concupiscible. This is derived from Aristotle in the passage recently cited and from Scotus in the cited place (*shortly before G.*). It is called a habit as its genus. Elective is added to distinguish it from the intellectual habit, which is natural. In the mean is placed to exclude vice, which consists in some extreme. What is primarily concupiscible is added to distinguish it from fortitude, which regards not the fitting but the offensive, as is clear from the preceding article. Once explained in this way, the assertion is easily established. For it is a good definition that is composed of genus and difference. But the definition given is of this sort, as is clear from the preceding explanation of its terms. Therefore temperance is aptly defined.

First Objection. Temperance concerns only the pleasures and pains of the body. For no one is called temperate or intemperate with respect to the delights of the

intellect or will, as the Philosopher noted above. Therefore the definition given is faulty, since it exceeds temperance by encompassing spiritual pleasures.

I deny the antecedent. For not only the sensitive appetite but also the intellective appetite needs a habit that moderates and tempers what is concupiscible and delightful to it — since both appetites curb their concupiscible and pleasurable objects, as the Doctor firmly and consistently maintains in the cited place. Though it is most properly concerned with venereal pleasures, food, and drink.

Second Objection. Virginity is a virtue belonging to temperance, yet it does not consist in a mean, because the virgin abstains from all venereal pleasure, which is one of the extremes. Therefore temperance is not well defined as a virtue consisting in moderation, since it is placed not in a mean but at an extreme.

I respond that virginity consists in the mean not according to the quantity of the thing, following (2 *Eth.* 6), but according to the right dictate of reason, with respect to which the mean of virtue is taken — as is clear from magnanimity, which, although it is occupied with great things, is nevertheless placed in the mean with respect to reason (4 *Eth.* 3), because the magnanimous person tends toward great things according to the right dictate of reason. For the magnanimous person tends toward the lofty not for his own glory but for the glory of God and the benefit of neighbor. And so he holds the mean between the timid and the reckless, as I made clear in the preceding article.

Disputation II. How Many Kinds of Temperance There Are

Since temperance resides in the concupiscible and regards the fitting good as its object, the following foundations and notes must be laid for tracing out its species and subjective parts.

Note firstly, from Scotus (3.*dist.* 34.*quest.un.* §. *His suppositis. ante K.*), that there is a threefold fitting good: the honorable, the delightful, and the useful. The first two goods are desired for their own sake and therefore primarily move the appetitive power to desire them. The third does not primarily move the appetite, since it is desired for the sake of something else — for example, riches are useful goods desired for the acquisition of honors and pleasures. Yet riches can also be delightful goods insofar as they are beautiful and gladden the heart of man; in this way they can be primarily desired, just as anything else that is pleasant to sight and delightful to behold — such as the tree of life, of which Genesis III speaks.

Note secondly, from (7 *Eth.* 1), that in every species of virtue or vice there are three degrees: disposition, perfection, and excess. In virtue, the first degree is called continence, which is a disposition and preparation for virtue — as when someone restrains a passion and acts rightly, though with difficulty, owing to a passion that resists him. The second degree is called virtue, as when someone

who has the habit operates easily and with delight, though without exceeding the common mode of human action. The third is called heroic, when someone excels others in action. For those who exceed the common mode of action are called heroes, angelic, and divine. Correspondingly, in vice there are three degrees: the first is called incontinence, as when someone, urged and dominated by passion, falls into sin. The second is called malice, as when someone, from frequent evil acts, has an evil habit. The third is called bestiality, when someone, by vicious acts, surpasses the human mode of action and becomes like the beasts — especially by intermingling and consorting with them.

Note thirdly, from the same passage, that perseverance and continence stand to one another as resisting and overcoming. In the beginning of virtue it is called perseverance, and in progress it is called continence. For perseverance, it suffices to resist what impels. For to persevere means nothing other than to resist what impels and to stand firm against its onslaught. Continence, on the other hand, is said to overcome the opposite: for what is in our hands, we properly contain or hold. Hence one who restrains immoderate passions, conquers and curbs temptations, though with labor and difficulty, is called continent. Since continence and perseverance are only dispositions toward virtue, they pertain to the first degree of virtue, to which softness is opposed — that weakness by which one easily falls, withdrawing from the good and not overcoming evil with good. Note further that perseverance can be taken for a habit whereby someone endowed with it persists in good works and is counted among the virtues — especially if it endures until death. Hence Christ the Lord says (*Matt. 10*): *But he who has persevered to the end shall be saved*. And the Angelic Doctor adds (*1 de perseverantia*): *No one can be said to have perseverance while he lives in this life, unless he perseveres unto death*.

First Assertion. There are two species of temperance. So holds the Doctor in the cited place (*sub K.*). It is proved firstly: there are two objects primarily concupiscible — namely, the honorable good and the delightful good. Therefore there are also two primary species of temperance. The antecedent is clear from the first note; the consequence holds, since the number of the primary species of temperance is drawn from the number of primarily concupiscible objects. Secondly, every genus is first divided into two species, as is evident from animal, which is distributed into brute and man as its two species. But temperance is a genus having species under it, just like fortitude and the other virtues. Therefore there are two species of it: one is called humility, by which the desire for great things is restrained and directed toward the lowest and most humble; the other, which is concerned with pleasures, retains the name of its genus.

Second Assertion. There are as many species of temperance as there are distinct pleasures or specifically distinct delightful objects to be moderated. So holds the Doctor in the cited place. It is proved firstly: specific habits are as many as there

are specific acts and objects, as has been seen elsewhere. But there are many specifically distinct delightful objects — such as tactile, gustatory, and others of the kind — and many acts with respect to them, as experience makes evident; for one person takes delight in one object, and another in a different one. Therefore, in accordance with the number of specifically distinct delightful goods, there is a corresponding number of species of temperance. Secondly, one species of temperance can exist without another; therefore they differ from one another in species. The antecedent is proved: someone can be temperate with respect to tactile things — namely venereal pleasures — and intemperate with respect to gustatory things, namely food and drink. Likewise, someone can be temperate with respect to sensible things and intemperate with respect to speculative things — as when a person abandons what is useful and necessary for his life and well-being on account of his devotion to speculative disciplines.

Concerning the moderation of tactile pleasures, four species are set down: two regarding venereal matters, which are chastity and modesty; and two regarding food and drink, which are abstinence and sobriety. Chastity restrains venereal pleasures and is divided into virginal, conjugal, and widowed chastity. Modesty curbs the pleasures that consist in the outward signs of venereal things, such as immodest glances and kisses. Related to this is modesty of countenance, which is a fear of disgrace and infamy. Abstinence is a virtue that consists in moderation in the consumption of food; sobriety, on the other hand, moderates the pleasure of drink — though the two are sometimes confused. For sobriety, as I noted above following the Angelic Doctor, is taken for the whole genus of temperance. And abstinence is not infrequently used for the moderate consumption of drink, as in Numbers VI: *Let him abstain from whatever can make him drunk, and from wine.*

Objection. Aristotle (*3 Eth. 10*), in defining temperance, says that temperance is a mean with respect to the pleasures and pains of taste and touch. Therefore temperance does not apply to the will, which lacks touch, taste, and pain — and consequently belongs only to those who possess a sensitive appetite.

I respond that this definition is too narrow, as I noted with Orbellis in the first note — just as the definition of science in the first book of the Posterior Analytics is accommodated only to a priori science. For temperance taken universally comprehends every delight, whether sensible or spiritual. For angels and the spiritual soul take delight in delightful goods, as the Psalmist indicates (*Ps. 33*): *Taste and see that the Lord is sweet.* (*Ps. 36*): *Take delight in the Lord.* (*Isa. 66*): *Their soul shall be delighted.* (*Rom. 12*): *Not to be more wise than it behooves to be wise, but to be wise unto sobriety.* Cicero also supports this (*2 artis veteris*), defining temperance in these words: temperance is the firm and moderate dominion of reason over lust and over other disordered impulses of the soul.

Article IV. On Justice

It remains to treat of justice, which by universal consent is placed in the will as its subject, as is evident from Aristotle (*5 Eth. 1*) and Scotus (*3.dist.33.quaest.un.§.Haec optime. ante A.*); and justice excels and shines above the other moral virtues. For through it, things go well both for the one who possesses it and for another, since it preserves the good for itself and for another — as the Philosopher observed admirably in the passage just cited. There he cites the saying of Bias: *Rule shows the man, since it is a matter of dealings with another and of one who is in a position of authority in society.* And he concludes in the same place: *The worst man is he who employs wickedness both toward himself and toward others; the best is not he who practices virtue toward himself, but he who practices it toward others — since that is something very difficult.*

Disputation I. What Justice Is

Justice — which is also called the status of the law, as Vorreux notes (*4.dist.16.art.6.art.1*) — is used in many senses, as can be seen in the Angelic Doctor (*verb. Iustitia*) and in Scotus (*4.dist.46.quaest.1.§.Hic primo. A.*), Ricardus, and others in the same place. First, for any rectitude of the will, in which sense Anselm (*lib. de veritate, cap.12*) defines justice as follows: justice is the rectitude of the will preserved for its own sake. Chrysostom intimates the same (*homil.12 in Matt.*): thus holy men are called just, as in Matthew I: *Joseph, being a just man.* And I Timothy I: *The law is not made for the just man.* In the same way: *The Lord is just and has loved justice; his face has beheld equity (Ps. 10).* Wherefore, since God has a most upright and unerring will, justice taken generically is consequently located in him — and this can be determined and specified by the formal account that Aristotle adds (*5 Eth. 1*), which is that it is directed toward another, as the Doctor notes in the cited place. Second, justice is taken for the fitting demand and agreement of things among themselves — thus there is justice in fire in that it is hot, in water in that it is cold, in the light in that it moves upward and in the heavy in that it moves downward, as the same Doctor elaborates admirably (*cit. f. Non improbando sub G.*). Third, justice is taken for the habit inclining the will to render to each what is his own — and it is in this sense that the discussion of justice is conducted in the present place.

Assertion. Justice is rightly defined as the moral virtue inclining the will to render to each his own. This is drawn from Aristotle (*5 Eth. 1*) and Scotus in the cited place (*and 3.dist.34.quaest.un.§.His suppositis L.*). The definition of Ambrose (*1 de off.*) amounts to the same: *Justice is that which gives to each what is his own, claiming nothing of another's.* And Augustine (*19 Ciuit. cap.21*): *Justice is the virtue that distributes to each his own.* The first definition is explained as follows: virtue is said as the genus; moral is added to distinguish it from intellectual virtue; the remaining terms are added to distinguish it from the other virtues. Once explained in this way, the assertion is established by the common medium: that definition is fitting and adequate which is composed of genus and difference, as

I have repeatedly pointed out; and the definition of justice given is of this kind, as is clear from what has just been explained. Therefore justice is well defined. Moreover, not one of the philosophers I have encountered contradicts this, but it is accepted by universal consent. This is therefore a clear sign that it is the genuine definition of justice.

Objection. Ulpian (*in leg. Iustitia, ff. de iustitia et iure*) and the common body of jurists define justice in these words: *Justice is the constant and perpetual will to render to each his own.* Therefore justice is not well defined as a virtue, since a will is not a virtue but the principle of virtue — for virtue is caused by many acts elicited by the will according to the right dictate of reason.

I respond that this is not an identical predication but a causal one. For there the principle, cause, and subject of justice are taken for the virtue of justice itself — whereby someone with a constant and firm spirit and will renders to each his own right. This is just as in (6 *Eth.* 3) the intellect is taken for the habit of the intellect, concerning which I have discoursed at length above.

Disputation II. How Many Kinds of Justice There Are

Justice, which from (5 *Eth.* 1) is the good of another, either regards the uncreated good and inclines man toward divine honor — and this is religion, or latria (that is, in Latin, religio, as the Angelic Doctor notes following Augustine (*verb. Latria, post Aug. 10 Ciuit. 4.*), which is the honor or worship owed to God alone, as is clear from the Doctor (3.d.9.quest.un.)) — or it regards the created good and inclines man toward the good of his neighbor, and this in two ways. For if that good is common and laws have been established by the Legislator to protect it, legal justice arises; but if there is a particular good, particular justice applies to it. This division of justice is handed down by Aristotle in the cited place (*and 3 Pol. 5*), and is received by the Doctor (4.d.40.quest.1.§. *Hic primo*) and by all jurists and moralists — in particular the Angelic Doctor (*verb. Iustitia*). Legal justice is further subdivided into political and domestic. Again, either a man communicates himself to another as fully as possible — and this is friendship, which is the more perfect justice, because total justice is more perfect than what concerns only oneself, as I noted at the beginning of this article — or he communicates something else to another. And that something else is either an extrinsic or an intrinsic good pertaining to human sustenance. If he communicates something intrinsic and necessary to one who is joined to him, such as governance, there arises authority, by which superiors rightly govern their subjects; or there arises obedience and due submission, from which flows obedience, by which subjects rightly comply with the commands of their superiors. To this belong truthfulness and affability. But if he communicates an extrinsic good, this can be done in two ways: according to due measure and equality, from which equal justice emerges, which Aristotle (5 *Eth.* 3) divides into commutative and distributive. Commutative justice is discerned in commerce and exchanges, in which arithmetic proportion is preserved and equal is

rendered for equal; its acts are many, such as buying, selling, hiring, usufruct, deposit, surety, pledge, transaction, and others of this kind, which are enumerated by the jurists and the Coimbrans (*disp.9.Eth.quest.1.art.3*).

Distributive justice shines forth in the bestowal of rewards or the infliction of punishments, preserving geometric equality and regarding the dignity of persons. This is further subdivided into remunerative and punitive. The former regards the dignity of the persons to be rewarded; the latter considers the punishments by which the guilty and wicked are to be punished. Again, punitive justice is divided into punitive of oneself as a defendant — since to punish oneself is granted to oneself as a minister of the judge, as the Doctor notes (*4.dist.14.quaest.2*) — and punitive of another, by which a judge condemns the accused and inflicts capital punishment. Or according to fittingness and inequality — under which are contained liberality and piety, whether piety is taken for the honor of children toward parents, or for mercy toward the poor and wretched, or for devotion toward God. More on this can be found in Ricardus (*3.dist.33.art.3.quaest.7*) and in Aureolus (*Quol.14.art.4*), who enumerates a sufficiency of twenty-two virtues contained under justice.

First Objection. Common and particular do not constitute a specific difference within any genus, as is clear from logic. Therefore justice is badly divided into general and special as into two species — otherwise general justice will be the species of special and particular justice.

It follows that the particular or singular does not constitute another species, since species is essentially predicated of many things differing in number, which are singulars; and therefore the said division of justice is not a genus into its species.

I distinguish the antecedent: if common and particular are taken precisely and in logical rigor, I grant it; if they are taken relatively, I deny it. For in our case, justice is called general with respect to the object, or the public good and due service that is to be preserved — and in this it differs from special justice, which is occupied with private law, which is called particular by appropriation because it is possessed by a private individual and owed to him, even though in itself and in the character of a good it is not particular, since it regards not one but many private and particular goods. This answers the objection: for it is not called particular because it is communicable to one alone and incommunicable to many, as the argument proves, but because its enjoyment and possession is owed to one and not to another.

Second Objection. Justice tends toward the good of another, on the authority of Aristotle (*5 Eth. 1. 2.*). Therefore the division of justice into punitive of oneself and punitive of another is faulty, since one and the same man is not distinct and divided from himself such that the function of justice can be exercised toward himself.

I respond that the antecedent holds most properly of remunerative justice. Or I say that it is to be understood of the good of another, or of what is quasi-another, because each person can punish himself for sins committed through fasting, bodily mortification, and penance, as the Doctor interprets (*in 4 cit. ante B. §. Hic primo*).

Third Objection. What does not fit the definition of justice is not justice or a species of it. But the definition of justice does not apply to liberality, obedience, gratitude, friendship, affability, religion, truthfulness, and piety. Therefore these are not rightly enumerated among the species of justice. The major is evident. The minor is shown: the liberal man does not render goods to another from a legal duty, but from an honorable motive and the cheerfulness of his spirit. The grateful man similarly does not keep in mind the one who has done him good out of a legal duty, which is required for justice, but out of a moral duty. Again, friendship tends toward a friend not out of duty but out of good will. And affability consists in kind compliance. Regarding religion toward God and piety toward parents, there is no justice between a master and a slave, or between a father and a son, as Aristotle testifies (*5 Eth. 9 & 8 c.14*).

I grant the major. To the minor I say that some of the aforementioned are not true and genuine species of justice but dispositions toward them. For in some cases there is not a legal but only a moral duty — as in liberality, affability, and gratitude; or there is not equality, as in piety toward God and parents, and in the reverence by which virtue is honored — as is clear from (*4 Eth. 3*): perfect virtue does not receive an honor equal to its worth. I pass over truthfulness, which in this context is the virtue by which a man presents himself to his neighbor through words and deeds as he truly is in the moral character of his ways. Finally, in friendship it is clear that there is a legal duty and that it is perfect justice, as Scotus affirms (*3.d.34.quaest.un.L.*).

One may ask firstly: what is law, and how many kinds of it are there? Aristotle responds (*5 Eth. 2*): what is just and right. For this reason, Celsus in defining law says: *Law is the art of the equitable and the good*. And the act of law is, for anyone just, to firmly will to preserve the due rectitude in one's works toward another. A judge, moreover, is called, as it were, one who speaks the law; and judgment amounts to the pronouncing of the law, as is clear from the regulations on the signification of words (*Extra de significationibus verborum*). Judgment is defined as the act of a judge as one pronouncing sentence according to the rules of law — as the Doctor notes (*4.d.47.q.1. §. Respondeo.B.*). Law is divided into natural and positive. Natural law is described (*5 Eth. 7*) as having the same force everywhere, and is distinguished by the Doctor (*3.d.37.quest.un. §. Ad quaest.*) and the Angelic Doctor (*verb. Lex*) into natural law strictly taken — which is known from its terms, such as the first practical principles and the law of nature: *Do to another what you would have done to you*, and *Do not do to another what you would not have done to you* — and the precepts of the first table, such as *Worship one God*; and

natural law broadly taken, such as the precepts of the second table — for example, *You shall not kill*. Positive or legal law is what has been established by some Legislator. Hence it is called legal — that is, receiving its force from some prescribed and sanctioned law. If the law is from God, it is called divine law; if it comes from man, it is called human law, as Scotus indicates (*4.d.14.quaest.2. infra E.*). Human law is further subdivided into canon law and civil law. Canon law is ecclesiastical law and is derived from the word canon, meaning rule. For it contains the rules of the holy Fathers and the supreme Pontiffs, and is again divided into the Decree and the Decretals. Civil law is so called because it was established by the commonwealth, prince, or emperor. Hence, as the former is called pontifical law, the latter is called imperial law, as the Doctor touches upon (*4.d.15.q.3.E.*).

One may ask secondly: what is law, and how many kinds of it are there? Alexander of Hales responds (*3 p. quaest.26.m.4.*) from the teaching of the jurists — law (which, according to Isidore (*2 Eth. 1.*), derives from reading, because it must be read and promulgated in order to bind; or from binding, because it binds and obliges subjects to observe it) — is defined in these words: *Law is a holy sanction commanding what is honorable and forbidding the contrary*. It is explained by Vorreux (*3.d.38.art.1.*): it is called a sanction — that is, a determination and command. For it belongs to a superior to determine and command what is to be done and what is to be avoided by those below him, and this is an act of jurisdiction (*verb. Lex*). Holy is added, that is, just — for this reason the law of the Lord is called immaculate (*Ps. 18*) and: *All your commandments are truth* (*Ps. 118*). Commanding the honorable is placed there, that is, the state of honor. For laws are established so that citizens may live honorably and peaceably. Forbidding the contrary is added, so that every disturbance among citizens may be removed, audacity restrained, and innocence defended. From this are gathered two ends of law: one principal, which is honorable life; the other less principal, which is the restraint of temerity and the protection of the good. Hence Mayr rightly, as cited by the Angelic Doctor, defines law as the art of living honorably, binding man to its observance.

Law is threefold, as is derived from the Decrees (*d.1*) and as is learnedly and skillfully treated by Alexander of Hales in the cited place, omitting the rest that is adduced and expounded by the canonists. The first is natural law, described as the natural light given to us prescribing what is to be done and what is to be avoided, and this is contained in only two precepts: one affirmative, *Do to another what you would have done to you*, and one negative, *Do not do to another what you would not have done to you*. The second is written law, or the law of Moses, which is contained in the Pentateuch and has three types of precepts — moral, judicial, and ceremonial — concerning which see the Doctor (*3.d.40.q.un.*). The third is the law of Christ, called the law of grace, which is contained in the Gospel. The second is called the law of fear; the third the law of love. The former promises

temporal goods to those who observe it; the latter promises eternal goods. The former has been abrogated; the latter will endure until the end of the world.

One may ask thirdly: whether law is immutable? I distinguish: the law of nature and divine law is immutable, as Augustine asserts (*3 cap.7*), and Alexander of Hales shows in the cited place (*m.S.*). The reason is that God is immutable, and what is commanded in natural law is simply good, and what is prohibited is simply evil. Therefore the law of nature and of God always and everywhere stands firm. The other positive laws, whether old or new, can be changed — and indeed the old law has been suppressed and removed, as is evident from the law of circumcision. And one law can be abrogated — for God can confer grace without the reception of the sacraments. Human laws are frequently varied and changed, as is evident from the decrees of parliaments and the constitutions of religious orders, especially the Franciscan.

One may say: even divine law can change. For God, who in the Decalogue forbids homicide, commands Abraham in Genesis XXII to sacrifice his son Isaac. And the same God, who there forbids theft, commands the Israelites in Exodus XI and XII to carry off the golden vessels of the Egyptians. And in Osee I: *Go, beget children of fornication*. Therefore the law of God admits of change.

Alexander of Hales responds in the cited place that the divine law is in itself immutable and immutable as to counsel, but is mutable in effect and as to sentence. To the instances adduced one may say that God dispensed in these cases, being the Lord of all, and transferred the dominion of the Egyptians to the dominion of the Hebrews. Or one may say with Scotus (*in Rep. 3.d.37.q.un. in fine*): the Israelites served the Egyptians; they received so much that the Egyptians were unwilling to render back to them. For this reason it was given to them by the superior, who is God, by whose command the Israelites could justly and licitly take from the Egyptians what was due.

One may ask fourthly: how many functions does law have? I respond that there are five: to command, to prohibit, to permit, to punish, and to reward. Good things are commanded, evil things are prohibited, indifferent things are permitted — and sometimes evil things are permitted to avoid greater evils — transgressors are punished, and those who observe the law are rewarded. May God place us in the number of these, he who bestows upon the just the crown of life and of justice. Amen.

Transnatural Philosophy, or Metaphysics

of Father Bonaventura Columbi of the Order of Conventual Friars Minor, Doctor of Sacred Theology and Professor of the Same

Preface

The doctrine we are undertaking to treat is distinguished by many names, which are applied to it on account of its excellence and eminence. For just as many names are assigned to God to declare his infinity, immensity, omnipotence, and the remaining essential, notional, and personal attributes and predicates, so Metaphysics acquires numerous titles on account of its nobility, loftiness, and eminence. First, so that its nomenclature may be clear, it is called Metaphysics, which is equivalent to Transnatural, inasmuch as it transcends natural science or Physics, because it treats of things abstracted and separated from matter; or it is called Postnaturals, for the reason that it is handed down and taught after Physics and natural science — although Bonetus (*1 Met.*) and Antonius Bernardus of Mirandola (*1.20.vers.sing.cert.*) hold that it should be set before the other disciplines. By our Subtle Doctor in the proem of his Metaphysics it is named the Theoretical Philosophy of Philosophers, because above all others it is occupied with the contemplation of the truth of transcendental things. By Aristotle (*1 Met. c. 2*) it is called Wisdom, because it contemplates the highest causes and the first principles of things. By the same author (*4 Met. T. 4*) it is called First Philosophy — first not only by priority of origin and nature, but also by priority of dignity and perfection. And in the same place (*T. 5*) it is called Philosophy by antonomasia, since in truth only he who is master of this doctrine deserves to be called a philosopher — a doctrine which is rightly proclaimed Queen of the sciences by Antonius Andreas (*at the end of the prol. Met.*). Further, in (*6 Met. c. 1*) and (*11 of the same work, c. 6*) it is proclaimed Natural Theology, because it conveys and imparts what can be known about God by natural means. Moreover, it is called Common and Universal Science, because it treats of common and universal things, meditates upon first principles, and establishes, fortifies, and defends the elements of the remaining sciences. Now five books are proposed and organized on this science, of which the first treats of the Prolegomena to Metaphysics, the second of being and its properties, the third of Angels, the fourth of God, and the fifth of beings of reason.

Book I

On the Prolegomena to Metaphysics

Following the customary practice, certain prefatory matters are set out and resolved in this discipline, as in the other disciplines as well, so that our approach to what we are about to say may be more convenient and more straightforward. For these preliminaries make plain, and clearly indicate and manifest, the nature of Metaphysics and the things that pertain to it.

Question I

On the Nature and Character of Metaphysics

Article I: Whether Metaphysics Is a Science

What the nature and essence of science demands, and what conditions are required for it, I made clear and established in the Prolegomena to Logic (*1.1. q.2*). And there (*q. 1*) I pointed out, not obscurely, the discovery of Metaphysics and of the other disciplines; these matters having been presupposed and foreknown.

The assertion is: Metaphysics is truly and properly a science. So holds Scotus (*q. 3 prol. § Ad 1. secunda q. V.*) and (*collatio 1. § praeterea tertio*), following Aristotle (*1 Met. c. 1*) and (*6 of the same work c. 1*), who divides science into Mathematics, Physics, and Metaphysics. No philosopher I have seen departs from this assertion.

It is proved first: science is acquired either by demonstration from the posterior or from the prior; but in Metaphysics many demonstrations are made from the posterior — for example, a multiplicity of beings, dependency, composition, and the like demonstrate that something exists which is actually simple, independent, and necessary. Whence Aristotle concludes (*12 Met. near the end*): beings do not wish to be badly governed; therefore there is one ruler of the universe, one first cause, and one God. Demonstrations from the prior are likewise had in Metaphysics — for example: every being is good; substance is a being; therefore it is good. For the properties of being are demonstrable and knowable through being, which is their middle term and cause, as will be clear in the next book. Therefore Metaphysics is a science, inasmuch as it is generated by demonstration from both prior and posterior.

Second: from (*1 Post. c. 2*), science is certain and evident cognition of a necessary thing, obtained through its proper cause by means of syllogistic reasoning; but Metaphysics is of this character, as the first proof just offered shows; therefore it is a science.

Third: the remaining disciplines — such as Mathematics and Physics — are sciences, because they concern conclusions caused by true and necessary premises; therefore Metaphysics likewise is a science, as it is the mistress and queen of those disciplines, through which their own principles are established and fortified.

You will object first: Metaphysics is wisdom, from (*1 Met. c. 2*), since it is concerned with the highest and most excellent things, namely God and the Angel; therefore it is not a science. The consequence holds from (*6 Eth. 3*), since science and wisdom are two habits of the intellect distinct from one another. I concede the antecedent and deny the consequence. For science can be taken in one way for certain cognition, whether of a contingent or a necessary thing — and in this sense science is distinguished from wisdom. It can be taken in another way for certain and evident cognition of a necessary object, whether or not it is generated through the highest cause; and if it is generated through the highest cause, it is not distinguished from wisdom but is wisdom itself, which is what Metaphysics is. This is hinted at by the Doctor (*12 Met. near the end of his conclusions for that book*). Nor does Aristotle appear to dissent from this (*6 Eth. c. 8*): wisdom is a composite habit, composed of intellect, which is the habit of principles, and of science, which is the habit of conclusions. Nor does Augustine disagree (*11 Trin. 15*), asserting the difference between wisdom and science to be that intellectual cognition of eternal things belongs to wisdom, and rational cognition of temporal things to science. And in (*13 of the same work*) he adds that each can be called both science and wisdom, with the broader term.

You will object second: science and prudence are distinct habits (*6 Eth. 3*), yet Metaphysics is called prudence by Aristotle (*1 Met. 1*); therefore it is not a science. I concede the major. I distinguish the minor: properly, I concede; by way of likeness, I concede. The resemblance consists in this: just as prudence is eminent among practical habits, so Metaphysics shines above the speculative ones.

You will object third: science is produced through a cause, as its definition makes clear; but Metaphysics is not generated through a cause, since it is about God, of whom no cause is given. I concede the major and deny the minor. For about God there are made demonstrations from the posterior, through which science is also acquired from the posterior. Add to this that Metaphysics has God as its principal partial object, but being as its total and adequate object, as will be shown in the following book; and of being there are demonstrations from the prior, as is clear from the proof of the assertion set out above.

Article II: Whether Metaphysics Is a Speculative Science

The things I said and established in Logic (*1.1. art. 5. q. 2. dub. 1. 2*) must be reviewed and recalled; these having been foreknown and presupposed.

The assertion is: Metaphysics is speculative. The Doctor holds this (*3 d. 34. q. un. § Notandum sub D.*) and (*1 Met. concl. 13*), where he gives this reason: because Metaphysics exists for the avoidance of ignorance and not for any external end — a sign of which he adduces in the fact that it was later sought out, after the other sciences which serve human necessities had already been established. It is proved first from Aristotle (*1 Met. c. 4*) and (*6 of the same work, c. 1. T. 2*), affirming that speculative science is of three kinds — namely, Mathematics, Physics, and Metaphysics — the sufficiency of which division has been proved and settled in Logic (*loc. cit. art. 6*). Second: speculative science exists for its own sake, since it rests in the mere contemplation of its object; practical science, on the other hand, exists for the sake of something else, since it is directed toward action — whether moral or manual. But Metaphysics is placed in the mere contemplation of its subject, namely being, which is neither doable nor makeable; therefore Metaphysics is a speculative science. Furthermore, practical science is either active or productive, by the common judgment of all; but Metaphysics is neither active — since it is not Ethics or Moral Philosophy — nor productive, since it is not manual or mechanical; it is therefore concluded to be speculative.

You will object first: practical science was discovered so that we might become good, and speculative science so that we might know; but Metaphysics was discovered so that we might attain the highest good — namely happiness, which from (*1.10. Eth. 10*) consists in the contemplation of abstract substances; therefore it is practical. Confirmation: to order things belongs to practical science; but Metaphysics orders the other sciences and corroborates their principles (*1 Met. 1*); therefore it is to be counted among the practical sciences. I concede the major. I distinguish the minor: per se, I deny it; per accidens, I concede it. To Aristotle I say that he indeed believed his own happiness to lie in the contemplation of abstract substances; but such contemplation is not praxis, and therefore Metaphysics is not practical on that account. To the confirmation I distinguish the major: to order in the role of director and regulator, I concede; to order in the role of end alone, I deny. For it is the function of the wise person to order in the role of end, not in the role of efficient cause.

You will object second: just as supernatural theology perfects our intellect supernaturally, so Metaphysics perfects our intellect naturally; but theology in the school of Scotus is practical; therefore Metaphysics is likewise practical. I reply that the likeness alleged between theology and Metaphysics is very remote, and nothing is concluded from it. For all sciences perfect the intellect, and yet not all are practical; some are practical and some are speculative. Whether the other sciences are subalternated to Metaphysics or not has been settled in Logic at the passage cited above (*art. 7*).

Question II

On the Object of Metaphysics

Article I: What Is the Adequate Object of Metaphysics

This difficulty is treated at length and with precision by Scotus (*1 Met. q. 1*), Antonius Andreas there, Bonetus (*c. 6*), Tataretus, Ponce (*disp. 68. q. 1*), Suárez (*disp. 1 Met. sect. 1*), Fonseca (*4 Met. cap. 1. q. 1*), Hurtado (*disp. 1. sect. 2*), and others, who cite many divergent and conflicting opinions. From their number I select and present four of the more celebrated ones.

The first is that of those whose names Suárez suppresses (*cit. n. 2*), who hold that being taken in the most common and abstract sense — as it abstracts from real being and being of reason — constitutes the total and adequate object of Metaphysics. Hurtado (*cit. subsect. 1 and 2*) favors this, and Fonseca (*ibid. sect. 3. § Atque est quidem*) finds it not displeasing as a response to the arguments put against this view.

The second is defended by those who hold that God alone is the first and adequate object of this science. Hurtado just named (*sect. 4*) supports this, and Averroes anticipated it (*1 Phys. com. 83*), adding abstract substances or intelligences as the total subject of this science, so that he wishes God and the intelligences together to constitute one adequate subject of Metaphysics.

The third is recounted and refuted by our Doctor in the passage mentioned, and is attributed to Buridan, who determines that the total subject of this discipline is substance precisely and abstractly considered, abstracted from both finite and infinite, and from both spiritual and material — to such a degree that he excludes all accidents from its consideration.

The fourth is the common position, championed by Scotus (*ibid.*) and (*1 d. 3. q. 3. § sed contra B.*) and (*4 dist. 49. q. 8. § Respondeo B.*), by St. Thomas and the disciples of both, and before them by Alexander of Hales, Avicenna (*1 Met. cap. 1*), and Aphrodisias; to which Suárez (*in the passage reviewed, n. 24*) and Fonseca (*sect. 2*) and other recent authors subscribe — determining and defining that being as real being, common to God and creature, is the total and adequate subject of Metaphysics.

Note I, from Scotus (*Quol. 3. art. 1. § De primo. A*): a thing or being is taken in three ways — most broadly, broadly, and strictly. Being taken in the first way comprehends all real beings, both per se and per accidents, and beings of reason, so that to being taken in this most transcendent sense there is opposed nothing — that which is called prohibited being and repugnant being, because it can have being neither in the intellect nor outside the intellect. By contrast, what has being in the intellect or outside the intellect is called being; and what has being only from the intellect is called a being of reason — in which way logical intentions are called beings of reason — while what has or can have being outside the intellect is a real being, such as everything created by God or

creatable. In the second way, being is taken commonly and transcendently for real being, which abstracts from substance and accident, from God and creature — of which Avicenna makes mention (*1 Met. c. 5*), and which is explained by Lychetus and Gadius in their commentary on the Quodlibet just cited. In the third way, it is taken for substance alone, whether material or spiritual, which is described as being subsisting per se — in which sense Aristotle speaks of being (*7 Met. tit. 2*), calling substance the first being, and calling accidents beings of being, because they are caused by it and inhere in it as their subject, and cannot naturally exist without it, and thus depend on it for their being, are ordered to it, and bear relation to it — whether they are absolute, like quality, or are themselves relations and respects, if they are relative accidents, such as similarity and dissimilarity and the rest which are placed in the last seven categories.

Note II: the division of being taken in the most common sense is not a division of a univocal into its univocates, but of an equivocal analogate into its analogated equivocates, as the Formalists write together with their master Syrectus (*Tract. Formalitatum, art. 1 principale*) — because being taken simply and being taken in a qualified sense have nothing in common that is univocal. But real being is being simply, and being of reason is being in a qualified sense; therefore the aforesaid division is not a division of a univocal into its univocates. Furthermore, being taken most precisely is either real or of reason, because no medium exists between them; it is not, however, a real being — otherwise real being would be included in being of reason, and being of reason would be formally real being, which is absurd; nor is it a being of reason — otherwise real being would be a being of reason, which is false. Therefore real being and being of reason are not univocated in the concept of being taken most precisely, whatever Bonetus (*recently cited. § Ens autem*) may protest. The division, however, of real being taken broadly and commonly — into God and creature, into substance and accident — is indeed univocal, as I shall show in the next book. Similarly, the distribution of substance into material and spiritual, into transcendental and predicamental, is univocal, since of these the same name and the same essential and formal account is predicated, in which true and genuine univocation consists, as I have amply explained in the (*Epitome Dialecticae, l. 1. q. 1. art. 5. n. 17*).

Note III: recall from what was said in Logic (*l. 1. q. 3. art. 1*) what an object is, and how many kinds there are, and the conditions required of it in order for it to be the total and adequate object of the science that deals with and is occupied with it — all of which matters, having been carefully examined and discussed there, need not be repeated here but should be reviewed in memory there and applied here.

First Assertion: being taken in the most common sense, as comprehending all real beings and beings of reason, as well as accidental beings, is not the adequate

object of Metaphysics. This assertion is two-part; the first part is derived from the Doctor in the passage recalled above, and expressly from (*6 Met. in exp. Text. near the end*) and there (*q. 3. contra Hurt. cit. § 51*). It is proved first from Aristotle, who at the end of (*6 Met.*) explicitly excludes being of reason from the consideration of Metaphysics. Therefore in the Peripatetic tradition, being of reason is not a proper partial object of Metaphysics, as Hurtado holds.

You will say: the same Aristotle writes (*4 Met. T. 5*) that Dialectic and Metaphysics deal with the same common being — which is not real being, and is therefore being of reason; and so being of reason is included in the most common object of Metaphysics. I reply that he is to be interpreted as speaking of Logic properly so called, which disputes about every being just as Metaphysics does, but in a different way; for Logic treats of diminished and qualified being clothed in a second intention, while Metaphysics contemplates being simply and really. Because being of the second intention extends just as broadly as real being, both are therefore said to meditate upon common being — as the Doctor rightly expounds (*q. 3. cit. § secundam veritatem*). See what I said in Logic (*l. 1. q. 3. a. 5*), where I adduced and explained the same testimony of the Philosopher, with other passages from the same Subtle Doctor cited there.

Second: every science derives its unity and specification from the object about which it is occupied, because sciences are divided as things are divided (*3 Anima T. 51*). But real being and being of reason share no unity except one of name; therefore being of reason cannot be a partial object of Metaphysics. The major is clear; the minor is at hand, since no whole can coalesce or be constituted from real being and being of reason. Hurtado encounters this objection (*cit.*) and says that Metaphysics is not one but multiple; and therefore in its most common object there is no need for a univocal unity that would belong to its partial objects. On the contrary: a science is one by the unity of the genus of its subject; but a genus is one by univocal unity with respect to its species; therefore Metaphysics, which is about being — which is transcendent — is one by a unity befitting itself, which is transcendental. Furthermore, the science which is about a conclusion is caused by premises, which are its immediate or mediate principles and causes, and the middle term is the definition of the subject or of the property; and the subject contains potentially, or virtually, or formally all the truths of the science of which it is the subject, as Scotus proves (*q. 3. prol. § De secundo. B.*) and as I showed at length in Logic (*l. 5. q. 2. art. 5*). But these and similar things cannot be said of being of reason, which is a diminished and qualified being, depending solely on the operation of the intellect; therefore being of reason is wrongly established as the proper partial object of Metaphysics, which is a true and proper science. What is more, all those things I have just enumerated about the object of science are necessarily connected, maintain a mutual relationship and an indissoluble bond with one another, as is clear regarding natural body, its properties, and the species thereof, and likewise regarding substance, its properties, and the like — which have absolutely no

affinity or connection with being of reason; therefore being of reason is not comprehended under the most common object of Metaphysics.

Third: real science is distinguished from rational science, as is clear from the law of a good division, the members of which must be distinguished from one another; but Metaphysics is a real science, as is clear from the threefold division of real speculative science (*6 Met. T. 2. c. 1*). And indeed, for no other reason than because it is about a real object; and rational science is so called because it is about an object of reason. Therefore Metaphysics does not have being of reason as its proper partial object; otherwise it would be called rational just as it is called real, and would simultaneously be both real and rational — which involves a contradiction.

Hurtado forestalls this (*ibid.*) and says there is nothing incongruous about one and the same science treating of opposites, given the adage that opposites fall under the same account and law; and therefore Metaphysics treats of real being and being of reason, just as Logic reasons about the true and false syllogism, the demonstrative and sophistic one; Physics about form and privation; Medicine about health and sickness; and Theology about grace and sin, virtue and vice. On the contrary: real being and being of reason are not properly opposites but only improperly and broadly so. For opposites are of four kinds, as is clear from the Postpredicaments, and among them real being and being of reason are by no means found. They are not contrary opposites, of which one expels the other from the same subject; nor privative, of which one imports the privation of the other; nor contradictory, of which one denies the other; nor relative, which mutually regard each other. The examples that Hurtado adduces and offers are privative opposites; therefore the said author does not satisfy the objection and argument brought forward. Furthermore, it is not necessary that if a science treats of one broadly-taken opposite, it must treat of the other opposite. For Metaphysics does indeed treat of spiritual substance — namely God and the Angel — yet it does not contemplate corporeal and natural substance. And likewise, Physics, which considers corporeal and natural substance, does not meditate on incorporeal and immaterial substance.

You will press: being of reason is knowable, having its own properties in its own way; therefore it belongs to some science — and to none other than Metaphysics, which is the common and universal science of being; therefore being of reason is comprehended under the object of Metaphysics. It is satisfactorily answered by saying that Grammar, Rhetoric, and Logic treat of being of reason; but Metaphysics does so not per se and directly, but per accidens and reductively. But what is treated by a science in this fashion is not thereby established as its proper partial object, as Hurtado holds with respect to being of reason in Metaphysics, making it a partial object thereof. Thus negations, privations, and the like — which are referred back to the things of which they are the negations and privations — do not constitute one

predicament distinct from the decimal number of predicaments, as I affirmed in its place; likewise being of reason, which is referred back to real being as qualified being is referred to being simply, does not constitute a special object distinct from the object of Metaphysics, which is real being — and that is Hurtado's own intention and proposal. You will press further: being taken in the most abstract sense can be the object of the intellect, as Scotus teaches (*Quol. 3. cit. B.*). But nothing can be intelligible that does not include the account of being so taken; therefore such being is considered by Metaphysics. One must reply with Gadius and Lychetus in their commentary on that passage: the discussion there is not about the motivating object of the intellect, but the terminating one — and not the primary, but the secondary, as a consequence and by a kind of corollary. In this way being of reason is contained under being taken in the most common sense, which Metaphysics does not regard directly and per se, but indirectly and reductively, in the manner explained above.

The second part is defended by the Doctor (*6 Met. in exp. T. 4*) and there (*q. 2*), and is the express mind of Aristotle in that place — taken of accidental being that is not fortuitous and chance, but aggregated from many beings, such as "the white musician" and "the musician builder." It is proved first: science is about one object (*1 Post. T. 43*); but accidental being is not one being but many, as the examples given make clear; therefore, since Metaphysics is a science, it is not occupied with accidental being. Second: what a science is occupied with has properties demonstrable and knowable of it, as is clear in all the objects of the sciences; but accidental being participates in no demonstrable and knowable properties, nor does there appear to be any necessary and natural connection between one being and another, as the examples already adduced and the induction of Aristotle in all the sciences — both practical and speculative — indicate. Therefore Metaphysics does not contemplate accidental being.

You will say: Music is a true science, and yet it is about accidental being — namely sonorous number. Likewise, Perspectiva, which is counted among the sciences, deals with the visual line, which is an accidental being; therefore there is no obstacle to Metaphysics contemplating accidental being. I deny the consequence. The reason for the disparity is that Metaphysics is a disparate science, whereas Music and Perspectiva are subalternated sciences, whose objects are contracted by an accidental difference, as I amply showed in Logic (*l. 5. q. 4. art. 7*), and as Vigerius plainly teaches (*q. 5. prol.*).

Second Assertion: neither God alone, nor God together with the intelligences, is the total and adequate object of Metaphysics. This assertion has two members and is defended by the Doctor (*1 Met. q. 1. § Contra istam positionem*) and (*q. 3. prol. § Ad argumentum 2. q. T.*).

The first part is urged first: just as a power is related to its object, so too a habit is related to its object — for each regards its adequate object, about which it is occupied; but a power has an object common to all the things it regards, as

sound — which is the object of hearing — belongs to all the things perceived by that very hearing; taste to all perceived by taste; smell to all reached by smell, and so on; therefore a habit, whether intellectual or moral, has an object that is common to all that is treated in it. But Metaphysics is one of the intellectual habits, since from what was said in (*1 q. of this book art. 1*) it is a science; therefore it has an object that is common and universal to all that is treated in it — which is not God alone, who is not predicated of being, substance, accident, and the rest that are contained in Metaphysics; and therefore God cannot be determined as its first and adequate object.

Second: the adequate object of a science extends just as far as the science itself, and is therefore called adequate because it neither exceeds the science of which it is the object nor is exceeded by it. But Metaphysics extends and spreads more broadly than God; for it contemplates being, which is more common and universal than God; therefore God is not its total object.

Third: Metaphysics is a science from the prior and through the cause, as I showed above. But God has no cause and no middle term from the prior through which God is naturally demonstrated; and if some demonstration is made, it is from the posterior and from the effect, as I showed (*Tract. de Deo uno, disp. 1. q. 2.*). Therefore God is not established as the adequate object of Metaphysics. Whence in Hurtado's stated position there seems to be a contradiction in terms, when (*sect. 4. disp. 1 Met.*) he places God as the adequate object of attribution of Metaphysics, and then (*q. 102*) adds that by "proper and adequate object of attribution" he understands what is called the principal object by others. For the general run of philosophers calls the adequate object of attribution the total object, beyond which the science of which it is the total object does not extend; and by "principal object" they take the inadequate, partial, though nobler and more excellent object. If that is what Hurtado means, he would not differ from the common position of philosophers, who commonly hold God to be the first and most noble thing considered in Metaphysics — especially Scotus (*just cited*), Vigerius, Lychetus, and others there, from whom the Thomists do not differ. If that is so, Hurtado's labor and controversy appear vain and empty — a quarrel over a name, when he says: what they call "principal," I call "attributive." Perhaps, however, they think otherwise, judging that God does not have the true and formal account of even a partial principal subject, since the necessary conditions required for such an object are not adapted to him — especially because properties knowable from the prior are not demonstrated of him, as *propter quid* demonstration requires, in order to generate *propter quid* science, which is what Metaphysics is held to be — but rather that God is the highest and most eminent cause, as St. Thomas indicates (*1.2. q. 66. art. 5.*) cited by the same Hurtado, and as Scotus openly teaches (*1 Met. q. 1. § Ad alias auctoritates*) in these words: *Prima consideratio est de entibus, inquantum attributis ad Deum, non vt subiectum, quia non potest habere conditiones subiecti scientiae propter quid, sed vt ad causam* — the first consideration is of beings

insofar as they are attributed to God, not as subject, because God cannot have the conditions of the subject of proper quid science, but as to a cause. The same he teaches in the Prologue a little before the place cited, to which Antonius Andreas and other Scotists there adhere. And so all things treated in Metaphysics are attributed to God as to the supreme efficient and final cause of all, and as such are directed, ordered, and referred to him. And nothing else is proved by the arguments and testimonies that the same Hurtado adduces and heaps up (*ibid.*). For Metaphysics is called Theology because it treats of God as cause, not as its object — just as Physics is called natural because it treats of nature, even though nature itself is not its object but its principle and cause, as Aristotle intimates (*1 Met. near the end of c. 2*), where, after calling Metaphysics the most divine and most honorable science — both because God possesses it in himself, and because it is about God, who is worthy of all honor and praise — he adds that God himself is the cause and principle of all things.

You will say: the most noble science is about the most noble genus (*6 Met. T. 2 and 1 Anima 1 Met.*); but Metaphysics is the most noble science among the speculative and practical sciences; therefore its object is God, who excels all things in nobility and excellence. I reply with Scotus (*in prol. cit.*) that God is not the first subject of Metaphysics, though he is considered in it in the most noble manner in which he can be considered in any science acquired by natural powers. To this I add: if per impossibile God did not exist, there would still be Metaphysics, which is the common and universal science of being and other common and transcendental things; therefore its proper adequate object is not God.

Hurtado replies by denying the consequence of the antecedent, giving the reason that God is the cause of all, and therefore when their cause is removed, all the things that were made and caused are also removed. On the contrary: science abstracts from existence and is concerned with the thing in objective being — as in the case of a rose that does not exist — and most especially Metaphysics, which is the science that abstracts from all matter. Furthermore, from inferior to superior the consequence does not hold, as in: there is no man; therefore there is no animal — since there could be a lion or something else. Similarly the following does not hold: there is no God; therefore there is no being — because being abstracts from God and creature, substance and accident. This therefore is a sophism of the consequent.

The second part is shown first: one science has one object (*1 Post. T. 43*); but Metaphysics is one science, distinct from the rest (*6 Met. T. 2*); therefore it has one subject. But God and the intelligences are two subjects; therefore they are not the subject of Metaphysics. Nor is it valid to say that they are two partial subjects constituting and integrating one total and adequate subject — since what is under investigation here is not the partial and inadequate subject, but the total and adequate subject, which we deny to be God and the intelligences.

Most especially because, if a total subject were formed from these as partial subjects, it would plainly follow that neither God nor the intelligences is the subject of this science, but rather that thing composed and integrated from them — just as in Physics neither matter nor form is its subject, but the composite of matter and form, which is natural body; and likewise in the book *On the Soul* their total subject is not body nor soul, but the composite of both, which is animated body.

Second: the same mode of philosophical treatment must be applied to intelligences as to God, for they are abstract substances separated from matter, which are known by us only from the posterior. But in the preceding part of this assertion it was decided that God constitutes neither the total nor the partial object of this science; therefore the same must be held of the Angels, who are known by us in the same way as God — namely, from the posterior and from the effect. But Metaphysics is a science from the prior, and indeed the most excellent of the sciences; therefore Angels are not its object.

You will say: Angels are knowable by proper science; for they are immaterial substances, about which there is science. But they do not fall under any other science than Metaphysics; therefore they are not to be expelled from its object. I reply that they are indeed knowable, but not by the ministry of the senses and in the present state — only from the posterior and from the effect, and under the common and transcendental predicates by reason of which they are treated in Metaphysics. But another special science of these is possible in another state, as Scotus and his disciples write (*in the place recalled above*).

You will press: Metaphysics is wisdom, which contemplates the highest causes and the first principles — such as abstract and separated substances — therefore such substances, which we call Angels, are the first object of Metaphysics. I reply with Scotus (*q. 1. prol. § Contra istam rationem*): the aforesaid substances belong to Metaphysics under common and transcendental concepts, but not under proper and peculiar ones, which in the present state are hidden from us; and therefore they are not established as the object of Metaphysics, but rather the common nature they participate in, as will be explained below.

Third Assertion: substance taken universally is not the first and adequate subject of Metaphysics. The Doctor holds this (*1 Met. q. 1. § sed contra praedicta instatur*). It is proved first: the total object of a science is not more contracted and narrow than the science that is occupied with it, but is perfectly commensurate with it, as I have impressed more than once above; but substance taken broadly is limited and narrower than Metaphysics, since this science contemplates not only substance but also accident, being, and its properties — both reciprocal and disjunct — and other common and universal things, as is evident throughout its whole course; therefore substance taken precisely and abstractly is not determined as the object of Metaphysics.

You will say: accident is referred back to substance, and everything else treated in this science, for it is the base and foundation of all those things; therefore it is the first and adequate subject of this science. I reply that substance is indeed the underpinning and support of all accidents and their cause; yet the accidents themselves are beings distinct from substance — since being is sufficiently divided into substance and accident, and there is only one predicament of substance, whereas nine predicaments of accidents are reckoned. Wherefore, although these are referred to substance and cannot naturally subsist and exist without it, they are nonetheless distinct knowable things and partial objects of Metaphysics — though less principal ones — while substance is its more excellent and principal object.

Second: if substance were constituted the total object of Metaphysics, it would contain under itself all substance — both material and immaterial — and would contemplate both; and it would therefore not be distinguished from Physics, since it would share the same object, namely material and natural substance. This conflicts with Aristotle (*6 Met. c. 1*), who divides science into Physics, Metaphysics, and Mathematics; and that which conflicts with Aristotle conflicts also with this view. The consequence of the major is shown thus: whoever treats of a genus likewise treats of its species — as whoever reasons about animal also disputes about man and the remaining species. But Metaphysics would treat of incorporeal substance, which is its species; and it would equally consider corporeal natural substance, which is another species of the same genus — and so the speculative sciences would be confused.

Third: if substance were the object of Metaphysics, its properties would be set forth therein, as the object which a science regards requires; but nowhere in the books of Metaphysics are the properties of that object assigned, except perhaps (*7 Met. c. 1 tit. 4*), where we read that substance is first in account, in cognition, in time, and in nature before all things. But these are not demonstrable or knowable, since they do not have a middle term and cause through which they are demonstrated and known, as demonstration and science require (*1 Post. c. 2 tit. 5*). Therefore the account of the adequate object of Metaphysics is not to be ascribed to substance.

You will say: Aristotle (*4 Met. tit. 2*) writes that substance is the first subject of this discipline, from which the others depend; and that the principles and causes of substance pertain to Metaphysics. Then (*tit. 4*) he adds that there are as many parts of philosophy as there are substances. Furthermore, (*7 of the same work tit. 5*) he inquires about the causes, principles, and properties of substance; therefore he takes substance to be the total object of Metaphysics. It is satisfactorily answered by saying that these and similar testimonies are to be taken of the partial principal subject, not of the total and adequate subject, as Scotus expounds there.

Fourth Assertion: real being taken abstractly as being is established as the total and adequate object of Metaphysics. So holds Scotus (*cit.*) and (6 *Met. q. 1 and last*); and this is the express mind of Aristotle in many places, especially (6 *Met. 1*) in these words: *De ente, ut ens est, ac quid est, et qua ei insunt, prout ens est, speculari huius est, puta Metaphysicae* — to contemplate being as being, what it is, and what belongs to it as being, belongs to this science, namely Metaphysics. The same is had (4 of the same work, in the beginning of c. 1 T. 1): *Est scientia quaedam, quae speculatur ens, prout ens est, et quae ei per se insunt* — there is a certain science which contemplates being insofar as it is being, and what belongs to it per se. This science is Metaphysics, as is plainly clear from its whole course; therefore in the Peripatetic and common school, being as being is the first and adequate object of this science.

It is proved first: the fitting and appropriate conditions of the first and adequate object of any science are that what the thing is and whether it exists be foreknown of the object, that its properties be demonstrated of it, and that all things treated in such a science be reduced to it; but being as being is of this character; therefore it is the total and adequate object of Metaphysics. The major is drawn from (1 *Post.*) and is pressed many times in what precedes. The minor is in common acknowledgment from the two texts of Aristotle just cited. For of being it is presupposed and foreknown whether it is and what it is; in Metaphysics its properties are demonstrated — which are one, true, good, and the like. And all things treated in Metaphysics are referred back to being itself — either as principles, or as parts, or as causes, or per se, or per accidents, or in some other way — as is evident to anyone who contemplates it.

You will say: if there are properties of being, they are either beings or nothing — since no middle exists between being and nothing. But they cannot be nothing, because nothing has no property; nor can they be beings, otherwise the same thing would be the property of itself, which is self-contradictory — for being would be the cause of being and would be predicated in quid of its own properties, which is not accepted in the school of Scotus. I reply that the properties of being are not beings formally and quidditatively, but are aliquities (determinate characters) of being. And therefore they are placed in the definition of being as an addition to it.

You will press further: such properties are either within the essence of being or outside of its essence. If the first, then they are predicated in quid of being and are of its essence and quiddity. If the second, then they are accidents, since they come to being as accidents come to a subject; and so they are really distinguished from it, just as accidents really differ from the subject of which they are accidents. I reply that they are outside the essence of being and differ from it — not really, but formally — which is to be decided in the following book.

Second: being taken commonly is knowable, because it is demonstrable through its own properties, as I was just saying; but it is knowable by no other science than Metaphysics; therefore it is the proper adequate subject of the latter. The major is clear. The minor is at hand, since Metaphysics, according to its own nomenclature, is a transcendent science, because it is occupied with being and the other transcendental things. And if there were another science about being, the threefold division of speculative science handed down by Aristotle (*6 Met. tit. 2*) would be insufficient. Furthermore, Metaphysics would not be first philosophy, but that science which regards being — as the Philosopher subjoins (*ibid. tit. 3*), saying that if there were no science besides Physics that contemplated being as being, Physics would be the first science and first philosophy; but Aristotle treats it as absurd that Physics be the first science; therefore Metaphysics is to be admitted, which is the first and universal science contemplating as its adequate object being as being. Moreover, (*1 Met. c. 2*) Metaphysics is called wisdom, whose task it is to know all things and inquire into everything; and the wise person is said to be omniscient — not in the singular and particular, but in the common and universal, since he excels and presides over all; therefore to it belongs the contemplation and consideration of being and the other transcendental things. Furthermore, to the greatest science there is owed the greatest object, because between it and its object there is a proper commensuration and adequation; but Metaphysics is the greatest science, the most honorable and the most eminent, and the prince of sciences; therefore there befits it the most eminent object, which is being — than which nothing is prior and more eminent, most remote from the senses, simply simple, and irreducible into anything else.

You will object first: the most noble and most excellent science has the most noble and most excellent object; but being is the most ignoble and most imperfect of all, and Metaphysics is the most excellent science, supreme above all; therefore its object is not being. I reply that it is not necessary for the total object of the aforesaid science to be the most excellent and most worthy; it suffices for the partial object to be the most noble, or for what is considered in it to be the most excellent, and for it to be considered by it in the most noble manner — as Vigerius reports from Scotus (§ *Ad 1. arg. secunda q. in com. q. 3. prol.*). Thus God and the Angels are considered in Metaphysics in the most noble manner, by reason of which Metaphysics is called the most noble and the most excellent. This Aristotle also hints at (*1 Anima primo* and *6 Met. summa 1 in calce tit. 2*), saying that the most honorable science is about the most honorable genus.

You will object second: that by which a science is distinguished is its object, as is clear from (*3 Anima T. 38*); but Metaphysics is distinguished from the other sciences by its abstraction and separation from sensible and intelligible matter, as is evident from the passage just cited; therefore its subject is not being. I concede the major. To the minor I say that abstraction from matter is a kind of distinction, but that the essential and total distinction is derived from its total

and adequate object — being — as the Philosopher hints (*cit. at the end of T. 3*), assigning being as being as its total formal object.

You will object third: the adequate object of a science has principles and properties demonstrable and knowable of it (*1 Post. c. 2. T. 5*); but being taken universally and precisely does not have principles, since it is irreducible into anything else, is simply simple, and has nothing above it — otherwise it would not be absolutely first, and there would be a prior prior, which is self-contradictory; therefore being so taken is not the adequate object of Metaphysics. I concede the major. I distinguish the minor: of constitutive principles that constitute and integrate being itself, I concede; of emanative and originative principles of its own properties, I deny. For reciprocal and disjunct properties flow and proceed from it, just as risibility from man and roaring from the lion, as will be more fully established in the following book.

You will object fourth: if being as such were the total object, our beatitude would be placed in the speculation of being — which pertains to the wise person, whose office it is to know all things and preside over all. But this conflicts with Aristotle, who places our happiness in the contemplation of abstract substances (*10 Eth. c. ult.*); therefore being is not to be determined as the object of Metaphysics. I deny the consequence of the major. For it is one thing for being to be the object of Metaphysics, and another for it to be the object of happiness. These two do not entail each other, since they are disparate. Most especially because true happiness consists in the vision and fruition of God.

Article II: Whether Metaphysics Contemplates All the Quiddities of Things

In this article two positions are related and refuted by Scotus (*1 Met. q. 9*) and by Antonius Andreas there. The first is that of those who hold that the contemplation of all natures and quiddities — both in the universal and in the particular, though not under all aspects belonging to other sciences — pertains to Metaphysics. The second is that of those who think that Metaphysics considers not only all quiddities, both common and singular, but also the accidents of those quiddities. Those who hold that there is only one science of all things — divided into different sciences for the use and convenience of learners and students, of whom I made mention in Logic (*l. 5. q. 1. art. 6*) — favor this view. The third position, which is followed and chosen by our aforementioned Doctors (*cit.*) and by the rest outside our school — among whom are Hurtado (*disp. 1. Met. sect. 5*), and in part Suárez (*ibid. sect. 2*) and Fonseca (*1 Met. c. 2. q. 1. sect. 2*) — affirms that Metaphysics contemplates all quiddities only in common and under the account of being.

Note and recall from what was said: the distinction of sciences is sought from their distinct objects, about which they are occupied — according to that well-worn dictum (*3 Anima tit. 38*): sciences are divided as things are divided. And

therefore from the distinction and diversity of things the distinction and diversity of the sciences is derived, as Aristotle does (*6 Met. tit. 2*), abstracting and dividing speculative science into three — namely Mathematics, Physics, and Metaphysics — according to three distinct abstractions and three specifiable objects; and there he concludes that Metaphysics is the common and universal science, contemplating being as being as its first and adequate object. Further, note that by the quiddities of things we understand the natures and essences thereof — whether they are substances or accidents. For each being, whether substantial or accidental, has its own nature and essence, which is expressed and made manifest through definition or description; although quiddity is most properly said of substance, and sometimes substance is taken for the nature and quiddity of any thing whatsoever — both substance and accident — as Augustine uses the term (*in exp. Ps. 68. enarratio 1. partis*), saying: *Natura ipsa, substantia dicuntur* — "nature itself and substance are said." And before him Aristotle, in the definition of univocals: *univoca sunt, quorum nomen est commune, et ratio substantiae secundum illud nomen est eadem* — "univocals are those whose name is common and whose account of substance according to that name is the same."

First Assertion: Metaphysics does not regard all the common and special quiddities of things apart from their accidents that belong to the other sciences; nor does it consider those same quiddities together with their accidents. This assertion contains two parts, handed down by Scotus at the beginning of this article cited. The first part is proved first from Aristotle (*1 Met. sum. 1. c. 2*), saying that the wise person knows all things maximally, as is possible — that is, in the universal and not in the particular, as Scotus interprets there and (*q. 1. prol. § Tertio arguitur sub F.*). But by the same Philosopher there, the wise person is called the metaphysician, and wisdom is called metaphysics; therefore according to Aristotle, Metaphysics does not contemplate quiddities in the particular but in the universal. With this agrees the version of Cardinal Bessarion, saying: "We think the wise person knows all things maximally as is possible, not having singular knowledge of them" — that is, not being versed in their special natures and quiddities. This is further clarified by what is added a little later: "He who knows universals knows in some manner all their subjects." The aforesaid Cardinal translates: "He who has the most universal science must necessarily have it. For he in a manner knows all subjects." Therefore if Metaphysics knows and grasps its subjects in some manner and to some degree, it does not attain their proper and special accounts and quiddities. And from (*4 of the same work, tit. 1*): *Et scientia quaedam, quae speculatur ens, prout ens est, et quae ei per se insunt. Haec autem nulli earum, quae in parte dicuntur, eadem est. Nullae namque caeterarum universaliter de ente, prout ens est, considerant: sed eius aliquam partem abscindentes, quod ei accidit, speculantur, ut Mathematicae scientiae* — "And there is a certain science which contemplates being insofar as it is being, and what belongs to it per se. But this science is not the same as any of those which are said to treat of a part. For none of the others consider being universally as being, but

cutting off some part of it, they contemplate what belongs to that part, as the Mathematical sciences do." From this text it is plainly clear that Metaphysics does not go beyond the limits of its adequate object — which is being as being — nor does it consider the peculiar degrees and proper accounts of the remaining sciences; but each labors about its own object, which it happens to consider. The same is read (*6 Met. near the beginning tit. 1 sum. 1*).

You will say: (*4 Met. at the end of tit. 6*) it is held that Metaphysics contemplates being insofar as it is being, and its species and the species of species; and it belongs to one and the same science to consider the whole and its parts, the genus and its species. Therefore, since Metaphysics contemplates the common and general accounts of being, it likewise contemplates the special degrees and proper quiddities of any given thing and nature. I reply with Scotus there in exp. T.: Metaphysics indeed contemplates being and its own proper and special properties belonging to being as being; but the species of species — that is, the subjective parts of being under special accounts — belong to the particular sciences, such as Physics and Mathematics.

You will press: (*6 Met. c. 1*) Metaphysics contemplates what a thing is — that is, the natures and quiddities of things; and (*4 of the same work. tit. 5*) the contemplation of all degrees, even individual ones, pertains to Metaphysics — for example, whether Socrates and Socrates sitting are the same? Whether there is one contrary to one? Or what a contrary is, or how many ways it is said? I reply that Metaphysics alone treats of the quiddities of things in common and in the universal, not in the special and in the particular. As to the addition, I reply that Metaphysics indeed judges what is the same or different, what is contrary to one thing or not, and similar matters — because these are contained within the limits of Metaphysics, for they are common affections of material and immaterial things, about which Aristotle treats (*5 Met. c. 9 and 10*). Yet it does not scrutinize their special natures and quiddities and individual degrees, since there is no science of singulars (*3 Met. at the end*), nor definition or demonstration of them (*7 of the same work, c. 17 tit. 53*).

Second: the adequate object of a science neither exceeds the science nor is exceeded by the science, as is clear from the notion of the name; but being as being is the adequate object of Metaphysics, as I showed in the preceding article; therefore Metaphysics does not diffuse or extend itself except to being as being, and does not stray through the special accounts of the objects of the others.

You will say: Metaphysics is the common and universal science of the sciences (*6 Met. T. 3*) — common and universal by the commonness and universality of its object, which is being; and being is absorbed and diffused through all the objects of the other disciplines and faculties. Whence Aristotle (*4 Met. T. 5*) writes that the philosopher — that is, the metaphysician — speculates about all things; and shortly after, that Metaphysics and Dialectic dispute about everything; and that being is common to all; therefore Metaphysics pervades and penetrates through

the proper objects of the remaining sciences. I reply that Metaphysics is called common and universal not because it contemplates all the objects of the other sciences, but because it regards being — which is common and transcendent — and investigates first principles and the highest causes in common and in the universal; and it is in this way that it speculates and disputes about these things. This is how Aristotle in the passage cited is to be interpreted. Third: common properties flow from the common subject — which is being — and are demonstrable and knowable about it, and not about a special and any other particular subject, from which particular properties alone demonstrable and knowable about that very subject proceed — such as mobility from natural body, and so on; therefore Metaphysics is contained only within being and its properties, first principles, and whatever other transcendental and common things there are.

You will say: whoever treats of the superior likewise treats of the inferior; and similarly whoever treats of the whole likewise treats of its parts; and whoever treats of the genus likewise treats of its species — as Physics treats of natural body, which is the whole, and of matter and form, which are its parts, and of animated and inanimate body, which are its species. But Metaphysics contemplates being; therefore also its subjective parts, which are the objects of the other sciences — all of which are comprehended under being — and so it attains the special and proper accounts of those sciences. I reply that all of this is true in the manner fitting and appropriate to it. But since Metaphysics is competent to contemplate all these things only under common and transcendental accounts, it consequently does not regard their proper and special accounts, their degrees; but leaves them to be considered by the remaining sciences, as they belong to those sciences and are specified, constituted, and distinguished by them. Hence Metaphysics does not meditate on animated or inanimate body, nor on the healable body, nor on sonorous number, nor on other things belonging to other sciences; but it remains within the limits of its first and adequate object, as the Doctor rightly pursues (*q. 1. prol. § Tertio arguitur. Sub E.*).

Fourth: the object of a science formally or virtually contains all the demonstrable and knowable truths about it, as the Doctor shows (*nunc cit. § Arguitur*); but being neither formally nor virtually comprehends the demonstrable and knowable truths about the proper objects of other sciences. For about God as God — who is the object of Theology in himself — it does not contain such truths as: God is one and triune; the Deity is communicable to three divine Persons; and the like. Likewise, about immaterial and incorporeal substance it possesses only common and general concepts belonging to Metaphysics itself; the proper and special ones are hidden from us, and if they were known to us, they would constitute a proper science distinct from the others. For just as there is a proper science of corporeal natural substance called Physics, so likewise there is another science of incorporeal and immaterial

substance — since it has knowable properties, as the former does. The same is to be said of the objects of the other disciplines, which, since they have their own properties and demonstrable middle terms, are consequently neither investigated nor scrutinized by Metaphysics, except in common.

