Objection I against the first assertion. The celestial orbs have the same motion, figure, and other attributes of this kind that are seen and established by us; therefore they are of the same species. I grant the antecedent and deny the consequent. The reason is that motion, figure, and other such attributes are common accidents, from which the specific distinction of things is not derived. Or I distinguish the antecedent: concerning the diurnal motion by which all the spheres are revolved and swept along, I grant it; concerning the other motion by which each heaven is individually set in motion, I deny it, as I made plain in the preceding article, in which the proper and individual motions of the celestial bodies were observed and transmitted.

Objection II. Aristotle (1 *Caeli*, c. 2) writes that besides the four elements there is a fifth simple substance, which, as I noted above, is commonly called the fifth essence of the Peripatetics; if therefore, according to Aristotle, only one

substance is posited, it is plainly inferred that the celestial orbs are of the same species. I respond that the philosopher indeed admits a fifth body distinct from the elements, but does not decide whether it is one in genus or in species. We, however, supported by the foregoing foundations and arguments together with the aforementioned authors, establish that it is one in genus but multiple in species.

Objection III against the second assertion. Stars, whether wandering or fixed, possess light; but the remaining parts of the celestial bodies lack light; therefore between the stars and the orbs in which they inhere there is a specific distinction. Confirmation: stars possess certain powers that their orbs lack — as the Moon dominates in moist things, and to it are attributed the ebb and flow of the sea, but not to its orb in which it is found. Likewise Mercury inclines man to literature, but not so its orb. Similarly, the lesser bear attracts the magnet, which the remaining stars of the firmament do not do; therefore a specific difference falls upon them. I grant the antecedent and deny the consequent. For only an accidental difference is inferred, since light is a common accident. The reason why the stars shine but the remaining parts of the heavens do not is that the former are the dense parts, which receive light into themselves, while the latter are the rare parts, which cannot retain light within themselves. To the confirmation I say that from these things only an accidental difference is derived, as is clear from men, of whom some have the power of healing the sick and others do not; some are inclined to learning and others are not — yet all are of the same specific nature. One may add that the orbs to which the stars are affixed enjoy the same powers and possess the same influences as the stars themselves, though those of the stars are greater and more efficacious — just as heat existing in the pores of iron heats and burns more than heat existing in tow, because the former is dense while the latter is rare.

Article X: Whether Eccentric Circles and Epicycles Are to Be Admitted in the Motions of the Planets

Averroes (*2 Caeli, com. 3*) and Aristotle (*2 Caeli, T. 45, & 2, T. 46*), together with Bonaventure (*2, d. 14, a. 1, q. 2*) and Richard (*ibid., a. 3, q. 2*), deny them. But Scotus (*eadem d. & q., §. De secundo*), Durand (*ibid., q. 1*), Tartaretus (*2 Caeli, q. 1, dub. 1*), and Joannes de Magistris (*q. 3, dub. 3*) affirm them, and Ptolemy and the other astronomers preceded them in admitting both eccentric circles and epicycles.

Note first that a circle is divided into concentric and eccentric. A circle is called concentric whose center is the same as the center of the world. An eccentric circle is one whose center is different from the center of the world; and this is of three kinds: one with respect to its convex surface, which is simply called eccentric; another with respect to its concave surface, called eccentric in a qualified sense; and a third with respect to both surfaces, called the deferent circle, in which the body of the Planet is moved and carried along in its motion.

The part of this circle most distant from the center of the world is called the apogee, that is, the elevation; the part least distant from the said center and opposite to the former is called the perigee, that is, the depression; and the intermediate parts are called the stations.

Note second that the epicycle is a small sphere contained within the thickness of the simple eccentric and existing above the circumference of the deferent circle. In the epicycle, astronomers describe four points and draw two lines proceeding from the center of the world enclosing that circle, one directed toward the east, another toward the west. The point touching the eastern line is called the first station, and the point touching the western line is called the second station. A Planet existing at either of those two points is called stationary. The arc between them is called the direct arc, and a Planet existing in it is called direct; the lower arc is called the retrograde arc, and the Planet in it is called retrograde.

Assertion I. Eccentric circles are to be admitted. This is defended by the Doctor (*loco pract.*). It is urged by experience: it has been established that a given Planet traverses one sign more quickly than another, even though both signs are of equal magnitude and the Planet moves uniformly. Therefore eccentric circles are to be posited. The antecedent is clear from the sun traversing the sign of Pisces more quickly than that of Leo. Moreover, some Planet at times approaches closer to the earth and at times recedes further from it, given equal clearness of the air — as astronomers have established with certain and suitable instruments — and this is evident in the sun, which is sometimes seen truly larger and sometimes smaller by us because it is sometimes nearer and sometimes further from the earth; and one eclipse in the same sign lasts longer than another, for no other reason than that the aforesaid circles exist.

Assertion II. Epicycles are also to be admitted. Scotus does not object to this (*ubi supra, & dist. 43, q. 3, §. Hic sciendum, sub B.*). It is proved: astronomers have observed that one and the same Planet traverses one and the same sign more quickly at one time than at another, which does not happen unless in the deferent there is an epicycle in which that Planet is moved independently of the motion of the deferent; and such a motion is the motion of the epicycle. Therefore epicycle circles are to be admitted. Mayronis (2, *dist. 14, q. 2*) deals with further matters.

Objection I. Aristotle (*cited at the beginning of this article*) denies the aforesaid circles; therefore such circles are neither to be handed down nor received. The antecedent being granted, the consequent is denied. For in this matter the astronomers are to be followed as experts in their art, as Mayronis (*loc. alleg.*) indicates. I add with Scotus (*in exp. 12 Met., Tit. 44*) that Aristotle was not very skilled in astronomy. Therefore it is not surprising if he did not admit the said circles; and likewise he posited only eight heavens, whereas astronomers teach there are more than eight, as I wrote above in article VIII of this question.

Objection II. If eccentric circles were admitted, there would be diverse centers in the world; for heavy things would have two places toward which they would naturally tend, and there would be more than ten mobile heavens. The consequent is denied: for the earth is the center of the world, toward which heavy things are borne by their very nature, and each heaven possesses its own center distinct from that of another; and so there would not be more total heavens beyond those enumerated, although many more partial ones exist.

Objection III. If Planets were moved in an epicycle, they would describe a circle other than that made by the orb to which they are assigned, and would be moved outside that orb itself, and would thus be moved by themselves, after the manner of animals. The consequent is denied. For such a circle is produced in a partial heaven, not in a total one, as the argument supposes.

Objection IV. The Moon is not moved by the motion of an epicycle, as all concede regarding the Sun; therefore the same must be asserted of the other Planets. The antecedent is shown by the image that is seen in the moon itself, which the common people think to be the figure of a man carrying a weight on his back, which always appears in the same way — but it would appear differently if it were set in motion by an epicycle, for sometimes its face would be seen upward and sometimes downward, and in a diverse and opposite manner. Richard (*loc. cit.*, in the beginning of this article) and the Parisians (2 *Caeli*, in fine, q. 2, fol. 116) respond that the Moon is moved about its own center only to the same extent that it is moved about the center of the epicycle, and because the motion of the one is opposite to the motion of the other, for that reason the aforesaid image in the Moon always maintains itself in the same manner and remains in the same position and appearance.

You ask first whether in the heaven there exist the six positional differences — namely right, left, up, down, before, and behind. Aristotle (2 *Caeli*, Tit. 13) responds affirmatively, and the Seraphic Doctor (2, *dist.* 14, art. 1, q. 2) and the Subtle Doctor (*ibid.*, d. 2, q. 6, §. *Alij autem A.*) understand this not properly but by way of analogy: for "right" properly belongs to an animal, in whose part the chief power of moving and acting resides; in the heaven, however, since it is devoid of soul, "right" is attributed improperly — thus the east, where motion begins, is called its right; the west its left; the Antarctic Pole its up; the Arctic Pole its down; its front is the part that receives motion; and its back the part opposite to this.

You ask second whether the heavens are colored. I respond negatively, which is derived from Scotus (2, d. 25, q. un., sub G., & 4, d. 49, q. 15, §. *Respondeo*, sub A.). The reason is that color is caused by a mixture of the primary qualities, which, since none are found in the heaven, it is aptly inferred that there is no color in it. The blue color that is itself seen in the heaven is not a true color but only an apparent one, just like that which is seen in the sea. The reason is that where there is no true color, its terminus is seen to be blue.

You ask secondly whether the heaven is heavy or light. The Doctor (*4, d. 49, q. 16, §. Alij dicunt, ante E.*) responds negatively. The reason is that where there are no primary qualities there are no secondary ones either, such as heaviness and lightness; but it was established above that there are no primary qualities in the heaven, and therefore no secondary ones either.

You ask fourth whether the heavens are contiguous. The Seraphic Doctor (*nuper cit.*) and Lyra (*in 1 Gen.*) respond affirmatively. For the universe is so ordered and disposed that its bodies are contiguous and each is proximate and immediate to another, so that no vacuum occurs between them. Hence astronomers add that the heavens are contiguous in much the same manner as the layers and parts of a single onion.

You ask fifth whether the wandering and fixed stars receive their light from the sun. Augustine (*2 de genesi ad lit., cap. 16, & in Psal. 10*) responds affirmatively, following Paul (*1 Cor. 15*) and Aristotle (*1 Caeli, T. 100*), and this is verified especially in the waxing and waning of the Moon and in its eclipse. For that reason the sun has been placed in the middle of the celestial orbs so that it may be able to pour forth and communicate its light to all the stars, just as the heart holds its seat in the middle of an animal's body so as to give life to all its parts and members — although the stars participate in some light of their own not borrowed from the sun, as is clearly seen in the said eclipse of the Moon.

Question II: On the Motion of the Heaven

Article I: Whether All the Heavens Are Moved

There existed the opinion of certain ancient philosophers — whose names are reported by the Coimbrans (*2 Caeli, cap. 5, q. 4, art. 1*) — who held that only the earth is moved while the celestial orbs are fixed and immovable. This opinion seems to me foolish, false, and erroneous, inasmuch as it conflicts with the senses and experience, and does not conflict with sacred scripture, which affirms that the earth stands forever and is immovable — as will be shown in the following book. All later philosophers and scholastics establish this (*2, d. 14*). They do doubt, however, whether the lower orbs are moved by the motion of the primum mobile, and whether they are also set in motion by their own proper motion distinct from the motion of the primum mobile. This difficulty will be decided by the two following assertions.

Assertion I. The lower celestial spheres are moved by the motion of the primum mobile. This is defended by the Doctor (*in utroque opere, 2, d. 14, q. 2*). It is urged first by experience: the wandering and fixed stars are seen by us to rise above our horizon, then to set, and afterwards to return to their rising, and again to be swept about to the west in the space of twenty-four hours; but this motion proceeds from the primum mobile, and for that reason it is called the diurnal motion and the motion of rapture, since it draws the other lower celestial

spheres along with it. Second, from (*10 Met., T. 22*): in every genus there is one thing that is the measure and standard of the rest; therefore in the genus of motion the motion of the primum mobile is to be admitted, in relation to which the motions of the remaining celestial orbs are moved, measured, and regulated. Third, things that are proximate and immediate to something are, if that thing is moved, necessarily set in motion themselves — as may be observed in many cases; but the lower celestial orbs are mutually proximate and immediate, after the manner of the parts of a single onion, as I established in the preceding question, article last, query third; therefore, with the primum mobile moved, the remaining lower orbs are necessarily moved as well.

Assertion II. The lower celestial orbs are agitated by their own proper motion from west to east. This is held by the Doctor (*ubi supra*) together with the common judgment of astronomers, and is indicated by Damascene (*2 fidei, 6*). It is proved first: the Planets do not always maintain the same proximity or distance among themselves, as we observe every day with the eye; but this cannot arise from anywhere other than the proper motion that the lower orbs possess distinct from the motion of the primum mobile, otherwise they would be moved in the same way and would equally maintain their distance and proximity. Second, each orb completes and accomplishes its particular course in a diverse manner and time — the sun in one year, Mars in two years, and the Moon each month, as I observed in the preceding question, article VIII. But this diversity proceeds from the diversity of motion of each celestial body; therefore the aforesaid bodies enjoy their own proper motion. Third, diversity of effects points to diversity of motions; but each of the aforesaid orbs obtains its proper effect, as I noted in the passage just cited, article IX; therefore each is agitated by its own proper motion. Mayronis (*2, d. 14, q. 1*) deals with further matters.

Objection I. What is moved by its own proper motion and by the motion of another must have both motions impeded and retarded; but the motion of the primum mobile cannot be retarded and impeded by the proper motions of the other orbs, since it is stronger and more vigorous than they; therefore the other orbs are not driven around by the primum mobile along with their own proper motions. Isidore (*3 Etymol., cap. 34*) meets this by conceding that the motion of the primum mobile is in some way retarded by the proper motions of the other orbs. The astronomers respond that the motion of the primum mobile is modified by the motions of the lower orbs in much the same way as we modify the motion and impulse of a body carried upward or downward.

Objection II. What is moved in a contrary direction is resisted and its power impeded; but the lower orbs are moved in a contrary direction by the motion of the primum mobile — namely from east to west — therefore their motion is opposed to it, since it is from west to east. I respond that the major holds for what is moved by a natural or violent motion, but not for what is set in motion

by a neutral and indifferent motion, which is the manner in which the Heavens revolve.

Objection III. The same thing cannot be simultaneously moved by contrary motions; but if the lower orbs were agitated by their own proper motions, they would be moved by contrary motions — that is, from east to west and conversely; therefore they are revolved only by the motion of the primum mobile. I distinguish the major: if that motion is from one point ascending and from the same point descending, I grant that it is a contrary motion and that one and the same thing cannot simultaneously be moved by contrary motions; but if the matter is otherwise, as in our case, I deny that it is a contrary motion. This can be explained by the analogy of an ant moving on a wheel by its own proper motion, and likewise of a sailor who, walking about the ship, is moved by his own proper motion distinct from the motion of the ship.

Article II: Whether the Heavens Are Moved by Angels

Two principal opinions of philosophers and theologians shine forth here. One is that of Mayronis (2, *Cal.*, Saxony (*S. Phys.*, q. ult.), Racon (q. 3 de motu caeli, art. 1), and others, to whom Avicenna (9 *Metaphys.*, cap. 1) and Aurora (2, dist. 14, art. 2) seem to give support, who hold that the heavens are moved by their own forms intrinsic to them. The other is the common teaching of Scotus (2, d. 14, q. 1), Antonius Andreas (*ibid.*), Bonaventure (art. 3, q. 2), and the rest, who teach that the heavens are moved by intelligences assigned to them by God.

Assertion I. The heavens are not moved by their own proper form. This is held by the Doctor (*cit.*). It is proved first: the motion proceeding from the heaven's own proper form would be either violent or natural; but neither is possible; therefore the heavens are not moved by their own proper form. The major is clear. The minor is readily apparent: not violent, because nothing violent is durable (1 *Caeli*, 15), and yet according to Aristotle the motion of the heavens is to last eternally; nor natural, otherwise rest would be violent for them, and thus after the day of judgment the heavens would rest violently. Second, every inanimate thing — such as the heaven is, as was said in the preceding question, article IV — is not moved locally by something intrinsic in its own place, as is evident in the case of water, air, and the rest, which are not agitated except from without; but the heaven is in its own proper place; therefore it is not moved by its own form.

Assertion II. The heavens are revolved by intelligences. This is transmitted by Scotus (*ubi supra*, § 4, dist. 48, q. 2, §. *Ad quaest.*, § 2, dist. 2, q. 6, paulò ante A.). Job IX: *sub quo curvatur, qui portant orbem* — "Under whom they bow who carry the orb" — that is, the Angels, as Lyra interprets. Since therefore the carriers of the orb are Angels, it is plainly inferred that they move the heavens. Second, from Aristotle (8 *Phys.*, T. 52, § 12 *Met.*, T. 43), who enumerates as many motive intelligences of the celestial orbs as there are mobile orbs. Augustine (3 *Trin.*, cap.

4) and Gregory (4 *Dialog.*, cap. 4) subscribe to this. Third, what is not moved from within must necessarily be moved from without, since the principle of motion is either intrinsic or extrinsic; but celestial bodies are not set in motion from within, as was shown in the preceding assertion; therefore they are revolved from without, namely by Angels constituted for them by God.

Objection I. If the heaven were not moved from within, its form would be idle, because being is for the sake of acting (2 *Caeli*, T. 17, & 9 *Metaphys.*, 15, 16). Therefore, if its form were not a principle of moving, it would be useless and superfluous. I respond by conceding that that form is not the efficient principle of local motion, yet it is nonetheless the cause of other effects that are produced in this universe; and therefore it is not in vain — especially since it is the intrinsic cause of the heaven itself, which is constituted of matter and form.

Objection II. God immediately moves the heavens; therefore Angels have not been constituted by God to revolve them. The antecedent is urged from Job XXXIV: *Quem constituit alium super terram, aut quem posuit super orbem, quem fabricatus est?* — "Whom has he set over the earth, or whom has he placed over the orb which he made?" — where Gregory and Lyra add that God immediately rules and governs all things, and so great is his power that it extends immediately to all things. I grant the antecedent and deny the consequent; to its proof I say that this is to be taken of internal direction, not of external execution. For God wills to operate through secondary causes, as I showed in the book on causes, article IV, q. III.

Objection III. To every passive power there corresponds an active power, from Aristotle (*passu memorato*); but the heaven possesses a passive power with respect to motion; therefore also an active power with respect to that same motion. I respond with Scotus (q. 1 *prol.*, ma.) that the major is to be glossed through this distinction: in itself, or in the entire coordination of being — in which sense the passive power of the organized human body corresponds to the active power of God infusing a rational soul into it when duly disposed and rightly organized. Likewise, the passive power of the heaven corresponds to the active power of the Angel for revolving it.

Objection IV. One Angel suffices to move all the heavens, since nothing resists him; therefore Angels are needlessly multiplied in proportion to the multiplication of mobile heavens. I deny the antecedent. For although no resistance from a contrary quality intervenes, there is nonetheless a resistance on the part of the magnitudes of the heavens. For they are so great and vast that one Angel could by no means move them all — just as one Angel cannot simultaneously exist in several total and adequate places; the reason being that an Angel is a finite and limited substance, and on account of this is determined to a certain place.

You ask first whether an Angel becomes fatigued in moving the heaven. I respond negatively. The reason is that fatigue is a diminution of the animal spirits, which can be replenished by rest. But an Angel is immune from weariness, because, not being an animal, he lacks animal spirits; and for the same reason the heaven itself cannot be fatigued. Scotus adds (*in Report.*, 4, *dist.* 45, q. 14, §. *Dico, ut prim.*) that fatigue never occurs unless the patient overcomes the agent in some respect, even if it is overcome absolutely; but there, there is no suffering in return, and therefore no fatigue.

You ask second through what power an Angel moves the heaven. I respond that an Angel moves not through the will, as was established at the University of Paris, but through an executive power distinct from his intellect and will.

Article III: Whether the Motion of the Heaven is Natural

The prior opinion is attributed to Bonaventure (2, *dist.* 14, q. 3, *contra Gentes*, cap. 23) and others who hold that the motion of the heaven is natural. The Coimbrans (1 *Caeli*, cap. 2, q. 3, art. 2), Aegidius (2, *dist.* 14), and Argentinas (*ibid.*, q. un., art. 1) subscribe to this. The posterior position is held by the Doctor (2, *dist.* 2, q. 6, O., & 4, *dist.* 48, q. 2, E.), Richard (2, d. 14, q. 6), Durand (q. 2), Hurtado (*in praesenti*, disp., sect. 4), Arriaga (sect. 5), and Avicenna (9 *Met.*, c. 2), who establish that the motion of the heaven is neutral and indifferent.

Note that a body is moved naturally toward the place in which it naturally rests, and conversely is moved violently toward the place in which it rests violently. Natural motion, as distinguished from violent motion, requires two conditions conjunctively: first, that the principle be intrinsic — that is, the passive principle; second, that the mobile naturally incline toward such a motion. In the absence of either or both of these, the motion is called neutral and indifferent. Thus, when it is said that a motion is not natural, this can be taken either with respect to the principle or with respect to the terminus, but most properly with respect to the terminus toward which it tends.

Assertion. The motion of the heaven is neither natural nor violent but neutral and indifferent. So Scotus (*cit.*), whom the Parisians (1 *Caeli*, fol. 111), Joannes de Magistris (*ibid.*, q. 1, dub. 3), and Tartaretus (*Scibili primo*) follow. It is proved first: every motion is either natural, or violent, or neutral; but the motion of the heaven is not natural, otherwise the heaven would sometimes naturally rest, for upon attaining its terminus natural motion ceases — as is evident in the case of a stone seeking its center, in which it rests — yet the heaven never rests but always revolves; therefore its motion is not natural. Nor is it violent, since nothing violent is durable (1 *Caeli*, 15), yet the motion of the heavens is eternal, both from the side of the past and from the side of the future, according to Aristotle; therefore it is not violent, and consequently it is neutral and indifferent. Second, if the motion of the heaven were not neutral, it would be simultaneously natural and violent; but the same motion cannot be

simultaneously natural and violent; therefore it is neutral. The major consequent is shown: for it would be natural inasmuch as it tends by its own nature toward its terminus, and it would be violent inasmuch as it recedes from that terminus — as is clear in all circular motion, such as the motion of the heaven. Third, natural motion is directed toward some advantage of the mobile body, as is evident in the case of heavy and light things seeking their places, in which they are perfected and preserved in their being — in accordance with the well-known saying that place is the preserver of the thing placed. But the heaven receives no advantage or perfection from its motion, since it always remains in the same condition; and the empyrean heaven, which is the noblest, does not move but is at rest. Moreover, if it were perfected in motion, it is not clear why it would be more perfected by motion from east to west than by motion from west to east.

One might say with Gabriel (*2, d. 14, q. un., art. 3, dub. 2*) that, although the heaven receives no proper perfection of its own from its motion, nonetheless the universe does, since through it the perennial generations, varieties, and vicissitudes of things come to pass. On the contrary: the present dispute is not about the advantage that the things of the world participate in through the motion of the heaven, but about the proper advantage that Gabriel attributes to the heaven itself — which is in truth none at all. Likewise, the question is not whether the motion of the things of the universe is natural, but whether the motion of the heaven itself is natural; to answer that it is natural by reason of the things of the universe is to go outside the question — just as to say, when water rises upward lest a vacuum be produced, that this motion is natural by reason of the natural connection of things; yet it is, as Scotus notes in a similar difficulty (*4, dist. 49, q. 14*), absolutely and simply a violent motion.

Again, the motion of fire in a sphere is not violent, because through it no place is required in which it would rest violently, as is evident in its own sphere in which it moves in a circular manner; nor is it natural, because it is borne naturally only upward. Therefore it is neutral. And the same must be asserted of the motion of the heaven. Furthermore, a surface is in a neutral potency to receive whiteness or blackness; therefore the heaven likewise is neutral with respect to motion from east or west, and conversely. Finally, in Ethics there are indifferent acts, as I showed at length in Moral Philosophy (*1, 3, q. 2, art. 3*); likewise in Physics a neutral motion is to be admitted, such as is the motion of the heaven.

Objection I. Aristotle (*1 Caeli, 5*) shows that the heaven has a natural motion, because it is a natural body. He intimates the same (*3 eiusdem operis, 1, & 8 Met., 1 & 2*). Confirmation: (*2 Phys., 78*): *unumquodque ut agitur, sic aptum natura est, & ut aptum natura est, sic agitur* — "Each thing as it is moved, so it is by nature suited; and as it is suited by nature, so it is moved." Since therefore the heaven is revolved in a circle, it follows that its motion is natural. I respond that all those passages are to be expounded concerning naturalness with respect to the

principle of the mobile body, not with respect to the terminus toward which — from which terminus naturalness of motion is chiefly derived, as I observed in the preceding note. To the confirmation I say that the philosopher is speaking of the end naturally intended by the agent. Or I say that the motion is called natural insofar as it does not proceed from a supernatural agent but from an Angel, who is a natural, created, and finite agent. Or, as regards the natural influences that it causes in these lower and sublunary things.

Objection II. From Ethics III, 1: the violent is that whose principle is external; but the principle of the motion of the heaven is external, inasmuch as it is moved by the Angel assisting it, as I proved above in article II of this question; therefore the motion of the heaven is violent. I respond that in the major the other qualifications that Aristotle there adds are to be placed — that he confers force, that is violence, upon the patient — namely when the mobile suffers violence through that motion. But the Angel, although he is the extrinsic cause of the heaven's motion, nonetheless imposes no force upon the heaven itself, nor does the heaven have any propensity toward that motion. For this reason, such a motion is neither natural nor violent but neutral.

Objection III. The heaven is not in a worse condition than a sublunary body; but a sublunary body is moved by a natural motion; therefore so too is the celestial body. I respond that the heaven is of such a nature that it is capable of being moved in a circular manner. But circular motion appears to be nobler than other motions, just as a circular and round figure excels other figures. Therefore, although the heaven is not agitated by a natural motion, it does not follow from this that it is worse and inferior to other bodies.

Article IV: Whether the Motion of the Heaven is Regular and Uniform

Note that the regularity of motion is to be derived from equal time, so that that which is moved in equal time is moved regularly; and conversely, that which is moved in unequal time is moved irregularly. The uniformity of motion, however, is derived from the motion of the parts of the mobile body: for that is moved uniformly whose parts are moved equally quickly or equally slowly; and conversely, that is moved difformly of which one part is moved more quickly or more slowly than another.

Assertion. The motion of the heaven is regular and uniform. So Aristotle (2 *Caeli*, 35) and all astronomers, and Scotus indicates it (2, d. 14, q. 3, *ante* §. *dico ad q.*, & 4, d. 48, q. 2, §. *In ista q. C.*, & d. 49, q. 13, *ante* §. *Ad rationes. G.*, & *in Rep.* 4, d. 43, q. 4). It is proved first by experience: for the diurnal motion of the primum mobile is always accomplished in the space of twenty-four hours. Likewise the sun completes its course in a year and the moon in approximately a month. Second, astronomers predict lunar and solar eclipses correctly — not only with respect to the day but even with respect to the hour and minute in which they

occur. Likewise many other things are foretold that are certain and infallible; but all these things cannot be predicted with certainty and infallibility unless the motion of the heaven were regular and uniform, as is self-evident.

Objection I. Not all the heavens traverse equal space, since the larger traverse more and the smaller less; therefore their motion is neither regular nor uniform. I respond that the aforesaid regularity of motion is to be derived principally from the motion of the primum mobile and subsequently from the proper motion of each orb, not from an alien motion and with respect to others, as is clear from what was asserted above.

Objection II. In the motion of the heaven there occur eclipses of the sun and moon; but such failures point to irregularity and difformity of motion; therefore the motion of the heaven is neither regular nor uniform. I grant the major and deny the minor. The reason is that such eclipses arise from the primordial constitution of the celestial bodies and serve for the adornment and perfection of the universe, as is evident in the case of night, day, light, darkness, and other opposites — in accordance with the saying: opposites placed side by side shine more brightly.

Objection III. Sometimes the sun stood still, as in Joshua X; at other times the same sun went back ten degrees, as in Isaiah XXXVIII; and at one point, at midday, the same sun was darkened, as in Luke XXIII. Therefore the motion of the heaven is neither regular nor uniform. I respond that all these events were miraculous and preternatural, of which we are not speaking in the present context. Hence at the time of the Lord's passion, a certain person who observed the sun darkened at the full moon and at midday exclaimed: "Either God in nature suffers, or the entire fabric of the world will be dissolved."