The second part is urged first: the other principal sciences contemplate primarily substantial objects — as Physics considers corporeal natural substance, Mathematics quantified substance; therefore the other sciences besides Metaphysics do not regard only the accidents of the natures and quiddities in question. Second: a quiddity and its accident compose one accidental unity, about which there is no science (*6 Met. T. 4*). But accidents cannot exist without the subject in which they inhere; and the subject with its accident constitutes one accidental unity, which is excluded from science. Whence Antonius Andreas (*ibid.*) rightly warns that we should avoid those who make mobile being or mobile body the subject of Physics — because mobility is an accident which, together with the subject, makes one accidental being, which cannot be the object of Physics or any other science.

You will say: Perspectiva is a science whose object is the visual line, which is an accidental being. Likewise, Music is counted among the sciences, whose object is sonorous number, which is an accidental being; therefore even if the remaining sciences regard the accidental accounts of quiddities and natures of things, they are not on that account to be removed from the number of true sciences. I reply that these are subalternated sciences, whose objects we do not deny to be accidental beings; but the present discussion concerns disparate sciences — such as Metaphysics and the other speculative sciences, which are not subalternated to one another and whose objects are per se beings, as the Doctor touches on (*q. 3. prol. § contra istas positiones*). Third: of accidental being it is not presupposed whether it is and what it is, nor are there knowable properties demonstrable of it, since it has no proper ones; therefore such being does not fall under a science — especially the first, disparate science of which we are now speaking.

Second Assertion: Metaphysics contemplates all the quiddities of things in common and solely under the account of being. This is the common position of Aristotle, Scotus, and the others cited above, and follows from the preceding assertion. It is urged first from the whole course of the things treated in Metaphysics — namely, first principles and causes, being and its properties both reciprocal and disjunct, universals, predicaments, intelligences, and God, and whatever other common and transcendental things are contained in the twelve books of the Metaphysics of Aristotle, Scotus, Antonius Andreas, Bonetus, Alexander of Hales, and others who wrote on this science; therefore Metaphysics does not overstep the limits of common and transcendental quiddities.

You will say: in Metaphysics there is dispute about matter and form, which are essential parts of the physical composite, as is clear (*7 Met. c. 1*). Likewise about

the four kinds of causes (*5 Met. c. 2*), which are treated in (*2 Phys.*). And about principles (*1 Met. summa 2. c. 1*) and elsewhere, of which there is extensive treatment in (*1 Phys.*). About God (*12 Met.*), of whom under the name of the mover (*8 Phys.*); and then at the end of (*12 Met.*) the number of intelligences is determined in accordance with the number of movable heavens, and the heavens are objects of physical consideration. I pass over the rest concerning the Mathematical disciplines, Dialectic, and other sciences which are not rarely read about in the same work on Metaphysics; therefore Metaphysics strays through the proper objects of each individual discipline. I reply that all these aforesaid things are considered differently by this science and by the others. For this one contemplates them in common and under the account of being; the others, however, under their proper and special account. Therefore the objection carries no weight. Most especially because some things are there mentioned indirectly, in passing, and per accidens.

Second: each science does not transgress the limits of its total and adequate object; otherwise there would be great confusion among the sciences. But Metaphysics has its first and adequate object — which from what has been said is being as being; therefore it contemplates only being as being, and what befits it as such. Hence Aristotle (*6 Met. c. 1*), in enumerating the speculative sciences, assigns them their adequate objects; and indeed at the end of that chapter (*T. 3*) he assigns in explicit terms the adequate object of Metaphysics, saying: *De ente, prout ens est, ac quid est, et qua ei insunt, prout ens est, speculari, huius est* — to contemplate being insofar as it is being, what it is, and what belongs to it insofar as it is being — this belongs to this science. The same he writes elsewhere repeatedly.

You will say with Suárez (*cit. n. 11. assert. 1*): Metaphysics descends to some inferior things to contemplate them under their proper and special accounts. Nor does Fonseca (*concl. 2 and 3*) seem to be far from this, affirming that Metaphysics regards and considers the quiddities and essences that abstract from matter, and many that include matter as well. On the contrary: besides the fact that the said Suárez contradicts himself — assigning along with the common view the total object of Metaphysics to be being as being, and attacking the prior opinion affirming that Metaphysics extends itself to peculiar quiddities and special natures of things, Suárez himself now admits that Metaphysics diffuses itself not only to common but also to inferior and proper accounts of things — once this is posited, being taken precisely is no longer the adequate object of this science, because it extends to inferiors and contemplates the peculiar accounts of things, which is to transgress its own limits. For if Metaphysics regards not only body insofar as it is being, but also its proper account as body, then it contemplates body insofar as it is body — because body is constituted in the being of body through corporeity, which is its essential difference; but body belongs to Physics; therefore if Metaphysics descends to the peculiar accounts of things, it transgresses its own limits.

Nor does it avail to say with the same Suárez that not all but only some special quiddities are regarded by Metaphysics — those that have the same degree of abstraction as the common ones, and that are necessarily connected with one another. For the same or different degree of abstraction neither widens nor narrows the object of a science; rather, it is a broader or narrower quiddity of things. Hence if Physics were to regard something outside of natural body, it would exit beyond the limits of its own object — even if it abstracted with the same degree of abstraction — since a science is specified not by its abstraction but by its object. Therefore if, according to Suárez, Metaphysics regards other inferior objects besides being as such, it goes outside the limits of its adequate object. As to his addition about the necessary connection among those special quiddities, it does not serve the purpose — since all inferiors are necessarily joined with superior predicates, and therefore one argues rightly from inferior to superior, because the superior predicates are of the essence of inferiors. Therefore Metaphysics contemplates no inferior quiddities and no peculiar accounts of things.

What the same author appends together with Fonseca — that Metaphysics contemplates the proper and special accounts of abstract substances — is false, because the proper and peculiar natures and quiddities of those substances are hidden from us, as the same authors candidly admit; and if they were known to us, there would be a special science about them, as Scotus rightly saw (*cit. q. 9. primi Met.*). For if there is a proper science of corporeal and material substance, there would similarly and without doubt be another science of incorporeal and immaterial substance, since the reason is equally valid on both sides, and there would be properties demonstrable and knowable of it. But to say that the latter belong to Metaphysics and not the former concerning corporeal substance is empty and without any foundation or reason.

Nor does the distinction alleged by Fonseca (*ibid.*) — between the Metaphysician as common artisan and as particular artisan — seem less empty and imaginary. For the Metaphysician is one completely undivided, just as Metaphysics is one in every way undivided in itself and distinct from every other science by the unity of its formal and adequate object — which is not divided into common and particular, since it is irreducible into other superiors, because it is simply simple and common to all inferiors by a commonness not of application, as is the object of Logic, nor of consideration — because it does not consider the inferiors under their proper and special degrees — but of predication, because it is predicated of all that is contained under it. Furthermore, it is not the task of the Metaphysician to inquire into the proper objects of the other sciences, to distinguish them, and to pass judgment on them; rather, this belongs to the intellect as the common and general judge of all — since Metaphysics itself exists for its own sake and remains in the mere contemplation of its own object. But if some particular science, needing proof of its principles, proves and confirms them through the first principles of Metaphysics — which are the most

common, most certain, and most evident, such as: "everything either is or is not"; "it is impossible to affirm and deny of the same thing at once" — then Metaphysics remains within the limits of its formal and adequate object. Therefore the aforesaid distinction into common and particular artisan is not to be accepted, as it is fictitious and resting on a sandy foundation, devised not to dissolve the opposing arguments but to evade them — which arguments seem to me to be most firm and most valid.

Furthermore, if the said distinction were admitted, the other sciences would be superfluous. For the Metaphysician as particular artisan would investigate and scrutinize what belongs to his own object; but as common artisan he would pervade and inquire into what pertains to the other sciences. Since therefore Metaphysics does everything, the other sciences are redundant; and these authors fall into the inconveniences and absurdities into which those fall who favor the affirmative part of this article. Moreover, Metaphysics is posterior in discovery to the other disciplines — as these authors do not deny. Those sciences therefore already enjoyed their proper and special objects, which Metaphysics did not take away from them when it was later devised. Since therefore it has taken away nothing, but only holds and possesses what is its own, it must be firmly and consistently held that it does not descend to alien things, nor strips the remaining sciences of their goods or proper objects, but rather clothes them more fully, by proof and confirmation of their principles — in the manner explained above.

You will object first: Metaphysics is called the Goddess of the sciences, in which God is especially powerful; therefore just as God understands and sees all things — not only the common but also the special — so Metaphysics regards all things, both transcendental and non-transcendental, both universal and particular. I concede the antecedent. To the consequence I say that the likeness consists only in this: just as God excels and is eminent over all things in dignity and perfection, so Metaphysics is the most excellent and eminent of all the sciences. In the remaining respects there is dissimilarity and disparity — because God beholds all things, even the deepest abyss, while Metaphysics regards only transcendental things.

You will object second: if Metaphysics contemplated only being and the other common and transcendental things, it would be the most imperfect and most ignoble of the sciences — because being is the most ignoble and most imperfect of all; therefore Metaphysics contemplates not only common things but also the proper and special objects of the other sciences. I reply that Metaphysics is the most noble and most excellent, because it concerns itself with the most noble thing considered in it — which is God — and it deals with first principles and the highest causes, as I was noting a little above from Aristotle and Scotus.

You will object third: the object of Metaphysics is just like the object of the intellect, as Scotus hints (*Quol. 3. art. 1.*); but the intellect regards all beings —

common and particular; therefore the same must be said of Metaphysics. Confirmation: a superior sense, such as the phantasy, perceives its own proper subject and the individual objects of the other inferior senses; therefore Metaphysics — which is first philosophy and first science — also attains its own object and the proper objects of the inferior disciplines and doctrines. I reply that if the major is conceded of the motivating object, it is not however to be conceded of the terminating object, as Gadius expounds the testimony of Scotus; or it can be absolutely denied, because the intellect is a power that is not determined by the object about which it is occupied; but Metaphysics and any other intellectual habit is determined by the object with which it is occupied, and is partially caused by it. Therefore it cannot overstep the bound of its own object. To the confirmation the same must be said — since a superior sense has greater power and extends to more things than an inferior sense; but a habit is caused and specified by the object about which it is occupied; therefore it cannot extend to other things than its own object.

Book II

On Being

Philosophers treat of being principally in (*4 Met. c. 1*) together with Aristotle, and Scotus there both in the exposition of the text and in (*q. 1 of the same book*). And theologians treat of it in (*1 dist. 3*) and there the Doctor, Lychetus, Vigerius, Bargius, and the rest of his interpreters; Syrectus (*Tract. Formal. art. 1*); Trombeta, Brulifer, and others there, preceded by Mayronis in a special treatise on the univocation of being in nine questions, placed before the compiled commentary on the fourth book of sentences of the same Doctor; and in (*q. 2. prol.*) and from there forward. I, however, with my accustomed brevity and clarity, will review, decide, and settle in the following questions and next articles what is said about being itself and its properties.

Question I

On the Concept of Being

Article I: Whether There Is One Common Concept for Real Being and Being of Reason

Although from (*2 q. of the preceding book, art. 1*) this difficulty seems already to have been resolved, nevertheless, so that its decision may be rendered more evident and exact, it is my pleasure to examine it in the present context and to establish its truth as best I can. There are those who defend the affirmative part, among whom is Bonetus (*1 Met. Sua. c. 6. § Ens autem inquantum*), saying that

there is one common concept belonging to real being and being of reason. The negative part, however, is embraced by all the rest — notably Mayronis (*Tract. praecit. q. 6. Canon. 1. Phys. q. 3. § contra 4. concl. arguitur*), Lychetus (*1 dist. 3. q. 3.*), and Gadius (*Quol. 3.*) — who say that real being and being of reason have nothing in common.

Note and recall from what was said in Logic (*l. 1. q. 3. art. 5*): real being is described as that which has being or can have being apart from any operation of the intellect; while being of reason, by contrast, is that which has being only from the intellect. Further, note from the same (*l. 2. q. 1. art. 7*): concept is distributed into formal concept — which is equivalent to the intellection and cognition of the thing cognized and understood, or the representative likeness and image of the thing itself understood and cognized — and objective concept, which is the object presented to the intellect, whether it actually exists or not, so long as it is presented to the intellect. The present dispute is not about the formal but about the objective concept, and what is asked is whether some objective account belongs to both real being and being of reason.

The assertion is: no common concept exists for real being and being of reason. This is derived from Scotus, who, presupposing the truth of this assertion, inquires whether real being is a common univocal for substance and accident, God and creature — as is clear (*4 Met. q.*) where he proceeds problematically, though according to Mauritius and Cavellius there he inclines to the affirmative part. In (*1 dist. 3. q. 3.*) and elsewhere he explicitly and resolutely adheres to and vigorously maintains the affirmative part.

The assertion premised is proved first by Ponce (*disp. 69. q. 1. concl. 1*): if there were one concept common to real being and being of reason, it could be explained; but it cannot be explained, and if it were given it could be explained; therefore no such concept is given. This argument is not conclusive, since many things exist that cannot be explained by us — such as the ultimate differences of things which are hidden from us, the proper differences of intelligences, the will of God, and many other things of which we are entirely ignorant. Furthermore, explanation does not posit a thing, and non-explanation does not remove it if it exists — since explanation is extrinsic to the thing itself, just as affirmation or negation does not cause a thing to be or not to be. Especially since Aureolus, cited by Canonicus (*ibid.*) and others of the opposing view, express and defend that common concept, as is clear from their arguments to be adduced below in the objections. Furthermore, things of minimal being — such as beings of reason — and things most remote from the senses are either not grasped by us or are barely known, even though their existence is clearly admitted and granted by us; therefore it is no wonder if that concept is barely explained even by those who posit and assert it, since explanation neither posits nor removes it. Therefore the argument of Ponce is feeble and empty.

Second, it is proved by Mayronis (*pass. alleg.*): between contradictories there is no common middle; but real being and being of reason are contradictories; therefore there is no common concept of them, predicable of and applicable to each. This does not satisfy me. For, the major being conceded, the minor must be denied — since being and non-being are indeed contradictories, but not real being and being of reason; for the latter is diminished and qualified being, while the former is being simply; therefore they are not contradictories, since one contradictory denies the other — whereas this is not the case with real being and being of reason, since the latter exists only in the mind, while the former exists outside the mind, as will be clearer in the last book, and is already clear in Logic (*l. 1. q. 3. art. 5*).

Third: to being simply and to being in a qualified sense there is no common objective concept, as is clear regarding a real man and a painted man, who have nothing in common except in man; for this reason Aristotle (*l. Praedicamentorum c. 1*) places them among equivocals. But real being is being simply, and being of reason is being in a qualified and diminished sense; therefore no common concept belongs to them.

You will say: substance is being simply, and accident is being in a qualified sense (*4 Met. T. 2*), yet in the school of Scotus they are univocated; therefore the same must be said of real being and being of reason. I reply that there is a disparity, because accident, with respect to substance — which is the principal being and its cause — is called being in a qualified sense and being of being; yet absolutely it is being and possesses the true and proper account of being, just as substance does; and being is rightly divided into substance and accident. This is not the case with being taken in the most common sense, which is distributed into real being and being of reason — since the name "being" is merely common to these, just as the name "man" is common to a real man and a painted man, as Aristotle exemplifies (*in Antepredicamentis c. 1*). Furthermore, nothing appears to be included in real being that is of lesser perfection than being of reason. For just as among beings, being of reason participates in a minimum of entity and therefore in the minimum of perfection, so if such a common concept of being were given, something would be included in real being that would be more imperfect than being of reason — namely, the said concept, since what is included is more imperfect than what includes, and the more common are more imperfect than the less common, as animal is more imperfect than man; and so on. Finally, about that one concept there would be some science, since science is about what is univocal, as asserted elsewhere; but it would not be Metaphysics, which excludes being of reason from its subject (*at the end of 6 Met.*); nor is any other special science yet found that contemplates it per se, as is clear to anyone who surveys them. Therefore one concept — abstracting and prescinding from real being and being of reason — is not conceded.

You will object first: where there is a property, there is a subject, and such a property always accompanies the subject from which it flows — as risibility always accompanies man, from whom it proceeds. But intelligibility is a property of being. Hence that saying (2 *Met.* 4): "as a thing is related to being, so it is to being known"; and this belongs both to first intentions, which are real beings, and to second intentions, which are beings of reason; therefore being — which is common to all of them — is intelligible, and accordingly there is one objective concept of it, from which intelligibility proceeds as its property. I reply that intelligibility belongs to being on account of the name, which is indeed common; but not on account of the thing, because they have nothing in common in the thing. Or you may say with Canonicus (*cit.*) and Vallonius (*in sua lectura, fol. 15*): intelligibility belongs per se to real being, but per accidens to being of reason.

You will object second: one who is certain about one concept and doubtful about diverse ones has one concept distinct from the others, as the Doctor shows in (1 *cit.*); but someone is certain about something that is being, and doubtful whether it is real being or being of reason; therefore being, prescinding from real being and being of reason, imports one concept common to both. I concede the major. I distinguish the minor: about the name, I concede; about the thing, I deny.

You will press: what is divided is participated by the dividing members, as animal is participated by man and brute; but being is divided into real being and being of reason; therefore being is common to them. I reply that this is a division of a name into its acceptations — just as the name "dog" is divided into terrestrial, aquatic, and celestial, and "man" into living and painted. You will press further: when several things are said to be many, they share one common thing, as many animals share the common account of animal; but real being and being of reason are said to be many beings; therefore they share one common concept of being. I must reply that they are absolutely not many beings except in name — just as a painted man and a real one are not two men, and a terrestrial and a celestial dog are not two dogs.

You will object third: every power that regards many things is occupied with a common object under which those many things are contained — as sight regards white and black, which have a common object, namely color, which comprehends both. But the intellect is directed to real being and being of reason; therefore being is indeed common to them. I reply that any power whatsoever possesses its own proper per se object under which some things fall per accidens and by a kind of consequence; thus the intellect considers real being per se and being of reason per accidens. Therefore there need not be something common to both, to which the intellect is directed.

You will press: God and creature are more distant than real being and being of reason; yet the former share in the common account of being; therefore so do

the latter. The major is clear, because God and creature are infinitely distant — since God is infinite and immense, while creature is finite and limited.

Confirmation: being of reason is predicated of creature and is founded in it — for it is valid to say "animal is a genus" and "man is a species," and genus and species are beings of reason, while animal and man are real beings; therefore it seems probable that real being and being of reason enjoy a common concept of being. I distinguish the major: of infinite intensive and perfective distance, I concede; of entitative distance, I deny. For God and creature share in the common account of real being; but real being and being of reason do not. To the confirmation I reply, in accordance with what was asserted in Logic, that it is a privilege of second intentions — which are beings of reason — to be predicated of first intentions — which are real beings — and to be founded in them. Yet they are more distinguished than real beings; indeed, they share nothing in common. This can be illustrated by accident, which is founded in a subject and predicated of it; yet it is more distinguished from the subject itself than one individual from another individual of the same species — for these differ only in number, while the former differ in genus.

Article II: Whether There Is One Concept of Being Prescribed from Its Inferiors

The difficulty exists not only regarding the formal concept but also the objective. Regarding the formal concept, however, there is not one unanimous opinion. For Cajetan (*l. de analogia nominum c. 4. § 6.*), Ferrariensis (*1.1. contra Gentes c. 34*), Gerard (*Quol. 1. q. 1.*), and Aureolus (*1 d. 2 art. 4*) do not admit one formal concept abstracted from its inferiors. The rest, however — such as Scotus (*1 d. 8. q. 2.*) and elsewhere, Lychetus, Bargius, Vigerius, and others there, to whom Suárez (*disp. 2. Met. sect. 1. n. 9*), Hurtado (*sect. 2*), and the rest cited by them subscribe — teach that one formal concept of being exists, prescinded from the particular and special formal concepts. But regarding the objective concept of being, not all are in agreement. For although those who reject one formal concept of being also reject one objective concept of it, there are nevertheless those who concede one formal concept but deny one objective one. Scotus, however, and his whole school (*loc. praecit.*) — to whom the more recent authors cited and many others unanimously adhere — firmly defend that one objective concept of being, abstracted and prescinded from its inferiors, must be admitted; just as they also concede that one formal concept of the same being exists, separated from the rest and terminated at the aforesaid objective concept.

Note: being can be taken in two ways. In one way, as a participle — which is the same as "existing" — so that a proposition that consists only of a subject and the substantive verb "is" is called one of the second adjacent, such as "Peter is" — that is, "Peter is existing," as I explained in (*Epitome Dialecticae l. 2. q. 2. art. 3. n. 15 at the end*). In the other way, as a noun — and so it signifies something to which

essence and existence are not repugnant. Hence a proposition consisting of subject, predicate, and verb as copula of both is called a proposition of the third adjacent — such as "man is animal." In this sense that division of being into act-being and potential-being is admitted. For even though something does not actually exist, yet because it is in potency to existing, or because existence is not repugnant to it, it is called a real being — as Gadius notes, above others, (*in exp. Quol. 3*). Furthermore, Aureolus (*ibid. art. 1*) notes that being can be used grammatically and metaphysically. If it is taken grammatically, the inquiry is whether "being" is a noun devised and imposed to signify one concept of real being or of reason, or of some other such type — or many concepts of the ten predicaments, or other concepts of the transcendentals, copulatively or disjunctively. If it is taken metaphysically, the investigation is whether the concept of being comprehends under itself the proper and special concepts of inferior things, or only being itself abstracted and prescinded from all those contained under it — in which sense this controversy is agitated, which Aureolus (*nunc cit.*) considers very difficult and arduous.

The assertion is: one formal concept of being prescinded from its inferiors is given; and one objective concept of the same being is given. This assertion is two-part, as the Doctor holds (*loc. praememoratus*). The first part is urged by Ponce (*disp. 69. q. 2. concl. 3*): if there were many concepts of being, we would notice and experience many objects; but we do not notice or experience many concepts, but only one concept of being; therefore one concept of being as such exists. But this argument does not satisfy me: for it is subject to the same objections that Ponce himself brings against the argument he adduces for disproving one common concept for real being and being of reason, as is clear from the preceding article. Whether we notice or not, a single or multiple concept of being is not thereby posited — since our consideration posits nothing in the thing, but presupposes the thing in being and is extrinsic and adventitious to it. Furthermore, opponents do not notice or experience such a concept; indeed, they plainly deny it and say they perceive many concepts. Therefore the aforesaid argument of Ponce is of no weight or force.

But it is proved otherwise. First: words are signs of formal concepts that reside in the mind (*1 Perih. c. 1 at the beginning*); one word signifies one concept, and many words signify many concepts, as is clear in Logic explaining terms, and as everyday experience teaches us in our conversations and reasonings. But "being" is one word and one noun, as I explained above in the Note; therefore it signifies one concept, which we form in our mind — and so one formal concept of being must be admitted.

You will say: names are by convention; therefore the name "being" can signify both one concept and many, at the will and pleasure of those who use it. I reply that words and names signify from the original imposition of the one who established and imposed them; and since the first instituter wished to use

"being" for one formal concept, it is not in the hands of others to take it differently and to use that name to signify many formal concepts.

Second: cognition and intellection — which is the formal concept — is directed to the object which is proposed to be known and understood, and by which it is specified and determined, according to the adage received by all: powers and acts are specified by their objects (*2 Anima T. 33*). But being as such is the first and adequate object of Metaphysics, by which Metaphysics itself is called one, as is clear from what was said; therefore the formal concept we have of being is one, just as being itself is one.

Third: on hearing the name "being" we form in ourselves a concept of it — and not of God, or creature, or substance, or accident, or anything else; therefore this formal concept is prescinded from all others. Most especially because we experience that if we see someone from afar, we first cognize them as being, then as animal, then as man, and lastly as Peter. Hence Avicenna rightly says (*1 of his Met. c. 2*): being and thing are impressed with the first impression. Therefore, since being is presented and set before us to be known — apart from its inferior degrees and predicates — it is plainly deduced that we have its formal concept abstracted and prescinded from those same inferiors.

The second part follows from the first: for to one formal concept there corresponds one objective concept, since the former is determined and specified by the latter; therefore the former cannot be one simply unless the latter is one simply — since our cognition must conform to the object cognized. Therefore if the latter is one absolutely, the former is likewise absolutely one. Furthermore, it can be proved first from Aristotle (*4 Met. at the beginning of c. 1*) and (*6 of the same work T. 3 at the end*), assigning being as being as the first and adequate object of Metaphysics — whether universally taken, abstracting from accident and substance, from God and creature; therefore the objective concept of being prescinded from its inferiors is had, as just shown (*in loco*). Second: what things agree in, is not the same as that by which they differ — as man and brute agree in the common concept of animal, but differ by their proper differences, which are rational and irrational. But God and creature agree in the common concept of being, which is essential to both and is essentially predicated of each. For it is true to say: "God is being," "creature is being"; but they differ in that creature is finite and God is infinite. Therefore the objective concept of being prescinded from its inferiors is to be given.

Third: every property has its adequate subject from which it emanates (*1 Post. T. 43*); but there are transcendental properties — namely, one, true, good, contingent, necessary, and the like — of which some are reciprocal, others disjunct. Now these properties belong only to precise being and not to its inferiors, as is clear to one who contemplates the matter; therefore their subject — which is being — simply imports one objective concept abstracted from its inferiors.

You will object first: that name does not exhibit one concept simply and absolutely which is equivocal; but "being" is equivocal; therefore being does not import one concept simply. The major is clear. The minor is supported by the authority of Porphyry (*in Isag. c. de specie*), who says: if someone calls all beings equivocals, he will name them equivocally. And it seems to be Aristotle's position (*1 Phys. T. 16*): "being is said in many ways"; but manifoldness excludes unity of concept. The same is found (*4 Met. T. 2*), from which this argument is extracted: what stands in relation to its signifieds as "healthy" stands in relation to its own does not exhibit one precise and abstract concept of those of which it is predicated — because "healthy" is said of the drink, urine, medicine, and animal equivocally-analogically; but such is being with respect to substance, accident, and the others; therefore being does not import one concept precisely and absolutely. I concede the major and deny the minor. To its proof from the testimony of Porphyry, I say he is to be interpreted as speaking of physical equivocation, not logical or metaphysical, in accordance with that saying (*7 Phys. T. 31*): "in genus equivocations lie hidden" — physical ones — as the Doctor expounds (*4 Met. q. 1*).

You will say: Porphyry (*cit.*) treats of Logic; therefore he is not to be understood as speaking of physical but of logical equivocation. One must reply that in Logic many things are said not logically, just as in Metaphysics some things are said not metaphysically — as (*2 Met. T. 12*): "in every removed thing there is matter," which belongs to Physics. To the first passage of Aristotle it is thus expounded by the Doctor (*cit. in exp. T.*): "in many ways" — that is, in many modes, since being is not divided into differences but into modes, as will be explained below. Hence Antonius Andreas (*ibid. q. 1*) adds: being is said in many modes — namely, finite or infinite. To the second passage I reply with Scotus there in commentary: just as Grammar regards all words, and Medicine all healthy things, so Metaphysics universally contemplates all beings — whether per se or per accidens, whether directly or reductively, or in any other way. Whether the concept of being is univocal or analogous is to be weighed below.

You will object second: if one concept of being were given, one idea of it would likewise be given, and vice versa, as Plato teaches; but Aristotle (*1 Eth. c. 6*) writes that Plato ought not to posit one idea of being; therefore neither is one concept of it to be handed down in the Peripatetic school. I reply that Aristotle denies the idea of being in the way in which Plato affirms it — namely, a subsisting and really existing idea separated from singulars, as I made plain in Logic (*l. 2. q. 1. art. 3*). And therefore he does not deny one concept of being abstracted from its inferiors, which is what we intend.

You will object third: no common thing simply signifies the inferiors contained under it — as animal, which is common to man and brute, does not signify man and brute, but only the precise account of animal abstracted from them. But "being" signifies substance and accident, as is clear (*l. Praedicamentorum c. 5*):

"each of the uncomposed signifies either substance, or quantity, or quality, or the like." The same is read (*5 Met. c. 7. T. 14*). Therefore one concept of being simply is not to be admitted. I reply that those testimonies only indicate that being is divided immediately into those members, and not into other prior ones — just as animal is distributed into rational and irrational — and that they do not reject the concept of being prescinded from those enumerated. This the Philosopher hints at (*4 Met. T. 4*), saying that being is at once something, a quantity, a quality, and the like — because these are the immediate parts of being, so that being is not divided into other parts before these ones. This is interpreted by Scotus (*4 Met. q. 1*).

You will press: the predicaments are primarily diverse, as Averroes (*10 Met. com. 3*) and Porphyry (*in Isag. c. 3*) write — for they are the first and highest genera; but what is primarily diverse agrees in nothing; therefore no common concept of being abstracted from inferiors is to be conceded. I distinguish the major: the predicaments are primarily diverse subjectively — that is, they agree in no potential reality contractible by differences, I concede; they are primarily diverse objectively — that is, they do not agree in the common concept of being prescinded from them by the intellect, I deny. The same must be asserted about God and creature, which are said to be primarily diverse not objectively but subjectively, as will be clearly established in the next article.

Article III: Whether the Concept of Being Prescinded from Its Inferiors Is Real and Distinct from Them

No small controversy exists among the Scholastics about the aforesaid objective concept of being — whether it is real or of reason. About the formal concept of the same, however, there is no dispute, since everyone asserts it to be real, as it is a quality placed in the category of quality. The present controversy therefore obtains only about the objective concept, and the greater dispute arises about its distinction from inferiors. For Suárez (*disp. 2. Met. sect. 3. n. 7*) and the Thomists cited by him deny that such a concept of being is formally and from the nature of the thing distinct from others. Among the Scotists, John Vallone (*in sua lectura, fol. 74*) and most recently Mastrius (*disp. 2 Met. n. 75*) favor this; but the opposite is affirmed commonly by Scotus and his disciples (*1 d. 8. q. 3.*) and (*Tract. Formalitatum art. 3 partiali*), teaching that being taken universally is formally distinguished from its inferiors, to which it is determined and contracted. To settle this controversy and decide the dispute, what I said and noted in Logic (*l. 2. q. 1. art. 16*) on real, formal, and rational distinction is very valuable — indeed necessary.

Note I: for the present, being is used in two ways. In one way, for what is outside of nothing — that is, for what has some being, whether that being is quidditative, or aliquitative, or modal. In this way, the properties of being are called "aliquities" of being, its modes — such as finitude and infinitude — and the ultimate differences are called beings, even though "being" is not predicated

of them in quid, as I shall show below. In the other way, being is taken for the common concept of being abstractable from its inferiors and predicable of them in quid. And it is being taken in this sense that is the topic of the present discussion — which is the first transcendental, having its reciprocal and disjunct properties, and which is the first and adequate object of Metaphysics, of which Avicenna (*1 of his Met. c. 2*) makes mention, saying that being and thing are impressed with the first impression. The first acceptation of being is also mentioned by the same author (*2 of the same work c. 5*), saying that being and thing are common to all ten genera, as Trombeta (*pass. alleg. parte 2 fol. 24*) well explains; and there he adds a third acceptation of being — for what first and per se has being and subsists per se, such as substance — in which sense Aristotle (*7 Met. T. 2*) takes being, writing that accidents are not beings except because they belong to being — namely, to substance, from which they proceed and in which they inhere. And there (*T. 14*) he adds: quality and the other accidents are not beings except in the way logicians say "not-being is being" — not simply, but in a qualified sense; which is to say, substance is primarily being because it subsists per se, and secondarily accident is being because it inheres in another — that is, it is subjected in substance itself.

Note II: the objective concept taken universally is divided into the quidditative and the qualitative. The quidditative — or what is predicated in quid of its inferiors — is subdivided into the transcendental, as the concept of being is simply predicated in quid of God and creature, substance and accident; and the predicamental, which is either generic, as animal, which is said in quid of man and brute; or specific, as man, who is enunciated in quid of Peter and Andrew. The qualitative — or what is predicated in quale — is tripartite. The first is in essential quale, as "rational" of man. The second is in modal quale, as "creature is finite" and "God is infinite," where finitude and infinitude — which are modes — are predicated in modal quale, so called from the said modes. These modes and degrees are some transcendental, as the aforesaid; others categorical, of which some are specific and others individual — the former belonging to specific natures and called portions and perfections of them, such as degrees of whiteness; the latter belonging to individuals and singular natures, such as this particular whiteness having four or five degrees. The third is in accidental quale — and this is bipartite: either in accidental quale taken for something extraneous — that is, what is outside the essence of the subject, as it is taken in the fallacy of accident — so a property is predicated of its subject, as "man is risible"; or in contingent accidental quale, which can be present and absent without injury to the subject — so an accident is predicated of a substance, as "the heaven is quantified." From all this it is clear that some concepts are contractible, as the superior ones; and others are contracting, such as the inferior concepts. Those that are contracted by essential differences are potential and generic; those that are contracted by modes or degrees are neither potential nor generic, as will be made plain in the following Note.

Note III: there is a difference between a difference and an intrinsic mode. For a difference imports a perfecting, constituting, and contracting reality, contracting the reality of the genus — which is in potency to it — so that from the reality of the genus and the reality of the difference there is formed one composite with a metaphysical composition, just as from matter and form there is formed a physical composite. A mode, however, does not in any way perfect the thing of which it is a mode, nor is the thing in potency to that mode — since it is included in the perfect concept of the thing. For a thing is never perfectly and completely conceived unless it is conceived together with its intrinsic mode: if God is perfectly understood, he is understood along with his infinity, which is his intrinsic mode; and if creature is perfectly understood, it is likewise perceived along with its finitude, which is its intrinsic mode. But a genus can be well conceived without its difference — as animal without rational or irrational — because the sensitive, which is animal, is outside rationality and irrationality, which are its divisive and constitutive differences; and therefore it is in potency to them. A mode, however, because it is not outside the thing of which it is a mode, means that the thing itself is not in potency to it — since it includes it within itself, and nothing is in potency to what it already has. Therefore the concept of being along with its mode is perfect and adequate; the concept of being without its mode is imperfect and inadequate. And being as conceived without a mode does not exist, nor is it understood as existing in the thing — but only in the concept — because it is abstracted and conceived as abstracted; and so it is not known by intuitive cognition but by abstractive cognition. Hence God cannot be seen by the Blessed without his infinity, nor can creature be seen without its finitude. This can be illustrated by whiteness intensified to the degree of eight, which no one can fully and perfectly intuit unless they see it with those eight degrees — although by abstractive cognition they can reach whiteness itself. Therefore being is known abstractively without its modes, to which it is determined and contracted; but it cannot be conceived intuitively without them. The reason is that being including its modes is one formal object of intuitive cognition; but prescind from those very modes, it is the object of abstractive cognition.

You will say: if degrees and modes of being are related to being as degrees of whiteness are to whiteness, then just as whiteness is in potency to its degrees, so being is in potency to its modes; but whiteness is directed to its degrees as potency to act — because it is intensified and perfected by them; and so, when it has its ultimate degree, and is most intensified, it no longer tends to another degree. Similarly, being is in potency to its modes, and since it is precisely the most ignoble and most imperfect, it is contracted and perfected through the said modes; and therefore in God there would be something potential, ignoble, and imperfect — which is absurd, false, and impossible. I reply that degrees of whiteness — since they are homogeneous and of the same account — do not stand to each other as act and potency, and therefore do not form one

composite but one homogeneous whole; and so neither is whiteness properly in potency to them, nor is one degree in potency to another. And if perhaps there is some order among them, that order is irrelevant to composition — as is clear in the world and in an army, in which there is indeed order, but not composition. I add further: if perhaps in created things, because they are finite and limited in entity and perfection, some potentiality is found — this is not the case with God, who is infinite and unlimited, and therefore incapable of further perfection. Wherefore neither in being nor in God is there any potentiality, but all things in God himself are most actual and most perfect — even though being taken precisely is said to be the most ignoble and most imperfect, as was amply decided and explained in the preceding book (*q. 2. art. 1*).

First Assertion: the concept of being is real, yet it is not after the manner of a common and universal nature in relation to its inferiors. This is derived from Scotus (*1 d. 8. q. 3.*) and from the other places adduced in Logic (*l. 1. q. 1. art. 5*). The first part is professionally handed down and defended by Antonius Andreas (*1 Met. q. 1. art. 3. concl. 2.*), Canonicus (*1 Phys. q. 3. art. 3. concl. 4.*), Trombeta (*2 part. Tract. Formal. fol. 41*), Vorrillongus (*1 d. 3. ad finem 1. partis*), and the rest in common — with a few exceptions, whom Vigerius follows (*1 d. 8. q. 2. § Ad 1. principale*), who hold the concept of being to be of reason.

It is proved first: what essentially and quidditatively belongs to something and is predicated of it in quid is real, because the essential predicate of a real being is real; but being is an essential and quidditative concept, and is predicated in quid of God, creature, substance, and accident — for it is truly valid to say "God is being," "creature is being," and so on of the rest; therefore the concept of being is real.

You will say: many things are predicated which are nevertheless not real — as "animal is a genus" and "man is a species," yet genus and species are beings of reason; therefore it is false that what is predicated of others in quid is real. I must reply that this holds in logical predicates taken in terms of second intention; but not in metaphysical predicates taken in terms of first intention, of which we are now treating.

Second: what precedes every operation of the intellect is a real being, because a being of reason is made by the intellect or follows its operation; but being precedes every operation of the intellect — since it is its object, and an object precedes the power of which it is the object, as color precedes sight and sound precedes hearing; therefore the concept of being is real, not of reason.

You will say: being of reason, as directive of the operations of the intellect, is the object of Logic; therefore the object does not always precede the operation of the intellect. I reply that in the present context we are speaking of the motivating object, which along with the intellect concurs partially in its

operation — which being of reason is not, since it follows the very operation of the intellect, as I said in Logic (*l. 1. q. 2. art. 5*).

Third: a real science is occupied with a real object, as is clear from induction in all the real sciences; but Metaphysics is a real science, whose object is being (*4 Met. T. 1*); therefore the concept of being is real. Nor does it help to say that Logic is real — since it is a quality — and yet it is occupied with second intentions, which are beings of reason; for Logic is called real formally and entitatively, which is not what we are talking about, and not materially and objectively, which is what is under discussion here.

Fourth: what real beings agree in is real, because agreement is a real relation whose foundation is real; but substance and accident — which are real beings — agree in being and share in its quidditative and essential account; therefore being common to them is real.

You will say: man and brute agree in genus and enjoy its essential account, and yet genus is a being of reason and a second intention. It is satisfactorily answered by saying that the objection holds for a logical genus; not, however, for a metaphysical genus, which is relevant to our purpose.

The second part is urged first: a common nature is contracted by its own differences; but being is contracted by its modes — and I showed above in Note III that a vast difference lies between mode and difference. Therefore being is not related to its inferiors in the way a common nature is.

Second: a common nature, together with its difference, forms a composition — as from humanity and Petrinity Petrus is formed; but from being and its mode no composition arises — as from Deity and infinity God is not composed, as I showed above; therefore being is not related to its modes as a common nature is related to its differences.

Third: a common nature and its difference are two realities; but being and its mode are by no means so — for being merely imports a real concept abstractable from its inferiors, and a mode is a degree inconceivable without the thing of which it is a mode, and a mode added to a thing does not change the thing. A difference, however, in quidditative and essential being constitutes the thing of which it is the difference and distinguishes it from everything else. Therefore the similarity and parity between a common nature and being taken simply and precisely is not complete.

Second Assertion: being differs formally from its modes and from the rest of its inferiors — and indeed from its modes formally negatively, and from others formally positively. The Scotists commonly teach this three-part assertion, and especially the Formalists (*Tract. Formalitatum*) together with Syrectus there — against whom Mastrius (*recently cited*) unjustly inveighs, since they are distinguished by learning and subtlety, brilliant in talent and genius; and as our

venerable and praiseworthy masters, they drew their knowledge from the most abundant source of the Subtle Doctor.

The first part is proved first: formal distinction belongs to those things that have distinct definitions or descriptions and cannot be in any way separated from one another — as I showed at length in *Logic (l. 2. q. 1. art. ult.)*; but being and its inferiors are of this character — for being is described differently from finite and infinite, from substance and accident, as is clear to one who contemplates and describes them; therefore they are formally distinct from one another.

Second: what is communicable and what is incommunicable, inseparable from one another, differ formally — as is clear in the divine nature, communicable to several, and divine paternity, which is incommunicable to many; but being is communicable to all its inferiors, while infinity belongs to God alone. Likewise being is predicated of substance and accident, while substance is predicated only of subsisting things, and accident only of things inhering in subjects; therefore between being and these there falls a formal distinction.

Third: one thing is distinguished from another really, or formally, or by reason; but being is not really different from its inferiors, since it is of the quiddity and essence of them — than which nothing is more intimate, and if that essence is destroyed, what it is the essence of is also destroyed; nor by reason only — since, apart from any operation of the intellect, the inferiors add something to being by which they differ from it, as substance adds subsistence, accident adds inherence, and so on; therefore being differs from these things by more than reason — namely, formally, since no other distinction remains besides the formal one.

The second part is shown first: a mode does not enter into the essence of which it is a mode — as degrees of whiteness are not placed in its essential and quidditative definition, because that definition abstracts from them and precedes them; therefore likewise the modes of being are not of its essence, but are formally distinct from being itself.

Second: what is posterior is not of the formal account of what is prior, because the prior is presupposed as constituted in its essential being before the posterior exists — as is clear of the cause, which precedes its effect; but the modes are posterior to being, since being is more common and universal than they are; and that the more common and more universal precede the less common and less universal, the Stagirite commits to writing (*1 Phys. c. 1. T. 4*). Therefore being is formally negatively distinguished from those modes — I say negatively, because a mode does not import a distinct formality from the thing of which it is a mode, since it is not conceivable or intelligible per se without it, as I noted above in Note III. Therefore between being and its modes there is found a formally negative distinction — which others call a modal distinction, drawing its name from the lesser extreme, which is the mode.

The third part is urged: what has distinct conceivabilities and intelligibilities is formally distinguished — because formality means nothing other than a distinct conceivability and intelligibility, to which the intellect is terminated, as the Formalists commonly teach (*ibid.*); but being and its inferiors exhibit distinct conceivabilities and intelligibilities, to which the intellect is directed in understanding being precisely, substance, accident, and the rest; therefore among these there intervenes a formally positive distinction. Furthermore, distinction conforms to those things between which it distinguishes, and derives its name from them — as real distinction is from real extremes, because it falls between thing and thing; rational distinction is from extremes that are beings of reason, or between two second intentions, such as subject and predicate, genus and species. Therefore likewise between two formalities or realities and conceivabilities, there is found a formally positive distinction, deriving its name from them. But being and what follows it and is subjected to it are of this character — for they are positive formal extremes, per se intelligible and conceivable; therefore they formally differ.

You will object first: Scotus, cited by Vallone (*in sua lett. fol. 74*), writes that the concept of being is of reason; therefore it is not real. The consequence holds because real being and being of reason seem to be opposed to each other, and the common division is between being in the mind, which is being of reason, and being outside the mind, which is real being. I reply that Scotus there takes "reason" for the quidditative and objective account, not for an account caused by the intellect — as he makes clear in (*Quol. 1. art. 2.*) and (*4 d. 49. q. 1. § Ad argumenta. P.*). And before him Aristotle (*l. Praedicamentorum. § 1.*), in defining univocals: *univoca sunt, quorum nomen est commune, et ratio substantiae, secundum idem nomen est eadem* — univocals are those whose name is common and whose account of substance according to that name is the same.

You will press: if being were simply real and contractible by inferior degrees, there would be composition in God — namely, from that contractible being and the contracting Deity, since composition is made from a contractible potency and a contracting act (*8 Met. 15*); but God is immune from all composition, both physical and metaphysical; therefore that being so prescinded from its inferiors is not real, but of reason. I deny the consequence of the major: for if the composition is physical, it is made from thing and thing, or from matter and form; if it is metaphysical, it coalesces from reality and reality — namely, from genus and difference. But the concept of being is not a genus, which is potential, nor is its mode a difference; and therefore from being and its mode no composition arises. Consequently, even though in God there is being and infinity — which is his mode — there is no composition admitted in God himself, since he is most supremely simple and separated from every imperfection.

You will press further: from what is contracting and what is contractible there is composition, as from what is actualizing and what is actualizable; but being is contractible and actualizable, and infinity is contracting and actualizing; therefore, given such a real common being for God, composition is plainly admitted in God himself. I distinguish the major: from a contractible reality and a contracting reality there is composition, I concede; from a real concept and its mode there is composition, in your sense I deny — as remains amply explained and declared in what precedes.

You will object second: being is participated by God and creature — for each is a being. Either, then, all of being is participated by God, or only a part of being. If the first, then creature is not being, since (*3 Phys. § 3*) the whole is described as that outside of which there is nothing. If the second, then in God there would be something imperfect — since a part is an imperfect and incomplete being, which is incompatible with God himself. I reply that all of being is in God — not indeed adequately, but inadequately; which is to say, in God there is whatever is required for the quiddity and nature of being, even though being extends to creature, which is also a being and participates in the quiddity and nature of being itself — just as man is said to have the whole nature of animal, because nothing pertaining to the nature of animal is lacking to him, even though the nature of animal itself also extends to the brute, which equally participates in it.

You will press: the dividing members are parts of the divided, into which the divided is itself divided; therefore, since being is divided into God and creature, it follows that God is its part. I reply that the antecedent holds of a material and physical divided; but not of a transcendental and metaphysical divided, which is what being is with respect to God and creature.

You will press further: the divided is prior to the dividing members, as a whole is prior to its parts; but if being is divided into God and creature, being would be prior to God — which is false, since God is the first being, the first cause, and the first mover (*8 Phys. 1*). I reply that being is first in conceiving and predicating, not however in existing and causing. In that sense it is true that God is the first being, the first efficient, and the first cause, from which all created things derive their origin.

You will object third: God is most actual and most singular — since he is, of himself, this God. But if one concept of real being common to God and creature is admitted, it would be contracted and singularized through the very divinity and infinity of God himself, through which creature is also distinguished; and so God would not be free from composition and imperfection. Therefore the aforesaid concept of real being is not to be conceded. I concede the major and deny the minor — because that concept is not determined to God by a difference, but by a mode — namely, infinity — as I noted above; and therefore neither imperfection nor any composition is placed in God. Most especially because God is of himself and from himself this individual and singular being

— not from something extrinsic, as are created individuals and singulars, which are individuated and singularized through individual differences or thisnesses from the agent that produces those individuals. Wherefore, although God includes being in himself, his supreme actuality and singularity are not thereby injured — just as the divine essence, containing in itself the divine attributes, does not cease to be this thing of itself, since they are really identified with it, even though they are formally distinguished from it.

You will press: the concept of being is either God or not. If the former, then something is in God that is not God. If the latter, then something is in creature that is God; and these and similar things involve great contradiction and absurdity. For all things that are in God are God, and all things that are in creature are created, caused, and participated; therefore such a real concept of being common to God and creature is to be rejected. I reply that being taken precisely is neither God nor creature; but if it is contracted through infinity, it is God; through finitude, however, it is creature — just as animal taken precisely is neither rational nor irrational, but if contracted through rationality, is rational, and if through irrationality, is irrational. Therefore all things that are in God are indeed God — yet not formally, as in the case of intellect and will; for the divine attributes are the same in God really, yet they are formally distinguished. Likewise being and the other common and transcendental predicates are really identified with the Deity, even though they differ from it formally.

You will object fourth: the same thing cannot be dependent and independent, participated and unparticipated, supremely necessary and contingent, caused and uncaused, created and uncreated. But being taken simply would be of this character. For if being is in God, it is independent, unparticipated, supremely necessary, uncaused, and uncreated; but in creature, being is dependent, participated, contingent, caused, and created; therefore there is no common real being for God and creature. I distinguish the major: the same thing with respect to the same cannot undergo the aforesaid predicates, I concede; with respect to different things, I deny. For being taken precisely is neither dependent nor independent, neither created nor uncreated — since it abstracts from both. But if it is contracted through finitude, which is its mode, it is finite being — participated, dependent, caused, and created; whereas if contracted through infinity, it is infinite being — unparticipated, independent, supremely necessary, uncreated, and uncaused.

You will press: what is in God assumes its properties, since nothing exists in God but what is God himself; but the properties of God are infinity, independence, supreme necessity, and the like; therefore being which is in God is infinite, independent, supremely necessary, unparticipated, and uncreated — and by contrast, being which is in creature is finite, communicated, dependent, and caused; and so being does not prescind from all these predicates just enumerated. I reply that all of this is true really, but not formally — and as being

is contracted to God, not as being is in itself considered and prescinded from God and creature. Hence Scotus (*cit.*) adds that being in itself is neither finite nor infinite, but abstracts from both — which is to be maintained about the other modes, attributes, and predicates; but that it is infinite as it is determined to God, and finite as it is contracted to creature. To argue from a prescissive abstraction to a divisive one does not hold as a consequence. Likewise, from superior to inferior affirmatively is a sophism of the consequent. Thus the following does not hold: being simply is not uncreated and independent; therefore being which is in God is not uncreated and independent. Similarly: being taken precisely is not finite nor created; therefore being as it is contracted to creature is not finite, created, communicated, and participated. This can be corroborated regarding the relations of origin, which of themselves are neither finite nor infinite, neither perfect nor imperfect formally; but really, as they are identified with the divine essence, they are infinite and perfect — on the authority of Scotus (*Quol. 5*). It can also be illustrated by substance — which of itself and precisely taken is neither corporeal nor incorporeal; yet as it is contracted to material things, it is corporeal; and as it is contracted to spiritual things, it is incorporeal. But if someone were to argue: natural substance is corporeal; therefore substance precisely is corporeal — the consequence would be poor. And likewise if someone were to argue: substance precisely taken is not corporeal; therefore natural substance is not corporeal — the consequence would be invalid, for the reasons stated and confirmed. Therefore these and similar objections, which Mastrius (*recently cited*) heaps up and presses at length against the torrent of Scotists, collapse — since he abandons the most stable and most firm foundation of our teachers and relies upon a reed, a sandy, alien one, to make himself pleasing and agreeable to the Recentiores.

Article IV: Whether the Concept of Being Is Univocal

St. Thomas (*1 Th. 1. p. q. 13. art. 5.*) and (*contra Gentes cap. 32*) and his disciples there, to whom Fonseca (*4 Met. c. 2. q. 2. sect. 9.*) and not a few others subscribe, hold that being is analogous to God and creature, to substance and accident. Scotus, however, (*4 Met. q. 1.*) and (*1 d. 3. q. 1. 3.*) and (*d. 8. q. 3.*) and his followers there — to whom Arriaga (*disp. 11. Log. sect. 4.*) and many others subscribe — teach that being is univocal to all of the aforesaid. The things I noted and explained in (*Epitome Dialecticae l. 1. q. 1. art. 5.*) and the rest I handed down in Logic (*l. 3. q. 2. art. 1. 2. and 7.*) must be reviewed and brought back to memory; these having been presupposed and foreknown.

The assertion is: being taken precisely is univocal to God and creature, to substance and accident. So the Doctor (*just cit.*), for whom Canonicus (*q. 3. primi Phys.*), Antonius Andreas (*4 Met. q. 1.*), and Bonetus (*1 Met. c. 1.*) fight brilliantly. And it follows from what was said above: since being simply exhibits one objective concept prescinded from those enumerated, it is plainly established that it is univocal and synonymous with them.

It is proved efficaciously and evidently: a univocal is what belongs to many under the same name and the same account of substance — or essence, quiddity, and objective account — as is clear from its definition adduced by the Philosopher (*l. Categoriarum c. 1. near the beginning*). But being belongs to God and creature, to substance and accident, under the same name and the same objective account. For God is called being, and creature is likewise called being, which is also said of substance and accident. Likewise, the account of being — which is to have real being outside of nothing independently of any operation of the intellect — belongs to all of them, since they all participate in real being and real entity, without anyone thinking of it; therefore being is univocal to them.

The Thomists encounter this objection and say that a univocal is equally participated by its univocates; but being is not so: more noble and more excellent being is God than creature, and substance than accident. And therefore it is to be judged not to be univocal but analogous. On the contrary: the same account and nature of being equally belongs to God, creature, and the rest enumerated; therefore being is truly univocal to them. The antecedent is at hand: the essence of being is unsplittable and impartible — since it is simply simple and irreducible into another superior, and nothing is found above being; and therefore being is either totally known or totally unknown; therefore being is equally participated by its inferiors, and hence is truly univocal.

Furthermore: the account of being simply is to have being simply real, outside of nothing; but God, creature, and the rest equally enjoy such being simply and outside of nothing — for they are truly and properly real beings, outside of nothing; therefore being is by no means to be denied of them as univocal. Hence some, perceiving the force of this argument and the weakness of the response, have recourse to another response, saying that a univocal properly belongs to its univocates without any order and dependence of one upon another — as is clear of categorical substance, which is univocal to corporeal and incorporeal substance without any subordination and mutual respect. But the inferiors of being are not so related. For creature essentially depends on God, and accident regards substance as its subject, in which it inheres and without which it cannot naturally exist; therefore being is not univocal. On the contrary: the order and dependence that inferiors import to one another does not remove the univocation of the prior, the superior, and what is common to them — since that dependence is posterior, while univocation is sought with respect to the common account of the superior; therefore such respect and dependence, which creature imports to God, and accident to substance, does not remove from them the univocation of being.

Furthermore: quality states an order to quantity as its subject in quo; relation depends on its extremes; habits of the intellect and will depend on their principles and powers; and yet they are univocated in their common and

general account; therefore the same must be said of God and creature, of substance and accident, with respect to being.

Second: an intellect certain about something and doubtful about two things has one concept about which it is certain, distinct from the others about which it is doubtful. But the intellect is certain that something is being, and doubts whether it is God or creature, substance or accident; therefore it has one concept of being distinct from the others about God and creature, substance and accident — and so the concept of being is univocal to all of them. The major is in common acknowledgment, because the unity of a concept is derived from the unity of the object, and its multiplicity is sought according to the multiplicity of the object. But being is one object, whereas God and creature, as well as substance and accident, are many objects; therefore one univocal and quidditative concept of being is had, common to all those enumerated.

Cajetan meets this objection (*l. de ente et essentia c. 2.*) and says that the concept of being is different from the concepts of God and creature, substance and accident — yet not univocal, but analogous. On the contrary: that concept of being belongs to its inferiors under the same name and the same account and quiddity of being; therefore it is univocal. The antecedent is conspicuous from the definition of univocals. For nothing more is required for univocation than the same name and the same account or essence according to that same name; and being is such, as I evidently showed in the first argument. What is more: between equivocal and univocal there is no middle, as I proved in *Logic (l. 3. q. 2. art. 7.)*. But Cajetan admits that being is not equivocal; therefore he must concede that it is univocal and synonymous.

Third: the object of any science is univocal, about which its knowable properties are demonstrated — as is clear from induction in all the objects of the sciences. But being is the first and adequate object of Metaphysics, as I showed in (*1.1. q. 2. art. 1.*); therefore it is univocal to its inferiors, of which it is essentially predicated. Furthermore: God is naturally known by us, as is clear (*8 Phys.*) and (*12 Met.*). But God is not known under proper predicates, as Scotus rightly pursues (*q. 1. prol.*); therefore under common and transcendental predicates — among which being is found first, which, since it is predicated in quid of God himself and of the rest mentioned, it is plainly deduced that it is univocal to God himself and the others. This very thing Aristotle hints at (*2 Met. T. 4.*), when he urges that eternal principles are most true — because each thing is most such, through which univocation belongs to others; as if fire is the cause by which other things are hot, fire itself is hottest. Therefore, since being is the first thing by which other things are, and since it is participated by all its inferiors, it plainly follows that being itself most supremely has being, and thus is univocal to them, and is predicated of them univocally, essentially, and in quid.

You will object first: Aristotle (*4 Met. c. 2. T. 2.*) writes that just as health is said of the health of an animal, of urine, and of medicine, so being is said of substance

and accident; but health is not univocal to the health of an animal, of urine, and of medicine; therefore neither is being univocal to substance and accident. Confirmation I from the same (*7 Met. T. 14.*): accidents are not beings except because they belong to being, and as logicians say "not-being is being" and "not-knowable is knowable"; therefore if accidents do not participate in the account of being, it follows that being is not univocal to them. Confirmation II from (*1 Eth. c. 6.*): being is analogous, because it is said first of substance and afterward of accident. I reply that Aristotle there adduces a likeness and parity in that — just as the health of urine and medicine is ordered to the health of an animal — so accident is ordered to substance, since substance is being subsisting per se. In another respect there is disparity and dissimilarity: because health is formally only in the animal, in urine as a sign, and in medicine as a cause. But the account of being simply is formally and properly in substance and in accident. If it were otherwise explained, being would be equivocal to substance and accident — just as healthy is equivocal to those enumerated — which Aristotle denies in that place, saying that being is said of substance and accident not equivocally. What is more, since in that place he seems not to be speaking assertively — as he adds: "but however one wishes to say these things, it makes no difference" — if it makes no difference, someone will say that being is univocal, which the Doctor explains and corroborates (*4 d. 12. q. 1. § Ad quaestionem. H.*). To Confirmation I, I reply with the same Doctor in his exposition of that text and in (*collatio 25.*): it is there only signified that accident is caused by substance; and therefore it is called "being of being" — that is, being caused by the substance in which it inheres and without which it cannot exist. To Confirmation II: the Philosopher explicitly makes no mention of any analogy; and if he were to adduce any, it would have to be reduced to univocation — and he refers to another philosophy, which is Metaphysics, which in no place expresses such an analogy, as is clear from what has been said. You will press: Job, the patriarch of the suffering (*c. 14. of his book*), addressing God, says: *Nonne tu, qui solus es?* — "Are you not the one who alone is?" Therefore, if God alone is being, the rest are non-beings; and consequently being is not univocal to God and creature. I reply that God alone is being from himself — independent and unparticipated — while creature is dependent and participated being. In this way the testimony of Job just cited is expounded, which does not remove the univocation of being with respect to God and creature.

You will object second: nothing is simpler than God, since he is supremely simple; but if being were univocal to God and creature, being would be simpler than God — since what is contracting is simpler than what is contracted, and the superior is simpler than the inferior; but being is contracted to God through infinity, and is superior to God himself, since it is his essential and quidditative predicate; therefore, and so on. I reply that being is said to be simple in one way, and God in another. For being is simply simple — because it is irreducible into anything superior; while God is supremely simple — by exclusion of all

composition and composability, as I taught in (*Summa Theologica Tract. 2. disp. 1. q. 6.*).

You will press: a univocal is equally participated by its inferiors, as is clear of a genus, which is communicated equally to its species, and a species to its individuals; but being is unequally participated by its inferiors — and therefore substance is being more nobly, since it subsists per se, while accident is being more ignobly, since it inheres in a subject; therefore being is not univocal to substance and accident, God and creature. I concede the major and deny the minor. Why substance surpasses accident in nobility, and God surpasses creature — this is not sought according to the common account of being, which is equal to all of them, but according to the proper and peculiar accounts by which they are distinguished from one another.

You will object third: if being were univocal to those enumerated, it would be their genus — for it is of the essence of a genus to be predicated in quid of many differing in species; but being is not a genus (*Met. T. 10.*); therefore neither is it univocal to them. I deny the consequence of the major: for a genus imports a potential and contractible entity in the manner of a part; but this does not belong to being — since it is simply simple and contracted through modes, not through differences as a genus is, on the authority of Scotus (*1 d. 8. q. 3.*), to whom Bonetus (*1 Met. c. 1.*) and the other Scotists adhere.

You will press: where there is reality and reality, there is a genus — since a species coalesces from a contractible reality, which is the genus, and a contracting reality, which is the difference; but being imports a contractible reality, because it is being contractible by the proper contracting accounts of substance and accident; therefore without any foundation or reason it is excluded from the account of a genus. The major being conceded, I deny the minor. For being designates a real objective concept — not a potential reality that is composable with the reality of a difference, as I made abundantly clear in the preceding article. And therefore Mastrius (*cit.*) rightly criticizes Ponce for conceding that being exhibits a contractible reality with respect to God and creature — for in that case God would not be free of metaphysical composition, which is made from reality and reality; but this is false and rejected by the general run of Scotists and the other Scholastics.

Article V: Whether Being Is Predicated in Quid of All Things

It is nearly certain among all that being is predicated univocally and in quid of God, creature, substance, and accident, and of all those that are placed directly in the predicaments. A not insignificant quarrel, however, exists between Thomists and Scotists as to whether being is predicated of its own properties and of the ultimate differences. The affirmative part is defended by the Thomists — notably Cajetan (*l. de ente et essentia q. 3.*), Soncinas (*4 Metaphys. q. 19.*), Suárez (*disp. 2. Metaphys. sect. 5. n. 16.*), Hurtado (*ibid. sect. 4. § 57.*), and very

many others. The negative part is embraced by Scotus (*1 d. 3. q. 3. art. 1. § Ad quaestionem igitur. F.*), Vigerius, Lychetus (*ibid.*), Syrectus (*Tract. Formal. artic. 1. principale*), Trombeta, Brulifer, Vallone (*ibid.*), Rada (*Contr. 21. art. 2. primae partis*), and many others.

Note I and recall from what was said in (*Epitome Dialecticae l. 1. q. 2. art. 2.*) what predication is and how many kinds there are; and what I asserted (*l. 2. Logicae q. 5. artic. 3.*) about superior and inferior differences — namely, that the former are not predicated of the latter quidditatively and essentially, but only denominatively and identically. Furthermore, it is to be brought back to memory from (*l. 2. de Anima q. 1. artic. 11.*) that there are intermediate and subordinated forms, and that in one animated being, besides the soul, there is a form of corporeity presupposed and pre-required to it — which persists and endures even when the soul departs, though it does not long endure, because it is ordered to the soul, through which one whole is constituted and ultimately completed, and without which the composite is gradually corrupted and reduced to dust.

Furthermore, very useful for understanding and resolving this controversy is the repetition of the acceptance of being brought forward and explained in this book (*art. 3. of this question*) — namely, for the common quiddity and the first transcendental, to which reciprocal and disjunct properties are accommodated, univocal to all inferiors and predicable of them, which is established as the first and total object of Metaphysics. And for everything that is positive and outside of nothing, which follows upon being taken in the first way — whether it is a property of it, or a mode, or an ultimate difference, or something else outside the quiddity and essence of being taken in the most abstract and most precise sense. One who does not discern or weigh this — such as Suárez (*praecit.*) — assails Scotus vainly and uselessly at great length and heaps up many things there that utterly collapse once the acceptance and distinction of being now noted is grasped. For when it is asked whether the ultimate differences and modes are real beings or not, the reply is easy and fully satisfying: they are beings taken not in the first but in the second way — or, as others say, they are not beings formally but really and identically.

Note II: some differences are intermediate and subaltern — such as living and sensitive — while some are specific and ultimate, such as rational. Besides, some are formal and essential — such as corporeal, which constitutes corporeal substance, and incorporeal, which constitutes spiritual substance; while others are material and individual — such as thisnesses, by which individuals are constituted in the being of an individual.

Some doubt whether the present difficulty is to be taken of only the ultimate differences, or also of the subaltern and intermediate ones. For Vallone and Rada (*recently cit.*) include both; while the rest — such as Vigerius and Lychetus (*just enumerated*) — call only the ultimate ones into question and treat of them.

And indeed rightly, for Scotus (*loc. alleg.*) and in (*Rep. ibid.*) and (*2 d. 3. q. 6.*) and elsewhere makes mention of and discusses only the ultimate differences; and when the mind of an Author is clear about something, it is not to be dragged and twisted to something else. And the adversaries attack and contend against Scotus about the ultimate ones and not about the intermediate differences. What is more, subaltern differences are essential parts of genera — as corporeal is an essential part of body, and animate is an essential part of animated body — of which being is predicated in quid; and also of the said essential parts, Scotus asserts (*1 d. 3. q. 3. § Quantum ad 2. art. I.*). Therefore this contest is moved solely about ultimate differences.

Note III: a difference is derived from the form or from the ultimate reality of the form. The former difference — derived from the form — is not simply simple, because since the form includes many realities and formalities, it shares in the common account of form, as well as in the common objective concept of substance; and consequently in the common concept of being. Wherefore, just as the form participates in its essence distinct from the rest, so it likewise has its own difference by which it differs from others. Likewise, according to the multiplicity of realities which it contains in itself, it likewise acquires a multiplicity of differences by which such realities differ from others — as by the account of form it differs from matter, by the account of substance it differs from accident, and so on. The latter difference, however, is simply simple — primarily diverse and irreducible into another — just as the concept of being is abstracted and prescinded from its inferiors. This doctrine — which is true and very subtle, built on a firm foundation — is attacked by Fonseca (*4 Met. c. 2. q. 3. sect. 2.*) and Suárez (*recently cit.*) and is refuted as false and empty. For they say that no difference drawn from the whole form is given, and no ultimate difference except the individual one; and therefore the division of a difference into ultimate and non-ultimate, just set out, is insufficient and void — and so being is predicated in quid of all, including differences and modes, in which it is essentially included.

On the contrary: each thing, just as it has its essential and quidditative being by which it shares with others, so also has being by which it differs from others. Hence the adage adduced by the Doctor (*1 d. 26. q. un.*): "the constitutive principle of a thing is the same as the distinctive principle." But the form has its being by which it is constituted in the being of form; therefore it also has a distinctive principle — a difference — by which it differs from others that are not form; and thus a difference drawn from the form is had. Furthermore: a whole is distinguished from its parts — from what was said elsewhere — and from everything that is not the whole; therefore also the whole form has a difference by which it differs from everything that is not form.

Furthermore, in the form there are many realities: the reality common to it in which it is univocated with other forms; and the reality of substance, and other

aforesaid common things — both predicamental and transcendental — that are comprehended in the form itself; and the reality proper to it, through which it differs from everything else that is not form. Therefore a difference drawn from the form is to be admitted.

Furthermore: there are supreme, subaltern, and lowest genera; and each genus has its own differences into which it is divided and through which its species are constituted; therefore an intermediate and ultimate difference derived from the ultimate reality, or from the total form, must be conceded — otherwise all things would be confused and gathered into one. Yet the predicaments are unmixed and distinct, and all things placed in them enjoy their proper and distinct positions and are located in them. Or else everything would be fabricated by the intellect, and nothing would be real besides singulars and individuals — which I have shown elsewhere to be false at length.

But when the aforesaid authors add that from Scotus's doctrine it follows that the ultimate differences are only individual ones — this is wrongly inferred, since individual differences are material, while Scotus is speaking of formal and essential differences, which are the specific differences of the lowest species, that among essential differences occupy the last place. Nor does it help them to add that in Scotus's view there would be only ultimate differences, because all differences are sought from the last degree and the final actuality. For, since some things are common and others singular (*1 Perih. § 5.*), it follows that some differences belong to common things — by which they differ from others — while others are adapted to particulars and singulars, contracting and actualizing indifferent and undetermined things.

Furthermore: from the antepredicamental canon, for different genera not subalternately ordered there are different differences, species, and individuals — as is seen in the entire catalogue of each predicament. But such differences of genera are not drawn from the ultimate singular and individual actuality, because this is incommunicable to many, while the former are communicable to many — namely to those that are of the same genus. Most especially because some contractible potential reality and some contracting reality belong to subaltern genera, while others belong to lowest genera and atomic species — as can be seen in the tree of Porphyry and in all the series we have ourselves constructed for each predicament. Therefore the aforesaid Scholastics wrongly infer from Scotus's doctrine that there are no differences except ultimate and individual ones.