Question III: On the Influence of the Heaven

Article I: Whether the Heaven Exerts Influence upon These Lower Things

Setting aside certain errors that Mayronis (2, *dist.* 14, q. 4) recites and refutes, and which the Coimbrans (2 *Caeli, cap.* 3, q. 1, art. 2) and Ruuius (*ibidem, tract.* 1, q. 1) mention, following Thomas (2, *d.* 15, q. 1, art. 2).

Assertion I. The heaven and the stars exert influence upon this lower world. This is the common opinion of Scotus (2, *dist.* 14, q. 3), Mayronis (*ibid.*, q. 5), Richard (art. 3, q. 5), Bonaventure (q. 2, art. ult.), Tartaretus (1 *Meteor.*, q. 1, scibili 3), Joannes de Magistris (*ibidem*, q. 2), and other philosophers and theologians. It is proved first from Aristotle (1 *Meteor.*, c. 2): *Oportet Mundum hunc inferiorem subiectum esse superioribus lationibus, ut inde vis eius universa regatur* — "This lower world must be subject to the superior motions, so that the whole of its power may be governed from there." And (1 *de gener.*, 15, & 12 *Met.*, 33, 34). Augustine (3 *Trin.*, c. 4) gives his assent: "The coarser and lower bodies are governed in a

certain order by the subtler and more powerful ones." And (5 *de civit.*), Boethius (4 *de consol.*), Dionysius (*de divinis nominibus*, cap. 4), and Basil (6 *Hexam.*, 2) — by the motion of the sun the fourfold division of the year is produced, as Augustine (*in praefatione Psal. 150*) and Lyra (*in c. 1 Gen.*) observe above all others. For it is divided into two equinoxes — vernal and autumnal — and two solstices — estival and wintry. Moreover, the sun passing through the oblique circle of the zodiac is the cause of the generation and corruption of things. Its approach to us is the cause of the rising of things, and its recession is the cause of their perishing. And (2 *Phys.*, 26): *sol & homo generant hominem* — "the sun and man generate man." Furthermore (1 *Caeli*, 32): *Deus & natura nihil agunt frustra* — "God and nature do nothing in vain"; but God created the heaven, the planets, and the remaining stars; therefore, lest they appear useless and superfluous, it must be established that they communicate their influences to these lower and sublunary things.

Assertion II. The heaven and the stars exert influence upon the elements with respect to alteration and generation. So Scotus (*cit.*, & 3, *dist. 16, q. 2, §. Rationes iste, ante A.*). It is proved by experience: for when the sun approaches our zenith, the higher elements — fire and air — are increased and augmented; hence in summer heat and dryness abound; but the lower elements are diminished and decrease, so that in the said summer heat moisture and coldness are deficient. When the sun recedes from our zenith, the lower elements — water and earth — are increased and augmented; hence in winter water and cold abound; but the higher elements decrease, for that reason in winter heat and dryness are lacking.

Assertion III. The celestial bodies concur in the motion of sublunary things. This is held by the Doctor (*in 2 passu memorato*) and he shows it thus: when the elements conflict with one another, their motion is produced by the power of the heaven, and a mixture is caused from such conflict through the power of the heaven, as will become plain in the next book; therefore the heaven exerts influence by moving these lower things. Moreover, it is established by experience that comets are moved in a circular manner by the motion of the Heaven. Therefore sublunary things are moved by the motion of the Heaven.

Assertion IV. Imperfect and perfect animate things participate in the effects of the planets and other celestial orbs. Scotus defends this (*ubi supra, in utroque opere*). It is proved first from Galen (*lib. 3 de diebus criticis*), who directs that the conjunctions and oppositions of the planets, and especially of the Moon, are to be observed so that sick bodies may be well treated; hence the Doctor (*mox cit.*) adds that physicians ought to be astronomers so as to administer their remedies to the sick opportunely. Second, marine oysters, shellfish, crabs, and the like are found to be full at the oppositions of the sun and moon, but empty at their quadratures; therefore the planets exert influence upon animate things. Further, men called lunatics are agitated more at one time than another, since they receive greater influences from the Moon at quadrature than at opposition.

Again, in aged people heat is more vigorous at the full moon than at the new moon. Finally, evident and wonderful effects appear in the planting of trees, in their felling, in the ebb and flow of the sea, and in many other things that daily meet our eyes and are discussed at length by the Doctor.

Objection I. Genesis I says that God made the sun and the moon and placed them in the firmament of the heaven to be for signs and for times; therefore they are not causes of these lower things but only signs. And this seems to be confirmed by Damascene (2, *cap.* 6) in these words: "We say that these stars are not the cause of any of the things that have come to be, nor of the corruption of the things that perish; but they are great signs of rains and of changes in the air." I respond with the Seraphic Doctor and Lyra that they are not only signs but also causes, as the sacred text indicates when it adds that they are to give light in the firmament of the heaven and to illuminate the earth — just as the sacraments are signs and causes of grace. To Damascene I say that he denies them to be a primary and independent cause, not a dependent, created, and universally concurrent cause together with the particular causes of these lower things; for that reason Lyra (*loc. cit.*) says that Moses deliberately narrates that God made those two luminaries lest the Jewish people, prone to idolatry, should worship them as gods. Hence Deuteronomy IV: *Ne forte oculis elevatis ad caelum, videas Solem, & Lunam, & omnia astra Caeli, & errore deceptus adores ea, & colas, quae creavit Dominus Deus tuus in ministerium cunctis gentibus* — "Lest perhaps lifting up your eyes to heaven you see the sun and the moon and all the stars of heaven, and being deceived by error you adore and serve them, which the Lord your God created for the service of all the nations."

Objection II. Aristotle (7 *Phys.*, *Tit.* 26) writes that the agent and the patient must be together for action to proceed and an effect to come about; but the heaven is far distant from these lower things; therefore it cannot exert influence upon them. I respond that the philosopher is to be expounded through a distinction: togetherness of the suppose, I deny; togetherness of power, I grant. For although the suppose of the heaven is as distant as possible from the earth, its power is nonetheless proximate to it, by reason of which effects are produced.

Objection III. The same Aristotle (1 *de gener.*, *cap.* 7, *T.* 51) and Dionysius (2 *de divinis nominibus*) affirm that an agent assimilates its patient to itself as much as it can; but the heaven does not assimilate sublunary things to itself — for there is no similarity between them; therefore the heaven does not act upon these lower things. This testimony is to be expounded through a distinction: concerning a univocal agent, it is granted; concerning an equivocal agent, such as the heaven is, it is denied. Therefore it is not necessary for some similarity to intervene in order for celestial things to exert influence upon sublunary things.

You ask whether the empyrean heaven exerts any influence upon this sublunary world. The Seraphic Doctor (2, *dist.* 2, *part.* 2, *art.* 1, *q.* 2) responds problematically, adducing probable arguments for each side and ingeniously

dissolving them. The affirmative part is pleasing: both because no substance in the world is idle, and because the noblest and most perfect body possesses the most excellent power of acting and exerting influence upon its inferiors — as is the empyrean heaven.

Article II: Through What Means the Heaven Acts upon This World

Three things can be debated: namely light, motion, and occult power, which some call occult and hidden influence — all of which I shall briefly and clearly set out through the three following assertions.

Assertion I. The heaven acts upon these lower things through light. This is the common view of Scotus (*in antecedente art. alleg.*) and the other scholastics and philosophers. It is proved: by the light of the sun sublunary bodies are illuminated and warmed, and in its absence they are darkened and grow cold — we observe that by the light of the sun wax is liquefied and mud is hardened. And its heat is a dispositive cause of the generation of things, and its privation is a cause of their perishing, since life consists in heat and moisture. Moreover, trees that are exposed to the light of the sun bear fruit, while those deprived of it do not.

Assertion II. The heaven also exerts influence upon sublunary things through motion. This is held by the Doctor (*ubi supra*) with the remaining scholastics. It is proved: the approach and recession of the sun from us, and its motion in the oblique circle of the zodiac, is the cause of the rise and perishing of things. And the accepted axiom among philosophers is that motion is the cause of heat, just as rest is the cause of cold; and that heat is at least a dispositive cause of things, no one denies. Therefore the heaven acts upon these lower things by its motion.

Assertion III. The occult influences of the heavens, that is, their proper powers and virtues, by which innumerable and wonderful effects are produced, are to be admitted. This is against Pico della Mirandola (*3 contra Astrologos, cc. 20 & 6*) and certain others cited by recent writers, and is for Bonaventure (*2, dist. 14, part. 2, art. 2, q. 2*), Richard (*ibidem, art. 3, q. 5, ad 5*), Mayronis (*q. 4*), Mayronis (*q. 8*), Tartaretus (*1 Meteor., q. 1, scibili secundo*), and Scotus does not object (*passu praememoraro*), and Augustine (*21 Civit., cap. 4, 5, 7*) lends support. It is proved first from the generation of metals, especially silver, which cannot be reached by the motion and light of the heavens; therefore they come from those other faculties and powers of the heavens, which are commonly called their occult influences. First, the ebb and flow of the sea, especially the ocean, is attributed to the hidden power of the Moon, which has great dominion over moist bodies. Again, the magnet is drawn toward the arctic pole and recedes from the antarctic pole; and other such things, which appear to be produced by no other cause than the powers of the celestial bodies, called occult influences. Second, sublunary things produce many wonderful effects through their own powers that escape us, just as their specific substantial forms escape us; therefore

celestial things likewise produce wonderful effects whose powers are hidden from us — just as their specific substantial forms are hidden — as the Seraphic Doctor (*loco prarecensito*) and others excellently pursue. Finally, astronomers attribute diverse effects to the stars: some cool, like Saturn; some heat, like the Sun; some moisten, like the Moon; and others desiccate. These and similar things proceed from nothing other than the diverse powers and faculties of the heavens, which, because they are unknown to us, are called occult influences. Therefore Pererius and others (*cited by Ruuius, 2 Caeli, cap. 3, q. 2*) wrongly call these the fictions of dreamers and a refuge of ignorance, since they mean nothing other than the powers and faculties of the heavens from which wonderful effects proceed. For if the powers of sublunary things produce wonderful effects that are not known to us — as is established in the case of the powers of many stones, herbs, and plants — how much more the faculties of celestial things, which, being the noblest and most excellent, doubtless possess the most excellent and most eminent powers, from which the noblest and most excellent effects proceed? Thus, since these powers of the heavens are not denied, their aforesaid occult influences, which entirely coincide with them, are assuredly not to be denied.

Objection I. Light surpasses all qualities in nobility and causality, as we experience in the effects and works of these sublunary things that are produced by light; therefore the heaven acts through light alone. The antecedent is apparent from the flowers of plants and the fruits of trees, which acknowledge light as their parent and cause; therefore the same must be asserted of the other effects and parts of other things. I respond: although light produces innumerable effects, it nonetheless does not reach the workings of metals, which are generated in the bosom of the earth, and other effects that are more excellent and distinguished than light; and therefore other and more excellent causes are to be sought, which are called occult influences.

Objection II. Motion, as was said in book VIII of the Physics (*q. 1, art. 4*), is formally a relation, which does not belong to the genus of active things; therefore the heaven does not exert influence upon these lower things through motion. I grant the antecedent; I distinguish the consequent: as an efficient principle, I grant it; as a condition *sine qua non*, I deny it. Thus light is indeed a prior and dispositive condition for producing a substance, yet it does not effectively attain it.

Objection III. It is unworthy of a philosopher to assert things that can be proved by neither sense nor reason; but that there are occult influences of the heaven can be urged by neither sense nor reason, nor indeed by authority — for Aristotle in his writings does not mention such influences. Therefore they are not to be admitted. I grant the major and deny the minor, as is clear from the third assertion set forth above. Many truths were hidden from Aristotle; for to

God alone are all things known, in accordance with Hebrews IV: *Omnia sunt nuda, aperta oculis eius* — "All things are naked and open to his eyes."

You ask whether, if the motion of the heaven were to cease, any motion could be produced in these lower things. I respond affirmatively with Scotus (2, d. 2, q. 11, §. *Dico ergo, sub A.*, & 4, d. 48, q. 2, sub I.) against Thomas (2 *Caeli, lect. 4*) and his followers. For from Augustine (11 *Conf.*): with the heaven at rest, the potter's wheel is moved. And this was established at the University of Paris; the reason is that sublunary things, apart from the motion of the heaven, have a sufficient efficient cause of their own motion. Therefore they can be moved without the motion of the heaven.

Article III: Whether the Heavens and the Stars Exert Influence upon the Human Soul

The planetary and judicial astrologers hold that the heavens and the stars so exert influence upon the human soul by a natural and necessary influence that it cannot act otherwise than according to the influence of those same heavens and stars. But Scotus (2, d. 14, q. 3, §. *Quarto dico. H.*), Bonaventure (*ibid.*, q. ult.), Richard (q. 5, art. 3), Mayronis (q. 8), Gabriel (q. un., dub. ult.), Durand (*part. secunda*, q. 2), and the other scholastic and orthodox Doctors deny that the heavens and the stars compel the human will to produce its actions and operations necessarily.

Note, from Scotus (*mox cit.*), that the heaven and the stars act upon mixed things — whether inanimate or animate — through their influences, namely by altering them through fitting or unfitting qualities; and therefore the said celestial bodies can be said to exert influence upon the human soul remotely and indirectly, inasmuch as the aforesaid qualities can harm those mixed things, which are able to dissolve the organs and the temperament of those things. When the senses are injured, the intellect and will can become disordered in their acts and works. Hence Orbellus (2, *dist. 25, q. 2*) adds: when the organ of the imagination is injured and impeded, as is evident in those with frenzy, the intellect is impeded in its function and operation.

Assertion I. Directly and immediately the heavens and stars do not exert influence upon the human soul. This is held by the Doctor (*cit.*, & q. 11 *de anima*). It is proved first: a body cannot directly act upon a spirit; for the agent is nobler than the patient, as Augustine (12 *de gen. ad lit.*, cap. 29) transmits above all others. But the heavens are corporeal, and the human soul is spiritual (3 *anima*, 19, & 2 *de gener. animalium*, cap. 3); therefore they cannot act directly upon it. Second, the human soul is incapable of material accidents; hence the agent intellect transfers material species into spiritual ones, which the patient intellect receives (3 *anima*, 18). Moreover, from Damascene (2 *fidei*, cap. 7): the celestial bodies operate naturally and necessarily; therefore if they were to exert

influence upon the human soul, they would harm its freedom, the opposite of which we shall establish in the third assertion.

Assertion II. Indirectly and remotely the heavens can exert influence upon the intellect and will of man. This is defended by the Doctor (*passu allegato*). The first part is proved from Aristotle (*1 anima, Tit. 66*): the intellect is corrupted when something within is corrupted — that is, when the sense is harmed, especially the imagination, the intellect is indirectly harmed and disordered. Second, experience establishes that when the common sense is harmed, and especially when the imagination and the phantasy are confused, the intellect is confused and disordered in its acts and works, as is evident in those with frenzy and lunatics, who are agitated more at one time than another according to the greater or lesser influence they receive from the Heaven. The first part is urged from (*1 Polit., 3*): the sensitive appetite naturally relates to the rational part as a servant to a master. But sometimes the servant indirectly at least resists the master; therefore the same must be said of the sensitive appetite, which draws the will to itself, however reluctantly and resistingly. Hence Romans VII: *Non quod volo bonum, hoc ago, sed quod odio malum, illud facio* — "For the good that I will, I do not do, but the evil which I hate, that I do" — drawn by sensuality, as Lyra adds there. Second, the human will follows the sensitive appetite, inasmuch as the sensitive appetite moves the will effectively toward pursuing that which is offered and presented to it by that sensitive appetite, if it is advantageous and good for that will; but the sensitive appetite can be disordered and harmed by a harmful celestial influence; therefore indirectly the heaven can act upon the human will.

Assertion III. The heavens and the stars do not compel the human will to act, but leave it in full mastery of its own acts and works. The Doctor (*ubi supra*) champions this. It is proved first from the Councils of Braga I (*cap. 9, 10*) and Toledo I, in which Priscillian, his followers, and his supporters — who held that the celestial bodies through their influences defile human freedom — are condemned. Augustine (*in the catalogue of heresies, heresy 70*) mentions them. The holy Fathers lend support, specifically Dionysius (*4 de Divinis nominibus*), Basil (*hom. 6 in Hexamer.*), and Augustine (*13 Trin., c. 4*). And it can be corroborated from Deuteronomy IV: *Solem, & Lunam, & omnia Astra caeli creavit Dominus Deus in ministerium cunctis gentibus, quae sub caelo sunt* — "The Lord God created the sun and the moon and all the stars of heaven for the service of all the nations that are under heaven." But what has been created for the service of man does not dominate him in governance, power, and will, otherwise it would have been created for lordship and not for service; thus, since the heavens and the stars were created to serve man, it is plainly concluded that they impose no force upon the human will. One may add the well-known saying of Ptolemy, the most distinguished astronomer, in the *Almagest*: *Sapiens dominabitur Astris* — "The wise man will dominate the stars."

Second, from Aristotle (*1 Perih., near the end*), affirming that man has a power toward opposite things — that is, a will — in whose power it is to will, or to not will, or to not-will, otherwise counsels and negotiations would be in vain.

Fourth, what essentially belongs to something is inseparable from it, otherwise its nature would be destroyed; but the human will is essentially free — for by this it is distinguished from the intellect and the other natural powers.

Therefore the human will is not compelled to act by the influence of celestial bodies. Finally, if man's will were necessitated in its acts, when he acted badly man would not be to blame and punished, but the stars would be to be accused, which compelled him necessarily to commit evils — and so all basis for merit and demerit, praise and blame, honor and reproach would be removed.

Objection I. From Aristotle (*1 de elementorum proprietatibus*): "Kingdoms have been emptied and lands depopulated on account of the conjunction of the two great stars, namely Jupiter and Saturn." Therefore the stars by their influence necessitate men to make war and perform other works. I respond that this is to be interpreted as dispositive, not coercive: they incline but do not constrain men to undertake these or those things.

Objection II. The stars exert influence upon demons, who are pure spirits; therefore, with greater reason, upon the rational soul, which is united to a body. The antecedent is urged: it is established by sure experience that demons torment those possessed more at one time than at another — as is evident in the waxing and waning of the Moon — which proceeds from no other source than the greater influence that the Moon then emits upon them, by reason of which they more greatly vex and agitate those with frenzy and lunatics. I deny the antecedent. To its proof I say that it is not the demons that receive such influence, but the said lunatics. For the demons recognize the opportune time at which these men can more easily be agitated and tormented — namely on account of the abundance of humors — and for that reason they then more greatly disturb and afflict them.

One might say: demons are attracted and repelled by certain herbs and stones and living things, which those skilled in the magic art use; therefore it is not an obstacle that they should be capable of receiving the influences of celestial bodies. I say that this is accomplished through their tacit or express agreement, in applying active to passive things. Hence Augustine (*20 contra Faustum, c. 22*) writes and adds: "Those proud and impious spirits are nourished not by the odor and smoke, as certain vain people think, but by the errors of men."

Objection III. Some possess a more excellent intellect than others, for no other reason than that those more gifted were conceived and born under nobler and more fitting stars — as those born under Mars are more suited and fitted for war, and those under Mercury for literary study. Therefore celestial bodies act upon the human soul. I grant the antecedent; I distinguish the consequent: remotely and indirectly, I grant it; proximately and directly, I deny it. The stars indeed

assist and dispose toward goodness and excellence of intellect, but their chief cause is God creating a nobler soul from which a nobler intellect flows with the other more perfect powers. This is especially clear in the school of Scotus, which teaches that a singular substance participates in grades of perfection by reason of which one soul is nobler and more excellent than another, as was established at the University of Paris.

Article IV: Whether Astrologers, from the Observation of the Stars, Can Predict Future Things with Certainty

Just as opinions clashed in the preceding article, so too they conflict in the present one. For its resolution and decision it is helpful to make a distinction between future events that are necessary and natural, on the one hand, and those that are voluntary and free on the other — in accordance with which two following assertions are established.

Assertion I. If astrologers were to know the natural powers and faculties of the stars, they could with certainty foreknow and predict their necessary and natural future effects. So Scotus (2, *dist. 14, q. 3, §. Secundo dico. F.*). It is proved first: once the cause is perfectly known, its effect is known, because the latter essentially depends upon the former. Hence one who has a demonstration through the cause can easily have a demonstration through the effect. Therefore, if astronomers understood well and perfectly the natures and powers of the stars, they could certainly and without doubt predict their future natural effects. Second, daily experience establishes that astrologers predict many future things that are to be produced and brought about by the stars — such as their conjunctions and oppositions, eclipses, fair weather, storms, rains, droughts, abundance and scarcity of things, earthquakes, the rise and perishing of those same things, war or peace among nations, and the like. Hence Sixtus V, in the Bull he issued against judicial astrologers, excepts natural effects in these words: *Futuris eventibus ex naturalibus causis necessario, vel frequenter provenientibus, quae ad divinationem non pertinent, duntaxat exceptis* — "Excepting only future events arising necessarily or frequently from natural causes, which do not pertain to divination." Scotus (*passu praememoraro*) adds that an angel certainly foreknows such natural effects because he perfectly knows their natural causes. Therefore, if astrologers well and fully knew the essences and powers of the stars, they would without doubt predict their effects with certainty. Hence the Coimbrans (1 *Caeli, c. 3, q. 9, art. 2*) are refuted who hold that the said astrologers can only probably foreknow those effects. For since astronomy is properly a science, one who is well versed in it knows the universal natural causes belonging to it and therefore possesses scientific knowledge of them and of their effects, and thus can predict such future effects necessarily and evidently — even though sometimes, on account of an improper disposition of sublunary things or some other obstacle, they may be prevented from coming about.

Assertion II. Astrologers can at least conjecturally foreknow the characters of men, especially if they know under the dominion of which planets they were conceived and born; yet not those things that depend on their free will. The assertion is twofold, and is held by the Doctor (*ubi supra*, §. *Quarto dico. H.*). The first part is proved: those who are in diverse climates acquire diverse characters, as Ptolemy (*tract. 2 quadripart.*) observes above all others, and as we clearly observe in Italians, Germans, Gauls, Spaniards, and other nations. Hence Aristotle in his Problems writes that those who are closer to the south are for the most part of more excellent intellect and keener understanding and more capable of action, on account of the proximity of the circle of signs and wandering stars to the zenith of their heads; therefore astrologers, adroitly noting this and other things, can easily predict the characters of men. Moreover, we observe that some are devoted to Mathematics, as Plato; some to History, as Pliny; some to prose and eloquence, as Cicero; and others to the poetic art, as Ovid, who himself said: *Quidquid conabar dicere, versus erat* — "Whatever I tried to say turned out to be verse."

Second, an argument for recognizing the sons of parents is drawn from the parents themselves, because the son is part of the father (*5 Eth.*, 6) and resembles him; hence a bastard is not advanced to sacred orders, because if the father was incontinent the same is presumed of his son, as is evident from the Extravagant on the sons of priests. Therefore an astrologer well versed and skilled in his art can conjecture the character of someone if he knows his origin and the influence of Jupiter, Saturn, or another star. Third, character follows the temperament of the body, as Galen transmits in his book entitled by himself: "The temperament of the human body depends not a little on the influence of the stars. Hence those born under Jupiter are lively on account of the abundance of blood that that planet infuses; those born under Saturn are melancholic on account of the dryness and coldness communicated by that planet; those under Mars are prone to war; those who are under Venus are devoted to lust." Hence Genesis VIII: the sacred text conveys the sense that "the feelings and thought of the human heart are prone to evil from adolescence." From Ecclesiastes I: *Perversi difficile corriguntur, & stultorum infinitus est numerus* — "The perverse are difficult to correct, and the number of fools is infinite."

Fourth, the will of man pursues what the sensitive appetite presents and follows, as I was saying in the preceding article, Assertion II. But the stars directly exert influence upon the sensitive appetite; therefore, with their influences known, astrologers can conjecture the characters of men. Especially because, as we read in James I: *unusquisque tentatur a concupiscentia sua abstractus, & illectus* — "each one is tempted, being drawn away and enticed by his own concupiscence." And Virgil: *Trahit sua quemque voluptas* — "each is drawn by his own pleasure."

The second part is proved first from sacred scripture, Deuteronomy XVIII: *Gentes istae Divinos audiunt, tu autem Domine Deo tua aliter institutus es* — "These

nations hearken to soothsayers, but the Lord your God has established you otherwise." Isaiah XLVI: *Non est ultra Deus, nec est similis mei, annuntians ab exordio novissimam, & ab initio, quae necdum facta sunt* — "There is no God besides me, nor is there one like me, who announces the last things from the beginning and from the beginning those things which have not yet been done." And Isaiah XLVII: *Qui contemplabantur sydera, & supputabant Etti suas quasi stipula, ignis combusit eos* — "Those who observed the stars and counted their courses, fire has consumed them like stubble." Second, planetary and judicial astrologers are condemned and anathematized by the Church, as is evident from the second part of the Decretals, cap. 16, the Council of Braga I, cap. 9, Toledo I. And finally they are excommunicated by Sixtus V in his proper Bull against those practicing judicial astrology. Hence not without reason does Bonaventure (2, d. 14, q. ult.) call the opposite opinion heretical, diabolical, repugnant to reason and sense, and self-contradictory. Third, from the Fathers: Clement (9 recognitionum), Gregory (hom. 10 in Evang.), Epiphanius, and Augustine (7 Conf., cap. 3), where, rejecting the divinations of the mathematicians, he adduces the example of the twins Esau and Jacob, who were simultaneously conceived and born from the same womb of their mother, yet were vastly different and dissimilar in life and character. And (1 de gen. ad lit., 17) he gives the example of shrubs, plants, seeds, and herbs that are planted and sown at the same time, born at the same moment, and yet are evidently diverse. He asserts the same (5 Civit., cap. 1, at the end, & cap. 2, 3, 4, idem; and lib. 83 qq., q. 45; & 1 ad Simplicianum, in fol. 1, q.). Genebrardus (1 Chron., par. II) writes and establishes the same. Fourth, the human will is by its own nature indifferent and undetermined toward opposite objects, acts, and effects, as I pursued at length in Moral Philosophy (liber 3, quaestione 1, a. 1) and intimated in the preceding article. Therefore none of the astrologers can know from knowledge of the stars what that will is going to do. For although the stars incline that will toward performing something, they do not compel or necessitate it to carry out its operations.

Objection I. The heavens are like books in which all the future effects of men and of all sublunary things appear to be read. Thus Genesis I: the stars are said to be placed in the firmament of heaven to be signs of future things, through their various and diverse aspects, as Origen interprets. Isaiah XXXIV: *Complicabuntur sicut liber caeli* — "The heavens shall be folded together like a book." And Apocalypse VI: *Caelum recessit, sicut liber involutus* — "Heaven departed like a scroll that is rolled up." Therefore, if anyone knows and perfectly understands the characters of the celestial orbs, he will certainly predict the future events and effects of things. Confirmation: Matthew II: the Magi knew that Christ the King was born through the star appearing to them. John II: *Nondum venit hora mea* — "My hour has not yet come." And chapter VII: *Nemo apprehendit eum, quia nondum venit hora eius* — "No one laid hands on him, because his hour had not yet come." If therefore Christ the Lord was born under a star and also died under one, with greater reason the same must be asserted of

other men, whose birth, acts, character, and death depend on the stars; and consequently skilled astrologers can foreknow all these things. I respond that these passages and similar ones are to be expounded of necessary and natural effects, as I showed in the first assertion. But not of contingent and free effects, as was shown in the second part of Assertion II. Or they are to be interpreted as referring to probable and conjectural knowledge, not to certain and infallible knowledge. To the confirmation I say that this was not a true star from among the fixed or wandering ones, but something meteorological compacted by God or by an Angel for leading the Magi to the manger of the Lord, and a sign constituted divinely to indicate the nativity in the flesh of the same Lord. And the Lord was born before the aforesaid star was made; therefore Christ was not born under a fateful star. To the other testimonies of scripture I say that they signify the time predefined by God the Father in which Christ the Lord had to be born, suffer, and die, in accordance with the prophecies of the Prophets.

Objection II. An appearing comet is a sign of the death of a king or of another great man, as Aristotle and the astronomers assert. Therefore astrologers from the aspects of the stars can make true predictions. I respond that a comet is for the most part a sign and cause of bad events, because, as was said in the Meteorology, since there is a great abundance of exhalations simultaneously joined and raised to the first region of the air, falling afterwards they harm many and bring death, among whom is a king or another powerful man, whose death is especially noted and named. And then tumults and wars are stirred up, whose outcome is unhappy and inauspicious, bringing death to the king. Or say with Damascene (*2 fidei, cap. 7*) that by the command of God a comet is a foreboding of the death of kings and great men, so that they may dispose and prepare themselves as quickly as possible to render an account of the good or evil things they have committed in the present life.

Objection III. Astrologers predict many true things — such as that Caesar would be emperor, Nero would kill his mother, Alexander would perish by poison, Francis would be poor and a standard-bearer of Christ, Bonaventure most learned, and the like. Therefore astrologers are not to be excluded from the foretelling of future truths. I respond that astrologers do indeed sometimes predict many true things — whether by chance, or probably, or conjecturally — but they put forth far more false things, and therefore faith is not to be placed in them, as Augustine (*1, 83 qq., q. 45*), Bonaventure, and Mayronis (*loc. cit.*) observe above all others.

Book III: On the Elements

Aristotle treats the elements learnedly and abundantly in books III and IV *On the Heavens* and in book II *On Generation*. We, however, comprehend in this single

book what is transmitted concerning their nature, number, powers, and faculties, both in common and in particular.

Question I: On the Elements in Common

Article I: What an Element Is and How Many Kinds There Are

That an element exists, no one doubts; but what it is, all are agreed upon — except Arriaga (*disp. 4 de elementis*), who offers a singular definition of an element to be refuted below. How many elements there are, however, is a not inconsiderable dispute among philosophers. For some count infinitely many elements; others, even if they posit a finite number, do not agree among themselves — some enumerating three and others four, nor are those lacking who make only one.

Note first that "element" is taken in multiple ways. First, for the principle of any thing: in this sense, letters are called the elements of syllables, and self-evident propositions are called the elements of the sciences. Augustine (*in Psal. 9*), Aristotle (*4 Top., cap. 1, & 1 Phys., in initio, & 5 Met., cap. 3, T. 4*), and Scotus (*ibi*) touch upon this usage. Second, for more universal predicates and principles of generation, as the Stagirite writes (*12 Met., cap. 4*). Third, for a simple body that is capable of contributing to the generation and composition of a mixed body, and it is of the element so taken that we speak in the present context.

Note second that Aristotle offers two definitions or descriptions of an element, of which the first is found at (*5 Met., cap. 3, T. 4*): "An element is said to be that from which something is primarily composed, being present within it, indivisible in species into another species." Its explanation is read in the Doctor (*in com. loci pract.*), which the Doctor himself does not think to be applicable to the four elements but to prime matter. The second is transmitted at (*3 Caeli, T. 31, sum. 5*): "An element is that into which other bodies are resolved, which is present in them either in potency or in act." This is the proper and exact definition of an element and is therefore to be retained. But an element can be defined more clearly as a simple body into which other bodies are resolved. It is called a body so as to differ from matter and the rest that do not possess a corporeal character. Simple is added on account of a mixed body. It is further said, into which other bodies are resolved, so as to distinguish it from the heaven, which, although it is a simple body, is not something into which mixed bodies are resolved, since in fact it is incorruptible and irreducible.

Assertion I. An element is aptly defined as a simple body into which other bodies are resolved. Neither the last definition of Aristotle nor Scotus (*5 Met., cit., & 2, d. 15, q. un., & in Rep. ibid.*) departs from or conflicts with this. It is urged: it consists of genus and differentia. For its genus is body, and the rest are its differentia. It contains nothing deficient or superfluous and applies to the element adequately; therefore the foregoing definition is sound and fitting.

Hence Arriaga (*loc. alleg.*) is refuted, who defines an element as something that consists of only one of the primary qualities. For a substance, such as an element, does not participate in an accidental differentia, such as a primary quality, which Arriaga posits as its constitutive and distinguishing differentia. Moreover, below we shall show that the primary qualities are not the essential differentiae of the elements, and that one element possesses two qualities, and that there are four primary qualities corresponding to the four elements; therefore Arriaga is mistaken in seeking another definition of an element that departs from the common one.

Assertion II. There are only four elements: earth, water, air, and fire. So Aristotle (*locis praememoratis*), Scotus (*ubi supra* § 2, d. 14, q. 3), Augustine (*de gen. ad lit.*, cap. 2, § 8 *Civit.*, cap. 5, § 22 *eiusdem operis*, cap. 9), Basil (*hom. 2 de Mundi opificio*), Damascene (*2 fidei, capite 7*), and other Fathers and scholastic Doctors give their assent. It is proved first: there are four primary qualities residing in four distinct bodies; therefore there are four primary and simple bodies in which those qualities inhere as passions in their subjects, commonly called the four elements. The antecedent is clear: heat, cold, moisture, and dryness are called and are the four primary qualities; and indeed heat is attributed to fire, moisture to air, cold to water, and dryness to earth. The consequent holds, since from proper accidents we arrive at knowledge of substance; and therefore from the four primary qualities the quaternary number of the elements is rightly manifested. Second, there are four distinct places in which those four said simple bodies are located, since, from what was said in book VI of the Physics (*q. 3, art. 1*), there is no vacuum in the nature of things. Therefore there are the four aforesaid elements. The antecedent is shown: there are two upper places in which fire and air dwell; and there are two lower places in which water and earth remain. Furthermore, four temperaments of living things are found: the melancholic, in which earth dominates; the phlegmatic, in which water prevails; the sanguine, in which air reigns; and the choleric, in which fire burns. Therefore the four elements named by the royal Psalmist (*Psal. 148*) and by Daniel III are to be admitted.

Objection I against the first assertion. Other bodies are not composed of elements, nor are the elements themselves composed of matter and form any less than those other bodies; therefore both foregoing definitions of an element are inept. I respond that elements are prerequisite for the composition of mixed things as their efficient principles, not as their formal principles. For elements are not in mixed things formally but only virtually. The elements themselves are said to be simple, even though they are constituted of matter and form, because for the production of those very elements no prior things are required, as is the case in the generation of mixed things — as will become plain in the question on mixture and the mixed body.

One might say: in Aristotle's first definition an element is posited as existing within what it composes; and in the second the element is also said to exist in the mixed thing in act or in potency. Therefore the foregoing response carries no weight. I say that the aforesaid inexistence of the element in the mixed thing can be said to be not formal but virtual and potential. Or say with Scotus that it is not a definition of an element in the proper sense but of prime matter as Scotus interprets there. As to the other point that is added there, he speaks problematically and does not decide the dispute whether the element is in the mixed thing in act or in potency, but does so later in the work on generation and corruption.

Objection II against the second assertion. Moses, in Genesis, weaving the series of all the things created by God, and especially the elements, makes no mention of fire; therefore there are not four elements. I respond that an argument drawn from negative authority does not conclude. Hence Bonaventure (*2, d. 14, art. 1, q. 2*) notes that the divine Chronicler likewise makes no mention of air, which is not denied to be one of the elements. The reason why he did not record fire is offered by Lyra: because he was speaking to an unlearned people who could not grasp spiritual things and what is above us. Likewise, he makes no mention of the creation of the Angels, whom Augustine notes (*11 Confes., cap. 22*) to have been created by God. And Augustine writes (*1 de gen. ad lit., cap. 17, & 2 eiusdem operis, cap. 18*) that by the creation of heaven the Angels are to be understood, who are spiritual creatures; and Genebrardus (*1 Chron., pag. 2*) records this in writing. Add that Damascene (*2 fidei, cap. 7*) says that by the light created on the first day fire is to be understood, because fire is nothing other than light.

Article II: Whether the Forms of the Elements Are the Primary Qualities

Galen (*1 de usu partium, & 1 de elementis*), Philoponus (*2 de generat., com. 7*), and Alexander (*12 Met., com. 12*) hold that the essential forms of the elements are the primary qualities. The opposing opinion is intimated by Aristotle (*2 de general., T. 16, & 54*) and is defended by the Parisians (*ibid.*), Richard (*2, d. 14, art. 2, q. 1 & 2*), Aurora (*d. 15, art. 1*), and others, who commonly deny that the forms of the elements are the primary qualities.

Assertion I. The elements are not constituted in their substantial elemental being through the primary qualities. This is presupposed by the Doctor (*2, d. 15, q. un., §. dico ergo. A.*), where he maintains that the substantial forms of the elements do not remain in the mixed thing in act and formally, and that the mixed thing itself is constituted through its own proper form distinct from the forms of the elements. For that reason Aristotle (*2 de gener., loc. proxime cit.*) inveighs against the ancient philosophers because they treated of qualities but not of the substantial forms of the elements. Moreover, the same philosopher (*lib. de sensu, & sensili, cap. de sapore*) adds: "Fire heats as hot, but it does not ignite as hot." Here Aristotle clearly shows that the form of fire is not heat; otherwise

fire would ignite as hot, which he openly rejects. Thus according to Aristotle, warming indeed proceeds from the heat of fire as its instrument, but ignition proceeds from the form of fire, through which fire is essentially constituted in its being as fire. Augustine intimates this same point (*in expof. Psal. 147*): "What is hot makes hot by heat, and what is cold makes cold by cold, and what is swift is made swift by swiftness." And (*lib. de natura, & gratia contra Pelag.*): "Heat and cold are qualities of substances, and substance is contrary to substance through its qualities." Moreover, no composite substance is constituted in the being of substance through an accidental form, otherwise it would not be a being through itself but through accident, as I showed in book II of the Physics (*q. 6, art. 1*). But if the primary qualities were the forms of the elements, the elements themselves, which are substantial composites, would be constituted in the being of substance through accidental forms, such as the primary qualities, which are accidents placed in the predicament of quality. No one denies that the elements are substantial composites, as is clear from the definition of an element adduced in the preceding article. Therefore the elemental forms are not the primary qualities. Again, the passion of a thing is not its essential form, since a passion presupposes the thing already constituted through its essential form; but the primary qualities appear to be passions of the elements. From fire flows heat, or rather the power of heating, as Bonetus (*1 Met., §. Iuxta*) notes. From water coldness, or the faculty of cooling; from air moisture, or the power of moistening; and from earth dryness, or the power of desiccating. Furthermore, what can be separated from something, while that thing remains whole and unharmed, is not its substantial form, because with the form of a thing separated, the thing itself constituted through such form is destroyed; but the elements can exist without the primary qualities; therefore the primary qualities are not the forms of the elements. The major is known. The minor is shown: the fire in the Babylonian furnace did not heat or burn the three young men cast into it (*Dan. 3*). At that time, therefore, there was fire without heat, yet it did not exist without its substantial form; therefore neither is heat the form of the element fire, nor are the other qualities to be considered as forms of the remaining elements.

Assertion II. Each element possesses its own proper substantial form. This is derived from the Doctor (*ubi supra*). It is proved first: what is constituted of matter and form possesses its own proper substantial form, as is clear from what was said in the Physics (*passu proxime cit.*). But each element is constituted of matter and form, because an element is a body, from the assertions of the preceding article. Therefore each element possesses its own proper substantial form. Second, what is the proximate and immediate subject of material accidents enjoys its own proper substantial form distinct from others; but each element is the proximate and immediate subject of material accidents; therefore each element is endowed with its own proper substantial form. The major was

shown (*1, 5 Phys., q. 1, art. 4*). The minor is clear, since each element is a body constituted of matter and form.

Objection I. Aristotle (*2 de gener., 7*) says in explicit words that the principles and constitutive forms of the elements are the primary qualities. Therefore in Aristotle's school the primary qualities are the forms of the elements. I respond that those words are uttered by the philosopher in the opinion of the ancient philosophers, whom he there sharply censures, as is plain from the same Stagirite (*T. 54*). Or, if you prefer, say with the text that it is to be taken circumlocutively — using the passions of the elements in place of their essential forms, as philosophers sometimes do, especially when the substantial forms are not known to us — as is evident at (*5 Met., cap. de quanto*), where divisibility is taken for the essence of quantity, which is in reality its passion.

One might say: from (*2 de partibus animalium, c. 1*), qualities and powers of elements are the matter of a mixed thing, but the matter of a mixed thing is substance; therefore the said qualities are also substances. We must meet this by saying that those qualities are called the matter of the mixed thing insofar as they are material dispositions for making the mixed thing.

You will press: living things are nourished by things cold, hot, moist, and dry (*2 anima, 28*); but the nutriment of living things is substance; therefore the qualities of the elements also are. It is sufficient to say that living things are nourished by cold, hot, moist, and dry things — that is, by substances affected by heat, cold, moisture, and dryness — as the same philosopher signifies (*3 anima, 10*).

Objection II. From the substantial form, which is an active principle, some operation ought to proceed; but from the form of fire no operation other than heating proceeds; therefore heat and not another form constitutes fire in its substantial elemental being. I grant the major and deny the minor. For from the form of fire there proceeds ignition, by which fire ignites and produces fire, just as from heat there emerges warming, by which fire heats.

One might say: the verb "to ignite" and the noun "ignition" are not found in approved authors but are invented to elude the force of the aforesaid argument. I say they are found in Augustine (*l. 3 contra litteras Petiliani Donatistae, c. 4*). And the same Doctor observes in (*exp. psal. 104*) where the Vulgate has "the word of the Lord inflamed him," other editions read "ignited him." And Damascene (*4 fidei, c. 14*) mentions both terms. And Aristotle (*1 Meteor., cap. 4*).

You ask first whether the elements differ from one another in species. I respond affirmatively, which their passions, operations, effects, and diverse locations clearly indicate, which I have often insisted point to distinct specific natures.

You ask second whether the elements are nobler and more excellent than mixed things. I respond negatively, with Aristotle (*1 de gener., 84*) and Scotus (*1, d. 3, q. 7*,

§. *Ad argumenta*, P., & 2, d. 15, q. un., §. *Dico ergo C.*) The reason is that the form of a mixed thing is more actual, superior, and posterior in order. For those things that are posterior in generation are prior in perfection — in the same order, as Scotus rightly explains (4, d. 11, q. 3, ante §. *Ad rationes ergo AA.*).

Article III: Whether the Elements Are Incapable of Generation and Corruption

Aristotle (2 *de gener.*, 51) and Scotus (1, d. 5, q. 5, §. *sed pars, sub B. & C.*) transmit that the elements are incapable of generation and corruption. How this is to be understood will become plain from what we shall add below.

Note that something can be said to be incapable of generation and corruption in three ways. First, because it is without matter, as an angel is. Second, because it has no contrary capable of overcoming it by force, as the heaven. Third, because it has an equal power in resisting the active power of its contrary — as the elements. Again, for the present, something can be said capable of generation and corruption in two ways. In one way, with respect to part — that is, because some part of it is generated or corrupted. In another way, with respect to the whole — that is, the whole persists always, even if some part of it is lost in one place, yet in another place it is repaired and restored; in which way the whole is said to always endure.

Assertion I. The elements with respect to their parts are capable of generation and corruption. The Doctor champions this (2, d. 14, q. 3, §. *Dico ad q., sub A., & Quol. 11, ubi Gadius, fol. 19, pag. 2, colum. 1 & 3, & 3, d. 16, q. 2, §. Rationes iste, ante A.*). It is proved first from Aristotle (3 *Caeli*, 52, & 2 *de gener.*, 6), where he treats at length of generation and corruption with respect to parts. Second, when the sun approaches above the zenith of some region, the higher elements — namely fire and air — increase and grow, while the lower — namely water and earth — diminish, as is verified every year by experience; and conversely, when the sun recedes from the zenith of some region, the lower elements increase and the higher diminish. But increase and decrease do not occur without generation and corruption of certain parts of those very elements; therefore the elements according to their parts are generated and corrupted. Third, contrary agents strive with their powers to assimilate opposing things to themselves; but they cannot act upon contraries unless some generation and corruption of parts occurs, as is established in the case of fire, which is extinguished by water, and of water which is absorbed by fire. Therefore the elements are to be considered capable of generation and corruption with respect to their parts.

Assertion II. The elements with respect to themselves as wholes are incapable of generation and corruption. This is defended by the Doctor in the first passage cited above and in the third recently mentioned. It is proved first from Aristotle (2 *de gener.*, 51), who affirms that the elements are eternal and everlasting, just as the world is; but the world is incapable of generation and corruption with

respect to the whole. Therefore the same must be asserted of the elements. Another passage of the philosopher lends support (*1 Meteor.*, c. 3), where he holds it to be an absurdity that one element so surpasses another by its power as to corrupt and destroy it. Therefore according to Aristotle the elements with respect to themselves as wholes are incapable of generation and corruption. Sacred scripture gives support, Ecclesiastes I: *Terra autem in aeternum stat* — "But the earth endures forever"; therefore if the earth is everlasting, so too are the other elements. The same author intimates this in the same work chapter III: *Didici, quod omnia opera tua perseverent in aeternum* — "I learned that all your works persist forever." Lyra interprets this passage as referring to the principal works, which are the celestial and elementary bodies. Second, things that are equal in acting and resisting, and that are tempered to an equilibrium in their powers, are incapable of generation and corruption, because corruption proceeds from the unequal power and faculty of an agent surpassing the potency of the patient; but the elements are mutually equal and tempered in their powers, as the experience of so many years establishes, during which the elements themselves have been preserved uncorrupted with respect to themselves as wholes. Finally, where no created agent is found stronger and more powerful than another, there is likewise no corruption and dissolution of the other, as is self-evident; but in the nature of things there is found no created agent stronger and more powerful than the elements themselves, with the other created things assisting and preserving them; therefore the elements with respect to themselves as wholes are incapable of generation and corruption.

Objection I. What is capable of generation and corruption with respect to its parts is also capable of generation and corruption with respect to the whole, because when the parts are corrupted the whole is also corrupted, just as when the parts are generated the whole is generated; but in the first assertion it was established that the elements are capable of generation and corruption with respect to their parts; therefore also with respect to themselves as wholes. I respond that the major holds for a whole all of whose parts are lost and destroyed, not for a whole of which some parts are corrupted while others are generated. In our case, if some parts of the elements are lost in one place, some other parts are acquired and restored and repaired in another place.

Objection II. One element can so increase that it is capable of destroying another by its power; therefore the elements with respect to themselves as wholes are corruptible. The antecedent is urged: for if fire, which is more active than the rest, were always increasing while opposed to combustible material, it would at length overcome air by its force and be able to destroy it. I respond: to the extent that one element grows in one place, it diminishes to the same extent in another place. Therefore I deny the consequent of the antecedent — namely that one element can so increase as to be capable of diminishing and overturning another, as will be shown more fully below.

Objection III. The elements are constituted of matter and form; therefore they are corruptible. The antecedent is acknowledged from the definition of an element. The consequent holds: for what is composed of matter and form is liable to corruption, since matter, with the privation annexed to it, is the root and origin of corruption (*1 Phys.*, 80). I grant the antecedent; I distinguish the consequent: proximately, I deny it; remotely, I grant it. Or say that this is true of what is possible, but not in fact — just as was said of the heaven (*l. 2, q. 1, art. 6*).

Article IV: Which Element Is the Nobler

Assertion. Fire surpasses the other elements in nobility; air follows; then water; and last earth. This is derived from Scotus (*4, d. 47, q. 2, §. Ad argumentum. C.*). It is the express opinion of Augustine (*1 de spiritu, & anima, c. 15*), who says: "Fire and air are the pre-eminent bodies." And (*2 de gen. ad lit., c. 3*): "Fire is above air." And (*8 civit., c. 14*): "Just as the dignity of their places is diverse, so also that of their natures." It is urged first: what participates in a nobler property and a more excellent principle of acting is nobler and more excellent among the elements — since a more excellent passion and power of acting indicates a nobler and more excellent nature, since the latter gives rise to the former; but fire is endowed with a more excellent power, since it is maximally active. Hence Aristotle (*2 anima, T. 50*) adds that through the intervention of heat all things live and are preserved. But heat belongs most of all to fire; therefore fire is the noblest of the elements. Second, to what is more excellent and eminent, a more excellent and eminent place is to be assigned. For nature is so ordered and disposed as to give to each what is its own; but fire is given the highest place, which is above the air in the concavity of the orb of the Moon. Hence the Stagirite (*5 Top., c. 1*) writes: "Fire is the noblest body, having the highest place." And Ovid sings: *Ignea convexi vis, & sine pondere caeli, Emicuit, summaque locum sibi legit in arce* — "The fiery force of the vaulted heaven, without weight, flashed forth and chose for itself its place in the highest citadel."

Objection I. Earth is at rest in its center; but fire and the other elements are always moved and agitated — as comets, which are revolved by its motion, especially indicate to us in the case of fire. Therefore earth in nobility is to be placed before the other elements. Confirmation: earth provides food for all living things; therefore it is to be placed before the other elements. I respond that the nobility and excellence of any thing is not to be derived from its rest or motion, but from its nature, passion, and power. For it is accidental that something be moved or at rest. All the more so because no one doubts that the heavens are more excellent than earth, yet they are perpetually revolved. To the confirmation I grant that earth is more useful to living things, but not nobler. For merchandise is more useful than the sciences, but not nobler than them.

Objection II. The more excellent and distinguished temperament of living things is the sanguine, which consists of heat and moisture; but heat and moisture befit air more than the other elements; therefore air is to be preferred

to fire. I respond that the excellence and eminence of the elements are not to be derived from the nobility and excellence of a temperament, but from the nobler nature, power, and location of the elements themselves, as I have insisted above.

One might say: if location contributes to the nobility of an element, birds that dwell in air and fish that live in water would be superior to men who inhabit the earth. I respond: from location only a qualified nobility is inferred, not an absolute one, as Augustine (*8 Civit.*, c. 15) expounds it. But man absolutely surpasses all living things in nobility by reason of human nature and especially by reason of the rational soul, and because on earth he is as on a way and tends toward his homeland, which is heaven, the dwelling of the Blessed. Hence Paul (*Hebr. 13*) adds: *Non habemus hic civitatem permanentem, sed futuram inquirimus* — "We have no abiding city here, but we seek the one to come." I conclude with Augustine (*in exp. Psalmi noni*): "Since earth is as it were the final terminus, it is the last element in which men most orderly labor." Pliny (*2 Hist.*, c. 66) writes the same.

Article V: Whether the Elements Are Equal to One Another

The question can be in four parts. First, whether the elements are equal in the quantity of their mass — that is, in magnitude and extension. Second, whether they are equal in density and rarity. Third, whether they are equal in active and passive powers. Fourth, whether they participate in equal matter. All four things are to be established and decided through the following assertions.

Assertion I. The elements are unequal in magnitude and extension. This is indicated by the Doctor (*in utroque opere*, 2, d. 14, q. 3, §. *Ad q. dico. A.*). It is proved first from Aristotle (*2 de gener.*, 37): the same proportion holds of the entire element with respect to quantity as of its parts; but if some part of earth were resolved into a part of water, that part of water would be ten times larger. Likewise, if a part of air were resolved into a part of fire, that part of fire would be ten times larger; and therefore some calculate that fire exceeds earth a thousandfold. Therefore the higher elements surpass the lower ones in magnitude. Second, the container is larger than what is contained, as no one denies; but the higher elements contain the lower: fire contains air, air contains water, and water contains earth. Moreover, what is rare is more extended than what is dense and occupies a greater place, as is plain to everyone; but the higher elements are rarer than the lower, as is evident in earth and water, which are very dense and thick. The mathematicians, who measure all the elements, testify that fire surpasses air in magnitude, likewise air water, and water earth. Therefore the elements with respect to magnitude and extension are not equal to one another.

Assertion II. The elements are unequal in density and rarity. This is intimated by the Doctor (*ubi supra*, § 4, d. 47, q. 2, *near the end*). It is urged first: those things that are more material and thick are more dense, as is evident in liquids,

especially oil; but the lower elements are more material and thick than the higher ones. Hence earth is compacted and water freezes, but not so air and fire. Second, things that are more pure and unmixed are more rare, because density appears to arise from the joining together of many things that are mixed with one another; hence pure water cannot freeze, especially the sea, because in it there are not the conditions that make for freezing as in lakes and ponds; but air and fire are immune from compaction and freezing; therefore they are rarer and purer, as Mayronis (2, d. 14, q. 5) also concludes.

Assertion III. The elements are equal to one another in active and passive powers, and in matter. The assertion is twofold, which the Doctor shows (4, d. 49, q. 13, §. *Respondeo, sub B.*). The first part is proved: the elements are proportioned and tempered; therefore they are equal in active and passive powers. The antecedent is established from what was said above in article III of this question. The consequent is derived: for if one element were unequal in power — either surpassing another or being surpassed by it — the one would be corrupted by the other and dissolved, and consequently in fact the elements would be corruptible, which was rejected above. Hence there is as much heat in fire as there is cold in water, and as much moisture in air as there is dryness in earth, as Joannes de Magistris (1 *Meteor.*, q. 3) well pursues. The second part is proved, having an equal subject but, as I showed in the first part of this assertion, equal powers; therefore there exists equal matter of the elements. And so, if all the matter of any fire were gathered into one, and likewise if all the matter of any water were gathered into one place, the matter of water would be equal to the matter of fire. And the same must be affirmed of the matter of air and earth. Therefore the elements are wonderfully ordered and disposed with respect to matter, powers, and virtues.

Objection I. Sailors dropping a lead weight find the depth of the ocean to be only three miles; and geometers measuring the earth say its depth is six hundred and eighty-eight miles; therefore the higher elements do not exceed the lower ones in magnitude and extension. I respond that the argument does not conclude concerning water gathered all together into one, but concerning water dispersed and divided into what is above the earth and beneath the earth, in so many seas, rivers, ponds, lakes, springs, wells, and the like — so that it is no wonder if the ocean does not possess as great a depth as the earth, which is for the most part gathered together into one.

Objection II. If fire were larger than the other elements, since a greater power appears to exist in a larger body, it would already have devoured the other elements and laid everything waste — which is patently false; therefore fire does not surpass the other elements in magnitude. I respond that the power of fire is tempered and held in check by the moisture of the air and by the stars and heavens which are virtually cold and moist, as well as by the moisture and coldness of water, whose vapors rise to the second and sometimes to the highest

region of air. The response of Scotus (4, d. 49, q. 13, §. *Respondeo, sub B.*) seems to come to the same point, saying that this proceeds from the proportion or equalization of the others in resisting its power in acting — at least with the concurrence and cooperation of the Heaven. I add that its power is not so strong and vehement on account of its rarity in its own sphere and center.

Article VI: Whether the Elements Are Round

The principal bodies of the universe and its more distinguished parts are spherical in shape — this is Mauritius (*in margine Mayr.*, 2, d. 14, *ad finem*, q. 5) and the common opinion of philosophers.