Note IV: some things are of a different account and primarily diverse — which happens in two ways: subjectively and objectively. Those are said to be primarily diverse subjectively that agree in no potential and generic reality — such as God and creature, who have no genus in common, since God is most actual and outside every genus, as Augustine affirms (*1 Trin. cap. 15.*). Others are primarily diverse objectively — those that do not participate in the common concept of

being abstracted from its inferiors, such as the Doctor considers the ultimate differences and properties of being to be. But God and creature, although primarily diverse subjectively, are not so objectively — since they agree in the common concept of being univocal to them, from what was asserted in the preceding article. Likewise, matter and form — which are essential parts of the physical composite — differ totally from each other subjectively, not having any genus, since they are parts reducible to the genus of substance; but they do not do so totally objectively, since they are truly and properly beings, of which being is predicated simply and in quid, as the Doctor acknowledges (*1 dist. 3. q. 3.*). Matter and form can also be said to be primarily diverse with respect to the accounts of receptibility and receptivity — that is, insofar as matter precisely is subjective potency and form is pure formal act — as Trombeta indicates (*Tract. Formal. fol. 15. pag. 2.*), and before him Averroes (*1 Phys. com. 1.*). In this way they do not include being formally, but denominatively. For Aristotle (*5 Metaphys. c. 9. T. 16.*) and (*10 of the same work, T. 12.*) says: primarily diverse things include nothing the same, so that nothing of one is something of the other. Therefore matter and form so taken include nothing the same in their essences and quiddities quidditatively — which could be predicated of them quidditatively and essentially — though they can be predicated identically and denominatively.

First Assertion: being is not predicated in quid of the ultimate differences. So Scotus (*ibid.*) and (*2 d. 3. q. 6. § Ad quaestionem ergo. G.*) and in the Report.

It is proved first: between the same and the diverse there is no medium (*10 Met. T. 12.*); but the ultimate differences are not the same as being — because being is contractible, while the ultimate differences are contracting; and between what is contractible and what is contracted there is a distinction, as is clear in Physics regarding matter and form, and in Metaphysics regarding genus and difference, of which one is contractible and potential, the other contracting and actualizing. Furthermore, since being from what was said in the preceding article is univocal — if the ultimate differences are univocated in being, they differ from one another; and what differs, differs by differences; and so either there would be a process to infinity, or one must stop at the ultimate differences — which differ by themselves and do not include being quidditatively in themselves, such that being would be predicated of them in quid. Nor are they diverse things, since diverse things are described (*5 Met. c. 9.*) as having something the same, while things primarily diverse are said to include nothing the same; but the ultimate differences are primarily diverse — since nothing of one is something of the other; therefore they do not include being in themselves, which would be predicated quidditatively and essentially of them.

Soncinas and Suárez (*just cited*) encounter this objection and say that things primarily diverse can agree in some common concept — as is clear of the predicaments, which are supreme genera and primarily diverse, and yet all

agree in being, which is predicated univocally and quidditatively of them; and similarly there seems to be no contradiction in the ultimate differences being primarily diverse. On the contrary: the predicaments are primarily diverse subjectively — that is, they do not share in any common reality of a genus; but they are not primarily diverse objectively, since they agree in the common concept of being. But the ultimate differences are primarily diverse in both ways — that is, objectively and subjectively — having no reality of a genus and participating in no quiddity of being; and therefore there is no parity between the predicaments and the ultimate differences. Nor does it avail to add that the ultimate differences are not things that differ, but things by which other things differ. For even though the ultimate differences are what by which species differ from one another, it still remains to be inquired whether the differences themselves differ from each other by themselves or by other differences — just as whiteness and blackness are what by which a white and a black wall differ, and whiteness and blackness do not differ by themselves but by other differences. Wherefore, if the ultimate differences include something quidditatively, they are not simply simple but resolvable into another concept which they include, and it remains to be inquired by what they differ; and so on successively, proceeding to infinity. Therefore the argument set out is in no way broken by the adversaries' response, but still remains in its full force.

Second: just as in physical composition and resolution there are first and ultimate principles from which physical composites are composed and into which they are resolved — which are matter and form — so the same manner of reasoning holds in metaphysical composition and in its resolution into the first and ultimate principles of the same; but of the physical principles, one does not include something of the other — form does not include something of matter, and conversely — since they are of a different account and primarily diverse, from Scotus (*2 dist. 12. q. 1. § Sequitur secundo. E.*). Therefore neither do the ultimate differences contain within themselves being as something common to them and an essential predicate.

The adversaries encounter this — notably Suárez (*cit.*) — and say that the comparison and likeness between physical and metaphysical principles does not hold, since above composites and metaphysical principles there are being and the other transcendentals — which are referred to and predicated quidditatively of them. But in Physics, above its principles there is nothing found that is included in them and predicable in quid of them; and therefore there is no parity.

On the contrary: the parity and proportion aforesaid consists in this — that just as the ultimate reality of natural principles is simply simple and irreducible into another reality, so the ultimate reality of transnatural principles is simply simple and irreducible into another; but of matter and form — which are the first principles of natural things — there exist the aforesaid ultimate realities —

namely, receptibility and receptivity — which do not contain in themselves other realities distinct from themselves; therefore the same must be said of the ultimate differences pertaining to Metaphysics. And so the parity is found.

Third: in ascending there is a last contractible and determinable quidditative thing, which is being — simply simple; therefore there must be conceded a last contracting and determining quidditative thing in descending, which is the ultimate specific difference — simply simple. The consequence is derived: because contractible and contracting, determinable and determining, mutually regard each other — like active and passive power, act and potency; and no one denies that being is simply simple; therefore nor will anyone deny the same of the ultimate differences. Furthermore: from what was proved in Logic (*l. 2. q. 5. art. 3.*), inferior differences do not formally include superior differences; therefore neither do the ultimate differences formally contain the first transcendental, which is being.

Second Assertion: being is not included quidditatively in its own properties, but only identically and denominatively. The Doctor defends this (*ibid. sub G.*).

The first part is urged first: what is placed in the definition of a property through addition does not enter the essence of it — since a definition by addition is not quidditative but descriptive, from the notes in (*Epitome Dialecticae l. 2. q. 7. art. 2.*); but being is placed in the definition of its property, since being is its subject from which it flows (*4 Met. c. 3. T. 5.*); therefore being does not essentially and quidditatively include its own property.

This is corroborated: a per se proposition of the second mode is not converted into a per se proposition, but into a per accidens one — as "man is risible" and "the risible is man" — whose reason is that in the first proposition the subject is the cause of the predicate, whereas in the second proposition it is not, as I showed at length in Logic (*l. 5. q. 3. art. 7.*). Hence I showed there that in the first mode of saying per se, the predicate is of the essence of the subject — as "man is rational"; while in the second mode of saying per se, the predicate is outside the essence of the subject — as "man is risible." But this proposition "being is one" is of the second mode of saying per se; therefore being in its own essence does not include its own property, and consequently it is not predicated essentially of it.

Second: being is sufficiently and adequately divided into uncreated and created being; but the property of being is not uncreated being — since this is God alone — nor created, since created being is finite, while the property of being abstracts from finite and infinite; therefore being does not essentially include its own property. Nor does it avail to say that just as the property of being abstracts from finite and infinite, so it also abstracts from created and uncreated. For even if this is admitted, nevertheless an essential predicate that is superior is not a property of its subject, since a property is reciprocated with its very subject; and being itself is what the property follows, as originated from originating and

produced from producing. But what is originated and produced is not included in the quiddity and essence of what originates and produces — just as the effect does not enter the essence of its cause; but the property of being emanates from being; therefore it is not of its quiddity and essence.

Third: is the property of being a being, or nothing? Not the latter — because nothing, just as it has no being, so has no property. Nor the former — because being would proceed from being, and it would be its own property, which is false. Nor something else — for it would then be asked whether that something else is being, and so on successively, proceeding to infinity, which Aristotle (2 *Met. c. 2.*) warns we must avoid. It is therefore concluded that being is not predicated quidditatively of its own properties.

Convinced by these arguments, Fonseca (*cit. at the end of sect. 3.*) does not dare to contradict this part; but he refutes the preceding assertion as consequent upon the univocation of being — which he calls new and dangerous, because it conflicts with the older tradition handing down the analogy of being. But new doctrine resting on firm reason and consonant with truth, and not opposed to the Orthodox faith, is not to be despised. For the law and doctrine of Christ the Lord was new in its beginning, as is clear from (*Jn. 13*): *Mandatum novum do vobis* — "A new commandment I give you"; and (*Col. 3*): *Expoliantes vosvetem hominem cum actibus suis, et induentes novum* — "stripping off the old man with his deeds and putting on the new"; and (*1 Cor. 5*): *Expurgate vetus fermentum, ut sitis nova conspersio* — "Purge out the old leaven, that you may be a new batch." Hence Tertullian rightly (*l. contra Gentes*) rebuked those who despised the Orthodox religion as new. But vain novelty is to be rejected, and anything opposed to the rites of the holy Church, as St. Bernard intimated (*Epist. 174. ad Canonicos Lugdunenses*). Add to this that Aristotle (*1 Phys. 1. and 2. Met.*) and elsewhere refutes the views of the ancients and proves and confirms his own by arguments — in whose footsteps Scotus similarly follows, refuting the positions of prior Scholastics with the most firm foundations and the most acute arguments — yet modestly, as is his custom, in these words (*1 dist. 3. q. 2. ante B.*): "Secondly, not asserting it, because it does not agree with the common opinion: it can be said that God and creature agree in the concept of being — not analogous, but univocal." And it is not incongruously used by recent authors, that saying of Anastasius of Sinai (*1.2. epist. 35.*): "Truth is open to all; it has not yet been seized; much of it is left for those who come after."

The second part is at hand for us: for a property is the same really as the subject of which it is a property — just as a power is also really identified with the thing of which it is a power, as the Doctor writes (*2 dist. 16. q. un.*); and as I discussed in (*l. 2. de Anima q. 2. art. 2.*).

You will object first, against First Assertion: that to which the definition of being belongs is formally being; but the definition of being belongs to the ultimate difference; therefore the ultimate difference is formally being, and being is

predicated quidditatively of it. The major is clear by the argument from definition to defined. The minor is also evident — because the definition or account of being is the account of being, and the ultimate difference has being; therefore it also has the account or quiddity of being. I concede the major and deny the minor. To its proof I distinguish: if the account of being is taken for the quiddity of being prescinded from inferiors, I deny that it belongs to the ultimate difference. But if it is taken for everything that is outside of nothing — apart from the operation of the intellect — I concede, as I noted above in Note I.

You will press: to what the properties of being are adapted is formally being; but the properties of being belong to the ultimate differences — for the ultimate difference is one, good, and the like. I concede the major. I distinguish the minor: formally, I deny; identically and denominatively, I concede, as I made plain above.

You will urge: what exists is being — since existence accompanies being insofar as it is outside its causes; the ultimate difference has existence, if it exists on the part of the thing; therefore it is truly being. I concede the major. I distinguish the minor: the ultimate difference exists by the existence of common being simply, I deny; by its own proper existence, I concede. For each thing, according to the being which it has, participates in existence.

You will object second: the ultimate difference of substance — such as rational — is substance; therefore the ultimate difference is formally being, and being is predicated quidditatively of it. It is satisfactorily answered by saying: if the difference is drawn from the form of rationality, the antecedent is conceded; but if it is drawn from its ultimate reality, the antecedent is denied — as remains amply explained and settled above.

You will press: from (*1 Phys. c. 6. T. 52.*) — from what is not substance, substance is not made; but from animality and rationality man is made, who is a substance; therefore rationality — which is his essential and differential part — is substance; but substance is being quidditatively; therefore the ultimate difference of substance is also essentially being. I reply that this objection is dissolved by the distinction just premised. For if the difference is sought from the form which is rationality, it is being and substance incompletely quidditatively; but not so if it is drawn from its ultimate reality. For then it is only identically and denominatively substance and being.

You will urge: whatever is, is either substance or accident; but the ultimate reality of a substantial form is not an accident; therefore it is substance. I reply that it is substance really and not formally — just as a property of being is being really but not formally; and the intellect in the school of Scotus is the soul really but not formally; and in the divine Trinity, paternity is God really but not formally.

You will object third: from (*3 Met. T. 10.*) if being or one were a genus, there would be no difference; but being is not a genus; therefore it essentially includes differences — both ultimate and non-ultimate. I reply that, apart from the fact that Aristotle speaks there not assertively but problematically — as the Doctor rightly notes in his exposition of that text — if being were a genus, it would not have a difference of which it would be predicated in quid, but only in quale. For a difference is outside the formal account of a genus.

You will press: the ultimate difference is either something or nothing; but it is not nothing — since it is an essential part of a species; therefore it is something. But something is being; therefore the ultimate difference is being. I reply that it is being identically, not formally; it is something of the form, or the ultimate reality of it.

You will urge: that ultimate reality of the form is either being or nothing — since no medium exists between being and nothing; it is not nothing; therefore it is being. I reply that the same response recurs — namely, that it is being really, but not formally.

Question II

On the Properties of Being

From the quiddity and essence of things arise properties, which are called their properties, affections, and attributes; likewise from being taken simply there emanate properties, of which some are called conjoined — such as one, true, and good — while others are disjunct — such as one or many, act or potency, necessary or contingent. Wherefore, the foregoing debate about the common concept of being and its quiddity having been completed, the order of nature demands that we now treat principally of the conjoined properties of that same being.

Article I: Whether the Properties of Being Are Real

The things I noted in (*Epitome Dialecticae l. 1. q. 3. art. 6.*) about what a proper attribute is and its modes are to be reviewed; these having been reviewed and noted — since they contribute very greatly to the understanding and decision of this doubt.

The assertion is: properties are real and positive. So Scotus (*4 Met. T. 1. and 5. in comm.*) and (*q. 3. prol. § Ad 1. argumentum 2. q. Sub T.*) and (*d. 3. q. 3. § Ad quaestionem igitur sub G.*); Antonius Andreas (*1 Met. q. 1. concl. 4.*); Bonetus (*1 Met. cap. 1.*) and others of the same rank — against the Thomists, whom Suárez (*disp. 3. Met. sect. 1.*) and Fonseca (*4 Met. Sect. 3. q. 5 cap. 2.*) cite and follow, holding that the properties of being are not real and positive, but negations, or relations of reason, or extrinsic denominations.

It is proved first from Aristotle (*4 Met. at the beginning*), affirming that a certain science — namely Metaphysics — contemplates being insofar as it is being, and what belongs per se to it, which are its properties, as Scotus interprets there — which Suárez and the others just cited do not deny. But what belongs per se to real being is real, since a being of reason does not belong per se to real being nor follows from it by itself; yet the properties of being, according to Aristotle, belong per se to being itself, accompany it, and are reciprocated with it; therefore they are true and real properties. Furthermore, the same Philosopher (*ibid. T. 5. c. 2.*) adds that just as number, solid, and the like enjoy proper properties considered and demonstrated in the special sciences, so being participates in true and proper properties which are demonstrated of it in Metaphysics.

You will say with Fonseca (*cit.*): it is not necessary that these properties formally exhibit something positive superadded to being; it suffices that they formally import some negation or relation of reason — just as (*2 De Anima c. 7.*) visibility is a property of color, even though it adds nothing real and positive to color itself. On the contrary: negation or relation of reason does not arise from the essence and nature of a thing — since a being of reason depends on the intellect, and negation is absolutely nothing; but the properties of being flow from being as rays from the sun and streams from the source; they are subjugated to and reciprocated with being; but a being of reason and a negation do not inhere in being nor are converted with being itself. It is absurd that real being should be converted with being of reason — since the former can exist without the latter — and that real being should be reciprocated with nothing, which is what negation is. Nor does the testimony adduced about the visibility of color favor this view but militates against it — since visibility is the capacity and aptitude by which color is apt by nature to be seen, just as the intelligibility of an object is the capacity by which the object can be understood; and such properties are real on the part of the thing — without anyone thinking of it — and distinct from the natures of which they are properties, as I shall show in the next article. The same must be asserted about the properties of being.

Second: a real science is occupied with a real object and with real knowable properties demonstrable of it (*1 Post. T. 5.*); but Metaphysics is a real science, whose object is real being (*4 Met. 1. 5.*); therefore its properties demonstrable of it are real — since they proceed from real being itself as effects from a cause.

You will say: it is sufficient for a real science that such things be after the manner of real properties and properties — even though they may not truly be so and may include nothing real and positive beyond the nature of being which they express and declare. On the contrary: the foreknowledge of a subject is different from the foreknowledge of a property (*1 Post. 1.*); and to generate science through premises, a property must be demonstrated of a subject — as the Philosopher writes there and Scotus explains (*1 Met. q. 1. § Ad 3. rationem.*).

Therefore a property is something real distinct from being — otherwise nothing would be concluded in the conclusion, and its subject and predicate would be formally the same; therefore the properties of being are true, real, and positive properties.

Furthermore: if real properties belonging to and true of being are not given — as Suárez deduces — then other things would also lack proper and true properties, since the same reason applies in all cases; and thus properties and affections of things would be abolished, and to them would be assigned only negations and relations of reason — which, and similar conclusions, are known to all to be false and absurd.

Third: the disjunct properties are real and positive — such as same or diverse, contingent or necessary; therefore the conjoined properties of being are likewise real and positive. The antecedent is well known. The consequence holds — because the latter are more immediate and proximate to being; therefore if the former are real and positive, and not negations or relations of reason, the same must be asserted about the latter, with stronger reason.

You will object first: if the properties of being are real, they are beings — since what is real on the part of the thing is being; but they cannot be beings, since properties are outside the essence of the subject, as Aristotle hints (*1 Post. c. 18. T. 35.*) and (*7 Met. c. 5. T. 18.*); therefore the aforesaid properties are not real, but of reason. It is satisfactorily answered by saying that such properties are beings really but not formally — as I made plain at length in the preceding question, in the last article.

You will object second: what is quasi-such is not such — since the particle "quasi" is distracting; but according to Avicenna (*1 of his Met.*) the properties of being are quasi-such; therefore they are not such, and therefore not real. I reply that the word "quasi" is sometimes distracting — as (*Eccl. 24.*): *Ego quasi vitis fructificavi* — "I like a vine put forth fruit." Sometimes, however, it is confirmative — as (*Jn. 1.*): *Vidimus gloriam eius, gloriam quasi unigeniti a Patre* — "We saw his glory, the glory as it were of the Only-Begotten from the Father"; where "quasi" is equivalent to "truly the Only-Begotten from the Father." That profane authors have also used it in this way, Calepinus (*verb. quasi*) reports. Wherefore, when Avicenna (*cit.*) says that being has quasi-properties, it is the same as if he said that being has true properties, or truly has properties.

Article II. How the Properties of Being Are Distinguished

There are as many divergent opinions on the present article as were reported in the preceding one. Those who hold that the properties of being are not real and positive consequently place between being and its properties a distinction of reason as reasoned (*distinctio rationis ratiocinatae*), in much the same way that these authors distinguish the divine attributes both from one another and from the divine essence. This is the express position of Suarez (*cit. Hurt. disp. 3. Met.*

sect. 2. & Art. disp. 1. sect. 2.). Those, on the other hand, who affirm that the properties of being are real and positive consistently hold that between being and the said properties there obtains a formal distinction.

What I set out and noted in Logic, Book II, Question I, final article, concerning the real distinction, the formal distinction, the distinction of reasoning reason, and the distinction of reasoned reason must be presupposed and recalled from memory. With these preliminaries in place:

The properties of being differ formally from being itself and from one another. This is the position of the Doctor (*2. d. 16. q. vn. & 4. Met. q. 2.*), where also Anthony Andrew and other Scotists hold it against the Thomists and others named above. It is proved first: in the definition of a property its subject is placed as something added, on the authority of Aristotle (*1. post. T. 35. & 7. Met. T. 18.*). Therefore a property is outside the essence of the subject from which it emanates, and consequently differs from it formally. But if in general a property differs formally from its subject, it is plainly established that the properties of being differ formally both from being itself and from one another.

You will say: this holds for a positive addition, but not for a negative addition, such as is the case when a property is added to being. On the contrary: what is added to real being and follows it per se is not a negation, because negation, properly speaking, is not something real, and so is not properly said to be added to real being — non-sight is not added to a stone, nor nothing to being. But a property is added to being and properly follows it, as something that emanates and is caused by being itself, as the Doctor says (*2. d. 25. q. vn. § Contra, sub C. & 1. d. 8. q. 4. § Ista M.*). Moreover, a property is predicated of its subject in the second mode of saying per se — as "man is risible" — whereas a negation is not predicated in the second mode of saying per se of that of which it is a negation. And the property of being is so predicated of being — for example, "being is one," "being is good" — but it is not said that "being is a negation." Therefore what a property adds above being is something positive and real that formally differs from it.

Second: things that receive distinct descriptions and are inseparable from one another are formally distinguished, as I said in the Logic passage cited. But being and its properties are described in different ways: being is described as the objective concept that is precise from its inferiors and predicable of them; one as what is undivided in itself and divided from everything else; true as what is conformed to its principles; and so on for the rest. Therefore being and its properties are formally distinguished from one another.

You will say: there are not distinct formalities, but only distinct conceptions. For if, as Suarez argues, being is conceived confusedly as a subject having common entity and essence, it is called being; but if it is conceived as having a mode of perfection and property, it is called one, true, and good — and thus between

being and its properties there intervenes only a distinction of reason. On the contrary: between positive terms that exist on the part of the thing, independently of any operation of the intellect, and that are inseparable, there falls a positive distinction on the part of the thing, prior to any act of thinking — which distinction the Scotists call a formal distinction. But being and its properties are positive and real terms, not fabricated or devised by the intellect, as the same Suarez candidly admits (*ibid.* n. 10.). Therefore between them there is a formal distinction.

Again: given positive real terms, a real relation arises by the common sense and agreement of all. But being and its attributes are real terms, as the same author likewise concedes (*ibid.* n. 6.). Therefore the distinction that obtains between them is a positive real one — not the kind that exists between thing and thing, but the kind found between reality and reality, which is called the distinction from the nature of the thing, or the formal distinction. Furthermore, just as certain things in the nature of things are distinguished in a certain way, because the distinction is demanded by objects that are distinct from one another, and the intellect conceives them as they are on the part of the thing — if it were to conceive them otherwise, it would err — so too being and its attributes are real, apart from any operation of the intellect, as the same Suarez equally admits in that place. Therefore they are not distinguished by reason, which is effected by the intellect, but by formal reason, which precedes every operation of the intellect.

Third: the natural inclinations, capacities, and aptitudes of things are not fabricated by the intellect, nor do they coincide entirely with things, since they proceed from and are caused by those things — and the same thing cannot be both producer and produced, both cause and effect. But the properties of being seem to be nothing other than its capacities and aptitudes, as the aforesaid Suarez concedes (n. 5.). Therefore they differ from being not by reason but formally. Moreover, the powers and faculties of things differ formally from one another and from the things themselves, as the Doctor holds (2. d. 16. q. vn.), and as I proved at length (l. 2. *de anima* q. 2. art. 2.). Therefore the same must be asserted of being and its properties.

Against this: one should philosophize about the distinction between being and its properties in much the same way as about the distinction of the divine attributes — but the divine attributes are distinguished by reason, both from one another and from the divine essence. Therefore being and its attributes likewise differ by reason. I grant the major and deny the minor, as I showed at length (*Tract. 2. Summa Theologica, disp. 2. quest. 2.*).

You will press: Scotus, writing in 10. *Met. concl.* 13, says that one and being are the same, though they differ by reason — but one is a property of being, and therefore between being and its properties there falls only a distinction of reason. I say that Scotus must be understood not of reasoning reason or

reasoned reason, but of objective and formal reason that precedes every operation of the intellect — in which sense the Philosopher himself uses "reason" (*cap. 1. lib. praedicam.*) when defining univocals as those whose name is common and whose account of the substance according to that name is the same.

Against this a second objection: a property and its subject belong to the same genus and predicament, as is evident in the property referred to under the third species of quality. Likewise, then, the properties of being are entirely identical with being and thus are not formally distinguished from it. I respond that the term "property" is equivocal. It is taken, first, for a quality of brief duration affecting the senses, as in the passage just cited; and second, for an affection and property of a thing, as here. If the latter is predicamental, it is located in the predicament in which its subject resides. But if it is transcendental — as is the property of being — it resides in no predicament.

Against this a third objection: between a cause and its effect there is a real distinction — but a property is caused by the subject of which it is a property, and therefore between being and its properties there falls a real distinction. I distinguish the major: if the cause acts through motion and change, I grant it; if it acts through simple emanation, or if the effect proceeds through natural resultance — as in the present case — I deny it.

You will press: Scotus, in *1. Met. q. 1.*, as Mauritius notes there, seems to want the properties of being to be distinguished really — and therefore not formally. Mauritius addresses this there, saying that Scotus in that passage is speaking in a loose sense and in the manner of others, or else is not treating of reciprocal properties in the fourth mode. Or one may say that he uses "real distinction" not in the strict sense — which is between thing and thing — but in the sense of what is found between reality and reality, as I have indicated above, and which Scotus himself (*1. Rep. d. 48. q. 2.*) calls a real distinction in a qualified sense.

Article III. How Many Properties of Being There Are

The cleverness of the dialecticians is hinted at by that one word *REUBAU*, which is transmitted as containing the six transcendentals, each letter signifying one transcendental, as I noted in the *Epitome of Dialectics*, *l. 1. quest. 1. art. 9.* — namely, being, one, true, good, something, thing. Since being is the first transcendental, the remaining five, which proceed from being itself, are counted as its properties. Bonetus, however, in *5. Met. cap. 1.*, while not departing from the number five for the properties of being, omits the last two just mentioned and adds two others in the abstract — namely, primateness and contractibility. The rest, whom Fonseca (*4. Met. q. 5. sect. 2.*) and Suarez (*disp. 3. Met. sect. 2.*) follow, posit only three properties of being: namely, one, true, and good.

Note first that the name "thing" is most universal and common, applying both to uncreated and to created realities. For this reason Scotus, at the beginning of

Quodlibetal 1., citing that passage from Ecclesiastes I, "All things are difficult," says it must be interpreted of all things — created or uncreated, necessary or contingent. He adds that in divine matters it is taken both essentially and notionally, citing the testimony of Augustine (1. *de Doctrina Christiana*, cap. 1.): "The things we are to enjoy are the Father, the Son, and the Holy Spirit" — where "thing" is taken notionally. And: "That same Trinity, one supreme thing common to all who enjoy it" — where "thing" is used essentially. Moreover, "thing" and "being" appear to be confused and to be synonyms — like "sword" and "blade" and the like — as is evident in Scotus (*Quol.* 3.), where Sirect, Trombetta, and many others agree, and Suarez (*ibid.*) assents.

Note second, and recall from what was said in Book I of this work, *Question II, Article I*: according to Scotus in the passage just recalled (§ *De primo. A.*), the name "thing" is equivocal, and therefore is to be distinguished and understood as the approved authors have used it, who seem to hand down three principal acceptations of it — the most common, the common, and the most narrow. The first stands for everything that has being, comprehending all being. Since being is twofold — in the soul and outside the soul — thing accordingly is posited as twofold: in the soul, which contains beings of reason and second intentions, which are usually called logical things; and outside the soul, which extends to all that has being on the part of the thing, whether prescinding from existence or enjoying existence. Thus Avicenna (2. *Met. c.* 5.) speaks: "Being and thing are impressed as first impressions." The second acceptation is for absolute being, in which sense the first three genera — substance, quantity, and quality — are called beings and things, while the remaining genera are called modes of a thing and its circumstances, because they express the relation of one thing to another. Boethius (1. *de Trin. cap.* 10.) refers to this acceptation. The third acceptation is for a being and subsisting thing; in this sense substance is a being, and accident is the being of a being. Aristotle took it this way (7. *Met.* 2. 14. and following).

Note third that the name "reality" is an abstract whose concrete form is "real," derived from "thing." Now "thing" receives a double nomenclature, as Henry holds (in his *Summa*, art. 2. *quest.* 23.), with which Scotus is not displeased (1. *d.* 36. q. vn. & 2. *Report. d.* 1. *quaest.* 2.), along with Sirect and others in the *Tractatus Formalitatum*. One derivation is from the verb *reor*, meaning to think, imagine, or feign — in which sense "thing" is taken in the most common manner and applies to beings of reason, real beings, and fictitious beings, as I showed in the preceding note. The other derivation is from the participle *ratus*, *rata*, *ratum*, meaning firm, stable, true, not feigned. In this sense, "a settled thing" is called a real, firm, stable, true, and non-feigned thing — in which sense both quiddity and essence, whether in objective being or in the being of existence and subsistence, are called things. From this arises the real distinction, which is between thing and thing, and the formal distinction, which is between reality and reality, in the manner explained above.

Note fourth that "something" can be viewed in two ways: either absolutely without any addition, in which case it does not appear to be distinguished from being but is opposed to nothing — hence it is commonly said that a thing either is something or is nothing, so that "something" and "nothing" are contradictorily opposed, and "nothing" and "non-being" are synonyms, as are "being" and "something." Taken this way, "something" is equivalent to having some quiddity. Or, if it is taken with an addition — that is, if something else is joined to it — it clearly differs from being: for example, "something substantial" or "something accidental," and in this case "something" means nothing other than "another what," whose abstract is "somethingness" (*aliquitas*) — a name that can be applied to every property not only of being but of anything else whatever. For "unity" is a somethingness of being, "truth" is a somethingness of being, and "goodness" is a somethingness of being; likewise, "risibility" is a somethingness of man, "ability to roar" is a somethingness of a lion, and so on for the other properties of things which, since they flow from their essential principles, are outside those essences — and therefore are rightly called, not the essences themselves, but the somethingnesses of those essences, by Scotus and his disciples.

The properties of being are three: one, true, and good — and if any others are listed, they do not appear to be separable from these. This assertion is two-part, from which Scotus and his followers do not depart (*at the places cited above*), nor do the Thomists cited by the Recents disagree. The first part is established first: whatever emanates from being is either undivided in itself and divided from everything else, or conformed to its principles, or whole and perfect. If the first, it is one; if the second, it is true; if the third, it is good. Therefore there are three properties of being, and no more and no fewer.

You will say: beyond those three properties of being just recounted, it is possible to add "same," "diverse," and the like — so those three are insufficient. I say that "same" and "diverse" are disjunctive properties of being — but we are speaking of conjunctive and convertible properties, which we hold to be contained in the number three alone. Second: every attribute of being either expresses the relation and respect of indivisibility in itself — and is one — or the relation of conformity with its principles — and is true — or the relation of integrity — and is good. Nothing else remains for a property of being to regard; therefore only those three properties of being are to be admitted, which Scotus explicitly sets out (*4. Met. in expositione tex. 3. cap. 2. & 2. d. 16. q. 1. K.*).

You will say: there still remain other transcendental relations and habits — such as primateness, contractibility, intelligibility, and the like — so if the number of properties of being is reckoned by distinct habits, there are more than the three enumerated. I say that those three are properties in the fourth mode; the others, however, also belong to being in other respects — for primateness is adapted to the ten highest genera, contractibility also to genera both supreme and subalternate and proximate as well as to species that are contracted through

individual differences, and intelligibility applies not only to being in general but to any particular being, according to that saying (2. *Met. cap. 1. T. 4.*): "As a thing stands with respect to being, so it stands with respect to intelligibility."

The second part is conceded from what was said above in the foundational section: for "thing" coincides with being, as I showed in the second note, and "something" either is not separated from being, or is a property in no way distant from the three already given, as I showed in the fourth note. Moreover, if any other properties are devised, they can comfortably and aptly be reduced to the three aforesaid, as is plainly evident from what has gone before. Therefore other properties are not to be introduced into the Peripatetic school and posited there without any foundation or reason.

Against this first objection: being extends more broadly than thing — therefore being and thing do not coincide. The antecedent is proved: action and passion are called two beings, but not two things. Likewise in divine matters there are many beings, because there are many Persons, yet there is one thing common to the three Persons. Again, there are many beings because there are many attributes, yet they are not many things — and therefore being and thing are not synonyms but are two transcendentals, and thing should be posited as a property of being. I respond by denying the antecedent. Regarding its proof, I say that action and passion are indeed two realities, but not two things, nor two beings, unless they are called two relative beings. Likewise in divine matters there is one absolute thing, which is the deity common to the three — though there are not three absolute things, but three things and three relative beings. Likewise the attributes are many attributal beings, but not simply so, since they are many not really but only formally distinct, as I said at greater length elsewhere.

Against this second objection: "something," as a particular sign placed with the subject of a proposition, makes the proposition particular — as "some animal is rational" — and therefore "something" is not the same as being but is something distinct from it, which is its property separate from the rest. It is answered by saying that "something" taken substantively is not separated from being; otherwise, when taken adjectivally, as happens in a particular proposition whose subject is modified by that particular sign, as is explained in the proposition just cited — "some animal is rational."

Article IV. What One Adds Above Being

A serious and difficult controversy persists among the older and more recent metaphysicians on the present article, as Mauritius notes (*in annot. 2. q. Scoti, 4. Met.*). There are three principal divergent opinions. The first is that of Averroes (4. *Met. com. 3.*), Thomas (1. *p. quaest. 11. art. 1.*), Mayron (1. *d. 24. q. 2.*), Aureolus (1. *d. 3. art. 4. § Restat*), Fonseca (4. *Met. cap. 2. q. 5. sect. 5.*), Suarez (*disp. 4. Met. sect. 1.*), and many others, who hold that one adds to being nothing but the negation or

privation of division in itself and of division from everything else. The second is that of Alexander of Hales (*1. p. q. 13. m. 1.*), Bonaventure (*1. d. 24. quest. 1. art. 1.*), Vasquez (*Tom. 2. disp. 128. cap. 2.*), and others, who hold that one formally imports something positive, differing from being by reason alone. The third is handed down by the Doctor (*4. Met. q. 2. & 2. d. 3. q. 2. § Concedo igitur. D. & d. 16. q. vn. § Ideò dico. sub K. & ibid. in Report.*), Anthony Andrew (*4. Met. quaest. 3.*), Tataretus (*ibid. q. vn. art. 2.*), Bonetus (*5. Met. cap. 1.*), Viguer (*1. d. 24. q. vn.*), Poncius (*disp. 70. q. 2.*), and not a few others of the same school, who teach that one is a real positive property of being, formally distinct from being itself — and Avicenna (*7. Sua Met. cap. 1.*) seems to have preceded them, as cited by the Doctor in the places cited above.

Note first that "one" is taken in two ways: as a principle of number, which is located in the predicament of quantity; and as a property of being, which resides in no predicament, since it is transcendental. The number of which "one" as a principle is the source is caused by the division of the continuum and is called quantitative number and number simply, as Lychetus notes in particular (*in expositione 1. d. 24. q. vn.*). The number of which the transcendental "one" is the principle is effected by the distinction of quiddities and essences and is called quidditative number and number in a qualified sense — in which way we say "two souls," "three angels," and the like, about which number I treated at length (*tract. de Deo Trino disp. 4. quaest. 7.*). Further, "one" is taken simply, insofar as it is a conjunctive and reciprocal property of being simply; or in a qualified sense, insofar as it is opposed to multitude and is a disjunctive property of being — in which case it is said that "being is one or many," and one so taken does not convert with being except disjunctively.

Note second that "one," according to Bonetus (*cited by Vallone in his lecture, fol. 109.*), is fivefold: transcendental one, one in genus, in species, in number, and by proportion. The transcendental one, which is the first property of being, is described by Aristotle (*4. Met. T. 3. & 10. eiusdem T. 5. & 5. cap. 6.*) and by all subsequent philosophers as that which is undivided in itself and divided from everything else. This description of one, though commonly received, is explained differently by different authors; setting aside their interpretations and disputes, it is my pleasure to explain it in the following way. In that description two negations are signified: one is the negation of division from itself, the other is the negation of identity with anything else — which denotes that one in the concrete is not distinct from itself but is distinct from everything else. Its abstract is unity, by which one is not distinguished from itself but by which it is distinguished from everything else that is not itself that same one. And through this kind of negation is hinted a real positive property of being proceeding from being itself, by which that same being is rendered undistinct in itself and distinct from everything else — just as risibility is a real positive property of man proceeding from humanity, by which man is risible. Therefore, just as given risibility man is risible, so given unity — which is non-distinction from itself

and distinction from everything else — being is one with transcendental unity. This refutes Poncius (*pract. concl. 1.*) explaining "one" as that which does not include several things separate from one another, since some things are not separate from one another — as a wall and its whiteness — and yet they are not one with entitative and transcendental unity; though united, they are not one according to that unity. Likewise, the parts of a continuum are not separate from one another, and yet they are not one with that unity, but with the unity of integrity and continuity. Again, matter and form in a composite are not segregated from one another — but they do not participate in that unity as united in the composite; rather, each, since it is a being, enjoys its own unity. For "one" is said in as many ways as "being," as Aristotle teaches (*at the places cited above*), and as I noted in Logic, *l. 2. q. 1. art. 6.* For this reason I shall not expound the other unities just recounted here, since they have already been expounded and illustrated there at length.

If you should object against this explanation of the description of transcendental one and say: man is one, and yet he is not undivided in himself, since he is divided into his parts — namely genus and difference, or into animal and rational — from which he is constituted; therefore it is not correctly explained that one is undivided in itself and divided from everything else. I say: first, man is one from the unity of humanity, which is specific unity — and is one with entitative and transcendental unity insofar as he is a being, because the greater unity, such as specific unity, entails the lesser, such as transcendental unity; even though being simply is divided into substance and accident, into uncreated and created. The reason is that unity is not drawn from the dividing members but from the whole that is divided — namely from being, from man, and so on — otherwise there would be no unity but only multitude, since everything divided is split into dividing members, as I made plain (*Epit. Dialect. l. 2. q. 7. art. 1.*).

The first assertion is that the transcendental one is not formally negative or privative. This is defended by the Doctor (*cit. in Met. & 2. d. 3. quaest. 2. § Concedo. D.*). It is proved first: from a real positive subject there emanates only a real and positive property, as is evident by induction — from man flows risibility, from a lion the ability to roar, and so on for the rest, which are their real and positive properties. But being simply is real and positive (*4. Met. T. 1. & 5.*), whose first property is one, which reciprocates with it. Therefore one is not formally negative or privative.

You will say: one indeed formally imports a negation, but fundamentally is being itself as real and positive, since they are entirely the same and of the same nature, as Aristotle openly writes (*ibid. T. 3.*). And this can be illustrated by incorruptibility, immateriality, and immortality, which formally present negations but fundamentally are real and positive entities and properties. On the contrary: although in the description of one a negative name is used —

namely, "undivided" — it formally signifies a reality and a real and positive formality. For, as Aristotle notes in the place just cited, being and one stand to each other as cause and effect — but an effect is a real positive just as a cause is — therefore one formally designates a real positive property and attribute of being. Moreover, the examples adduced concerning incorruptibility, immateriality, and immortality tell against the objection. For they formally present real and positive entities, as is clear in the case of substance, which is divided into corporeal and incorporeal, corporeal into animate and inanimate, animal into rational and irrational. The irrational, the incorporeal, and the inanimate substance are real positives formally, though they are designated by negative names; therefore the same must be asserted of one, which is defined through "undivided in itself," which is a negative term.

Second: what measures something positive is formally positive, because no negation or privation is the measure of anything positive. But one is formally the measure of number, which is a positive being, since it is the subject of arithmetic — whence Aristotle writes (*10. Met. cap. 2.*): "Number is multitude measured by one." Therefore one is formally positive, from which follows the negation of undividedness in itself.

Third: a negation or privation does not formally denote a perfection simply, because privation has the character of evil (*1. phys. 82*): "privation engineers harm." But one imports perfection simply, since in anything it is better to be it than not to be it, as is clear from the description of simple perfection given by Anselm (*in Monol. cap. 3.*). For this reason, supreme unity belongs to God, the first being, who is subject to no imperfection. Therefore one formally designates something positive.

Fourth: in negatives and privatives there is no reduction to a first such thing — to a supreme evil — because there is no supreme evil. But in positives, such as goods, there is reduction to the supreme good; in truths, to the supreme true; and in ones, to the supreme one. Therefore one is formally positive.

Furthermore, privation or negation does not admit of more and less; but one does admit of more and less — for what is simple is more one than what is composite. Moreover, a positive is not composed of negations and privations, as is evident; yet number, which is something positive, is composed of units. Hence the Philosopher adds (*loc. memorato, T. 5.*): "Number is a multitude of units." Therefore one is formally positive.

You will say: these and similar arguments only prove that one is positive fundamentally — that is, by reason of being, in which it is grounded and in which it is based — but not formally, for formally one means nothing other than the twofold negation set out and explained above. On the contrary: one is a proper property of being, either by reason of the foundation or by reason of what is added above being. Not the first: for the foundation of the property — or of one — is being; and if one were a property of being through the foundation,

it would be a property of itself, which involves a contradiction. Nor the second: for that which is added above being would be either positive — and the point is established — or negative — and this is impossible, because since a property is really identified with the subject of which it is a property, being would be composed of positive and negative; and since a negation is formally nothing, and nothing is opposed to being, it would consequently follow that being and nothing are one, and that nothing is a property of being — which is false and absurd. This objection appears so compelling that the Adversaries greatly torment themselves and diverge into various positions, adducing various responses, as can be seen in Fonseca and Suarez (*cit. sect. 2.*); but since these responses do not satisfy the objection or remove the difficulty, it is tiresome to adduce and refute them.

The second assertion is that one does not differ from being by reason of the intellect alone, but formally, from the nature of the thing. This is the position of the Doctor (*cit.*). The first part is established: what arises from and follows something else with no one thinking of it does not differ from it by reason of an operation of the intellect. But one arises from being and accompanies it (*4. Met. cap. 1.*). Therefore one is not separated from being by the intellect alone.

You will say: Aristotle, just cited (*T. 3.*), explicitly writes that being and one are not signified by one account — therefore, just as they are signified by a distinct account, so they are also distinguished by reason from one another. I say that the Philosopher there does not take "account" for the account of the intellect but for objective account, with any operation of the intellect excluded — just as I have more than once noted him using "account" in the definition of univocals (*l. praedicam. cap. 1.*), saying that univocals are those whose name is common and whose account of substance according to that name is the same. And (*1. 5. Met. cap. 6.*).

The second part remains proved by the second article of this question, in which I showed universally that the properties of being differ formally both from being itself and from one another. Moreover, it is shown most powerfully of one from Aristotle just cited, where he says that being and one mutually follow each other as principle and cause: but principle and cause import distinct formal accounts. For "principle" is said by reason of primateness — hence the Philosopher adds (*1. post. T. 5.*): "I say the same thing by 'first' and 'principle.'" But "cause" is said by reason of giving being — hence a cause is described as that upon whose being something else follows. And (*1. phys. sum. 3. cap. 3.*): "Privation is indeed a principle of natural things, but is not a cause, because it does not influence the generation of the natural composite." Likewise, a point is a principle of a line, but is not its cause, since it communicates nothing to it and causes nothing. Therefore one formal account belongs to principle and a different formal account to cause. Likewise, in our matter, one formal account belongs to being and another to one, as is plainly clear from the descriptions of

each. Whence Aristotle adds in the same place (4. *Met.*), as just recalled, that being and one are, in generation as in corruption, inseparable from each other — which is a clear indication of the formal distinction between them. I conclude therefore that one adds to being not something negative but something positive, formally different from being itself.

Against this first objection: Aristotle, in the place just cited, openly says that one signifies the same nature as being. And a little further he adds that one is nothing other than being. And the same is intimated (10. *eiusdem*, T. 5.): "For this reason to be one is to be indivisible — it is truly being itself and inseparable." Therefore one adds to being nothing beyond a negation or rational relation. I respond that these and similar testimonies, which may be adduced, must be interpreted of real identity, not formal identity. Thus being and one are really the same and formally distinguished. Therefore they do not designate two natures but one — just as "man" and "risible," designating only one nature, are really identified and formally differ from one another.

Against this second objection: being, insofar as it is distinguished from one, is either one or not one — not the latter, because there is no being that is not one, since they mutually imply each other. If the former, it is either one through another, and that through another, and so on to infinity; or it is one through itself — and thus being is one without any positive addition to it, which is what the Adversaries intend. I say that being taken precisely abstracts from unity and multitude, just as it abstracts from finitude and infinity, substance and accident. In this sense perhaps Avicenna (5. *Met. cap. 1. & 2.*) said: "horseness is only horseness, neither one nor many." But being is one through the unity added to it — just as man is risible through risibility joined to him.

You will press: that positive thing which one adds above being is either one or not one — not the second, because everything positive is one; nor the first, because if it is one, it is either one through another, or through itself — and the first argument recurs. I say that the sophism of the figure of speech is committed, changing *quo* into *quod*. For one is that by which (*quo*) being is one, not that which (*quod*) is one — just as whiteness is that by which a wall is white, while whiteness itself is not white.

Against this third objection: between two positive real terms there is a real distinction — but being and one are two positive real terms — therefore between being and one there intervenes a real distinction and not a formal one. I distinguish the major: if the said terms are thing and thing, I grant it; but if one is a thing and the other is a somethingness of it, as happens here, I deny it.

Article V. On the True

After one follows the true, and then the good — this is the common opinion of all philosophers, because a thing seems first to be undivided in itself, by reason of which it is one, before it is true and conformed to its being, and afterward

good — namely, whole and perfect in its being. For these last two there is given a different reason: the true regards the intellect and the good regards the will; and no one denies that the intellect is naturally and generatively prior to the will. What the true is, as a property of being, and what it adds above being — this is genuinely difficult and hard to understand, no less than what was said of one in the preceding article. Concerning complex truth, which is called logical truth, I treated at length in *Logic, l. 4. quaest. 4. per totam*. Now, however, I shall briefly treat only of incomplex and entitative truth, also called the truth of the thing, leaving aside the various and diverse opinions reported by Aureolus (*1. d. 19. tertia parte, art. 1.*) and Suarez (*disp. 8. Met. sect. 7.*) and other Recents.

The first assertion is that transcendental truth is not the quiddity of a thing, nor is the true the whatness (*quid*) of a thing. This assertion militates against Aureolus (*mox cit. art. 2. propositione tertia*) and is held for Scotus (*2. Met. in exp. T. 4. & 6. eiusdem, quaest. 3.*), Anthony Andrew (*quaest. 6.*), and others of the same school (*ibid.*), from whom the Thomists and others outside both schools do not diverge. It is proved first: if the quiddity of a being were its truth, being and true would be formally the same, and no distinction would fall between them. But Aristotle asserts that the true differs from being (*4. Met. T. 1.*), saying that metaphysics contemplates being and the properties that follow it, among which is truth. And before that (*2. Met. T. 4.*) he had premised that "as a thing stands with respect to being, so it stands with respect to truth." But if being or essence were to coincide with the true and with truth, there would be no comparison or similarity but complete identity — which is contrary to the cited text showing that truth follows the thing; hence first principles are eternal and supremely true because their being is eternal and sempiternal. And a little before: "an effect is true if its cause is true, and indeed the cause is truer than its effect." Hence if wood is hot on account of fire, fire itself is hotter — indeed hottest. Therefore truth is not the essence of a thing but follows the essence itself.

You will say: if this argument held, then since the earth is hot on account of the sun, the sun would be hotter — which is not granted. I say this holds for univocals, not for equivocals, of which sort are the sun and the earth, which are of a different kind.

Second: the truth of a proposition — which is called the truth of cognition — is not the quiddity or essence of the proposition, as I observed in the *Epitome, l. 2. q. 3. art. 1. n. 4. & q. 2. eiusdem lib. art. 2. n. 9.*, but is its property; hence if someone asks "What is a proposition?", the answer is that it is a statement of something about something. But if someone asks "What kind of thing is a proposition?", it is properly answered that it is true or false. Therefore the same must be affirmed of the truth of a thing and transcendental truth — namely, that it is not the quiddity of being but its property — since the reason is the same in both.

Third: if transcendental truth were entirely the quiddity and essence of being, then the proposition "being is true" would be not of the second but of the first

mode per se — indeed it would be nugatory, just as I said above: if one did not differ from being, then "being is one" would be the same as "being is being," and it would be an identical proposition because the same would be predicated of itself, as "man is man." But this is commonly rejected — therefore so is that.

You will say: Augustine (2. *Soliloq.* c. 5.) expressly says: "The true is that which is." But what is, is a being, and its essence is the quiddity or truth by which that being is — just as whiteness is that by which a white thing is white. Therefore the truth of a thing means nothing other than the quiddity and essence of that thing. I say that this testimony of Augustine and similar ones, if adduced, must be understood of real identity, not formal — that is: truth is really identified with being, though it formally differs from it. Scotus likewise interprets (4. *Met.* T. 3.) the statement that "one, beyond being, is nothing else, and signifies the same essence" — understood, that is, really and not formally.

If you should reply and press: when a craftsman holds a touchstone (*lapis lydius*) to gold to examine whether it is true gold, he inspects it and its luster, touches it with the said stone, and thereby knows whether it has the nature of true gold or not — therefore truth is the quiddity and nature of the thing. I reply that the craftsman scrutinizes true gold from its property, which he knows; and by the said stone he comes to knowledge of its nature along with its essence and that of everything else that may be hidden from us. But from this it is not rightly inferred that truth is the nature of a thing; rather, it is a property of it, since the property becomes known while the nature remains hidden.

The second assertion is that the true does not include a relation of reason to an intellect — whether created or uncreated. This follows from the Doctor (*at the places cited above*) and is opposed to Molina (1. p. q. 16. *disp.* 2.) and some others. It is established first from Aristotle (1. *praedicam. cap. de substantia, propè finem.*): "From the fact that a thing is or is not, a statement is true or false." Therefore the truth of a thing imports no relation to a created or uncreated intellect. Conversely, the truth of a cognition is only in terms of the truth of the thing: for if the intellect knows a thing as it is on the part of the thing, its cognition is true; but if it knows the thing otherwise than it is on the part of the thing, its cognition is false. Therefore the truth of a thing in no way regards the intellect, whatever its kind.

Second: if by an impossible hypothesis there were no intellect — as Scotus also seems to suppose (6. *Met. quaest.* 3.) — transcendental truth would still exist, because there would be being; and being and the true mutually imply each other. But there would be no relation of reason, because this is effected by the intellect and follows upon its operation; with no intellect existing, there would be no operation of it, and consequently no relation of reason. Therefore the truth of a thing and transcendental truth in no way includes a relation of reason.

Third: before the aforesaid relation of reason to the intellect, there was truth and being was true. Hence the Church sings in the Nicene Creed: "God from God, true from true." Moreover, a craftsman proposing to himself some exemplar to be imitated, just as it is outside his intellect — as a painter looks at the image of the Blessed Virgin as Saint Luke the Evangelist painted it — does not regard the idea he has in his mind or the idea God has in his intellect, but regards it as it is truly set before him and represented outside himself, as was long ago commanded to Moses (*Exod. 25.*): "Look, and make it according to the pattern shown to you on the mountain." Hence Aristotle (*1. Eth. in fine, cap. 6.*) says that to perform true things, it is not the Platonic ideas and their concepts that must be contemplated, but the things themselves that must be pursued and executed — just as a physician treating a sick patient need not look at health and the concept of it that he holds in his mind, but at the very health he wishes to bring about in the sick person, and indeed at this health in this sick man, as that same Philosopher concludes there. Furthermore, if truth presented this relation of reason to the human or divine intellect, it would be necessary for the craftsman to know the concepts and ideas of both intellects — with the result that every craftsman would have to be a philosopher and a theologian, since to know a relation one must know its terms. But that this and similar consequences are absurd and preposterous, there is no one who does not see. Therefore truth does not present such a relation of reason to a created or uncreated intellect.

The third assertion is that the true is a property of being, adding above being itself something positive — namely, knowability (*cognoscibile*) — whose abstract is truth or knowability, formally differing from being itself. Both parts are hinted at by the Doctor (*ibid.*), and are evident from what was said in the preceding article on one. The first part is further established from (*1. Met. T. 4.*): "As a thing stands with respect to being, so it stands with respect to being known." That is, according to the entity of a thing, its knowability or truth is had. For these reciprocate and are adequate to one another: true being, knowable being, entity, truth, and knowability. Again, given the knowability of a thing and its adequation, the transcendental truth of the thing is given; and if knowability is removed, that truth is removed as well. For if there is no knowability, there is no truth; and if there is no truth, there is no entity — since truth follows entity. Therefore the true is equivalent to the knowable, and truth is the same as knowability.

The second part is at hand. For every property formally differs from that of which it is a property, as I showed in article II of this question. But truth is a property of being, by the assent and agreement of all. Therefore it formally differs from being.

Against this first objection against the first assertion: without conceiving or considering anything distinct from the nature and quiddity of a thing, truth is conceived and understood — for if the nature of man is conceived and

understood as it is, true humanity is conceived and understood, and so for the rest of the natures and essences of things. Therefore truth is nothing other than the quiddity of a thing. I distinguish the antecedent: really, I grant it; formally, I deny it. For since truth is a property of a thing, it consequently differs formally from the thing of which it is a property, and is really identified with it — as is sufficiently clear from what has been said.

You will press: Hilary (6. *Trin. ante medium*) calls God subsistent truth — but nothing subsists besides substance; therefore if subsistence belongs to truth, it is itself also a substance and a substantial nature, and consequently truth is not distinguished from the substance and nature of the thing. The answer must be given through the same distinction — namely, that truth is really identified with the divine subsistence but formally differs from it, as do the attributes and the relations of origin, which are discussed in the *Tractatus de Deo Uno, Trino*.

Against this second objection against the second assertion: truth presents a relation and respect toward a knower. Therefore truth expresses at least a relation of reason to the intellect, whether created or uncreated. The antecedent rests on the testimony of Augustine (1. 2. *Soliloq. cap. 5.*): "The true is that which is such as it appears to a knower who is willing and able to know it." I respond that truth indeed imports a relation — not of reason, but a real aptitudinal transcendental relation, which can exist without the term actually existing, as I indicated in Logic (l. 3. q. 6. art. 11.). And this is also signified by Augustine (*ibid. a little later.*): "Because even if a thing is not seen, nor has conformity with any cognition, nonetheless it is true."

You will press: Aristotle, at the end of 6. *Met.*, explicitly writes that the true and false are not in the thing but in the mind; while on the other hand, good and evil are not in the mind but in the thing. Therefore truth necessarily includes a relation of reason to the intellect. I say that Aristotle must be interpreted of complex truth, which belongs to logic, not of incomplex and transcendental truth, which metaphysics treats.

Against this third objection: truth, according to Scotus (*cit.*), is a conformity of the thing to the intellect — but conformity is a relation; therefore truth also is a relation. It is answered by saying it is a relation not predicamental but transcendental, as Scotus seems to hint for all the properties of being (4. d. 49. q. 4. § *Iuxta hoc, sub I.*) after Augustine (l. *de vera religione*, c. 36.): "Truth is the supreme likeness" — and Boethius: "Truth is the adequation of thing and intellect."

You will press: relatives are said by way of conversion (*ex l. praedicam. cap. de ad aliquid.*) — as a father is the father of a son, and a son is the son of a father. But the true does not stand this way — for it is not said that "the true is the true of the true" — therefore neither is the true relative nor truth a relation. I say the major holds especially for predicamental relatives, but not for transcendental

ones, which are under discussion here. Especially since it does not seem incongruous for these too to be converted: as "the knowable of something is knowable," and "the visible of something is visible," and "the conformable of something is conformable," and "the true of something is true" — whatever Hurt (*disp. 7. sect. 15. 7.*) and Arrubal (*disp. 1. sect. 5. Subsect. 3.*) may say.

Article VI. On the Good

There are as many competing opinions on the present article as were reported in the two preceding articles — setting these aside, I note that what I observed and asserted in the *Philosophia Moralis*, l. 2. *quaest. 1. art. 1. 2. 3.* must be recalled, where the acceptations, divisions, and descriptions of goods — especially transcendental good and moral good — are had and explained. These need not be adduced and repeated here lest I do what has already been done, but should be sought and read there. Now, however, I shall briefly touch on a few points that contribute to our present discussion.

The first assertion is that good is properly a property of being. This follows from Aristotle (6. *Met. propè finem.*) and is plainly had (1. *Eth. cap. 6.*): "Good is said in as many ways as being." This is against Molina (1. *part. quaest. 5. disp. vn.*), who denies that good is truly a property of being. It is the common position of Scotus (4. *Met. in exp. T. 3. & 2. d. 16. quaest. vn. K. § Ideo dico*) and the rest of the Scholastics (*ibid.*); and it remains proved from the third article of this question. Moreover, it is shown specifically: what follows being and converts with it is properly a property of it, as the Philosopher indicates (4. *Met. T. 1.*) and Molina himself seems to sense (*ibid.*). But good follows being and reciprocates with it. For being comes first, and then following upon it is appetibility and fittingness — which is good. And every being is appetible and fitting, and vice versa. Therefore good is truly a convertible and reciprocal property of being. Furthermore, the other properties convert with good, and syllogisms about them formed in the first mode of the first figure are valid and necessary — as: "every one is good; every being is one; therefore every being is good." Likewise: "every true is good; every being is true; therefore every being is good."

You will say: some things are beings but not good — according to Aristotle (3. *Met. T. 3.*), mathematical objects are beings but not good. Likewise, matter is a being, which, being pure potency, is devoid of all goodness. And the divine relations have a share in entity but do not receive goodness and perfection according to Scotus (*Quol. 5.*). Therefore good is not properly a reciprocal and convertible property of being. I say that mathematical objects, since they abstract from motion and from matter existing in a qualified sense, are not called good in that qualified sense, because they are not then active and useful; but simply and absolutely they are good, with the entitative goodness befitting them, since they are real beings. Hence Lyra, commenting on *cap. 1. Genesis*: "God saw the light that it was good" — that is, useful, as he explains. Conversely, what is not useful is said not to be good — for example, mathematical objects

and Platonic ideas, in the interpretation of Scotus on that text just adduced. To the other objection about matter, I say it is good with transcendental goodness because it is a being and possesses entitative act, as I asserted in *Physics* (*l. 2. quaest. 2. art. 5.*). To the last, I say the relations of origin are good with entitative goodness but not with gradual goodness, as I showed at length (*Tract. de Deo Trino, disp. 5. quaest. 5.*).

The second assertion is that good adds to being more than a relation of reason alone. The Doctor (*cit.*) is patron to this, and opposed to it are Capreolus (*2. d. 34. q. 1.*), Molina (*as cited above*), and Fonseca (*4. Met. q. 7. c. 2. sect. 5.*), with Thomas cited (*q. & 21. de veritate art. 1.*). It is proved first from Aristotle (*6. Met. sum. 2. c. 2. T. 8.*), affirming that the true and false are in the mind, while the good and evil are in things — where the Philosopher evidently suggests that complex truth formally presents nothing other than a relation of reason, while good formally signifies a positive reality, said to be in the thing or on the part of the thing. Augustine's saying is consonant (*1. de Doctrina Christiana, cap. 32.*): "Insofar as we are, we are good." And the sacred text favors it (*Gen. 1.*): "God saw all things that he had made, and they were very good" — where beyond any doubt there is question of transcendental goodness, which inheres in all created things prior to any intellect forming a relation of reason of fittingness toward them, as sacred Scripture openly attests and clearly proclaims.

Second: from a real positive subject there does not proceed a property of reason formed by the intellect, as is evident to one who runs through all the particular subjects from which real positive properties proceed. But being, of which we are speaking here, is real and positive, from which good and the other properties arise, as I showed above. Therefore good is not formally a mere relation of reason of fittingness.

Third: good is sufficiently divided into transcendental or natural good and moral good — and the latter is real and positive, and it is the science of morals that deals with it. Therefore likewise the former is a real positive. Hence perhaps the royal Psalmist, adorned with the goods of nature and grace, addressing God (*Psalms 118.*), says: "Thou hast dealt well with thy servant, O Lord, according to thy word." Moreover, truth is attributed to the intellect and goodness to the will; the end of speculative science is truth and that of practical science is goodness. And of privative opposites, one term is a real positive and the other is privative — as seeing and blind, light and darkness. But good and evil are privative opposites. Evil indeed is privative, since it is a privation of good; and good is positive, as what I have adduced up to this point, and similar considerations that can be brought forward, plainly shows and clearly demonstrates.

The third assertion is that good does not formally add to being something absolute, nor a connotate, but a real relative fitting, formally differing from being. The assertion is fourfold, hinted at by Scotus (*at the places cited*) and Durand (*2. d. 34. quaest. 1.*). The first part is proved first: the absolute is "toward

itself" and the relative is "toward another," as is evident from the explicit terms explained in the *Epitome Dialectics*, l. 1. q. 1. art. 6.. But good is not toward itself but toward another, insofar as it is a property of being and expresses fittingness toward another, or insofar as it is good for another — as Suarez himself explains and candidly admits (*disp. 10. Met. sect. 1. n. 14.*), along with other adversaries whose names Durand suppresses (*ibid.*). Therefore good does not formally import something absolute.

Second: if good formally designated something absolute, the evil opposed to it privatively would present the privation of such an absolute. But this is false. The minor is shown: feverish heat is bad for a man not because it denotes the privation of that heat, but because it is unbecoming (*disconveniens*) to that man. But what is unbecoming or becoming is not absolute but relative. Therefore good does not formally signify an absolute.

Third: good is equally divided into transcendental and moral good — for each participates in the common and general character of goodness. But moral good is not absolute, since it is described as that which belongs to the will in relation to right reason. Therefore transcendental good also is not absolute, since it regards what is proper and fitting to the thing and its quiddity, as Dionysius hints (*4. de divinis nominibus.*): "Good comes from an integral cause, and evil from any defect whatsoever."

You will say: Scotus (*Quol. 18. § De primo. C.*) after Augustine (*8. Trin. cap. 3.*) divides good into primary or essential good, and secondary or accidental good. The former is called good in itself and simply; the latter good in a qualified sense and with respect to another. And Suarez holds the latter to be the property of being, but not the former, because he thinks the primary good entirely coincides with being while the secondary differs from it in some way, by reason of which it is called a property of being. On the contrary: primary good is what is fitting to a being, and primary goodness is the fittingness and perfection of that being. But what follows and accompanies the quiddity of something is not its essence nor of its essence, because it presupposes the essence it follows. But the simple good accompanies being when it befits it in the second mode of saying per se and is its perfection following upon its entity — just as the perfection of a species follows the specific nature, which is why one species is said to be more perfect than another, as Aristotle notes (*8. Met. 10.*): "Species are like numbers, of which one is more perfect than another." Therefore simple good is not entirely the same as being but is its property. It is called essential and good in itself because it belongs and is proper to being, and flows from its essence — not as accidental good, which comes from some external term. Hence Augustine (*cit.*), in explaining this, adds: "Good health without pain and weariness," which is called good because it is good for another — namely, for man, because it befits him. And: "A good face of a man which has all that belongs to a face." In each explained goodness, fittingness is placed, which is a relation

and respect of one thing to another. Therefore Suarez's response seems neither fitting nor legitimate. Hence the said author, not firmly adhering to it, offers another response — namely, that good differs from being by reason — which response plainly conflicts with what he himself offered in section cited (*n. 3.*), expressly refuting the opinion of those who hold that between being and good there is only a distinction of reason; which now, pressed by the argument, he admits (*n. 17. eiusdem sect.*).

The second part argues against the aforesaid Suarez (*ibid. n. 12.*) and other "connotators," whom I reported and rejected (*1. 2. Philosophia Moralis, q. 1. art. 3. aff. 3.*). It is established first: between absolute and relative there is no middle, because everything that exists either is "toward itself" and is absolute, or is "toward another" and is relative. But good is not absolute, as I showed in the first part. Therefore it is relative — and thus a connotate is not distinguished from a relative, as Suarez strives to introduce into the school, establishing a position on connotation of the good that differs from the rest.

Second: good presents an order and some relation by reason of which a thing is called appetible and lovable — hence by such respect Aristotle defines good (*1. Eth. c. 1.*): "that which all desire," as the said Suarez concedes in that place. Therefore good does not include a connotation distinct from the relation of fittingness that good formally imports.

Third: a connotation is either intrinsic to the good or extrinsic. If intrinsic and essential, it must enter into its definition; but in its definition only the relation of appetibility and lovability is placed, as I was just saying. If extrinsic, it is irrelevant to expressing and capturing its formal and essential character. Nor does it help to add that good connotes the capacity and propensity of the nature to which it is good — for such capacity is already required and presupposed in the nature that is capable of good, and does not constitute the formal character of good. And that capacity and propensity belongs among relatives, just as good does. Therefore good is not a connotate distinct from a relative.

The third part follows from the two preceding ones — for since good is a real positive, and is neither absolute nor a connotate, it is plainly established to be relative, as its definition shows. For good is what is fitting to the thing of which it is good, and goodness is the fittingness of that same thing — which is a relation and respect of the thing to which it belongs, or to another. Moreover, moral good is a relative of the act of the will to right reason, as I proved (*loco nuper cit. art. 3.*). Therefore the same must be asserted of transcendental good, which imports the fittingness of the thing of which it is good, or fittingness to another. Furthermore, transcendental truth is indeed a relative, as I showed above (*art. 5. of this question.*), and universally all properties of being are transcendental relations, as Scotus seems to hint (*4. d. 49. quaest. 4. § Iuxta hoc. L.*). Lastly, good perhaps differs little or not at all from the appetible and lovable — and that the

appetible and lovable belong among relatives, there is no one who seems to doubt. Therefore the same must be concluded of good.

The fourth part is plainly clear and remains proved from article II of this question, in which I showed universally that the properties of being differ formally both from being and from one another. But good is a property of being; therefore it formally differs from being itself. Moreover, the description of good specifically shows this, which description is different from that of being and from the descriptions of the other properties of being. And that a distinct description argues a distinct formality, I have insisted upon sufficiently above. Therefore between being and good, and the other transcendentals, there falls a formal distinction from the nature of the thing.

Against this first objection: Scotus (*Quol. 6. § Contra ista arguitur. K.*) cites the testimony of Augustine (6. *Trin. c. 8.*): "To be greater is the same as to be better." For essential goodness, by which one species is better than another, is not a thing added to the essence. Therefore if the goodness of a species is not distinguished from its essence, then likewise the goodness of being is not distinguished from being itself, even formally. I respond: the magnitude of God, which coincides with his infinity, is really the same as the divine essence and is distinguished from it formally and negatively, because infinity is its mode; likewise the goodness of the specific nature is really identified with it and formally differs from it. And the same must be affirmed of transcendental good, which is really the same as being and formally different from it. This is how Scotus explains Augustine, as is apparent to one who inspects his text.

Against this second objection: transcendental goodness belongs both to God and to creatures. But in God goodness is not distinguished from his essence and is common to the three Persons, as is the essence. Therefore the same must be affirmed of the goodness of creatures. All the more so because no relation is found in God that belongs to the three Persons — rather, each Person has its own proper relation, as the Father has Paternity and the Son has Filiation — but goodness is adapted to the three Persons; therefore it is in no way distinguished from the Godhead, and consequently formally imports not a relative but an absolute. I grant the major and deny the minor. For it is really identified with the divine essence from which it formally differs, just as the other relations do. To what is added, I deny that there are no real relations common to the three suppositis, as Scotus teaches (*Quol. 6.*) and as I showed at length (*Tract. de Deo Trino, disp. 5. art. 6.*).

Against this third objection: each being participates in its goodness, even if it regards nothing else — as heat is good even if it is not in fire, since it has whatever belongs to the nature of heat. Therefore goodness does not formally include a relation. I respond: good is twofold, as I noted above — simply and in a qualified sense, or in itself and with respect to another — and each is relative. Hence heat considered in itself apart from fire or any other subject has primary

goodness, which is fittingness according to the demands of its nature, so that it is desiccative and nothing is lacking to it that contributes to the integrity and perfection of that nature.

You will press: a relation presupposes actually existing real terms from which it emerges — but heat separated from fire does not have such terms; therefore neither does it participate in such fittingness. I say the major holds for predicamental and actual relation, not for transcendental and aptitudinal relation, of which sort is the relation of fittingness and entitative goodness that we are discussing.