Assertion. The elements are endowed with a round figure. This is derived from Scotus (2, d. 14, q. 3, & d. 15, q. un.) and is expressly defended by Mayronis (*ibidem*, q. 5) and other Scotists, preceded by Pliny (*lib. 2 hist. natur.*, cap. 2), Plutarch (*1 de placitis*), and Ptolemy (*in Almegis*). It is proved first: the entire world is spherical; therefore its principal parts are round, among which the elements are found.

The antecedent is sung by Manilius in the following verses: *Haec est naturae facies, sic Mundum & ipse, Inconnexo volans, teretes facit esse figuras. Stellarum, solisque orbem, lunaeque rotundum Aspicimus tumidumque quaerentes corpore lumen* — "This is the face of nature; thus flying in continuous course, nature itself makes all to have smooth round shapes. We behold the sphere of the stars, the disk of the sun, the rounded moon, and swollen bodies seeking light." Second, the celestial bodies are distinguished by a round figure, for which reason they are moved circularly; therefore the elements are also endowed with the said figure. The consequent holds: the lower orbs are conformed to the higher orbs; but the higher orbs are spherical; therefore the lower are too, as Aristotle (*2 Caeli*, cap. 4) asserts and Augustine (*2 de gen. ad lit.*, c. 19) intimates, expounding that passage of Psalm CV: *Qui extendit Caelum, sicut pellem* — "Who stretches out the heaven like a skin." Third, it is urged individually: and indeed that earth is round, Aristotle (*2 Caeli*, from T. 104 to the end of that book) attends to fully and properly — both because all parts of the earth recede equally from the circumference of the Heaven and approach its center; and also because heavy things falling from any part of the heaven are moved toward the earth at equal angles; therefore it is a clear sign that the earth is spherical. Again, the shadow follows the shape of the body from which it proceeds; but the shadow of the earth that is seen in a lunar eclipse, on account of the interposition of the earth between the sun and the moon, is spherical; therefore the earth is also round. Moreover, those who inhabit the eastern region see and are illuminated by the sun sooner than those who dwell on the western shore — which assuredly proceeds from no other source than the roundness of the earth, as Clavius and others rightly observe in their commentaries on the Sphere. That water is spherical is shown by its small drops existing above the leaves of plants, which appear round; and in the mouth of a cup water swells on account of its roundness. Moreover, those who sail the sea from afar heading toward the shore first see the peaks of mountains before

the valleys and plains — which plainly proceeds from the roundness of the earth. That air too is round is readily shown: air contains water, which, since it is round from what was just asserted, it follows that air too is round. Moreover, air is moved in a circular manner, as is established from comets, which, existing in it, are moved in a circular manner by its motion and that of the heaven. Finally, fire is spherical: both from the side of the Moon, which together with its orb is spherical; and also from the side of air, which from what has just been said is circular. It must therefore be concluded that all and each of the elements individually are spherical and circular.

Objection I. What is moved in a circular manner participates in a round figure, as Aristotle (*1 Caeli, quinta*) writes; but the elements are moved by rectilinear motion, as is evident in earth, which tends downward, and in fire, which is borne upward; therefore the elements do not obtain a round figure. I grant the major; I distinguish the minor: outside their proper sphere, I grant it; in their proper sphere, I deny it. For we observe with the eye that ignited comets are moved circularly, existing in the highest region of the air and near fire.

Objection II. When the sun rises, it is not seen by us to move in a circular manner; but if the earth were round it would be seen by us to rise circularly. Rather it appears to be born with a plane figure and to be moved by a straight motion; therefore the earth is not spherical. I respond to the major: our sense can barely perceive or cannot at all perceive circularity in the motion of the sun around the earth. The reason is that in a great circle and a very wide circuit the curvature and sphericity of a small and slender part is not discerned.

Objection III. In the earth are found mountains, valleys, plains, springs, and rivers, of which some flow from east to west and some from west to east; but if the earth were circular, neither rivers would flow in this way nor would there be mountain peaks and the like; therefore the earth is not to be considered round. Granting the major, to the minor I say that the earth is not round like a mathematical globe, as the argument proves, but round after a fashion and imperfectly, as we contend.

You ask first why the world and its principal parts are distinguished by a spherical figure. Mayronis (*nuper memoratus*) responds that this was done for four reasons: first because the round figure is the simplest; second because it is the most capacious; third because it is the most equal; and fourth because it is the most integral and perfect.

You ask second whether the elements are pure in their spheres. Aristotle (*1 Meteor., c. 3*) responds that something of pure fire is found in its sphere. The reason is adduced by Scotus (*4, d. 47, ad finem, q. 2*): fire is maximally active; hence if anything impure or foreign is carried there, it immediately consumes it or casts it out from itself. Thus fire is purer than any other element, as Augustine (*2 de gen. ad lit., c. 3*) intimates. One may add that something of pure air exists in

the highest region of the air, something of pure water in the depths of the sea, and something of pure earth in its innermost recesses, as the Parisians (*2 de gener., fol. 135*) indicate. Absolutely speaking, however, these three elements — earth, water, and air — are impure and mixed, as is evident from the vapors and exhalations that rise into the air, from the saltiness and sweetness of water, and from the rottenness and mire of earth; and other such things, which render the aforesaid elements very impure and mixed.

Question II: On the Transmutation of the Elements

Article I: Whether the Elements Are Mutually Transmutable

The difficulty is not about the accidental but the substantial transmutation of the elements — not indeed with respect to the whole, since from what was asserted in the preceding question, article III, they are incapable of generation and corruption, but with respect to their parts. For since, as was said there, the elements are capable of generation and corruption with respect to their parts, it is likewise derived that they are partially transmutable. The greater doubt is whether the elements are immediately or mediately convertible into one another. For three conflicting opinions are reported in this matter: the first is that of those mentioned by Marsilius (*2 de gener., q. 9*) and Toletus (*ibidem, q. 5*), who hold that elements are first converted into certain mixed things — such as vapor or exhalation — before they are transmuted into one another. The second is that of Themistius (*5 Phys., Tit. 9*) and Ruuius (*2 de gener., cap. 6, q. 1*), who opine that one symbolic element can indeed be immediately converted into another symbolic element, but not into a dissymbolic one. The third is defended by Tartaretus (*2 de gener., q. 2*), Joannes de Magistris, the Parisians (*ibidem*), and many others who write and teach that all and each of the elements are immediately mutually transmutable.

Note first that conversion or transmutation is twofold: one immediate, the other mediate. The former is when one is converted into another without the intervention of a third — as man into a corpse; the latter is when one is not transmuted into another unless something intervenes — as food is converted into the substance of the living being nourished, by means of chyle and blood.

Note second that the elements mutually act and are acted upon through their qualities, which do not reach their substances since they are accidents, but dispose them proximately toward their production and generation. Among the primary qualities, heat holds the chief place; it is followed by cold; then moisture; and lastly dryness in acting. In resisting, however, the order is inverted: dryness comes first, then moisture, then cold, and heat occupies the last place — of all which things more will be said below in question III.

Assertion I. The elements are mutually transmuted. This is transmitted by Aristotle (*2 de gener., T. 7, 24, & 1 Met., 2, 4*) and Scotus (*ibi, & 2, d. 14, q. 3, §. Dico*

ad q., sub A.). It is proved first: contraries are mutually transmuted because they conflict among themselves; and what gains victory over another converts it into itself — just as an animated living being converts nourishment into itself. But the elements are mutually contrary and wage continuous war; and sometimes one overcomes another — in summer fire and air overcome water and earth, and conversely earth and water in winter overcome air and fire; therefore the elements are mutually transmuted. Second, from (*1 de gener., cap. 4, Tit. 18*): the generation of one is the corruption of another, and conversely; but certain elements are generated and others corrupted with respect to parts — namely at the times just mentioned; therefore there is perpetual and perennial transmutation among them. Third, we observe with the eye that if fire is cast into water and is of lesser power, it is extinguished by that water; but conversely if fire possesses a greater power, it absorbs water. And the same must be asserted of the other elements; therefore a continuous and mutual transmutation exists among the elements.

Assertion II. Both symbolic and dissymbolic elements are immediately converted into one another. This is derived from the Doctor (*ubi supra, § 2, d. 3, q. 4, §. Contra. Sub F.*) and appears to be the explicit view of Aristotle (*locis pract.*). For he proves there the transmutation of all the elements precisely because those elements are contraries, and they are immediate contraries — as water and fire, earth and air; therefore according to Aristotle the elements are transmuted into one another immediately. Moreover, all the elements possess the power of this kind of immediate transmutation; therefore an immediate transmutation of the elements is not to be denied. The antecedent is readily apparent, since one element participates in the power by which it can immediately convert another element into itself — as water can immediately extinguish fire, and conversely fire can absorb water. Nor does it help to say with Ponce (*disp. 56, q. 5, concl. 1*) that the elements do not have sufficient powers and capacities for converting themselves immediately into one another. For nature does not fail in what is necessary; since the conversion of the elements is necessary for the consistency of the universe and the perennial generation of sublunary things, they must possess fitting and sufficient faculties for such mutual immediate transmutation. Indeed, if the elements through their prior qualities can immediately reach the production of a mixed thing — as Ponce admits — with greater right they can immediately generate an element, since this is more ignoble and inferior than that. What can do the greater can certainly also do the less. All the more so, given the proper dispositions present through their qualities, nothing prevents one from being immediately converted into another — as if the heat of fire surpasses the cold of water and its dryness the moisture of the latter, with no medium interposed the transmutation of water into fire will occur. Again, if a drop of water is cast into an enormous and burning furnace, fire immediately devours it and converts it

into itself; therefore the said mutual and immediate transmutation of the elements is to be admitted.

One might say with Ponce (*cit.*), denying the antecedent. For he thinks that a small drop of water cast into a large fire is first converted into smoke or another mixed thing. On the contrary: such a drop of water is immediately absorbed by the fire — as is indicated by the crackling sound it emits, and no smoke or anything else proceeds, since it is immediately destroyed and perishes, as is seen with the eye; therefore nothing mixed is produced. Furthermore, the qualities of the elements immediately act upon one another — as heat upon cold, moisture upon dryness; therefore the substances of the elements too, given the proper dispositions, immediately act and are mutually converted.

Objection I. An extreme cannot pass to an extreme without first passing through the mean (*5 Phys.*, 22). But fire and water are extreme elements, dissymbolic and maximally contrary, between which air mediates; and likewise air and earth are extremes between which water is interposed; therefore fire cannot be converted into water unless it is first converted into air, and likewise air cannot be transmuted into earth unless it is first transmuted into water, and consequently an immediate transmutation of the elements, at least of the dissymbolic ones, cannot be effected. I distinguish the major: if the passage through the mean is necessary, as in local motion and in the formation of man from what was noted in the first note, I grant it; but if it is not necessary, as in our case, I deny it — which the proofs of the second assertion set forth above effectively demonstrate.

Objection II. If water were immediately to convert fire into itself, fire would first have to receive the coldness of water into itself, because it is necessary that fire be disposed through it for the introduction of the form of water; but fire cannot receive the coldness of water — both because it is contrary and repugnant to it, and also because Aristotle (*2 de partibus animalium*, c. 2) expressly denies it. Therefore one element cannot be immediately converted into another. I grant the major; I distinguish the minor: fire cannot receive the coldness of water into itself as proper and connatural to it, I grant; as violent and repugnant to it, I deny — just as water receives heat, which is contrary to it; so too fire receives coldness, which is opposed to and resists it. Thus Aristotle is expounded.

Objection III. Fire is the lightest and earth the heaviest; therefore fire cannot be generated from earth. The antecedent is evident; the consequent is shown: since lightness and rarity would have to be received in earth, which is incapable of them, since it is heavy and dense. I grant the antecedent and deny the consequent; to its proof I say that its heaviness is remitted by the rarity of fire overcoming it, in such a way and disposition suitable and fitting that it can receive the form of fire — as Scotus (*1, d. 17, q. 3, §. Hic dicitur versu. Tertio sic*) notes in a similar case.

Article II: Whether Symbolic Elements Are More Easily Transmuted Into One Another Than Dissymbolic Ones

Various opinions and conflicting ones exist, as may be seen in Toletus (*2 de gener.*, q. 9) and Ruuius (*ibid.*, c. 6, q. 2). We, however, follow the common opinion which is affirmative, and which was first embraced by Joannes de Magistris (*eo in loco*, q. 2), Tartaretus (*scibili primo*), and the Parisians (q. 1, fol. 134).

Note that those elements are called symbolic that agree in some quality — as fire and air, which both participate in heat; and likewise water and earth, which both obtain cold. Dissymbolic elements, however, are those called by that name that have no quality in common — as fire and water. For fire is hot and dry; but water is cold and moist. Likewise air and earth are dissymbolic, since air is hot and moist, but earth is dry and cold. The ease or difficulty of mutual transmutation of the elements can be derived from the primary qualities or from the secondary qualities; and likewise from their activity or resistance, or from both simultaneously.

Assertion. Symbolic elements are more easily and quickly transmuted into one another than dissymbolic ones. This can be derived from the Doctor (*2, d. 14, q. 3, §. Dico ad q.*) and is transmitted explicitly by Aristotle (*2 de gener.*, c. 4, T. 25). It is proved first: it is easier and more convenient to overcome one than two — as can be gathered from Ecclesiastes IV: *Funiculus triplex difficile rumpitur* — "A threefold cord is not easily broken." And from the common saying: "Not even Hercules against two." But in the transmutation of a symbolic element into a symbolic one, only one contrary power and quality is to be overcome — there being only one resisting power and quality in them; but in the dissymbolic ones two contrary powers and qualities are to be surpassed, as is established from the note set out above. Therefore the transmutation of symbolic elements is easier and quicker than that of dissymbolic ones. The major is to be taken with other things being equal. For on account of an excess of powers and qualities of dissymbolic elements, a quicker and easier transmutation of them can be effected — as if a drop of water is cast into an enormous fire, it is more quickly and speedily converted into that fire than air into fire, or water into earth, even though those are dissymbolic and these symbolic. Second, the form is introduced more quickly and readily into matter when there is one impediment to be removed than when there are two obstacles of no small size — as may be observed in natural, moral, and artificial things. In the conversion of a symbolic element into a symbolic one, only one obstacle stands in the way — namely one contrary quality; but in the transmutation of a dissymbolic one into a dissymbolic one, two obstacles stand in the way and oppose — namely two contrary qualities. Furthermore, two warring substances can more than one; but in symbolic ones only one fights, whereas in dissymbolic ones two fight; therefore the transmutation of the latter is more difficult, while that of the former is easier and quicker.

Objection I. The same reasoning holds for the transmutation of symbolic and dissymbolic elements; therefore symbolic elements are not more easily and quickly transmuted than dissymbolic ones. The antecedent is urged: in both there are two qualities that do not persist in the transmuted element, otherwise an accident would migrate from subject to subject. I deny the antecedent; to its proof I say there is a disparity, because in dissymbolic ones there are two contrary qualities to be overcome; but in symbolic ones only one quality is to be vanquished, while the other, even if it perishes, does so not through itself but through accident — namely at the corruption of the subject — because when the subject is corrupted all that is in the subject is corrupted.

Objection II. A drop of water cast into a great fire is more quickly and speedily devoured by the fire than a particle of earth; but fire and earth are symbolic, while water and fire are dissymbolic. Therefore the conversion of dissymbolic ones is easier than that of symbolic ones. All the more so, action takes place between contraries; therefore where there is greater contrariety, there the quicker and easier action proceeds; but dissymbolic ones conflict more than symbolic ones, because the latter contend with respect to only one quality, but the former with respect to two qualities; therefore the transmutation of the latter is quicker and more convenient. I respond that our foregoing proposition is to be taken with other things being equal; but in the argument adduced there is an inequality, because a portion of earth possesses more matter than a drop of water and therefore offers more resistance and is more difficultly converted; but if the matter were equal in both, a portion of earth would be more quickly converted into fire than a drop of water. To the other point that is added, I say that although action takes place between contraries that mutually contend, nevertheless where there are more and stronger contraries to be overcome, a slower and more difficult victory is gained — as happens in the present case, because two contrary qualities in dissymbolic ones are to be vanquished, while in symbolic ones only one; and for that reason the transmutation of the latter is easier, of the former more difficult.

Article III: Whether from Two Elements a Third Can Be Produced

The title of this article can be taken in two ways: in one way, whether an element can corrupt two elements and generate a third element specifically different from them; in another way, whether through the action of a third, an element distinct from two mutually conflicting ones can be produced — or whether from two defeated elements one element can produce a third distinct from them. But either sense can be understood both of dissymbolic and of symbolic elements; and it is treated by Joannes de Magistris (*2 de gener., q. 2, scibili 2*), Tartaretus (*ibid.*), and other Scotists, and most recently by Ponce (*disp. 56, q. 6*).

Assertion I. One element can generate another element specifically distinct from it. Scotus (*2, d. 14, q. 3, & d. 15, q. un., & d. 18, q. un., §. Dico igitur. Sub K.*) does not appear to depart from this. It is proved first from Aristotle (*2 de gener., c.*

4), writing that there is a mutual transmutation of the elements. And (*ibid.*, T. 26) concluding their circular generation; therefore according to Aristotle one element can generate another. Nor does Ruuius (*in praesenti*, c. 6, q. 3) satisfy this testimony of the philosopher, saying that there Aristotle only wishes to say that from any element, as a terminus from which, another can be generated, but not that one is the efficient cause of another. For Aristotle there, adducing the reason why elements are mutually transmutable, says that it is because they are contraries fighting through their primary qualities; but such contraries are efficient and causative; therefore the Stagirite is speaking not only of the terminus from which, but of a true efficiency of them. Moreover, he teaches there that the passage is easier and quicker in symbolic than in dissymbolic ones; but such transmutation pertains to the efficient cause. Furthermore, a symbolic element truly causes a symbolic element — as fire causes fire; therefore when the question is whether a dissymbolic one can generate a dissymbolic one, such a question pertains to the efficient cause, and therefore Ruuius's interpretation is incongruous and inept. Second, the four primary qualities are as it were the seminal reasons of the elements, as Scotus (2, d. 18, q. un., ante L.) notes with Augustine (3 *Trin.*, 9). Therefore through them the elements are prepared and disposed for their aforesaid conversion, and thus one can cause another, since each of them participates in two, or at least one, of those qualities. Ruuius (*cit.*) objects that one quality does not suffice, but two are necessarily required. On the contrary: one quality, stronger and more efficacious than others — like heat — can prepare and dispose one element for the corruption and generation of another, as is evident in summer when heat is fierce and cold languishes; and conversely in winter when cold dominates and heat perishes; therefore whether one or two qualities suffices for the generation of any element. All the more because Aristotle (1 *Meteo.*, Sum. 4, cap. 1) affirms that in the crypts and caves of the earth, from the air enclosed in them, water is generated, whose efficient cause is none other than the earth, whose coldness overcomes the heat of the air and disposes for introducing the form of water. Hence springs and rivers take their origin. Since the coldness of the earth is directed of itself and tends toward expelling the heat of the air and introducing the form of water, with the concurrence of moisture and the other things prerequisite for its generation — for since the elements are not pure but mixed, the coldness of the earth is not alone in those places but is accompanied by moisture and the like, which contribute to the production of water — therefore earth is through itself the cause of the generation of water. Again, there is greater agreement and efficacy in one element for causing another than in a mixed thing for generating an element; but a mixed thing can cause an element — as flint and iron struck together generate fire; therefore it is not to be denied that one element can cause another. Ruuius (*loco memorato*) meets this and denies that fire is generated from struck iron and flint as from causes through themselves, and has recourse to universal causes and celestial powers, whose role it is to supply the deficiency of particular causes when these cannot produce

such effects — as happens in the generation of imperfect animals from putrid matter. But daily experience teaches us that fire is caused in that manner; therefore, since particular causes of those effects are plainly present, the recourse to universal and celestial causes is empty and vain. Especially because the production of fire from the said striking of iron and flint does not exceed their powers and virtues — since they are mixed things that surpass any element in nobility; therefore, since fire is seen to issue from them with the eye, no other cause is to be sought and tracked down. What Ruuius says about the generation of imperfect animals does not help him, because the putrefied earth or whatever else is adduced, being more ignoble and imperfect than those animals, cannot cause and generate them, and for that reason recourse to a universal cause is taken — but not so in the present case.

Assertion II. One element can corrupt two elements and generate a third distinct from them. Scotus (*locis prarecensitis*) does not dissent, nor does Aristotle (*2 de gener., Tit. 29*). It is proved first: the stronger power of one element can overcome the weaker powers of two elements; therefore through that victory which one element gains over the other two, a third distinct from them can be produced. The antecedent is urged: a large fire by its force can overcome some part of water and a portion of earth, from which afterwards air could be produced; therefore given the hypothesis, one element can corrupt two elements from which another distinct one is produced. Second, it sometimes happens in mixed things that one destroys two, from which a third distinct from them is generated. The antecedent is readily apparent: one of these can kill two men, from which corpses, worms, and the like are made, which are distinct from man.

Assertion III. Through the action of a third, from two mutually conflicting elements, another can be generated. Scotus (*ubi supra*) and Aristotle (*cit.*) do not oppose this. It is proved first: if water and earth should conflict among themselves and their powers be weakened, through the action of a supervening fire from those defeated ones, air could be produced, as I intimated above. Therefore through the action of a third this is possible. Second, in mixed things this occurs not rarely — as from iron and bronze, through the action of fire, gold can be produced; and from a horse and a she-ass a mule is generated, which differs specifically from them; therefore this can also occur in the elements.

Objection I against the first assertion. If one element could generate another specifically different from it, it would be either its univocal or equivocal cause; but it can be neither cause; therefore this is to be considered impossible. The major is clear because the division of cause into univocal and equivocal is adequate. The minor is shown: a univocal cause is of the same character and species as the effect it causes; an equivocal cause is more excellent than the effect it produces, since it contains it eminently and virtually; but one element

does not contain another eminently, since it is not superior and more excellent than it. I grant the major and, having admitted the first part of the minor, I deny the second part: for fire, being the noblest of elements, is generated both univocally and equivocally, as I showed above. The same is asserted of animals, which are generated through putrefaction and propagation.

Objection II. If fire and air should conflict among themselves, since both are hot, if water were produced through the action of a third, heat would persist in the water; but heat cannot remain in water since it is extrinsic and repugnant to it, and water returns to its own coldness; therefore from two elements a third cannot be produced. I respond that given the hypothesis, the heat of fire and air does not endure in the water, which expels it as its contrary; and when the subjects of that heat — namely fire and air — are corrupted, that heat itself is corrupted insofar as it was subject in them.

Objection III. The same thing according to the same respect and with reference to the same thing cannot be stronger and weaker; but if a third were generated from two elements mutually contending, the same would be both stronger and weaker; therefore it is impossible. The major is evident. The minor is shown: the same would be stronger because it would overcome another, and weaker because it would be overcome by another — since both would be corrupted, since a third would be produced from both. I grant the major and deny the minor; to its proof I say that this is accomplished through the action of a third, as remains explained and proved in the third assertion.

Question III: On the Primary Qualities of the Elements

Article I: How Many and What the Primary Qualities of the Elements Are

Some, both ancient and modern — whom Arriaga (*disp. 4 de gener., Sect. 2*) follows — posit only two primary qualities, namely heat and cold. The common opinion, however, is that of Aristotle (*2 de gener., cap. 2, T. 8*), the Parisians, Joannes de Magistris, Tartaretus, and others, who enumerate four primary qualities: heat, cold, moisture, and dryness.

Note first that the primary qualities are not inseparable from the elements. For fire can exist without heat, and water without coldness — yet not the former without the power and virtue of heating, nor the latter without the principle of cooling. Therefore the said qualities, whether they belong to the second or third species of the category of quality, are really distinct from the elements; but the powers and faculties of the elements are really identified with them, as the Doctor (*2, d. 16, q. un., §. Ideo dico*) transmits generally of all the real virtues of things.

Note second that the four aforesaid qualities are called active, not because other qualities are not active, but because the primary qualities are productive of their

like — as heat produces heat, cold produces coldness, moisture produces moisture, and dryness produces dryness; but other qualities do not do so. For heaviness does not cause heaviness, nor lightness lightness; for that reason they are called passive rather than active. Furthermore, note that moisture and dryness are called passive qualities not absolutely but relatively. For since heat and cold are more active than moisture and dryness, the latter are therefore said to be passive with respect to the former; and they are of greater resistance than the former. What is of greater resistance is called passive with respect to what is of lesser resistance — as Joannes de Magistris (*2 de gener.*, q. 1, dub. 1) notes above all others.

Assertion I. There are four positive primary qualities as enumerated above. These are presupposed by Scotus (*4, d. 1, q. 5, §. Ad primum, sub F.*) and are indicated by him (*q. 40 praedicamentali, in fine*). And they are cited by Augustine (*1 de doctrina Christiana, c. 14, & in expositione Psal. 6*). It is urged first: there are four elements, from what was asserted in question I of this book, article I; therefore there are also four primary qualities. The consequent is derived: each element participates in its own proper quality in the highest degree — as fire in heat, air in moisture, water in coldness, and earth in dryness. Second, there are four humors — phlegm, blood, black bile, and yellow bile — from which four complexions of animals arise: the melancholic, phlegmatic, sanguine, and choleric; therefore the quaternary number of primary qualities is rightly inferred. Moreover, qualities are granted to elements so that there may be mutual transmutation among them, as Aristotle (*2 de gener.*, cap. 2) well saw; but for transmutation four qualities are required — two active, which are heat and cold, and two passive, which are moisture and dryness. Finally, all qualities are fourteen in number as cited by the same philosopher (*ibid.*, T. 8); and the remaining ones are reduced to the first four, as is shown in that passage and explained by Joannes de Magistris. Therefore no more than four primary qualities are to be reckoned.

Assertion II. The primary qualities are rightly distributed — being neither derived from others nor from one another, but being those from which the other tangible and sublunary qualities arise. This is consistent with Aristotle (*2 de gener.*, T. 15) and does not conflict with Scotus (*cit.*, & *aliis suae doctrinae locis*). It is urged: the primary qualities dispose toward the generation of a thing, while other qualities pertain to the adornment and perfection of the thing; therefore just as a thing is first generated before it is adorned and perfected, so those qualities precede these ones in the order of nature and thus are not from others but are primary. Moreover, heat generates only heat, and coldness coldness, and so on for the rest; therefore they are not from one another. Again, from the mixture of these there proceed the other qualities — as the Doctor (*4, d. 49, q. 15, §. Respondeo, sub A.*) asserts of color, following Aristotle (*sect. ult. problem. de sapore, lib. de sensu, Sensibili, cap. 4, & de odore ibid., cap. 5, & 2 anima, cap. 9, de gravitate, & levitate, 4 Phys., T. 85, & de sono, Sect. undecima problem.*). Therefore, since the

foregoing definition is adequate and reciprocal, containing nothing superfluous or deficient, it is to be considered correct and fitting.

Assertion III. Virtual qualities of the elements, distinct from the four aforesaid ones, are not to be admitted. This is not at variance with the principles of Scotus and is defended by Tartaretus (*2 de gener., q. 1, scibili tertio*), the Coimbrans (*cap. 3, q. 2, art. 2*), Ponce (*disp. 54, q. 3, concl. 4*), and others both ancient and modern. It is proved first: if beyond the four actual primary qualities there were four virtual ones, there would be eight qualities; but this is contrary to Aristotle (*2 de gener., 7, 15*), who transmits that there are only four qualities. Moreover, the primary qualities are either of the second or third species of the predicament of quality; but these are only actual; therefore no virtual qualities distinct from actual ones are given. Second, other qualities besides the primary ones proceed from the mixture of the primary ones themselves, as I made plain in the second assertion; therefore if virtual qualities were admitted, they would be to be assigned among the secondary qualities. Furthermore, whatever exists is either really identified with substance or really differs from it. If the first, it is not a quality, because since quality is an accident it does not coincide with substance. If the second, therefore it is an accident, which is not divided into actual and virtual; and consequently the primary qualities are wrongly distributed into four virtual and four actual ones.

Objection I. One primary quality is produced from another; therefore the primary qualities are not well defined as those neither derived from others nor from one another, but from which the other sublunary qualities arise. The antecedent is acknowledged. For in summer, from the heat pressing and burning, dryness and aridity of the earth arise; for at that time herbs, plants, and most other things are desiccated and dried up. I deny the antecedent; to its proof I distinguish: through itself, I deny; through accident, I grant. For from the fact that heat then consumes the moisture, dryness and aridity of the earth are produced through accident.

Objection II. Water, when it is hot, reduces itself to its former coldness; therefore water has a virtual quality through which it returns to its native cold; but that virtual quality differs from those four actual ones enumerated above; therefore virtual qualities distinct from actual ones are to be admitted. I respond that water returns to its native coldness not from any virtual quality distinct from the four primary actual ones, but from its substantial form, by the power of which it is made cold — as I intimated above at the end of the first note.

Objection III. In mixed things there are virtual qualities; therefore also in the elements. The antecedent is apparent from wine and pepper, which although actually and formally they are cold, yet when taken by a man and introduced into his stomach they heat; and physicians likewise experience that certain herbs are virtually hot and others virtually cold. I grant the antecedent and deny the consequent; because such powers proceed from the specific natures of those

things and perhaps are not properly qualities and common accidents but proper ones, really identified with their substantial natures — as I noted in the first note.

Article II: What the Individual Primary Qualities Are

In the preceding article a definition of the primary qualities in common was adduced; in the present article the individual qualities are to be described. For Aristotle (*2 de gener., cap. 2, T. 8, & 4 Meteor., cap. 1*) defines each primary quality in the concrete. He says: "The hot is what gathers the homogeneous and separates the heterogeneous" — as heat gathers gold mixed with other metals into one and separates and divides it from them, as is established in the liquefaction of metals. "The cold is what gathers both the homogeneous and the heterogeneous" — as is evident in frozen water, in which wood, stones, straw, and the like are gathered together. "The moist is what is with difficulty terminated by its own terminus but easily by an alien terminus" — as water is terminated by stones and embankments as by alien termini. "The dry is what is easily determined by its own terminus but with difficulty by an alien one" — as is evident in earth and stone, which are indeed terminated by their own limit with ease, but by an alien terminus only with labor, since they must be cut and divided into parts.

Assertion. The individual primary qualities were aptly and fittingly defined. Scotus does not depart from this in his writings. It is urged: those foregoing descriptions lucidly declare the natures of the primary qualities and well explain their passions and effects; therefore they are rightly transmitted. Again, genus and differentia can be assigned in them. For all agree in the common character of quality and differ in the rest, as is clear to one running through the words and particles set out above.

Objection I. A thing ought to be defined through what is prior and more intimate to it — for a definition explains the intrinsic nature of the thing; but there are other things in the primary qualities more prior and intimate than gathering the homogeneous, joining the heterogeneous, being terminated by an alien terminus, and being determined by one's own terminus. Therefore the individual primary qualities were not well described. The major is clear. The minor is proved: to heat is more intimate to heat than to gather the homogeneous; to cool is prior to cold than to join the heterogeneous; therefore the primary qualities are better defined through these than through those. I respond that all this argument is true, but Aristotle preferred to describe the said primary qualities through other properties and inferior and posterior effects, because those other things are not so well known and easy as heating, cooling, and the like — for he would have said nothing new and worthy of knowledge, nor would he have furnished us with greater knowledge of the said qualities.

Objection II. Heat joins the heterogeneous; therefore it is not distinguished from cold by the fact that cold gathers both the heterogeneous and the homogeneous, while heat gathers only the homogeneous. The antecedent is proved: in the liquefaction of wax and resin, in which both the homogeneous and the heterogeneous are gathered into one. Again, in the generation of a mixed thing from hot and moist, heterogeneous parts are put together; and in the nutrition of a living being, food of one kind is joined through natural heat with food of another kind. Finally, by cold stones are sometimes broken and members are dissolved, as is evident by experience in winter. I distinguish the antecedent: absolutely, I deny it; in a qualified sense, I grant it. Likewise the remaining proofs that are added must be answered. For by reason of some viscous quality, through heat, heterogeneous bodies are united together with homogeneous ones. Absolutely speaking, however, such a union is not effected by heat. To the last point I say that this occurs not through itself but through accident, insofar as certain parts are too much constricted and cannot sustain themselves; therefore they are loosened and collapse.

Article III: Whether Some Primary Quality in the Highest Degree Belongs to Each Element

Assertion I. The four primary qualities in the highest degree belong to the four elements. The common opinion of philosophers and physicians is to this effect, from which the Doctor (*2, d. 15, q. un.*) does not depart. It is proved first: there are four elements, from what was said in question I of this book, art. I; therefore there are also four primary qualities belonging to them in the highest degree. The consequent holds: just as each element is distinguished specifically from another, so it also obtains a quality specifically distinct from the rest, through which it acts and exercises its operation. Second, the four primary qualities in the highest degree do not apply to mixed things, because in these they are said to be refracted and weakened; therefore they belong to the elements themselves, whose nature is simple. But from a simple thing substantially and virtually, only one quality proceeds primarily and immediately; and therefore only one simple operation is exercised.

Assertion II. Heat belongs to fire and moisture to air in the highest degree. This is derived from the Doctor (*cit., & 4, d. 47, q. 2, ad finem*). The first part is urged first: to the nobler element a nobler quality is due, since qualities are distributed in accordance with the distribution of natures; but fire is the nobler element, from what was shown in art. IV, q. I of this book, and heat surpasses the remaining qualities in nobility; therefore heat is rightly attributed to fire in the highest degree. Second, to the origin and source of heat the highest heat is due, just as to the source of light the highest light; but fire is the source of heat (*2 de gener., cap. 3, T. 23, & 2 Met., C. 1, T. 4*); therefore the highest degree of heat belongs to it. The second part is proved from Aristotle (*2 de gener., passu nunc alleg.*), attributing moisture to air, heat to fire, coldness to water, and dryness to

earth. And (7, 49, *eiusdem lib.*), adding that fire and air resist water and earth — for no other reason than that fire is hot, by reason of which it is opposed to water, and air is moist, by reason of which it is opposed to earth. Therefore according to Aristotle the highest moisture is ascribed to air. Second: the moist is that which is with difficulty terminated by its own terminus and easily by an alien one, as is established from the preceding article. But air is of this kind: for its own proper terminus is with difficulty assigned to it, while it is easily enclosed by an alien one, as is evident in bladders and bellows. I add that things that are moist are made more moist through air, as is evident in oil and other moist things.

Assertion III. Water is cold in the highest degree, and earth is dry likewise in the highest degree. This does not conflict with Scotus's works. The first part is from Aristotle (*loc. proxime cit.*, T. 23). It is proved first: water cools maximally, as is evident by experience when someone spends a period of time in it — his teeth chatter. Second, water is maximally opposed to fire, since they are dissymbolic elements; but fire is supremely hot; therefore, by opposition, water is supremely cold. The second part is transmitted by Aristotle (*ubi supra*), and can be shown from Genesis I, where earth is called arid — that is, maximally dry — as Basil (*hom. 4 Hexam.*) interprets it. Moreover, unless earth is moistened by rain or river water, it is maximally desiccated and dried up; therefore dryness in the highest degree is appropriate to earth.

Objection I against the second assertion. Water moistens more than air; therefore the highest moisture is to be adapted to water and not to air. The antecedent is acknowledged: for it is established by experience that those places are maximally moist that are full of water. Confirmation I: air becomes dry through the blowing of the winds; therefore it is not subject to the greatest moisture. Confirmation II: the Moon powerfully dominates in moist bodies; and the Moon has great dominion over water, as the Doctor (2, d. 14, q. 3, §. *Dico ad q., ad B.*) asserts of the ebb and flow of the sea; therefore water is rather to be called maximally moist than air. I respond that this occurs because water is denser and thicker than air; hence water moistens more than air, which is rare, thin, and subtle. This can be explained by the case of heated iron, which heats the hand more than fire consuming tow. The reason is that fire and tow are rare bodies while iron is dense. To Confirmation I: I say that dryness proceeds not from air but from windy exhalations. To Confirmation II: I grant that the Moon maximally dominates water; but from this it is not inferred that water is moister than air. Why the Moon should so dominate water the Doctor (*loc. nuper cit.*) investigates, as will I in the proper place.

Objection II against the third assertion. The further something is from the heaven, the colder it is. For the heaven appears to be the cause of heat — hence it was considered by some to be ignited. But earth is further from the heaven than water, since it is the lowest element; therefore the highest coldness belongs

to earth, not to water. Confirmation I: if water were maximally cold, it would be frozen; but experience testifies the contrary; therefore the highest coldness is not proper to water. Confirmation II: maritime places are warmer than inland places; but if water were the coldest, maritime places, in which there is the greatest abundance of water, would be colder; but this is evidently false; therefore. I deny the major: for greater or lesser distance from the Heaven is not the cause of greater coldness or heat, since the heaven is not formally hot but only virtually. To Confirmation I: the consequent of the major is to be denied. For the cause of the freezing of water is a terrestrial exhalation. Since however in the sea there are no such exhalations, for that reason the sea does not freeze. But marshes and ponds freeze maximally. Indeed we experience that warm water freezes more quickly than cold, the reason for which is that there is a greater abundance of exhalation in warm water than in cold. To Confirmation II: I say that mountainous places are closer to the middle region of the air, which is coldest through antiperiastasis; and likewise on account of snows that almost always remain in those places, and on account of the rays of the sun which do not directly reach them. But maritime places are very low and remote from the edge of the second region and devoid of snows; and likewise the sun directly illuminates and with its light directly looks upon them with no obstacle interposed; for that reason they are warmer.

You ask whether each element has twin qualities. I respond affirmatively, yet not both equally primarily, since one is prior to the other. For fire is hot and dry; air moist and hot; water cold and moist; earth dry and cold — as Damascene (*2 fidei, cap. 12*) transmits after Aristotle (*2 de gener., T. 23, & 4 Meteor., cap. 1*).

Article IV: Whether the Symbolic Qualities of the Elements Are of the Same Species

Some — whose names Toletus (*2 de gener., q. 7*), the Coimbrans (*q. 6, art. 1*), and Ruuius (*ibid., q. 10*) keep silent about — hold that the symbolic qualities of the elements are distinguished from one another in species. The common opinion, however, is that of Tartaretus (*de gener., q. 1, scibili 4*), Marsilius (*q. 4*), Racon (*q. 3, art. postremo*), and others who teach that the aforesaid qualities participate in the same species.

Note that some elemental qualities are symbolic and some are dissymbolic. The symbolic are those that belong under the same name to many elements — as the heat of fire and air, the moisture of air and water, the coldness of water and earth, and the dryness of earth and fire. The dissymbolic, however, are called by that name those that differ from one another both in name and in reality — as the heat of fire and the coldness of water, the dryness of fire and the moisture of air, the moisture of water and the dryness of earth.

Assertion I. The symbolic qualities of the elements are of the same species. This is intimated by the Doctor (*in utroque opere, 2, d. 15, q. un.*). It is proved first:

things that mutually intensify one another belong to the same species — as is evident in water added to water, through which water itself increases; and in light added to light, through which that same light is augmented. But the symbolic qualities of the elements mutually intensify one another — as the coldness of water intensifies the coldness of earth, and the heat of fire intensifies the heat of air; therefore such qualities are of the same species. Second, there is an easier passage of a symbolic element into a symbolic one than of a symbolic into a dissymbolic one, as remains proved in question II of this book, article II. But if the symbolic qualities did not enjoy the same species, the transmutation of dissymbolic ones would be equally easy as that of symbolic ones, because in both, both qualities would have to be overcome. Indeed there would be no symbolic element, because both of its qualities would be of a diverse species. Moreover, there would not be only four primary qualities but eight — which was rejected in article I of this question. And there would be two contraries for one, which not only conflicts with Aristotle (*10 Met., cap. 9, T. 25*) but also with sacred scripture, Ecclesiasticus XXXIII: *Duo contra duo, & unum contra unum* — "Two against two, and one against one." Therefore the symbolic qualities of the elements are of the same species.

Assertion II. Elemental heat appears to differ specifically from the natural heat of a living being, so that although the qualities of a mixed thing are similar to the qualities of the elements, they do not however participate in the same species. This is held by the Doctor (*loc. pract., §. Ad 1 in oppositum. F.*) and followed by Lychetus (*ibid.*). It is proved first: things of the same species mutually assist, foster, and intensify one another — as is evident in several lights joined and united together; but elemental heat — specifically febrile heat — consumes and extinguishes the natural heat of living beings. Hence the Stagirite (*5 Polit., cap. 8*) adds that death is the extinction of natural heat in the radical moisture; therefore elemental and vital heat are not of the same species. Second, things that produce diverse effects are of diverse species — for diversity of species is discerned from the diversity of effects that proceed from them; but native heat disposes for the conversion of food into the substance of the being nourished, and flesh is caused; but the heat of fire obtains a different effect — namely the disposition and preparation for generating fire; therefore the heat of fire is of a different species from vital heat.

Objection I against the first assertion. Things that proceed from natures specifically different are of diverse species; since natures specifically different enjoy properties specifically distinct. But the symbolic qualities proceed from natures specifically different — as heat from fire and air. But fire and air differ specifically; therefore the heat of fire and air differ specifically from one another. I respond that the major is not universally true except of properties in the fourth mode. For although the ox and the eagle differ specifically from one another, nevertheless the sight of the one and the other are of the same species. Likewise, although man and angel differ specifically, yet the intellect of man and

of an angel are not distinguished in species, as Scotus (2, d. 1, q. 6, §. *potest etiam addi. D.*) admirably and lucidly transmits.

Objection II. The moisture of water extinguishes fire, but the moisture of air does not consume fire; therefore it is a clear sign that the moisture of air and water are not of the same species. I respond: the reason why the moisture of air does not extinguish fire is that it is thinner and subtler; but the moisture of water is thicker and denser, and for that reason consumes and destroys fire.

Objection III. The heat of fire remains violently in air and in fire itself naturally; but things of the same species are not found violently and naturally in the same subjects; therefore the symbolic qualities of the elements are of diverse species. I distinguish the major: heat in the highest degree remains violently in air, I grant — for it belongs to fire alone to this degree; heat in a remiss degree, I deny. For in this manner it is adapted to air, which is hot in a remiss degree and moist in the highest degree.

Objection IV against the second assertion. Aristotle (*lib. de respiratione, cap. 7*) calls the natural heat that serves for nutrition "igneous heat"; therefore natural and igneous heat agree in one and the same species. I respond that there is indeed a kinship and similarity between both heats, as Scotus (2, dist. 15, q. un., §. *Ad primum*) notes; but they nonetheless do not enjoy the same specific nature — just as the qualities of mixed things are similar to the qualities of the elements yet are not the same in species, as the same Doctor teaches (*ibid.*). Hence Aristotle (*praealleg.*) so expounds this, as is plainly indicated (*lib. de iuvent., cap. 1*), where he says that the soul in the heart is as it were fiery — that is, has heat similar to the heat of fire — as the particle "as it were" consulted placed by him denotes.

Objection V. Igneous heat assists natural heat, as is evident in medicines affected by the heat of fire, which serve for decoction; and chickens are said to be hatched from hens' eggs placed in an oven with igneous heat, as the Coimbrans (*loc. cit., in the beginning of this difficulty, art. 2*) report. Therefore this heat does not differ specifically from that one. I respond that by this only a certain similarity and agreement is proved between the said heats, as I was just saying with Scotus — not however that they agree in the same species; just as man and brute participate in many common, kindred, and similar things, yet differ in species. To the other point that is adduced, I say that from this it is only argued that chickens can be generated equivocally from hens' eggs — just as fire is equivocally generated, namely from fire, from solar rays, and from the collision of two bodies.

Article V. Whether Two Contrary Qualities Can Exist Simultaneously in the Same Subject

The question of this article can be understood in two ways: first, whether two contrary qualities can exist simultaneously in one and the same subject in a remiss (i.e., diminished) degree; second, whether they can exist simultaneously in the highest degree. Each of these modes can be taken with respect to either natural or supernatural power.

Note that the common run of philosophers call a quality "in the highest degree" that reaches the eighth degree, so that the highest degree of heat is heat as eight, and cold in the highest degree is cold as eight; while a quality "in a remiss degree" is one that falls below the range of eight degrees, such as heat as four and cold as four. More on this when we discuss the intension and remission of quality. Moreover, for the resolution of this question, considerable assistance is provided by what I adduced and established in *2 Phys.*, q. 4, art. 7.

First Assertion. Several contrary qualities in a remiss degree can be compatible with one another simultaneously in the same subject. The Doctor holds this at (*2, d. 18, q. un.*, § *Ad argumenta M., contra Dur.*, q. 2, *Prol.*, n. 19), and others cited by the Coimbrans at (*2 de gener.*, c. 3, q. 8, art. 1). It is also deduced from Aristotle at (*2 de gener.*, T. 48), and is likewise intimated at (*3 Top.*, c. 4), (*5 Phys.*, T. 19), and (*4 Met.*, T. 27). It is argued for in the first place as follows: between two extremes there is a middle term, as between white and black there is an intermediate color, such as red or green; therefore, between qualities in the highest degree, there exist qualities in a remiss degree. For the natural passage from one extreme to the other does not occur except through an intermediate state, and so when water is heated, it does not immediately become hot in the highest degree, but warms gradually, as experience shows with the water in a pot: if fire is applied beneath it and one touches the pot by hand, it gradually receives heat, then it boils and scalds, and finally overflows the pot and extinguishes the fire. Second, between hot and cold there is tepid, as is evident from the case of lukewarm water, which John alludes to in *Apoc.* 3 when he says: "Would that you were cold or hot; but because you are lukewarm, I will vomit you out." Contrary qualities, then, can exist simultaneously in the same subject in a remiss degree. The elements in turn contend with one another by acting and being acted upon, so that their forces and powers are diminished and refracted, with the result that a mixture is produced in which their qualities are reduced to a certain moderation suited to the mixture itself (*2 de gener.*, c. 10; *2 de partibus animalium*, c. 1). For contrary qualities in the highest degree dispose a mixture toward corruption and destruction, whereas in a remiss degree they sustain and preserve it; thus, as long as the tempered qualities in an animal remain as they are, the animal lives; but if any one of them exceeds too greatly, the animal dies, as is clear in the case of burning and malignant fever, which causes the death of the very animal it afflicts. Furthermore, in artifacts, colors, odors, flavors, and other secondary qualities are blended and remain in the same subject reduced to a certain moderation. And two contrary agents contending with each other remain simultaneously, each enjoying equal force, and neither is able to

overcome the other or to drive it from its place, as is evident in the case of two wrestlers equally matched and vigorous — notably Jacob and the angel wrestling with him (*Gen. 32*). Moreover, in moral matters the habit of temperance existing in the same man can be compatible with an act of intemperance, and indeed with several other acts which, if repeated over time, can destroy the said habit of temperance and generate a habit of intemperance. Therefore the same must be asserted of contrary natural qualities, since the same reasoning applies equally to both. Finally, contrary qualities — as will be said elsewhere — are capable of intension and remission; therefore they can be so remitted that one cannot drive the other from the same subject, for instance heat as four and cold likewise as four, since, given that they are assumed to share equal force, it follows that neither can overcome and drive out the other from the subject in which it inheres.

Second Assertion. Contrary qualities in the highest degree can be simultaneously present in the same subject neither naturally nor supernaturally. This assertion is twofold, as the Doctor holds at (1, d. 17, q. 3, § *Contra istam opinionem, sub VV.*), (3, d. 1, q. 1, § *Ad argumenta, in sol. 3*), and (4, d. 49, q. 16, § *Ad 1, infra C*). The first part is proved in the first place from (2 *Top.*, c. 3): it is impossible for contraries to exist simultaneously in the same subject. The same is read at (3 *of the same work*, c. 4), (5 *Phys.*, Tit. 19), and (2 *de gener.*, Tit. 16). This is the common opinion among philosophers. Second, experience teaches us that heat drives out cold, as is evident in summer, and conversely that cold drives out heat, as is clear in winter; and the same must be asserted of the remaining contraries, as is verified daily in ourselves and in all sublunary things. From this arises the well-known maxim that contraries are cured by contraries: hot things by cold, moist by dry. Third, this cannot be brought about by uncreated power, as I shall show in the proximate part of this assertion; therefore neither can it be done by created and natural power. The consequence holds by the argument from the greater to the lesser, as I have explained in *Epitome Dialect.*, lib. 13, q. 3, art. 4.

The second part, which militates against Gabriel in (*Can. lect. 46*), the Coimbrans (2 *de gener.*, c. 3, q. 8, art. 5), Ruv. at the same place (q. 6, n. 93), and not a few others, is proved in the first place as follows: things that are mutually repugnant cannot be compatible with one another simultaneously in the same subject, because the object of divine power is everything possible, but not the impossible, which involves repugnance, as Scotus teaches at (4, d. 10, q. 1, § *Ergo ad q. F*). Now, two contrary qualities in the highest degree are repugnant to coexisting simultaneously in the same subject, as is plainly evident from their definition. For contraries are defined as those that mutually expel each other from the same subject (10 *Met.*, Tit. 14); and if the essence of contrary qualities is such as is expressed by this definition just cited, it plainly follows that they cannot simultaneously coexist, even by divine power, since God does not change the essences and natures of things, which are immutable and invariable.

You will say: if this argument were valid, contrary qualities in a remiss degree could not coexist simultaneously in the same subject, since to these also the aforementioned definition applies. But this contradicts the first assertion, in which I established that said qualities in a remiss degree can exist simultaneously in the same subject. On the contrary, according to Scotus at (*1, d. 17, q. 3, IV.*), there is something positive in the former that makes simultaneous existence repugnant to them, but not in the latter. For mutual expulsion from the same subject, and perpetual contrariety, are indicated by their definition already cited above, whereas the simultaneous coexistence of those same qualities in the same subject — or their repugnance — regards either the lowest or the highest of their degrees. For in a remiss degree they can exist simultaneously, but not in an intense and excellent degree, just as a vessel can hold so much water and no more, and similarly a person can carry so much weight and no more, and a river can be crossed up to a certain limit but cannot be swum further. Likewise, an animate creature is allotted certain determinate limits of its greatness and smallness which it cannot exceed; in the same way, contrary qualities within the range of certain degrees can be simultaneously compatible, but not at the full range of intense and supreme degrees.

Second, if contraries in the highest degree could coexist simultaneously in the same subject, then so too could contradictories, as Aristotle infers at (*4 Met., c. 4, T. 27*); but contradictory statements cannot be simultaneously verified of the same subject, as is the unanimous opinion of all philosophers; therefore neither can contraries exist simultaneously in the same subject. Gabriel, cited above, objects that this testimony is not to be understood of contrary qualities but of propositions in contrary opposition. On the contrary, the Philosopher there says that it is impossible for contraries to exist simultaneously, whether both in some respect, or one in some respect and the other absolutely; therefore he is not speaking of the incompatibility of contrary propositions, but of the simultaneous coexistence of contrary qualities, which is impossible. Add to this that propositions do not inhere in things but are stated, predicated, affirmed, or denied of subjects, whereas contraries inhere or do not inhere in subjects; therefore Gabriel's exposition does not fit Aristotle's text. And Scotus adds in his exposition of that passage that one contrary, which is more imperfect than the other, designates the privation of the other as more perfect, as black designates the privation of white; but privation is the negation of the same being; therefore, consequently, contraries exhibit the same repugnance as contradictory opposition.

You will say, with the same author cited — whom Suarez follows in (*dis. 45 Met., Sect. 4, n. 15*) — that contraries are not opposed by immediate and formal opposition in terms of the incompatibility of their very forms, but only by virtual opposition in terms of effects that are incompatible in the same subject; but God is able by his absolute power to suspend those effects, as he did in the Chaldean furnace; and therefore the opposition of contradictories does not

follow, nor would the same thing be supremely hot and supremely cold. On the contrary, it is impossible for a form to be in a subject and not confer its formal effect upon it, just as it is impossible for whiteness to be in a wall and not give to that very wall its formal being, which is to make the wall itself white. But if contraries were to exist simultaneously in the same subject — say, heat and cold — they would confer their formal being upon it, which is to be hot and cold. God can indeed prevent fire from heating and water from cooling, because he is their efficient cause in producing those effects; but he cannot bring it about that heat does not have the being of hot, and cold the being of cold, because this is their nature and essence, which cannot be altered without being destroyed. Moreover, two substantial forms simultaneously in the same matter are incompatible, as I maintained in *lib. 2, Phys., q. 4, art. 7*; therefore the same must be asserted of two contrary qualities simultaneously in the same subject.

Objection I. The reason why two contrary qualities cannot be simultaneously present in the same subject is that they are opposed to each other; but they are equally opposed in a remiss degree as in an intense degree; therefore, if they cannot exist in an intense degree, neither can they exist in a remiss degree. I concede the major and deny the minor, because in the highest degree qualities have greater force to expel one another from the same subject, which is not the case in the lowest degree, for the reason that their forces there are refracted and weakened, as I explained at length above in the second part of the assertion, in response to the objection brought there.

Objection II. Two bodies can by divine power exist simultaneously in the same place, as I affirmed in *lib. 6, Phys., q. 2, art. 3*; therefore also supernaturally, two qualities in the highest degree can exist simultaneously in the same subject. I concede the antecedent and deny the consequence. The reason is that the former is possible, whereas the latter involves a contradiction, as I showed in the second part of the last assertion.

Question IV. On the Motive Qualities of the Elements.

Article I. What the Motive Qualities of the Elements Are, How Many There Are, and to What They Belong.

The motive qualities of the elements are those by which the elements are moved upward or downward. For gravity is the motive quality toward a place downward, and levity toward a place upward. Four motive qualities of the elements are distinguished: the first is levity simply, which belongs to fire; the second is gravity simply, which belongs to earth; the third is levity in a certain respect, which belongs to air; and the fourth is gravity in a certain respect, which belongs to water. Hence, in terms of these qualities, the elements are called heavy or light simply, or in a certain respect. That which is light simply is what rises above all the other elements; that which is heavy simply is what lies beneath all the rest; that which is light in a certain respect is elevated with

respect to some but subordinate with respect to others; and that which is heavy in a certain respect is what rises above earth but is inferior to the other elements.

Assertion. Fire is supremely light and earth is supremely heavy; air is light in a certain respect, and water is heavy in a certain respect. This assertion is twofold, and is indicated by the Doctor at (2, d. 14, q. 3, § *Dico ad q. A*). The first part, concerning fire, is handed down by Augustine at (22 *Civ.*, c. 9) and Damascene at (2 *Fidei*, c. 6), and is argued first as follows: to the highest element the highest motive quality must be attributed, as the nature and order of things demands; but fire is the first of the elements in dignity and excellence, being maximally active and pure; therefore the highest levity belongs to it. Second, that which is in a higher place is supremely light; but fire is found in a higher place, namely beneath the concave of the lunar orb; therefore fire is supremely light. From the opposite side, Aristotle writes that earth is the heaviest at (5 *Top.*, c. 2), and the reason is that earth is the lowest element; therefore the lowest motive quality must be assigned to it, and this is supreme gravity; therefore earth is supremely heavy. Again, earth occupies the lowest place among the elements; therefore the lowest motive quality belongs to it, which is supreme gravity. Again, extreme motive qualities must be granted to the extreme elements, and fire and earth are the extreme elements, as is evident; therefore extreme qualities suit them, such as supreme gravity and supreme levity.