Question III. On the Divisions of Being

Article I. What Is the Primary Division of Being

John Vallone (*fol. 28. of his lecture on the Tractatus Formalitatum of Master Anthony Sirect*) adduces and refutes several diverse opinions on this article, of which I examine and investigate the three more important and celebrated. One is that of the Thomists reported by the aforesaid author, who hold that the primary division of all being is into one and many. The second is that of those whom Suarez follows (*tom. 2. Sua Met. disput. 28. sect. 1. n. 5.*), who hold that the first and most known division of being is into infinite and finite. The third is handed down by Scotus (*Quol. 5.*), Gadius, Lychetus (*ibid.*), Trombetta (*Tract. Formal. art. 1. principali, fol. 5.*), and the rest of the same school, who teach that being is first divided into quantified being (*ens quantum*) and non-quantified being (*ens non quantum*) — which, so that it may be correctly grasped and clearly understood, and vindicated from the attacks and calumnies of the Adversaries:

Note first that real being is distributed in many ways, of which certain divisions are related. Thus it is divided by the Doctor (*in prooemio Quodlibetorum*) into uncreated and created being; likewise into being from itself (*ens a se*) and being from another (*ens ab alio*); also into necessary and contingent being; then into infinite and finite being; further into unparticipated and participated; and afterward into actual and potential being. Uncreated, from-itself, necessary, infinite, unparticipated, and actual being is God. Created, from-another, contingent, finite, participated, and potential being is creature. Other divisions are dissimilar and diverse: in this way being is divided into quantified and non-quantified, into absolute and relative, into one and many, and into substance and accident. The prior division of being is theological and difficult to grasp, and must therefore be explained by us.

Note second that quantity is twofold: quantity of bulk and quantity of power or perfection. The former belongs to corporeal things, which are extended through quantity; the latter to spiritual things, which are magnified by power, vigor, and perfection. In this sense Augustine writes (6. *Trin. 8.*): "In things that are great not by bulk, to be greater is to be better." In the present context, through "quantified

being" we understand a being perfect with virtual and gradual perfection, and through "non-quantified being" we understand a being lacking this intensive and gradual perfection. But Lychetus (*2. d. 1. quaest. 4. Ante §. Ibi.*) adds for the sake of clarity that he distinguishes quantified being into that which includes perfection and excludes every imperfection — as God — and that which admits perfection with imperfection — as created substance. And he gives some being that neither formally participates in perfection nor in imperfection — as are the relations of origin, namely paternity, filiation, active spiration, and passive spiration. The same author adds some being that formally receives no perfection but includes imperfection — as a created relational genus. The first three members of being the Scotists all uphold and defend; but the fourth they reject: for since a created relation is formally finite and hence quantified, residing in the predicament of relation, it consequently is not lacking in all perfection, but participates in some, though slight. For quantified being formally presents perfection, as is clear from its description given above; and conversely non-quantified being is devoid of all perfection. Therefore, since a created relation is quantified and finite, it should not be excluded from all perfection. In divine matters, however, the relation of origin precisely and formally is neither finite nor infinite, because it is not quantified; hence in the school of Scotus it is rightly inferred that it formally imports neither perfection nor imperfection.

But if you contend that an uncreated and a created relation are of the same kind — and therefore if the latter is quantified, so also is the former; especially since it is not formally infinite but only identically so, that is, because it is really identified with the divine essence, which is formally infinite and perfect — indeed the sea of all perfections: the answer must be given from Scotus (*nuper cit.*), Gadius (*ibid.*), Trombetta (*Tract. formal. fol. 5. pag. secunda.*), showing that these relations are greatly distinguished. For to a created relation it is not repugnant to exceed or be exceeded; hence quantity, finitude, or infinitude is not repugnant to it. But to a divine relation it is repugnant to be exceeded, because it is really identified with the divine essence, which is formally infinite. What is infinite cannot be exceeded. And it is also repugnant to it to exceed, since exceeding belongs to that which participates in the character of measure or is a first and absolute being. But a divine relation cannot be a first and absolute being, nor some whole from whose plenitude of perfection it might measure everything else — more as it approaches, less as it recedes from it. For that uncreated relation presupposes and presupposes the fontal plenitude of all goods and the first foundation and root of all things, which is the divine essence. Therefore, since the said relation can be neither measure nor measured, it cannot be formally quantified — and hence neither finite nor infinite — of which sort being precisely is also neither finite nor infinite, nor God nor creature, nor substance nor accident, though it can descend to these and be determined by them. This is repugnant to the said relation; and in this the parity does not hold.

Note third that the quantity of power and perfection is twofold: one which belongs to the quiddity of the thing and is called quidditative, because it follows the quiddity itself — as Scotus speaks of essential and quidditative goodness (*1. d. 1. quaest. 2.*) with excellent explanation by Viguer (*in com.*) — and another which is adapted to the individual by reason of its individual difference and which follows individual being, in which way one individual is more perfect than another, even though there is no essential order among individuals, according to Aristotle (*3. Met. T. 11.*). Now when a thing has its quiddity, essential perfection, modes, properties, and other such things, if it is divided, it is first divided into quiddities and essential perfections, as Scotus touches upon (*1. d. 1. quaest. 2. § Ad argumenta. I.*); then into modes; then into properties; and so on for the rest that follow it and are subjected to it.

Again, note that we can speak of the primary division of being in two ways — theologically and philosophically. If theologically, the primary distribution of being seems to be into quantified and non-quantified, because theology teaches us that the divine relations of origin are not quantified, as Scotus proves subtly and effectively with three arguments (*Quol. cited above.*), while everything else divine is formally quantified with intensive and gradual quantity. But if we discuss it philosophically, the prior distribution of being is held to be into infinite and finite being, as Anthony Andrew hands down above all others (*1. Met. q. 1. art. 1.*), and the Doctor does not dissent — neither there nor elsewhere, in the *Oxoniense* and *Reportata*; nor do his disciples and followers diverge, among whom are Gadius (*in fine Quol. 5.*), Barolus (*fol. 20.*), Sarnus, and the rest of the same school.

The first assertion is that the division of being is into quantified and non-quantified. This is the position of Scotus (*Quol. nunc memorato, § Ad argumentum principale: BB.*). It is proved first: what is more intimate, more immediate, and more proximate to a thing, if that thing is divided, is first divided into that more intimate, immediate, and proximate before into the rest, which are not so intimate, immediate, and proximate to it. But quantified and non-quantified are two members more intimate, immediate, and proximate than the rest that belong to being, since they immediately belong to the quiddity itself — and nothing is more intimate to them than the quiddity and its quidditative and essential perfection. Therefore the said division of being is the first of all.

Second: the natures and essences of things stand as numbers (*8. Met. T. 10.*) — that is, one essence is more perfect than another, just as one number is greater than another. Therefore essential quantity of perfection and power belongs to being before its modes, attributes, and properties — and accordingly being is first differentiated and divided into quantified and non-quantified being before the other members.

Against this first objection: that is not the primary division in which another prior division is found. But another division of being is had — into real being

and being of reason — which precedes the division of being into quantified and non-quantified, as is apparent in the Doctor (*Quol. 3. § De primo. A.*). Therefore the said division is not the first of all. I grant the major and distinguish the minor: of the division of an equivocal into its equivocates, as is the division of being into real being and being of reason, I grant it; of the division of a univocal into its univocates, as is the distribution of being into quantified and non-quantified, I deny it.

Against this second objection: a transcendental division is prior to a predicamental division, since transcendentals precede predicamentals. But the division of being into one and many, and likewise into infinite and finite, is transcendental; while the division of being into quantified and non-quantified is predicamental — for "quantified" is one of the ten predicaments (*5. Met. T. 18. cap. 13.*). Therefore the said division is not to be preferred to the rest. I grant the major and deny the minor. Regarding its proof, I say it concludes of quantity of bulk, not of quantity of power, as I forewarned in the second note.

Against this third objection: if the said division were to be admitted as prior to the rest, it would be primarily because a divine relation of origin formally does not import goodness and perfection. But this seems false, for Augustine (*3. de lib. arbitrio, cap. 5.*) says: "All things that are in God are good." He repeats this (*1. 83. qq. q. 24.*). And our Doctor (*1. d. 1. quaest. 2. § Ad argumenta. I.*) adds that a divine relation enjoys a certain goodness, though not enjoyable (*non fruibili*), and that good converts with being. Therefore the said division of being is not to be received as primary. I grant the major. To the minor, supported by the authority of Augustine, I say it is to be interpreted identically, not formally; or to be understood of entitative goodness, not of gradual and intensive goodness. So too Viguer and Lychetus (*in com.*) interpret Scotus (*cit.*).

You will press: equality or inequality is a property of quantity — and every being compared to any other is either equal or unequal. But since the divine relations are beings, they can be compared to other beings and hence equated or made unequal to them. Therefore they are quantified, perfect, and infinite. I say the objection holds of quantified being, of which sort the divine relations are not. For where a subject is removed, the property of that subject is likewise removed — as if humanity is taken away from a horse, risibility is taken away in like manner. Thus since quantity is removed from the said relations, equality or inequality — which is a property of quantity itself — is likewise separated from them.

Article II. How Being Is Divided into the Ten Predicaments

From the preceding article it is plainly clear that being is divided into quantified and non-quantified; then quantified being into infinite and finite; and afterward finite being into the ten predicaments. It is now investigated whether this proximate division into the ten categories is into ten distinct modes of being, or

rather into ten modes of predication. In the present discussion it is presupposed from what was said both in Logic (*l. 3. quaest. 3. art. 2.*) and in this book (*quaest. I. art. 3.*) what a mode is, what the difference is between mode and difference, and that being is not a genus with respect to the said members and its other inferiors.

The assertion is that real finite being is divided into the ten predicaments as into ten modes of being, not into ten modes of predication. This is the position of Scotus (*5. Met. quaest. 6. § Ad 2. q.*), Anthony Andrew (*ibid. quaest. 7.*), Vallone (*fol. 148. of his lecture*), and others in the *Tractatus Formalitatum* with Sirect — against certain others whose names the aforesaid authors suppress (*in those same places*), who hold that being is distributed into the said predicaments as into modes of predication. It is proved first: a mode of being is prior to a mode of predication, because being comes before being predicated — since the latter is grounded in the former. Therefore being is divided into the ten predicaments as into ten distinct modes of being. Second: the modes of predication simply are either two — namely, *in quid* and *in quale* — or five, from what was said in Logic (*l. 1. quaest. 1. art. 10.*); while the predicates according to Aristotle (*1. Top. cap. 4.*) are numbered as four. Moreover, logic deals with modes of predication, while metaphysics treats of modes of being. Finally, modes of predication depend on the intellect and are counted among second intentions, while modes of being are on the part of the thing, excluding any operation of the intellect; and metaphysics is a real science, treating as it does of real being and what follows it — among which are found modes of being. Therefore the aforesaid modes of being, and not modes of predication, are devised and examined in this science.

Against this first objection: being is not contracted to the ten categories through differences, as Scotus and others commonly affirm. Therefore it is contracted through modes, which are modes of predication, treated also by logic as well as by the predicaments. I grant the antecedent. To the consequence I say that being is indeed contracted through modes of being, but not through modes of predication — and the predicaments belong per se to metaphysics, to logic only insofar as they serve the construction of the syllogism and as simple and incomplex terms.

Against this second objection: the predicaments are primarily diverse, as Aristotle (*3. phys. T. 4.*) and Porphyry (*in Isag. cap. de specie.*) seem to indicate. But what is primarily diverse does not admit of division into modes of being — therefore into modes of predication. I distinguish the major: objectively, I deny it; subjectively, I grant it, as I explained above. Here the division of being into universal and singular should be adduced and weighed. But since I have already treated this at length in Logic (*l. 2.*), I do not call it into examination again here — only the investigation remains as to what is the principle of individuation, that is, what it is that constitutes an individual in the being of an individual and a singular in the being of a singular, which I explore in the following article.

Article III. What Is the Principle of Individuation

On this very difficult and very arduous controversy there are reported many diverse and opposing opinions of the Scholastics, by Scotus (*2. d. 3. from the first question to the sixth*), Canonicus (*1. phys. quaest. 6.*), Suarez (*disput. 5. Met. sect. 2.*), Poncius (*disput. 6. quaest. 2. and following*), and not a few others. Setting aside the rest, I adduce and discuss four principal opinions. The first is that of Ockham (*1. d. 2. quaest. 6.*), Gabriel, Adam (*1. d. 33. quaest. 8. art. 1.*), Aliacus, Gregory, and the rest of the Nominalists, who hold that there is no principle of individuation for an individual and a singular, but that an individual is an individual and singular through itself, not through anything added to it that might constitute it in the being of the individual and the singular. The second is that of Godfrey (*Quol. 6. q. 16.*), who affirms that quantity is the principle of individuation. The third is that of Thomas (*1. p. q. 3. art. 2. ad 3. and elsewhere*), Cajetan, and the whole Thomistic school, who posit the principle of individuation in designated matter — that is, matter affected by quantity. The fourth is defended by the Subtle Doctor (*cited above*) and (*2. Rep. d. 3. q. 1. & 7. Met. quaest. 3.*), Canonicus (*ibid.*), Anthony Andrew (*5. Met. q. 5.*), Bonetus (*8. Met. dicto quinto Peripatetico.*), Tataretus (*in com. 2. d. 3.*), Gratian of Brescia, Lychetus (*in that place*), Rhadus (*secunda parte, contr. 3.*), and very many others, who commonly teach and hold that the principle of individuation is the individual difference, called by these authors "haecceity" (*haecceitas*). This opinion is embraced by Fonseca (*5. Met. cap. 6. quaest. 1. sect. 1.*), who premises (*quaest. 4. sect. 6. in fine*) that Scotus discovered and handed down the truth of this matter. And Ockham (*cited above*), though an opponent of Scotist doctrine, testifies that in this matter Scotus surpasses everyone else in subtlety. Hence Mauritius adds (*in annot. 7. Met. quaest. 1.*) that Scotus comprehended the great chaos of opinions and disputes, distinguished, explained, and corroborated them with firm foundations, powerful arguments, and efficacious reasons.

Note first, and recall from what was said in Logic (*l. 2. quaest. 1. art. 4.*), that there are given real common natures, which are indifferent to being either universal or singular. For they become formally universal through an operation of the intellect, and singular through individual differences. For what is indifferent and indeterminate is contracted and determined by something added to it. But a real common nature is in itself indifferent and indeterminate, as I showed abundantly and clearly there. Therefore it must be determined and contracted through individual differences, which the Scotists call haecceities. And this is clearly illustrated: just as a specific nature is determined by its specific difference — as human nature by rationality — so an individual nature is determined by its individual difference, and becomes this by haecceity — as Peter by Petriety and Paul by Paulinity, and so on.

Note second that the nature, inspected in quidditative and specific being, is not rarely called "form" by Aristotle, as is evident (*5. Met. T. 2. & 7. eiusdem operis, T.*

41.), which Scotus clearly explains (2. *practit. q. 6. § Ad argumenta. O.*). But the nature in individual and singular being is sometimes called "matter" by the same Philosopher, especially (1. *Caeli, summam 8. cap. 7. T. 92.*), in these words: "When I say 'heaven,' I say the form; and when I say 'this heaven,' I say the matter." A not incongruous reason for this is given: just as matter is subjected to everything (1. *phys. T. 82.*), described as the first subject of every form, so the singular nature is subjected to all that is placed in a straight predicamental line. Hence it is called "matter." Therefore when Aristotle sometimes says that the cause of individuation is matter, he is not to be interpreted of the matter of the part — which enters into the essence and quiddity of a physical composite — but of the matter of the whole, which is the individual difference, so called for the reason just assigned and hinted at by Scotus (5. *Met. in exp. cap. 6. T. 12.*).

Note third that to newly discovered things new names must be found and imposed upon them. Hence the holy Fathers — notably Augustine (7. *Trin. cap. 4. & 3. contra Maximinum, cap. 14. & libro contra sermonem Arrianorum propè finem*) — invented a new name to signify the unity of the divine substance and essence of the three Persons — namely, *homoousios*. And Augustine himself (*Tract. 97. in Ioan.*) observes, from the Acts of the Apostles XI, that the disciples of Christ were first called Christians in Antioch. Then, to signify the transformation of bread into the Body of Christ, the Council of the Lateran under Innocent III and the Scholastic Doctors coined the term "transubstantiation" — confirmed by the Council of Trent (*sess. 13. can. 4.*). So no one should find it remarkable if the individual difference is called "thisness" (*hecheitas*) or "haecceity" — not only by the Scotists but by Scotus himself (1. *Met. Sum. 2. in expositione cap. A. & S. eiusdem cap. 6. T. 12. & 1. post. quaest. 6. q. Ad rationes. & collat. 26. propè initium. & collat. 36. post § Ad rationes.*). The individuating difference can thus be called by that one name aforesaid, and singulars can be named by their proper names — both in the concrete, as Peter and Paul, and in the abstract, as Petriety and Paulinity. Marcus Tullius long ago did this (3. *Epist. 7. ex Appio & Lentulo.*), speaking of Appianity (*Appietatem*) and Lentulanity (*Lentulitatem*). And Augustine does the same (6. *Trin. cited by Scotus, 7. Met. quaest. 13. § Ex ista opinione.*), abstracting Danielity (*Danielitatem*) from Daniel. Finally, it is said that Diogenes said to Plato: "O Plato, I see a table and a cup, but I do not see tableness and cupness." I add: since the matter is established, the novelty of a term ought not to offend a philosopher, as Athanasius testifies (*dep. habita contra Arrianos.*). And accordingly, Scotus and his disciples rightly assigned a new name to the principle of individuation newly brought forth by themselves.

The first assertion is that an individual is not an individual through itself but through something added to it, by which it is constituted in the being of the individual and singular. This is the position of Scotus (2. *d. 2. quaest. 1. § Ad quaest. E.*). It is proved first: if an individual were an individual through itself and without any addition, a common nature could not be understood under the universal character — since the singular and the universal are opposed, for the

singular is incommunicable and the universal is communicable. But a common nature can be understood under the universal character, because it is in itself indifferent and indeterminate to being universal or singular, as I noted in the first note. Therefore it is not individual and singular through itself, but through something added to it — which is the individual difference, called by one name "haecceity."

Second: from (*10. Met. T. 3.*): "In every genus there is given a one that is the measure and standard of others." But that sort of one is not one in number or singular, because it belongs to many. Therefore if something becomes singular, it is constituted in singular being through something adjoined to it, which is haecceity.

Third: a species is not a species through itself but through its specific difference — as man through rationality. Therefore an individual is not an individual through itself but through its individual difference. The antecedent is evident. The consequence holds by analogy, since the same reason manifestly applies in both cases.

You will say: a substance or nature is proper to that of which it is the nature, and not to another (*7. Met. 20.*). Therefore a nature is singular through itself and not through something coming to it from outside. I say that something can be proper to something in two ways: in one way through itself, with nothing accruing to it — which I deny; in another way through something contracting it, by which it is rendered incommunicable to another — which I grant, and thus a nature is made singular and incommunicable, even though it is not repugnant for it to be communicated to others. In this way the human nature in Peter is singular through Petriety, while through itself it is communicable to many others and is in fact communicated to and contracted through many individual differences. This refutes the opinion of Henry (*Quol. 5. quaest. 8. 15.*), who holds that a nature becomes singular through a negation called incommunicability to many. For a positive constituted thing receives a positive constitutive principle and a principle distinctive from others — indeed the constitutive and distinctive principle of something is the same. But one individual is positively distinguished from another individual of the same species. Therefore it is also constituted through something positive — which is the individual difference. The major is evident. The minor is at hand: individuals are numerically distinguished from one another and act differently, as we daily experience — and these and similar facts evidently argue that they are distinguished from one another by positive numerical differences, through which they are constituted in individual and singular being. But if any negation is noted in them, it designates their positive entity, which it perhaps follows and accompanies.

The second assertion is that quantity is not the principle of individuation. This is handed down by the Doctor (*cit. q. 4. § contra istam conclusionem. A.*). It is established first: the predicaments are unmixed, as is clear in the individual

syllables of each predicament elaborated in the *Epitome Dialectics*, l. 1. q. 4. and in the second antepredicamental rule (*ibid.* art. 1.) established: the genera that are not subalternately posited have diverse differences, species, and individuals. But if the individual of substance were individuated through quantity, substance and quantity would coalesce into one — for the former would be contracted to singular being through the latter — which is false.

Second: a thing is first constituted in its substantial being before it is in accidental being. For a thing is first constituted in itself before it regards something distinct from itself, since the prior, as prior, is not constituted through the posterior. But substance precedes quantity as its subject — and as a cause precedes its caused effect. Therefore substance is first individual before quantity accrues to it — which is its accident — and hence is not individuated through quantity.

Third: given Godfrey's opinion, the individual of substance would not be one per se but per accidens — for it would be constituted from substance and accident, which is one per accidens, as is evident (7. *Met. Summa Secunda*, capite 3.). Therefore substance is not individuated through quantity.

You will say: division and distinction belong to quantity, and individuals are mutually distinguished and a species is divided into individuals — therefore the individuals themselves are individuated and singularized through quantity. I distinguish the antecedent: into integral and quantitative parts, I grant it; into substantial and subjective parts, of which sort are individuals, I deny it.

The third assertion is that neither matter nor form is the principle of individuation. The first part is held by the Doctor (*cit. quaest.* 5.) and is shown first from Aristotle (1. 2. *Met.* T. 27.), who affirms that my matter is one thing and your matter is another. But such matter, which is common to you and to me, is not made individual through another matter — otherwise there would be a regress to infinity — nor is it individual through itself, as I proved in the first assertion. Therefore beyond matter, another principle of individuation must be sought. Especially because matter, from what was said in Physics (l. 2. *quaest.* 2. art. 11.), is one in species — therefore matter itself, which is common to many individuals, is not the constitutive cause of the individual in the being of the individual and singular, which is incommunicable to many.

Second: the matter is the same in the generated and the corrupted, as experience shows. But the generated and the corrupted are distinct individuals, not distinguished through matter, which is the same for both — therefore through something else, to be handed down below. All the more so because accidents are individuated not through matter, of which they have no share — therefore through something else they become singular.

Third: what is of the essence of something cannot be the principle of individuation, because essence pertains to specific being. But matter enters into

the essence of a physical composite — for a physical whole is constituted from matter and form as from two essential parts. Therefore individuation is not had through matter. Especially because this or that rational soul is singular not through matter, of which it is devoid since it is spiritual — therefore the principle of individuation is not sought from matter.

You will say: Aristotle (*7. Met. T. 28.*) clearly writes that Callias and Socrates differ from each other in matter. He frequently repeats the same thing elsewhere: Callias and Socrates are individuals. Therefore if they are individuals through matter, it plainly follows that matter itself is the principle of individuation. I say that Aristotle must be interpreted of the matter of the whole, which is the individual difference, as I explained in the second note — not of the matter of the part, which together with form constitutes the natural composite.

The second part of the third assertion is taught by Scotus (*cited above, quaest. 6. § Ad quaestionem ergo respondeo. Sub K.*). It is established by nearly the same arguments as the first part, since form is incommunicable to many and is of their essence — indeed it is their principal part, by reason of which they are mutually assimilated. But the individual difference is incommunicable to many and pertains to material and ultimate subjectable being. Therefore form cannot be the principle of individuation. Moreover, if form were the principle of individuation, it would be either the form of the part or the form of the whole — but neither is able to individuate anything. The major is evident from a sufficient enumeration of parts. The minor is at hand: each can be considered either universally or particularly. If the first — it is communicable, either by information or by inherence, which is opposed to the incommunicable, as is the individual principle. If the second — there still remains the question of through what a singular form is individuated, and thus form itself is not the cause and individual principle. Moreover, just as each thing has its entity, so it also has its unity, since unity is a property of being as has been said. But form participates in its entity distinct from matter, the composite, and everything else — therefore it also participates in its unity distinct from them. And if it is specific, the unity is specific; and if it is numerical, the unity is numerical. Consequently form itself does not constitute itself and other things in numerical and individual being, but is constituted in such being through its numerical unity and individual difference. Therefore from form itself the individual character of anything is by no means derived.

You will say: form separates and distinguishes one thing from another (*7. Met. T. 5. and following.*). Therefore the principle of individuation and distinction of one individual from another is derived from form. I distinguish the antecedent: specifically and formally, I grant it; numerically and materially, I deny it. And form is a principle of being in the way in which it is a principle of distinguishing — and since it is a specific and essential principle of being, it is likewise a specific

and essential principle of distinction, but not an individual and material one, which is now at issue.

I know that some Scotists, whom Faber follows (*Theor. 90. cap. 2. 10.*), think that the ultimate reality of form is the principle and cause of individuation of everything. But this assertion conflicts with Scotus (*just cited*), who says in explicit words: "Such an entity (namely the individual one) is not matter nor form nor the composite, insofar as any of these is a nature — but it is the ultimate reality of the being that is matter, or that is form, or that is a composite." Therefore according to Scotus the individual character is the ultimate reality — it follows that it is not the ultimate reality of form, as Faber supposes. There was thus no need for Faber to labor in handing down and determining as the cause of individuation the ultimate reality of form, as he does (*c. 2. of the place just cited*), since Scotus had already established it to be the ultimate reality of being — which, if it is that of matter, is called the ultimate reality of matter; if of form, the ultimate reality of form; if of the composite, the ultimate reality of the composite — which the Scotists subsequently collectively comprehended under one name, calling it haecceity. And the Doctor hints at this (*ibid.*), affirming that this is the ultimate reality of the being that is matter, or that is form, or that is a composite. If Scotus held that the individual character is the ultimate reality of form, he would plainly have said it is the ultimate reality of the being that is form. Since he enumerates those three disjunctively, it evidently follows that he by no means wanted the ultimate reality of form to be the universal constitutive principle of every individual.

Furthermore, Scotus (*at the passage cited, sub H.*) from Aristotle (*cited by him*) calls the individual difference "matter," insofar as it precisely constitutes the individual in individual being — which is said to be material and ultimately subjectable. Therefore if according to Scotus this reality is matter in that sense, it follows in Faber's position that the ultimate reality of form is matter — but who does not see that this is false? For matter does not arise from form but is presupposed by it, being the common subject of all forms. Therefore the ultimate reality of form cannot be the individual character — especially in the school of Scotus, in which the individual principle is called "matter." Again: matter taken specifically is contractible through its individual differences, but not through the ultimate reality of form, because form and its reality are really distinguished from matter and can by divine power be stripped of all form, as I asserted (*l. 2. Phys. quaest. 2. art. 8.*). Therefore from the ultimate reality of form the common character of individuation of anything whatsoever is not derived. For just as other things do not borrow their entity from form, so neither do they borrow their unity and individual difference from it.

You will say with Faber (*cit.*): this is true of form in itself, but not of form taken as the ultimate reality of form. On the contrary: first, the ultimate reality of form is not called "form" by Aristotle and Scotus but "matter," as I just noted —

and can only be called form really and not formally. Granting Faber's opinion, everything that Scotus constructs to resolve those testimonies of Aristotle indicating that only what receives matter can be multiplied and divided would collapse; and he would have accumulated those many passages and arguments to disprove Thomas's opinion that the cause of multiplication of individuals is matter to no purpose — if by the individual character is not understood matter taken for the individual difference, since the ultimate reality of form can in no way be that matter in that sense, nor does it suit the text of the Philosopher, as is evident to one who reflects on it. Finally, there still remains the question to ask Faber: what is that ultimate reality of form? And since beyond what has been said he has no other answer, he must be set aside, and Scotus with his followers must be embraced — who hold that the individual principle is the ultimate reality of being, that is, haecceity.

The fourth assertion is that the principle of individuation is the ultimate reality of being, or the individual difference, which is called haecceity. The primary author and patron of this is Scotus (*cited above, quaest. 6. § Ad quaestionem ergo. C.*). And it follows from what has been said: since a nature is not individual and singular through itself, but through something added — something real and positive that is not quantity, not matter, not form, nor anything else — it is plainly inferred to be the ultimate reality of the thing, or haecceity.

Second: every inferior in itself includes something that its superior does not include, because a superior is contracted to an inferior through something contracting and determining it — as is evident in any predicamental series. But a specific nature, which is superior to individual nature, is contracted and determined through the individual difference to individual and singular being. Therefore this individual difference, or haecceity, is the principle of individuation.

Third: the ultimate constituted thing is constituted through the ultimate difference — as is evident, because the nature of the constituted is that of its constitutive. But the individual is the ultimate constituted thing, being placed at the base of the predicamental series. Therefore its principle is the ultimate constitutive, which is the ultimate individual difference and haecceity.

Moreover, one should philosophize in much the same way about species and about the individual. But a species is constituted in specific being through its specific difference — as man through rationality. Therefore an individual is likewise individuated through its individual difference — as Peter through Petriety, Bucephalus through Bucephalicity, and so on for other individuals and singulars.

Against this first objection: a singular act presupposes and requires a singular potency, which it contracts and actuates, as Aristotle indicates (*2. Phys. T. 38.*), saying that a particular form presupposes particular matter. But haecceity is a

singular act — therefore it presupposes a singular potency, which it determines and actuates. But that potency is the nature within the individual or of the individual. Therefore the nature of the individual is singular before the advent of haecceity, and thus haecceity is not the principle of individuation. This argument is Aureolus (*cited by Canonius, 1. Phys. quaest. 6. § circa praedicta.*), from whom Cajetan took it (*1. de essentia, cap. 2.*), and what follows below. I respond: granting the major, I distinguish the minor — of a singular act that has the character of a *quod*, I grant it; of a singular act per se and primarily, which properly has the character of a *quo*, I deny it — for this properly is not called singular but rather the character of singularity, indeed singularity itself, by which the singular is constituted in singular being, just as rationality is not the species of man but the constitutive principle of it in specific being. And perhaps Cajetan, not noticing this (*at the passage recalled, q. 5. cap. 2. 1. part. quaest. 85. art. 7.*), concedes intrinsic individuating differences to individuals — which here he strives to overthrow and eliminate.

You will press: what is posterior is not the cause of what is prior — just as an effect is not the cause of its cause, because a cause is presupposed to be before its effect. Hence there is the common axiom: the cause is prior to its effect. But the individual difference is prior to the nature that is contracted through it, since the contractible precedes the contracting — just as matter, which is actuatable through form, is prior to the actuating form that contracts it. I grant the major and distinguish the minor: in the being of nature, I grant it; in individual being, I deny it. For they are simultaneous and exist simultaneously — just as the nature of animal by natural presupposition precedes rationality, which is its difference through which it is constituted in specific being, yet they exist simultaneously. For an animal cannot exist without being either rational or irrational. Therefore between the contractible and the contracting, such a priority of nature — not of time — is established, as is contended in the objection. Or the major can be distinguished: of what is produced and truly caused, not of a constituting and determining principle.

Against this second objection: the principles of individuation are primarily diverse — but the haecceity of Peter and the haecceity of Paul are not primarily diverse, therefore they are not principles of individuation. The major is Scotus's, who from what was said above establishes that ultimate differences, of which sort haecceities are, share no real common concept. The minor is shown: the haecceities of Peter and Paul have more in common with each other than the haecceities of Bucephalus and Francis. But what share something in common are not primarily diverse, as is evident from the terms. Therefore. I grant the major and deny the minor. Regarding its proof, I distinguish: they share a common real and quidditative concept, I deny it; they share in some third thing really identified with them — which is nature — I grant it. But this does not prevent such haecceities from being primarily diverse.

You will press: what belongs to one and is repugnant to another of the same species necessarily presupposes their distinction. But Petriety belongs to Peter and is repugnant to Paul — therefore they are not primarily diverse but differ in something and agree in something. I say the major must be restricted — provided, that is, that the relevant feature is not distinctive of them — as haecceities are, which are the principles distinctive of individuals, as is evident from Scotus (*Quol. 2. art. 1. ad C.*) if read attentively.

Against this third objection: if Scotus's opinion were true, in every material and corporeal individual there would be three haecceities — namely, of matter, of form, and of the composite — but this is impossible, because one individual would be a triple individual. I respond: there are two partial haecceities and one total — just as there are two partial entities and one total coalesced from them. It does not follow, however, that there is a triple complete individual composed of two partial and incomplete ones.

You will press: if matter and form united to the composite enjoy their own haecceities, then likewise drops of water joined to the whole water, or separated from it, participate in their own haecceities, and are therefore many individuals — but this seems false. The major is evident. The minor is shown: the same water, when certain drops are removed from it or added to it and again joined to it, would lose its haecceity or recover it, and would thus be now "this" and now not "this" — which involves a contradiction. I say there is a disparity, because the said drops when joined together make one with homogeneous and integral unity. But matter and form constitute one with essential compositional unity really distinct from each, as I said in Physics, Book II. I have written many things fully and distinctly in the *Tractatus de Angelis, disp. 1. quaest. 6.*, in nine complete paragraphs, in which I treated of all and singular things — both corporeal and incorporeal — that can be individuated.

Question IV. On Essence and Existence

Article I. Whether the Essences of Things Are from Eternity

The first opinion is that of Henry (*in his Summa*) and Francis of Meyronnes (*1. distinct. 42. quaest. 1. and following, & Quol. 8.*), who suspect that the essences and quiddities of things are uncaused, and that they are created and caused in time only in respect of their being of existence. The second opinion is the common one of Scotus (*2. Rep. dist. 1. quest. 2. & dist. 36. quest. vn.*), Lychetus, Viguer, Barge, Vorlong, Bonaventure (*ibid. art. 1. quest. 1.*), Richard (*dist. 19. quaest. 3. art. 3.*), Ockham (*dist. 36. quaest. vn.*), Aureolus (*art. 2.*), Canonicus (*2. Phys. quaest. 1. art. 2.*), Suarez (*disp. 30. Metaphys. sect. 2.*), Hurt (*disp. 8. sect. 1.*), and the rest, who teach that the essences of things are produced and created by God in time in respect of both their being of essence and their being of existence — so that all being, whether of essence or of existence, is produced and caused by God in time, and what was not made by God is absolutely nothing.

Note first, from Durand (*in 1. dist. 36. quaest. 2.*) after Augustine (*12. Ciuit. cap. 2.*): "Just as from that which is *sapere* (to be wise) wisdom is named, so from that which is *esse* (to be) essence is named." But since being admits of a twofold mode — in potency and in act — essence is likewise posited as twofold: in potency and in act. The former is producible, or it is not repugnant for it to be produced — in which it is distinguished from prohibited being, namely that which is repugnant to be produced, such as fictions and other impossibles. The latter is produced and caused and enjoys actual existence, as are all things that now exist in the nature of things. From this arises the division of being into potential being and actual being, or potential being and actual being — the former is called objective being in a qualified sense and diminutive being; the latter is real positive being and being simply.

Note second, from Bonaventure (*cited above.*), that to be in another can happen in three ways: in respect of actual existence, or in respect of a likeness present, or in respect of creative power. In the first way things exist that are actually existing in the universe — whether inanimate, corporeal, or incorporeal. In the second way things exist in the knower and in the artisan who is working, whether they actually exist or not, whether they are future or merely possible. In the third way things exist in their causes — that is, causes have the power and virtue to produce things — as a plant participates in the power of producing flowers, a tree of producing fruits, and so on. This distinction contributes greatly to understanding and explaining the testimonies of Sacred Scripture and the holy Fathers adduced and expounded by Ockham and Gabriel (*as cited above.*), especially (*Ioan. 1.*): "All things in him were life" — understood, that is, cognitively and causally, since God from eternity knew all things and had the power of creating and causing them, and willed to create those same things in time, as is evident (*Gen. 1.*): "In the beginning God created heaven and earth." Or exemplarily and ideally, because God has in his mind the exemplars and ideas of all things that can be made, according to (*Hebr. 11.*): "By faith we understand that the worlds were framed, so that visible things were made from invisible things." And Boethius (*3. consol. metr. 9.*): "Governing the world and forming it from a like image." Augustine adds (*12. Ciuit. cap. 25.*), saying that ideas are the efficient causes of things. Therefore the passages adduced by opponents in opposition are rightly expounded in this twofold way — ideally or causally — as Lyra also forewarned (*in postil. Ioan. 1. and elsewhere.*). Thus (*Exod. 33.*) is to be interpreted: "I will show you all good" — that is, causally. And Augustine (*hom. 3. in Ioan. & serm. 4. de Verbis Domini.*): "What you seek variously here, he himself will be all things to you as one." And the Seraphic Father in prayer, addressing God, says: "My God and my all." Nor should the following from Dionysius (*de divinis nominibus 1.*) be omitted: "God is the life of the living, the substance of substances, the beginning and cause of every life and substance."

Note third, from Scotus (*in the place cited above, § Concedo. sub C.*), that all the motivating arguments adduced by Henry regarding the divine intellect in

support of and to confirm his own opinion seem also to be able to be adapted and to suit the human intellect in defense of our own position. First: our intellect can understand something not only in respect of its being of essence but also in respect of its being of existence, because each is intelligible — even though that thing may not actually exist, and even though our intellection does not produce or cause it in the true being of essence and existence, nor has the power of producing and causing such being. The same must be asserted of the divine intellect, which — even though a thing may have no being of essence or existence — nonetheless understands it most perfectly. Hence Augustine adds (5. *super Gen. cap. 7*): "God does not know things already made differently from things yet to be made." Therefore although God has foreknown from eternity the being of essence and existence of a thing, no Catholic admits any being of existence of a thing from eternity — but holds that the being of existence of a thing was known from eternity; and the same must be conceded of the being of essence of a thing, namely that no being of essence of any created or creatable thing existed from eternity, but the being of essence was only known.

But there is a difference between these intellects, because the divine intellect understands before the human intellect does — which Scotus calls the first production into intelligible being, and production into known and qualified being. But that intelligible being and known being does not require the being of the thing simply either unproduced or to be produced — because just as our intellect, in order to understand, does not presuppose that being simply, so too the divine intellect, in order to understand things *ad extra*, does not presuppose any being of their essence or existence. Therefore, from the eternal knowledge by which God foreknows things from eternity, it is wrongly inferred that their being of essence is eternal; rather, only that their being as known is from eternity is deduced — which is not a middle between real being and being of reason, as Poncius thinks (*disp. 59. quaest. 5. concl. 4.*), since being taken in the most common sense is rightly and adequately divided into real being and being of reason, as after Aristotle (6. *Metaphys. T. 8.*) the Doctor writes (*Quol. 3. art. 1.*). Therefore the said being does not mediate between either member of being as just described.

Moreover, the members of a good division are opposed, as is apparent from the precepts of a good division — and this can be induced from all particular divisions, especially of animal, which is adequately distributed into rational and irrational, so that no animal can be found that is not either rational or irrational. Likewise no being is found that is not either real or of reason. Nor does it help to say with Poncius (*cited.*) that the said being of creatures is a middle not by participation in the extremes but by negation of them. For since that division is of an equivocal into its equivocates, its parts and members do not participate in the nature of the divided term — of which there is none — but only in the common name, as is clear from the description of equivocals (*l. 1. praedicam. cap. 1.*). It therefore remains to investigate what that being is — whether real or of

reason, whether within or outside the intellect? If the first, it is real being; if the second, it is being of reason. Therefore it does not mediate between real being and being of reason.

Moreover, being is sufficiently divided into created and uncreated, into unparticipated and participated, into being from itself and from another, as I asserted above. But none of these can be such a middle being as Poncius devised — otherwise it would be God or creature, which is impossible. Furthermore, such being is diminutive and qualified, as Poncius himself concedes (*ibid.*). Therefore it is in no way simply being, since between simply being and being in a qualified sense nothing is interposed. Finally, the said being — since it is the same as known being — has its being either from the divine intellect or from a created intellect. The first Poncius denies, against Scotus (*1. dist. 39.*); the second he cannot affirm, since it is against the orthodox faith. But to posit such being of creatures as independent, from itself unproduced, necessary, and eternal is a fiction and plainly a dream, which I am reluctant to continue refuting. And if perhaps the mind of the said author does not err, certainly his manner of speaking is not to be received — since not only must error be avoided but also the way and occasion of erring — of which sort it is to posit, besides God, something independent of itself, unproduced, and eternal, as Poncius (*cited.*) endeavors to prove. See the *Tractatus de Creatione, disp. 1. quaest. 6.*, in which I treated and examined this difficulty at length.

The assertion is that the essences of things are not from eternity, but exist in time whenever God willed to produce and create them, together with their existences. This is the common opinion, and the opposing view has already been rendered obsolete and repudiated by the Doctor (*ibid. § Contra conclusionem istarum rationum. C.*). It is established first from Augustine (*12. Cinit. cap. 5.*) defending the said assertion with these words: "Every essence was made by God." And Sacred Scripture suggests this, especially (*Gen. 1.*): "In the beginning (that is, at the beginning of time) God created heaven and earth." But what was created was created according to its total being — which is being of essence and existence — since creation is production from nothing, or from no presupposed subject. Therefore the essences of things are not from eternity unproduced and uncreated.

You will say: Augustine (*lib. de natura boni 6. 8.*) seems to hold that the being of essence coincides with possible being — but possible being is from eternity, since it is not repugnant for creatures to have been from eternity, as I asserted elsewhere, and things are possible through themselves. Therefore the being of essence is also from eternity. I say either Augustine speaks in the opinion of others, or is to be interpreted of objective possible being — which is known being and diminutive being — not of the being of essence and quidditative being, according to the opinion of Henry cited above. Or one may say with Scotus (*cited, ante N.*) that by the "capacity of the form" mentioned by Augustine,

matter is to be understood — which enjoys entitative act, which is not being of essence nor possible being, as is clear from Physics (*l. 2. quaest. 2. artic....*).

Second: given Henry's opinion, there would be no creation and no annihilation — since things would arise from that preexisting and presupposed being of essence, and would return to that same being of essence, not to nothing — which is contrary to truth.

You will say: in the school of Scotus a real common nature is given, which is not produced — since production, generation, and corruption are of singulars. Therefore such a common nature has an uncaused and unproduced being of essence — which the first opinion, that of Henry, admits and hands down. I say indeed that Scotus teaches a real contractible common nature, really identified with individual differences and formally distinguished from them. Hence although singulars are produced and generated *per se* and immediately, the common nature is produced and generated mediately and *per accidens*, as is evident (*l. praedicam. cap. de substantia, & 1. Metaphys. cap. 1.*). Especially because universals and particulars are inseparable from one another, since the former are intimate and essential to the latter — therefore if the latter exist, so do the former; if the latter are caused, so are the former — with the qualification that we now establish from the Philosopher cited.

Third: either God produces the essences of things as understanding them or not? If the first, then such essences are known before they have that being of essence — and thus are posited in vain on account of God's eternal cognition. If the second, then God produces them purely naturally — as fire naturally heats — which seems absurd of everything that God himself produces *ad extra*, and thus that eternal being of essence is devised wrongly.

You will say: this argument involves a contradiction in the sayings of Scotus. For Scotus himself concedes known being from eternity — having posited which, one can likewise argue: either God first understands this in known being, or not? If the first, therefore it is first understood before it is produced. If the second, therefore he produces purely naturally, as fire produces fire. Therefore either Scotus's argument against Henry is invalid, or in his assertions there is open inconsistency. I say there is no contradiction. For it is one thing to produce something in qualified being; another to produce it in simply being. It would be inconvenient if God produced something in simply being and did not pre-understand it, but not so if he produced something in qualified being — as Lychetus shows at length. Therefore, since Henry speaks of the being of essence which is simply being, and Scotus treats of known being which is qualified being, there is a disparity — and thus no inconsistency exists in the writings of the Doctor.

Against this first objection against the proposed assertion: Ecclesiastes I: "There is nothing new under the sun. Nor can anyone say: behold, this is new." But this

cannot be said in respect of being of existence, since daily new individuals of diverse species arise that never existed before. Therefore it must be understood in respect of being of essence, which is eternal and unproduced. I respond: that testimony must be interpreted of known being, because since creatures were known by God from eternity, nothing new can fall into the knowledge of God. Or it must be expounded of specific being — that is, that God no longer founds new species. Hence it is written (*Genesis 2.*): "He rested on the seventh day from all the work he had done" — and, in the interpretation of Lyra (*in postil.*): he ceased from creating new species. Or: what is now said to be discovered by the wise was discovered previously by others — as Aristotle attests (*1. Met. c. 1.*) — though it perished through the flood, or through the carelessness and death of men and was given to oblivion, as the same Postillator notes (*in cap. 1. Ecclesiastes cit.*).

Against this second objection: relatives are simultaneous by nature (*ex Arist. 1. praedicam. c. de ad aliquid.*). But God from eternity is understanding creatures, and creatures are understood by him. Therefore creatures have some being from eternity that is understood. But that being is not being of existence — therefore it is being of essence, and hence the being of essence of creatures is eternal and unproduced. I respond: it suffices for an intellect to understand a thing that it have objective being — for of a thing not existing, as of a rose in winter, we have cognition according to its objective being. But to argue from objective being to real being of essence is the fallacy of arguing from what is so in a qualified sense to what is so simply.

Against this third objection: truth follows the thing of which it is truth. Hence Aristotle (*at the place just cited, c. de substantia*) hands down: "A statement is true if the thing is so, and false if the thing is otherwise than is affirmed or denied." But there are propositions of eternal truth, as I asserted in Logic (*l. 4. q. 4. art. 5.*), not in respect of being of existence. Therefore in respect of being of essence. I respond: truth does not follow being of existence and essence but objective being. Hence concerning things not existing in the intellect there exist propositions that are true and of eternal truth, as I abundantly explained and powerfully confirmed at the passage just cited.

Against this fourth objection: the divided is predicated of its dividing members, as animal of rational and irrational. But being is rightly and adequately divided into potential being and actual being. Therefore potential being participates in true being before it is produced and caused — but this is not being of existence, therefore it is being of essence. And hence being of essence is eternal and uncaused. I respond: this holds of being in the distinctive sense of potency, not of the distractive sense — just as if man is divided into living man and dead man. Add also that potential being does not have true being in itself, but in its cause, which is able to produce and cause it, as I noted above with the Seraphic Doctor.

Article II. Whether Essence and Existence Are Distinguished from Each Other

Scholastic Doctors are divided three ways on this article. Some — namely the Thomists with Thomas (*l. de ente & essentia, c. 5. & 1. p. q. 3. art. 4.*) — acknowledge a real distinction between essence and existence. Others — such as Aureolus (*1. d. 8.*), Alexander of Hales (*7. Met. in text. 22.*), Gabriel (*3. d. 6.*), and Gregory (*2. d. 6. q. 1.*) — posit only a distinction of reason between essence and existence. Still others — namely Scotus (*2. d. 16. q. vn. & 4. d. 13. q. 1.*), Canonius (*1. phys. q. 9. art. 1. propositione 2.*), Trombetta (*Tract. Formalitatum fol. 37.*), Vallone (*ibid. fol. 58.*), and in part Fonseca (*4. Met. c. 2. q. 4. sect. 4. concl. 3.*) — teach that essence and existence are distinguished from the nature of the thing, formally, not positively but negatively.

Note that essence is equivalent to the nature and quiddity of a thing — as the essence of man is rational animal — while existence is the actuality of a thing; hence "to exist" is said to stand outside of itself (*extra se sistere*). For that being which a thing has outside its cause is said to be actually existing being, because the essence of a thing exists through existence — which is its actuality — and is contracted and modified by it. Hence essence is called the "thing" and existence is its "mode," as I made plain at length (*q. 2. art. 3. & q. 1. art. 3. and other places not rarely*).

The assertion is that essence and existence are distinguished from each other — not really, nor by reason alone, but formally and negatively. This assertion has three members, defended by Scotus (*ibid.*) and (*1. d. 36. q. vn.*). The first part is established first: what are really distinguished from each other can, at least through the absolute power of God, be separated from one another, with one existing without the other, as I proved elsewhere when treating of the real distinction. But existence cannot be separated from essence, nor vice versa. For singulars cannot exist without universals, because these are the essences of those things — thus Peter cannot be without rational and the other essential and quidditative predicates. Conversely, such quidditative and essential predicates cannot exist without singulars and individuals, which are their bases and foundations, in which they inhere and subsist. Hence Aristotle rightly adds (*c. de substantia*): "When primary substances are corrupted, secondary substances are corrupted as well" — since the latter are universal substances and the former are singular. And the same Philosopher continually argues against Plato, who thought universals exist per se separated from singulars, because universals are the essences of singulars, which essence is inseparable from existence — and hence really indistinguishable, since it is impossible for things to exist without their essences, as for Peter and Paul without human nature, and for Bucephalus without equine nature and essence, and so on. Therefore between essence and existence a real distinction is not to be interposed.

Second: between a thing and its mode there is no real distinction, because a mode cannot exist without the thing of which it is a mode — as a degree of whiteness cannot exist without whiteness. But existence is a mode of essence, as I observed above. Therefore between existence and essence there falls no real distinction. And Fonseca (*cited, in fine sect. 2.*) writes that the Philosopher touched on this (*1. post. 1.*). Add that the real distinction falls between thing and thing — but if essence and existence differed really, they would be two things and two beings, which does not seem rightly said — for one existing singular, since it is one with the greatest unity, would be a double thing and a double one, and those two things and two beings would be separable from one another, as things that really differ can be — so that Peter could be separated from himself, since his essence could be without his existence because they are really separated.

The second part is shown first from Aristotle (*2. post. 7.*), who distinguishes the existence of man from his essence with these words: "But what man is, is other than that man exists." And again: "But being is not the substance — that is, the essence — of any thing." And this is intimated by the same author at the beginning of the same book, distinguishing the question "whether it is" — which denotes existence — from the question "what it is" — which designates essence. These are had apart from any operation of the intellect. For even if no one were thinking, there would still be the question whether something is — that is, whether it exists or can exist — and what it is, whether the essence is such or such, definable in this or that way. Therefore in the school of the Philosopher, essence does not differ from existence by reason alone.

Second: things that differ by reason alone — what is adapted to one is likewise accommodated to the other on the part of the thing, and they share the same predicates and attributes. But essence is common and definable and resides per se in a predicament, while existence is not so — it is only located reductively in a predicament and lacks those predicates. Therefore essence and existence differ by more than reason.

The third part follows from the two preceding ones. For if essence and existence are distinguished neither really nor by reason, it is plainly inferred that they are distinguished by a middle distinction — which is called formal. Moreover, things that are described differently are formally distinguished, as has often been insisted upon. But essence and existence receive different descriptions, as is evident from the preliminary note — for essence is described as the nature and quiddity of a thing, while existence is described as the intrinsic mode of the thing, or its actuality. Therefore between them there is a formal distinction. Furthermore, what is contractible and determinable is formally at least distinguished from its contracting and determining term — as is evident of a genus and its differences. But essence is contractible and determinable, while existence is contracting and determining of it. For a common nature through existence becomes an existing one — just as through the individual difference it

becomes this and singular. Therefore between them a formal distinction must be established — not indeed a positive one but a negative one, because since existence is a mode of essence, and a mode, as has been said, is not conceivable per se without that of which it is a mode, nor is it a distinct reality, it follows that they do not formally differ positively but negatively — as Trombetta, Lychetus, and other celebrated Scotists affirm, from whom perhaps Fonseca (*cit.*) and Poncius (*disp. 59. quaest. 4. concl. 2.*) do not depart — not daring to call the said distinction formal actual and Scotistic, because existence is a mode, which is not a reality distinct from essence as a positive formal distinction requires, whereas a negative formal distinction does not require this — which distinction the said authors would perhaps not deny. I know that others call it a modal distinction, the denomination taken from existence, which is a mode of essence. But call it as you will — we do not insist on the name, since the matter is clear.

Against this first objection: Aristotle (*4. Met. c. 2. T. 3.*) openly asserts that man and existing man are the same. And afterward he adds that things subject to generation share the same nature. And (*7. of the same work*) he adds that there is no difference between saying "a man who is strong" and "a man is strong." Therefore essence and existence are entirely identified. I respond: these and similar testimonies that can be adduced must be taken of real identity, not formal — as Scotus indicates in his exposition of them. And this interpretation is exhausted from those same passages, in which the Philosopher writes that those things are the same — as being and one. But it is clear from what was asserted (*q. 2. art. 2. 4. of this book*) that being and one are really identified and formally distinguished. The same must be affirmed of essence and existence, between which falls not a real but a formal distinction.

Against this second objection: what is indifferent and undetermined with respect to something is really distinguished from that by which it is determined and limited — as is evident of matter, which is determined by form and really distinguished from it. But essence is indifferent to existing. Therefore between essence and existence there is a real distinction. I respond: the major holds of thing and thing, but not of thing and the mode of a thing, as happens in our case — and it is exemplified of matter and form, which are two things and two beings, though incomplete and imperfect. To the minor I say it is true in the precise sense, not the divisive sense. For although essence can be prescinded from existence, it cannot be divided and separated from it.

Against this third objection: between potency and act there is a real distinction, because potency can exist without act. But essence is potency and existence is act, since through existence essence exists actually. Therefore between these there intervenes a real distinction. I respond: the major can be granted of subjective potency and formal act, but not of objective potency and its act. For the same thing that is in potency is the very same thing that actually exists through its efficient cause. To the minor I deny that essence is objective potency.

For from what has been said, essence is the nature and quiddity of a thing — which, before it exists, is said to be in objective potency, but is not itself objective potency. For there is a wide difference between objective potency and that which is in objective potency.

Question V. On Substance and Subsistence

What substance is and how manifold, its properties and affections, were treated abundantly and carefully in Logic (*l. 3. q. de substantia*), and in the *Epitome*, *l. 1. q. 4. art. 3. 4. & 5.* Here, however, a few things that are lacking there are briefly weighed and decided.

Article I. Whether Substance Is Prior in Time to Accident

Three opinions are reported by Scotus (*7. Met. q. 2.*) and Anthony Andrew (*ibid.*), the first two of which are refuted by those same authors, while the third is received — as can be seen in the aforesaid authors.

Note that "time" is used in two ways. In one way, properly, as it is defined by Aristotle (*4. Phys. T. 101.*): "the number of motion according to before and after" — for in this sense time is the measure of motion and rest. In another way, improperly — as meaning that it does not imply a contradiction for something to be separated from another, to last without it, and to not depend on it; and thus in this acceptation of time three things are designated as belonging to it: first, that it is not repugnant to be separated from another; second, that it can remain without the other; and third, that it does not depend on the other — as the Doctor indicates (*2. d. 1. q. 5. § Contrà istud. L.*), arguing against Henry (*Quol. 9. quaest. 3.*).

The assertion is that substance precedes accident in time. It is proved first from Aristotle (*7. Met. T. 4.*), who advances this proposition: "Substance is prior to accident in time, in definition, and in cognition." The Doctor agrees (*ibid. & at the places just cited.*). Second: what is not repugnant to be separated from another, and does not depend on it, is said to be prior in time in the second sense accepted above, as is apparent from the preliminary note. But substance can be separated and stripped of every accident, and does not depend on any accident — indeed, on the contrary, accident depends on substance, is caused by it, and cannot exist without it. Therefore substance precedes every accident in time. This priority, moreover, does not seem to differ from the priority of nature, just as a cause naturally precedes its effect.

Against this first objection: nothing is prior in time to what is eternal, since the eternal is without before and after and lasts with all its duration at once. But some accidents are eternal — namely motion (*8. Phys. 1.*). Therefore the proposition "substance is prior in time to every accident" is not universally true. I grant the major and deny the minor — for Aristotle wrongly held that the world and motion existed from eternity, as I showed clearly there. Or: even

granted that motion and time had existed from eternity, substance would still be prior in time to every accident, in the last acceptance of time adduced and exhibited and explained in the preliminary note.

Against this second objection: risibility is simultaneous in time with humanity — but risibility is an accident and humanity is a substance, and the former arises from the latter. Therefore substance does not precede accident in time. The major is known to all. The minor is at hand, since risibility is a proper accident, as is evident in the *Isagoge* of Porphyry. I grant the major. To the first part of the minor, I say that risibility is indeed a proper accident — taken for something extraneous really identified with humanity — but not a common accident, which is what the present difficulty is about.

Article II. Whether Substance Precedes Accident in Definition

Aristotle (*7. Met. summa secunda, cap. 1. T. 4.*) openly affirms that substance precedes accident in time, in definition, and in cognition. I examined the first in the first article; the second in the second; and the third will be weighed and decided in the third article.

Note that neither actual inherence of an accident in a subject nor aptitudinal inherence enters into the essence of the accident, as will be examined and established in the final question of this book. But an accident connotes the subject in which it inheres — which subject is the substance from which it arises — hence it is called "the being of a being" (*entis ens*), that is, a being caused by substance. Hence in the definition of every accident the subject is always placed as something added, and its definition is accordingly called a definition by addition (*definitio per additamentum*), as I explained in the *Epitome, l. 2. quaest. 7. art. 2.*

The assertion is that substance precedes accident in definition. So Aristotle (*ibid.*) and Scotus (*ibid.*). It is proved first: substance is prior to accident in entity — therefore also in definition. The antecedent is conspicuous: substance is the subject and cause of accident; but a subject is prior to that which is subjected in it. The consequence holds from (*2. Met. T. 4.*): "As a thing stands with respect to entity, so it stands with respect to knowability." But substance precedes accident in being — therefore also in being known and being defined. Second: the simple is prior to the mixed and composite and aggregate. But an accident includes its subject, in which it inheres. Therefore accident is posterior to substance in definition.

Against this first objection: a definition is constituted only from genus and difference — but the definition of an accident is of this sort — therefore an accident does not include a subject in its definition. The major is evident. The minor is shown from the antepredicamental rule: of different genera there are diverse differences, species, and individuals. But the accident has diverse genera, as is plainly clear from the book of predicaments. Therefore. I distinguish the

major: of a quidditative definition, I grant it; of a descriptive definition, I deny it. To the minor I say with Scotus (4. d. 12. q. 2. § *Ad argumenta principalia K.*) that in the definition of every accident the subject is placed — which is substance — so that a perfect and intellect-satisfying concept of it may be had, which cannot be had of an accident without the subject on which it depends, as the same Doctor writes (*ibid.* q. 1. § *Ad q. Respondeo L.*).

Against this second objection: a proper and legitimate definition only explains distinctly the nature of the defined — but the nature and essence of an accident is not confused and mixed with the nature and essence of substance, since accident is just as simple as substance. Therefore it is not necessary that substance be placed in the definition of accident, and consequently accident is not placed after substance in definition. I grant the major. To the minor I say that although accident does not formally and essentially include substance as its subject, it nevertheless connotes it and is ordered toward it as depending on it. Hence every accident is completely and satisfyingly defined through substance, as Scotus and Mauritius forewarning (*quaest.* 29. *Universalium*, fol. 4. col. 2.).

Article III. Whether Substance Is Prior to Accident in Cognition

I adduced and explained the many modes and acceptations of priority in the *Epitome* — here I only recall and adduce two: one is called the primacy of generation, which occurs when one thing is generated before another — as the heart in an animal is generated before the rest of its members and parts. The subsequent one is called the primacy of perfection, whereby what is more perfect and excellent than another is said to be prior. Hence the Philosopher adds (9. *Met.* 16.): "what is prior in generation is posterior in perfection — and conversely, what is posterior in generation is prior in perfection," as is evident in the order of nature, which proceeds from the imperfect to the perfect.

The assertion is that substance of itself and absolutely is prior in cognition to every accident — but from our perspective, accident is known before substance. This assertion has two members, which the Doctor hands down (7. *Met. quaest.* 3.). The first part is established first from Aristotle (7. *Met.* T. 4.), who absolutely advances this proposition: "Substance is the first of all beings in cognition." And it can be proved from the same Philosopher (2. *of the same work*, T. 4.), who establishes as a maxim: "As a thing stands with respect to being, so it stands with respect to being known." But substance in being precedes accident as its subject. Therefore also in being known.

Second: substance is the first being and cause of the rest of beings, as Aristotle writes (*at the place just cited.*). Hence among the predicaments it holds first place. Therefore absolutely substance is found to be first with respect to cognition.

Third: substance is more perfect than every accident — for it is a being subsisting per se, while accident is a being in another and a being of a being. Therefore in dignity and perfection, substance excels the rest of beings.

The second part is shown first: all our cognition takes its origin from the senses, and the senses only perceive sensible accidents — as the eye color, the ear sound, smell odor, taste flavor, and touch primary qualities. Therefore from our perspective accident is known before substance. Second: through accidents we arrive at knowledge of substance. Hence Aristotle writes (*1. de anima T. 11.*): "Accidents contribute greatly to knowing substance." And (*3. of the same, 39.*): "The one who understands must contemplate phantasms." But species and what through them is represented to sense and intellect are accidents. Therefore accident is first in cognition from our perspective and in the order of generation. Hence its cognition is more imperfect — and what is more imperfect is first in the way of generation, according to what I brought forward at the end of the preliminary note: what is prior in generation is posterior in perfection.

Against this: what is known by us is known through a species representing the object to sense and intellect, as I showed elsewhere. But of substance for this state we have no proper species, as the Doctor writes (*1. dist. 3. quaest. 3. & dist. 22. quaest. 1.*) — though we do have one of accident, through whose knowledge we arrive at knowledge of substance. Therefore accident is prior in cognition to substance. I respond: the argument concludes of cognition according to proportion, not of cognition in itself and absolutely and perfectly taken — as is sufficiently declared and proved above, and can be further illustrated by this example. The vision of an eagle looking at the sun is absolutely more perfect than any vision of ours — yet according to proportion, our vision of this white thing is more perfect than the eagle's vision of the sun. The reason is that we see this white thing more perfectly than the eagle sees the sun.

Article IV. On Subsistence

Whether and what hypostatic and personal subsistence is, is greatly controverted among the Scholastic Doctors. For us it seems to have become known solely through faith in the sacred mysteries of the Trinity and the Incarnation. And the greater and more serious difficulty is whether it is distinguished from the singular and individual substance. First of all, Aristotle and the other Philosophers neither acknowledged nor distinguished it from singular substance, as is evident in the book of the predicaments and in other places where Aristotle himself treats of substance. What is cited from him (*1. Met. 1.*): "Actions are of suppositis" — in that passage "of suppositis" is not found, but "of singulars," as Scotus rightly interprets (*that passage in his commentary.*). Hence Augustine (*7. Trin. cap. 5. & 9.*), whom Aureolus reports and follows (*1. dist. 25. artic. 3. propositione tertia.*), says that formerly "person" was confused with singular and individual substance, and no distinction was established between them — but with the passage of time the holy Fathers and Scholastic Doctors distinguished person from singular and individual substance, and hence in divine matters confessed three persons and one singular substance. And in the

humanity of the divine Word, they confessed one person of the Word himself and two natures and singular substances — divine and human. There are read, moreover, many divergent opinions at Bassolis (*3. distinctione prima, quaestione prima, articulo primo.*), Faber (*ibid. disput. 2.*), and Fonseca (*5. Met. cap. 8. quaestione 6.*) — on what a person formally presents and what it adds above a singular substance, and what distinction obtains between them. From these I select and discuss three more important and celebrated ones. The first is that of Durand (*1. distinctione 34. quaest. 1.*) and Henry (*Quol. 4. quaestione quarta.*), who hold that the singular nature and individual substance differ from the supposit and person only in the mode of conceiving and signifying — as concrete and abstract differ, such as "man" and "humanity." The second is that of Cajetan (*3. part. quaest. 4. articulo 2.*), Medina (*ibid.*), Ferrariensis (*4. contra Gentes, capite 42.*), Fonseca (*cit. sectione quarta.*), Suarez (*disput. 34. Met. sectione secunda, num. 20.*), Hurt (*disput. 11. sectione tertia.*), Arrubal (*disp. 4. sect. 11. subsect. 2.*), and many others, who hold that a supposit adds some real positive thing above the singular substantial nature — which the aforesaid Recents say is a substantial mode, the ultimate term and complement of the same singular substance. This opinion does not seem improbable to Scotus (*3. distinctione prima, quaestione prima, articulo tertio, § Ideò propter sub D. vers. Quid autem sit illud proprium, quo natura est personata, duae videntur viae probabiles. & § Non asserendo potest mediari inter istas vias ante E. & 1. dist. 25. quaest. vn. & dist. 23. quaest. vn.*). In favor of it are Lychetus (*ibi in com.*), Gadius (*Quol. 19.*), and Rhadus (*3. parte contr. 1. art. 1. conclus. 5.*). The third is that of Scotus (*now cited*), and (*Quol. 19. art. 3. V.*) and (*in Report. 3. dist. 1. quaest. 1.*), Bassolis (*ibid.*), Meyronnes (*quaest. 11. Quand.*), Bonetus (*6. naturalis Theolog. cap. 1.*), Aureolus (*1. dist. 25. art. 3.*), Ockham (*3. quaestione.*), Gabriel, Marsilius, and the rest of the Nominalists, Molina (*1. part. quaestione 29. disput. 2. in fine.*), Salmerón (*Tom. 2. Tract. 27.*), and others both older and more recent, who teach that a supposit formally adds nothing to the singular and individual substance beyond a twofold negation — of actual and aptitudinal dependence.

Note first that singular, individual, supposit, and person stand to each other as superior and inferior, as Scotus touches upon (*1. distinct. 2. quest. 7. § Ad 2. quaestionem, CC.*). For every person and every supposit is singular and individual — but not every singular and individual is a supposit and person, because singular and individual belongs both to substance and to accident. For this whiteness is indeed a singular but is neither a supposit nor a person. Moreover, every person is a supposit, but not every supposit is a person — for "supposit" extends more broadly than "person," being adapted to both living and non-living substance, while "person" is adapted to the rational and intellectual alone. Hence person is defined by Richard of St. Victor (*4. Trin. cap. 22.*) as "the incommunicable existence of an intellectual nature." Through this, the description of person given by Boethius (*libro de duabus naturis & una persona Christi*) — "the individual substance of a rational nature" — is corrected and expressed. For in place of "rational nature" is placed "intellectual nature," and

instead of "individual substance" is placed "incommunicable existence," as the Doctor rightly notes (*1. dist. 23. quaest. vn. § Ad quaestionem ante C.*).

You will say: Augustine (*lib. contra Donatistas post collationem lib. 4.*) calls fish and cattle "persons." Therefore the name "person" is not accommodated solely to rationals and intellectuals. I say that there Augustine spoke metaphorically of "person" — just as in the Gospel the predestined are improperly called "sheep" and the foreknown "goats," as is evident (*Matt. 25.*): "He will set the sheep on his right and the goats on his left."

Note second, from Scotus (*just cited & dist. 2. quaest. 7. § Ad q. dico DD.*), that there is a twofold incommunicable and a twofold communicable — as a *quo* and as a *quod*. What is communicable as a *quo* is what is communicated to something as a part or in the manner of a part — as form is communicated to the composite, of which it is a part. What is communicable as a *quod* is what is communicated to something as its quiddity and essence — as the universal is communicated to the singular. What is communicable as both *quo* and *quod* is what is communicated to something according to its entire being — as the common nature is communicated to singulars. Conversely: the incommunicable as a *quo* is what is not communicated to something as a part or in the manner of a part; and the incommunicable as a *quod* is what is not communicated to something as its quiddity and entire essence. A supposit is incommunicable with that twofold incommunicability — as *quo* and as *quod* — namely, the supposit cannot be communicated to anything either as part or as whole, either as form or as entire essence.