The second part is shown as follows: intermediate motive qualities are assigned to intermediate elements; but air and water are elements intermediate between fire and earth; therefore intermediate motive qualities suit them, which are levity in a certain respect and gravity in a certain respect. And this is also supported by the intermediate places which air and water occupy, interposed between the places of fire and earth. Therefore air is light in a certain respect, and water is heavy in a certain respect.

Objection I. Aristotle at (11 *Meteor.*, c. 4) affirms that portions of fire from the sphere of fire sometimes descend to the lowest places; therefore fire is not supremely light, since it is carried to the lowest places. I reply that this descent of fire is not due to fire itself, but to some heavy material compacted with it by the power of the celestial orbs; which can be illustrated by the case of comets, whose parts when dissolved are carried downward and fall to earth.

Objection II. Iron and lead are heavier than earth; therefore earth is not supremely heavy. The antecedent is confirmed by experience: for if a portion of iron or lead equal to a portion of earth is weighed, the former will outweigh the latter. Consequence I: dead bodies, if cast into the sea, tend initially to the bottom, but afterwards rise to the surface; but such bodies are earthen; therefore earth is not heavier than water. Consequence II: pumice, as Pliny attests, floats on water; but pumice itself is a stone of earth; therefore water seems heavier than earth.

I respond that the antecedent is true of earth mixed with other elements, but not of pure earth, which is plainly the heaviest, as Scotus indicates at (4, d. 49, q. 14). To Consequence I, I say that this proceeds from the corrosion of the earthen parts: once the corrupt matter is consumed and the heavier parts dissolved, the body rises to a higher place, because the bones and other members are lighter than water, as the same Doctor indicates at (§ *Respondeo ergo ante I*). All the more so because those parts are porous and full of air. To Consequence II, I say that this stone possesses the properties of the higher elements, just as oil, which floats on water — either because it is extremely porous and air is enclosed in its pores, which rises above water.

Article II. Whether the Elements Gravitate or Levitate in Their Own Places.

Some, who seem to be favored by Aristotle at (4 *Caeli*, T. 39), hold that elements gravitate or levitate in their own places. The common opinion, however, of ancient and recent philosophers — followed by Tatar. (4 *Caeli*, q. un., scibili quarto), the Parisians (q. 3, fol. 119), the Coimbrans (*ibid.*, c. 6, q. 2, art. 1), and Ruv. (q. ult.) — holds that the elements do not gravitate or levitate in their own centers.

Note first that gravity and levity are divided into habitual and actual. Habitual gravity — also called gravity in first act — is the quality by which a heavy body can be moved downward, and habitual levity is the quality by which a light body can be carried upward. Actual gravity is that by which a heavy body is actually carried downward, and actual levity is that by which a body is actually set in motion upward; and both are called gravity and levity in second act, or gravitation and levitation. Note second that an element heavy in a certain respect and light in a certain respect descends more easily than it ascends: water, which is heavy in a certain respect, flows more freely than earth and less freely than air; and so, if any part of earth is removed, air enters into that place, provided there is no obstacle. Hence water and air descend without any interposed obstruction, but do not ascend, because each element is bounded and circumscribed within certain limits and surfaces, and the heavy element is detained by the circumscribing surfaces lest it ascend, but is not prevented from descending.

Assertion. The elements in their own proper and natural places do indeed have habitual gravity or levity, but not actual gravity or levity. This is drawn from the Doctor at (4, d. 49, q. 13, § *Ad rationes principales I*). The first part is argued first as follows: where the essence and nature of a thing is, there too is its property and power, because the property and power follow upon the nature of which they are the proper attribute and capacity; but in their own places the elements possess their essences and natures; therefore also their properties and powers of moving themselves upward or downward, which are habitual gravity and levity. Second, elements can be moved outside their own center, as experience shows

when fire is sometimes observed falling from its own sphere, as is noted at (4 *Meteor.*, c. 4). But from act to potency the consequence is valid. And they retain the same power of moving themselves when they exist in their own places as when they remain outside their proper centers. Therefore, in their own places the elements participate in habitual gravity or levity, that is, gravity or levity in first act.

The second part is shown first by the experience of those who descend to the bottom of the sea: even though they have much water above them, they nonetheless feel no weight from the water. Furthermore, we do not feel any weight of air, even though a great quantity of air exists above our heads. Again, when a vessel full of water is in a well, it does not weigh down; but if we wish to draw it out full from the well, we clearly experience its weight. Therefore the elements in their own places neither gravitate nor levitate. Second, if elements, as they are in their own centers, were to gravitate or levitate, they would not rest naturally in them but would exist there violently, because they would be moved in the same places — and it is evident that when things are moved in their own natural places, they are moved from an external source, and so violently. Hence the common maxim of the philosophers is true: elements in their own proper places neither gravitate nor levitate.

Objection I. Aristotle at the passage cited at the beginning of this article seems to affirm that the middle elements, namely air and water, gravitate or levitate in their own places. For he says that skins filled with water or air gravitate, which can arise from nothing other than the fact that these elements gravitate or levitate in their own places. Consequence I: a piece of wood of a hundred pounds descends through air more quickly than a pound of lead, whereas in water the contrary holds: the pound of lead is carried to the bottom more quickly than the said piece of wood, as is evident to anyone observing.

Consequence II: air sometimes descends below earth and sometimes rises above air; therefore these elements gravitate or levitate in their own centers. I respond that Aristotle does not assert this. The reason why skins filled with water or air gravitate is that the air in them is dense, and dense things are heavier than rare things; and earthly vapors and atoms are mixed with said air, and therefore acquire some gravity. This is the exposition of the cited Aristotle. To Consequence I, I say that the piece of wood is heavier than a pound of lead, and therefore moves downward more quickly. As to why this does not occur in water, the reason is that the wood, on account of its pores full of air and on account of the density of the water, is impeded and its motion retarded — especially since the wood is dry; and I add that the wood is more airy and the lead more earthen. To Consequence II, I say that this occurs lest a vacuum arise in nature, as I showed in *q. art.*, *lib. 6, Phys.*

Objection II. The denser parts of earth are heavier than its rarer parts; therefore earth gravitates in its own center. Consequence: an empty vessel floats in water,

but if it is filled with water it sinks to the bottom; therefore this is a sign that water gravitates in its own place. I respond that this arises from the fact that the upper parts of earth are more porous, dry, and close to air, while its lower parts are denser and more moist, and therefore heavier. To the consequence, I say that when a vessel is filled with water, the air is expelled from it, and that it is carried downward not by reason of itself but by reason of the iron attached to it, or of some other heavy thing adhering to it, as is evident from the experience of an iron or lead vessel. But if the vessel were made entirely of wood, it does not sink to the bottom of the water, and is filled with water only by force.

Objection III. We experience that if some part of earth exists above our heads, at the center of the earth itself, it has some gravity; therefore earth gravitates in its own natural place. I distinguish the antecedent: if that part is separated from the other parts, I concede; but if it is joined together with the rest, I deny.

Question V. On the Elements in Particular.

Article I. Whether the Place of Fire Is Beneath the Concave of the Lunar Orb.

The Pythagoreans deny this, followed by Arr. (*disp. 4, sect. 3, n. 67*) and Poncius (*disp. 57, q. 7*). Aristotle affirms it at (*2 Caeli, c. 3, T. 18*) and (*c. 13, T. 73*), as do his interpreters there, and the Scholastics at (*2, d. 17*) — Scotus (*q. 2, § Si ratio ista B*), St. Bonaventure in the literal doubts, Gabriel (*q. 2, art. 1*), Ricardus (*q. 5*), Orbellus, and the rest in the same place — all teaching that there is a sphere of fire near the lunar orb.

Assertion. Scotus proves this at (*2 Reportat., d. 17, q. 2, § Item motus*) from the motion of the elements: water ascends above earth, air above water, and fire above air, as is perceived with the eyes; therefore the sphere of fire in the vault of the moon is conceded. Although, Scotus adds there, the small fire that exists below cannot reach that sphere, this arises from the great power of the containing body and the small power of the resisting body, which is corrupted before it reaches the said sphere. Poncius at the place cited, therefore, is wrong to say that Scotus does not prove the aforesaid assertion but merely presupposes it. The Doctor adds that the supreme region of air is the hottest; but this heat does not come from the middle region of the same air, because that region is cold, nor from the moon, since the moon too is virtually cold; therefore it comes from fire, whose sphere is placed above air. Augustine (*2 de gen. ad litt., c. 2 & 3*) supports this view, adducing nearly the same argument. Fire is carried upward, as experience shows — for an excited flame seeks a higher place; therefore, since each thing tends toward its own proper place, it is clearly deduced that the sphere of fire is above air.

You will say, with Poncius named above, that fire in burning coal and in red-hot iron does not rise, and indeed sometimes descends to devour its fuel; and if

anything rises, it is smoke, not fire. On the contrary, coal and iron are hard and dense; for this reason they do not burst into flame but glow, and if straw is applied to them, it immediately catches fire and the fire rises upward. And if fire sometimes descends to consume fuel, this is incidental, to prevent a vacuum from arising. Moreover, a flame is not merely smoke but flaming fire; and smoke participates in the nature of fire, and therefore tends upward. Aristotle's argument is added: each element obtains its own quality and property; and to fire belong supreme heat and supreme levity; therefore also the first and highest place among the elements, which is above air. Again, the other elements too have their own definite places and determinate centers; therefore fire also has its proper place, which is beneath the moon. To say, with Poncius at the place cited, that we experience this in the other elements but not in fire, is trivial, because reason persuades and compels that every body enjoys a definite and proper place — and flaming comets demonstrate this, being ignited and set ablaze by nothing other than the fire existing there. Finally, all sublunary things are tempered so that the universe may subsist; but unless fire existed in the concave of the lunar orb, as in its proper place, all things would not be tempered, since the moisture of air, the cold of water, would exceed the heat of subterranean fire, which is very small in comparison with the aforesaid; therefore the aforesaid sphere of fire must be conceded, supported and defended not only by authority but also by reason, whatever Poncius may say to the contrary.

Objection I. Aristotle writes at (*1 Meteor., c. 4*) that the fire that is said to be above us is not true fire; therefore according to Aristotle there is no proper sphere of fire in the concave of the lunar orb. I respond that Aristotle there does not deny absolutely that fire exists, but only in a certain respect — namely, burning, flaming, blazing, and glowing fire, such as we have here below, as is clear to anyone reading that text and the places cited at the beginning of this article, where he formally proves that there is a proper sphere of fire above air. You will press: if fire were beneath the concave of the moon, since it is maximally active and exceedingly swift in acting, it would already have devoured and consumed all sublunary things, as the philosopher cited infers. And for the same reason the same philosopher concludes that the heavens are not fiery — otherwise they would already have reduced everything to ashes. The consequence is denied, because fire is tempered by the surrounding air, by the moon, Saturn, and other celestial bodies that are virtually cold and moist, as Scotus notes at (*4, d. 49, q. 13, § Respondeo sub R*). Nor does there obtain parity with the heavens, which are far greater than the rest; hence the Philosopher rightly concluded that if the heavens were fiery, they would already have consumed everything.

Objection II. Fire, in order to be preserved, requires fuel, as daily experience attests and confirms; but in the concave of the moon there is no fuel or nourishment by which it may be fed and sustained; therefore no fire is there, but all fire is subterranean and destined either for human use or reserved for the punishment of the wicked. I distinguish the major: in its proper sphere, I deny;

outside its proper sphere, I concede. The reason is that in its proper place a thing is not assailed by contraries; but outside its own sphere it is, and therefore requires sustenance and nourishment in order to be preserved.

Objection III. If there were a proper sphere of fire, certain animals would inhabit it, as is evident in the case of the places of the other elements — for birds dwell in air, fish in water, and man and quadruped on earth; but no animal can live in fire, since it is maximally voracious and destroys and consumes whatever approaches it; therefore the sphere of fire beneath the lunar orb must be denied. If the major is conceded, the minor must be denied. For, as Berchorio attests at (*l. 10, Reduct. mor., c. 9*), the salamander lives in fire without any consumption of itself, just as a fish lives in water without corruption, because water is its natural place; and in the same way the salamander dwells in fire as in its own center. Or you may say that it is not necessary for animals to exist in all elements, since terrestrial living things dwell not at the center of the earth but only on its surface.

Article II. Whether Air Is Hot.

Assertion. Air is by its own nature hot. So Aristotle at (*2 de gener., c. 3, T. 16*), along with his disciples and interpreters there, Johannes de Magistris, Tatar., and the Parisians — against the Stoics, Arr. (*disp. 4, sect. 2, subsect. 3*), and Poncius (*disp. 56, q. 4, concl. 4*). This is deduced from Scotus at (*2, d. 14, q. 3, § Dico ad q., sub A*), who calls the higher elements — namely fire and air — hot, and the lower — water and earth — cold. It is argued first from the reason of Aristotle at the passage just cited: there are four possible and useful combinations of elemental qualities: one is heat and dryness; another is coldness and moisture; a third is moisture and heat; and a fourth is dryness and coldness. And one of these in the highest degree belongs to each element individually — namely, heat in the highest degree to fire, and dryness to earth; what remain are moisture and coldness, of which one must belong to water and the other to air. But coldness in the highest degree cannot be adapted to air, because two immediately adjacent elements are not dissimilar, otherwise they would mutually destroy each other, or could only exist in a mixed state; therefore the highest degree of moisture together with heat, though not in the highest degree, belongs to air; and consequently air is hot. Nor does it help to deny the major with Poncius at the cited place, since, besides the fact that it is handed down by Aristotle as just cited, it is argued as follows: the elements contend with one another, come together, and are tempered in order to produce a mixture, according to that well-known saying, "concordant discord and discordant concord." But if the four said combinations were not admitted, there would be no concordance and tempering among the elements; the middle elements would be the extreme and the extreme would be the middle — which is plainly adverse to the right order of the universe, and to its conservation and perpetuity.

Second, the moist — from (*2 de gener., c. 2, T. 8*) — is what is easily bounded by an alien boundary; but air is more easily bounded than water, since to bound water requires stones, logs, embankments, and things of that sort, which are made only with great labor, whereas air is more easily limited in bellows, bladders, and other vessels receiving and bounding the air. And things that are moist, with air predominating in them, are more moist than water and warmer, as is evident in the case of oil, which is hot — as Pliny says at (*l. 15, hist., c. 4*). Third, things that are rare are hot, for heat is suited to rarer bodies and melts and extends dense bodies; but air is rare and thin, and yields to all opaque and dense bodies; therefore air is hot. And so our assertion is confirmed and established by both authority and reason, whatever Poncius may endeavor to say to the contrary.

Objection I. Water, which is by nature cold, after having been heated returns to its original cold state, as experience confirms; but air is of this kind, for in the absence of the sun, at nighttime and in winter, it returns to a cold state; therefore air is by its own nature cold. Consequence: the middle region of air is extremely cold; for this reason rains, snows, hails, and things of this sort are produced in it, which clearly indicate the coldness of air. I concede the major. I distinguish the minor: intrinsically and by reason of itself, I deny; extrinsically and by reason of the vapors which, drawn up by the power of the sun, return to their original cold state, I concede. To the consequence, I say that this is brought about by antiperistasis: the vapors, having ascended to the said region and losing their external heat, return to their native cold, and being surrounded and besieged by the upper and lower regions of the same air, become intensely cold.

Objection II. Oil, which is airy, freezes more quickly than water; therefore air seems by its own nature to be cold. I concede the antecedent and deny the consequence. For the reason why oil freezes more easily than water is its thickness and fattiness. And things that are fat and thick freeze easily and quickly.

Objection III. The fanning of air cools our bodies in summer; therefore it is not an obscure sign that air is cold of itself. I concede the antecedent and deny the consequence. The reason is that at that time our bodies are hotter than the air, and therefore they are cooled by the fanning of the air; especially because through said fanning the hotter parts of the air recede from us and the cooler parts approach us, from which cooling results.

Article III. Whether Earth Is in the Middle of the World.

There is almost unanimous consensus among philosophers that the earth is situated in the middle of the world. The philosophers themselves, however, are in doubt whether the center of the world is the same as the center of gravity, and likewise whether the center of quantity is the same as the center of magnitude. Note that the center of the world is the point from which all lines drawn to the

circumference of the first mobile are equal; the center of gravity is the point of a straight line dividing a heavy body into two equal parts; and the center of magnitude is the point of a straight line dividing some quantity into two parts equal to each other.

First Assertion. The earth is placed in the middle of the universe. So Aristotle (*2 Caeli, c. 13 & 14, T. 100*), Ptolemy in the *Almagest*, Pliny (*l. 2, hist., c. 71*), the Parisians, Johannes de Magistris, Tatar., and others in their commentaries on the cited Aristotle; and Scotus does not dissent at (*2, d. 14, q. 2 & 3*), nor does Major at the same place. It is proved first: that is the center of the world to which heavy bodies descend at right angles and perpendicularly; but heavy bodies descend to the earth at right angles and perpendicularly, as experience confirms; therefore earth is constituted in the middle of the world. Second, unless earth were in the middle of the world, lunar eclipses would not occur, because the earth would not be interposed between the sun and the moon, since both planets could exist at a point of the zodiac opposite to it, without the interposition of the earth. Hence Manilius elegantly sings: "Unless the earth hung poised in its balanced weight, it would not drive the course of the world as the stars rise beneath, nor would Phoebus return to the east after setting in the west, nor would the moon govern its courses submerged through the void."

Second Assertion. The center of the universe and the center of gravity are the same; but the center of gravity is not the same as the center of magnitude. This assertion is twofold and is not discordant with Scotus just cited. The first part is shown as follows: the supremely heavy body has the lowest place in the world, as is evident from what has been said; but the lowest place in the universe is the place of earth, which is supremely heavy; therefore the center of the world and the center of gravity are the same.

The second part is argued thus: in certain places earth is heavier than everything else, as in places where earth is covered by water, and likewise where earth is denser. Moreover, earth is not perfectly spherical, as was established above; therefore the center of gravity does not coincide with the center of magnitude.

Objection. Earth is vast and immense — about whose magnitude geographers and cosmographers treat abundantly — but the center, as noted above, is a point which, from what has been said, is indivisible and impartible; therefore earth cannot be the center of the world. I concede the major. To the minor I say that earth is after the manner of a point — not absolutely and in itself, but relatively, that is, in relation to the celestial orbs, which are of the greatest and most immense magnitude.

Article IV. Whether Earth Is Higher than the Sea.

This is a problem found among both sacred and secular philosophers: whether earth rises above the sea or not. Some — such as Cicero (*2 de natura Deorum*),

Burgensis on (*c. 1 Gen.*), and Catharinus, supported by Thomas Aquinas (*1 p., q. 69, art. 1, ad 2*) — hold that earth is lower than the sea. Others, however — such as Lyran. in the postilla on (*c. 1 Gen.*) and elsewhere, Major (*2, d. 14, q. 4*), the Parisians (*2 Meteor., q. 2, fol. 98*), Johannes de Magistris (*ibid., q. 1*), and the Master at the place cited — seem not to diverge from this; and neither the Seraphic Doctor in his exposition of the letter, nor the Subtle Doctor at the same place (*q. 3, § Dico ad q., ante C*) — teach that earth is more elevated than the sea.

They argue first from Sacred Scripture. *Gen. 1*: "Let the waters that are under the heavens be gathered together into one place, and let the dry land appear" — where Lyran. at the cited place, and other noteworthy interpreters, say that the waters were forced into the hollows and caverns of the earth, and that God elevated said earth so that the waters would not flood and cover the whole earth, in order that terrestrial living things could live, and that plants, trees, and the like could sprout — toward which, perhaps, the royal Psalmist was looking when he says in *Ps. 32*: "Gathering the waters of the sea as in a flask." And he had prefaced in *Ps. 23*: "He founded it upon the seas," that is, the orb of the earth. And *Ps. 134*: "Who established the earth upon the waters." Second, from the Holy Fathers. Augustine (*q. 132 of his 1 on Gen.*), explaining the last passage of Scripture just cited, adds: "According to this expression it is rightly understood that earth is higher than water, being raised higher by the waters where terrestrial animals dwell." He writes the same in (*q. 111, l. 1, Contra adversarium legis et Prophetarum, c. 13*) and in his commentary on *Ps. 135*. Jerome on *Ps. 32* and Chrysostom (*hom. 9 ad populum Antiochenum*) support the same opinion. Third, that which is first illuminated by the sun is higher and more elevated; for experience teaches us that the sun first diffuses its light upon higher and more elevated places than upon lower and inferior ones. But the sun illuminates the earth before the water. For the sun first appears on the summits of the mountains before it appears on the sea; therefore earth rises above the sea. Fourth, rivers flow toward more inclined places, as is clear to everyone; but rivers flow into the sea; therefore it is an evident sign that the sea is lower than the earth. Again, it would be a perpetual and continuous miracle if the sea did not cover and inundate the whole earth — and the common maxim among theologians holds that miracles are not to be admitted without necessity. Finally, from high and lofty mountains the sea is seen as very low and depressed, which would plainly not be the case if the sea were higher than the earth.

Objection I. *Ps. 104*: "You have set a boundary that they shall not cross, nor shall they return to cover the earth." And in the same: "Upon the mountains the waters shall stand." "Thus far you shall come and no further, and here you shall curb your swelling waves." *Matt. 6*: "He descended to them from the boat." And *Luke 5*: "And as Jesus went up into a small boat." Therefore the sea is contiguous to earth and higher. I respond that the first two testimonies conclude nothing against us, for in them only this is contained: that God set limits to the sea, or made cavities within which the sea itself is contained and does not go beyond

them. And in the beginning of the world, water occupied the higher place and existed above the earth, since the natural place of water is above earth; but for the necessity and convenience of terrestrial living things, God raised the earth above the water, and placed it in the caverns and hollows of the earth, and there it remained until the time of the flood, when the waters floated above the mountains — where Augustine and Eugubian observe that the future tense is used for the past, because the Hebrews lack the imperfect tense and use the future in its place. After the flood, by God's command, the waters receded from the land, remaining where they were at the beginning, and there shall no longer be a flood devastating the whole earth (*Gen. 9*). To the remaining passages, I say that it is only inferred there that the ship is elevated above the contiguous earth; and therefore a person is said to go up to the ship, not to the sea. This is deduced from *Ps. 106*: "Those who go down to the sea in ships." And from *Jonah 1*: "He went down to Joppa and found a ship going to Tarshish."

Objection II. *Ecclesiastes 1*: "All the rivers run into the sea, and thence they return again to flow." Since therefore the rivers draw their origin from the sea as their principle, it is plainly shown that the sea surpasses the earth in height. I respond that this testimony must be glossed not immediately but only mediately. For the springs from which rivers rise are formed from vapors converted into water, as Aristotle teaches at (*1 Meteor., c. 13*).

Objection III. Those who sail on the high sea and toward land see the land itself as lower and more inclined than the sea; therefore it is an evident sign that the sea is higher and more elevated than the earth. I respond that the senses are then deceived. The reason is that earth is of a dark color, and things that are dark and obscure appear low and deep; for this reason painters, wishing to represent the depth of a well, use a dark color. Thus earth appears lower than the sea because it is of a dark color. I add that "high" is sometimes used for "deep"; hence *Ps. 68*: "I have come into the depths of the sea" — where Lyran. renders it as "into the deep of the sea." And Virgil intimates this in (*1 Aeneid*): "Scarce out of sight of Sicilian land they were spreading their sails upon the deep."

You may ask whether the earth is immovable. Aristotle responds affirmatively at (*2 Caeli, T. 102*), and it is confirmed by *Ecclesiastes 1*: "But the earth remains forever," that is, immovable, as Lyran. interprets. Hence the Church sings in the hymn for Tuesday at Vespers: "You gave the earth as immovable." The reason is that earth is the heaviest and the center of the world, and therefore stands immovable, like the center of a sphere. Pliny assents to this at (*2 hist., c. 5*). Take finally, as a complement to this work, the admonition of St. Augustine on *Ps. 145*: "Contemplate the whole heaven, all these things together very good, because God made all things very good; beauty of the work on every side, which commends to you the craftsman; you marvel at the fabric, love its maker. Do

not be occupied with what has been made, and turn away from him who made it."

Books on Generation and Corruption

Preface

After the two works of natural philosophy — the first contained in the eight books of the *Physics*, and the second in the four books *On the Heavens and the World* — Aristotle hands down a third, comprised in two books *On Generation and Corruption*, which we now undertake to treat. The proximate and adequate subject of these books, as established in the Scotist school, is the generable and corruptible body. For just as in the books *On the Heavens* the ingenerable and incorruptible body is established as their immediate and total subject, so in these books the generable and corruptible body stands as their proper and adequate object. The reason is that the whole of Physics regards the natural body as its genus, and its parts regard the species of that same body, among which the generable and corruptible body is numbered. I divide this entire matter into four books: the first is on generation and corruption, the second on intension and remission, the third on action and reaction, and the fourth on mixture and the mixed body.

Book I

On Generation and Corruption

Although in the aforementioned books Aristotle treats of the other motions already described, these books are nonetheless entitled *On Generation and Corruption* because generation and corruption are their more distinguished and noble parts; and that denomination is taken from the nobler part, as Augustine acknowledges (*2 Retract.*, cap. 4). Now since alteration precedes generation, as the Doctor teaches (*1 dist. 1, quaest. 4, §. Si tenendo*) following Aristotle (*8 Phys. 1*), the reason being that generation does not occur without prior alteration — for the action of an agent expelling the prior form is required so that a new form may be introduced into matter through that same agent's action, in order that a new composite may be generated — we therefore rightly set out alteration first, before we treat of generation.

Question I: On Alteration

Article I: What Alteration Is

That alteration exists, no one calls into doubt, since it is clearly confirmed by manifest experience. What alteration is, however, is not a matter of agreement among philosophers. For some, taking the name of alteration more broadly, and others more narrowly, describe and define alteration in various and differing ways. For a more convenient and easier grasp of this, note the following.

Note first, from the force of the word, that alteration is a motion by which a subject is rendered *alterum* — that is, altered or changed accidentally. This is perhaps what Porphyry had in mind in the *Isagoge*, in the chapter on difference, when he says that accidental difference makes a thing *alterum* and essential difference makes it *aliud*, because the former merely alters the subject insofar as it differs from another accidentally, while the latter constitutes the subject in its quidditative and essential being and distinguishes it from everything else. Alteration is chiefly used in two ways. First, broadly, for any successive motion that alters and changes a subject — in which sense air is said to be altered when it passes from dark to bright, and a man when he passes from ignorance to knowledge. Hence Aristotle (*8 Phys.*, T. 26) writes that the soul undergoes the motion of alteration in imagining and opining. Second, strictly, for a continuous successive motion having contraries — in which sense a man is altered when he passes from cold to hot, from white to black, and vice versa. In this way philosophers commonly speak of alteration with Aristotle (*1 De gen.* 1) and (*1 De caelo* 20), where it is said that the heavens are exempt from alteration because contrary qualities do not exist in them; and in (*cap.* 4, T. 24), alteration is distinguished from augmentation, diminution, and local motion.

Note second, from the same passage (*ibid.*, *cap.* 4, T. 23), where alteration is defined thus: alteration is a motion with respect to contrary extreme or intermediate qualities, the same sensible subject remaining. All the parts of this definition are now explained. It is called *motion* as its genus, because in this it agrees with the others. There is added *according to contrary extreme or intermediate qualities* as the difference, since in this it differs from improper and metaphorical alteration, mentioned in the preceding note. There is subjoined *the same sensible subject remaining*, to distinguish it from generation and corruption, in which the subject — that is, the composite — is newly brought into being or corrupted, as will be made clear in the two following questions.

The assertion: alteration is rightly defined by Aristotle as cited. Scotus does not disagree (*9 Met.*, *quaest.* 14, §. *Quarto*) and (*4 d.* 11, *quaest.* 1, §. *De primo.* 4) and in the *Reportata* (*ibid.*, §. *Dico primo*), nor do the Parisian doctors (*1 De gen.*, *in com.*), John of Mairs, Tataret, and others there. The proof: a good definition is one given through genus and difference, as I have often forewarned; and the definition just stated is of this kind, as is clear from the second note; therefore it is well given. Furthermore, by it the nature and essence of alteration is best explained, and it is distinguished from everything that is not alteration; it enjoys all the properties of a good definition and contains nothing superfluous or deficient; therefore it is to be counted among correct definitions.

Objection: the aforesaid definition of alteration seems to apply to quality of the first and fourth species; but alteration properly so called is accommodated only to quality of the third species, as Aristotle indicates in the cited passage where he mentions the passions that pertain only to the third species of quality; therefore

the said definition is not genuine and proper. I concede the major and deny the minor. For Aristotle illustrates the said definition with examples of health and sickness, which are placed in the first species of quality, and of metal, which is now round and now angular, whose seat belongs to the fourth species of quality; hence alteration does not seem to be restricted and confined solely to the third species of quality.

The Complutenses reply (*disput. 4, quaest. 1, §. 3*) by saying that alteration is located per se in the third species of quality, and per accidens in the other classes of quality, since the prior qualities — for example, by the alteration of hot and cold — bring it about that what was healthy becomes sick, and vice versa. But this reply does not remove the difficulty just raised, since the Philosopher (*1 Praedicam., cap. 4*), setting out the series of qualities per se, includes health and sickness in the first species among them; therefore health and sickness reside per se, and not per accidens, in the first species. Furthermore, a correct definition is given of things per se; since Aristotle has therefore supplied a fitting definition of alteration and exemplified it with health and sickness, it plainly follows that these are qualities per se, and not per accidens, located in their first class. What is more, the same Philosopher, compiling the catalogue of the third species of quality, does not list health and sickness, though he would have been obliged to include them there if they belonged to it per se. Moreover, certain not undistinguished interpreters of his render the word *passiones* as *affections*, a term that can be adapted to all qualities of whatever species. Finally, alteration is adequately divided into intension and remission, according to the said Complutenses (*cit. quaest. 2, §. 2*); but health and sickness are intensible and remissible; therefore Aristotle rightly places them in the first species of quality as qualities per se — with the agreement of Scotus (*Quol. 13, §. Nunc tertio. 5 & T*).

Article II: Whether, If Generation Were Impossible, Alteration Would Likewise Be Impossible

Aegidius (*1 De gen., cap. 1*) and Saxony (*ibid., q. 3*) assert as simply true that if generation were impossible, alteration would likewise be impossible. Others, however — such as the Parisian doctors (*in praesenti, dub. 3, fol. 122*), Toletus (*quaest. 1*), and Poncius (*disput. 53, quaest. 1*) — absolutely admit that alteration is possible even if generation were impossible.

Note that this dispute is not about alteration that has no contrary — for it is plainly clear that alteration of this kind is not conjoined with generation, as in the case of illumination. Nor is it about mediate quality, but immediate quality, that is, quality which immediately affects the sense, as Gadus infers and explains (*Quol. 13*) from Scotus there (*§. Nunc tertio sub S*). For when a man passes from ignorance to knowledge, there is a mediate alteration that is neither preceded nor followed by any generation simply speaking, as the Doctor indicates (*1 dist. 3, quaest. 6, §. Tertia quaestio sub X*).

First assertion: absolutely speaking, alteration can exist without generation. This is deduced from Scotus as cited. It is proven first: the prior can simply exist without the posterior, especially when there is no essential dependence between them. But alteration is prior to generation, for it is necessary that the elements first be altered so that the mixed body may be generated, and that matter be prepared and disposed to receive the new form and for the new composite to be generated; therefore, if there were no generation, alteration could still exist. Second: an accident can simply exist without a substance, as is evident in the Sacrament of the Eucharist; therefore the production of the former can exist without the production of the latter. But alteration and its terminus are accidents, while generation — though formally an accident — has as its terminus a substance; therefore, since there is no essential ordering between these two, it is aptly concluded that alteration can exist without generation existing.

Second assertion: naturally, through the argument from final cause, if generation were impossible, alteration would likewise be impossible. This seems to be the view of Aristotle (*1 De gen. 1*) and previously (*8 Phys. 1*), from which Scotus in the places cited above is not far removed. Proof first: generation does not occur without the suitable preparation and due disposition of matter; but such disposition and preparation of matter is not brought about without alteration; therefore, if there were no generation, there would be no alteration. Second: generation does not occur without the action of contraries, since the preceding composite must be corrupted in order for the new one to be generated; but this does not happen without alteration, as is clear in the case of fire altering wood through heat and converting it into its own substance so that new fire may be generated; therefore, if generation is removed, alteration is removed as well.

Objection I, against the first assertion: things that are essentially ordered to one another cannot exist, one without the other. But alteration and generation are essentially ordered. For the order fixed by nature is that generation does not occur without prior alteration; therefore, etc. I concede the major and deny the minor. For even if this holds naturally, it is not absolutely true, because sometimes alteration occurs without generation following — as is evident in the case of almonds blossoming quickly but not bearing fruit.

Objection II, against the second assertion: every form and matter requires certain dispositions and determinate circumstances, by the removal of which it is removed, and by the positing of which it is posited. But such dispositions are introduced into matter by the natural agent through alteration, so that the new composite may be generated; therefore, if generation is impossible, alteration is likewise impossible. I respond that the argument concludes with respect to what in fact happens, because they are naturally connected and this is generally what

occurs — but not with respect to what is possible, as is effectively argued by what I have adduced above.

Article III: Whether Alteration Is Distinguished from Generation

This question is raised by Aristotle (*1 De gen., cap. 1*) and by his interpreters, particularly the Parisian doctors, Tatarct, and John of Mairs (*ibid., quaest. 3*).

First assertion: alteration and generation differ from one another. The Doctor holds this (*1 dist. 3, quaest. 6, §. Tertia quaest. sub X*) and (*4 Rep. d. 11, quaest. 1, §. Dico primo*). It is proven principally in three ways. First, from the definition of each: things that receive distinct definitions are distinguished from one another; but alteration and generation receive different definitions; therefore they differ from one another. The major is evident. The minor is at hand: for generation is a change of the whole into the whole, no sensible subject remaining, while alteration is a motion according to contrary qualities, the same sensible subject persisting, as was established in the first article of this question. Second, from their terms: things whose terms are distinct are themselves mutually distinct; but the *termini a quo* and *termini ad quem* of the said transmutations are distinguished; therefore the transmutations themselves are separated from one another. The major is known from (*8 Phys., quaest. 2, artic. 2*). The minor is clear: the *terminus a quo* of generation is privative, since generation is a passage from the non-being of substance to the being of substance, while alteration is a passage from one contrary quality to another; according to Aristotle (*in Postpraedicam., cap. 4, T. 24*), the *terminus a quo* of alteration is positive. The *terminus ad quem* of generation is substance, and of alteration is an accidental quality. And that motion is specified by its *terminus ad quem* was shown in the place just cited. Third, from the subject: for in generation no subject persists, whereas in alteration the same subject endures. Again, generation is instantaneous while alteration is temporal. Furthermore, generation is production simply speaking, while alteration is production in a qualified sense; therefore generation and alteration are distinguished from one another.

Second assertion: alteration differs from the other motions. Aristotle teaches this (*cit., at the end of cap. 4*), and Scotus does not depart from him (*ibid.*). It is proven, both because the definition of alteration is separated from the definitions of the others, and because its *terminus ad quem* differs from their *termini ad quem*, as the Philosopher rightly demonstrates (*in Postpraedicam., praecit.*). The distinction between alteration and the remaining motions is therefore well established.

Objection I, against the first assertion: every motion by which something is disposed differently now than before is alteration; but generation is of this kind, since matter receiving a new form is disposed differently now than before. Nor does it help to say that matter receives a substantial form while the composite that is altered receives an accidental form — for whether the form be substantial

or accidental, the subject receiving either or both forms is altered. I respond that the major is insufficient; one must add that the subject receives a quality, and that alteration is a quality. But when matter receives a new substantial form, it is not properly said to be altered by receiving it. You will press: the subject of generation and the subject of alteration is common to both, namely matter; therefore my response is of no avail. I say that matter is the immediate and proximate subject of generation, but the mediate, remote, and partial — not total — subject of alteration, just as the composite is.

Objection II: the subject of generation and of alteration is a being in act, since in the view of Scotus matter shares in an entitative act; therefore generation and alteration do not differ with respect to subject. I respond: although the subject of each is a being in act, the distinction lies in this — that the subject of alteration is a complete and perfect being, while the subject of generation is an incomplete and imperfect being.

Article IV: Whether Alteration Is a Continuous Motion

Aegidius (*1 De gen., quaest. 16*), to whom Jandun seems to assent (*8 Phys., quaest. 5*), holds that alteration is a continuous motion with respect to intension but not with respect to extension. Others, cited by the Coimbrans (*1 De gen., cap. 4, quaest. 2, artic. 1*) and the Complutenses (*ibid., disp. 4, quaest. 10, §. primo*), defend alteration as continuous in neither way, holding that it occurs through certain pauses and discrete instants — for example, fire, in order to heat wood, produces the first degree of heat and then briefly rests, and after a slight pause causes the second degree of heat, and so on with the others. The common view of the Scotists and Nominalists, however, teaches that alteration is a continuous motion, to which subscribe Suarez (*disp. 46 Met., Sect. 3*), Toletus (*in praesenti, quaest. 6*), and Ruverio (*tract. 3, cap. 4, quaest. 2*).

Note first that the question here is not whether an alteration already underway can be interrupted — for experience testifies that this is possible and not uncommon. Fire beginning to heat wood, meeting a stronger contrary that resists and overcomes it, ceases, or for some other reason does not continue the heating of the said wood. The difficulty is rather whether alteration is by its very nature capable of being perpetual and continuous, such that sustained succession does not oppose or conflict with it.

Note second, from a double standpoint a motion can be called continuous. First, on the part of the subject, because the subject is changed and altered by the continuous flux of form — as wood is continuously and successively heated by the heat continuously produced and emitted by fire. Second, on the part of the form, which namely continuously, without any interruption, intensifies and perfects the subject in which it exists — as whiteness, through the action of whitening, whitens a wall and perfects it by continuous whitening, rendering it progressively more white, because the whiteness itself is more intense and more

perfect by the addition of several new degrees. Hence a double alteration is distinguished: extensive alteration, which regards the subject and the place through which it is diffused and extended; and intensive alteration, which regards the new degrees added to the form itself, in virtue of which the form itself is said to be intensified.

Assertion: alteration is a continuous motion, both with respect to intension and with respect to extension. This is handed down by the Doctor (*1 dist. 17, quaest. 3, §. Hic dicitur, versu. Item quarto*) and (*2 dist. 2, quaest. 9, sub N*), and it is suggested by Augustine (*1 de 83 quaest., quaest. 9*): *When hair grows, it happens without any interruption*. Proof first, from Aristotle (*5 Phys., T. 39*): every motion is continuous; and he had premised in the same book (*T. 18*) that alteration is one of the species of motion properly speaking; and (*T. 41*) he adds that a motion is not one in number unless it is continuous; therefore in the Peripatetic school alteration is a continuous motion. Second: alteration and generation are distinguished principally in that generation occurs in an instant and alteration in time, as is clear from the preceding article. But the measure must correspond to the measured; and since alteration is measured by time, and time itself is continuous, it is plainly inferred that alteration is to be enrolled among continuous motions. Third: an agent altering some subject does not desist from its action if the subject upon which it acts is rightly disposed and well prepared — as is evident in the case of dry wood properly placed near fire, which is continuously heated and burned by that same fire, and likewise in the case of fire heating the water in a pot, never ceasing if sufficient combustible material is supplied and no obstacle is interposed. Moreover, it is incredible and implausible that a necessary and natural agent, when unimpeded, should not act and should rest, having an apt and duly disposed subject. For a cause of such rest would have to be assigned, and why it acts at this moment rather than at another; and since no plausible reason can be adduced to dissolve the said motive, it is plainly deduced that alteration is a continuous successive motion.

Objection I: from (*8 Phys., T. 23*) — to say that alteration occurs continuously is to oppose things very manifestly evident. Therefore according to Aristotle alteration is not a continuous motion. I respond that in that passage the Philosopher argues against those who hold that alteration is always occurring and never ceases, so that there is never any interval to be assigned in which the subject is not being altered — for example, that water is always being heated and continuously agitated — which the Philosopher denies. For he asserts that alteration sometimes ceases, and hence that the subject of alteration is sometimes exempt from alteration itself.

Objection II: that motion whose terms cannot be continuous cannot itself be continuous. But the terms of alteration cannot be continuous, because they are contraries; therefore alteration is not a continuous motion. Hence one reads at (*6 Phys., T. 18*) that motions occurring in contraries or contradictories are not

continuous. I concede the major. I distinguish the minor: if the subject is not duly disposed and one contrary is stronger than the other, I concede; but if the subject is apt and rightly prepared and one contrary is weaker and more feeble than the other, I deny. This is how Aristotle in the cited passage is to be understood.

Objection III: if the subject does not rest briefly during alteration, then in every instant a new degree is produced, and since the instants are infinite the degrees produced or to be produced will likewise be infinite, and thus an actual infinite would be given, which has been rejected (*quaest. 5, 1. 5 Phys.*). I deny the consequent, because alteration is not effected in an instant but in time, like every other continuous motion. What is more, those instants, like points and proportional parts, exist in potency in the continuum and not in act; therefore it does not follow that an actual infinite is given, even if the stated consequence be granted.

Question II: On Generation

Article I: Whether There Is Substantial Generation

Philosophers earlier than Plato and Aristotle — namely Leucippus, Democritus, Empedocles, and Anaxagoras — deny all substantial generation, holding that all things pre-exist in act and are only moved in a certain manner, that is, through aggregation or separation, rarity or density, as is recorded (*1 Phys., cap. 4, T. 33*) and (*1 De gen. 1*) and elsewhere. This view takes its origin from the axiom *ex nihilo nihil fit* — from nothing, nothing comes to be. For if a thing were generated anew, it seems to them that such a thing would necessarily come from nothing. All later philosophers — the Academics, the Peripatetics, and their followers — oppose these, teaching that substantial generation exists.

Note first, and recall from what was said (*2 Phys., quaest. 4, artic. 1*), that substantial forms are admitted as really distinct from matter; for since we experience that various and diverse operations proceed from agents, and since matter is only passive (*1 De gen., T. 53*) and (*2 eius, T. 53*), it must consequently be maintained that those actions proceed from substantial forms. For form gives being and consequently operation. And the composite coalescing from matter and form is the *principium quod* of operations, while the form is the *principium quo* of those same operations, as I have noted elsewhere.

Note second, from Aristotle (*1 De gen., cap. 3*) and Scotus (*11 Met., Summa 4, in expositione cap. 3*), that the natural production of a substance is called generation simply speaking, and the composite generated by it is called a being simply speaking; while the production of an accident is called generation in a qualified sense, and the accident produced by it is called a being in a qualified sense. Nor does it matter that Aristotle in the same passage subjoins that the generation of earth is generation in a qualified sense, although earth itself is a substance — for

he does not say this absolutely but relatively, namely with respect to fire, whose generation is called production simply speaking because it is nobler and more excellent than the generation of earth.

Assertion: substantial generation is to be admitted. It is defended by the Doctor (*1 dist. 3, quaest. 6, §. Tertia quaestio sub X*) and (*dist. 13, quaest. un.*), by Ockham, Gabriel, and other scholastics there, preceded by Augustine (*3 contra Maximum, cap. 6*), who says *man generates man, and dog, dog*, and the same in (*ibid., cap. 14*). Proof first: natural agents produce things like themselves — fire generates fire, and man generates man, as Augustine has just cited, and before him Aristotle (*2 Phys., T. 26*); but such production is substantial generation, because by it is produced the composite, which is a complete substance; therefore substantial generation is to be conceded. This is corroborated: there are three sufficient principles of substantial generation — matter, form, and privation (*1 Phys., cap. 6, T. 7*). Moreover, accident generates accident — as heat generates heat — therefore substance too generates substance. Again, alteration is possible, and it is ordered toward substance; therefore the generation of substance is also possible. For if the means is possible, so too is the end to be acquired through that means. Second: matter desires substantial form (*1 Phys., T. 81*); but this desire cannot be satisfied except through generation, by which the substantial form is drawn out from the potency of matter by the natural agent. Furthermore, the same species is conserved and perpetuated (*2 Anima, T. 34*); but such conservation and perpetuation of the species is not effected except through the substantial generation of many individuals. For we observe that a grain of wheat is corrupted and from the corrupted grain a stalk is generated, in which many grains of the same wheat are produced, as the Savior forewarned (*Ioan. 12*): *Unless a grain of wheat falling into the ground die, it remains alone; but if it die, it brings forth much fruit*. Substantial generation is therefore to be conceded.

Objection I: if substantial generation were given, it would come to be from non-being simply speaking, since its terminus is being simply speaking, namely substance; but non-being simply speaking is nothing, and from nothing nothing comes to be; therefore no substantial generation is to be admitted physically. I respond to the major by a distinction: it would come to be from non-being simply speaking, both in act and in potency, which is nothing — I deny; it would come to be from non-being simply speaking in act but in potency — I concede, because from that which is not in act but is in potency, something can be made that is in act, as is clear from what has been established. You will press: what is generated is generated from something that is a being in act — as air is made from fire, which is a being in act; therefore generation does not occur from a being in potency. I distinguish the antecedent: from something that is a being in entitative act, which is matter possessing that act of being and existing in subjective potency, I concede; from a being that is complete and perfect in act and persisting in the generated thing, I deny — for only matter, which is an

incomplete and partial being, persists in the generated thing, as it had existed in the corrupted one.

Objection II: the whole is that which coalesces from its parts; therefore the whole is generated when all its parts are generated. For from (*1 De gen., cap. 4, T. 23*) generation is a change of the whole into the whole, no sensible subject remaining. But the parts of the whole are not generated — especially matter, which is ingenerable and incorruptible (*2 De gen., T. 51*); therefore there is no substantial generation. I concede the antecedent and deny the consequent. For it suffices for the generation of the whole that the parts be simultaneously united and constitute the whole itself, even if some part of it pre-existed — namely matter — and another part, namely form, is drawn out from the pre-existing matter; just as in the resurrection, which is a kind of regeneration, all the parts of the composite pre-exist and pre-exist, as is recorded in Scripture about Lazarus restored to life (*Ioan. 11*). You will press: form is nobler than matter; therefore if matter is not generated, neither is form. But if form is not generated, neither then is generation, and so generation is impossible. I say that form is not properly made but drawn out from the potency of matter, while the composite is what is properly made and generated (*1 Phys., T. 64*) and elsewhere.

Objection III: from (*8 Phys., T. 69*) — the same thing cannot simultaneously be and come to be; but if substantial generation were admitted, the same thing would simultaneously be and come to be, since generation occurs in an instant; therefore generation should rather be eliminated than that the said inconvenience and absurdity be conceded. I respond that the testimony of the Philosopher is to be understood of successive things, not of instantaneous things, which is what generation is.

Article II: What Generation Is

The Coimbrans (*1 De gen., cap. 4, quaest. 9, artic. 1*), Ruverio (*tract. quaest.*) and others hold that generation is essentially a change. Against them stand Scotus (*1 d. 2, quaest. 7*), Mayr (*ibid., d. 4, quaest. 1*), Vorrilong (*same dist.*), Alexander (*3 p., quaest. 7, num. 9*), Arriaga (*disput. 1 De gen., Sect. 1*), and the Complutenses (*ibid., disput. 2, quaest. 2, §. 4*), who deny that generation precisely and absolutely essentially includes change.

Note first that generation is used in three ways. First, for the production of any being whatsoever, whether substance or accident — in which sense Aristotle (*5 Phys., T. 7*) writes: *Generation is a change from non-subject to subject* — that is, from privative to positive, as from non-man a man is generated, and from non-white a white thing is generated. Second, for the production of a living thing only — in which sense generation is described as the production of a living thing from a living principle conjoined with life, unto the likeness of nature. In this sense St. Augustine (*2 contra Maximum, at the end*) says that Adam was not generated but made by God. Third, for the production of substance alone, whether that which

is generated by it be living or not. It is in this third sense that philosophers treat of generation in the present question, following Aristotle (*1 De gen., T. 23*), who defines it in these words: *Generation is a change of the whole into the whole, no sensible subject remaining*. This definition does not differ from the others given by the same Aristotle, as Poncius shows in this place.

Note second that these three — origin, production, and generation — stand in relation to each other as the more general and the less general. Every production is an origin, but not every origin is a production; for the divine attributes originate and spring from the divine essence, yet are not produced. Likewise, a passion originates from the nature of which it is a passion, but properly speaking is not produced from it. Furthermore, every generation is both a production and an origin, but not every production and origin is a generation. For the Holy Spirit is produced and originates, but is not generated, as I showed at length in the (*Tractatus de Deo trino, disp. 1, quaest. 5*).

First assertion: generation is not essentially a change. The Doctor holds this (*ibid.*) and (*dist. 5, quaest. 2, §. Ideo tenendo E & F*) and (*dist. 13, quaest. un., §. Ad argumenta ante Q*). Proof first: change, from (*5 & 6 Phys.*) as cited by Scotus (*2 dist. 1, quaest. 5, §. Secundum primam opinionem T*), is when a subject holds itself differently through the reception of something new; but generation is not of this kind, because what is generated did not previously exist, and through generation it acquires a total being anew; therefore generation is not essentially a change. You will say: through generation matter is changed by receiving a new form that it previously lacked; therefore generation is essentially a change. Against: if matter did not pre-exist but were produced and generated together with the form, then generation would exist without change — and so generation is not essentially a change. Furthermore, although matter is indeed changed by the reception of the new form, it does not follow well that generation is formally a change, as Fonseca pursues at length (*5 Met., cap. 13, quaest. 9, sect.*).

Second: the generation of the divine Word does not essentially include any change, as no Catholic denies; therefore generation, taken precisely, is not formally a change. For change presents imperfection, which is far from divine things; therefore, since generation belongs to God the Son, it is rightly deduced that generation in its essential being does not include change. You will say: there is a disparity, because the generation of the Son of God is eternal and infinite, whereas the generation that belongs to created things is temporal and finite, and hence essentially a change. Against: although they are distinguished from each other in these respects, nevertheless they share a common univocal notion — just as God and creature agree in the common univocal notion of being. Therefore, just as divine generation does not include change, so too created generation does not.

Third: if the sacramental species are corrupted and from them a worm is generated, since no matter pre-exists there, generation is then had without any

change; therefore generation does not in itself include change. You will say: given that hypothesis, what occurs is not generation but the pure drawing out of form from matter, and so it does not follow that generation can exist without change. Against: whatever is produced in created things is either created or generated; a worm, in the given case, is not created, because it is not made from nothing; therefore it is generated, because it is produced from matter newly created by God. Furthermore, when a form is drawn out from the potency of matter, generation is had, because by it the composite is brought into being. Again, if the sole drawing out of form were distinct from generation, there would not be generation; but the worm is truly generated from the said species; therefore it is generated by true generation and not by some other action distinct from it.

Second assertion: generation is formally the production from the substance of something, or a relation intrinsically accruing to the generating thing with respect to the generated. This is Scotus (*3 d. 8, quaest. un.*). Proof first, from (*5 Met., cap. de relatione, T. 20*), where are listed the relations founded on active and passive power, among which active and passive generations are numbered. Second: that by which certain things are mutually referred to one another is formally and intrinsically a relation; but through generation the generator and the generated mutually regard each other; therefore generation is the aforesaid relation. The major is clear from what was said in the (*Logic, quaest. de relatione*), and the minor is evident from the same place. Third, from the common sense of theologians and universal agreement: the generation of the divine Word is the relation by which the Word itself is constituted in personal being; therefore if generation in divine things is formally a relation, so too in created things, since the same reason holds in both.

You will say: relation belongs to the genus of the sterile, as I have repeatedly emphasized above; but generation in the generating thing is active; therefore generation is not formally a relation. I concede the major and distinguish the minor: generation is called active as a productive and effective principle of the generated term, I deny; but extrinsically, because it results from that in which such a productive principle formally resides, I concede.

You will press: action, which according to Scotus is a relation, is the *principium quo* of the term's production — as heating is the principle by which fire heats; therefore the same must be maintained of generation. It must be replied that action, which belongs to the genus of action, is a relation extrinsically accruing, while generation is a relation intrinsically accruing; hence it is no wonder if the former is productive, but the latter is not.

Objection I: from Aristotle (*1 De gen., cap. 4, T. 13*) — *generation is a change of the whole into the whole, no sensible subject remaining*; and (*cap. 5 of the same book, T. 25*) — *generation is a change from substance in potency to substance in act*; and (*8 Phys., cap. 7, toward T. 57, 58*) — *generation is a change from non-being to being*. But what enters

into the definition of something in the nominative is essential and quidditative to it; change enters into the definition of generation; therefore change is intrinsic and essential to it. I respond that generation is rather described than defined by Aristotle; for the Philosopher describes and explains it through certain circumstances. Since from that which generation is in created things, change follows it. But absolutely and precisely generation is not a change, as is proven in the first assertion.

Objection II: the same Stagirite (*5 Phys., T. 51*), inquiring into and asserting the difference between alteration and the other motions on the one hand and generation on the other, subjoins that generation is a change. But if change were not intrinsic and essential to generation, the said difference would be null. It therefore seems that according to Aristotle, change is enclosed in the essence of generation. I respond that this is indeed one difference, but not the proximate and precise cause — in much the same way that in the matter of creation I asserted that artisans cannot create because they work through a body, though this is not the chief motive but rather that they are not independent; likewise generation is distinguished from alteration and the other motions because it is a change, yet this is not the precise cause — rather, it is because motion is successive while generation is instantaneous; and because through motion an accident is produced while through generation a substance is generated; and generation is a production from the substance of the producer.

Objection III: three principles of natural generation are posited — namely matter, form, and privation; but where privation is a principle, there is change, for matter passes from privation to form; therefore generation is a change. Hence Scotus (*2 d. 1, quaest. 3, §. Tenentes autem ab F*) subjoins that generation necessarily includes change. I concede the major and distinguish the minor: per se and essentially, I deny; per accidens and concomitantly, I concede. This is how Scotus in the cited passage is to be interpreted — for created generation carries change with it, because privation of the form always precedes and matter passes from privation of the form to the form itself. Nevertheless, absolutely and precisely generation includes no change.

Article III: Whether Generation Is Instantaneous

Some — among whom are Thomas de Vio (*Nip., quaest. 36, artic. 6*) and Hervaeus (*tract. de unitate formarum, q. 17*) — not distinguishing the action of alteration from the action of generation, maintain that generation is successive and occurs in time. But Scotus (*2 d. 2, quaest. 9, sub L*), Mayr (*ibid., d. 19, quaest. un.*), Lichetus (*d. 16, at the end*), the Coimbrans (*1 De gen., cap. 4, quaest. 12, artic. 1*), Ruverio (*ibid., tract. 1, quaest. 5*) and others, recognizing that the action of alteration is distinct from the action of generation, teach that generation is instantaneous.