Note third, from the same Doctor (*Quol. 19. § De tertio art. V.*), that there is a threefold dependence: actual, aptitudinal, and potential. Actual dependence is that by which one actually depends on another — as whiteness has actual dependence on the white wall in which it inheres. Aptitudinal dependence is that by which one aptitudinally depends on another — as a stone existing above has aptitudinal dependence on its place below, which is its center. Potential dependence is that by which something has no repugnance to depending on another — as it is not repugnant for a stone in its center to be placed above. Now a supposit and a created person is independent with actual and aptitudinal independence — that is, it depends neither actually nor aptitudinally on another. Hence a rational soul is not a person, because although when separated from the body it does not actually depend on the body, it still has aptitudinal dependence toward the body itself. Bassolis (*as cited above*) adds that the rational soul separated from the body is not a person because it is not a total and complete nature as is required for the personal character, but a partial and incomplete one — which is excluded from the character of person. But a divine Person enjoys a threefold independence — actual, aptitudinal, and potential — meaning it neither actually, nor aptitudinally, nor potentially depends on another, because it is repugnant for it to depend on another. Hence God alone is

independent, and to God alone is it repugnant to depend on another — not only by reason of the three personalities but also by reason of the absolute subsistence that belongs to God as he abstracts from the three Persons, as I showed and proved at length (*Tract. de Deo Trino, disp. 4. quaestione 10.*).

The first assertion is that suppositional and personal subsistence does not differ from singular and individual substance only in the mode of conceiving and signifying — in the concrete and abstract. This follows from Scotus (*at the places just listed*) and is shown first. Signifying belongs to a name, because a name is a voice signifying by convention, as I said and expressed in the *Epitome, book second, question second, article first*. But a supposit does not differ from a singular nature by name and word alone — otherwise they would be entirely the same in reality, and thus in divine matters there would be only one person, because there is only one divine nature; and in Christ there would be two persons, because there are two natures, divine and human — which is erroneous and heretical. From this arose the heresy of the Sabellians, because they did not know how to distinguish and establish a difference between nature and supposit, as Alphonsus a Castro reports (*5. Adversus haereses, verb. Deus, haeresi quinta.*) after Eusebius of Caesarea (*l. 10. historiae Ecclesiasticae, cap. 29.*). Second: things that differ by the mode of conceiving alone differ by reason — but apart from any distinction of reason, a supposit and a singular substantial nature still differ from each other. For the singular human nature was assumed by the divine Word, but not its human supposit — as has been established by faith. Therefore they differ by more than reason.

Third: from the seventh general Synod (*Tom. 3. Conciliorum, actione 6.*) it is read that many erred by not distinguishing nature from supposit. And Emperor Justinian in an edict of faith, after the second Council of Toledo, openly declared that nature and supposit do not coincide. Moreover, John of Damascus, reported by Alphonsus (*l. 4. adversus haereses, verbo Christus, haeresi 4.*), writes that the errors and heresies of the Eutychians and Nestorians arose from the fact that they confused nature with person. For Nestorius, acknowledging two natures in Christ, thought there were in him two persons. Conversely, Eutyches, acknowledging only one nature in Christ, confessed one person in him. Therefore, according to truth and orthodox doctrine, a supposit and a singular substantial nature are distinguished from one another. Nor does it help to say with Vasquez (*Tom. 1. tertia partis, disp. 31. cap. 1.*), in defense of Durand, that to save all the aforesaid it suffices to have a distinction of reason between nature and supposit — for the motivating arguments and testimonies cited above intend more. For if nature and supposit do not differ on the part of the thing except through the intellect, it is plainly inferred that in Christ there would have been two persons — human and divine — which smacks of Nestorian heresy. For if according to Durand nature and person are the same thing, and the human nature was truly in Christ, then so also was the human person — since

these two really do not differ except by an operation of the intellect and in the mode of signifying.

Hence briefly the argument runs thus: either in Christ there existed a human person or not? If the first, the Nestorian heresy arises, positing in the same Christ a double person — created and uncreated. If the second, then person is really distinguished from nature — since it does not remain when nature remains. But to remain and not to remain with respect to the same thing involves a contradiction, and clearly indicates a distinction of more than reason and mode of conceiving and signifying. Furthermore, the communicable and the incommunicable differ with no one thinking — but nature is communicable and assumable, while person is incommunicable and inassumable, according to truth and the opinion of all. Therefore a distinction of reason alone is not sufficient between nature and person. But if you say that the authorities cited should be taken of divine nature and person — which differ by reason in the Thomistic school — this helps Durand even less than the preceding response, since the Councils and Fathers were speaking of a created person. For they were disputing against Nestorius, who admitted two persons — created and uncreated — in Christ, and strove to show that in Christ there are two natures, divine and human, and one supposit of the Word alone that supplies the place of the human supposit, which did not exist in him. But if it truly did not exist, it is evidently deduced that it is distinguished from the created nature that was in the same Christ. Between that which is and that which is not, it is plainly established that there is a distinction in reality and not by reason — and hence the said Fathers, notably Vigilius and Epiphanius, were speaking explicitly also of the distinction of nature from a created person. All the more so because a divine person differs formally from nature, with every operation of the intellect excluded and its distinction eliminated — since the former is absolute and communicable, the latter relative and incommunicable, between which a formal distinction is found, which from what I have asserted elsewhere precedes every activity of our intellect.

Moreover, neither Suarez, Hurta, and Arrubal are to be heard or tolerated when they draw the opinion of Scotus to that of Durand. For, as will be plainly evident below, a wide difference lies between the chief of the subtle school and Durand — who is not infrequently judged by theologians to be a leader of rash opinions. For Durand thinks that a singular nature and a supposit differ as concrete and abstract — which are in fact the same and differ only in the mode of signifying — while Scotus holds that a supposit and nature are distinguished on the part of the thing without any mode of conceiving and signifying, and establishes that the supposit itself is incommunicable as *quo* and as *quod*, as I explained in the second note above. Again, Durand concedes that man taken absolutely and precisely is a supposit, while Scotus denies it; and according to the latter, God taken precisely from the Persons is indeed the individual of the Godhead, yet is not a supposit. Moreover, Durand distinguishes nature from supposit only in

the mode of signifying — while Scotus presupposes the distinction and asks whether what by which a supposit differs from nature is positive or negative, as will be made plain below through the following assertions. Scotus is therefore not with Durand but far distant from him, as anyone who interprets both without distortion can see.

The second assertion is that a supposit taken formally does not add any real positive thing to the singular substantial nature. The Doctor (*at the passages cited*) is its patron. It is proved first: that positive thing allegedly added above the individual nature, which is held to be formally the supposit — either it is assumable and capable of being united to something in suppositional unity, or it is inassumable and incapable of being united to another in such suppositional and personal unity. Neither can be said. Therefore no real positive thing superadded to the singular individual substance is to be admitted. The major is evident from a sufficient enumeration of parts. The minor is shown as to the first part: a supposit is formally incommunicable, as is apparent from its definition explained in the first note. As to the second part, it is established: the thing in question is inassumable and was in fact not assumed by the divine Word, as the Councils cited above define and the Fathers mentioned confirm, and all Scholastic Doctors in *3. distinctione prima* teach. But what is inassumable is incurable — on the authority of Damascus (*3. fidei, capite 6. 18.*), who says: "What is destitute of assumption is incurable." But what is incurable is irredeemable and unsaveable — and thus there would be something in us that Christ not only did not and could not redeem and save, but could not have redeemed and saved either, namely that real positive thing which person adds above the singular substantial nature. The Thomists — notably Cajetan, Medina (*3. parte, quaestione quarta, articulo secundo.*), and Suarez (*disput. 34. Met. sectione secunda, numero 20.*) — arise against this and distinguish a twofold positive entity: one natural, following nature; the other personal, following person. The former they make assumable, capable of union, and curable; the latter, inassumable, incapable of union, and incurable. Through this distinction they suppose themselves to satisfy the Councils and Fathers cited for us. Against this, however, I argue thus: either everything that is assumable by the Word pertains to the quiddity and essence of the assumable nature, or necessarily follows and accompanies it. If the first, then the Word did not assume the singularity or haecceity of the humanity assumed by it — since this is not of the essence of that humanity — and likewise the properties, powers, and faculties that proceed from it. If the second, then just as it assumed its individual difference — which we call haecceity — so also it assumed the said personal positive entity through which nature is supposed and personated. For each positive entity is in obediential potency to be assumed by God for whatever he effects if he wills. For it is an absolute entity, creatable and annihilable, and hence capable of union and assumption. For all things are placed in the hand of God — hence David, addressing God (*Psal. 118.*), says: "All things serve you," and (*Psal. 75.*): "Who can

resist you?" Since therefore all things do the word of God, and no one can resist his will, it plainly follows that no power exists in the said entity by which it could resist being assumed and united. For if being assumed means nothing other than being hypostatically united, then it can itself be united to the hypostasis of the Word, just as any other entity can. Especially in the position of Suarez, who thinks that any creature can be an instrument of creation for creating anything to which God wills to assume it. For if every creature in creation can be assumed, it is not apparent why also in hypostatic union — since the latter is not a greater or more difficult work than the former, nor is it harder to unite than to make. It is remarkable in Suarez and others among the Recents that every creature can obey God, and yet that personal positive entity cannot obey God — and that there should be some creature altogether disobedient with respect to which God is powerless to coerce it, while a resistive power would be established in that same entity and a coercive power would be removed from God. All the more so because God is in all things through essence, presence, and power, and through grace in the blessed and in the assumed humanity through hypostatic union — as Paul hints (*Coloss. 2.*): "In him dwells all the fullness of the divinity corporeally" — that is, as Lyra (*in postil.*) explains, through union in the supposit of the Word. But if God exists in all created things by the aforesaid modes, then also in that positive entity — and can inhabit it "corporeally," to speak with Paul, which is equivalent to assuming and uniting to himself, in Lyra's interpretation (*ibid.*). If therefore that positive entity is capable of union with God, it is not apparent why in Christ it was not united — as Nestorius contended. But if it is not capable of union with God, God's power of uniting seems to be lacking — which is absurd and false in both alternatives.

Second: that to which something is lacking for totality, perfection, and integrity is not total, perfect, and integral, as is evident from the description of whole, perfect, and integral. But nothing is lacking to Christ pertaining to the totality, perfection, and integrity of man — for he is a perfect man, subsisting in a rational soul and human flesh, on the authority of Athanasius (*in the Symbol.*). But if personality were a real positive entity, something pertaining to the complement of man would be lacking to him — namely, the created personality, which according to the Adversaries is the ultimate term and complement of humanity. Therefore Christ would not be whole and perfect man, as is proclaimed by all the Orthodox and defended against sectarians by Alphonsus (*l. 4. adversus haereses, verbo Christus.*).

The aforesaid authors arise against this and say — making a distinction — that Christ indeed participated in everything pertaining to human nature, by reason of which he is called a perfect man, but not in what belongs to his person, whose place was taken by the person of the divine Word. Therefore they do not consider it inconvenient that Christ lacked the said positive entity constituting person. On the contrary: that positive entity devised by the aforesaid authors is the ultimate term and ultimate complement of nature, as they themselves

admit. Therefore it pertains to nature — and hence if Christ had been lacking in it, he would not have been perfect, since he would not have had what belongs to the integrity and complement of nature. And something would be in man that was not redeemed and healed by Christ the Lord — which contradicts the words of Christ himself (*Ioan. 7.*): "I have made the whole man well." And Augustine (*in fine serm. 145. de tempore*): "The Word redeemed everything, assumed everything, liberated everything in its totality — he who created all in totality." And Damascus (*3. fidei, capite 6.*): "He assumed the whole in totality, and the whole was united to the whole, that he might bestow salvation on the whole." There follow the definitions of the Council of Chalcedon (*actione quinta.*), where these words are read: "We teach that the same Christ, according to humanity, is in all things like us according to humanity, without the stain of sin." And the sixth Council (*actione prima.*): "Like us in all things, without sin." This was prefigured by the Apostle of Tarsus (*Hebr. 2.*): "He had to be like his brothers in all things" — save guilt, as the glossator Lyra notes — to which accords Dionysius (*lib. de divinis nominibus, cap. 2.*): "From us the Word was fully and truly made man." And even more remarkably, Damascus (*at the passage cited, capite 6. & 22.*) gives testimony: "Nothing of what God the Word planted in our nature when he formed us in the beginning is lacking, but he assumed all — body, rational soul, and their properties." These and other things that Alphonsus (*just cited*) adduces not obscurely show that the opinion of Scotus on the supposit and person taken formally is truer and more conformable to Sacred Scripture, the ecumenical Councils, and the holy Fathers than the rest. But if personality were a positive substantial entity, Christ would truly be lacking in that entity, and would not be "like us in all things" except for guilt. For heretics — and even Catholics — would say that Christ lacks that positive substantial entity which makes for the excellence and dignity of man; and more excellent and noble is the personality of man than any kind of irrationality or inanimate supposit. And I add that according to the Adversaries it is the last positive complement of man — which does not seem to accord with the sanctions of the Councils stating that the Word assumed everything, even the properties of man, except sin. For it would be opposed to them that the Word did not assume the said positive entity posited and asserted by the Adversaries — and thus that except for guilt it did not unite to itself all things conducive to man — namely, that positive substantial entity — which does not seem to agree with the Councils and Fathers aforesaid.

Third: if the Word were to lay aside the assumed humanity — given this hypothesis — either that humanity would remain unpersonated, or the personality of it would be newly produced in that humanity. Neither can be said. Therefore the said positive entity through which nature is constituted in the being of person is not to be admitted. The major is evident and sufficient: just as the Word could assume humanity, so it can also lay it aside. Having this granted, the question is investigated: whether the said humanity would remain without personality, or whether a personality for it would be caused from that humanity

itself, or by God. The minor is established as to the first part: it is inconvenient for such a nature to exist without its personality, which is its ultimate complement and term — just as a line cannot subsist without the points terminating it. As to the second, it is shown: God can refrain from cooperating to its production. Given this, that nature would persist without its personality, and there would be a personalizable nature without personality — as a rational one without rationality.

Medina (*cited.*) responds: given the hypothesis, personality would flow from nature as its property, in the way that risibility proceeds from humanity as its property, ninnability from equinity, and light from the sun. On the contrary: first, Medina himself and the other Thomists deny that substance is immediately and proximately active — therefore since that humanity is a substance, it cannot cause its own personality. Moreover, if personality flows from humanity as its property — since all properties and properties remained in the assumed humanity, as Damascus teaches (*at the place just recalled.*) — so too its personality would have remained, which is erroneous and heretical. Again, something would have been lacking to Christ's humanity — namely, that personal property — and hence it would not have been whole and perfect humanity, as was defined in the Councils cited above. Hence those who took away the will from that humanity — the Monothelites — were condemned at the Council of Constantinople, as Alphonsus testifies (*ibid. haeresi 6.*).

Cajetan (*cit.*) responds otherwise and says that personality flows from humanity not as a property but as an effect from its cause. Hence he does not think it inconvenient for a nature abandoned by the Word to exist without personality and to receive such a mode of subsisting alone until another mode of subsisting *per se* comes — which is the personal one. But this response is of no moment. For it multiplies mode upon mode, which is vain and fruitless. Moreover, if God had from the beginning of the world produced all singular intellectual natures in that way, none would be persons — which appears absurd. Furthermore, a singular intellectual nature existing this way is truly and properly a person — for in that way it is incommunicable as *quo* and as *quod*, as the definition of person requires. Therefore the aforesaid explanation and response does not satisfy and does not diminish the force and efficacy of Scotus's argument.

The third assertion is that suppositional subsistence is not a positive substantial mode added to a singular substantial nature actually existing. This follows from the Doctor (*ibid.*) against Suarez (*cited above, sect. 4. n. 24.*) and other Recents. It is proved first: the mode of a thing is distinguished modally from the thing of which it is a mode, as the same Suarez candidly admits (*ibid. n. 33.*), or formally and negatively, as the Scotists want. But what is modally distinguished consists of inseparables — as does what is formally distinguished. But in Christ there did not exist a created supposit in the humanity united to the Word, but only the divine supposit. Therefore between nature and supposit there is no modal

distinction — and consequently neither is the supposit itself formally the said substantial mode. Moreover, to feign a real and modal distinction simultaneously between them, as Suarez does (*at the place just cited*), involves a contradiction in terms — since real distinction is between thing and thing, and modal distinction is between a thing and its mode. Especially since he himself does not distinguish existence really from essence, though he concedes that existence is a mode of essence — why then does he now interpose a real and modal distinction between nature and supposit, which he makes its substantial mode?

Second: from nature and supposit there is no composition — otherwise in God there would be composition, in whom there is one nature and three hypostases; likewise the person of Christ would be composite. But Suarez (*at the passage cited, n. 39.*) holds that from the said mode and nature there is composition, so that the former is determining and actuating and the latter is determined and actuated. This especially seems most false both in God and in Angels. Again, something of human perfection would be lacking to Christ's humanity — namely, the said substantial mode — which, since it does not enter into the essence of man, would be adventitious to it and accidental, not substantial. Again: to an accident existing without a subject in the Eucharist, no new positive mode is added, as I showed elsewhere. Therefore neither to a singular substance existing is there to be given a real positive mode determining and actuating it. What I adduced in Physics (*l. 2. quaest. 5. art. 2.*) also pertains here — where it is shown that form is united to matter without any substantial mode superadded to them.

The fourth assertion is that suppositional and personal subsistence formally adds to the singular substantial nature something negative — namely, a twofold incommunicability as *quo* and as *quod*, or a twofold negation of actual and aptitudinal dependence. This is the position of Scotus (*cit.*). It is proved first from the refutation of the others: since a supposit and person does not formally coincide with singular substantial nature — as I showed in the first assertion — nor is it something positive, nor a substantial mode, as I proved in the two preceding assertions — therefore it is the negative thing shown and asserted above. Second: from the definition of person, which is the incommunicable existence of an intellectual nature. For a person is not precisely the intellectual nature, because this is in Christ without a created person; nor is it formally existence, because existence belongs to singular nature, and the humanity in Christ participates in its own existence — which existing humanity was assumed by the Word. What remains is the twofold incommunicability and twofold negation of dependence shown and explained above, through which a person is formally constituted in the being of person.

Third: what first, when posited, is posited, and when removed is removed, formally constitutes a supposit. But given that twofold negation of

communicability and dependence, a person and supposit is given, and when it is removed, the supposit is removed. Therefore that twofold negation formally constitutes a supposit. And hence it is concluded that a supposit materially includes the singular substantial nature, and formally includes the twofold negation of dependence — actual and aptitudinal — as just described. Nor should anyone be surprised by this, since primary substance is described by a twofold negation — namely, what is neither in a subject nor said of a subject. Matter (7. *Met. T. 8.*) is designated negatively; indeed God is known through negations, as Dionysius (*lib. de caelesti Hierarchia.*) hints — and Alexander of Hales infers from him (1. *p. quaest. 2. art. 2.*). All the more so because in this way the difficulties raised by the Adversaries are easily dissolved, and all things are well and properly coherent — as Molina (1. *p. quaest. 29. art. 1. in fine disp. 2.*) notes and defends above others. And this will be clearer and plainer from the resolution of the objections to be adduced immediately below.

Against this first objection in favor of the first opinion: concrete and abstract do not differ except in the mode of signifying, as "white" and "whiteness" — with Scotus's assent (1. *dist. 4. q. 1. in calce.*). But "man" is a concrete name and "humanity" is an abstract, and the former is a supposit and the latter is a nature — therefore nature and supposit entirely coincide, and thus a supposit adds nothing above nature. I distinguish the major: of concrete and abstract of accident — which others call the concrete concretized to a subject — I grant it; of concrete and abstract of substance — which others describe as concrete concretized to a supposit — I deny it. So Lychetus (*in com.*) expounds that passage of Scotus. The reason for the difference is that singular accident, since it is in a subject and cannot naturally subsist without it, cannot be a supposit; but a singular substance, since it is a being per se, can subsist per se in solitude and not depend on any extrinsic supposit — hence it can be a supposit through something added to it, by reason of which it is called incommunicable and independent.

You will press: what the supposit adds above the singular nature is the twofold negation set out and explained above — but a negation is nothing; therefore a supposit adds nothing to nature. I grant the major and distinguish the minor: a negation is nothing formally, I grant it; fundamentally, I deny it — just as eternity formally is the absence or negation of beginning and end, while fundamentally it is the divine essence existing entirely at once and independently, as Scotus hints (*Quol. 6.*), whom Suarez follows (*disp. 50. Met. sect. 4. n. 12.*). I add that privation is the absence of a form in a suitable and fitting subject, and yet is a principle of natural generation (1. *Phys. cap. 6.*) and the terminus *a quo* of the same, as I sufficiently explained and proved there. So it should surprise no one if a supposit taken formally adds something negative to the singular substantial nature.

Against this second objection in favor of the second opinion: the divine supposit adds something positive above the divine nature — namely, a subsistent relation of origin, through which it is constituted in the being of a supposit. Therefore the same must be affirmed of a created supposit, since it also adds something positive above nature. The consequence holds, since the reason seems the same in both. For both agree in the same character of supposit — therefore if the former is positive, so also is the latter. I grant the antecedent and deny the consequence. The reason for the difference is that the divine supposit presents the negation of a threefold dependence — actual, aptitudinal, and potential. But the negation of potential dependence designates something positive. For what negates potential dependence and for which it is incompatible to depend on another formally includes something positive, by reason of which it is incompatible for it to be communicated to another. But a created supposit, because it is constituted only through the twofold negation of actual and aptitudinal dependence, therefore formally includes nothing positive. The common character of person, however, abstracts from positive and negative — just as being abstracts from finite and infinite, and animal from rational and irrational. Therefore this argument, held in such great esteem by the Recents, wholly collapses; and their admiration in the school of the subtle ceases, if they correctly consider and equitably judge.

You will press: an uncreated and a created person are univocated in the common character of person, since the definition of person is adapted to each. But between positive and negative there is no common univocal — therefore if an uncreated person formally designates the positive and a created one the negative, they are not univocated. Scotus addresses this (*in 3. praealleg. § per hoc ad argumenta. G.*) and says that an uncreated and a created person are indeed univocated in the common concept of the twofold negation of actual and aptitudinal dependence, but not in the concept of the third or potential negation — by which it is incompatible to be communicated to another — which is accommodated to the divine person alone, and by reason of which it formally imports something positive.

Against this third objection: what is absolute residing in the predicament of substance is something positive, since the predicaments are series of positive beings. But a created supposit is located in the category of substance, as can be seen in Porphyry's tree. Therefore a created supposit is something positive. I grant the major and distinguish the minor: fundamentally, by reason of the individual substantial nature, I grant it; formally, by reason of the twofold negation of dependence just recalled, I deny it.

You will press: real positive actions proceed from a real positive principle — on that saying of Aristotle (*1. Met. c. 2.*): "Actions are of supposits." Therefore a created supposit formally is something positive. I grant the major and deny the minor. Regarding that saying of the Philosopher, I say it is not well rendered as

"of suppositis" but as "of singulars" — in the interpretation of Scotus (*in com.*), from whom Suarez and other Recents (*cited.*) do not depart; and that text is sufficiently open and clear.

Against this fourth objection: a supposit is one per se — but from the positive, such as singular nature, and the negative, such as the supposit taken formally, there is not had one per se. Therefore a supposit does not formally include the twofold negation described above. I distinguish the major: by reason of the foundation — namely the singular nature, which consists of act and potency, from which one per se is made — I grant it; by reason of the twofold negation described above, through which the supposit is formally constituted in the being of supposit, I deny it. Therefore, since one per se is properly composed of act and potency, whether physical or metaphysical — and the person of the Word is not the act of the assumed humanity, nor is humanity its potency, since in the character of humanity it is complete and perfect — the supposit therefore does not seem to be one per se in this sense. Otherwise the person of Christ would be composite not only with the composition of humanity from body and soul, but also from humanity and the personality of the Word — which in the *Tractatus de Verbo Incarnato* we have rejected. Or if the major is conceded, the minor may be distinguished: positively, it is granted; negatively, it is denied. For in this way one subsisting per se is constituted with suppositional and personal subsistence — and thus there is one Christ with the unity of person and of the supposit of the divine Word, which — since it is positive — is one subsisting positively. But if there were a created supposit, since it is formally negative, it would be one negatively — which is what we are speaking of here.

You will press: an individual is incommunicable to many, and yet according to Scotus (*2. dist. 3. q. 2.*) it is constituted through a positive individual difference, and is one per se positively. Therefore the same must be asserted of the created supposit — which, though incommunicable, nevertheless has its formal constitutive as positive. I grant the antecedent and deny the consequence. The reason for the difference is that it is incompatible for an individual to be divided into several subjective parts — but not so for a supposited or supposable nature to be supposited by an alien or proper supposit. For the nature supposited by the Word can be laid aside by it and supposited by a proper supposit, or by another. Hence it is not necessary that its formal constitutive be positive. But an individual is incompatible with being communicated to another — hence its formal constitutive is positive.

You will say: every negation is referred back to an affirmation (*2. Perih. 3. & 4. Met. tit. 6.*). Therefore every negative is reduced to a positive — and consequently if a supposit imports a negation, it still does not depart from a positive being. It is answered: all of this is true fundamentally, but not formally — which is now at issue.

Against this fourth objection: the pronouns "I," "you," "he," and the like signify a person — and commonly they designate not a negation but a substance; indeed they are primary substances, which no one doubts are positive beings.

Therefore person formally presents something positive. I respond: those pronouns signify the whole concrete thing composed of singular substantial nature and personality together — but if they were taken precisely for personality alone, they would signify a negative independence alone.

You will press: if Christ's humanity were to be laid aside by the Word, it would become another person from the person of the Word — since the relative "other" is a relative of diversity of substance. Therefore one cannot deny that person adds to the singular nature something positive. I say: given the hypothesis, it would be another person distinct from the person of the Word. For it would stand per se in solitude, independently from an extrinsic supposit. Hence I deny that the relative "other" always designates substance — since sometimes it designates an accident, as "the whiteness in Peter is different from that in a wall." So it is not surprising if in the given case it were to signify formally the negation of twofold dependence as described above.

You will urge: nature inclines toward its own personality — but a natural inclination is not directed toward a negative but toward a positive. Therefore person formally includes something positive. I say that just as any thing desires its natural mode — as a stone desires to be below and fire to be above — so also the individual substantial nature desires its mode of subsisting in solitude, independently of another. Just as when someone is standing, he desires to sit: this mode of existing and subsisting per se in solitude and independently of an extrinsic supposit is itself the proper supposit and personality of that nature.

Against this fifth objection from Valencia (*Tomo 4. disp. 1. quaest. 4.*): Scotus seems to explain the unknown through the equally unknown or more unknown. For the question is: in what precisely does the character of person consist? And the answer is that it consists in the negation of communicability or dependence on an extrinsic person — which negation, unless one first perceives what a person is and what such dependence on a person is, cannot be understood. Therefore Scotus wrongly thinks the formal character of person lies in the said negation. Valencia responds that he does not perceive the mind of Scotus nor attain his meaning. For Scotus himself excellently explains what a person formally is, as is sufficiently clear from what was said above. For it is not necessary to know beforehand what a person is in order to understand what that negation of twofold actual and aptitudinal dependence is — because this negation is formally person. For if rational animal is man, to know rational animal it is not necessary to first know man, because man and rational animal entirely coincide — unless one speaks of confused and indistinct cognition, which does not pertain to the matter.

You will press: the definition given by Richard cannot suit person unless it is explained ridiculously and ineptly. For if according to Scotus potential communicability is not repugnant to person — and only actual and aptitudinal communicability can be negated of person — it would be necessary that those words "incommunicable existence" be expounded in this way: that the substance of person is not incommunicable per se but only ex hypothesi and in the composite sense, if we posit that it is not actually communicated. I deny this follows from Scotus's opinion. For Scotus does not say that potential communicability belongs to person, but to nature — since person as person cannot be communicated to anything, and hence a personated nature is inassumable. Yet it is not repugnant absolutely and in the divided sense for a created personated nature to be communicated to another supposit. Valencia therefore errs when he thinks we say the same thing of nature and of its personality — since above we showed a wide and open difference between the two.

Against this sixth objection: the orthodox faith teaches us that the Word assumed humanity, but not the personality of that humanity, as Alphonsus narrates (*l. 3. adversus haereses, verb. Christus, haeresi 3.*). But if personality imports a twofold negation as Scotus teaches, it follows that the Word did not assume the said negation, and that in Christ there is no created person — because in him there is no such negation. But a negation is simply nothing. Therefore in this way the Word would not have assumed that nothing which should have been in the humanity if the Word had not hypostatically united it to himself. But this is plainly false, absurd, and unworthy to be handed down by a true theologian — since the sanctions of Councils and the doctrines of holy Fathers against sectarians defending the opposite would be vain, jocular, and ridiculous. An inept meaning indeed would be the saying of the Fathers that the Word "consumed" the created supposit — that is, consumed its negation. Likewise, that it did not assume the created supposit — that is, did not assume its negation, but removed it and prevented it. And that it did not join such a created supposit to itself, because it did not conjoin and unite its negation to itself, and the said negation did not remain in Christ. Add: the Word did not assume the human supposit, because it did not permit the humanity remaining in itself to remain united to itself. Who is so ignorant and foolish as not to see that this meaning is plainly void and entirely false? What purpose all those labors, prayers of Catholics, and definitions of Councils — to establish that the Word did not unite to itself the negation that the human supposit formally presents? For something else was intended by the Nestorians, who thought that in Christ two persons existed — namely, person constituted by an absolute entity that they posited in Christ according to both humanity and divinity, so that, just as there were two natures in him — human and divine — they suspected there were two persons in him as well — human and divine — constituted through real positive constitutive principles. Finally, not a few brand the Scotistic opinion with the

mark of falsity and error, as Arrubal reports (*disp. 4. Met. sect. 9. subsect. 2.*), conspiring and howling against Scotus like cubs against a lion, chattering like birds against an eagle, fighting like pygmies against a giant, seeing like the eyes of an owl in the light of the sun. To whom we easily respond, presupposing that the Councils and Fathers condemned and anathematized the Nestorians who asserted two persons in Christ disjunctly and separately — one human, called the Son of Man, and the other divine, called the Son of God. Hence they call the Blessed Virgin not the Mother of God but the mother of a man, and imagine Christ to be not God but a God-bearer — in whom God specially inhabits by prerogative, grace, and friendship — and hold him to be one with accidental and moral unity, not with physical and suppositional and substantial unity. Against whom Leo I contends (*in epistola ad Flavianum.*), using the testimony (*1. Ioan. 4.*): "Every spirit that dissolves Jesus is not from God, and this is the Antichrist." And the most learned Alphonsus, the keenest refuter of these and other sectarians (*l. 4. adversus haereses, verbo Christus, haeresi 3.*), adds: "Who is it that more truly dissolves Jesus than Nestorius, who separates the divine nature, positing two persons — dissolving that admirable bond of each nature in the unity of the supposit?" Hence the Council of Ephesus established that the holy Virgin "corporeally gave birth to the God-Word united to flesh, according to subsistence." The same is written by Cyril (*lib. de vera fide, ad Theodosium.*), Pope Gelasius, and others reported by the same Alphonsus. From all these it is plainly clear what the heretics wrongly held and what the Fathers and Councils aforesaid intended — namely, that Christ has two natures, human and divine, united in the unity of the person of the Word. But what person formally is, whether it presents something positive or negative, they do not touch upon — but leave it for Scholastics to dispute. Just as the orthodox faith hands down that there are three divine persons, but whether those very persons are constituted through relatives or absolutes it does not decide. Likewise philosophers commonly assert that one is a property of being, but whether it is formally positive or negative remains a matter still under judgment. With these things posited, without labor and sweat, it is plainly and fully answered to the objections cited above — which the aforesaid Recents hold in great esteem, while we consider them of small moment. Therefore I grant the major and distinguish the minor: of a negation universally and precisely taken, I grant it; but of the negation of actual and aptitudinal dependence, as described above — which is the mode of subsisting in solitude per se — I deny it. But this mode, though negative, is not nothing — just as a point is the terminus of a line, though it is the negation of further length in the opinion of many; and just as one is a property of being, though in the opinion of the Adversaries it is the negation of division from itself and from everything else. Likewise this mode is indeed negative, but is grounded in the singular substantial nature, by reason of which it is rendered independent and incommunicable to another. But Christ's humanity, which naturally should have had this mode — namely, to be independent and incommunicable to another, and to stand per se, united to no

one — was anticipated by the supposit of the Word, and united to it hypostatically. By reason of this, Christ is one with the unity of person — God and man at once — whom the Blessed Virgin bore. Hence she was the true Mother of God and of man. But Nestorius wanted her to have been only the bearer of a man, because he divided Jesus — namely standing per se in solitude, and separated from the person of the Word, and not united to it in subsistence — which the Council of Ephesus just cited sanctions the opposite of. It is therefore evident that Scotus's opinion accords with the Catholic truth and the sanctions of the Councils and the doctrine of the Fathers, and opposes the dogma of heretics who separate humanity from divinity according to the subsistence of the Word — to use the words of the Council just cited — and who suspect that that union was by grace and friendship, and not "according to subsistence," as the same Council also notes; and Aureolus adds (*3. dist. 4. art. 3.*). Hence enormous was the labor of the Council in establishing that Christ was not a pure man born of the Virgin, that he never stood per se separated from the divinity, but was always united to it in suppositional unity — "whom the holy Virgin corporeally bore," according to the definition of the Council just cited. Therefore all that the Neotericians heap up against Scotus collapses, and his doctrine remains firm and stable, ever immune from any suspicion of error — as the Sacred Congregation of Cardinals declared in the year of the Lord 1610 — for the person of the Word supplied in the assumed humanity whatever the created personality would have furnished if it had been there. For if created personality had been present, it would have stood per se independently and incommunicably to another — and it subsists in the person of the Word, incommunicable and independent in that same person. Hence the supposit of the Word is said to have "consumed" the created personality — that is, that mode of standing per se in solitude, which it would have had if it had not been assumed by the Word. Hence it is said to have been exalted and elevated to that greatest hypostatic union with the divine Word. Hence she is said to have been the true Mother of God and of man.

You will press: that union according to Scotus is an accident — as a relation grounded in the assumed humanity and terminated toward the Word. Therefore Scotus's opinion favors the aforesaid heretics who held that union to have been accidental, and it is opposed to the orthodox faith that teaches it to be substantial. I say that that union indeed formally is an accident — but is called substantial with respect to the united extremes, which are substances — just as also in physics, the union of matter and form is formally an accident, yet is called substantial because what is united through it are substances. But I treated this ex professo (*tract. de Deo incarnato, disp. 6. q. 2. & l. 2. Phys. q. 5. art. 2.*).

You will say: if the human nature is not a person because it is united to the Word, then by the same token the Word is not a person because it is united to humanity. I say that the assumed human nature is not personated by its own personality because at the very moment when it should have been personated

by its own personality, it was personated by the personality of the Word — but not so the Word when it is united to humanity, since the Word itself is a person and not a personalizable nature, as humanity was in that instant when it was to be personated by its own or another's personality. Or if the antecedent is conceded, the consequence must be denied. The reason for the difference was shown above — because a created person formally presents the negative, while a divine one presents the positive; hence it remains in the humanity united to it.

Question VI. On Accident

In the preceding question I treated substance; in the present question I propose to treat accident, the knowledge of which Aristotle in *On the Soul* I, ch. 11 urges greatly aids the knowledge of substance. I also presuppose what I have handed down on accident itself in the *Epitome*, Bk. I, Q. 3, Art. 7, and Bk. II, *Logic*, Q. 7.

Article I. What the Essence of Accident Is

This difficulty is treated by Scotus (4, d. 12, Q. [text missing]), Bassolis, and other disciples of his; the Conimbricenses (Q. 1 in the *Predicaments*, Art. 3, Cap. 4); the Complutenses (in the same place, Disp. 11, Q. ult., Dub. 3); and most recently Poncius (Disp. 13, Q. 1). For a more ready grasp of the question, the following remarks will be of immediate service.

Note 1, from Scotus cited above: accident is a concrete name, concrete with respect to a subject, and is taken in two ways. In one way, formally, that is, for accidentality, which is nothing other than the relation, adventitious from without, of the inhering thing to the subject in which it inheres — a relation from which it derives its origin, as the Seraphic Doctor observes (1, d. 8, n. 9) — or because it presupposes the thing to which it happens, as the Subtle Doctor touches upon (*Quodl.* 3, Art. 3, §. *Respondeo* 5). In the other way, materially, or for the denominated thing to which accidentality belongs; and accident thus taken is divided into absolute accident, such as quantity, and relative accident, such as paternity, of which I have treated at length elsewhere.

Note 2, from the same author (*ibid.*, and 7 *Metaph.*, Q. 1): there is a twofold inherence of accident — actual and aptitudinal. The former is that by which an accident actually inheres in a subject, as the inherence by which whiteness actually inheres in a wall; the latter is that by which an accident is apt and suited to be able to inhere in a subject — which is to say, aptitudinal inherence is the essential order or disposition of an accident toward a subject.

Note 3: for something to belong to the essence of a thing means nothing other than that it belongs to the quidditative concept of that thing and enters into its nature and essence — as animal belongs to the essence of man, and rational likewise belongs to the essence of the same man, since the whole and complete essence of man is composed, integrated, and essentially completed from both. For one thing to be really identified with another is the same as being undivided

and unseparated from it, and also inseparable by any power whatsoever, whether created or uncreated — even though not infrequently one proceeds from and follows upon another, as unity and truth are really identified with being and emanate from it as its proper attributes, even though they differ formally from it and from each other, as I wrote in Q. 2, Art. 2 of this book.

Assertion: The essence of accident is situated neither in actual inherence nor in aptitudinal inherence in a subject, but in the root and foundation of both. The assertion is threefold and is defended by the Doctor in the places already cited.

The first part is common and easy to prove. First: of accident there is demonstration and scientific knowledge, insofar as it is considered by metaphysics, as stated in Bk. I, Q. 1, Art. 1, and there is true and proper science of it; but the actual inherence of an accident is not knowable scientifically, because the accident can exist without it, and science is of necessary and inseparable things (*1 Post., Cap. 2*). Therefore the essence of accident does not consist in actual inherence in a subject.

Second: an absolute accident can by divine power exist without any subject, as faith teaches us regarding the sacramental accidents, sanctioned by the Lateran Council under Innocent III and by the Council of Trent (*Sess. 13, Can. 2*). But what exists without another and is separated from it neither includes nor is included in it as in an essence or as an essential part of it. Therefore actual inherence does not enter into the essence of accident.

One might object that at least actual inherence belongs to the essential notion of a relative accident, which can in no way exist and be separated from it. I reply that this inference is not rightly drawn, because the reason why a relative accident is inseparable from its subject is not that its essence consists in actual inherence in a subject, but because it depends entirely on the subject, that is, on the foundation and term from which it arises. Add to this that relative accidents mutually posit and mutually destroy each other; for this reason they cannot exist without actual inherence in a subject — and yet this inherence is neither their essence nor part of their essence.

The second part is argued first as follows: the capacity and aptitude of something for a thing is not the essence of that for which it is a capacity and aptitude — for instance, the aptitude and capacity for laughter is not the essence of man but his proper attribute; but aptitudinal inherence is the capacity and aptitude of an accident, by which the accident is suited and fitted to inhere and to exist in a subject. Therefore such inherence is not to be posited as the essence and nature of accident.

Third: the posterior presupposes the prior as already constituted in its essence, as is evident from an effect, which, being posterior to a cause and the cause being prior to it, presupposes and requires its cause to be already constituted in its essential and quidditative being. But aptitudinal inherence is posterior to the

absolute accident, because it emanates from it as an effect from its cause, or as a proper attribute from the nature of which it is the attribute. Therefore it is not to be constituted as that accident's essence. Moreover, a relation does not belong to the essence of what is absolute, since the absolute and the relative are distinct members of being; but aptitudinal inherence is a relation, as is clear from Note 2. Therefore it does not enter into the essence of accident.

The third part follows from the two preceding: since the essence of accident is neither actual nor aptitudinal inherence, it follows that it is the root and foundation of both aforementioned inferences. Furthermore, every relative thing is something over and above the relation, on the authority of Augustine (7 *Trin.*, 5). Therefore accident, over and above the relation of inherence which it imports toward the subject, is something, which is called accident. Again, being is equally and sufficiently divided into substance and accident, and accident abstracts from the absolute and the relative into which it is distributed. Therefore that which is thus abstracted and set apart from these is the nature and essence of accident, which earns this name; and by some it is called affection or inhabitation.

Objection 1: Aristotle (1 *Phys.*, T. 14) holds that accident is inseparable from the subject in which it inheres; therefore actual inherence in a subject must be regarded as the essence of accident. This is confirmed by St. Augustine (5. *contra Iulianum*, Cap. 9): "What is in a subject cannot exist without it." He writes the same in the *Book of the Categories*, Cap. 6, and in *On Nature and Grace against the Pelagians*, Cap. 10.

I reply that these and similar testimonies, which are adduced and can be brought forward, are to be interpreted as speaking of natural power and potency, not of supernatural power, as the Scholastics speak in (4, d. 12).

You will press further: what essentially depends on another cannot exist without it even by divine power, as is clear from a creature essentially depending on God, without whom it can in no way exist; but accident essentially depends on the subject in which it is subjected. Hence the common run of philosophers cries out that the being of accident is to be-in. Therefore neither by created nor by uncreated power can accident be separated from its subject.

I reply that the objection concludes with respect to intrinsic dependence, not extrinsic — and such is the dependence of accident on its subject, which some call the dependence of the sustained on the sustainer.

Objection 2: What is the formal constitutive principle of something belongs to its essence; but the inherence of accident is its formal constitutive principle; therefore it belongs to its essence. The major is evident, because its subject includes its predicate in the first mode of per se predication. The minor is supported by the authority of Aristotle (7 *Metaph.*, Cap. 1, T. 2) and the other philosophers who divide being into being per se, which is substance, and being

in another, which is accident. The essence of substance is its per se subsistence; therefore the essence of accident is inherence.

I concede the major and explain the minor by a distinction: being is divided into being per se and being in another as essential differences — this I deny; as distinct modes — this I concede, as I have made abundantly clear elsewhere.

You will press: just as substance is related to being per se, so accident is related to being in another; but substance is constituted in being by being per se; therefore accident is constituted in being by being in another. I concede the major; I distinguish the minor — essentially, I deny; modally, I concede — as I have just now satisfied the objection.

Objection 3: What is included in the definition of a thing belongs to its essence, because a definition is a discourse distinctly explaining the nature of a thing; but inherence enters into the definition of accident, because accident is defined as being in another, namely as inhering in a subject; therefore inherence belongs to the essence of accident. I reply that the argument holds for a quidditative definition, but not for a descriptive one, which is the kind of definition of accident cited above.

You will press: a definition given through genus and difference is essential and quidditative, as I have repeatedly insisted in the foregoing; but the definition of accident is of this kind, for being is its genus and being in another is its difference; therefore it is quidditative and essential. I concede the major and deny the minor: being is not a genus but a transcendental, and being in another is not a difference but a mode of accident; therefore it is not a quidditative and essential definition.

Article II. Whether Several Accidents Differing Only Numerically Can Exist Simultaneously in the Same Subject

Among the various and diverse senses and opinions on this difficulty recorded by recent authors, notably Fonseca (*5 Metaph., Cap. 10, Sect. 2, Q. 1*) and Suárez (*Disp. 5 Metaph., Sect. 8*), I adduce and discuss the two more important and celebrated ones. The first is that of St. Thomas (*5 Metaph., Lect. 12, and 3a Part., Q. 35, Art. 5*) and his disciples, who deny that many accidents of the same species can simultaneously exist as subjects in the same subject. The second is defended by the Subtle Doctor (*3, d. 8, Q. un.*), Richard (*ibid., Q. 2, Art. 2*), Bassolis, Lychetus, Tartaretus, Antonius Andreas (*5 Metaph., Q. 8*), and other Scotists, who affirm that several accidents differing numerically can simultaneously be subjected in the same subject; with whom the Nominalists agree, notably Gabriel (*3, d. 8, Q. un., Art. 3, Dub. 1*), and not a few recent authors, among whom are Suárez (*Disp. cit., Sect. 3*). For a more easy grasp and convenient understanding of the question:

Note 1: Some accidents are intentional — so called not because they are beings of reason, but because from objects they tend toward the cognitive power — such as sensible species in sense and intelligible species in intellect; others are real, which are subdivided into relative, such as paternity and filiation, and absolute, such as quantity and quality. They are further divided into congenital, such as natural heat and color, and acquired, such as pallor from fear and redness from shame; and into those that are created, such as grace and glory, and those that are educed from the potency of matter, such as primary and secondary qualities; and into those that come to be in an instant, such as light, and those that are produced by motion and temporal succession, such as the arts and human sciences, which are acquired by long labor and toil.

Note 2: The aforementioned authors of the second opinion do not speak universally but indefinitely, as will be evidently clear from the assertions to be submitted below. For this reason, what Suárez (*ibid.*, nn. 11–12 and following) heaps up against them is easily dissolved. First of all, he says that all accidents are educed from the potency of matter, arguing against the distinction of accidents into those that are educed from the potency of matter and those that are not, placing light in the latter member according to their view — but he is mistaken, because the said authors do not remove light from the series of accidents educed from the potency of matter; they only say that light is a real accident and simultaneously intentional, as I said in (*Bk. IV, On the Soul, Q. 5, Art. 2*). Furthermore, that some accidents — for instance, grace — are not educed from the potency of matter, Scotus and his disciples hand down (2, d. 34, §. *Istae quaestiones. A, and 4, d. 1, Q. 1, Q. Ideo dici potest*). And that light is intensified not only by the addition of new light but is also multiplied, I shall show below in a specific assertion. Moreover, what the said Suárez adds in the same place against the distinction of accidents that come to be through motion or through an instant — since that distinction is true and admitted by all, and is not given for the purpose of producing numerical multiplication of accidents, as Suárez seems to presuppose, but for showing which accidents can simultaneously be multiplied numerically in the same subject and which cannot — he does not show the individual cause of those accidents as Suárez himself objects in the same place, because since it is universal and based on extrinsic features, it does not denote their principle of individuation. And what he adds about the distinction of accidents into absolute and relative — that not all relative accidents can simultaneously be multiplied in the same subject, as he exemplifies by the relation of the creation of one creature, which is non-multipliable in the same creature; and that not all absolute accidents generated in succession can be either — this does not harm us, who do not intend or maintain a universal canon and certain rule about all and singular accidents, as I indicated at the beginning of this Note, as Suárez himself also senses (n. 14). Moreover, note that this dispute does not concern proper and reciprocal accidents along with their subjects — such as their proper attributes and

properties — but common accidents, which are separable from the subjects in which they inhere.

First Assertion: Many intentional accidents differing numerically can simultaneously exist in the same subject. The Doctor maintains this in the cited place. It is proved first: in the same medium and the same eye there exist several sensible species of objects differing only numerically; similarly, in the same intellect there reside several intelligible species of objects differing only numerically, as of Peter, Paul, and the other individuals of human nature. But such species are intentional accidents participating in numerical difference; therefore such accidents can simultaneously inhere in the same subject. The minor is evident; the major is at hand, since wherever the eye exists, it can see those numerically distinct objects presented there, with no obstacle intervening either on its own part or on the part of the medium — for a natural cause duly disposed and unimpeded, having all the requisites for acting, necessarily passes into act and produces the effect which it is by nature capable of producing, such as the eye existing in an illuminated medium with no opaque obstruction, possessing the species of many visibles differing only numerically and the other things necessary for acting and seeing. And what I say about the eye must equally be affirmed of the imagination, the intellect, and the other powers acting intentionally, which receive not only such intentional species but also several acts and operations of the several objects presented through them. Hence, when several bells are rung and musical instruments played simultaneously, several sounds are produced at once, which appear undoubtedly to differ numerically and to be numerically different accidents.

One might object that the aforesaid species are subjected in distinct parts of the organ, not simultaneously in the same part or whole organ of sight or imagination, and therefore it does not follow that those species inhere simultaneously in the same organ and subject. Against this: not to mention that this reply has no place with intelligible species, which simultaneously reside in the same intellect devoid of parts, the parts of the visual organ are very small and minute, so that they individually and separately cannot receive the almost infinite visual species of the same species and kind — especially since through the narrowest aperture the eye sees an almost infinite number of visibles of the same species, such as innumerable white things or black things, of which it would not be capable if their species were not simultaneously in the same organ of sight. For how would such tiny parts of the medium and organ be able to contain so many species separately and in isolation? Hence some, perceiving the weakness and vanity of this reply, try to answer differently and to distinguish these species into natural being and sensible being, conceding in the first mode that they are of the same species, but denying this in the second. But this later reply is no less futile and feeble than the first. For apart from the fact that sensible being is also natural being — though the former is more manifest than the latter, because natural is adapted to both the sensible and the insensible —

two white things of equal magnitude and intensity have no other difference between them than numerical difference, both in natural being and in sensible being. Therefore this second reply is equally empty. Hence they have recourse to a third reply concerning the intensification of these species, which will be more conveniently adduced and more easily refuted in the first part of the last assertion.

Second: in whatever essential order, the unity of the prior is compatible with the multiplicity of the posterior, provided the posterior does not belong per se and adequately to the prior; but the subject is prior to any accident; therefore in one subject there can simultaneously inhere several numerically different accidents. The major is evident: one cause can have several effects, as one God has several creatures, one sun several rays, one intellect several acts of understanding, one tree several fruits, and one body several places. The minor is also clear, because a cause is prior to its effect, and the subject is at least the material cause of accidents; therefore it is prior to accidents.

One might object that the major is not universally true, especially when the prior is placed in the definition of the posterior, as happens in our case, because the subject enters into the definition of accident; and when the posterior is equal to and belongs per se to the prior — thus in the divine persons there cannot be several productions of the same kind, such as several filiations and several sons, nor several processions and several Holy Spirits; and one body cannot simultaneously occupy several places, precisely because place is equal to the body existing in it.

Against this: in the aforesaid major, the qualifications per se and adequately are aptly placed — two conditions limiting it — and when these are removed, the said proposition is true, and the objections cease. For one accident is not equal to the subject in which it inheres, since several can be subjected in it; nor does it belong to it per se in the first or second mode of per se predication; and if the subject is placed in its definition, it is placed only by way of addition, as I have abundantly explained elsewhere. All the more so because the foundation of the adversaries is ruinous, since they think accidents are individuated by their subjects — whereas above, in Q. 3, Art. 3 of this book, I showed that each nature, whether substantial or accidental, is individuated by its own individual difference or haecceity.

Second Assertion: Relative accidents differing numerically, whether congenital or acquired, can simultaneously be multiplied without contradiction in the same subject. The assertion is two-membered, and is patronized by Scotus cited above, and in (2, d. 2, Q. 7, §. *Et ideo. Sub cap.*, and 5 *Metaph.*, Q. 7).

The first part is argued first: absolute accidents can simultaneously inhere in the same subject, as I proved in the second assertion and will be shown in the next assertion. Therefore relative accidents as well — the consequence holds because

relatives are of lesser entity than absolutes; therefore if these are simultaneously compatible in the same subject, so likewise are those. Second: simultaneously existing extrinsic relative accidents can enjoy existence in the same subject — as the same piece of wood can be heated by several heatings, and the same body can be located by several locations; but heatings and locations, from what has been said elsewhere, are relations adventitious from without. Therefore if these can simultaneously be multiplied in the same subject, so likewise can those called intrinsically adventitious, since the same principle appears to hold in both. Here belong the arguments I adduced in (*Logic, Bk. III, Q. 6, Art. 7*) — the objections, counter-arguments, and replies of the adversaries, which, lest I do again what has been done, are to be seen and reviewed there.

The second part is proved first: experience is a collection of many certain and evident cognitions of singular things differing numerically, of objects singularly distinct — as cognitions about this and that rhubarb which cures bile, as Aristotle hands down (*1 Metaph., Cap. 1*). But such cognitions are singular accidents differing numerically, acquired by labor, about objects numerically distinct; therefore several numerically different accidents simultaneously in the same subject are not impossible. Second: several numerically different graces can be simultaneously infused into the same rational soul; but such graces are numerically distinct accidents not educed from the potency of matter; therefore it is not incompatible for the aforesaid accidents to share simultaneously the same numerical subject.

One might object that all accidents are educed from the potency of matter, because creation is adapted to a self-subsisting thing, which is substance alone; therefore the division of accidents into those that are educed from the potency of matter and those that are not is irrelevant. The antecedent is denied: many things are produced which are in no way educed from the potency of matter, such as physical composites, which are properly said to be generated, and their accidents which arise from them; likewise the acts of intellect and will, which are produced by them but are not educed from the potency of matter. Therefore the division of accidents into those that are educed and those that are not educed from the potency of matter stands firm.

Third Assertion: Most accidents that are produced in an instant in the same subject can simultaneously exist, but not those produced successively and through motion. Scotus in the place cited above defends both parts.

The first part is argued: homogeneous things are simultaneously united in the same place and are mutually compatible, as is clear from fire, water, and similar things — fire does not repel fire, nor water water; they are simultaneously joined and strengthened together. But most accidents produced in an instant are homogeneous, such as lights; therefore they share a simultaneous place and subject.

Suárez (*cit.*, n. 11) and Fonseca (*ibid.*), following Cajetan and other Thomists cited by recent authors, reply that lights joined together are not multiplied but only intensified, and when one of them is removed or extinguished, that intensified light is diminished. Against this: several lights separated from one another are numerically distinct; therefore also when united and joined together. The antecedent is evident and denied by no one I have seen. The consequence is proved: while they are joined, they do not perish but are intensified, and the intensification, which is posterior to their singularities, does not destroy their numerical differences — indeed, it conserves and strengthens their powers, because they illuminate and clarify the medium in which they exist more greatly; therefore they are numerically distinct. This can be confirmed from water and other homogeneous things, whose union does not remove their individual distinctness. Hence when they are separated from one another they remain distinct as they were before the union — which is an open indication that they retain their individual differences both when disjoined and when conjoined, differences which differ only formally from their essence. Especially since union and intensification are not given to destroy but to perfect; a cause must be assigned for the destruction of their individual differences and for the production of only one difference of the intensified quality newly produced — and since none can be assigned, it follows that all those that previously existed when the aforesaid lights were disjoined and separated from one another remain.

One might object that those many things coalesce into one and are one and not many numerically distinct things. Against this: even though from them one thing is made in the unity of homogeneity, yet one thing is not made in the unity of composition; nor does a change happen to them, but only a union and intensification which presupposes and requires the prior and pre-existing degrees — and thus they do not lose their numerical differences. Furthermore, matter and form, which are simultaneously united to make up a composite, retain in the composite itself their essential and numerical being; therefore likewise lights, which are simultaneously connected to make one more intensified and more perfect homogeneous thing, conserve their essential and individual being.

Second: existence belongs to singulars; but most numerically distinct accidents exist separately in isolation; therefore also when conjoined. Hence if at night two lit candles are placed in a hall, one on each side of the same hall, and someone walks through the middle of that very hall, two shadows of the walker will appear, corresponding to the duality of the light — but shadows are secondary lights and darkness is the privation of both lights, both primary and secondary; therefore those lights simultaneously joined retain their numerical differences, as those two shadows indicate. And if one of the said candles is extinguished, only one shadow will remain; therefore it is plainly established that two lights, when joined, are numerically multiple.

One might object that there is one light in the unity of the subject and medium, but two effectively — in the duality of lights producing one more intensified and more perfect light. Against this: two agents produce two effects, which are the terms of their actions; but two lit candles are two total efficient causes of two lights through their illuminations, as is clear if the light of one passes through an aperture of one wall and the light of the other passes through an aperture of another wall — for then they are distinct lights; and if both pass through the same aperture, there are indeed two lights simultaneously joined in the same aperture and subject. Furthermore, the two shadows seen from an interposed opaque body are two secondary lights proceeding only from two primary lights; therefore just as the shadows are numerically multiplied, so likewise the lights. Moreover, from those lights geometric rays are emitted, as well as perspectival and visual ones — otherwise *Perspectiva* would collapse regarding the intersection of rays, which John Peckham composed excellently and concisely, as Mauro attests (*5 Metaph.*, Q. 7), and which all admit as a true science subalternate to geometry. Furthermore, if two lights simultaneously united were only one numerically intensified light, they would undoubtedly cause only one species of themselves — but if they are diminished and reduced, no species of them would be had, because it is a diminished and unintensified quality; but species represents the thing as it is, since it is its natural likeness; therefore if there will be a species of the intensified quality, there will be no species of the diminished quality, and accordingly the diminished light would not be perceived by us — which is plainly false and absurd.

Third: if two whitenesses were inhering in two walls and God were to destroy the two walls while the two whitenesses remained in their being, those whitenesses would still differ numerically just as before when they were inhering in the said walls; similarly, if God were to destroy the two lit candles while their lights remained, then those would be two numerically distinct lights; therefore also those lights differ numerically when they share the same medium and the same subject.

One might object that, granted the hypothesis, if two whitenesses and lights exist separated from one another, they are indeed numerically distinct; but if they are simultaneously joined, they coalesce into one numerically intensified quality. Against this: God can supply the causality of any cause, especially an efficient cause, and can impede it if He wills, since all things are subject to His will; therefore He can suspend the action and causality of the two lights so that they are not intensified, because intensification pertains to the genus of efficient cause — and thus there would be two numerically distinct lights without intensification; that this is not impossible, among others Ockham (*1, d. 17, Q. 7*) and Gregory (*ibid.*, Q. 5) judge.

One might object that it belongs to the intrinsic notion of a gradual quality to be intensified, and therefore it cannot be brought about that two lights

simultaneously united are not intensified. Against this: intensification is a property of quality — not in the fourth mode, as I said in the question on quality — and it can be suspended so as not to pass into effect, just as fire can be prevented from burning and heating; therefore God can likewise bring it about that the intensification of two lights simultaneously united does not occur.

The second part is shown first: an accident that is induced in a subject through motion must expel the accident preceding it in the same subject, because from (5 *Phys.*, T. 19) motion occurs between contraries, which alternately expel each other from the same subject; therefore two numerically different accidents enjoying simultaneous existence and inhering in the same subject cannot occur. Second: the generation of one is the corruption of the other (1 *On Generation*, Cap. 4, T. 18) — which axiom I said in that place is to be understood not only of substances but also of accidents; therefore if one accident is produced through motion, the pre-existing accident must consequently be corrupted; otherwise the new one cannot be induced in the same subject, and thus accidents of this kind cannot simultaneously coexist and cohabit in the same subject. Third: an agent acts so as to introduce a new form, of which the subject is deprived, into a well-prepared and rightly disposed subject; hence, when the intended form is achieved, it acts no more. Hence comes that saying: *When the term is acquired, motion ceases*. And that other (5 *Phys.*, T. 26): *The terms of motion are impossible*. But if one accident of the same kind and species already precedes and pre-exists in the subject, the capacity of that subject to receive another accident of the same species no longer exists — just as matter informed by one form cannot simultaneously receive another form of the same species; and therefore in the same subject numerically distinct accidents are not simultaneously multiplied if produced through motion.

Objection 1: Aristotle (5 *Metaph.*, Cap. 10, T. 16) — the text said to be without commentary — writes in explicit terms that several numerically different accidents cannot in any way simultaneously inhere in the same subject; therefore the opposite view clashes with the Peripatetic school. I reply that Aristotle's testimony is to be interpreted as speaking of accidents produced through motion, as I was just asserting in the second part of the last assertion — not however of the other accidents, of which I treated in the first part of the same assertion and in the preceding ones.

Objection 2: Contraries in a diminished state are simultaneously compatible in the same subject, as is evident in lukewarm water, in which heat and coldness exist together; but contraries are properly accidents in the genus of quality; therefore it must not be denied that several accidents differing only numerically enjoy simultaneous existence in the same subject. It can be said that contraries are accidents of distinct species even though they participate in the same genus; but the present dispute is about accidents of the same species, yet differing numerically. Or it can be said that this occurs violently, not naturally, for the

reason that one element does not predominate over another; and hence their qualities remain in a refracted and diminished state, as I showed in (*On the Elements*, Q. 3, Art. 5).

You ask whether one numerical accident can be in several subjects. Scotus replies (4, d. 1, Q. 2, §. *De secundo principali*. C. and H., and d. 4, Q. 2, §. *Respondeo*. Sub B. and E.) that there is no contradiction implied — just as there is nothing incompatible about one body being simultaneously in many places, as I showed at length in (*Bk. VI, Phys.*, Q. 2, Art. 4).

Book III. On Angels

Since substance is rightly and adequately divided into corporeal and incorporeal, as is seen in the tree of Porphyry described by me in the *Epitome*, Bk. I, Q. 3, Art. 4, and since I have treated corporeal substance at length in the *Physics*, I shall now briefly add a few things about incorporeal substance as they pertain to the philosopher, leaving the remaining and more numerous matters to be examined by theologians.

Question: On the Nature of Angels (Single Question)

Article I. Whether Angels Exist and What an Angel Is

Those whom the Scholastic Doctors call angels in (2, d. 2–3 and following), the philosophers call intelligences, abstract and separate substances, as can be seen in Aristotle (12 *Metaph.*), Scotus, Antonius Andreas, Alexander of Hales, and others in the same place. The word *angel* is Greek; in Latin it means *messenger*, as St. Augustine observes (2 *Trin.*, 13); hence the same saint in his exposition of Psalm 103 adds: "Angel is the name of his office, not of his nature. Do you ask his nature? He is a spirit. Do you ask his office? He is an angel." St. Gregory writes the same in the *Moralia*, cited by Berchorius in the first part of his *Repertorium*, s.v. *Angel*. And it is indicated in (*Hebr. 1*): *They are all ministering spirits, sent to serve*.

First Assertion: Angels exist. This is presupposed by the Doctor in both works (2, d. 2, and 12 *Metaph.*, in the commentary, toward the end). It is proved first from sacred Scripture: Psalm 90: *He has commanded his angels concerning you, to guard you in all your ways*. Daniel 3: *Bless the Lord, all you angels of the Lord*. And Matthew 18: *Their angels always see the face of my Father*. Second, from the Lateran Council in the profession of faith, where it is decreed that God at the beginning of the world created both natures, the worldly and the spiritual, the angelic and the human. Third, from the Fathers — Dionysius (*On the Divine Names*, Cap. 6), Augustine (*Serm. 19 de tempore*), Damascus (2 *fidei*, Cap. 1), Bernard (*in his commentary on Psalm 90*), and Hilary (*on Matthew 18*) — who openly demonstrate and proclaim the existence of angels. The Theological Doctors subscribe to this with the Master (2, d. 2). The philosophers are favorable: Aristotle (8 *Phys.* and 12

Metaph.), Averroes (*ibid.*), Avicenna (9 *Metaph.*, *Cap.* 4), Plato, and the other Academics. Nor are there lacking reasons and congruences urging and confirming this. For substance, taken generically, is divided into material, under which corporeal and physical substances are contained, and immaterial, under which are comprehended substances devoid of matter, such as angels, as I noted immediately at the beginning of this book. Furthermore, the world is perfect, since it is the work of God whose every work is perfect; but if it lacked angels, it would not be perfect, because it would lack the most excellent and noble of all creatures. Add to this: a monarch has ministers and servants assisting and serving him in all things throughout his realm; but God is the supreme monarch of the universe, since He is the King of kings and Lord of lords; therefore He has ministers and servants ministering and serving Him, such as angels are, according to that of Daniel 7: *A thousand thousands attended him, and ten thousand times ten thousand ministered to him.* Moreover, the Magi perform wonders through demons, and demons are angels, though evil; therefore angels are not to be denied. Hence St. Augustine in (*Psalm 123*) subscribes: "We know from faith that angels exist; we read and hold that many have appeared; and it is not lawful for us to doubt this." They are divided into three hierarchies and nine orders, enumerated by me in the *Epitome*, Bk. I, Q. 4, Art. 5; likewise into good and evil, of which a definite number is not known to us, and their nature and attributes are barely manifest to us, except through common reasoning and general and transcendental predicates.

Second Assertion: An angel is a created, spiritual, and complete substance. This is deduced from the Doctor in the cited place and Quodl. 7, and is expressly handed down by Gadius in that place. The individual parts of the definition are explained. It is called *substance* to distinguish it from accident. *Created* is added on account of God, who is an uncreated substance. *Spiritual* is added to distinguish it from corporeal and material substance. *Complete* is appended to distinguish it from the rational soul, which is incomplete and the form of a body. The assertion, thus explained, is easy to prove, since this definition distinctly explains the nature of an angel, is composed of genus and difference, contains nothing superfluous or deficient, and therefore is to be received and retained — with which Gabriel agrees (2, d. 3, Q. 1).

Objection 1: St. Dionysius, cited just above, in defining an angel says: "An angel is the image of God, the manifestation of hidden light, a pure, splendid, and immaculate and uncontaminated mirror, receiving, if it is right to say so, the whole beauty of the well-formed divine likeness." And Damascus (*ibid.*) adds: "An angel is a certain spiritual, rational, and intellectual substance, ever mobile, of free choice, incorporeal, ministering to God, obtaining immortality by grace, not by nature." Therefore one or both of these definitions of angel should be taught, strengthened by the testimony of these saints, and not the one assigned above, which is supported by the authority of no saint or approved Doctor.

I reply that St. Dionysius has rather offered a similar and metaphorical description of an angel than an essential and quidditative one, as is clear from its parts excellently expounded by Alexander of Hales (*2 Part., Q. 20, Art. 2*) and by St. Bonaventure (*2, d. 9, Expositio lit., n. 3*). Especially since it is not adequate, since it fits only the good angel and not the evil and reprobate one — for a wicked angel is not an immaculate and uncontaminated mirror, which is explicitly placed in the cited description, in which the holy Father strives to describe only the good angel. The definition of Damascus is likewise descriptive, not quidditative, since it is given through the power and proper attributes of an angel, and makes the angel perhaps mortal by nature — whereas that angels are by their own nature immortal will be shown and explained in the good sense below.

Objection 2: A right and genuine definition is composed of genus and difference, as no one denies; but in the definition of the angel received by us, several genera and differences are placed, as is apparent to anyone running through its individual parts; therefore the aforesaid definition of the angel is not sound and legitimate. I concede the major; to the minor I say: when the nature of something is not fully and completely known to us, as in the present case, we employ several genera and differences to define and declare it as best we can, as we did in the proposed and explained definition of the angel. This is clear also in Aristotle (*1 Perihermeneias, Cap. 2*) in the definition of a noun, and (*ibid., Cap. 3*) in the definition of a verb.

Article II. Whether Angels Are Incorporeal

Philosophers and theologians, both ancient and modern, are not in agreement on this article. Some, such as Plato and his followers, to whom St. Augustine seems to adhere (*On the Marvels of Sacred Scripture*) and (*8 City of God, Cap. 15, and 15 of the same work, Cap. 23*), and which Cavellius does not consider improbable in his commentary (*Q. 15 On the Soul*), think that angels are corporeal. Apuleius, as Vives reports in his commentary (*8 City of God, Cap. 15*), explains that their bodies are intermediate between earthy and airy, much less dense than a cloud formed from the purest air; or, as others say, their bodies are very subtle and tenuous. The common view, however, is that of the others — Scotus (*Quodl. 9, and 4, d. 1, Q. 1*), Major (*2, d. 8, Q. un.*), Fabre (*Disp. 9*), Molina (*1 Part., Q. 50, Art. 1*), and Suárez (*Disp. 35 Metaph., Sect. 3, n. 10*) — affirming that angels are incorporeal; preceded by Dionysius (*On the Divine Names, Cap. 4*), Nyssenius (*1 On Prayer*), Chrysostom (*Hom. 22 in Genesis*), Gregory (*4 Dial., Cap. 29*), Bonaventure (*2, d. 8, Q. 1*), and many others cited by more recent authors.

Note: Some holy Doctors and Fathers held the negative part of this difficulty — that is, that angels are not incorporeal and thought them to be corporeal — among whom are cited Tertullian (*1 On the Flesh of Christ*), Lactantius (*2 Institutiones, Cap. 15*), Eusebius (*5 On the Preparation of the Gospel, Cap. 4*), Origen (*1 On First Principles, Cap. 6*), and not a few others, with whom Augustine agrees,

both in the places mentioned above and also in (*3 Trin., Cap. 1, and on Psalms 85 and 145*). This is not surprising, because at that time the Platonic sect holding this view was in its greatest vigor, to which the aforesaid Fathers, and especially Augustine, were favorably disposed; nor was there any sanction and definition of the holy Church that compelled them to affirm the contrary, nor does any evident and demonstrative reason seem yet to have been adduced and found that establishes the opposite, even though some brand with the mark of error and rashness those who hold the opposing opinion. Hence on the proposed question it pleases me to cite Augustine, who in (*Tom. 4, 1, 83 Questions, Q. 3*) says he wishes to hear the Doctors, and adds that he is ready to think otherwise and correct what he had said. "Nor ought we to be unteachable teachers; and certainly it is better for a perverse man to be corrected than for a hard one to be broken; in order that through those things which we have written, our own weakness or that of others may be exercised or educated, yet in a way that no canonical authority, so to speak, be established in them." Then he adds there, and at the end of that book: "I love to learn more than to teach." Wherefore, following in the footsteps of Augustine, I do not wish to censure the views of others, but to embrace what is common and consonant with sacred letters and councils.

Assertion: Angels are incorporeal. This is handed down by the Doctor (*ibid., and 2, d. 2, Q. 8, §. In ista q. ante A., and d. 3, Q. 7, §. Qui dicunt. sub F.*). It is proved first from sacred Scripture: Psalm 103: *Who makes his angels spirits*. But a spirit is devoid of body, according to Luke 24: *A spirit has neither flesh nor bones*. Therefore angels are incorporeal. The same is deduced from Tobit 12, where the angel Raphael says: *I use another invisible food and drink, which cannot be seen by men*. Since an angel lacks a body, as Lyran comments, it is not nourished by visible food and drink, as living bodies are nourished. Hence the angel had prefaced this by saying: *When I was with you, by the will of God I seemed to eat and drink with you* — as if saying: truly I did not eat or drink, because true eating and drinking is the conversion into the substance of the one nourished, which cannot be effected by an angel, but only a passing through and local movement of the food and drink by an angel in an assumed body. Hence in the passage of Luke cited above, Christ the Lord after His resurrection showed that He was a true man, as He had been before, through true eating, when He said to His disciples: *Do you have anything here to eat?*

Second, from the Lateran Council (*Cap. Firmiter de summa Trin. et fide Catholica*): "There is one universal principle, creator of all things invisible and visible, spiritual and corporeal, who by His almighty power simultaneously from the beginning of time created from nothing both creatures, the spiritual and the corporeal — that is, the angelic and the worldly — and then the human, as if constituted in common from spirit and body." From these words it is plainly clear that an angel is incorporeal, because it is contradistinguished from the corporeal. Creature is divided into incorporeal, such as the angel, and corporeal,

such as the heavens and whatever is contained under them, apart from man, who is composed of spirit or soul and body. Since, therefore, every creature is corporeal, or incorporeal, or composed of spirit and body, and an angel is a creature that is not corporeal, nor composed of body and spirit, but incorporeal, spiritual, and immaterial, it is undoubtedly concluded that the aforesaid Council supports the proposed assertion and that it is to be held and embraced by all the Orthodox.

Third, from Aristotle (*12 Metaph., Cap. 5, T. 49 and following*), affirming that the intelligences — which are angels — are substances separated and disjoined from matter; and those that abstract and are segregated from matter are spiritual and incorporeal. And (*8 Phys., T. 78*): intelligences lack magnitude, because they move for infinite time; therefore in the Peripatetic school, angels are incorporeal and spiritual.

Fourth: corporeal things cannot simultaneously exist in the same place, as is clear from (*Bk. VI, Phys., Q. 2, Art. 2*); but several angels can simultaneously occupy the same place, as narrated in (*Luke 8*), where a legion of demons was in one possessed man and demoniac. A legion, according to Vegetius, comprises six thousand six hundred and sixty-six. Therefore angels, among whose number are demons, are incorporeal.

Fifth: what is contained under one species is not comprehended under another, since diverse species are constituted through diverse differences; but angels are placed under the species of incorporeal substance, as is clear in the tree of Porphyry, expounded and delineated by me at length in the *Epitome*, Bk. I, Q. 4, Art. 5, as the Lateran Council whose words I cited above plainly shows, and as their definition cited and declared in the preceding article, Assertion 2, manifests.

Objection 1: Sometimes angels appeared clothed in corporeal garments, as in Tobit 12, Luke 16, and Revelation 22; therefore angels are corporeal, since clothing indicates one who is thus clothed. I reply that the appearances of angels were performed in bodies assumed by them and assisted by them — not however as the angels informing those bodies, since they cannot be acts of bodies and informing forms, as Scotus excellently shows (*Quodl. 9*). Thus angels can assume bodies and appear in them, and can even form and compose bodies, because they know well how to apply active things to passive; and in them they perform wonderful works. Hence Scotus reports (*2 Rep., d. 8, Q. un.*) about a certain king who was borne by a demon for a year and was believed by the people to be alive.

Further objection: Angels walk, speak, and perform other actions that can only be effected by corporeal beings; therefore angels are not immune from body. I say that these actions are performed by angels not because they inform bodies but because they move such bodies, as a charioteer moves a chariot and a sailor

moves a ship. Thus the angels themselves, by moving the tongue of the assumed bodies, appear to speak, and by moving the feet, to walk.

You will press: Demons, who are angels though reprobate, delight in the odors and smells of sacrifices and in venereal things — but these and similar things cannot be performed except by corporeal beings; therefore angels are corporeal. I say that the major is true objectively and not formally — just as fire tortures them objectively and detentively, as the Doctor hands down (4, d. 44, Q. 2).

Objection 2: The Church depicts angels in the likeness of boys and adolescents; therefore they have proper bodies, otherwise the Church would deceive us by representing a thing other than it is. I reply that this is done by the Church for our comprehension, because we do not grasp spiritual things except in the manner of corporeal and material things, since our cognition is bound to the bodily senses. Hence God the Father is depicted in the form of an old man, God the Son in the form of a youth, and the Holy Spirit in the form of a dove. But there is no deception, because according to the truth of the matter we are taught that angels are spiritual and incorporeal.

Further objection: At the Council of Nicaea, in the fifth session, the book of John, Bishop of Thessalonica, was read and received, asserting that angels ought to be depicted because they are corporeal, to which the holy Synod gave its assent; therefore according to the truth and orthodox faith, angels are corporeal. I say that indeed in the aforesaid Council it was decreed that angels should be painted, which was its intent — but it was not defined that they are corporeal, because that reason was offered by the aforementioned Bishop, whose was that book; and since he was a Platonist, he thought angels to be corporeal, which view was not rejected by that Council because it was not treating this *ex professo*. I add that at that time many Fathers and distinguished Doctors affirmed the same thing — namely, that angels are intermingled with bodies — whom the holy Synod did not wish to condemn, as Miranda and Joverius suggest in their summaries of councils, whatever Molina may say in the cited place.

Objection 3: In Genesis 6, where the Vulgate has: *Seeing that the sons of God, that the daughters of men were beautiful, they took wives for themselves*, the Septuagint translators render it: *Seeing that the angels of God saw the daughters of men*. And a little later, in the Vulgate it reads: *After the sons of God went into the daughters of men and they bore children*. But in the version of the Seventy it reads: *After the angels of God went in to the daughters of men*. Therefore, since angels contracted marriage with those women and begot sons by them, it is plainly inferred that angels are corporeal.

One must respond that by "sons of God" in that place the sons of Seth are understood — who, being just, were called angels of God — since it is customary in Scripture to call holy and just men angels, as in Malachi 3 and other places.

So explains Lyran, following Chrysostom (*Hom. 22 in 6 Genesis*), Augustine (*15 City, Cap. 23, and Bk. I, On the Literal Meaning of Genesis, Q. 3*).

You will press: in John 8, Christ says to the Pharisees: *You are of your father the devil, and you want to carry out your father's desires*; therefore if the devil, who is an angel, begot sons, as Christ the Lord testifies, the same must not be denied of the other angels. I say that the wicked are called sons of the devil not by creation or generation but by imitation — so explains Lyran there, and before him Augustine (*Serm. 51 de tempore, and Serm. 86*), and in his tract on the Epistle of John he adds: "The devil created no one and begot no one, but his imitators are born, as it were, from him." But if any generation occurs through an incubus or succubus, the one born through it is not the son of the devil but of that man from whom the seed was drawn.

Objection 4: St. Augustine (*1 Retract., Cap. 11*) recanted in these words: "By the name of holy angels I would now call every holy spiritual creature constituted in the hidden and secret ministry of God." Therefore he is no longer to be cited for the opposing view. It can be said that in the cited words there is no word of explicit retraction of what he had previously handed down. Especially because there are those who understand by "spiritual creature" an invisible, tenuous, and subtle substance, as can be seen in Bernard (*Sermon on the Canticle*), Eugubinus (*on Psalm 103*), and many others. Hence Louis Vives (*15 City, Cap. 23*) adds that it is beyond doubt, in Augustine's view, that angels are corporeal — although perhaps he sometimes hesitated and did not adhere to it as strenuously as others did.

Article III. Whether Angels Are Composite

The Scholastics are divided into three positions: some, like Durandus (*2, d. 3, Q. 1, n. 15*), make angels immune from all composition. Others think that angels are composed of matter and form — some of whom, like Avicembron (*On the Fountain of Life*), think that matter to be of the same kind and species as the matter of sublunary things, while others, such as St. Bonaventure (*2, d. 3, Q. 1, prima pars*), Richard (*ibid., d., Art. 2, Q. 1*), Auriol (*Art. 3*), and Alexander of Hales (*2 Part., Q. 29, m. 2*), think it to be of a diverse kind and species. Still others, such as Scotus (*Quodl. 9, Art. 2*), Lychetus, Tartaretus, Gadius in that place, Fabre (*2, Disp. 10*), St. Thomas (*1 Part., Q. 50, Art. 2*), Molina (*ibid.*), and Suárez (*Disp. 35 Metaph., Sect. 3, n. 33*) commonly teach that angels are composed of genus and difference.

Note: There is a twofold composition — one from thing and thing, that is, from matter and form, which is commonly called physical composition; another from reality and reality, that is, from genus and difference, which is called metaphysical composition — as can be seen in Scotus (*2, d. 3, Q. 6, K., §. Ad quaestionem ergo*).

Assertion: Angels are composite — not indeed by physical composition, but by metaphysical. The assertion is three-membered and is deduced from Scotus

(*ibid.*, and 1, d. 8, Q. 2, §. *Alia est opinio*, and *ibid.* in the *Report.*, Q. 5, §. *contra illam viam*).

The first part is against Durandus cited above, who removes metaphysical composition from angels and all accidents, and is proved: the predicaments are a series of genera, species, and individuals, as is clear from Logic; but angels are in the predicament of substance, under which they are placed as its species; but a species is composed of genus and difference, as is shown there; therefore angels are composite. Furthermore, the reason Durandus removes composition from angels is that they are simple, like accidents; but accidents, though simple, are nonetheless composite by metaphysical composition consisting of genus and difference, since there are nine predicaments of accidents, in which various genera, species, and individuals are assigned; therefore, even though angels are simple, they are not for this reason to be exempted from all composition.

The second part remains proved in the preceding article, where I showed that angels are incorporeal and immaterial; but everything corporeal consists of matter and form, and everything incorporeal is free from matter and form. Therefore, since angels are incorporeal and spiritual, they are devoid of physical composition, which consists of matter and form.

The third part is argued first: what resides under the species of categorical substance is composite by metaphysical composition, because the predicament of substance is a series of substantial genera and species; but angels are placed in the predicament of substance, as I showed in (*Logic, Bk. III, Q. 4, Art. 4*); therefore they are composed by metaphysical composition, which consists of genus and difference. Second: what is created, finite, and non-transcendent is constituted by genus and difference — for in this God is distinguished from created things, because since God is the most actual being, He is not constituted of potency and act, whether physical or metaphysical; but angels are created, finite, and non-transcendent beings, as is clear; therefore they are composed by metaphysical composition, which consists of genus and difference.

Objection 1, against the first part: simple and composite are opposed to each other, as is clear from the terms; but angels are simple and pure acts, as their description cited in the first article of this question indicates; therefore they partake of no composition. I concede the major; I distinguish the minor: angels are simple — with the simplicity opposed to physical composition, I concede; with the simplicity opposed to metaphysical composition, I deny. For in this way only God is simple, alien from all composition whether physical or metaphysical; and every creature is said to be composite — by physical composition, like natural composites, or by metaphysical composition, like an angel.

Objection 2, against the second part: to whatever the definition of physical matter fits, physical matter belongs, because the definition declares the nature of

what is defined; but the definition of physical matter fits an angel, which is the receptive subject of accidents, since an angel receives material accidents because it is capable of local motion and similar accidents, as well as spiritual accidents because it is possessed of love, hatred, grace, and the like; therefore an angel has physical matter and accordingly is composed by physical composition, which consists of matter and form. I concede the major and deny the minor, because the immediate and proximate subject of material accidents is not matter but the substantial composite, as I proved in (*Bk. V, Phys., Q. 1, Art. 4*). Even though an angel is capable of the aforesaid accidents, it does not therefore consist of physical matter and form, because although receptivity is a property of matter, it is not receptivity of accidental forms but of substantial ones; and if this is perhaps attributed to matter, this is done only in a similar and improper sense. And this is all that the authorities and arguments adduced by the authors of the second view prove, as is sufficiently clear to anyone attentively considering and reading them in the Seraphic Doctor, Richard, and Auriol just cited, as Molina protests in the cited place.

Objection 3, against the third part: corruptible and incorruptible differ by more than genus (*10 Metaph.*); but sublunary and corruptible substances are placed in the genus of substance; therefore angels, who are incorruptible substances, do not reside in the same genus and predicament of substance, and accordingly do not consist of genus and difference such as things composed by metaphysical composition. I reply by expounding the philosopher's maxim with Scotus in that place — that it speaks of physical genus, not of metaphysical genus, of which we are now disputing, and in which both material and spiritual substances agree, as I taught in (*Logic, in the passage cited above*).

Article IV. Whether Angels Are Immortal and Incorruptible

Some, among whom is mentioned Cardanus (*On Subtlety*), deny that angels are immortal and incorruptible. The common opinion of the philosophers (*8 Phys. and 12 Metaph.*) and of the theologians (*2, d. 3, and 1 Part., Q. 50, Art. 5*) affirms that angels are immune from all corruption and mortality.

Note and recall from what was said in (*Bk. V, On the Soul, Q. 1, Art. 3*) that immortality is used in three ways. In one way, for complete immutability and perfect necessity — in which way God alone is immortal, as the Seraphic Doctor affirms (*1, d. 8, n. 10, and 2, d. 19, n. 2*). In another way, for that which lacks an intrinsic principle of corruption and mortality, such as matter (*Metaph., T. 12; 1 Phys., T. 81*), which always contrives mischief by reason of the privation annexed to it and the appetite it has for receiving other forms which it does not have. Third, for that which is rendered incorruptible and becomes immortal through some gift and accident inhering in it — thus Adam was, in the state of instituted nature, through the original justice bestowed on him by God, which if he had not lost through sin would have kept him always incorruptible and immortal.

Assertion: Angels by their own nature are immortal and incorruptible. This is deduced from Scotus (*ibid.*, and *Quodl.* 9, *Art.* 2), Bonetus (6 *Metaph.*, *Cap.* 5), Durandus (2, *d.* 3, *Q.* 1), and others there.

It is proved first from Aristotle (2 *On the Heavens*, *T.* 36, and 12 *Metaph.*, *T.* 44), who openly writes that the intelligences are unalterable, perpetual, and immortal. And he had previously suggested this (4 *Topics*, *Cap.* 2), saying that some animals are mortal, others immortal — in whose catalogue most ancient philosophers numbered the angels. Augustine agrees (13 *City*, *Cap.* 16) based on the opinion of Plato, whose words he there cites; and (22 of the same work, *Cap.* 26). Dionysius agrees (*On the Divine Names*, *Cap.* 4): "Intellectual substances have everlasting life, which cannot be diminished, freed and liberated from all destruction, death, matter, and origin."

Second: rational souls are immortal and incorruptible, as has been defined as a matter of faith in the Lateran Council (*Sess.* 8, *under Leo X*); therefore also angels, who are more excellent and superior to them, as is clear from (2 *Peter* 2, *Hebr.* 2, *Psalms* 8).

Third: what lacks an intrinsic principle of corruptibility and mortality is incorruptible and immortal, since when the principle and cause is removed, the principiated thing and effect are also removed; but angels lack the intrinsic principle of corruptibility and mortality, which is matter with the privation conjoined to it, as I noted above — for they are substances disjoined and separated from matter; therefore they are incorruptible and immortal.

Furthermore, the corruptible and mortal is attacked, conquered, and perishes from a contrary; but nothing is opposed to angels, neither from within, since they are simple, nor from without, since there is no power in the nature of things that can compare with them. Moreover, what is created is not corruptible but only annihilable, as is clear from matter, which since it was created is incorruptible and can only be annihilated by God. Furthermore, the dwelling and reward of the good is incorruptible and perpetual — hence the Church in the office of martyrs during Paschal time sings: *Eternal light shall shine upon your saints, O Lord, and the eternity of time*. For the evil, the punishment is eternal, according to Matthew 25: *Depart, you cursed, into the eternal fire, prepared for the devil and his angels*. Angels, therefore, are to be considered alien from all corruption and destruction.

Objection 1: Incorruptibility and immortality are attributed to God alone, as St. Paul shows (1 *Tim.* 2): *Who alone has immortality*. Therefore incorruptibility and immortality are not to be assigned to angels. I reply that this testimony of the Apostle is to be expounded of immortality and incorruptibility taken in the first way, which belongs to God alone — not of incorruptibility and immortality taken in the second way, which I observed in the preceding note to belong to angels and rational souls.

Objection 2: In the sixth general Synod, in the eleventh session, there was read and received the letter of Sophronius holding that angels are incorruptible and immortal not by nature but by grace. Damascus also affirms the same (*2 fidei, Cap. 3*): "An angel is a substance that has obtained immortality by grace, not by nature." And Bernard confirms this (*5 On Consideration, to Eugene, Cap. 4*). Therefore it does not seem consonant with orthodox faith or the teaching of the holy Fathers to think that angels are by their own nature incorruptible and immortal. I reply that that Council and the Fathers had in view immortality taken in the first way, by which God alone is immortal — not the second way, by which angels and those lacking matter are immortal and incorruptible. For every creature, whether spiritual or material, depends on God in being and conservation and needs the continuous influence of God, which is called the grace of God — or rather the gratuitous will and influence of God. For just as God gratuitously by His good pleasure created it from nothing, so by His gratuitous influence He conserves the same perpetually. Looking to this, Plato in the *Timaeus* introduces God addressing the angels thus: "O gods of gods, of whom I am the maker and father; you indeed are my works, of a nature dissolvable, yet by my will indissoluble."

Objection 3: What is composed of non-being and being is corruptible and mortal, because it tends toward non-being; but angels are constituted from non-being and being, since they are finite and limited in entity and perfection; therefore angels are naturally corruptible and mortal. I reply that the major is insufficient: what is required is that such a composite from non-being and being have an intrinsic or extrinsic cause of death and corruption — from which angels are immune; therefore they are immortal and incorruptible. I have treated these matters more at length and more copiously in the treatise on angels, which I have completed in its entirety in sixteen disputations.

Book IV. On God

The name *God* in Latin is *Deus*, in Greek *θεός*, and in Hebrew *He who is* (*Exod. 3*). The reason God is called *He who is* is given because God is being by essence, while creatures are beings by participation. He is also called by one word *Adonai*, according to (*Exod. 6*): *My name Adonai I did not reveal to them* — which is called by the Greeks the Tetragrammaton, as Augustine notes (*2 Questions on Exodus, Q. 120*), and which is called the ineffable name, by reason of whose veneration and holiness it was pronounced only by the high priest. On which I have treated at length in the *Treatise on the One God*, Disp. 2, Q. 13 and following. Presupposing what I said of the predicates of God in (*1 and 8 Phys., Q. 4*), I will add a few remaining things that pertain to metaphysics.

Question: On the Nature of God (Single Question)

Article I. Whether God Can Be Known by Us

Scholastic Doctors dispute the knowability of God along with the Master (*1, d. 1*), among whom it does not seem there is any dissent that God falls under our cognition; but concerning the mode — whether He is known negatively or positively — there is controversy. For St. Thomas (*1 Part., Q. 3, Art. 3*), preceded by Alexander of Hales (*ibid., Q. 2, Art. 2*), hands down that God is known by us negatively. Against these are Scotus (*1, d. 3, Q. 1*), St. Bonaventure, Richard, Major, Auriol, and others who commonly teach that God is positively attained by our intellect.

First Assertion: God by His own nature is known by us. So Scotus (*ibid., Q. 1, §. In 1. quaestione*). It is proved first from sacred letters: Wisdom 13: *From the greatness of beauty and creature, the creator of them can be seen in a way that allows knowledge.* Psalm 18: *There is no speech, nor language, where their voice is not heard* — where St. Chrysostom adds (*Hom. 9 ad populum Antioch.*): "There is no nation of such hidden tongue that it does not hear and perceive the voices of the heavens and other things, which naturally proclaim God." Damascus (*1 fidei, Cap. 1 and 3*): "The knowledge that God exists is naturally implanted in all." And Augustine (*3 On Free Will, Cap. 23*): "If this does not appear as much as was needful, we are admonished that in that highest and ineffable unity of the Creator all these things are constituted; and if you attend piously and diligently, every beauty and motion of creation that falls under the consideration of the human mind proclaims our instruction — by diverse motions and affections, by a certain variety of tongues crying out everywhere and rebuking — that God the Creator is to be known." He writes the same (*1 On the Spirit and the Letter, Cap. 12*). Dionysius (*On the Divine Names, Cap. 7*) and Tertullian (*1 contra Marcionem*). Added to this is the testimony of St. Paul (*Rom. 1*): *The invisible things of God, understood through what has been made, are clearly seen — his eternal power and divinity* — where Lyran says: "The attributes of God are known, indeed even His very essence, through creatures, as a cause through its effect; and thus the philosophers knew God."

Second: Aristotle (*8 Phys. and 12 Metaph.*) and his interpreters there pronounce and predicate many attributes of God, saying that He is the first mover, the first cause, the first being, infinite and blessed, and the governor and prince of all things. Therefore God is naturally knowable by us.

Third: we desire to see God and to enjoy Him as the beatifying object; but the will, as stated elsewhere, is not moved toward the unknown; therefore our knowledge attains God, to which the royal Psalmist invites us (*Psalms 104*): *Seek his face always* — for when God is sought, He is found. And Augustine adds (*on Job 37*): "God will not save the wicked," assigning as the cause of their damnation that they did not wish to know God.

One might say that Augustine seems to affirm the opposite (*Serm. 180 de tempore*): "Do you want to know the nature of God? Know this: that you do not know; and be not saddened that you do not know, because neither do the angels know, nor similarly all creatures." I say that this testimony of Augustine, and whatever others may be brought forward, is to be interpreted as speaking of total and comprehensive unknowing — for in this way God alone knows and comprehends Himself — not of apprehensive and abstractive unknowing. Hence the same saint in his annotations on Job 9 adds: "This is the death of the soul: not to know God." The Seraphic Doctor deals with this similarly (*ibid.*).

Second Assertion: God is known by us not negatively but positively. The Doctor maintains this (*ibid.*). It is argued first: a negation is known only through an affirmation (*2 Perihermeneias, at the end, and 4 Metaph., T. 16*); therefore God is not known negatively unless He is known positively, since a negative concept presupposes an affirmative concept. Second: we know no negations about God except through affirmations, by which we remove things incompatible and repugnant to God Himself. For we say God is not composite because we attribute to Him simplicity opposed to physical and metaphysical composition; likewise we remove from God finitude and limitation because we attribute to Him infinity and illimitability; and so with the rest — therefore God is not known precisely through negations.

Third: we love God supremely, according to Augustine (*8 Trin., Cap. 4, and 10 of the same work, Cap. 1*); hence each person placed in grave danger invokes God and has recourse to Him. But we do not supremely love negations — otherwise we would love nothing, since negations are nothing; therefore God is not known precisely by us negatively. For either a negation is conceived precisely as a negation, or as something said of some positive thing. If the first, then God is conceived no more than nothing or a chimera — since a pure negation, such as not being a stone, is said of nothing and a chimera just as much as of God or any other positive thing, and accordingly God would be understood no more than nothing or a chimera. If the second, then either the concept of which that negation is truly expressed is affirmative or negative: if affirmative, the point is conceded; if negative, the argument recurs — namely, either the negation is conceived precisely as negation, or as said of some positive thing; and thus either God would not be understood more than nothing, or one must rest in some affirmative concept prior to any negative one. Which is our contention.

Objection 1, against the first assertion: Aristotle (*2 Metaph., T. 1*) writes: "As the eye of the bat is to the light of the sun, so is our intellect to the most manifest nature, which is God." But the eye of the owl cannot see the light of the sun; therefore our intellect cannot know God. I reply that the Philosopher's likeness consists in this: just as the owl cannot intuitively and distinctly gaze upon the light of the sun, so our intellect cannot see God by distinct and intuitive cognition, according to (*John 1, Cap. 4*): *No one has ever seen God, nor can see him.*

Objection 2, from (*1 Phys.*, T. 35): the infinite is unknown; but God is infinite; therefore He cannot be known by us. To the major I reply by a distinction: the infinite in potency and in multitude is unknown, I concede; in act and in perfection, such as God is, I deny. Thus Aristotle is explained in the cited place.

Objection 3, from (*3 On the Soul*, T. 30): phantasms are related to the intellect as sensible things are to sense; but sense can perceive nothing unless it is sensible; therefore neither can the intellect perceive anything unless it is imaginable in phantasms; but there is no phantasm of God; therefore neither is there cognition. It is satisfactorily answered if it be said that the comparison holds for the first motion of the intellect from its object. For phantasms in the agent intellect have the role of a first moving object — but not for every subsequent act after the first motion. Since the intellect can abstract the object included in some first mover and consider that object so abstracted without considering that from which it is abstracted, it can thus perceive what is common to sensible and insensible, and accordingly the immaterial and spiritual, such as God. But sense, because it does not abstract or prescind, requires and needs in every act of its, both first and second and subsequent, some first moving object.

Objection 4, against the second assertion: St. Damascus (*1 fidei*, Cap. 12) writes: "It is fitting that each of the things said of God be regarded not as signifying what He is according to substance, but as showing what He is not." And St. Gregory (*1 in Ezechiel*, Hom. 3) adds: "However much our mind progresses in the contemplation of God, it attains not to what He Himself is, but to what is below Him." I reply by explaining the authority — that is, negation is not to be taken precisely as negation, but as designating a positive thing, as has been sufficiently shown in the third argument I used to prove the second assertion. To Gregory, I say that perhaps he intends that God is known by us through creatures, as a cause is recognized through its effect. Or he means that we have a common transcendental concept of God — such as being, substance, and forms of this kind — but not a proper concept drawn from what is properly His, which we cannot attain by our own powers. Since that concept is inferior to this one in entity, likewise in intelligibility; for this reason the aforesaid saint adds that by our labor we arrive at a concept of God that is below Him — that is, inferior and less noble than the proper concept which is had of God Himself.

Article II. Whether It Can Be Demonstrated That God Exists

There are not a few among the ancient philosophers and moderns who think that God's existence can be demonstrated neither a priori nor a posteriori, dissolving the arguments by which Aristotle demonstrates both in *8 Phys.* that there is one first mover and in *12 Metaph.* that there is one first cause and one lord and prince of all things — among whom are Ockham (*in the Centiloquium*, Concl. 1), d'Ailly (*1 d.* 3, Q. 3), Major (*ibid.*, d. 2, Q. 1), Andreas de Castro Novo (*d.* 8, Q. 1), and not a few others. On the other side, some think that God's existence is demonstrated in both ways — both a priori and a posteriori — to whom Suárez

seems to be favorable in some way (*Disp. 29 Metaph., Sect. 3, n. 2*). The common view of the Scholastics, however, is that of Scotus (*1, d. 2, Q. 2*), Major, Auriol, Viger, Richard, and the rest, who teach that God's existence is demonstrated only a posteriori.

Note 1, from Aristotle (*1 Eth., Cap. 3*): there is not the same evidence and certainty in every matter and subject being treated. One kind of evidence belongs to mathematical discipline, another to metaphysics. Hence when the holy Fathers and Scholastic Doctors adduce physical or metaphysical arguments to show that God exists or any other matter, they do not all proceed with equal certainty and evidence — but some are stronger and more evident than others, according as the greater firmness and evidence belongs to the matters from which they are drawn and derived. If it sometimes happens that some do not perceive certain demonstrations, this occurs not because they are not true demonstrations, but because they are not so plain to sense, or it arises from their dull intelligence or from stubbornness and obstinacy — of whom perhaps is said that of Romans 1: *Their foolish hearts were darkened*.

Note 2, from Hermes Trismegistus (*1 On the Definitions of God*), who, describing God, says: "God is an intellectual sphere whose center is everywhere and whose circumference is nowhere." This is explained with respect to all its parts. It says *sphere* because just as in a sphere neither beginning nor end is found, so God has neither beginning nor end, since He Himself is the beginning and end of all things, as He says of Himself (*Apoc. 1*): *I am the Alpha and Omega, the beginning and the end*. *Intellectual* is added because God is the purest spirit, devoid of all matter and body, enjoying intellectual life, which surpasses all others. The clause *whose center is everywhere* is placed on account of His immensity. The clause *whose circumference is nowhere* is appended on account of His incomprehensibility, since He is enclosed by no term and no limit.

Note 3, from St. John Damascus (*1, 1 of his Sentences, Cap. 12*): the name *God* has a threefold etymology, which is cited and expressed by Vorillong (*1, d. 2, Art. 1*) and touched upon by Scotus (*ibid., Q. 2, §. Ex his, sub D.*). I adduce only the one I consider truer and more important — namely, that *Deus* in Latin and *θεός* in Greek is derived from *θεᾶσθαι*, which is the same as to behold, as Vives notes (*in the commentary on 1 City of God, Cap. 31*) — or, which is the same, from *to see*, because God beholds all things, even the depths of hell, and *all things are naked and open to his eyes* (*Hebr. 4*). And universally God is called from His actual operation, as Damascus in the cited place notes and the Doctor agrees in the same place (*ibid.*), because He always operates by cherishing, burning, and seeing: He cherishes with piety, burns with charity, and sees with clarity — so that there is no one who does not behold these operations, since there is no one who can hide from His warmth (*Psalms 18*).

Assertion: That God exists is demonstrated — not indeed a priori, but only a posteriori. This assertion is two-membered and is defended by Scotus (*1, d. 2, Q. 2, §. Ad 1. quaestionem. G.*).

The first part is common and easy to prove. What has no cause cannot be demonstrated a priori, because demonstration a priori is had through the cause (*1 Post., Cap. 2*); but of God there is no cause, since God Himself is uncaused; therefore His existence cannot be demonstrated a priori. Furthermore — and this seems to come to the same thing — the middle term of an a priori demonstration, especially of the most powerful kind, is the definition of the subject according to Scotus, or the definition of the predicate according to others; but there is no definition of God, since definition consists of genus and difference, which are far removed from God; therefore His existence cannot be demonstrated a priori.

One might say: if someone were to argue as follows from the divine attributes, which seem to be as it were the properties and proper attributes of God — "God is immense, therefore immutable; and He is infinite because He is independent and from Himself" — and arguing as it were a posteriori from these, could then a priori demonstrate and demonstrate His existence; therefore demonstration of God's existence a priori can be acquired and obtained by us. I say that this discourse is indeed good, yet not evidently known, since its principles are not clearly manifest to us — and especially the divine essence, which is the source of those attributes and the ocean of all perfections — and therefore no demonstration of God's existence a priori can be had, as St. Dionysius suggests (*1 On the Divine Names*). And this is handed down of any subject of science (*1 Post., T. 2*).

The second part is argued first from the testimonies of sacred Scripture cited in the preceding article and the authorities of the holy Fathers adduced there, to which I add Augustine (*Serm. 143 de tempore, and 1 and 3 On the Creed for Catechumens, Cap. 2*) and Ambrose (*in the Epistle to the Romans, Cap. 1*): "Since God was invisible, in order that He could be known even from visible things, He made a work which by its visibility might demonstrate the maker."

Second, it can be shown by the physical medium adduced by Aristotle (*8 Phys., Cap. 1, and 12 Metaph., T. 36*); and (*Summa 2, Cap. 1, at the end*): everything that is moved is moved by another; and since one cannot go on to infinity (*2 Metaph., Cap. 2, T. 2*), one must arrive at the ultimate mover and the first cause of motion, which we call God. And this is openly shown and lucidly declared by the same Aristotle (*12 Metaph., cited*) and by Scotus in his exposition of the text: for there is given the lowest moved thing, such as the earth; moved and intermediate movers, such as the remaining elementary and celestial orbs and the intelligences revolving them — as is clear from the motions of fiery comets, which are moved in the sphere of fire by the motion of the orb of the moon, and from the motions of the planets, each of which completes its motion and

course in a certain and determined interval of time, as we see daily with our eyes — therefore there is given a first mover, which among the celestial orbs is the outermost heaven, which in the space of twenty-four hours, carrying the rest along by its rapture, completes its course; and among the intelligences moving the said heavens, there is the first intelligence, which is called the first mover — namely, God; therefore through motion the existence of God is rightly demonstrated, and this is a physical demonstration a posteriori, as the Doctor (*Q. 3, Prol., §. Ad 1. argumentum. N.*) indicates.

Yet not all accept this; they strive to dissolve and undermine it. For the proposition "everything that is moved is moved by another" does not seem to be universal but indefinite, as I showed in (*8 Phys., Q. 3, Art. 3*) — since animals move themselves, and likewise heavy and light things; and there are those who think the heavens are moved by their own intrinsic form, being animated and constituting one thing through which the stars wander, as birds through air and fish through the sea. Moreover, Zeno and his followers deny motion, though wrongly and against experience. Furthermore, some admit a circle in movers and things moved. And the same Aristotle does not seem to have adhered firmly to the cited proposition, since according to Fonseca (*in the Preface to Metaph., Cap. 1*) he was accused of being ἄθεος καὶ ἀσεβής — without God and impious. For if he had denied God and despised His worship, surely everything he taught about the first mover, motion, and the other matters he tries to demonstrate in the cited places would have been undermined. But that the Philosopher did not fall into such a crime of impiety is openly shown by his life and writings, so that there is no need to defend him otherwise from such a slander, with which he is attacked by the envious and his enemies after the death of his pupil Alexander.

Third: everything that exists is either produced or unproduced — that is, either it is from another or from itself: if unproduced and from itself, it is God; if produced and from another, it is a creature. For nothing is found that produces itself; indeed, according to Augustine (*1 Trin., T. 1*): "There is nothing more inconvenient than that the same thing should produce itself." And since no infinite process is to be admitted in essentially ordered causes, as stated above, it follows that there is given a first efficient cause, the first maker of all things, which is God. Hence Scotus, cited just above, writes that the multitude of beings, their dependence, contingency, composition, and the like openly argue and clearly demonstrate that there is one independent, necessary, and simple being, which is God. But this is a metaphysical medium more excellent and efficacious than the physical medium premised above. Against it some come and say it is not demonstrative but dialectical — for Anaxagoras, cited by Aristotle (*1 Phys., T. 3*), thinks that anything is made from anything; Democritus posits an actually infinite number of generable and corruptible things (*1 On Generation, Cap. 1*) and infinite worlds, as Valerius Maximus testifies (*1.8*); and Aristotle himself, positing the eternity of the world from the past and unwillingly constrained to admit an actual infinity of souls — though he himself openly denies any actual infinite (*3*

Phys., T. 40, and 1 *On the Heavens*, T. 34) — and many other objections would be raised by a stubborn person yielding to no one and resisting truth, stable foundation, and firm reason, so as more freely to indulge every vice and finally slide into atheism.

Fourth: in any well-constructed and rightly ordered house, and in any republic and empire aptly disposed, there is established a lord, governor, and prince to whom all are subject and obedient, who rewards the good and punishes the wicked; therefore in this immense fabric of the world and assembly of all things there is and exists a supreme Lord, monarch of all, avenger of good and evil — which is God. And thus God's existence is demonstrated physically, metaphysically, and ethically.

Objection 1: What is self-evident cannot be demonstrated either a priori or a posteriori, but becomes known from the mere explanation of its terms; but it is self-evident that God exists, as Scotus writes (1, d. 2, Q. 2); therefore God's existence is in no way demonstrated. I concede the major; I distinguish the minor: it is self-evident that God exists — to one who distinctly conceives the terms, as God Himself and the Blessed do, I concede; to one who apprehends the terms only confusedly, as happens with us, who have only a confused and indistinct knowledge of God and His essence and existence, I deny. So the Doctor deals with this (*ibid.*, §. *Ex his ad q.*).

Objection 2: What is demonstrated cannot be denied by anyone, because demonstration is an evident and necessary syllogism; but some deny that God exists, as Psalm 13: *The fool says in his heart: there is no God*; therefore that God exists is not demonstrated a posteriori. I concede the major; I distinguish the minor: some fools and wicked persons deny that God exists, I concede; some wise and good persons deny this, I deny. Hence rightly in the cited testimony it is said *in his heart*, because if he had said it publicly, he would have spoken foolishly and would have been refuted by all creatures, which naturally proclaim that God exists. Or perhaps the fool said in his heart that there is no God, because if he had said it openly, he would have been burned, as atheists are burned.

Objection 3: It is self-evident that truth exists — for if there were no truth, it would be true that there is no truth, and thus truth would exist; but God is truth, as God Himself testifies in John 14: *I am the way, the truth, and the life*; therefore that God exists is not demonstrated a posteriori. I reply to the major: not every truth is self-evident — since for the most part it escapes us, and the philosophers labor greatly in its investigation, sweating over it and barely attaining it — but only that which is born from the mere distinct knowledge of the terms, which is not the case with God's existence, which we apprehend only confusedly.

Objection 4: What is believed by faith is not demonstrated, because faith is of things obscure and enigmatic, while demonstration is of things clear and evident; but we believe in God, as is clear from the Apostles' Creed, *I believe in God*; therefore it is not demonstrated that God exists. It is satisfied if it be said that of what there is demonstration, there is no faith; hence if someone has a demonstration of God's existence, of that same existence he has not faith but science — in which way pagan philosophers, lacking faith, acknowledged and knew that God exists, as is clear from Romans 1: *For when they knew God, they did not glorify Him as God, nor were thankful*. Wherefore Doctors have scientific knowledge of the common predicates of God, but faith regarding His proper predicates; while the uneducated and simple have faith regarding all, as I showed at length in the *Treatise on the One God*, Disp. 1, Q. 2.

Article III. Whether There Is One God

Alphonsus de Castro (*1.5 against Heresies, s.v. Deus*) reports that some think there are several gods — notably the Gnostics and Manicheans — preceded by Augustine (*On Heresies, Cap. 6*), Irenaeus (*1.3, Cap. 18*), and Epiphanius (*Heresies 33 and 36*), who recall and refute those who fell into polytheism. The common and orthodox doctrine teaches us that God is one. Whether it can be demonstrated that God is one is not agreed upon by all Scholastics. For Ockham (*1, d. 2, Q. 10*), Gabriel (*ibid., Art. 2, Concl. 3*), Major (*in that place, Q. 1, Concl. 3*), and others think that it is not demonstrated but only dialectically argued that God is one. But others, such as Scotus (*1, d. 2, Q. 3*), Mayr (*Q. 4*), Auriol (*d. 3, Art. 3*), and others commonly hand down that it is demonstrated that God is one. This difficulty presupposes that God exists and asks whether God is one — since a thing has being before its unity arises, since unity is a proper attribute of being (*4 Metaph., Cap. 2, T. 3*). Wherefore, since above it has been demonstrated that God exists, it is rightly inquired whether He is one God or several.

First Assertion: There is only one God. It is proved first from sacred letters: Deuteronomy 6: *Hear, O Israel: the Lord your God is one*. And (*ibid., 26*): *See now that I am alone, and there is no other god beside me*. Psalm 8: *Who is God except the Lord? Or who is God besides our God?* Wisdom 12: *For there is no other God but you, who cares for all*. 1 Cor. 8: *We know that there is no God but one*. And Ephesians 4: *One Lord, one faith, one baptism, one God and Father of all*.

Second, from the holy Fathers: Tertullian (*contra Praxeam*), Athanasius (*in the Symbol*), Augustine (*contra sermonem Arrianorum, Cap. 1, and 3 contra Maximinum, Cap. 10, and in the exposition of Psalm 49, and On the Ten Strings, Cap. 5*), and Damascus (*1 fidei orthodoxa, Cap. 5*). And it is decreed in the Nicene Symbol: *I believe in one God*. The philosophers concur, notably Aristotle (*12 Metaph., at the end*): "Beings do not wish to be ill governed; one, therefore, is the prince of all in the universe, who is called God." And it is reported that when the same Aristotle was near death, he uttered these words: "Being of beings, have mercy on me" — whatever Veglia may say in his (*4th Investigation*). And that Socrates, Plato,

Pythagoras, and other ancients held the same is attested by Augustine (*4 City, Cap. 11*) and Eusebius (*11 On Preparation, Cap. 3*), with whom Avicenna (*1 Metaph., Cap. 6, and 9 of the same, Cap. 1*) and Trismegistus (*On Divinity, to Asclepius*) agree, as Richard reports (*1, d. 2, Art. 1, Q. 1*).

Third: every multitude is reduced to one, after St. Dionysius — as Scotus writes (*Q. 3 Prol., before §. Ad 3. quaestionem. V.*) — and dependence reduces to the independent; but there exists an abundant multitude of created things and dependence; therefore it is reduced to one uncreated and independent being, which is the one God.

Fourth: in whatever essential order of things there is established one thing that is the measure and standard of the others (*10 Metaph., T. 2*); therefore in the whole aggregate of all things and their essential order there is had one first being, which is the measure and standard of all of them — namely, the one God.

Fifth: the things of the world are so arranged and ordered among themselves as soldiers of one army toward one general and as subjects toward one king and prince, as Aristotle records in writing at the end of (*12 Metaph.*). Those who think otherwise, positing several first principles and several princes of the world, make the substance of things and the mass of the universe incoherent. Therefore there is only one God.

Second Assertion: It is demonstrated that there is only one God. So Scotus (*ibid., and in the Report., ibid., Q. 4, and Quodl. 7*). It is proved first by a physical argument: there is one first mover because there is one first movable (*8 Phys., T. 54, and 12 Metaph., T. 44*), and the first mover is God; therefore there is one God. This argument seems indeed efficacious, yet it suffers many objections which I brought up in the preceding article. For if there were several worlds — which the Scholastic Doctors do not deny to be possible — there would be several first movers, yet not several gods. Furthermore, God does not immediately move the first movable, as Scotus hands down from Aristotle in his exposition of (*12 Metaph.*). Moreover, the pagans admit a plurality of gods, which they would not concede if it were demonstrated that there is only one God — since demonstration is a necessary and evident syllogism to which no sane person can contradict.

Second, it is shown by the metaphysical argument, which is stronger and more efficacious, as the Doctor rightly saw (*in the Prol., cited just above*): there is one independent, uncaused, and supremely necessary being, as I showed in the preceding article; therefore there is one God. The antecedent is evident because dependence reduces to the independent, caused things to the uncaused, and contingency to the necessary; but God is from Himself and independent, uncaused and supremely necessary; therefore it is demonstrated that there is only one God.

Third, by the moral and political argument: a better principate and a more excellent government must be posited in the world, since it is a better and more excellent work, to which a better direction and governance is fitting. But a monarchy in which one rules is better than a democracy and aristocracy in which several rule and predominate; therefore there is only one God, creating, governing, and ruling all things found in the universe.

Fourth: if there were several gods, they would be distinguished either specifically or numerically. Not specifically, because species are related as numbers, one of which is more perfect than another; but God is that than which nothing more perfect and greater can be conceived, since He is most perfect and contains the sum of every perfection. And what differs specifically is under the same genus, which is potential and finite, as is clear in Logic. Nor numerically — since not only does one individual surpass another in perfection, as the University of Paris decreed regarding the soul of Christ the Lord, but individuals are contracted by their individual differences and are finite and limited, and there is no incompatibility in their being multiplied to infinity — all of which are repugnant to divinity, which is infinite, unlimited, and non-multipliable.

Therefore it is demonstrated that there is only one God. Here belong the seven arguments adduced for the demonstration and confirmation of this by Scotus (*in 1, cited*) and treated at length and solidly by Antonius Andreas (*Q. ult., 12 Metaph.*), which for the sake of brevity I omit, and which can be read in the said authors.

Objection 1: Divinity is attributed to men, as Psalm 81: *God stood in the assembly of gods*. And shortly after: *I said, you are gods*. Therefore a plurality of gods is not incompatible. Lyran replies in his commentary there, saying that by gods in that place are understood judges, and he proves this from Exodus 22: *To the gods — that is, judges — both sides of the case shall come*. Judges are called gods because they execute the works of divine justice. And Augustine in his exposition of Psalm 49 writes that men are called gods not by nature but by grace; he says the same on Psalm 84 and in tract 48 on John. Damascus also adds (*4 fidei, 16*): "I say gods and kings and lords — not by nature but as ruling their passions, dominating them, and preserving the image and likeness of God in an unobliterated way. For a king is said to be the image of the king."

You will press: 1 Cor. 8: *There are many gods and many lords*; therefore a multitude of gods is not to be rejected. I say that this testimony holds for idolaters and pagans, as is clear from Psalm 95: *The gods of the gentiles are demons* — not for adorers of the true God. Hence the Apostle adds (*ibid.*): *But for us there is one God*. And Scotus adds, cited just above, that many are gods by name — that is, in name only — but one is God in reality and essentially, the creator and governor of all.

Objection 2, from St. Anselm (*Prosol., 2*) and Scotus (*1, d. 2, Q. 2, §. Quarta via, sub BB.*): God is that than which a greater cannot be conceived; but several gods are

those than which a greater cannot be conceived; therefore several gods are not to be rejected. The major, which the Nominalists do not accept, is premised and handed down by St. Augustine (*Book of Questions on the Old and New Testament, Q. 1, and 1 On Christian Doctrine, Cap. 7*): "God is that than which nothing better and more sublime is thought." The same is had in (*7 Confessions, Cap. 14*) and more expressly in (*On the Spirit and the Soul, Cap. 63*). I reply that the aforesaid major and authority are to be glossed and limited, provided there is no incompatibility. But it is incompatible for there to be several gods, as has been shown above; therefore a plurality of gods is to be denied, because it is impossible and involves contradiction.

Objection 3: It is better for there to be several goods than one good, as it is better for there to be several men than one man — hence it reads in Genesis 2: *It is not good for man to be alone*. But several gods are several goods; but one God is only one good; therefore a plurality of gods is to be admitted. It is satisfied if the major is glossed in the same way as the major of the preceding objection — that is, unless there be an incompatibility; but it is contradictory to affirm polytheism; therefore it is repudiated. Looking to this perhaps, Augustine, addressing God, says at the end of his exposition of Psalm 58: "No one is better than you, no one more powerful than you, no one more generous than you in mercy — from whom I received that I should be, from whom I received that I should be good."

Article IV. Whether It Is Demonstrated That God Is Infinite

Two things can be investigated in this article — namely, whether God is infinite, and whether it can be demonstrated or only dialectically argued that He is infinite. Concerning the first, there seems to be no difficulty, since no one I have seen removes infinity from God. Concerning the second, however, there are as many opinions as were related in the preceding article. For Ockham (*in the Centiloquium, Concl. 3*) and his followers assert that God's being infinite is to be held as probable and believed by theologians, from the signification of the word. But Scotus (*1, d. 2, Q. 2, and in the Report., Q. 3*), Mayr (*Q. 8*), Lychetus, Bargius, Viger, and others commonly there, with whom Suárez agrees (*Disp. 30 Metaph., Sect. 2, n. 2*), affirm that by natural reason it can be demonstrated that God is infinite. The acceptations and divisions of the infinite adduced and explained by Bonetus (*Bk. 2 of his Natural Theology, Cap. 1*) and by me (*Bk. V, Phys., Q. c.*) are to be recognized and recalled. Here, however, I only observe that this doubt is raised only concerning the infinite in act, in intension, and in power.

First Assertion: God is infinite in vigor and power. The Doctor maintains this (*cit., §. Ostensis igitur 7, and Quodl. 7, §. Sed quia. FF.*). It is proved first from sacred Scripture: Psalm 144: *The Lord is great, and his greatness is without end* — where Lyran adds: "God is great not in greatness of bulk but of power." And Baruch 3: *He is great, and has no end, high and immense*. Second, from the holy Fathers: Dionysius (*On the Divine Names, Cap. 9*): "Great above all greatness, transcending

all infinity." Augustine (*3 contra Maximinum*, Cap. 26) and Athanasius in the Symbol. Added to this is the Lateran Council under Innocent III (*Cap. Firmiter de summa Trin. et fide Catholica*), in which this assertion was defined; and it seems also to have been decreed before that in the Council of Florence in the instruction of the Armenians. Aristotle favors it, both (*8 Phys.*, T. 79) and (*12 Metaph.*, T. 41), Averroes there, and the other Peripatetics, from whom the other philosophical schools do not depart, who affirm that God is of infinite and unlimited power.

Third: being, universally and adequately, is divided into infinite and finite; under the finite every created thing is comprehended; therefore the remaining member, which is the infinite, imports the uncreated — which is God.

Fourth: the finite and the infinite are proper attributes of quantity, as I observed in the *Epitome of Dialectics*, Bk. 1, Q. 4, Art. 6, n. 19. But since quantity, as stated from there (n. 18), is twofold — of bulk and of power — the former belongs to material things and the latter to spiritual things; but finitude is adapted to created being; therefore infinity belongs to uncreated being, which is God.

Fifth: no imperfection is to be attributed to God, who is the most perfect and most eminent being; but finitude carries with it imperfection, as the lack of further perfection in the thing of which it is the finitude; therefore finitude is not to be ascribed to God, but infinity, which imports unlimited perfection and the fullness of every perfection simply.

Sixth: the closer something is to what is more imperfect and worse, the more imperfect and worse it is, as is clear from material forms, which are closer to matter, which is worse and more imperfect than all things; but finitude of bulk belongs to material things, which are inferior and worse than all others; but finitude of power is accommodated to limited spiritual things; therefore infinity of power, which is far removed from material things, belongs to the most excellent and supreme being, which is God.

Second Assertion: It is naturally demonstrated that God is actually infinite. So Scotus (*ibid.*). It is proved first: what is from itself and through itself is plainly and fully infinite, because it is caused and limited by no one; but what is from another is finite, because it is caused by another, which limits and ends it within the bounds of its own genus. But God is from Himself and through Himself, since He is unproduced and independent; therefore God is infinite, and accordingly it is demonstrated that God is infinite. And Aristotle recognized this (*in the cited places in the preceding assertion*), writing that the first mover, which is God, moves for infinite time — and what moves for infinite time is infinite; therefore according to the truth of the matter and Aristotle it is demonstrated that God is infinite.

One might say that this does not follow, since an angel applied to a heaven moves that heaven for infinite time, and yet that very angel is both in entity and

in power finite and limited; therefore by that medium Aristotle does not demonstrate that God is infinite in act in vigor and power, since motion and time are not simultaneously infinite but only successively so. And hence a finite incorruptible and immortal power, such as the power of an angel, can move by motion and for infinite time; and accordingly from the fact that the first mover moves for infinite time, it is not rightly inferred that it is of infinite power in intension, but only in duration, as the Nominalists think (*with Ockham, cit., and Quodl. 2, Q. 2, and Quodl. 7, Q. 11*). But this sense is alien from Aristotle's mind. For he hands down in the cited place of the Physics that an infinite power cannot exist in a magnitude — but it could, if the power were formally finite, just as the power of an intelligence is in the magnitude of the heaven it wished to move. Therefore, not obscurely, Aristotle is shown to teach that the power of the first mover is intensively infinite. But why does an angel perpetually move, and yet its power is formally finite and of infinite duration, while the first mover's power is formally and intensively infinite? Scotus excellently responds and assigns the cause: because the first mover is from Himself and independent, while the other movers, such as the angels, are from another and dependent on the first. Hence the first has infinite power, the others finite power in vigor.

One might say, along with Suárez (*cit., n. 4*), that this reply does not match Aristotle's text, which does not there mention the clause "from itself or independently" — which holds not only of motion but also of any other action. And the same Philosopher argues from the infinite duration of motion for his proposition. Especially since Aristotle uses a physical medium, which is not "to move from itself and without dependence on another." Moreover, that to move from itself and independently requires infinite and unlimited power has not been proven and demonstrated by the same Stagirite. Against this: even if Aristotle did not explicitly mention that clause, he implies it when he says one must arrive at one first mover and that everything moved is moved by another; therefore since the same Aristotle thinks there is given one first mover who is not moved by another but moves all others, plainly according to him that first mover is from Himself and independent. And intimating this (*12 Metaph., in the cited passage*), he adduces that proposition, so that — having prefaced the physical medium of motion — he might buttress and confirm it through metaphysics, as the same Philosopher himself did in that very place. Hence Averroes in his commentary on that place distinguishes a twofold mover: one first, which does not immediately move the first movable — and this is God, independent and supreme of all; another second, which immediately moves the said first movable, caused by and dependent on God. Thus Aristotle posits the first mover as from Himself and independent and of infinite power, which can be limited by no one since it has no superior — and thus the first uncaused and unparticipated being, which Suárez seems to sense in the cited place (*n. 22*). This sometimes happens: one who attacks Scotus unwillingly falls into his doctrine,

as the same Suárez expressly in the cited place (*n.* 8) frankly admits, arguing ingeniously against the Thomists.

Second: what can produce infinite effects of itself is infinite in power, because infinite effects argue an infinite cause; but God, as far as in Him lies, can produce infinite effects — as infinite souls; and especially according to Aristotle, who thinks the world is eternal, from which it follows that there is an actual infinity of souls; and according to the Nominalists, against whom we are disputing, an infinite magnitude, multitude, and intension is possible, as I reported in (*Bk.* 5, *Q.* 5); therefore God is of infinite power.

One might say that if the sun were to last infinitely, it would successively produce infinite effects, though it is of finite and limited power; therefore even though God successively causes infinite effects, He does not therefore possess infinite power in vigor and intension, but only in duration. I say there is a disparity, because the sun is a secondary and dependent cause, while God is the first and independent cause; hence God Himself possesses infinite power intensively, while the sun has finite power that would endure perpetually if God wills.

Third: an intellect actually understanding infinite intelligible objects is actually infinite, since a power that actually respects infinite things is actually and formally infinite; but the intellect of God actually understands infinite intelligible objects — for what it understands, it simultaneously understands, and the intelligible objects are infinite, which do not require existence to be understood but need only to be in objective being, from what has been asserted elsewhere; therefore if the intellect of God is formally infinite, so likewise His will — which are of equal scope and capacity — and likewise His essence and nature, since infinite powers and potencies can only proceed from an infinite essence; and thus it is shown that God is infinite in power and intension. This argument is held in such esteem by Mayr, cited just above, that he thinks it insoluble and that the adversary cannot escape and evade its force.

Furthermore: our appetite tends toward an end and does not rest in a limited object and end; therefore it requires an unlimited and infinite object and end — and such an end is God, according to Psalm 16: *I shall be satisfied when your glory appears*. Finally: the most eminent and most perfect being is formally infinite, for it has every possible and conceivable perfection, which it would certainly not possess if it were finite and limited, because finitude carries with it annexed imperfection; therefore it is concluded that it is demonstrated that God is intensively infinite — that is, in vigor and power.

Objection 1, against the first assertion: if some being were actually infinite, it could not be compatible with anything contrary to it, because one contrary expels another, as heat expels cold. But God is supremely and infinitely good. Therefore if God were actually infinite, there would be no evil in the universe,

which is false. I reply from Scotus (*1, d. 2, Q. 2, §. Ad 1. argumentum principale. DD.*) by distinguishing the major: of the natural and necessary, I concede; of the voluntary and free, I deny — such as God is, who does all things whatsoever He wills and permits evil in order to elicit good. Especially since evil is not a positive real thing but only the privation of good.

Objection 2: If an actually infinite body were given, it would not be compatible simultaneously with another body, since such an infinite body would fill and occupy all places; therefore if God were actually infinite, there would be no other being, and accordingly every created being would be excluded, which is false. I reply: given the hypothesis, such an actually infinite body would not be simultaneously compatible with another dimensional body occupying a place; but it would be compatible with another body abstracted and absolute from quantitative dimensions, as I handed down in (*Bk. VI, Phys., Q. 2, Art. 3*). Likewise, God is the infinite and independent being, who does not carry along with Himself another infinite and independent being; but He is compatible with a finite and dependent being, which is created being.

Objection 3, against the second assertion: a finite cause produces a finite effect; therefore if God is infinite in power, He causes an infinite effect; but every effect produced or producible by God is finite, since every creature is limited and finite; therefore it cannot be demonstrated that God is infinite in vigor and power. I concede the antecedent and deny the consequence; the incompatibility sought is not on the part of God, who is omnipotent, but on the part of the effect, which cannot be infinite since it is determined and limited in some genus. Just as another God is not possible, because it is incompatible for there to be two infinite, unproduced, and independent beings from themselves. Therefore the infinite power of God respects possibles, not impossibles — such as what is intensively infinite.

Objection 4: A finite power moves in time; therefore an infinite power, since it is more active and efficacious, moves in an instant. But motion cannot occur in an instant, because it is continuous and successive; therefore it is not evidently shown that God is formally and actually infinite. I concede the antecedent and deny the consequence; to the subsumption I distinguish: if motion is taken in its species, as continuous motion, I concede; if however it is taken in its genus and as instantaneous change, I deny — as I showed at length in (*Bk. VIII, Phys., Q. 1, Art. 5*).

Book V. On the Being of Reason

Many things about the being of reason are assembled by Mayron (*Quodl. 6 and 7*), Fuentes (*Q. 2 of the Logic*), Poncius (*Disp. 1*), the Complutenses (*Disp. 2*), Ruuio (*Tract. on the Nature of the Being of Reason*), Suárez (*Disp. 54 Metaph.*), Mastrius

(*Disp. 2 Metaph.*), and others, of whom some treat this matter at the beginning of Logic, others at the end of Metaphysics. Following them, I have until now deferred this treatment so that, having already obtained knowledge of real being, we might more easily arrive at knowledge of the being of reason, which is its opposite; and so that the obscurity and thinness of the subject might not delay and overwhelm the minds of beginners with its difficulty. For it does not seem to me a dialectical error if someone treats the being of reason in Logic — as Suárez just cited thinks — since almost all things treated in Logic are beings of reason, and the object of its predication is the being of reason. Especially since Aristotle at the end of (*6 Metaph.*) expressly removes the being of reason from the consideration of metaphysics, indicating that the being of reason does not per se and directly fall under its object, but only incidentally and reductively, as Scotus rightly saw there.

Question I. On the Nature of the Being of Reason

Article I. Whether There Is a Being of Reason

A very few, cited and named by the recent authors just adduced, with whom Mayron (*ibid.*) seems to agree, deny that there is a being of reason. But all the other philosophers and theologians affirm it, to such a degree that the said Mayron confesses that the affirmative part is too widely diffused in theology; and some add that he defends the opposing view only for the sake of disputation, as is clear from many points he places in the cited question. Indeed the said Mayr clearly stated at the end of (*Quodl. 6*). For a more convenient and easy grasp and understanding:

Note 1: reason is used in many ways — first, for the quiddity of a thing, which is called the formal notion of any thing; thus Ecclesiastes 8 seems to speak: *I understood that no man can find out the work of God* — because, namely, the differences of things, especially the ultimate ones, escape us; or, as Lyran explains there, no man can have certain particular knowledge in particular. Second, for the declarative knowledge of such a quiddity, which is sometimes called a definition. Hence Job 38: *Do you not know the order of heaven, and do you set its reason on the earth?* — where the aforesaid Lyran adds that its reasons pre-existing in heaven cannot be fully comprehended by all, nor fully applied to determinate effects. Third, for comparative knowledge of one thing in relation to another — in which sense the said Ecclesiastes 9 writes: *Neither work, nor reason, nor knowledge, nor wisdom will be in the underworld, where you are hastening.* Fourth, for cause — in this sense one who assigns the cause of something is said to give its reason. Perhaps looking to this, Augustine (*1, 83 Questions, Q. 46*) calls the ideas of things their eternal reasons. Fifth, for intellect — in which sense man is called capable of reason and rational.

Note 2: for something to be of reason or from reason happens in many ways. First, because it is produced by reason — that is, by the intellect — in which way

all intellectual habits are called beings of reason. Second, because it is caused by right reason or reason as ruler — thus that is said to be of right reason which right reason dictates. Third, because it is left behind by reason, as being-known follows from the act of knowing; or because it is entirely worked out by reason — and thus the intellect negotiating around intelligible objects is said to make diminished and qualified beings, which, as Richard notably observes (2, d. 1, Q. 2, Art. 1), are beings of reason distinct from real beings.

Note 3, from Scotus (1 *Elenchi*, Q. 1, and 1 *Post.*, Q. 11): being is divided into the being of nature and the being of reason — and commonly into being outside the mind and being in the mind, from (5 *Metaph.*, T. 14). The first is real being; the second is the being of reason, which from Scotus (4, d. 1, Q. 2, §. *Hic primo. B.*) is taken in three ways: subjectively, objectively, and comparatively. The being of reason subjectively is what is subjected in reason — that is, the intellect — such as science, which inheres in the intellect; and this is not distinguished from real being, since it is a quality, which is a real being. The being of reason objectively can be understood in two ways: either because it not only presents itself as object and is presented to the intellect, but beyond that objective being has being outside the intellect — and this likewise is a real being, such as a stone, which besides presenting itself to the intellect has being on the part of the thing; or because it has being only objectively in the intellect and depends in its coming-to-be and in its being on the intellect itself — and this is properly the being of reason. Third, comparatively: which, beyond the description just given, is described by the Doctor (*ibid.*) as the passive comparison of one known object to another known object, as will be clear in the following article. And this is properly the being of reason, which is distinguished from real being.

Assertion: There is a being of reason. This is the common view, and the opposite is against the torrent of philosophers and theologians, notably Scotus (1, d. 8, Q. 4, §. *Contra istam opinionem. F.*, and *Quodl.* 1, §. *De altero termino. H. and L.*) and other places; Thomas (1, d. 26, Q. 2, Art. 1, and 1 *Part.*, Q. 28, Art. 1) and the disciples of both there; preceded by Aristotle (5 *Metaph.*, Cap. 7, T. 14, and 6 of the same, T. 8, toward the end).

It is proved first from the most common and received division of being into real being and the being of reason: but the members of a good division are opposed, and if one is admitted, the other must likewise be conceded; therefore since real being is given — which has being apart from any act of the intellect — the being of reason is likewise to be given, which depends only on the act of the intellect and without which it cannot exist. Second: science is sufficiently and adequately divided into real science, whose object is outside the intellect and on the part of the thing, and rational science, whose object is in the intellect — as is clear from Logic, whose object is the syllogism, which is a being of reason; and likewise its parts, whether proximate or remote, are beings of reason. Grammar and Rhetoric likewise treat of the being of reason; therefore the being of reason is

not to be rejected. Third: if there is a necessary and natural cause duly approximated and unimpeded, its necessary and natural effect follows, as experience establishes; but the intellect, since it is a comparative and reflexive power over its own acts, is the cause of the being of reason — and indeed a natural and necessary one; therefore the being of reason is not to be denied. Fourth: if there is a proper attribute, there is likewise the being of which it is the attribute — just as if there is the capacity for laughter, there is likewise the man from whom the capacity for laughter emanates; but intelligibility is a proper attribute of the being of reason, because it truly is intelligible, as predicate, subject, affirmed, negated, and things of this kind, which we truly understand, are numbered among beings of reason; therefore there is a being of reason.

Objection 1: More entities are not to be posited without necessity; real entities suffice; therefore beings of reason are not to be admitted. The major is a universal canon and maxim received and recorded by all (*1 Phys.*, T. 52). The minor is shown: if there were beings of reason, they would be above all universals; but universals are real entities, as is clear by induction — for animal, which is genus, is a real being; rational, which is difference, is likewise a real being; man, who is a species, is likewise a real being; the capacity for laughter, which is a proper attribute, is likewise a real being; and whiteness, which is an accident, is numbered among real entities. I concede the major and deny the minor. To its proof, the minor being conceded, one must distinguish: metaphysically and in first intension, I concede; logically and in second intension, I deny. This distinction was abundantly expounded and declared in (*Logic*, Bk. II, Q. 1, Art. 7), whose elucidation I do not consider needs to be repeated here, but is to be reviewed and recalled there.

Objection 2: If there were a being of reason, it would be intelligible, because intelligibility follows entity as its proper attribute; but only real being is intelligible; therefore no being of reason exists. I concede the major and deny the minor. For (*2 Metaph.*, T. 4): "As a thing stands with respect to being, so it stands with respect to being known." Since the being of reason has being only objectively, in a qualified and diminished way, likewise it has the character of being knowable and intelligible in a qualified and diminished way, as Scotus indicates (*Quodl.* 3).

You will press: what is known is prior to being known, because the object precedes the act; but the being of reason is not prior to being known, because its essence is to be known; therefore in no way is the being of reason knowable and intelligible. The Complutenses (*Disp.* 2, *Log.*, Q. 1) deny the major, thinking that the essence of the being of reason consists in its actual cognition. But their reply admits an implication and a contradiction in terms, since in the same place they assert that the being of reason is knowable and that it is not knowable, because its essential being is posited in actual cognition — which openly involves contradiction. Furthermore, every being before it exists is producible and

knowable, according to its essential and quidditative being, which abstracts from existence; but the being of reason in its own mode has essential and quidditative being — abstracting from existence — which it receives from the intellect. For it is defined as that which has being objectively in the intellect alone, from what will be said in the next article. Therefore just as in its own mode it has possible being, so likewise it has intelligible being.

Moreover, the nature of the being of reason is not the cognition itself — for this is a second act pertaining to the science of the soul — but it is what is known through such cognition, by which the being of reason is said to be known, just as a wall through vision is said to be seen; therefore its essence is not posited in actual cognition. Wherefore to the objection I concede the major; I deny the minor — for the being of reason, even though formally it is not knowable except through the intellect, from which it receives its formal being, is nonetheless knowable fundamentally, according to its possible and objective being alone — as Mastrius rightly argues against Poncius (*Disp. 2 Metaph., n. 234*).

Objection 3: Apart from God, everything is caused and produced; but what is caused and produced is real; therefore no being of reason is to be thought up and introduced into the Schools. I concede the major; I distinguish the minor: of things caused per se and primarily, I concede; of things caused accidentally and secondarily, such as beings of reason, I deny. This distinction has been expounded at length in (*Logic, in the cited passage, Art. 1*).

You will press: a real cause produces a real effect; but the intellect is a real cause; therefore it produces no being of reason, and accordingly the being of reason is to be rejected. The objection is dissolved by the aforesaid distinction: the major holds for the primary effect, not for a secondary effect that follows and is left behind from the primary, through a comparative cause — such as the intellect is, or another collative power.

Article II. What the Being of Reason Is

Some, whom Suárez follows (*Disp. 54, Sect. 1*), think the being of reason is a non-being apprehended in the manner of a being. Others, with whom Poncius agrees (*Disp. 1 Logic, Q. 1*), describe the being of reason as that which cannot do anything or exist in anything capable of doing something, except through the consideration of a power capable of considering something. Still others, such as Averroes (*6 Metaph., Com. 5*), Orbellus (*4 Metaph., Q. 1*), from whom Siretus (*Tract. of Formalities, Art. 1 principali, folio 5*), Trombeta (*ibid., first part of the same tract*), Vallo, and Brulifer (*in that place*) do not seem to depart — think that the being of reason is that which has being only objectively in the intellect. And this is not obscurely indicated by Scotus (*Quodl. 1, §. De altero, sub H., and 3, d. 8, Q. un., §. Ad argumenta. H., and 4, d. 1, Q. 2, §. Hic primo. B.*), and Canonicus agrees (*1 Phys., Q. 3, fol. 10*), and Mayr does not dissent (*Quodl. 6, Art. 6*).

Note: the being of reason bears many names. It is called a qualified being, a diminished being, a secondly considered being, a being objectively in the mind alone, and a second intention. It is distributed into the being of reason that profits and serves the sciences, and what is wholly useless and chimerical. Hence arises the distinction into the being of reason that has a foundation in the thing — such as logical second intentions — and that which has no foundation in the thing, such as fictions, for example, a chimera, a goat-stag, and the like, which are wholly impossible and contradictory — and are prohibited beings.

Assertion: The being of reason is not aptly described as a non-being apprehended in the manner of a being; nor as that which cannot do anything; but as that which has being only objectively in the intellect — or rather, as the passive comparison of one known object to another known object. So the assertion is threefold and is consonant with Scotus in the places cited above.

The first part is argued first: being and non-being are contradictorily opposed; but the being of reason is a being, because it is comprehended under that most common division by which being is divided into real being and the being of reason, as is clear from the preceding article; therefore the being of reason is not rightly called a non-being apprehended in the manner of a being. Second: what has a cause of its being is a being, because non-being, since it is nothing, is not caused; but the being of reason has a cause of its being — namely, the intellect or another comparative power, even according to the adversaries. Third: if the being of reason were a non-being as described above, the intellect in its cognition of it would be deceived, because it would understand it otherwise than it is — in which there is deception; but the intellect in making and understanding the being of reason is not deceived, as is clear in Logic — indeed it is perfected in seeking truth and discerning it from falsity; therefore the being of reason is not such, but something left behind in the known object through an act of the intellect, such as a second intention.

The second part, over and above the fact that Scotus (*cit.*) combats its opposite — whose doctrine Poncius professes to embrace — is proved first: a definition does not exceed nor is exceeded by the defined, as I have repeatedly insisted in the foregoing; but the aforesaid definition of the being of reason is exceeded by the defined — since quantity, relation, and prime matter belong to the genus of sterile things, and yet they are not beings of reason but real beings; therefore the being of reason is incongruously defined as that which cannot do anything.

Poncius (*cit.*) replies, saying that although matter is not active, as the being of reason is, yet matter itself exists in form, which is active — and the being of reason does not thus exist in another capable of accomplishing something. Against this: the being of reason also in its own mode exists in the intellect, which causes the being of reason. For just as the being of reason in its own mode participates in the essence explicitly expressed through its description, so also

its existence in its own mode is in the intellect, by which it is made and in which it is; therefore the gloss adduced does not satisfy the aforesaid objection.

Second: one opposite is explained and declared through the other — hence that saying is celebrated: *of opposites the principle and science are the same*; but the being of reason is opposed to real being — for each is an opposed member of the most universal division of being taken most commonly; but real being is defined as that which has being apart from any act of the intellect; therefore its opposite, which is the being of reason, ought to be described as that which has being only objectively from the intellect — not as that which cannot accomplish anything, which is very far from the essence of the being of reason.

Third: a definition is a discourse distinctly declaring the nature of the defined, by the common sense of all; but the premised definition clearly does not explain the nature of the being of reason — since its nature does not consist in not being able to do anything, but in intentional objective being only; but not being able to do anything is rather a property common to others, namely matter and relation, as I touched upon above — just as being able to move and run belongs to man and to brute, by which neither man nor brute can be described. Hence the reply of Poncius is rejected, where he says that the being of reason is defined by not being able to do anything as its proper attribute, just as man is defined by the capacity for laughter, because the capacity for laughter is a proper attribute of man in the fourth mode — but this is not so with the inability to do anything, since this is participated by others, as I was showing just now. Hence the argument still stands in its force.

Fourth: what the said Poncius adds — that the being of reason comes to be through a power capable of considering something — is not absolutely true, since a power does not make the being of reason precisely insofar as it considers, otherwise the intellect speculating on a real being, substance, or accident, would make the being of reason, which is false. But if the aforesaid author comes back and says that it comes to be through the sole consideration of the intellect, he falls into the very view he refutes — namely, that the being of reason is a secondly considered being and has being only objectively in the intellect — the opposite of which he strives to introduce into the Scotist school.

The third part is shown first: a genuine and legitimate definition consists of genus and difference, or quasi-genus and quasi-difference in those things that do not properly have genus and difference; but the aforesaid description of the being of reason is of this kind — for its quasi-genus is being abstracting from real being and the being of reason, and its quasi-difference consists of the remaining parts assigned; therefore it is a right and fitting definition of the being of reason.

One might say that this description does not embrace the fictitious and chimerical being of reason, which since it is impossible is not presented to the

intellect; therefore the said definition of the being of reason is inadequate and not reciprocal with the defined, and accordingly illegitimate and poor. I say that the chimerical being of reason is also not excluded from that definition, because this likewise in its own mode has being objectively in the intellect — namely, as fictitious and chimerical — especially because one who defines the true also defines the false, since the straight is the judge of itself and of the oblique. Hence Scotus in (*Q. 4, Prol.*) defines right practice, because from this it is easily understood what wrong practice is; and of opposites the principle and science are the same.

You will press: Scotus (*4, d. 1, Q. 2. A.*) excludes the fictitious being of reason from the description of the being of reason handed down by him there, and says that the true being of reason is that which is secondly considered — which is, as his interpreters explain there, the passive comparison of one known object to another known object; but such comparison is a relation of reason; therefore according to Scotus every being of reason is relative.

I say that Scotus in that place removes nothing and the impossible from the true and proper definition, because it has nothing that is properly defined; and the Doctor there does not mention the chimerical being of reason, as is clear to anyone looking at the cited text — because even though this from the part of the thing is impossible, nonetheless in the intellect it has being in some way, namely as fictitious and chimerical, that is, as what has no foundation in the nature of things; hence in the preceding note I observed that it has no foundation in the thing. Second: the being of reason is that which immediately and proximately is distinguished from real being, just as rational is what immediately and proximately differs from irrational, since they are divisive differences of the same genus — which is the anomalous being; but real being is described as that which has being apart from any act of the intellect; therefore its opposite, which is the being of reason, is that which has being only objectively from the intellect, or which depends in its coming-to-be and in its being on the intellect, and is the artifact of the intellect and secondly considered and compared.

One might say that the likeness of two beings of reason does not have being only objectively in the intellect when they exist, because they are not actually made by the intellect — since to have being objectively in the intellect is the same as being conceived and considered by the intellect; therefore the being of reason is not aptly described as that which has being only objectively in the intellect. I say that a being of reason is real, not formally — just as the proper attributes of being are not formally beings, but only really, from what was said in (*Bk. II, Q. 2, Art. 1 of this work*). Add that even though the being of reason in actual existence consists in actually being conceived and considered by the intellect — in the order of essential being and quidditative being in its own mode, it does not; as I have sufficiently made clear above. Hence it is not an

obstacle that there can be a likeness between two beings of reason, just as between two real beings — though properly in the latter, and improperly in the former.

Third: the universal formally is, by the common view, a being of reason; but such a universal has being only objectively in the intellect, and comes to be through its comparative act, as I wrote in (*Logic, Bk. II, Q. 1, Art. 3*); therefore the premised description of the being of reason is to be retained.

Objection 1: The being of reason can be effected not only by the intellect but also by the will and the imagination, because these are collative powers; therefore the being of reason is wrongly defined as that which has being only objectively in the intellect, since it can likewise have being objectively in the will and in the imagination. I reply that properly the being of reason has being only objectively in the intellect, as its name denotes; but improperly in the aforesaid powers, as will be apparent in the following question.

Objection 2: If the being of reason were thus described, a possible being would be a being of reason — such as another possible world — because it has being only objectively in the intellect; but this is false; therefore so likewise is the former. I deny the consequence of the major, because a possible being, even though it does not actually exist outside the intellect, nonetheless it is not incompatible for it to exist outside the intellect — and in this it is distinguished from the being of reason, which can in no way exist outside the intellect itself.

Objection 3: If the being of reason is such as has been described, then it is not the passive comparison of one known object to another known object, as the common Scotist opinion holds. The consequence is shown: what can only be presented as object and considered by the intellect, even without being compared to another, would thus be a being of reason without the passive comparison of one known thing to another known thing. The consequence is denied: the reason is that the intellect, before it makes the being of reason, considers real objects — such as animal, man, and brute — and once these are known, it secondly considers that animal is superior to man and to brute; and comparing this to those, it makes the being of reason that is called genus. Say the same of man with respect to his singulars — for comparing him to these, it makes the being of reason called species. Or one can say that the first description of the being of reason suits the metaphysical being of reason, and the second suits the logical being of reason — just as the universal is distributed into the logical and the metaphysical universal, and a distinct description is assigned to each, as I showed in the *Epitome of Dialectics*, Bk. I, Q. 3, Art. 1.

Article III. Whether Extrinsic Denominations Are Beings of Reason

From a broader or narrower acceptance of the being of reason and of extrinsic denomination, many and diverse opinions have arisen, related and rejected by more recent philosophers. Some, thinking that the being of reason is all that is

not in the thing and outside the intellect, think that any extrinsic denomination of the intellect with respect to known objects, or of any other power with respect to its objects — indeed even of insensible and inanimate things, in the way that a column is called right or left with respect to the right or left side of an animal — are beings of reason. Others, among whom is Durandus (*cited just now*), think that only those extrinsic denominations that arise from acts of the intellect are beings of reason — such as being known and being understood, and the like. Still others commonly deny that any extrinsic denominations whatsoever are beings of reason.

Note 1, from the common view of all, clearly recorded by Vallonus in his reading (*fol. 179*) and deduced from Scotus (*1, d. 30, Q. 2*), Viger, Lychetus, and others there, and Mayr (*Quodl. 7, point 10*): there is a twofold denomination — one intrinsic, the other extrinsic. The former is sought with respect to a form that really exists in the subject through which it is denominated as such — as milk is denominated white through whiteness inhering in it, and the eye is denominated seeing through vision existing in the eye itself. The latter is taken with respect to a form existing indeed in another subject, yet terminating toward the very subject which it denominates extrinsically — as a wall is denominated seen by the vision existing in the eye, terminating toward the wall itself.

Note 2: these two terms, *denominating* and *denominated*, differ — because *denominating* signifies the form, while *denominated* signifies its subject; and the concrete signifies both, but with this difference: the form primarily and in the first place, the subject secondarily — as was established in (*Logic, Bk. III, Q. 2, Art. 2*). Wherefore the form denominates the subject, and the subject is denominated by the form; and because the form affects the subject either intrinsically or extrinsically, so if it affects the subject intrinsically, its denomination is called intrinsic; but if it affects and respects the subject extrinsically — that is, because it is carried toward it as to its term — its denomination is called extrinsic, as is illustrated by the examples in the first note.

Note 3: denomination is considered in two ways. In one way, for the appellation and signification of the word, which is made by convention of the one instituting and imposing it — in the universal sense spoken of in the *Epitome of Dialectics*, Bk. II, Q. 1, Art. 1 — and thus it is regarded as a being of reason. In another way, for the formal affection by which a form gives its formal being to a subject either intrinsically or extrinsically — and thus it is a real being preceding the operation of the intellect, of which we are disputing in the present context. Moreover, observe that cognition is considered in two ways: as it respects the intellect by which it is produced and by which the intellect knows the object — and this is called active cognition; or as it respects the object through which it is known — and this is called passive cognition, by which the object is

denominated known and understood. But cognition accepted in both ways is not a being of reason, because active cognition, by which the intellect knows the object, and passive cognition, by which the object itself is known, are had without the negotiation and comparison of the intellect.

First Assertion: Extrinsic denominations of whatever kind are not beings of reason. This is deduced from Scotus (*1, d. 30, Q. 2, and 3, d. 8, Q. un., and elsewhere*). Mayron (*Quodl. 7, point 10*), Fuentes (*in Logic, Q. 2, Diff. 2, Art. 4*), Fabre (*4 Metaph., Disp. 2*), Hurtado (*Disp. 19, Sect. 1*), and many others patronize it.

It is proved first: what is on the part of the thing, with no one thinking, is not a being of reason. But extrinsic denominations are on the part of the thing, with no one thinking; therefore they are not beings of reason. The major is evident, because the being of reason is made by the intellect; hence what precedes its operation is not a being of reason but a real being, which is opposed to the being of reason. The minor is shown: the form denominating and the denominated subject are real — such as the right side of the animal from which the column is denominated right; the vision of the eye from which the stone is said and denominated seen; likewise the act of understanding from which the wall is denominated understood and known.

Nor does it avail to say that this holds for intrinsic denomination, by which the real subject in which the form really inheres is denominated — not however for extrinsic denomination, by which the subject is affected by no form through which it is really denominated, but is thus said by the intellect negotiating, whose work is the being of reason, and accordingly such denomination is not real but of reason. This reply, however, does not weaken but rather corroborates our argument. For if intrinsic denomination is conceded to be real, extrinsic denomination is likewise real — since just as the subject is denominated on the part of the thing by a real form inherent to it by intrinsic denomination, so likewise the term which the same form respects is denominated by extrinsic denomination through the same form terminated toward it — as through the very same vision by which the eye is intrinsically denominated seeing, the stone is extrinsically denominated seen; therefore both denominations are real.

If you should come forward and say that for a denomination to be real, a real union of the form with the subject and term is required, which does not obtain with the term in the aforesaid extrinsic denominations — against this: even though this may be true for intrinsic denomination, it is not so for extrinsic denomination, for which not the union of inherence is necessary but of adhesion and termination, which in vital acts Scotus (*Quodl. 13, Art. 2, Q. circa secundum. M.*) calls the union or relation of reaching and tending toward the term. Hence it is not without reason that scholastics distinguish the object of a power into motive and terminative. Furthermore, in the hypostatic union of the divine Word with the assumed humanity, the Word terminates that union even though it receives nothing real in itself — therefore it is not necessary for the

term of the denominating form to receive that form in itself, but it suffices that the form is carried toward it and terminates to it.

Second: God is denominated creator and Lord, as is clear from Genesis 1 and 2, and as was decreed in the Lateran Council under Innocent III. But these denominations belonging to God are extrinsic, and precede the created intellect — and if no intellect existed, God would still be thus denominated; otherwise, if the being of reason fabricated by the created intellect did not exist, God would not be cause and maker of things and their ruler and Lord, which is false and absurd; therefore extrinsic denominations are not to be counted among beings of reason.

One might say that they are real fundamentally, but not formally. Against this: just as the things created are said and formally denominated created through the relation of creation, which is formally in creatures — as a wall is denominated white through whiteness which inheres in it — so God is formally denominated creator through the relation of creatures, which terminates toward Him, and is called Lord through the relation of subjection of those very creatures, terminating toward God Himself. Therefore just as things are formally and intrinsically called created, so God is formally and extrinsically denominated their creator and Lord.

If you press and say: God really and formally is creator and Lord; therefore being creator and Lord posits something real in God; but this is false; therefore so is the former. The prior consequence is shown: for God to be creator and Lord in reality and formally seems to be the same as for being creator and Lord to be something real in God. I deny the prior consequence; to its proof I deny those two things are identified — for God's being creator means nothing other than the relation of the creation of a creature terminating to God Himself, with nothing new and real accruing to Him; just as a work is denominated human because the human power making it terminates toward that very work, even though nothing of humanity exists in it. Likewise God is denominated Lord not by a relation of lordship that is in Him, but by the relation of subjection which is in the creature, subject to Him and terminating toward Him — as the Doctor excellently asserts (*1, d. 30, Q. 2, §. Ad argumenta 2. quest. sub R.*) and more clearly in the (*Report., ibid., at the end of the cited Q.*).

Third: moral extrinsic denominations are real — such as being good, evil, loved, hated, and the like — otherwise the will and other powers, both interior and exterior, of men and animals, would make beings of reason; therefore physical extrinsic denominations are likewise real, such as being agent, patient, and the like.

One might say that denomination is by convention of the denominating party; therefore it is not real but of reason. I distinguish the antecedent: by reason of

the name, I concede; by reason of the thing signified by the name, I deny — as I sufficiently expressed above in the third note.

Second Assertion: From extrinsic denominations no relation of reason results. This is deduced from the Doctor (*4, d. 1, Q. 2, §. Hic primo. B., and 3, d. 26, Q. un., §. Ad quaestionem igitur. E., and 1, d. 35, Q. un., §. contra conclusionem, and following*).

It is proved first: a real being by its own nature does not follow a being of reason; but extrinsic denominations are real; therefore of their own nature they are not accompanied by a being of reason. The major is evident, because the being of reason is not a proper attribute of real being, but its opposed member, as is clear from the foregoing assertions. The minor remains proved from the preceding assertion. Second: if a being of reason were to result from extrinsic denominations, it would undoubtedly be caused by them — as a proper attribute flows from a subject, such as heat from fire and light from the sun; but the cause of the being of reason is not an extrinsic denomination but a collative and comparative power of one thing to another, from what will be said in the following question; therefore the being of reason does not arise from extrinsic denominations.

Furthermore: if the being of reason were to emanate from the said denominations, it would either flow before any act of the intellect or not; if the first, then it is a real being, which from what has been said is distinguished from the being of reason — for this follows the act of the intellect, while that precedes it; if the second, then it is made by the act of the intellect and not by the extrinsic denominations. Moreover, that relation of reason would appear superfluous and needless, since it serves and profits no one; therefore as useless and fruitless it is to be rejected and denied. Yet I do not deny that the intellect can form in the denominated extreme denominated by extrinsic denomination a being of reason as if there were in it an intrinsic denomination — as in God a relation of creation by which He is formally denominated creator, and a relation of lordship by which He is formally denominated Lord. The reason that can be adduced is that correlatives mutually respect each other; therefore from the fact that in one extreme there is a true and real relation by which it is formally denominated as such, the intellect can likewise in the other extreme — in which no real relation corresponds and there is only the termination of the relation of the other extreme — form a relation of reason through which it formally denominates it. Yet such a relation of reason is not necessary, nor is it even profitable — and it seems to attribute to the said extreme what is incompatible with it, as Mayron argues (*in the cited point, toward the end*).

Objection 1, against the first assertion: every form by which a subject is denominated is intrinsic to it, since it provides its formal being to the same; but the object is denominated known and understood not through a real form, as is clear, since no real form is in it; therefore through a form fashioned by the intellect, which is a being of reason; and accordingly extrinsic denomination is a

being of reason. I distinguish the major: if the form formally exists in the subject, I concede; if however it terminates toward it, I deny. The minor is to be distinguished in the same way: the object denominated known through a form or cognition residing in it, I deny; through cognition and understanding terminating toward it, I concede — as I made clear above.

You will press: a concrete signifies the form and its subject — as *white* signifies whiteness and the wall in which whiteness inheres; but *known* and *understood* are concretes; therefore they signify the cognition and understanding not in the real form, since this resides in the knowing and understanding power — therefore in the form of reason; and accordingly the aforesaid denomination is a being of reason. It is satisfied if the major is distinguished by the same distinction: a concrete signifies a form inhering in it or terminating toward it — in which way *known* is a concrete that signifies cognition not existing in it but terminating toward it. For cognition is subjected in the knowing power and terminates toward the known object, as is clear from the second note.

Objection 2: Scotus (*1, d. 30, Q. un., §. concedo. C.*) calls the being-known of creatures a being of reason; but being-known is an extrinsic denomination; therefore extrinsic denomination is a being of reason. I reply that Scotus there does not assert that the being-known of creatures is a being of reason, as is clear to one reading the text — but that it is a qualified and diminished being. For since creatures from eternity were not produced by God, they do not have being simply, which is the being of essence and existence, but have only known being, because they are known by God — which is a qualified and diminished being — as the same Doctor explains (*ibid.*) in response 2. G.

You will press: Scotus himself in the same place (*§. Ad argumenta 1. quest.*) calls the qualified making — such as being-known — a relation of reason; therefore he is not to be drawn to another sense; and hence Mastrius (*Disp. 3 Log., Q. 2, Art. 1*), with Vulpes, explains him as speaking of the being of reason materially, not formally. But Scotus there does not seem to speak in his own view and as an assertion, but dubiously, saying: "And thus some one might concede concerning God, that God is lord, noting the qualified making — namely, a making according to some relation of reason." Hence the same Doctor (*1, d. 35, Q. un., §. poteft dici ad quest. H.*), having the same discussion of the divine intellect, adds in the third moment that the divine intellect can compare itself to the understood stone and can cause a relation of reason. Wherefore, according to Scotus, a being of reason properly is not had unless a new comparison of one thing to another is made, as is explained more explicitly by the same author (*4, d. 1, Q. 2. B., and Q. 5, §. Ad 1. argumentum 28. quest. Sub. K.*).

Objection 3: A transition from one contradictory to the other cannot be effected without some new form being acquired — as a wall from being non-white cannot become white unless it newly receives whiteness; but an object from being non-known becomes known; therefore it receives some new form — not a

real one, as all admit; therefore one of reason; and thus extrinsic denominations are beings of reason. I distinguish the major: without a new inherent form, I concede; without a terminating one, I deny. Thus God from non-creating becomes creating in time, without receiving anything new, but only the relation of the creature newly created by Him terminating to God Himself.

You will press: if God were to create Peter as emperor of the whole world, Peter would thus be denominated emperor of the universe without any new real form newly produced inherent in him or terminating — therefore through a form that is a being of reason, he would obtain such denomination. I say that given the hypothesis, he would thus be denominated by a real extrinsic denomination terminating to the act of the divine will constituting him lord of the universe. Wherefore, in these extrinsic denominations, either in one extreme some new form is produced, or a new termination occurs without the production of a new form.

Objection 4, against the second assertion: Scotus (*1, d. 36, Q. un., §. contra istud obiicitur. G.*) explicitly writes that after the diminished being a relation of reason follows; but being-known is diminished being and denominated by extrinsic denomination; therefore in the Scotist school from extrinsic denominations beings of reason result. I reply that the Doctor is to be explained as not meaning that of its own nature and absolutely, after extrinsic denominations, relations of reason follow — but that once these are posited, the intellect can form such relations of reason, as has been sufficiently declared above.

Article IV. Whether Negations and Privations Are Beings of Reason

Most Thomists, whom the Conimbricenses (*Q. 6 of the Universals, Art. 2*), Suárez (*Disp. 54 Metaph., Sect. 3, n. 4*), and Arriaga (*Disp. 6, Sect. 6*) follow, think that negations and privations are to be numbered among beings of reason. The opposite is defended by the Scotists, notably Mayr (*Quodl. 7, point 5*), Mastrius and Bellutus (*Disp. 3 Log., Q. 7*), Fuentes (*Q. 2, Diff. 2, Art. 1*), and Poncius (*Disp. 1, Q. 3*), to whom Fonseca (*5 Metaph., Cap. 7, Q. 6, Sect. 5*) and others agree, who remove negations and privations from the series and catalogue of beings of reason. Presupposing the acceptations of privation and its differences from negation adduced in (*Bk. II, Phys., Q. 3, Art. 1*), which are to be reviewed there:

Assertion: Privations and negations are not beings of reason. This is deduced from Scotus (*d. 23, Q. un., §. Item arguo. H., and 2, d. 12, Q. 2, §. Ad 1. rationem sub F., and 4, d. 22, Q. 1, §. De primo. A.*).

It is proved first from sacred Scripture: Genesis 1: *Darkness was upon the face of the deep* — that is, as Lyran comments, privations of light. And John 9: *As he passed by, Jesus saw a man blind from birth*. But these privations precede any act of the intellect; therefore they are not beings of reason. The same is indicated by the holy Fathers, especially Augustine (*On the Ten Categories, Cap. 18*), Anselm (*On the Fall of the Devil, Cap. 41*), and Damascus (*in his Philosophy, Cap. 2*).

Second: the being of reason depends in its coming-to-be and in its being on the intellect, as is clear from its description cited in Art. 1 of this question; but negations and privations exist with no one thinking — as, with any act of the intellect excluded, a brute is not a stone, a man is not a plant, Celidonium is blind from birth, Claudius is deaf, and so on; therefore they are not beings of reason.

Third: nothing that is the negation of a creatable being is the terminus a quo of creation and annihilation, and the terminus a quo of physical change and its principle is privation (*1 Phys.*, T. 57, and *12 Metaph.*, T. 22). But privative opposites are on the part of the thing, and form and its privation are privatively opposed; therefore privation and negation are not beings of reason, but are found on the part of the thing without any negotiation of the intellect. For it would be false and absurd to say that the aforesaid changes do not occur unless the intellect thinks, and that blindness is in Paul through the fabrication of the intellect.

The adversaries, among whom is Suárez (*cit.*), come forward and say that one must distinguish: negations and privations can be used in two ways — for the removals of positive entities, and thus they are found on the part of the thing apart from any act of the intellect; or for forms thought up by the intellect and apprehended in the manner of positive forms, which cannot exist outside the intellect, and thus they are beings of reason.

Against this: negations and privations are to be taken in the way in which they are described, since their descriptions denote and declare their natures and essences in their own mode, as happens with other things; but negations are defined as the absence of forms in subjects that are unfit, and privations as the absence of forms in subjects that are fit and suited; therefore they are thus to be understood — and thus they are on the part of the thing; therefore they are not beings of reason. But to think up and feign them in the manner of positive forms is contrary to their natures, which are not possessed of them but devoid and lacking them. Furthermore, if those conceived in the second way are beings of reason, anything else if so apprehended would be a being of reason — as if man were conceived as an angel, and the Holy Spirit as a dove, and things of this kind, which are real, would be beings of reason. Wherefore, even though negations and privations are feigned by the intellect in the manner of positive forms, they are not for this reason simply to be numbered among beings of reason.

Objection 1: What is considered by a science is a being, of which intelligibility is a proper attribute; but negations and privations are treated by metaphysics, as is clear from (*4 Metaph.*, T. 2, and *4 of the same*, T. 14); but they are not real beings; therefore they are beings of reason. The consequence holds, because there is no middle ground between real being and the being of reason. I concede the major; I explain the minor by a distinction: per se, I deny; per accidens, I concede. To what is further inferred — between real being properly taken and the being of reason there is no middle ground, I deny — for there is found an improper

being, such as negation and privation. Between real being taken broadly and the being of reason, no middle ground exists, I concede: for thus being taken broadly is divided into real being and the being of reason; and real being can be called all that is on the part of the thing independently of the intellect — in which way we call a non-being a non-being (*4 Metaph., in the cited passage*).

Objection 2: Affirmation and negation are acts of reason and pertain to Logic, which treats of the being of reason; therefore if affirmation is a being of reason, likewise negation is a being of reason. I distinguish the antecedent: as active and passive acts, I concede; but as objects of affirmation and negation, I deny. For thus they are on the part of the thing, independently of the intellect. Especially because by affirmation and negation is commonly understood composition and division, which do not pertain to our matter, since we are treating of simple and non-complex things as they are on the part of the thing, with the act of the intellect excluded.

Article V. Of How Many Kinds the Being of Reason Is

Many divisions of the being of reason are adduced by recent philosophers. The first is into relation, negation, and privation — which is indeed accepted and defended by the Thomists, but rejected and denied by the Scotists. For in the first place, relation is a real being and is posited as one particular predicament of real relations, as is clear from Logic. Furthermore, negation and privation are not beings of reason, because they are found on the part of the thing without any thinking intellect, as I showed at length in the preceding article. Moreover, a good and genuine division is two-membered, and its dividing members must be opposed, as the law of good division requires; but relation, negation, and privation are not opposed, as is clear from the four types of opposites handed down by Aristotle in the *Postpredicaments*, chapter on opposites; therefore this division is not to be accepted. Furthermore, under that division it does not seem that prohibited beings, fictions, and the like are comprehended, as our two younger authors rightly pursue (*Disp. 3 Log., Q. 7*); therefore the aforesaid division is deficient and incomplete.

The second is into the being of reason that has a foundation in the thing, and the being of reason that has no foundation in the thing. It is commonly known and received by almost all, and touched upon by the Doctor (*1, d. 43, Q. un., §. Aliter dico. E., and Quodl. 1, §. De altero H. and L., and Q. 4, on universals, §. Dicendum in solutione tertij*). But that being of reason is said to be founded in the thing whose motive, cause, occasion, and origin is provided by the thing — hence it is not rashly and gratuitously formed by the intellect; as because a nature is communicated to many, the intellect attributes to it formal universality, which is a being of reason, by which it is formally predicated of many. Likewise because a nature agrees with many differing in species, the intellect produces the being of reason that is genus, which is predicated in the *quid* of many differing in species. Similarly, because a nature is communicated

to many numerically distinct ones, the intellect fashions the being of reason that is species, which is predicated of many numerically differing ones. But the being of reason that is not founded in the thing is called that for which there is no opening, occasion, or property on the part of the thing for feigning it — but it is merely gratuitously and without any motive and foundation feigned by the intellect; hence it is called a fiction, such as a chimera and a goat-stag.

The third is into transcendental and predicamental. For just as real being is either transcendent or enclosed in one of the ten categories, so the being of reason — which is as it were the shadow of real being — is either placed or rather reduced to one of the ten predicaments: thus a chimera is referred to the genus of substance, and the imaginary space that some think up outside the heavens is referred to the genus of quantity, and so with the rest; or it transcends all genera, in which way God the Father is formed in the likeness of an old man, God the Son as a youth, and God the Spirit as a dove. Although this division of the being of reason has not been listed by anyone I have seen, it nonetheless seems congruous and fitting — since, just as every body is followed by its shadow, so every real being is accompanied, or rather can be accompanied and followed, by its being of reason. And this is splendidly expressed by Scotus (*Q. 6, on universals, in the solution of the 4th argument*), saying that just as in real being there are many degrees, so likewise in the being of reason — for this is understood through analogy to the former; hence it is divided in much the same way as real being; and accordingly, just as real being is divided into transcendental and predicamental, so likewise the being of reason is transcendental in one case and predicamental in another; and likewise one is substantial and another accidental, and so on. For created freedom is such that it strives to attain and somehow perceive not only real things but also intentional, true and fictitious, possible and impossible ones.

The fourth, which is a subdivision of the preceding, is into absolute and relative being of reason — which is indicated by the Doctor (*1, d. 36, Q. un., §. contra istud obiicitur. G.*) against certain Scotists who seem to recognize only relative being of reason, relying on Scotus's testimony (*4, d. 1, Q. 4, §. Hic primo. B.*), who defines the being of reason as the passive comparison of one known object to another known object; but such comparison is a relation of reason; therefore according to Scotus every being of reason is relative.

One must reply that a twofold being of reason is posited: one logical — and this is relative, described by the Doctor just cited — another metaphysical — and this is absolute, defined by the same Doctor (*Quodl. 1, §. De altero. H., and 3, d. 8, Q. un., §. Ad argumenta, sub. H.*) as that which has being only objectively in the intellect. Under this description every being of reason can be comprehended, whether absolute or relative. Nor should this surprise anyone. For just as the universal is described in two ways — the logical universal (*1 Perihermeneias, Cap. 3*) as what is fitted to be predicated of many, and the metaphysical universal (*7*

Metaph., T. 15, T. 45) as what is fitted to be in many — so a twofold being of reason is posited: logical and metaphysical, both of which I described above according to Scotus.

Objection 1, against the first division: every being of reason has a foundation in the thing; therefore the division of the being of reason into that which has a foundation in the thing and that which has not is valid. The antecedent is proved: a chimera and a goat-stag, numbered among those beings of reason that are supported by no foundation in the thing, participate in true and proper parts existing on the part of the thing. I reply that even though the parts of a fiction are real and founded in the nature of things when taken separately, yet when united together they are impossible and contradictory for composing and constituting that whole which is called fiction; hence by reason of the union of parts in the whole it is said to have no foundation in the thing, and to be incompatible with respect to any agent, whether created or uncreated — as the Doctor excellently writes (*1, d. 43, Q. un., §. Aliter dico. E.*). Therefore what cannot be made by any agent is rightly said to have no foundation in the thing, since it is impossible and involves incompatibility in coming to be and existing.

Objection 2, against the third division: if beings of reason are distributed in the manner of real beings, it follows that just as real being is divided into ten categories, so likewise the being of reason — but this is not admitted; therefore neither is the former; and accordingly the added partition of the being of reason into transcendental, predicamental, and the like is invalid and inappropriate. The consequence of the major can be denied, from what was asserted in (*Logic, Bk. III, Q. 3, Art. 2*), where this objection has been dissolved. For just as privations and negations are reduced to the habitual states of which they are the privations and negations (*2 On the Soul, T. 96*), so the being of reason — which is as it were the shadow of real being — is reduced to the real predicament in the likeness of which it is fashioned.

Objection 3, against the fourth division: as the cause is, so is its effect, because the effect is assimilated and proportioned to its cause; but the cause of the being of reason, from what will be said in the following question, is the comparative and collative cause, and its effect and action is comparison, which is formally a respect and relation, as the common run of Scotists holds; therefore the being of reason is wrongly divided into absolute and relative.

It can be said that the major holds for the primary effect and the one per se intended by a univocal cause — not however for a secondary and accidental effect from an equivocal cause, such as the being of reason is, which accompanies the operation of the intellect, and is rather left behind from it than properly caused — otherwise, just as the intellect is a power and real cause, so its effect would be a real effect and real being, which is false. To the minor I say that the intellect is thus denominated with respect to the principal being of reason, which is logical and a logical second intention — not however absolutely, with

respect to every being of reason, especially if fictitious and chimerical, which is absolute, such as a goat-stag, for whose being it suffices that it have being only objectively in the intellect, as its definition in the second article of this question cited and explained requires.

Article VI. Whether the Being of Reason Has Proper Attributes

Since in the preceding article the being of reason was chiefly divided into the being of reason that has no foundation in the thing on the part of the thing, and that which has a foundation in the thing itself, it can accordingly be doubted whether each or either of these obtains affections and properties befitting it or not. I resolve and decide this briefly through the following two assertions.

First Assertion: The being of reason that has no foundation on the part of the thing — which is called a fiction — is devoid of every proper attribute and affection. This is deduced from the Doctor (*1, d. 3, Q. 5, §. contra ista infra. G.*), Viger, Lychetus, and others there, who write that this kind of being of reason lacks genus and difference, which together are united to constitute the species from which proper attributes and properties emanate.

It is proved first: what is incompatible in its parts and whole participates in no proper attributes, since these arise from a non-incompatible and non-impossible whole; but a fiction and any other similar being of reason involves contradiction in its parts simultaneously joined and in the whole, as the Doctor clearly discusses (*1, d. 43, Q. un., before F.*); therefore it is devoid of any proper attribute. Second: what has no quiddity — either simply or in a qualified way — is deprived of its proper attribute, because the latter proceeds from the former; but a fiction has neither, since it and its parts are simultaneously impossible and devoid of any quiddity and essence — as all prohibited and impossible beings are; therefore it is stripped of every proper attribute.

One might say that a fiction participates in the definition of the being of reason and is its species, since from what was said in the preceding article the being of reason is sufficiently divided into the being of reason founded in the thing and not founded in the thing; and from a species flow proper attributes and affections; therefore the fictitious being of reason in its own mode is not stripped of its proper attributes. I distinguish the major: the chimerical being is defined by an improper definition, called a nominal definition, I concede; by a proper definition, which is called a quidditative or descriptive definition, I deny. To the minor I say that just as the being of reason is not properly a genus, so a fiction which is contained under it is not properly a species; and accordingly no proper attributes belong to it, since proper attributes are those that emanate from species, among which number the fictitious being is not comprehended.

Second Assertion: The being of reason having a foundation in the nature of things participates in its own mode in affections and properties. The Doctor

maintains this (4, d. 1, Q. 2, §. *de secundo. 1.*, and at the end of Q. 6 of the *Universals*), Mayr (*Quodl. 6, Art. 15*), and the rest of the Scotists.

It is proved first: the real transcendental and predicamental being is possessed of its proper affections and properties, as I showed in (*Bk. II, Q. 2 of this work*) and elsewhere not rarely; therefore the same is to be asserted in its own mode of the being of reason having a foundation in the thing. The consequence holds, because this kind of being of reason is in the manner of a real being and its likeness — it is therefore not deprived of its proper attributes of reason. Second: corresponding proper attributes belong to each and every being, because these proceed from those; but real being — which is being simply — participates in real affections, which are unity, truth, goodness, and the like; therefore likewise the being of reason — which is a qualified and diminished being — is not without its properties of reason. Third: the natures and essences of each and every being are accompanied by their proper attributes and properties, as is clear from all and singular genera, both of substance and accident, both of living and non-living things, both material and spiritual; but the aforesaid being of reason participates in its nature and essence, declared through its definition cited in the second article of the present question; therefore from this its own proper affections arise and follow.

Fourth: demonstration shows the inherence of the proper attribute in its subject — as the capacity for laughter in man through rationality; but Logic demonstrates many things and is concerned with the being of reason as the subject of its predication; therefore proper attributes are to be conceded to the being of reason. Otherwise Logic would not be a science, as Scotus adds (*in Q. 4, cited just above*) — since it would not have definitions consisting of genus and difference and proper attribute, in the mode in which the logician treats the proper attribute, genus, difference, and the like.

Thus from the being of reason founded in the thing proper affections are not to be removed. Added to this: the aforesaid being of reason is intelligible, on the authority of Scotus (2, d. 1, Q. 5, §. *contra istam opinionem. B.*); but intelligibility is a proper attribute of that of which it is the intelligibility. Hence (12 *Metaph.*, T. 4) Aristotle adds: "As being stands with respect to being, so with respect to intelligibility"; but the being of reason has being in a qualified and diminished way; consequently it participates in intelligibility in a qualified way proportioned and congruous to it, and the other affections belonging to it.

The recent undivided Scotists (Q. 6) object against the first assertion and say that intelligibility and the other properties are accommodated not only to the being of reason having a foundation on the part of the thing, but also to the fictitious and chimerical being of reason — for the reason that in its own mode it has an essence from which proper attributes flow; and moreover, propositions in the first and second mode of per se predication can be made about it, in which the proper attribute is predicated of the subject. Furthermore, it falls under science

and is intelligible, just as any other being of reason; therefore this being of reason is not to be stripped of its proper attributes. The parity is to be denied, because that being obtains a determinate and congruous nature and essence with respect to the things of which it is predicated, from which proper attributes suited to it proceed; but the latter by no means — since its parts among themselves and in the whole involve incompatibility and contradiction. Hence no proper attribute and affection can proceed from it; and accordingly it is not intelligible nor knowable, as Scotus not obscurely hands down (*Quodl.* 3, §. *de primo. B.*, and 1, d. 3, Q. 5, sub G., and d. 43, Q. *un.*), and Lychetus, Viger, and Gadius defend (*ibid.*) — because its parts are impossible and mutually contradictory. For what is contradictory cannot be a being outside the mind, nor in the mind, and consequently is neither intelligible nor knowable. Since two contradictories simultaneously, nor a contradictory with its contradictory, ever constitute one intelligible or knowable thing. Furthermore, a proper attribute is necessarily united with the subject of which it is the proper attribute, and is demonstrated of it, and demonstration is from true things. Hence science, which is its effect, is defined as certain and evident knowledge of the necessary thing through its proper cause — which certainly cannot be of a fictitious being of reason, as Mayr excellently shows (*Quodl.* 6, *Art.* 17).

You will press: the intellective power can feign a golden mountain, a chimera, and the like, which are called beings of reason not founded in the thing; but the intellect understands these in the mode in which they are and establishes a distinction between them and others; therefore these beings of reason have intelligibility and the other proper attributes, just as beings of reason founded in the thing. I concede the major; I distinguish the minor: the intellect understands them by knowledge of the name, not by knowledge of the thing — as Lychetus excellently saw (*Quodl. cit.*); or per accidens, not per se, as Gadius writes there.

Objection 2, against the second assertion: everything that exists is either a real being or a being of reason, as is clear from what has been said; but if a proper attribute of the being of reason were on the part of the thing, either it would be a real being — and this is false; or a being of reason — and this is not, because a proper attribute is a lesser being than the subject of which it is the proper attribute; but there is no lesser being than the being of reason, since this is the minimum among beings, having only a qualified and diminished being; therefore no proper attribute of the being of reason is to be handed down, even of that having a foundation in the thing. I concede the major; to the minor I concede the first part and distinguish the second part: identically, I concede; formally in its own mode, I deny. For a proper attribute of the being of reason is its aliqueity — just as a proper attribute of real being is the aliqueity of real being, as I showed in (*Bk. II, Q. 2 of this work*). To the subsumption the answer is clear through the distinction now adduced — how a proper attribute can be called a lesser being than the being of reason, namely formally, but not identically.

Objection 3: Intelligibility is adapted only to real being, as Scotus asserts (*1, d. 3, Q. 3, §. Quantum ad 2. art. 1.*); therefore it is wrongly attributed to the being of reason. I expound the antecedent by a distinction: motive intelligibility, I concede; terminative intelligibility, I deny. For the latter belongs to real being and the being of reason alike, as Bargius observes in his commentary on the cited passage.

You will press: nothing is intelligible unless it can impress a species of itself in the intellect, because from (*3 On the Soul, T. 31*): one who understands must inspect phantasms; but the being of reason can have no species of itself, because it is not sensible per se nor per accidens, nor formally nor virtually contained in real being; therefore it is not intelligible and accordingly intelligibility is not its proper attribute and affection. I reply that the major holds for the motive intelligible object, not for the terminative one — such as the being of reason is — for whose cognition no species of itself is prerequisite, since it cannot have one; but it is known through analogy to real being, in the manner of which it is fashioned.

Question II. On the Cause of the Being of Reason

In the present context the word "cause" is not taken in its proper sense, of which I treated at length in (*Bk. IV, Phys.*), but in the broad sense, insofar as it somehow attains its effect. For just as the being of reason is not properly a being but in the manner of real being and is known through analogy to it, so properly speaking it has no cause of its being — and in the mode in which it has being, its cause is likewise handed down, as will be clearly established in the course of this question.

Article I. Whether the Being of Reason Has a Cause of Its Being

Some, among whom Mayr (*Quodl. 6, Art. 4*), Gabriel (*2, d. 1, Q. 1, Dub. 4, T. 4*), and Soncinas (*6 Metaph., Q. 18*) are cited, acknowledge no cause of the being of reason. Others, such as Suárez (*Disp. 54 Metaph., Sect. 2*), concede an efficient cause to it, but remove the other causes — especially the final — from it. Nor are there lacking those who attribute the remaining causes to it, with the exception of the formal cause. Still others, whom our two recent authors follow (*Disp. 3 Log., Q. 3*) and Poncius (*Disp. 1, Q. 6*), think that the four genera of causes are in some mode accommodated to the being of reason — whom the Doctor seems to have preceded (*Quodl. 1, §. De altero. H., and Quodl. 3, §. De primo. B., and 1, d. 3, Q. 7, Q. Contra istam opinionem. F., and elsewhere*).

It is argued first: whatever has any being apart from God is caused — for every being, from the foregoing assertions, is either from itself and uncaused, as God is, or from another and properly caused, if it is a real being, or improperly caused, if it is a being of reason; but the being of reason has being in a qualified, diminished, and objective way, as is clear from the preceding question, articles 1

and 2; therefore the being of reason has a cause of its being. Second: what was not before and now is, is produced and caused by some cause — because nothing produces and causes itself; but the being of reason previously did not exist — as when someone previously did not syllogize, but now syllogizes, defines, divides, and performs other acts, which are formally beings of reason; therefore the cause of the being of reason is not to be denied. Third: as shadow is related to an opaque body, so the being of reason is related to real being, from the notes above — since the former is in the manner of a shadow of the latter and is fashioned in some way after its likeness; but a shadow has its cause — namely, the opaque body; therefore the same is to be asserted of the being of reason, that it has a cause of itself.

Specifically it is proved for each genus of causes — first indeed for the efficient cause, which Scotus specifically posits as the intellect for second intentions (2, d. 1, Q. 1, §. *Quantum ad hoc, sub H.*), and in general for all beings of reason, in the places just cited above. For this is indicated by its nomenclature — for "being of reason" is the same as a being made by reason, that is, by the intellect. What also manifests this is its definition: that it has being only objectively in the intellect. And Logic, which is concerned with the being of reason, is produced by the comparing and conferring intellect, conferring one known thing with another known thing. Hence the Formalists rightly add (*Tract. of Formalities, Art. 1 principali*) that the being of reason is the passive comparison of one known object to another known object. The intellect, therefore, is the efficient cause of the being of reason.

The final cause is shown. First: efficient and final causes are necessarily conjoined with each other — hence that saying (2 *Phys.*, Cap. 3, T. 30): "Causes are causes of each other" — which is understood chiefly of the efficient and final causes. Therefore if the efficient cause of the being of reason is given, the final cause is not to be denied to it. Furthermore, everything invented and existing is for some end — otherwise it would be fruitless and superfluous; but the being of reason is thought up and exists in the intellect; therefore for some end, as is clear from Logic about second intentions, which are by us for the pursuit of truth and its discernment from falsity; therefore the being of reason participates in the final cause.

Nor does it avail to say, with Suárez (*cit.*), that the end of the being of reason is the act or the very thinking of man. For the being of reason is made through that act and thinking; therefore it is not its end, because the very thinking or fiction is that through which it is made, and not that for the sake of which it is made — which is required for the notion of end. Moreover, cognition is a real being pertaining to the predicament of quality, and it would be absurd and ridiculous for a real being to be the end of a being of reason. Add that the same Suárez (*cit.*, Sect. 1, n. 8) in the second cause adduced by him seems to assign the end of the being of reason — comparing one thing to another, in order to judge

truth from falsity; therefore the end of the being of reason is not precisely cognition and thinking of man, as the said Suárez imagines.

Regarding the material and formal cause: in the logical being of reason and that which is founded in the thing, its genus and difference can be assigned — as Scotus agrees (*4, d. 1, Q. 2, Art., §. Ex his. L.*). For genus stands as matter, and difference as form, since the latter determines and contracts the former. But in the fictitious being of reason not founded on the part of the thing, its matter can be its parts mutually incompatible, and its form its entity and difference by which the whole fiction is constituted and distinguished from everything that is not itself.

Objection 1: If the being of reason had a cause, it would be proportioned to it, because the effect is proportioned to its cause; but every cause is real; therefore no effect of it is a being of reason, and accordingly the being of reason has no cause of its being. I reply that the argument concludes with respect to a proper cause and proper effect — not however with respect to an improper cause and its improper effect, as I noted just now at the beginning of this question.

Objection 2: What is produced is produced by a production, and what is caused is caused by a causation; but the production and causation by which the being of reason is produced and caused is either real or of reason: not real — otherwise the being of reason would be real, which implies a contradiction; nor of reason — because since production precedes the produced, the being of reason would exist before it was produced, which is incompatible. Therefore, lest any incompatibility be conceded, it seems better to say that the being of reason has no cause of its being. I concede the major; to the minor I say that that production is improper, just as the cause is improper — which by that production produces the being of reason — and therefore no absurdity follows, namely that the being of reason exists before it is caused. Whether the being of reason is subjected in the intellect or not, see what I wrote in (*Logic, Bk. II, Q. 1, Art. 13*).

Article II. What Are the Efficient Causes of the Being of Reason

Some hold that the being of reason is produced by the external and internal senses, whom Arriaga most recently follows (*Disp. 6, Sect. 3*). Nor are there lacking those who posit the intellect alone as its efficient cause, among whom are the Complutenses (*Disp. 2 Log., Q. 3, §. 2, T. 2, and 4*) and Poncius (*Disp. 1, Q. 7, Concl. 3*), and commonly the Thomists. Most Scotists, however, add the will; and among these a number, notably Stephen Brulifer (*Tract. of Formalities, fol. 7*), posit three formative powers of the being of reason — namely the intellect, the will, and the imagination.

Note: the being of reason is taken in two ways. In one way, strictly and properly, as it is made by the intellect or reason alone, from which it derives its denomination. For it is called a being of reason — of reason, which coincides

with the intellect — and thus the being of reason is caused only by the intellect, nor can any other power produce it except the intellect; otherwise there would be a contradiction in terms in investigating whether the being of reason is made by another cause than reason. Hence Fuentes (*Q. 2, Logic, Diff. 3, Art. 1*) abstained from the name of the being of reason and investigated whether the imagination or phantasy can feign beings. In another way, broadly and improperly, as it is made by another power, having some likeness and proportion with the true and proper being of reason — insofar as, namely, just as the proper being of reason has being only objectively in the intellect, so some fictitious being is given from another vital power, which in that power has being only objectively; and of this the present discussion is about. But this twofold acceptance of the being of reason is adduced and expounded by Lychetus in his commentary on (*Quodl. 17*) and Gadius in that place; and is indicated by Scotus both there (§. *De secundo. C.*) and in (*1, d. 45, Q. un., §. Ad argumenta. C. and D.*). But why the passive comparison of the will is called a relation of reason — the cause is assigned by our Doctor (*Quodl., cited just above*): because the will, even though essentially it is not rational, like the intellect, is nonetheless rational by participation; by reason of which, its said respect can be called a being of reason and a relation of reason. Perhaps looking to this, Aristotle (*9 Metaph., Cap. 2, T. 3, T. 6, T. 10*) little or not at all distinguishes the intellect from the will, and calls both powers rational. He writes the same in (*3 Ethics, T. 3*).

First Assertion: No sense, whether external or internal — except the imagination — can attain the production of the being of reason taken in the second way. This assertion is two-membered and is consonant with the doctrine of Scotus in the places cited just above.

The first part is certain among the Doctor and his disciples, since none of them whom I have seen defends the opposing view. It is proved first: the efficient cause of the being of reason must be comparative, from what was said in Art. 1 of this question; but no external or internal sense is compositive of one thing with another and collative of parts with the whole, or of superiors with inferiors, or of common things with particulars — since they are bound to sensible and material things, of which they are perceivers only of singulars, according to that not infrequently sung maxim: "Sense is of singulars and intellect of universals"; therefore the aforesaid senses are not makers of the being of reason. Second: the being of reason is fashioned by that whose object it is somehow contained under, as is clear from the intellect, which comprehends the being of reason as its terminative object, as Lychetus, Gadius, and others assert in the commentary on (*Quodl. 3*); but the being of reason is not attained by any of the aforesaid senses, since their object is the real sensible; therefore it is produced by none of them. Third: to whom the definition does not belong, the defined is likewise not accommodated to the same; but the definition of the being of reason — which is to have being only objectively in the knowing and making power — does not suit any production and causation of sense; for what is perceived by sense exists

outside it and is present to it; therefore the making of the being of reason is not adapted to sense.

The second part is indicated by the Doctor (*Q. 9, On the Soul, in the solution of the 4th*) and in the passages cited just above, even though elsewhere he seems uncertain; and the Scotists not a few favor it, to whom Suárez (*Disp. 54 Metaph., Sect. 2, n. 18*) and Arriaga (*Disp. 6, Sect. 3, subsect. 2, n. 27*) agree.

It is proved first: an effect or quasi-effect is conformed and proportioned, as much as possible, to its cause or quasi-cause — chiefly in this: that just as the effect is producible, so the cause is productive and causative of it. But the being of reason taken broadly is in its own mode producible by the phantasy or imagination — for it can present to that phantasy a golden mountain, a goat-stag, or another chimera, which would have no being unless only that objective being in the imagination itself, which would plainly be a being of reason as described above; therefore the imagination can cause this kind of being of reason. Second: a collative power is a maker of the being of reason, as the Doctor openly suggests in the cited place; hence the same Doctor (*4, d. 1, Q. 2. B.*) describes the being of reason as the passive comparison of one known object to another known object; but the imagination is a collative power, since it can simultaneously connect the species of a mountain and of gold and fashion a golden mountain and fully possess it in dreams and delight and enjoy it; therefore the imagination is not to be excluded from the fashioning of the being of reason.

Our two recent authors (*Disp. 3 Log., Q. 4, Art. 1*) reply, from Bargius (*1, d. 3, Q. 1, and Quodl. 17*) and Tartaretus there, saying that the imagination indeed apprehends the golden mountain precisely, yet not the union of mountain and gold — just as the eye sees Peter running without seeing that bond and copula of Peter with running. But for the being of reason to come about, it is necessary that the power making it attain the parts simultaneously united in the whole, and the whole itself composed from them — namely, mountain and gold, the connection of each, and the whole itself, the golden mountain, fashioned by the aforesaid power, which is formally the being of reason. But the imagination cannot perform this; therefore it cannot formally feign the being of reason.

Against this: in dreams, with the external senses at rest and with intellect and will not acting, someone imagines himself having a golden mountain, orders and arranges it for gaining honors and dignities, for contracting marriage with the great and princes of the world, and for acquiring other such things; therefore the imagination attains the parts of the whole, the union and bond of these with those. Hence the example adduced of the eye seeing Peter actually running does not hold, because the eye is an external sense perceiving objects existing and present only; but the imagination is an internal sense knowing both present and absent things, jointly and separately. Furthermore, with the imagination alone acting, a man recounts his dream — though he may not know

how to interpret it — as is clear from the cupbearers of Pharaoh in Genesis 40. On the contrary, in Daniel 2, Nebuchadnezzar did not know his own dream. Therefore the imagination also attains the whole complex and its union and copula. Third: the imagination excels the other internal and external senses; therefore if the other senses perceive a complex without distance — that is, without the copula, as the aforesaid authors hand down — the imagination, which is more excellent and efficacious than they, perceives more than them — namely, the complex and its union. Moreover, the will, which is conjoined with the intellect, is called rational by participation and a maker of the being of reason, as the Doctor writes (*Quodl. cited*). Therefore the imagination, which is proximate to the intellect and offers and presents sensible species to it, can by participation be called an effective cause of the being of reason.

Fourth: we experience that in phantasying and dreaming we form many beings of reason. Hence Scotus (*Q. On the Soul, cited above*) says: "The imagination perceives its own act — for we imagine that we are imagining and that we have imagined, and we dream that we are dreaming, as we clearly experience." Therefore the formation of the being of reason is not to be excepted from the imagination. For someone in dreams imagines himself to be a general of an army, commands the army, orders the foot soldiers, arranges the cavalry, and so on. Likewise another thinks himself lord and king of the universe, whom all obey and carry out his orders — and waking he sees himself a vile and humble servant as he was before the dream. But these and similar things are done by the imagination and phantasy alone, with the other powers not at all concurring; therefore the imagination can feign beings of reason in the mode stated above.

Second Assertion: Not only the intellect but also the will in its own mode is a cause of the being of reason. This assertion is two-membered, like the first, and is handed down by the Doctor (*cit.*). The first part is common and remains proved from the preceding article and Q. 1 of this book, Art. 1 and 2. And it is openly denoted by its nominal definition. For "being of reason" is the same as a being of the intellect, an artifact of the intellect, its work and effect, as I made clear above. Nor can it be more aptly accommodated and adapted to any other power than the intellect — since the intellect is collative, reflexive, discursive, and immaterial, attaining every conceivable and intelligible being, such as the being of reason is, as is clear from what has been said.

The second part is indicated by the Doctor (*1, d. 45, Q. un., §. Ad argumenta. D., and Quodl. 17, §. De secundo. C., and 4, d. 16, Q. 2, §. Respondeo. E.*) and is commonly defended by the Scotists, with few exceptions, whom Poncius follows (*Disp. 1 Logic, Q. 7, Concl. 2*).

It is argued first: every power collative of one object with another is a maker of the being of reason, as Scotus well saw in the cited place; but the will is a collative and comparative power of one willed object with another — such as of means toward the end, as when it loves a creature for the sake of God, and

conversely God for the sake of a creature; therefore the will can form the being of reason. Nor does it avail to say that if the will is moved toward an object and compares it to another that seems good but in truth is not good, it does not feign such good but the intellect that has first apprehended and presented it to it — and thus the intellect and not the will makes that being of reason. For each of these powers in its own mode forms the being of reason — the intellect indeed by understanding and judging, hence it is called proper and rigorous being of reason; the will truly by willing and ordering, which is the being of reason improperly and broadly taken; therefore just as the intellect, conferring one known thing with another, makes the being of reason, so the will, comparing one willed object with another, forms the being of reason. As when a sinner wishes to use God for the sake of a creature which he enjoys, such a relation of God to the creature is of reason — not of the intellect, because use and enjoyment do not pertain to the intellect; therefore it is of the will; and accordingly this formation is not to be removed from the will.

Second: the will can tend toward a pre-established and fixed end (*1, d. 1, Q. 1, Art. 3 and 4*) and will evil under the notion of evil, as I showed in (*Moral Philosophy, Bk. II, Q. 3, Art. 3*). But this pre-fixed end and evil under the notion of evil not pre-shown to it by the intellect can be impossible — such as equality with God sought by the evil angel (*2, d. 6, Q. 1*) — and can only be presented to the will itself, as the notion of the being of reason requires; therefore the will does not lack the power and virtue of making the being of reason.

Third: the object of the will extends as broadly as that of the intellect. For everything intelligible is likewise volible, as the Doctor seems to assert (*4, d. 49, Q. 1, §. Ad 1. quaestionem, before T.*). Indeed, the will is of greater power and dignity than the intellect, since it is mistress of its own acts, commands the intellect itself and the other powers, as I showed in (*Bk. V, On the Soul, Q. 3, Art. 2*). Therefore if the intellect can accomplish this, so likewise the will; and if that which proceeds from the intellect is called a being of reason, this that issues from the will can be called a being of the will, because it proceeds from the will.

Objection 2, against the first part of the first assertion: many and diverse appearances exist — such as colors in the rainbow and on the neck of a dove in the light of the sun, the obliqueness of a straight rod placed in water, and the curvature of an oar in the sea; but these and similar things are not real beings; therefore they are beings of reason fabricated by the external sense — namely the eye — and accordingly the external sense can form beings of reason. I concede the major and deny the minor. For real being is divided into true and apparent — just as good is likewise distributed into true good and apparent good, which is on the part of the thing; since even if no eye or other external or internal sense or intellect existed, there would still be the apparent colors of the rainbow and the like — meteors about which I treated in (*On Meteorology, Art. 3, Q. 3*).

You will press: sense is sometimes deceived when it perceives a thing other than it is, and its act is false; but a false act is a being of reason; therefore the external sense contrives a being of reason. I concede the major from (*Bk. IV, On the Soul, Q. 2, Art. 4*), and the erring sense the intellect can correct, as the Doctor writes (*1, d. 3, Q. 4, §. De tertiis cognoscibilibus. G.*). I deny the minor: for the act of sense and intellect, whether true or false, is placed in the predicament of quality, which is a series of real beings. Furthermore, a false act can be true if the object is perceived as it is — which does not belong to the being of reason, unless the being of reason is taken for a non-existent being that is nonetheless possible, as Arriaga (*cited*) does against common usage and according to his own whim and pleasure — which is not to be tolerated.

You will urge: the eye sees that light is absent but shadow present; but shadow is a being of reason, because it is conceived in the manner of some positive form, which truly is not; therefore the formation of the being of reason belongs to the external sense. If the major is conceded, the minor is to be denied: shadow, even though it is a privation of primary light, is nonetheless a secondary light, and accordingly a positive real being — while darkness is the privation of both lights.

Objection 2, against the second part of the same assertion: no power goes beyond the limits of its total and adequate object, as no one denies; but if the imagination were to feign the being of reason, it would go beyond the limits of its total and adequate object, which is the sensible, whether present or absent; hence, concerning this, it provides and supplies sensible and material species, in which the being of reason is contained neither formally nor virtually; therefore the faculty of imagination cannot fashion the being of reason. I concede the major and deny the minor: since in the imagination reside many species of diverse material and sensible things, it can join and compose them, and compare them mutually, and thus cause the being of reason — such as a goat-stag and other things that are comprehended within the limits of sensible things.

You will press: only immaterial and inorganic powers can produce the being of reason, as Scotus affirms (*Quodl. 17, §. De 2. C.*); but the imagination is a material and organic faculty; therefore it cannot attain the production of the being of reason. I deny the major; to the testimony of Scotus I say with Lychetus there that immateriality of the power is not the entire and precise cause of making the being of reason, but its collativity and comparativity of one thing with another; since, however, from what has been said the faculty of imagination is collative and comparative of one thing with another, and compositive of one with another — as our two recent authors concede (*cit., Art. 1, Disp. 3, Q. 4, before §. Altera etiam pars.*) — for this reason effectiveness of the being of reason is attributed to it.

Objection 3, against the second part of the later assertion: a cause is that which gives being to its effect, as is clear from its definition; but the will does not give

being to the being of reason, which is only objective being — for only the intellect communicates this to it; therefore the will is not a formative agent of the being of reason. I concede the major; I distinguish the minor: the will does not bestow being that is only objectively known, I concede; objectively willed, I deny. For just as the intellect primarily forms the being of reason in its own order, so the will likewise in its own order fashions its own willed beings — which, in the broad sense of the word, are called beings of reason, or rather beings of the will.

You will press: the will can be moved only toward what the intellect proposes and presents to it — hence that celebrated saying: *nothing is willed unless previously known*; therefore the will does not make the being of reason, but presupposes it as made by the intellect. I concede the antecedent and deny the consequence — for even though the intellect previously forms its being of reason and presents to the will all the relations of reason, nonetheless the will itself does not cause them in that known being — since they are already presupposed as caused by the intellect — but in the willed being, which pertains to the will itself. Indeed the will itself can will and choose the opposite of what is presented by the intellect — as when the intellect proposes good to it and it wills evil even under the notion of evil, it turns that intellect away from the right and commands the oblique.

You will urge: the will cannot bestow objective being upon real beings toward which it is moved; therefore neither upon beings of reason — since the reasoning is equal in both cases. It is satisfied by the distinction: for the will bestows upon real beings the being-willed, by accepting and loving and pursuing them through its direct act; upon beings of reason by a reflexive and comparative act — as the Doctor excellently expresses (3, d. 26, Q. un., §. Ad q. igitur. E.) and Mayron discusses (*Quodl.* 7, point 12).

Article III. By What Act of the Intellect the Being of Reason Is Made

From the various and diverse acceptance of the being of reason, modern authors proceed into various and diverse views. For some, such as Vásquez (1 Part., Q. 76, Cap. 2, n. 6) and Hurtado (*Disp.* 19 *Metaph.*, Sect. 5), deny that the being of reason is produced through the first act of the intellect — which is the apprehension of simple terms — and think it is made through the second, which is affirmative or negative. Others, such as Ruuio (*Tract. On the Nature of the Being of Reason*), Fuentes (Q. 2 *Log.*, Diff. 3, Art. 2, T. 4), the Complutenses (*Disp.* 2, Q. 3, Q. 2, T. 2 and 4), and Arriaga (*Disp.* 6 *Metaph.*, Sect. 3, Subsect. 3), think the being of reason can be formed through any operation of the intellect.

What was observed in (*Logic*, Bk. I, Q. 1, Art. 3) about the acts of the intellect — direct, reflexive, and comparative — is to be presupposed and recalled. The three operations of the same intellect described and explained there (Q. 3, Art. 6) are likewise to be recalled. Nor is one to depart from the common and ordinary

definition of the being of reason, which is: to have being only objectively in the intellect. To extend that definition to a prohibited and impossible being and to what does not exist but is nonetheless possible — or to restrict the same to a false composite or divided act pertaining to the second operation of the mind — is vain and voluntary; nor is it permissible according to anyone's whim to broaden or narrow the descriptions of beings received and subscribed by the common run of philosophers, such as the aforesaid definition of the being of reason — premised and pre-explained by me in (*Q. 1, Art. 2 of this book*). One must persist in it as in the others, as almost all do.

First Assertion: The being of reason can be formed through the first operation of the intellect. This is defended by Scotus (*Q. 3, on Universals, and following*), and is indicated in (*2, d. 3, Q. 1, §. Ad quaestionem igitur. E. and F.*).

It is proved first: to the first operation of the intellect belong simple and non-complex terms — such as genus, species, and the other universals, as well as the predicaments; but these are formally beings of reason, as the common sense of the Dialecticians holds; therefore the formation of the being of reason is to be attributed to the first operation of the intellect. Second: what can make something have being only objectively in the intellect can make the being of reason; but the intellect through its first operation can make something have being only objectively in it — as when it makes the abstract, the concrete, and the like, which depend only on it itself in such being and being-known; therefore through its first act the being of reason can be caused. Third: someone can imagine and apprehend a chimera and goat-stag without any affirmative or negative judgment; but the apprehension of these belongs to the first operation of the intellect; therefore through this action the being of reason can be feigned.

Second Assertion: Through the second and third operation, beings of reason are made not only materially but also formally. This assertion is consonant with Scotus (*ibid.*) and is at variance with Mastrius and Bellutus (*Disp. 3 Log., Q. 4, Art. 2*), who affirm that beings of reason pertaining to the form of a proposition and syllogism — such as subject, predicate, major, minor, and conclusion — are produced only through the first operation of the intellect, but as for matter, they are caused through all three.

It is proved first: each operation of the intellect participates in its own and peculiar efficiency, since they are distinct from one another, as is clear from their descriptions; therefore just as through the first operation — with respect to the matter and form of a proposition and discourse — the being of reason comes to be, so through the second and third — since these are not of inferior and worse entity and causality. Hence there are distinct books, of which some pertain to the first — such as the book of universals and predicaments — others to the second — such as the book of the *Perihermeneias* — and still others to the third — such as the books of the *Prior* and *Posterior Analytics*.

Nor does it avail to say, with the aforesaid recent authors, that what comes to be through the second and third operation are extrinsic denominations — such as being affirmed or negated, being antecedent and consequent — and only through the first operation are non-beings apprehended in the manner of a being, and accordingly only these are formally beings of reason pertaining to the first operation alone. For extrinsic denominations are on the part of the thing, with the operation of the intellect excluded, as those same authors admit (*cit.*, *Q. 2, Art. 1*); but being affirmed or negated, being consequent and antecedent, and the like have being only objectively in the intellect; therefore they are formally beings of reason pertaining to the second and third operation of the intellect. The minor is shown: the relation of predicate to subject, and conversely — when something is predicated of another — does not arise from the nature of the extremes, as "man is white"; nor likewise the relation of antecedent to consequent — but from the second and third operation; therefore it is formally a being of reason pertaining to those very operations.

Furthermore, what these authors add — that the being of reason is a non-being apprehended in the manner of a being — is false and was rejected by me in (*Q. 1, Art. 2 of this book*) in the first assertion. For it is required for the formal being of the being of reason that it have being only objectively in the intellect — whether it has apprehended being through the first operation, or affirmed being through the second, or consequent and inferred being through the third. Therefore the first operation does not respect the union of predicate with subject, nor the deduction and inference of consequent from antecedent — as the aforesaid Neoterics think. Second: an enunciation is the assertion of one thing of another — whether affirmation or negation — which is adapted to the second operation of the intellect; but this is not simple but a composite quality, as I showed at length in (*Bk. IV, Logic, Q. 3, Art. 2*); hence it is called composition or division; therefore what is fashioned through the second operation is not referred back to the first, which is the apprehension of simple things. Third: a syllogism is formally a being of reason composed of integral and subjective parts, and belongs to the third operation — as is clear from its description adduced and explained in the *Epitome of Dialectics*, Bk. III, Q. 1, Art. 3; therefore the being of reason, as to form, is not adapted only to the first operation.

The same Doctors come forward and distinguish: the relations of reason which an enunciation and argumentation exhibit — if taken in the concrete and in the exercised act — import something complex, pertaining to the second and third operation of the intellect; but if they are taken in the abstract and in the signified act, they are something simple and non-complex — namely relations and dispositions of predicate to subject, and of antecedent to consequent, suited to the first operation. But this distinction does not please — since, undoubtedly, the first operation is presupposed and is prior to the second; and simple and non-complex terms precede composite and complex ones, and parts precede the whole; but in the second operation, these terms are not taken in the abstract

and in the signified act, but in the concrete and in the exercised act — because the second operation itself is composition and complexio of one thing with another, in which predicates are bound with subjects through a verbal copula. Therefore that consideration and abstraction in the abstract and in the signified act is irrelevant for dissolving the aforesaid objections. Moreover, when the first and second operations concur in making their own being of reason, the first operation has already produced its being of reason; therefore the being of reason that is caused by these is not at all attained by the former, since the latter has already performed its function and what pertains to the former is remanded and delegated to it — since they are not confused but are distinct from one another in their entities, functions, and offices.

Objection 1, against the first assertion: through a false act the being of reason is made, by which a thing is perceived other than it is — as the nature of the being of reason requires; but in the first operation there is no falsity — since this pertains to the second operation; therefore neither is there a being of reason. The major is denied: for it suffices for the being of reason that it have being only objectively in the intellect; but it is accidental that the act is false, as I noted above.

Objection 2: The power formative of the being of reason is collative and comparative, and the being of reason by the common run of Scotists is described as the passive comparison of one known object to another known object; but in the first operation there is no comparison of one thing to another, since it is the apprehension of simple things; therefore through it no being of reason is produced. I concede the first part of the major; to the second it can be said that it is the definition of the logical being of reason and of logical second intentions — not however of the being of reason taken universally, as I observed in (*Art. 2, Q. 1 of this book*). Or say that in the first operation there is some comparison of one thing to another, yet without affirmation and negation — as when something is conceived through another, such as darkness through light, and in the manner of another, such as the being of reason, in the likeness of real being.

You ask whether an angel can produce the being of reason. I reply affirmatively. For the reasoning is equal concerning the angelic and the human intellect: both are collative, comparative, and discursive, as I showed at length in (*Tract. On Angels, Disp. 6, Q. 1, §. 5*).

Article IV. Whether God Can Make the Being of Reason

Vásquez (*1 Part., Disp. 118, Cap. 2, n. ult.*), preceded by Mayron (*1, Quodl. 6*), thinks not only that God cannot produce the being of reason, but that He cannot even know it. Suárez (*Disp. 54 Metaph., Sect. 2, n. 23*), however, admits that God knows the being of reason, but denies that He can cause it. Scotus, on the other hand (*Quodl. 1, §. De altero, before L., and in other places*), Gadius, Lychetus, Viger,

Bargius, and the rest of the Scotists teach that God both knows and makes the being of reason — to whom Gabriel (2, d. 1, Q. 2), Fonseca (7 *Metaph.*, Cap. 8), Arriaga (*Disp.* 6, Sect. 4), and many others agree.

First Assertion: God knows all beings of reason. The Doctor maintains this (*ibid.*, and elsewhere). It is proved first from sacred letters: Hebrews 4: *All things are naked and open to his eyes* — which place Lyran interprets as applying not only to things accomplished but also to things thought, which are sometimes real, sometimes imaginary, impossible, and fictitious — which are beings of reason. If you come forward and say that the cited testimony is to be taken of real beings only — I oppose to you that of (*Wisdom* 8), which can hardly be explained otherwise than of beings of reason: *He knows the subtleties of speeches and the solutions of arguments; signs and wonders he knows before they happen* — where Lyran translates "the fallacies of speeches." But it is clear that fallacies are argumentations apparently true but in truth false; and argumentations are formally beings of reason, as was shown and clearly proved in the preceding article.

Second: the knowledge of God is infinite, by which He comprehends the secrets of the heart, the thoughts of the mind, and all its acts wandering chimerically; but to comprehend is to know a thing in all the modes in which it is knowable; but the being of reason from what was said in (*Q. 1 of this book*, Art. 6) is knowable and is known by us; therefore also by God. Nor does it avail to say with Vásquez (*cit.*) that God knows the real extremes in which the being of reason is founded, but not their union, which is the relation of reason or the being of reason itself. For one who knows the extremes fully and in every mode likewise knows the union of the extremes — since one who attains the parts also attains the whole composed from the parts; if therefore God knows the false propositions and argumentations fabricated and put together by the created intellect, He also knows their union and connection — especially since some beings of reason, such as fictions, are supported by no extreme and no foundation. Hence Arriaga rightly says (*cit.*) that this view of Vásquez is rejected as false by all.

Third: who knows the greater, knows the lesser, from the place from the greater to the lesser; but God knows the greater being — namely real being, which is being simply; therefore He knows the lesser — namely the being of reason, which is a qualified and diminished being. Finally: the finite and created intellect attains the being of reason through its act; therefore it does not escape the infinite and uncreated intellect.

Second Assertion: God can make the being of reason. Scotus (*cit.*) favors this. It is proved first: who has the principle and power of making the being of reason can make the being of reason; but God has the principle and power of making the being of reason; therefore He can make the being of reason. The major is evident — for being and being able is for the sake of operating. The minor is admitted, because God possesses an intellect, which is a collative and comparative power of one object with another, and accordingly productive of

the being of reason, as I showed in (*Articles 1 and 2 of this question*). Nor does it avail to say, with our two recent authors (*Disp. 3 Log., Q. 1, §. 5*), that the effective force of the being of reason carries imperfection — that is, conceiving non-being in the manner of being — which is far removed from God; because, apart from the fact that the being of reason is not thus described, as I showed in (*Art. 2 of the preceding question*), it is the express doctrine of Scotus (*Quodl. 1, cited just above*), affirming that the divine intellect can confer one object with another and produce the being of reason. Especially because this does not lower but exalts the intellect, which extends to every being — real and of reason — and contains both under its object. What they say — that real being is the adequate object of the intellect, from (*1, d. 3, Q. 3*) — does not hold, because the Doctor there speaks of the motive object, not the terminative one — such as the being of reason is — as the same authors themselves sense and accept there (*Q. 6*) with Bargius and other Scotists. Therefore the argument stands in its force.

Second: every efficiency is to be attributed to God, who is the supreme maker and craftsman of all things; but the formation of the being of reason pertains to the efficiency of the efficient cause; therefore it is fitting for God. The major is evident, because only the causalities of the material and formal causes are removed from God, since they carry imperfection with them. The minor is clear from (*Art. 1 of this question*), in which the efficient cause of the being of reason was established. Third: God can do whatever a secondary cause can do — indeed greater and more excellent things, since He is of infinite power; but a secondary intellectual cause can contrive the being of reason, from what has been said; therefore also God, who is the first cause. Moreover, God can cause Logic in the intellect of someone — as He did at the beginning of the world, infusing it into Adam and the Angels; but Logic is concerned with the being of reason, namely the syllogism; therefore the production of the being of reason is not to be denied to God. All the more so: nothing is independent except God; but the being of reason would be independent, because for its being — which is qualified and objective — God Himself would not cooperate or concur; and if the created intellect in forming it were to act independently, without the concurrence of God — if it is conceded that God concurs with the created intellect in its production — then certainly it must be admitted that God Himself, without the cooperation of another, can attain the formation of the same.

Third Assertion: The affirmative part is certain and to be held in the Scotist school. This assertion militates against Mastrius and Bellutus, cited above (*Q. 5*), who defend it only problematically. It is argued first from (*Quodl. 1, §. De altero, before L.*), where it is openly and explicitly stated that both intellects — created and uncreated — form beings of reason through the comparison of their acts to objects. Second, from (*1, d. 30, Q. 2, §. Respondeo. sua. G.*), where it is perspicuously and clearly read that the divine essence can be compared to the creature both through the act of the created intellect and the uncreated, and can

cause a relation of reason in it. Third, from (*ibid.*, d. 36, Q. un., §. *contra istud. G. and H.*, and *Quodl.* 17, §. *de secundo. C.*, and 3, d. 26, Q. vn., §. *Ad quaestionem. E.*, and 4, d. 16, Q. 2), and other places, in which it is plainly established that our Doctor asserts that God produces beings of reason.

Nor does it avail to cite against this the testimony of the same Doctor (1, d. 2, Q. 4, §. *Ista tamen positio, ad N.*), where it is held as absurd that the divine intellect causes a relation of reason in the essence as existing. Because there, as Lychetus interprets it, Scotus is speaking of the direct and absolute act of the intellect through which the being of reason is not made — hence it is absurd for the being of reason to be made through such an act; for the being of reason is produced through the collative and comparative act of the intellect, as those same authors do not deny. The other testimony which they add from (1, d. 35, Q. un., §. *contra 2. positionem. H.*) — where Scotus, discussing the divine intellect as producing the being of reason, places the particle *fortasse* ("perhaps"), which is a dubitative word — does not profit them, because in (*Report.*, 1, d. 36, Q. 2) having the same discussion, he speaks assertively; and likewise in the other places cited above — which all his interpreters and his entire school follow. Wherefore, although in the first place he does not firmly determine himself to the affirmative part, yet in the later ones he adheres to it entirely; and accordingly this — and not the other, which is negative — is to be received and embraced.

Objection 1, against the first assertion: to know the being of reason is to feign something; but God cannot feign anything, since He is most truthful; therefore God cannot know the being of reason. The major is proved: to feign is to hold in mind what is feigned; therefore to know the being of reason is to feign something. I deny the major and its proof, which rests on no foundation; and accordingly, in the mode in which it is proposed, it is also dissolved.

Objection 2: God cannot be deceived, because He cannot know things otherwise than they are; but if He knew the being of reason, He would be deceived — because He would know non-being in the manner of being, as is clear from darkness and other privations, which are apprehended by us in the manner of real and positive forms; therefore God is devoid of knowledge of the being of reason. I concede the major and deny the minor. For the argument presses those who think that the being of reason is a non-being apprehended in the manner of a being — whom I refuted in (Q. 1 of this book, Art. 2).

Objection 3, against the second assertion: no imperfection is to be ascribed to God, since He is most perfect and the ocean of infinite perfections; but to make the being of reason is an imperfection — for to make the being of reason is the same as to make a qualified and diminished being; and to produce such qualified and diminished effects is a sign of weakness and impotence; therefore God is alien from the efficiency of the being of reason. I concede the major and deny the minor; to its proof I distinguish: if the effect is diminished by its own nature and of itself, I deny; but if the effect is not diminished of itself, I concede.

But the nature of the being of reason requires and demands that it be a qualified and diminished being. For if it were otherwise made, its nature and essence would be destroyed. Therefore the imperfection, weakness, and feebleness are attributed not to the making power but to the nature of the being of reason.

This concludes the whole and complete course of Scotist philosophy, which by God's guidance I began — addressing along with Scotus God Himself, who is the end without end — and with Scotus's support I finish and conclude with Him, who is the term and ultimate end of all, in whom may I enjoy for all eternity.

TABLE OF CONTENTS

Epitome of Dialectic, Divided into Three Books, According to the Mind of the Subtle Doctor	8
Book I: On Incomplex Terms	11
Question I: On the Divisions and Definitions of Incomplex Terms	11
Article I: On the Names of This Discipline	11
Article II: What a Term Is	13
Article III: On Mental, Spoken, and Written Terms	14
Article IV: On Significative and Non-Significative Terms, and Other Related Matters	17
Article V: On Equivocal and Univocal Terms	20
Article VI: On Concrete, Abstract, and Other Terms	22
Article VII: On Denominative and Denominating Terms	26
Article VIII: On Common, Universal, and Singular Terms	28
Article IX: On Convertible and Other Terms	30
Article X: On Terms of First and Second Intention	32
Question II: On the Properties of Incomplex Terms	34
Article I: On Sign and Signification	34
Article II: On Predication	37
Article III: On Supposition	40
Article IV: On the Ascent and Descent of Terms	43
Article V: On Status and Distraction	44
Article VI: On Ampliation and Restriction	46
Article VII: On Appellation	47
Question III: On the Universals	49
Article I: What the Common and the Universal Are	49
Article II: How Many Kinds of Universal There Are	50
Article III: On Genus	51
Article IV: On Species	53
Article V: On Difference	54
Article VI: On Property	56

Article VII: On Accident.....	57
Question IV: On the Predicaments.....	59
Article I: On the Ante-Predicaments	59
Article II: What a Predicament Is, and How Many There Are	61
Article III: On Substance	62
Article IV: On the Properties of Substance	63
Article V: In Which the Series of Predicamental Substance Is Examined	66
Article VI: On Quantity	66
Article VII: On Quality	68
Article VIII: On Relation.....	70
Article IX: On Action and Passion.....	71
Article X. On <i>Ubi</i> (Whereness).....	72
Article XI. On <i>Situs</i> (Position)	73
Article XII. On <i>Quando</i> (Whenness)	73
Article XIII. On <i>Habitus</i> (Vestiture).....	74
Article XIV. On the Post-predicaments	74
Book II. On Complex Terms.....	77
Question I. On the Parts of the Complex Term.....	77
Article I. On the Noun.....	78
Article II. On the Verb	81
Question II. On the Essence of the Complex Term.....	82
Article I. Whether the Complex Term is Distinguished from the Sentence, the Proposition, and the Enunciation.....	82
Article II. What the Complex Term Is.....	85
Article III. How Many Kinds of Complex Term There Are	86
Article IV. On the Hypothetical Proposition	89
Question III. On the Matter, Form, Quality, and Quantity of the Proposition	91
Article I. On the Matter, Form, Quantity, and Quality of the Categorical Proposition	91

Article II. On the Matter, Form, Quantity, and Quality of the Hypothetical Proposition	93
Question IV. On the Opposition, Equipollence, and Conversion of Simple Propositions	95
Article I. What Opposition of Simple Propositions Is, and How Many Kinds There Are	95
Article II. On the Canons of Opposed Propositions	97
Article III. On the Equipollence of Simple Propositions	99
Article IV. On the Conversion of Simple Propositions	100
Question V. On the Modal Proposition	102
Article I. What the Modal Proposition Is, and How Many Kinds There Are	103
Article II. On the Matter, Form, Quantity, and Quality of the Modal Proposition	104
Article III. On the Opposition and Equipollence of Modals	105
Question VI. On the Exponible Proposition	107
Article I. On Exclusives	107
Article II. On Exceptive and Reduplicative Propositions	110
Question VII. On Division and Definition	111
Article I. On Division	111
Article II. On Definition	113
Book III. On the Terminated	114
Question I. On the Syllogism in General	115
Article I. How Many Things Are Required to Constitute a Syllogism	115
Article II. From What the Syllogism Is Composed	116
Article III. What the Syllogism Is, and How Many Kinds There Are	116
Article IV. On the Regulative Principles of the Syllogism	119
Article V. On the Figures and Modes of the Syllogism	121
Article VI. On the Modes of the First Figure	122
Article VII. On the Modes of the Second Figure	124
Article VIII. On the Modes of the Third Figure	125
Article IX. On the Common Rules of the Syllogistic Figures	126

Article X. On the Particular Rules of the Three Figures	128
Article XI. On the Reduction of Imperfect Syllogisms to Perfect Ones	128
Article XII. On the Powers of the Syllogism.....	131
Question II. On the Syllogism Taken Specifically	132
Article I. On the Expository Syllogism	132
Article II. On the Syllogism from Obliques	133
Question III. On Dialectical Topics	133
Article I. What the Dialectical Topic Is, and How Many Kinds There Are	134
Article II. On Intrinsic Loci Drawn from the Substance of a Thing .	134
Article IV. On Extrinsic Loci.....	138
Article V. On Middle Loci.....	140
Question IV. On the Sophistic Syllogism.....	141
Article I. On the Purposes of the Sophists	142
Article II. What a Fallacy Is and How It Is Divided	143
Article III. On Fallacies in Speech	144
Article IV. On Fallacies Outside Speech	147
Rational Philosophy of Fr. Bonaventure Colombi of Nice, Minor Conventual, Doctor and Professor of Sacred Theology	151
Preface and Commendation of the Subtle Doctor	151
Book I: On the Prolegomena of Rational Philosophy, Which Is Called Logic.....	155
Question I: On the Existence and Discovery of Logic	155
Article I: Whether Logic Exists	155
Article II: How Logic Is Named and What It Is.....	158
Article III: How Logic Was Discovered	161
Article IV: Who Is the Discoverer of Logic	164
Article V: Whether Logic Was Discovered After the Other Sciences	167
Article VI: Whether Logic Is to Be Learned Before the Other Sciences	170
Question II: On the Nature and Quality of Logic.....	171

Article I: Whether Logic Is an Art	171
Article II: Whether Logic Is a Science	174
Article III: On the Using Logic	182
Point of Debate I: Whether the Using Logic Can Be Said to Belong to the Whole Discipline of Reasoning.....	182
Point of Debate II: Whether the Using Logic Is a Science	183
Point of Debate III: Whether the Using Logic Is Distinguished from the Teaching Logic	185
Point of Debate IV: Whether the Using Logic Is Distinguished from the Other Sciences It Serves	187
Point of Debate V: Whether Topica and Sophistica Are Sciences ..	188
Article IV: Whether Logic Is One Science.....	190
Article V: Whether Logic Is a Speculative Science.....	193
Point of Debate I: What Praxis Is.....	193
Point of Debate II: In Which the Chief Difficulty Is Weighed — Whether Logic Is Speculative.....	199
Article VI: Whether Logic Is a Real Science	205
Article VII. Whether Logic is a Universal Science.....	208
Article VIII. Whether Logic is Distinguished from Metaphysics.	209
Article IX. How Logic Differs from Rhetoric.	210
Article X. Whether Logic is a Part of Philosophy.....	211
Question III. On the Object of Logic.	214
Article I. What the Object Is in Its Several Kinds and What Is Required for It.....	214
Article II. Whether All Things Are the Object of Logic.	217
Article III. Whether Logic Is Concerned with the Active or Passive Acts of the Intellect.	219
Article IV. Whether Spoken Words Are the Object of Logic.....	221
Article V. Whether Being of Reason Is the Object of Logic.....	223
Article VI. Whether the Three Operations of the Intellect Are the Object of Logic.....	228
Article VII. Whether the Syllogism Is the Object of Logic.	231
Question IV. On the Utility and Necessity of Logic.	237

Article I. Whether Logic Is Useful.....	237
Article II. Whether Logic Is Necessary for Acquiring the Other Sciences.....	240
Book II: On Universals	245
Question I: On Universals in Common.....	245
Article I: Whether Universals Exist.....	245
Article II: Whether Universals Are Spoken Words or Concepts.....	248
Article III: Whether Universals Are Platonic Ideas	251
Article IV: Whether Real Common Natures Exist	253
Article V: Whether a Common Nature Is in Many Things Through Inexistence or Through Indifference	258
Article VI: Whether a Common Nature Has Its Own Unity Distinct from Numerical Unity	262
Article VII: Whether Universals Exist Prior to the Operation of the Intellect	265
Article VIII: How the Formal Universal Comes to Be	270
Article IX: What the Essence of the Logical Universal Is	275
Article X: How Many Kinds of Universal Are There.....	279
Article XI: Whether the Universal Is Univocal.....	283
Article XII: Whether the Universal Is the Subject of Porphyry's Book	286
Article XIII: Whether the Universal Is in the Thing or in the Intellect	287
Article XIV: How Universals Are Distinguished.....	290
Question II: On Genus.....	296
Article I: What Is Defined in the Definition of Genus.....	296
Article II: Whether the Definition of Genus Is Quiditative	299
Article III: Whether Genus Is Predicated of Species as a Whole or as a Part of It	302
Article IV: Whether Genus Demands Several Species in Act.....	305
Article V: Of What Things Genus Is Predicated	308
Article VI. Whether Predication in What Distinguishes Genus from Difference	311

Question III. On Species	313
Article I. Whether Species is Rightly Defined by Porphyry	313
Article II. Whether Species is a Universal by Relation to Individuals	316
Article III. Whether Species is the Adequate Correlative of Genus ..	318
Article IV. Whether Species Requires Many Possible Singular Individuals.....	320
Question IV. On the Individual	322
Article I. What and How Many Kinds the Individual Is.....	322
Article II. Whether There is Some Common Character among Individuals.....	324
Article III. On the Predication of the Individual.....	326
Question V. On Difference.....	328
Article I. What Difference Is	328
Article II. Through What Relation Difference is Constituted the Third Universal.....	331
Article III. Whether the Superior Difference is Included in the Inferior of Which it is Predicated	332
Question VI. On the Proper	336
Article I. Whether the Proper is a Universal.....	336
Article II. Whether the Proper is a Universal Distinct from Accident	340
Question VII. On Accident.....	343
Article I. Whether Accident is a Universal	343
Article II. What Accident Is	345
Book III. On the Predicaments	349
Question I. On the Preliminaries to the Predicaments.....	350
Article I. Who is the Author of This Book on the Predicaments	350
Article II. What is the Subject of This Work.....	350
Article III. Whether There is Science about the Predicaments	353
Article IV. Whether the Science about the Predicaments Pertains to the Logician	353
Question II. On the Antepredicaments	355

Article I. On Equivocals	355
Article II. On Univocals.....	356
Article III. On Denominatives.....	358
Article IV. Whether the Definition of Univocals Belongs to Denominatives	359
Article V. Whether the Denominative Signifies the Form or Its Subject	362
Article VI. On the Unity and Plurality of Concretes.....	365
Article VII. Whether There are Analogs Distinct from Equivocals and Univocals	369
Question III. On the Predicaments	377
Article I. Whether There is Something Univocal to the Predicaments	377
Article II. How Many Predicaments There Are	378
Article III: Whether the Categories Differ from One Another Really	384
Article IV: What Is Placed in or Excluded from the Categories	387
Article V: Whether Concreta or Abstracta Are Placed in the Categories	391
Article VI: Whether Something Can Be Placed in Diverse Categories	393
Question IV: On Substance	395
Article I: What Is the Highest Genus of the Category of Substance	395
Article II: What Is the Division of Substance into First and Second	399
Article III: Whether God Is in the Genus of Substance	403
Article IV: Whether Angels and the Heavens Are Placed in the Category of Substance.....	409
Question V: On Quantity	412
Article I: Whether Quantity Is a Highest Genus Distinct from Others	412
Article II: What Is the Essence of Quantity	414
Question VI: On Relation.....	419

Article I: Whether There Is One Genus of Relation Distinct from Others.....	419
Article II: What Is the Highest Genus of Relation.....	422
Article III: Whether There Are Real Relations.....	428
Article IV: Whether Relation Is Distinguished from Its Foundation	431
Article V. Whether a Relation Can Be Separated from Its Existing Foundation and Term	441
Article VI. Whether <i>Esse In</i> Belongs to the Essence of a Relation	444
Article VII. Whether a Relation Is Multiplied by the Multiplication of Terms.....	448
Article VIII. Whether One Relation Can Found Another Relation....	455
Article IX. Whether a Relation Terminates at an Absolute Thing	459
Article X. Whether the Same Thing Can Be Referred to Several Things.....	467
Article XI. Whether a Relation Requires an Existing Term.....	469
Article XII. Whether the Essence of a Relation Is Wholly in the Foundation.....	474
Article XIII. On the Threefold Division of Relation	479
Article XIV. On Action.....	487
Article XV. On Passion.	490
Article XVI. On <i>Ubi</i> (Where).	492
Article XVII. On <i>Situs</i> (Position).	494
Article XVIII. On <i>Quando</i> (When).....	497
Article XIX. On <i>Habitus</i> (Having).....	500
Question IX. On the Post-Predicaments.....	503
Article I. What Opposition Is.....	503
Article II. Whether Opposition Is a Real Being.	504
Article III. How Many Kinds of Opposition There Are.	506
Article IV. On Relative Opposites.....	507
Article V. On Contrary Opposites.	508
Article VI. On Privative Opposites.....	513
Article VII. On Contradictory Opposites.	515

Book IV. On the Proposition.....	520
Question I. On the Object of the Books on <i>Perihermeneias</i>	520
Article I. Whether the Proposition Is the Adequate Object.....	520
Question II. On the Parts of the Proposition.	522
Article I. Whether Voices Signify Conventionally.	523
Article II. Whether Voices Primarily Signify Things or Concepts.....	527
Article III. What the Signification of Voices Represents.	532
Question III. On the Essence of the Proposition and Its Species.	537
Article I. Whether the Proposition Is a Being of Reason.	537
Article II. Whether the Proposition Is a Simple Quality.	538
Article III. Whether the Apprehensive Proposition Differs from the Judicative Proposition.	543
Article IV. Whether the Division of the Proposition into Affirmative and Negative Is a Division of a Genus into Species.....	545
Question IV. On the Properties of the Proposition.....	548
Article I. What Truth Is.	548
Article II. Whether Truth Is a Real Being or a Being of Reason.	550
Article III. In What Subject Truth Subsists.	555
Article IV. Whether Truth Is Found in Every Operation of the Intellect?	560
Article V. Whether Propositions of Eternal Truth Exist.	563
Article VI. Whether a True Enunciation Can Be Changed into a False One.....	568
Article VII. Whether Enunciations about a Conjoined Extreme Can Be Necessary.	571
Article VIII. Whether, of Two Singular Contradictory Propositions about a Future Contingent, One Is Determinately True and the Other Determinately False.	575
Book V. On the Syllogism.	583
Question I. On the Syllogism in General.....	583
Article I. Whether the Syllogism Is the Subject of Aristotle's Prior Analytics.....	583
Article II. What the Syllogism Is.....	585

Article III. Whether the Division of the Syllogism into Dialectical and Demonstrative Is a Division of Genus into Species.	588
Article IV. Whether Discursus, Syllogism, and Argumentation Are the Same Thing.....	590
Article V. Whether the Conclusion Is of the Essence of the Syllogism.	593
Article VI. Whether a Fourth Figure of the Syllogism Is to Be Admitted.....	597
Article VII. Whether the Assent to the Conclusion Differs from the Assent to the Premises.	601
Article VIII. Whether the Premises Are the Cause of the Conclusion.	604
Article IX. In What Way the Premises Precede the Conclusion.....	608
Article X. Whether, Once the Assents to the Premises Are Had, the Intellect Is Necessitated to the Assent to the Conclusion.....	611
Question II. On Precognitions and Precognita.	615
Article I. What is the Subject of This Work.	615
Article I. What is the Subject of This Work.	616
Article II. Whether All Teaching and Learning Arises from Pre-existing Knowledge.	618
Article III. How Many Precognitions and Precognita There Are.	621
Article IV. What Must Be Foreknown Concerning Principles.	623
Article V. What Must Be Foreknown Concerning the Property.	625
Article VI. How Many Foreknowledges the Subject Has.	628
Article VII. Whether the Subject Can Be Demonstrated in Science.	631
Article VIII. Whether the Subject Virtually Contains All the Truths of the Science of Which It Is the Subject.	635
Question III. On Demonstration.	644
Article I. Whether Demonstration Exists and What It Is.	644
Article II. How Many Species of Demonstration There Are.	646
Article III. Whether Demonstration Is from True Premises.....	650
Article IV. Whether Demonstration Is from Primary and Immediate Things.....	653

Article V. Whether Demonstration Is from Prior and More Known Things.....	654
Article VI. Whether the Premises of Demonstration Are from Necessary Things and from All.....	660
Article VII. Whether Demonstration Is from Per Se Premises.....	664
Article VIII. Whether the Premises of Demonstration Are from Universal Predicate.	667
Article IX. Whether Demonstration Is from Proper Things.....	670
Article X. Whether Demonstration Is from Per Se Known Things...	671
Article XI. Whether Demonstration Can Be Made in All Genera of Causes.....	677
Article XII. Whether the Circle Must Be Excluded from Demonstration and the Regression Admitted.	680
Article XIII. What is the Middle Term of the Most Perfect Demonstration?.....	685
Question IV. On the Effect of Demonstration.....	692
Article I. Whether Science Exists.	692
Article II. What Science Is.	695
Article III. Whether Evidentiality Belongs to the Essence of Science.	697
Article IV. Whether the Division of Science into Practical and Speculative Is Essential.	698
Article V. Whether Science Is Called Practical or Speculative from Its End or from Its Object.	703
Article VI. Whether the Tripartite Division of Science Is Legitimate.	707
Article VII. Whether One Science Is Subalternated to Another.....	709
Article VIII. Whether the Subalternated Is Properly a Science.	712
Article IX. Whether Science Can Be Newly Acquired.....	713
Article X. Whether Science and Faith Can Simultaneously Exist in the Same Intellect Concerning the Same Object.	715
Article XI. Whether Science and Opinion About the Same Object Can Simultaneously Exist in the Same Intellect.....	720
Natural Philosophy, or Physics.....	726

Preface.....	726
Book I. On the Prolegomena to Physics.	726
Question I. On the Discovery and Utility of Physics.	726
Article I. Who is the Discoverer of Physics?	727
Article II. Whether Physics Is Useful.	728
Article III. What Rank Physics Claims Among the Other Sciences..	732
Article IV. On the Order of Dignity of Physics and the Other Sciences.	736
Question II. On the Nature of Physics.....	742
Article I. Whether Physics Is a Science.	742
Article II. Whether Physics Is Speculative.	746
Article III. Whether Physics Is One Science.....	749
Article IV. Whether Physics Is a Subalternate Science.....	752
Question III. On the Object of Physics.....	756
Article I. Whether Mobile Being or the Mobile Body Is the Adequate Object of Physics.	757
Article II. Whether the Generable and Corruptible Body Is the Total Object of Physics.	764
Article III. Whether Finite Being Is the Object of Physics.....	767
Article IV. Whether the Natural Body Is the Object of Physics.....	772
Book II. On the Principles of Natural Things.....	775
Question I. On Principles Taken in General.	775
Article I. What Natural Principles Are.....	775
Article II. To Which Principles the Aforementioned Definition Applies.....	785
Article III. How Many Natural Principles There Are.....	790
Article IV. Whether Principles Are Contraries.....	796
Article V. Whether Principles Are Univocated.....	801
Article VI. Whether Anything Comes to Be from Nothing.	804
Question II. On Matter.	812
Article I. Whether Matter Exists.	812
Article II. What Matter Is.....	816

Doubt I. What the Vulgar Thought About Prime Matter.	816
Doubt II. What Thales of Miletus Thought About Prime Matter. .	817
Doubt III. Whether Prime Matter Is Air.	819
Doubt IV. Whether Fire Is Prime Matter.	820
Doubt V. Whether Prime Matter Is Something Intermediate Between the Elements.	821
Doubt VI. Whether All Things Are One Material Principle.	821
Doubt VII. Whether There Are Many Material Principles.	824
Doubt VIII. Whether the Four Elements Are Prime Matter.	825
Doubt IX. Whether Numbers Are Prime Matter.	827
Doubt X. What Matter Is According to Aristotle and the Truth. ...	828
Article III. Whether Matter Is Substance.	830
Article IV. Whether Matter Is Created.	831
Article V. Whether Matter Has an Entitative Act.	832
Article VII. Whether Matter Has Partial Subsistence	842
Article VIII. Whether Matter Can Exist Without Form	845
Article IX. Whether Matter Separated from Form Needs a New Being and Influx in Order to Exist and Be Conserved	850
Article X. Whether Matter Is of the Essence of the Composite	853
Article XI. Whether the Matter of Sublunary Things Is One in Species	860
Article XII. On the Potency of Matter.	865
Dubitation I. Whether Potency Is of the Essence of Matter	865
Dubitation II. How Many Kinds of Potency Matter Has.	868
Dubitation III. To What Forms the Potency of Matter Extends	871
Article XIII. On the Appetite of Matter	875
Dubitation I. Whether Matter Desires Form	875
Dubitation II. How Many Kinds of Appetite Matter Has.	878
Dubitation III. Whether the Appetite of Matter Is Equal toward All Forms.	881
Article XIV. Whether Matter Is Per Se Knowable.	885
Article XV. Whether Matter Is Ingenerable and Incorruptible.	888

Article XVI. What Is the Root Cause of the Corruption of Natural Things.....	892
Article XVII. Whether Matter Is Purely Passive.....	894
Article XVIII. Whether There Is a Seminal Reason in Matter Co-Eternal with It.....	898
Question III. On Privation.....	901
Article I. Whether Privation Exists	901
Article II. What Privation Is	903
Article III. How Many Kinds of Privation There Are	907
Article IV. Whether Privation Is Distinct from Matter	910
Article V. Whether Privation Is Truly a Principle of Natural Generation, and in What Sense	911
Article VI. Whether There Is a Return from Privation to Habit	917
Question IV. On Form	919
Article I. Whether There Is a Substantial Form.....	919
Article II. What Form Is	922
Article III. Whether Form Is Newly Produced in Matter	924
Article IV. What It Is for a Form to Be Drawn from the Potency of Matter	926
Article V. Whether the Forms of the Heavens and the Elements Were Drawn from the Potency of Matter in the First Production of Things	929
Article VI. Whether Accidental Forms Are Drawn from the Potency of Matter	932
Article VII. Whether Several Substantial Forms Can Simultaneously Inform One and the Same Matter in Number	935
Article VIII. Whether One Form Can Simultaneously Inform Several Matters	939
Question V. On the Union of Matter and Form.....	942
Article I. Whether There Is a Union Distinct from Matter and Form	942
Article II. What the Union of Matter and Form Is	945
Article III. How Many Unions There Are Between Matter and Form	947

Question VI. On the Composite of Matter and Form	951
Article I. Whether the Composite Is One Per Se.....	952
Article II. Whether the Whole Is Really Distinguished from Its Parts	954
Article III. Whether the Integral and Per Accidens Whole Is Distinguished from Its Parts.....	965
Book III. On Nature and Art	970
Question I. On Nature	970
Article I. What Nature Is	970
Article II. Whether Nature Is a Passive Principle	972
Article III. To What Things the Account of Nature Belongs	977
Question II. On Art.....	981
Article I. Whether Art Imitates Nature	981
Article II. Whether Art Can Produce the Works of Nature.....	982
Article III. Whether Artificial Forms Are Distinguished from Natural Ones	984
Article IV. Whether True Gold Can Be Made by Alchemy	987
Book IV. On Causes.	989
Question I. On Causes Taken Generally.....	989
Article I. What a Cause Is.....	989
Article II. How Many Kinds of Cause There Are.	991
Article III. What Causality Is.....	993
Article IV. Whether a Cause Is Prior to Its Effect.	998
Article V. Whether a Cause Is Nobler Than Its Effect.....	1001
Article VI. Whether Causes Are Causes of Each Other.	1005
Question II. On the Efficient Cause.....	1007
Article I. How Many Kinds of Efficient Cause There Are.	1008
Article II. What the Efficient Cause Is.	1009
Article III. Whether Several Causes Can Simultaneously Produce the Same Numerically Identical Effect.	1011
Article IV. Whether Several Total Causes Can Separately Produce the Same Numerically Identical Effect.	1015

Question III. On the First and Second Cause.	1018
Article I. Whether the First Cause Preserves the Second Cause in Its Being.	1019
Article II. Whether Second Causes Are Active.	1021
Article III. Whether the First Cause Concurs with the Second Cause in Producing Every Effect.	1024
Article IV. Whether the First Cause Concurs with the Second Cause Immediately by Immediacy of Power and of Suppositum.	1029
Article V. Whether the First Cause Pre-moves and Pre-moves the Second Cause to Acting.	1031
Article VI. Whether the Action of the First and of the Second Cause Is One.	1039
Article VII. Whether the First Cause Determines the Second Cause as to the Specification and Exercise of Acts.	1042
Question IV. On the Exemplar Cause.	1046
Article I. Whether the Idea Is an Objective Concept.	1046
Article II. What the Exemplar Cause Is and to Which Genus of Cause It Is Reduced.	1050
Question V. On the Instrumental Cause.	1051
Single Article. Whether an Instrument is Active.	1051
Question VI. On the Material Cause.	1053
Single Article. What the Material Cause is and What it Causes.	1053
Question VII. On the Formal Cause.	1054
Article I. What the Formal Cause is and What it Causes.	1054
Article II. Whether God can Supply the Causality of the Material and Formal Causes.	1055
Question VIII. On the Final Cause.	1057
Article I. Whether the End is a True Real Cause.	1057
Article II. Whether the End Causes according to Intentional Being or according to Real Being.	1059
Article III. Which Things Act for the Sake of an End.	1062
Question IX. On Accidental Causes.	1064
Article I. Whether Chance and Fortune Exist.	1065

Article II. What Chance and Fortune Are.....	1066
Article III. Whether Fate Exists and What it Is.	1069
Article IV. On Monsters.	1071
Book V. On Quantity.....	1073
Question I. On Quantity in Common.	1073
Article I. Whether Quantity Can Exist without External Extension to Place.	1073
Article II. Whether Quantity Is Really Distinct from Substance.....	1075
Article III. Whether Quantity Divides Material Substance into Its Parts.....	1078
Article IV. What Is the Subject of Quantity.	1081
Article V. Whether the Division of Quantity into Continuous and Discrete Is the Division of a Genus into Its Species.	1085
Question II. On Continuous Quantity.....	1086
Article I. How Many Species of Continuous Quantity There Are...	1086
Article II. Whether in a Continuum There Are Real Positive Indivisibles.	1090
Article III. Whether a Continuum Is Composed of Indivisibles.	1095
Article IV. Whether a Continuum Is Divided into Always-Divisible Things.....	1100
Question III. On Discrete Quantity.....	1104
Article I. Whether Number Is a Real or Rational Being.	1104
Article II. Whether Speech Is a True and Real Species of Discrete Quantity.....	1108
Question IV. On the Termini of Natural Things.....	1110
Article I. Whether Living Natural Things Have Certain Termini of Their Greatness or Smallness.....	1110
Article II. Whether Non-Living Natural Things Have Termini with Respect to Greatness or Smallness.....	1112
Book VII. On Time.	1115
Question I. On the Nature of Time.	1115
Article I. Whether Time Exists.....	1115
Article II. Whether Time Is a Real Being.....	1116

Article III. What Time Is.....	1118
Article IV. Whether Time Is Distinguished from Motion.....	1120
Article V. Whether There Is a Discrete Time Distinct from Continuous Time.....	1123
Question II. On Things Subject to Time.....	1127
Article I. Which Things Are in Time.	1127
Article II. Whether There Is One and the Same Now throughout All of Time.....	1131
Book VIII. On Motion.....	1134
Question I. On the Nature of Motion.	1134
Article I. Whether Motion Exists.....	1134
Article II. What Motion Is.....	1135
Article III. Whether the Stated Definition of Motion Applies to Every Motion.....	1136
Article IV. Whether Motion Is Something Absolute or Relative.	1138
Article V. Whether Succession Belongs to the Essence of Motion. .	1140
Article VI. How Many Kinds of Motion There Are.	1142
Question II. On the Distinction and Unity of Motion.....	1144
Article I. How Motion Is Distinguished.	1144
Article II. From What the Unity of Motion Is Derived.....	1147
Article III. From What the Contrariety of Motion Is Taken.....	1151
Article IV. How Motions Begin and Cease.	1152
Question III. On the Mobile.....	1155
Article I. Whether an Indivisible Can Be Moved Locally.....	1155
Article II. Whether Anything Can Be Moved Locally in an Instant.	1158
Article III. Whether What Is Moved Is Moved by Another.....	1160
Article IV. By What Are Heavy and Light Things Moved.	1162
Article V. By What Are Projectiles Moved.....	1165
Question IV. On the Mover.	1168
Sole Article. Whether There Is One First Mover, Immobile and Immaterial.....	1168

Books on the Heaven, the World, and the Elements, According to the Mind of the Subtle Doctor	1171
Preface.....	1171
Book I.....	1171
On the World	1171
Question I.....	1172
On the Creator of the World.....	1172
Article I: Whether God Could Have Created the World	1172
Article II: Whether the World Was Created by God in Time	1175
Article III: Whether the World Could Have Been Created from Eternity	1179
Question II.....	1184
On the Creation of the World.....	1184
Article I: What Creation Is	1184
Article II: Whether Creation as Action Is a Real Being	1186
Article III: Whether Creation Is a Change	1187
Article IV: Whether Creation Is a Transient Action.....	1189
Article V: Whether Creation Is Distinct from the Created Thing....	1190
Article VI: Whether Creation and Conservation Are the Same.....	1193
Article VII: Whether Through Creation Some Real Relation Accrues to God.....	1195
Question III	1198
On the Fabric of the World	1198
Article I: What the World Is.....	1198
Article II: Whether Several Worlds Can Be Founded	1202
Article III: Whether the World Is Perfect	1203
Article IV: Whether God Can Make the World Better and More Perfect.....	1207
Article V: Whether a Creature Can Create Anything as a Principal Cause.....	1210
Article VI: Whether a Creature Can Be an Instrumental Cause for Creating Something.....	1215
Book II	1219

On the Heaven.....	1219
Question I.....	1220
On the Nature of Heaven	1220
Article I: Whether Heaven Is Composed of Matter and Form	1220
Article II: Whether Heaven Is Distinct from the Elements	1224
Article III: Whether the Matter of Heaven Is of the Same Species as the Matter of Sublunar Things.....	1226
Article IV: Whether Heaven Is Animate	1229
Article V: Whether Heaven Is Fluid or Solid	1232
Article VI: Whether the Heaven is Incorruptible	1233
Article VII: Whether the Heaven is Nobler than Any Other Body .	1236
Article VIII: How Many Heavens There Are	1238
Article IX: Whether the Heavens and the Stars are Distinct in Species	1242
Article X: Whether Eccentric Circles and Epicycles Are to Be Admitted in the Motions of the Planets	1244
Question II: On the Motion of the Heaven	1247
Article I: Whether All the Heavens Are Moved.....	1247
Article II: Whether the Heavens Are Moved by Angels	1249
Article III: Whether the Motion of the Heaven is Natural.....	1251
Article IV: Whether the Motion of the Heaven is Regular and Uniform	1253
Question III: On the Influence of the Heaven.....	1254
Article I: Whether the Heaven Exerts Influence upon These Lower Things.....	1254
Article II: Through What Means the Heaven Acts upon This World	1257
Article III: Whether the Heavens and the Stars Exert Influence upon the Human Soul.....	1259
Article IV: Whether Astrologers, from the Observation of the Stars, Can Predict Future Things with Certainty	1262
Book III: On the Elements.....	1265
Question I: On the Elements in Common	1266

Article I: What an Element Is and How Many Kinds There Are	1266
Article II: Whether the Forms of the Elements Are the Primary Qualities.....	1268
Article III: Whether the Elements Are Incapable of Generation and Corruption	1271
Article IV: Which Element Is the Nobler	1273
Article V: Whether the Elements Are Equal to One Another.....	1274
Article VI: Whether the Elements Are Round.....	1276
Question II: On the Transmutation of the Elements.....	1278
Article I: Whether the Elements Are Mutually Transmutable	1278
Article II: Whether Symbolic Elements Are More Easily Transmuted Into One Another Than Dissymbolic Ones.....	1281
Article III: Whether from Two Elements a Third Can Be Produced	1282
Question III: On the Primary Qualities of the Elements	1285
Article I: How Many and What the Primary Qualities of the Elements Are	1285
Article II: What the Individual Primary Qualities Are.....	1288
Article III: Whether Some Primary Quality in the Highest Degree Belongs to Each Element.....	1289
Article IV: Whether the Symbolic Qualities of the Elements Are of the Same Species	1291
Article V. Whether Two Contrary Qualities Can Exist Simultaneously in the Same Subject	1293
Question IV. On the Motive Qualities of the Elements.	1297
Article I. What the Motive Qualities of the Elements Are, How Many There Are, and to What They Belong.	1297
Article II. Whether the Elements Gravitate or Levitate in Their Own Places.	1299
Question V. On the Elements in Particular.	1301
Article I. Whether the Place of Fire Is Beneath the Concave of the Lunar Orb.....	1301
Article II. Whether Air Is Hot.	1303
Article III. Whether Earth Is in the Middle of the World.	1304

Article IV. Whether Earth Is Higher than the Sea.....	1305
Books on Generation and Corruption	1309
Preface.....	1309
Book I.....	1309
On Generation and Corruption.....	1309
Question I: On Alteration	1309
Article I: What Alteration Is	1309
Article II: Whether, If Generation Were Impossible, Alteration Would Likewise Be Impossible.....	1311
Article III: Whether Alteration Is Distinguished from Generation .	1313
Article IV: Whether Alteration Is a Continuous Motion.....	1314
Question II: On Generation	1316
Article I: Whether There Is Substantial Generation.....	1316
Article II: What Generation Is	1318
Article III: Whether Generation Is Instantaneous	1321
Article IV: What the Terminus of Generation Is	1324
Article V: Whether an Accident Can Generate Substance	1329
Article VI: Whether Substance Can Generate Accident	1336
Question III: On Corruption.....	1343
Article I: Whether Corruption Exists and What It Is.....	1343
Article II: Whether the Generation of One Is the Corruption of Another	1344
Article III: Whether in Corruption Dissolution Occurs All the Way Down to Prime Matter	1346
Book II: On Intension and Remission.....	1350
Question I: On Intension	1350
Article I: Whether Substance Admits of More and Less.....	1350
Article II: Whether Quality Is Intensified and Remitted.....	1354
Article III: In What Manner the Intension of Quality Occurs	1356
Article IV: Whether the Degrees of Intense Quality Are Homogeneous	1361

Article V: Whether the Degrees of Quality Are Distinguished from One Another	1364
Article VI: Whether Intension and Remission Differ from One Another	1365
Question II: On Rarefaction and Condensation	1366
Article I: Whether Through Rarefaction New Quantity Is Produced and Through Condensation Old Quantity Is Lost.....	1366
Article II. Whether Rarity and Density Belong to Quantity or Quality.	1371
Article III. Whether a Large Thing Can Be Made from a Small One without Rarefaction and without the Addition of New Matter.	1373
Book III. On Action and Reaction.	1375
Question I. On Action.	1375
Article I. Whether Action Is in the Agent or in the Patient.....	1375
Article II. Whether Action at a Distance Is Possible.....	1379
Article III. Whether Action and Passion Require Contact between Agent and Patient.	1383
Article IV. Whether the Same Thing Can Act upon Itself and upon Its Like and Unlike.	1384
Article V. Whether Action Always Proceeds from a Proportion of Greater Inequality.	1387
Question II. On Reaction.	1389
Article I. Whether Reaction Exists.	1389
Article II. Whether a Quality Existing in a Medium Is Intensified. .	1391
Article III. Whether a Quality Is Intensified through Antiperistasis.	1393
Book IV. On Mixture and the Mixed Body.	1395
Question I. On Mixture.	1395
Article I. Whether Mixture Exists.....	1395
Article II. What Mixture Is.	1396
Question II. On the Mixed Body.....	1398
Article I. What Is the Cause of the Mixed Body.	1398
Article II. Whether Elements Are in the Mixed Body.....	1399

Article III. Whether the Elements Remain in the Mixed Body According to Their Qualities.	1403
Article IV. Whether Temperament to the Exact Balance Can Exist in a Mixed Body.	1405
Article V. Whether the Same Thing Can Naturally Be Reproduced.	1406
Article VI. Whether Supernaturally the Same Numerically Permanent and Corrupted Effect Can Be Restored.	1409
Article VII. Whether by Divine Power the Same Numerically Successive Being Can Return.	1410
Book on Meteors.	1413
Question I. On Meteors in General.	1413
Article I. On the Causes of Meteors.	1413
Article II. Whether Vapor and Exhalation Are Essentially Distinct.	1414
Article III. In What Place and at What Time Meteors Are Formed.	1415
Question II. On Fiery Meteors.	1417
Article I. What Fiery Meteors Are.	1417
Article II. On Comets.	1418
Article III. On Thunder.	1420
Article IV. On Lightning.	1422
Article V. On the Thunderbolt.	1423
Question III. On Aerial Meteors.	1425
Article I. On the Vortex and Other Aerial Appearances.	1425
Article II. On Other Aerial Impressions.	1426
Article III. On the Rainbow.	1427
Article IV. On the Milky Way.	1428
Question IV. On Aqueous Meteors.	1430
Article I. On Cloud and Rain.	1430
Article II. On Other Aqueous Impressions.	1431
Article III. On Honey, Manna, and Sugar.	1432
Article IV. On the Sea.	1433
Question V. On Terrestrial Meteors.	1434

Article I. On the Earthquake.....	1434
Article II. What Wind Is.	1435
Article III. How Many Kinds of Wind There Are.	1438
Books on the Soul.....	1440
Preface.....	1440
Book I. On the Prolegomena to the Science of the Soul.....	1440
Question I. On the Object of the Science of the Soul.	1440
Article I. Whether the Soul Is the Object of the Books On the Soul.	1440
Article II. Whether It Belongs to Physics to Treat of the Soul.	1444
Question II. On the Nature of the Science of the Soul.	1447
Article I. Whether the Science of the Soul Is a Science.....	1447
Article II. Whether the Science of the Soul Is Nobler and More Certain Than the Other Sciences.	1448
Book II. On the Soul in Itself.	1451
Question I. On the Essential Predicates of the Soul.....	1451
Article I. Whether the Soul Is a Substance.	1451
Article II. What Kind of Substance the Soul Is.	1453
Article III. Whether the Soul Is Subsistent.....	1455
Article IV. What the Soul Is.....	1456
Article V. Whether the Second Definition of the Soul Is Legitimate.	1458
Article VI. Whether One Definition Can Be Demonstrated Through the Other.....	1460
Article VII. How Many Species of Souls There Are.	1462
Article VIII. Whether the Soul Is Indivisible.	1464
Article IX. Whether the Soul Is Whole in the Whole and Whole in Each Part of the Body.....	1467
Article X. Whether There Are Several Souls in the Same Living Thing.	1470
Article XI. Whether, Besides the Soul, There Is a Form of Corporeity in the Animate.....	1474
Question II. On the Parts of the Animated Body.....	1479

Article I. Whether Blood Is Animated.....	1479
Article II. Whether Seed and Milk Are Animated.....	1484
Article III. Whether Hair and Nails Are Animated.....	1487
Article IV. Whether the Organic Parts of an Animal Have Forms Specifically Distinct.....	1489
Article V. On the Parts of the Human Body.....	1492
Question III — On the Powers of the Soul in General.....	1496
Article I — By What the Powers of the Soul Are Produced.....	1496
Article II — Whether the Powers of the Soul Are Distinct from One Another and from the Soul Itself	1498
Article III — Whether the Distinction of the Powers Is Derived from the Distinction of Acts and Objects	1502
Book III — On the Vegetative Soul	1508
Question I — On the Nature of the Vegetative Soul	1508
Article — What the Vegetative Soul Is and How Many Kinds It Has	1508
Question II — On the Powers of the Vegetative Soul	1509
Article I — How Many Kinds of Power the Vegetative Soul Has.....	1509
Article II — How the Aforesaid Powers Are Distinguished.....	1512
Question III — On the Acts of the Vegetating Soul.....	1514
Article I — Whether the Acts of the Vegetating Soul Are Distinct from One Another	1514
Article II — Whether Something New Is Generated Through Nutrition.....	1516
Article III — Whether the Same Individual Persists from the Beginning of Its Origin to Its End.....	1519
Article IV — Whether Both Parents Concur Actively in the Generation of Offspring	1521
Article V — Whether Things Generated Through Putrefaction Are of the Same Species as Those Generated Through Propagation.....	1523
Book IV — On the Sensitive Soul	1525
Question I — On the Production of the Sensitive Soul	1525

Article I — Whether the Soul of Imperfect Animals Is Produced by the Heaven	1525
Article II — Whether the Sensitive Soul Is Produced from the Seed of the One Who Sheds It	1527
Question II — On Sensible Objects.....	1529
Article I — What the Common Sensible Is and How Many Kinds There Are.....	1529
Article II — Whether the Common Sensible Produces a Species of Itself Distinct from the Species of the Proper Sensible.....	1530
Article III — Whether, Besides the Impressed Species, the Presence of the Sensible Object Is Required for External Sensation	1532
Article IV — Whether Sense Can Err Regarding Its Proper Sensibles	1536
Question III — On the External Senses	1538
Article I — What the External Senses Are.....	1538
Article II — Whether the External Senses Need a Medium to Produce Sensation	1540
Article III — Whether the External Senses Can Perceive a Spiritual Object	1541
Question IV — On Intentional Sensible Species	1543
Article I — Whether Intentional Sensible Species Are Given.....	1543
Article II — What the Sensible Species Are	1545
Article III — Whether Species Are Divisible	1547
Question V. On Sight.....	1548
Article I. Whether light is an accident or a substance.	1548
Article II. Whether illumination is both a real and an intentional quality.....	1551
Article III. Whether illumination is necessary both on the part of the object and on the part of the medium for the act of seeing.	1553
Article IV. What the object of sight is.	1555
Article V. Whether sight is the most excellent of the external senses.	1557
Article VI. Whether vision is accomplished by the reception of a species in the eye from the object.....	1558

Article VII. In which part of the eye vision is accomplished.....	1560
Article VIII. Whether in a mirror the object is seen, or its image...	1562
Question VI. On Hearing	1563
Article I. Whether sound is the object of hearing.	1563
Article II. Whether sound is a motion or a quality distinct from it.	1564
Article III. On Echo.....	1566
Question VII. On Smell	1568
Article: Whether odor is a substance or a quality.....	1568
Question VIII. On Taste.....	1569
Article I. What taste is, and how many kinds of flavor there are. ...	1569
Question IX. On Touch	1571
Article I. Whether touch is one or multiple senses.....	1572
Article II. Where the sensory organ of touch is located.....	1573
Question X. On the Internal Senses	1574
Article I. How many internal senses there are.	1574
Article II. Whether the internal senses are active.	1577
Article III. In which part of the animal the internal senses are located.	1580
Article IV. Whether the internal senses engage in discursive reasoning.	1583
Question XI. On the Sensitive Appetite	1585
Article I. Whether the sensitive appetite is distinguished from the cognitive power.....	1585
Article II. Whether the concupiscible appetite is distinguished from the irascible.	1587
Article III. In which part the sensitive appetite resides.	1590
Book V. On the Rational Soul.	1591
Question I. On the Nature of the Rational Soul.....	1591
Article I. Whether the Rational Soul Is Created.	1591
Article II. Whether the Rational Soul Is an Informing or an Assisting Form.	1596
Article III. Whether the Rational Soul Is Immortal.....	1600

Article IV. What Aristotle Holds Concerning the Immortality of the Soul.	1607
Question II. On the Intellect of the Rational Soul.....	1611
Article I. Whether There Is an Agent Intellect and What It Is.	1611
Article II. What Is the Object of the Intellect of the Rational Soul.	1616
Article III. What the Mental Word Is.....	1621
Question III. On the Will.	1625
Article I. Whether the Will Is Distinguished from the Intellect.....	1626
Article II. Whether the Will Is Nobler than the Intellect.....	1627
Question IV. On Memory.	1633
Article I. Whether Sensitive Memory Exists and What It Is.....	1633
Article II. Whether Intellective Memory Exists and Whether It Is Distinguished from the Intellect.	1635
Question V. On the Motive Power of the Rational Soul.....	1639
Article I. Whether the Rational Soul Can Move Itself and the Body Which It Informs.....	1639
Article II. Whether the Motive Power Is Distinguished from the Other Faculties and Powers of the Soul.....	1640
Question VI. On the Separated Soul.....	1642
Article I. Whether the State of the Separated Soul Is Natural.	1642
Article II. What Belongs to the Separated Soul.	1645
Moral Philosophy of Brother Bonaventura Columbi, Conventual Minor, Professor of Sacred Theology	1652
Preface.....	1652
Book I: On the Prolegomena of Moral Philosophy	1653
Question I: On the Existence and Names of Moral Philosophy	1653
Article I: Whether Moral Philosophy Exists	1653
Article II: By What Names This Science Is Called	1654
Question II: On the Division and Nature of Moral Philosophy	1655
Article I: How Many Species Moral Philosophy Has.....	1655
Article II: Whether Moral Philosophy Is a Science.....	1658
Article III: Whether Moral Philosophy Is Practical	1659

Question III: On the Object of Moral Philosophy.....	1660
Article (Sole): What the Object of Moral Philosophy Is	1660
Book II: On the Good, the End, and the Happiness of Man	1663
Question I: On the Good.....	1663
Article I: Whether the Good Exists	1663
Article II: How Many Species of Good There Are.....	1665
Article III: What the Good Is	1666
Article IV: Whether the Exterior Act Adds Any Goodness to the Interior Act	1671
Question II: On Evil	1675
Article I: Whether Evil Exists	1675
Article II: How Many Species of Evil There Are.....	1677
Article III: What Evil Is.....	1678
Article IV: From What Evil Arises	1682
Article V: How Evil Proceeds from the Created Will as from a Good	1686
Question III: On the End	1690
Article I: How Many Species of End There Are	1690
Article II: Which of the Said Ends Is the Final Cause	1692
Article III: What Is the Constitutive Character of the End	1697
Article IV: What Is the Causality of the End.....	1702
Article V. Whether all actions of an agent are effects of the end.....	1711
Article VI. Whether means to the end are formally good.....	1720
ARTICLE VII. Whether there is an ultimate end in a qualified sense.	1725
ARTICLE VIII. Whether there is an ultimate end absolutely.	1727
ARTICLE IX. Whether the ultimate end concurs with particular ends in causing finally.	1730
QUESTION IV. On Beatitude.	1732
ARTICLE I. What beatitude is and how many kinds there are.	1732
ARTICLE II. On objective beatitude.	1734
DOUBT I. Whether beatitude consists in goods of fortune.	1735

DOUBT II. Whether beatitude consists in goods of the body.	1739
DOUBT III. Whether happiness consists in pleasure.....	1740
DOUBT IV. Whether happiness consists in goods of the soul, or in some other created thing.....	1742
ARTICLE III. On formal beatitude.....	1745
DOUBT I. Whether formal beatitude consists in operation.	1745
DOUBT II. Whether happiness resides in the essence or in the potencies of the soul.	1749
DOUBT III. Whether beatitude consists simultaneously in several operations.	1751
DOUBT IV. Whether beatitude resides in an act of the intellect or of the will.	1754
DOUBT V. In what act of the will does beatitude consist?	1759
DOUBT VI. Whether and how beatitude is perpetual.	1763
DOUBT VII. Whether beatitude renders the blessed person impeccable.....	1770
DOUBT VIII. Whether beatitude renders the blessed person secure.	1774
DOUBT IX. Whether joy is of the essence of beatitude.	1777
DOUBT X. Whether man is the lowest beatifiable being.	1780
ARTICLE IV. On the beatitude of the body.	1783
DOUBT I. On the beatific endowments in general.....	1783
DOUBT II. On impassibility.	1786
DOUBT III. On the agility of the body of the blessed person.	1794
DOUBT IV. On the clarity of the glorified body.....	1801
DOUBT V. On the subtlety of the body of the blessed person. ...	1804
Article V. On the beatitude of the whole human being.	1820
Doubt I. Whether all the senses of the blessed will have their acts.	1820
Doubt II. Whether the beatitude of all the blessed is equal.....	1822
Doubt III. Whether the punishment of the damned is equal.	1825
Doubt IV. Whether the elect will be more blessed after the day of judgment.....	1828

Doubt V. Whether the blessed see the punishments of the damned.	1831
Doubt IV. Whether the damned would prefer not to exist rather than to be tormented.....	1836
Doubt VII. What the aureole is, and how many kinds there are. .	1841
BOOK III. On the Principle and Acts of Human Beings.	1845
Question I. On the Principle of Human Acts.....	1845
Article I. What is the principle of human acts.	1846
Article II. Whether there is free will.	1848
Article III. In what freedom is situated.	1852
Article IV. Whether the will is only passive, or also active.....	1857
Article V. Whether the intellect moves the will.	1864
Article VI. Whether the will moves the other powers to act.....	1865
Question II. On Human Acts.....	1868
Article I. Whether the first act of the will is free.....	1868
Article II. Whether the act of the will is formally free.	1869
Article III. Whether there are indifferent acts.....	1871
Article IV. Whether command is an act of the will.....	1876
Book IV. On the Passions.	1879
Question I. On the Passions in General.	1879
Article I. What a Passion Is.....	1879
Article II. How Many Kinds of Passion There Are.	1881
Article III. Whether the Passions Are Acts.	1884
Article IV. In What Subject the Passions Reside.....	1887
Article V. Whether Passions Fall Upon the Wise Man.....	1889
Article VI. What Are the Causes of the Proneness to Passions.	1891
Article VII. What Is the Order Among the Passions.	1892
Article VIII. What Are the Appropriate Remedies for Restraining the Passions.	1895
Question II. On the Passions in Particular.....	1897
Article I. On Love and Hatred.....	1897
Article II. On Desire and Aversion.	1901

Article III. On Joy and Sorrow.....	1903
Article V. On Hope and Despair.....	1908
Article V. On Boldness and Fear.	1911
Article VI. On Anger and Meekness.....	1913
Book V. On Habits.	1915
Question I. On Habits Taken Universally.	1916
Article I. Whether Habit Exists.	1916
Article II. How Many Kinds of Habit There Are.....	1917
Article III. What Habit Is.	1921
Article IV. Whether the Intellect Is the Subject of Habits.....	1922
Article V. Whether Habits Reside in the Will.	1926
Article VI. Whether Habits Inhere in the Sensitive Appetite.	1928
Article VII. Whether Habit Resides in the Body and Its Members.	1930
Article VIII. Whether Habit Resides in Brutes.....	1931
Question II. On the Efficiency of Habit.....	1934
Article I. Whether Habit Is an Effective Principle of Acts.....	1934
Article II. Whether a Habit Is the Active Principle of the Moral Character of an Act.....	1939
Article III. Whether a Habit Concurs Efficiently toward the Substance of an Act	1941
Article IV. Toward Which Acts Does a Habit Exercise Influence	1944
Article V. How Acts Concur toward the Generation of a Habit	1946
Article VI. Whether One Act Can Cause a Habit	1948
Article VII. Whether an Act Is More Perfect Than a Habit	1951
Article VIII. How a Habit Is Perfected Through Acts	1952
Article IX. Whether a Habit Coalesced from Several Degrees Is One	1955
Article X. Whether and How a Habit Is Corrupted.....	1956
Article XI. Whether a Supernatural Habit Is Intensified Through Acts	1959
Article XII. Whether an Infused Habit Can Produce an Acquired Habit	1961

Question III. On the Habits of the Intellect	1963
Article I. On the Habit of Understanding.....	1963
Disputation I. Whether the Habit of Understanding Is Distinguished from the Intellective Power	1963
Disputation II. What the Habit of Understanding Is	1966
Disputation III. Whether the Habit of Principles Is Instilled by Nature	1967
Article II. On Wisdom	1972
Disputation I. What Wisdom Is.....	1972
Disputation II. Whether Wisdom Is Nobler and More Certain Than the Habit of Understanding	1974
Disputation III. How Wisdom Differs from Science	1976
Article III. On Prudence	1978
Disputation I. What Prudence Is.....	1978
Disputation II. Whether There Is One Prudence for All Things That Can Be Done	1980
Disputation III. Whether Prudence Concerns Means and Ends .	1982
Disputation IV. Whether Prudence Can Exist Without Moral Virtue	1985
Question IV. On the Habits of the Will	1987
Article I. On Habits or Moral Virtues in General	1987
Disputation I. What Moral Virtue Is	1987
Disputation II. Whether Goodness Is of the Intrinsic Nature of Moral Virtue	1989
Disputation III. Whether Moral Virtue Consists in a Mean.....	1992
Disputation IV. Whether the Moral Virtues Are Connected with One Another	1993
Disputation V. Whether the Moral Virtues Are Connected with the Theological Virtues	1996
Disputation VI. In What Subject the Moral Virtues Are Seated...	1998
Disputation VII. Whether There Are Moral Virtues in Angels.....	2001
Disputation VIII. Whether There Are Virtues Other Than the Theological and the Moral	2003

Article II. On Fortitude	2005
Disputation I. What Fortitude Is	2005
Disputation II. How Many Kinds of Fortitude There Are	2007
Article III. On Temperance.....	2009
Disputation I. What Temperance Is	2009
Disputation II. How Many Kinds of Temperance There Are	2011
Article IV. On Justice.....	2014
Disputation I. What Justice Is	2014
Disputation II. How Many Kinds of Justice There Are.....	2015
Transnatural Philosophy, or Metaphysics	2020
Preface.....	2020
Book I.....	2021
On the Prolegomena to Metaphysics	2021
Question I.....	2021
On the Nature and Character of Metaphysics	2021
Article I: Whether Metaphysics Is a Science.....	2021
Article II: Whether Metaphysics Is a Speculative Science	2022
Question II	2023
On the Object of Metaphysics	2023
Article I: What Is the Adequate Object of Metaphysics	2024
Article II: Whether Metaphysics Contemplates All the Quiddities of Things.....	2035
Book II	2043
On Being	2043
Question I.....	2043
On the Concept of Being	2043
Article I: Whether There Is One Common Concept for Real Being and Being of Reason	2043
Article II: Whether There Is One Concept of Being Prescribed from Its Inferiors.....	2047
Article III: Whether the Concept of Being Prescinded from Its Inferiors Is Real and Distinct from Them	2051

Article IV: Whether the Concept of Being Is Univocal.....	2060
Article V: Whether Being Is Predicated in Quid of All Things	2064
Question II.....	2073
On the Properties of Being.....	2073
Article I: Whether the Properties of Being Are Real	2073
Article II. How the Properties of Being Are Distinguished.....	2075
Article III. How Many Properties of Being There Are	2078
Article IV. What One Adds Above Being	2081
Article V. On the True.....	2086
Article VI. On the Good	2091
Question III. On the Divisions of Being	2096
Article I. What Is the Primary Division of Being	2096
Article II. How Being Is Divided into the Ten Predicaments.....	2099
Article III. What Is the Principle of Individuation.....	2101
Question IV. On Essence and Existence.....	2109
Article I. Whether the Essences of Things Are from Eternity	2109
Article II. Whether Essence and Existence Are Distinguished from Each Other	2115
Question V. On Substance and Subsistence	2118
Article I. Whether Substance Is Prior in Time to Accident	2118
Article II. Whether Substance Precedes Accident in Definition.....	2119
Article III. Whether Substance Is Prior to Accident in Cognition ..	2120
Article IV. On Subsistence	2121
Question VI. On Accident	2138
Article I. What the Essence of Accident Is.....	2138
Article II. Whether Several Accidents Differing Only Numerically Can Exist Simultaneously in the Same Subject	2141
Book III. On Angels	2149
Question: On the Nature of Angels (Single Question).....	2149
Article I. Whether Angels Exist and What an Angel Is.....	2149
Article II. Whether Angels Are Incorporeal.....	2151
Article III. Whether Angels Are Composite	2155

Article IV. Whether Angels Are Immortal and Incorruptible 2157

Book IV. On God..... 2159

Question: On the Nature of God (Single Question)..... 2159

Article I. Whether God Can Be Known by Us 2160

Article II. Whether It Can Be Demonstrated That God Exists 2162

Article III. Whether There Is One God.....2167

Article IV. Whether It Is Demonstrated That God Is Infinite..... 2170

Book V. On the Being of Reason..... 2174

Question I. On the Nature of the Being of Reason 2175

Article I. Whether There Is a Being of Reason 2175

Article II. What the Being of Reason Is.....2178

Article III. Whether Extrinsic Denominations Are Beings of Reason
..... 2182

Article IV. Whether Negations and Privations Are Beings of Reason
..... 2188

Article V. Of How Many Kinds the Being of Reason Is 2190

Article VI. Whether the Being of Reason Has Proper Attributes ... 2193

Question II. On the Cause of the Being of Reason 2196

Article I. Whether the Being of Reason Has a Cause of Its Being... 2196

Article II. What Are the Efficient Causes of the Being of Reason ... 2198

Article III. By What Act of the Intellect the Being of Reason Is Made
.....2204

Article IV. Whether God Can Make the Being of Reason 2207