Note that generation is taken in two ways. In one way, for the prior disposition of the subject together with the introduction of the newly produced form into

that same subject — in which sense generation thus taken can be called successive and temporal, because its dispositions and preparations are successive and temporal. In another way, for the sole introduction and production of the substantial form into aptly disposed and duly prepared matter — and in this sense generation is momentary.

First assertion: alteration and generation are two actions distinct from one another. This is defended by the Doctor (*1 d. 3, quaest. 6*) below and (*4 Rep. d. 11, quaest. 1, §. Dico primo*). Proof first, from Aristotle in the (*Postpraedicamenta, cap. 4*) distinguishing alteration from generation, and (*3 Phys., cap. 2, T. 6*) and (*5 of the same work, cap. 1, T. 9*) and elsewhere confirming the same. The reason is that alteration is between contrary terms — as from hot to cold, and from moist to dry — while generation is between contradictory terms — as from non-substance to substance; therefore according to Aristotle they are distinct actions. Second: distinct principles receive distinct actions and principiations, as is clear from (*1 Phys.*); but substance and accidents are distinct principles, since they are distinct members of being; but generation is attributed to substance, as (*2 Phys., T. 26*) — *the sun and man generate man* — while alteration is attributed to accident — for it is by heat and cold, health and sickness that a man is altered, and a wall by whiteness and blackness, which are accidents; therefore alteration is a different action from generation.

You will say: if this argument concluded, substance would be immediately active and operative, although action and operation are commonly attributed to accident alone. I reply to this objection by conceding that substance is the active principle of substantial generation. For although substance does not operate except through prior accidents disposing and suitably preparing the subject for the introduction of the substantial form into it, nevertheless substance itself is the productive and generative principle of substance, as I will clearly and effectively demonstrate below. Third: distinct terms argue for distinct ways by which one tends and moves toward them; but the terminus of generation is substance and the terminus of alteration is quality; therefore generation and alteration are established as distinct ways and actions by which the said terms are made and acquired.

You will say: this is effected through natural resultance — for from the fact that the subject is aptly disposed through alteration, the new form is drawn out, the old form expelled, a new composite comes to be, and the old one is corrupted. Against: quite apart from the fact that such resultance occurs through true efficient causation — as is clear in the case of a passion that arises from its subject and of a relation that is co-produced once the extremes are posited — that drawing out is a different action from alteration, because it tends toward a different terminus, namely the substantial form. And it was decided in (*8 Phys., quaest. 2, artic. 1 & 2*) that motion is distinguished according to its *terminus ad quem*. Furthermore, alteration can occur without generation; therefore the

former is distinct from the latter. The antecedent is clear, since the former is prior and the latter posterior, and I showed above that the prior can exist without the posterior. Moreover, if the agent altering desists from alteration — as when the one whitening a wall ceases from its whitening — then there is undoubtedly alteration without generation; and hence the one is an action distinct from the other.

Second assertion: generation is instantaneous. This is handed down by the Doctor at the citations near the beginning of this article, and it is suggested by Augustine (*3 Trin.*). Proof first, from (*5 Phys., T. 9, 10*): there is no motion per se toward substance; but the terminus of generation is substance, and motion occurs in time because it is successive; therefore generation, which is a change distinct from motion, occurs in an instant. Second: the measure corresponds to the measured, for they must be of the same kind; but generation and its terminus are indivisible, since it is permanent; therefore its measure is impartite and indivisible — namely, an instant. Third: unless generation were instantaneous and momentary, the same matter in number would be simultaneously informed by several forms, and one and the same individual would share in diverse species and would be a multiple and diverse individual, singular thing, and supposit — since it would be under the form of water, fire, and the like — as Mayr rightly inferred in the beginning of this article cited. Furthermore, illumination occurs in an instant, as Scotus notes (*5 Met., quaest. 7, §. Ad 2 argumentum*). And the Body of Christ is brought or produced in an instant in the consecrated host through the sacramental words; therefore likewise generation occurs in an instant.

Objection I: in the (*Postpraedicamenta*) generation is placed among the species of motion; therefore, since motion is successive and temporal, generation is likewise successive and temporal. The same is read (*3 Phys., cap. 2, T. 6*) and (*6 of the same work, T. 54, 55*): *what is changed is changed in time, not in an instant*.

Confirmation I, from Anselm (*in Monol.*): a substance that is gradually destroyed is produced with less and less being. Confirmation II, from Scotus as just mentioned: certain illuminations are successive; the same must be maintained of generation. I respond that in those places *motion* is taken generically, as it abstracts from motion taken specifically and from change — just as in the chapter on quality, *disposition* is taken generically, insofar as it encompasses both *habit* and *disposition* properly and specifically taken. To the last testimony I say either that the Philosopher there speaks of local change, or of change insofar as it encompasses the prior dispositions of the subject about to undergo change of form. Anselm for the first confirmation, and Scotus for the second, are to be interpreted in the same way.

Objection II: a created agent is of finite and feeble power; but to act in an instant requires supreme and infinite power. For this reason Aristotle (*8 Phys., T. 10; 12 Met., T. 29*) subjoins that God alone acts in an instant; and Scotus (*2 dist. 1, quaest.*

2) and (4 *dist.* 1, *quaest.* 1) that every creature acts in time. I respond that this is true if we speak of action independent of the subject — but not of action dependent upon matter that is aptly disposed and duly prepared, as I observed above.

Objection III: if generation were in an instant, it would be subjected either in matter or in the composite from matter and form — for since it is an accident it requires some subject in which it inheres; but it seems to be in neither. For it is not in the whole being generated, which does not yet exist; nor in matter, because it seems to be in a thing already accomplished. I respond that generation, insofar as it is an action, is in the generating thing, and insofar as it is a passion, it is in the generated thing. This is to be shown at length below, when we treat of action and passion.

Article IV: What the Terminus of Generation Is

Since every change proceeds from a *terminus a quo* to a *terminus ad quem*, and generation, from what was said above, is a change, it is rightly inquired here after its terminus. Passing over its *terminus a quo*, which all concede to be the privation of the substance to be produced, we investigate its *terminus ad quem*. On this there is not one view among the philosophers. For some, whom Hurt (*disp.* 1 *de gen.*, *sect.* 7, §. 74) follows, hold that the terminus of generation is the union of matter and form. The rest hold that it is the composite from matter and form — though they disagree among themselves: some, like Ruverio (*tract.* 1, *cap.* 4, *quaest.* 3) and the Coimbrans (*ibid.*, *quaest.* 15, *artic.* 2), hold that the terminus of generation absolutely is the whole constituted from matter and form, without regard to its suppositional character; others, to whom the Complutenses adhere (*disp.* 2, *quaest.* 3, §. 3), teach that the whole coalescing from matter and form, together with its existence and subsistence, is to be constituted as the total and adequate terminus of generation. Nor are there lacking those who, recognizing two actions — one of the form and another of the composite — determine the terminus of the former to be the form and the terminus of the latter to be the composite.

Note first, from Scotus (7 *Met.*, *quaest.* 10), Anthony Andrew (*ibid.*, *quaest.* 9) and (2 *dist.* 17, *quaest.* 1), that the terminus is bipartite into partial and total. The former is called the *quo* and formal terminus; the latter is called the *qui* and total, adequate terminus of generation. Thus the rational soul is the *quo* and *homo* is the *qui* terminus of human generation; in the same way the intellect is the *quo* terminus of intellection, and man is called the *qui* terminus of that same intellection. Likewise, filiation is the *quo* terminus and the son is the *qui* terminus of the father's generation. Furthermore, the Doctor observes in the same place that if the form is produced by a production distinct from the production of the whole, then a distinct action is required to produce it from the action by which the whole is generated; and since every action is a relation, and relations are multiplied according to the multiplication of terms, hence it is

that there is a peculiar and proper terminus of the production of the soul, which is called the formal terminus, distinct from the production of the whole, whose terminus is said to be total and adequate.

Note second, from the same Doctor (*1 dist. 4, quaest. 2, §. Respondeo B*) and (*§. Ad 1 argum. E, in responsione 2*): to each *quo* there corresponds its *quod* — just as every abstract has its concrete, as *humanity* has *man* and *whiteness* has *white* — and this is affirmed even in divine things, as *Deity* has *God*, although several *quods* can correspond to one *quo* inadequately, as several human supposita correspond to humanity: for this man is man through humanity, and that man is man through humanity, even though the proper *quod* of man in general is man, and the proper adequate *quod* of a particular man is this man. For just as man is man through humanity, so this man is this man through this humanity. Hence it is not without reason that the question arises whether the total terminus of generation is the whole including both existence and the essence of matter and form, or simultaneously the suppositional and hypostatic subsistence of the whole composite.

First assertion: the formal terminus of generation is established to be the form. This is Scotus in the places recalled at the beginning of this article. Proof I: there are three principles of natural things (*2 Phys., T. 52*) and thereafter — matter, privation, and form; but matter is the common subject of privation and form, and privation is the *terminus a quo*; therefore form opposed to it is the *terminus ad quem* — not total, since it is a part of the whole, but partial and formal. Second: form is nature (*2 Phys., T. 10*), and generation is called natural because it is a way to nature — not a way to matter, since matter pre-exists, nor to the composite, since the composite is that which *has* nature; therefore it is a way to form as to its formal terminus, from which it takes its denomination. Third: that from which something is constituted and specified in its essential being is its formal terminus; but form is of this kind; therefore it is the formal terminus. The major is clear: the formal terminus is called the *quo* terminus, by which the thing is determined in its essential and quidditative being. The minor is evident, in keeping with the common maxim: form gives being to the thing — namely essential and specific being.

Second assertion: the total terminus of generation is not the union of matter and form, but the composite from them. Both parts are suggested by the Doctor in the places cited above. The first part is proven first: the total terminus is generated per se, as Aristotle frequently emphasizes, notably (*7 Met., T. 26*); but the union of matter and form is not generated, since it is a relation, from what was said (*2 Phys., quaest. 5, artic. 2*), which arises from the positing of the extremes. Second: the copula and bond of terms is not a terminus, as I showed in the (*Epitome of Dialectics, lib. 1, quaest. 1, artic. 2*) in treating of the verb, which is the bond of the subject and predicate of a proposition; but union is the bond by which matter and form are united to make up the composite. Third: union is

formally an accident since it is an extrinsically accruing relation; but the terminus of generation is substance — for in this especially does generation differ from alteration, that the terminus of the latter is an accident while the terminus of the former is substance, as I abundantly explained in the second article of the first question of this book. Furthermore, union precedes the terminus of generation: for the parts are first united with one another before they constitute and cause the whole, since causes precede their effects at least in nature; but matter and form are the intrinsic causes of the composite; therefore union is by no means the terminus of generation.

You will say: besides union in the generated whole, nothing new is caused through generation. For matter pre-exists, and form is either introduced or drawn out from the potency of matter; and if it were already produced separately and united to matter, there would be a new composite through the new union of both; therefore union should be considered the terminus of generation. The antecedent is denied, since the composite is generated, which, from what was asserted in the (*Physics*, lib. quaest. 6, artic. 2) cited above, is really distinct from matter and form taken jointly.

The second part is common among the scholastics (*in 2 cit.*) and is perspicuously handed down by Aristotle (*1 Phys.*, T. 6, 7) and (*1 Met.*, cap. 1) and also (*7 Met.*, T. 26), writing that it is not matter, nor form, but the composite alone that is generated; therefore in the Peripatetic school the total terminus of generation is the composite. Second: what is made per se and generated is established by all as the total and adequate terminus of generation; but only the composite is made per se and generated — for matter is ingenerable and incorruptible, and form is either drawn out from the potency of matter or introduced into it; therefore the composite is the adequate terminus of generation. Third: in accidental generation the accidental form is not made per se — as whiteness is not — but the whole accidental thing — as the *white thing* — nor is music made, but the *musician* (*7 Met.*, cap. 8, T. 26, 27). Therefore likewise in substantial generation it is not the substantial form that is generated per se but the whole substance. Furthermore, two partial causes constituting one total cause enjoy their total and adequate effect, as is clear; but matter and form are two partial causes making up one total cause, whose effect and terminus is the whole. Finally, the first terminus of generation in intention is the composite; therefore the last terminus in execution is that same composite. For what is first in intention is last in execution. Moreover, the total terminus of corruption is the privation of the whole composite — as is clear in the death of a man, in which it is not the soul, nor the body, but the man who dies and is corrupted, who is constituted from soul and body; therefore conversely, in the generation of that same man — which is opposed to his corruption — the total terminus of that same generation is determined to be the man himself, coalescing from soul and body.

Third assertion: the whole including essence and existence, but not suppositional subsistence, is held to be the total and perfect terminus of generation. This is indicated by the Doctor in the places cited above and also (*2 d. 4, quaest. 3*) and (*3 d. 4, quaest. un.*). Proof I, from Aristotle, who in the passages adduced above and elsewhere, speaking of the composite, says that the composite is a third something constituted from matter and form precisely — but the whole so constituted contains precisely essence and existence, and does not denote suppositional subsistence, as it is the terminus of substantial generation. For the whole accidental thing, which is the terminus of accidental generation mentioned by the Stagirite in the (*Met.*) just cited, includes no suppositional subsistence, yet it obtains the true notion of a total terminus; therefore the same must be maintained of the total terminus of substantial generation. Second: actions and generations are of singulars (*1 Met., cap. 1*), but singulars do not precisely include suppositality — as Aristotle there exemplifies with experienced and knowing artisans, from whom their works proceed not as they subsist but as they exist. Hence Scotus (*4 dist. 12, quaest. 3, §. Ad principales rationes, AA*), explaining the said testimony of Aristotle, says that there it is not had that actions are of supposita but of singulars; and he adds that there one can say that actions are of supposita as ultimately denominated. Again, suppositional character was unknown to Aristotle and became known to us through the mystery of the Incarnate Word, in which we are taught that Christ as man is not supposed by a human but by a divine suppositality and personality, even though he is a perfect man and truly generated by the Blessed Virgin. Furthermore, the notion of suppositality formally presents not something positive but something negative, as the Doctor holds problematically (*3 dist. 1, quaest. 1, §. Non asserendo, Ad E*) and (*Quol. 19, artic. 2*); therefore the total terminus of generation does not precisely include suppositality.

You will say: suppositality is the ultimate terminus of substantial nature; therefore it is a real positive terminus of it, not a negative one as Scotus holds in the cited passage. The consequent is denied. For privation is the principle and *terminus a quo* of real and positive generation, and yet it is the absence and negation of form in an apt and capable subject. Likewise, a point is the terminus of a line, which is something real and positive, even though the point itself — in the view of the Nominalists whom I cited and refuted (*5 Phys., quaest. 2, artic. 2*) — is a negation of length.

Fourth assertion: form is produced by an action distinct from the action by which the composite is produced. Proof first, from Aristotle (*7 Met., T. 26*) and Scotus (*ibid., in com.*), teaching that the composite is made and generated per se, while the form is neither generated nor made per se but only per accidens; but the action per se differs from the action per accidens; therefore according to Aristotle and Scotus the action by which form is produced is different from the action by which the composite is generated. Second: the action of the form is called the drawing out, or introduction, into pre-existing matter; the action of

the composite is called generation; and the latter follows upon the former, for the form is first drawn out or introduced into matter before the composite is generated; therefore these actions are distinguished from one another. Third: action in the Scotist school is a relation extrinsically accruing; and a relation is distinguished according to the distinction of terms; and the terminus of the drawing out or introduction is the form, while the terminus of generation is the whole, really distinct from matter and form taken jointly. Moreover, the *quo* terminus and the *qui* terminus differ, as is clear from the first note: form is the *quo* terminus and the composite is the *qui* terminus; therefore the actions by which these are produced are distinguished from one another.

You will say: Scotus (*2 dist. 17, quaest. 1, §. Ad 1*) writes that the form drawn out from the potency of matter is produced by the production of the whole; therefore the action by which the form is produced does not differ from the action by which the composite is produced. I say that form is produced by the production of the composite, because the drawn-out or to-be-drawn-out form cannot exist without the composite; and it is said to be generated by the generation of the composite insofar as it is a part of something that is generated per se. In this way it is said to be generated per accidens, as Lichetus rightly explains there. Hence, although form of this kind is produced by a different action from the action of the composite, yet because it does not issue outside the whole itself, it is therefore said to be produced by the production of this whole — conversely, because the form to be introduced can be created outside the composite or outside matter, and before the whole comes to be, it is for this reason said to come to be by its own proper action, distinct from the action of the composite.

Objection I, against the first assertion: (*2 Phys., T. 70*) and (*8 Met., T. 12*) — form and end coincide; but if the end or terminus of generation is the form, it is therefore its total and adequate terminus. Confirmation from (*2 Phys., T. 10*): form is nature; and (*ibid., T. 14*): generation is the way to nature — not indeed to matter, which pre-exists, nor to the whole, which is not nature but that which *has* nature; therefore it is the way to form as to its true and proper terminus. I respond that this is to be understood of the partial principal end and *quo* terminus — not of the total and adequate end and terminus, which is the composite. I add, from the Doctor (*7 Met., quaest. 10, §. Ad 1 rationem*), that form is the end of generation because it is that by which the composite completes generation, and it is the per se end of matter. To the confirmation I say, from the same (*ibid.*) and (*5 Met., quaest. 1, §. Quod additur*), that generation is called a way to nature both because it tends toward the natural composite, which is its *qui* terminus, and because it tends toward form, which is nature and its *quo* terminus. Hence generation is called natural in two ways — from its total terminus, which is the whole, and from its partial and formal terminus, which is the form.

Objection II, against the third assertion: what is generated is not form or quiddity but the whole constituted from matter and form (*7 Met., T. 27*). Therefore in the Peripatetic school the *qui* terminus of generation is the supposit. Confirmation: the *qui* terminus of generation is complete and perfect and its ultimate end; therefore it is the supposit, inasmuch as the supposit is the ultimate terminus of substantial nature. The consequent is denied, because the quiddity or nature composed from matter and form is one *quo* to which there corresponds its *quod* — namely, that which has that nature — as to humanity there corresponds man, who precisely is not a supposit. For Christ is a true and perfect man, even though he lacks a proper supposit, the divine Word supplying it. Hence to this humanity of Christ, which is one *quod*, there corresponds its *quod* — namely, this man precisely, without any suppositality — just as to the Deity there corresponds God precisely, without the divine personalities, as the Doctor makes clear (*in 2 not.*) cited above. To the confirmation I distinguish the antecedent: in the notion of nature, I concede; in the notion of supposit, I deny. For generation tends toward the complete and perfect nature, prescinding from suppositality — which, since it formally presents a double negation, both as *quo* and as *quod*, formally denotes no generation.

Article V: Whether an Accident Can Generate Substance

Three leading opinions are on record in this article. One is mentioned by Soncinas (*7 Met., quaest. 7*), Ruverio (*2 Phys., tract. 4, quaest. 6*), and Fonseca (*5 Met., cap. 2, quaest. 6, sect. 2*), to which Maior (*4 dist. 12, quaest. 1*) seems to be favorable, affirming that an accident can immediately generate substance. The second is handed down by St. Thomas (*3 p., quaest. 77, artic. 3*), Cajetan (*ibid.*), and very many others, holding that an accident can attain the production of substance in the power of substance. The third is that of the Scotists with their leader (*4 dist. 12, quaest. 3*) and of the Nominalists with their guide Ockham (*2 quaest. 23*), denying that an accident generates substance either as principal or as instrumental cause. Not far from these are Durandus (*4 dist. 12, quaest. 2*), Arriaga (*disp. 11 Phys., sect. 2, subsect. 4*), and not a few others; and Richard seems to indicate this (*1 dist. 3, quaest. 1, ad 7*), although he seems to hold the opposite in (*4 dist. 14, artic. 3, quaest. 2*). And before them, St. Bonaventure (*ibid., artic. 2, quaest. 1*).

Note first that among created things some are passive, emitting no action and having no efficiency — among which matter, relations, and things of this kind are placed, to which may be added artificial forms that seem inert. Hence Aristotle (*2 Phys., T. 13*) says that if a bed were buried it would not germinate a bed but wood, because the said forms are not active. Others are active — their series is woven in the book of Genesis — and some of these produce things like themselves, as man produces man; while others produce things unlike themselves, as earth germinates growing grass, and the sun generates gold in the bosom of the earth. And since some accidental forms are active — as heat

produces heat — while some are not active — as quantity — and others are substantial — as the forms of plants and animals — the question arises whether these latter are active just as accidental forms are, or whether the actions and effects, both accidental and substantial, proceed not from the former but from the latter. Scotus discusses this at length (*1 dist. 7, quaest. un., §. Ad argumenta prima V*).

Note second that a substantial agent sometimes acts immediately — as fire generates fire in tow immediately as soon as it is applied to it — and sometimes mediately, through prior preparations and apt dispositions for introducing its form into the subject. Thus fire, through prior heating and drying, disposes green wood to receive its fiery form. This is indicated by Aristotle (*2 Anima, T. 60*), saying that the soul uses natural heat, by which food is disposed to be converted into the substance of what is nourished. Hence alteration precedes generation, since the subject is first altered and disposed before the form is introduced into it by the generating agent. For this reason fire has a heating power by which it disposes the subject, and an igniting power by which it introduces its form into the duly disposed subject.

Note third, from Ockham as cited, that for the knowledge and resolution of this controversy, experience is of great help. For we experience that heated iron does not burn tow placed near and applied to it — which clearly shows us that heat is not the cause and principle of igniting and burning — but if fire itself is present in the iron, lying hidden in its pores, it immediately ignites and burns the tow applied to it, because that same fire has in itself the power and faculty of producing its like, which power is really identified with its substance and nature, as Scotus proves (*2 d. 16, quaest. un.*) and Lichetus and Gratianus Brixianus explain there. Moreover, daily experience teaches us, and we see with our eyes, that plants, herbs, trees, and animals procreate their like. Hence Aristotle (*2 Phys., T. 26*) subjoins: *the sun and man generate man*; but it is clear that man and the other living things mentioned above are substances. Therefore not only the form — which is a partial substance and the *principium quo* — but also the composite — which is a total substance and the *principium quod* — is active, with the assent of the Stagirite (*1 Anima, T. 64*).

First assertion: an accident is not the immediate productive principle of substance. This is opposed to Pererius (*6 Phys., cap. 13*) on behalf of Scotus in the cited passage and (*2 Met., quaest. 7, §. Ad quaestionem*). Proof first, from (*7 Met., cap. 7, T. 32*) as adduced by the Doctor (*now cited, in M*) and (*2 Rep., d. 25, quaest. un., §. Dicunt saltem*): substance precedes accident, and for the generation of substance an accident is not pre-required; but if an accident were the generative principle of substance, it would without doubt be required for it, because a principle necessarily precedes its principiate and a cause its effect; therefore, since Aristotle there asserts that an accident need not precede substance — indeed, substance itself is prior to accident in nature, knowledge, and time, according to

the same Philosopher (*ibid.*, *cap. 1, T. 4*) — for it is the subject of accident, which must precede, and therefore accident can in no way generate substance. Second: an accident is of a lower order, and is more ignoble and inferior to substance; hence it is called *ens entis* — being of being — and a being in another; therefore, since substance is nobler than accident because it is a being existing through itself, it is not produced by accident as its immediate active principle. The antecedent is conceded; the consequent is shown: every effect is either univocal and equally noble as its cause, or equivocal and its cause is then nobler and more excellent, because an equivocal cause virtually contains its equivocal effect; but to contain something virtually argues greater nobility and excellence — hence God, who is most perfect, is said to virtually and eminently contain all things. Pererius replies in the cited passage by saying that an accident is less noble in the notion of being, but not in the notion of productive principle — for in this respect an accident surpasses substance in nobility. Against: the nobility or ignobility of a thing is taken from its entity, because the former follows the latter, as is clear from the Angel and man, who are nobler than the other created things because they share in a nobler entity and nature; therefore if according to Pererius substance excels accident in entity, it likewise does so in its principle and power of acting. Furthermore, the way to know things in their entities and essences is derived from their powers, potencies, and effects, as Christ the Lord warns (*Matt. 7*): *By their fruits you shall know them; for a good tree brings forth good fruit, and a bad tree brings forth bad fruit.* And his Apostle proclaims (*Rom. 1*): *The invisible things of God from the creation of the world, understood through the things that are made, are clearly seen — his eternal power and divinity.* And philosophers unanimously pronounce this saying: causes are known from their effects — and from this Philosophy has taken its origin, as is clear from (*1 Met., Sum. 1, cap. 2*). Therefore if an accident is surpassed by substance in entity, it is likewise surpassed in power and the ability to act; and hence the said distinction of Pererius is vain and futile for dissolving the aforesaid argument. Third: the more noble and excellent being of a thing is its essential and quidditative being; but if an accident were to possess its own essential and quidditative being of substance, it would be more ignoble and inferior than substance itself — since it would be accidental being, which is a lower being than substantial being; therefore, since an accident confers virtual being — which is the being of an active principle, following upon the essential being of the accident — it cannot immediately attain the production of substance.

You will say: substance is generated and results from the action of accident — for after alteration, generation follows, as I made plain in the first question of this book; therefore the immediate production of substance is rightly attributed to accident. Against: resultance presupposes action, just as a relation that results from extremes presupposes the production of the extremes — for the extremes must be produced first so that the relation may subsequently arise from them. Therefore if substance results after the action of accident, it requires not only

the dispositive action of accident itself but also the action of the generating thing, which is generation; hence the generation of substance is attributed not to accident but to substance. I add that alteration is a distinct action from generation, since the terminus of the former is accident — namely quality — while the terminus of the latter is substance, as was decided and established above.

Fourth: an accident cannot be the immediate corruptive principle of substance; therefore neither can it be its productive principle. The consequent holds, because equal power is required for both. The antecedent is shown: one thing cannot corrupt another unless it has greater proportional power; but an accident is inferior and less, both in entity and in power, as I showed before, and substance resists more than an accident acts; therefore accident has no dominion or authority over substance.

You will say: it seems incredible that all the coldness of water cannot extinguish the smallest spark of fire, and that all the heat of fire cannot absorb the tiniest particle of water — on the grounds that the former are accidents and the latter substances. I say this is neither incredible nor impossible — just as the power of any creature, even the highest, cannot attain the creation of any creatable thing however small, and if all the forces of all created things were joined together they could not create a single rational soul, nor divide all the proportional parts of a single continuum, nor bring about such things as exceed the capacity of them all. It should therefore be neither surprising nor absurd if all accidents joined together cannot immediately produce or destroy the smallest substance, since these things do not fall within the sphere of their activity.

Second assertion: nor does an accident generate substance in the power of substance. The Doctor as cited is its patron, as are also many of the external schools who follow him — notably Hurt (*disp. 9, sect. 3*) — against Suarez (*disp. 18 Met., Sect. 2*) and the Thomists. Proof first: the power of substance by which the Thomists say an accident attains the production of substance is either substance or accident, since between these there is no middle. If the first, then the intended conclusion is obtained, because it is substance and not accident that generates substance. If the second, then the Thomists fall willingly into the very opinion they endeavor with all their strength to refute — namely, that an accident generates substance. For they seem to dissent from the authors of the first view only in words: those hold that accident produces substance; while these hold that accident in the power of substance generates substance. But if anyone asks them what it means to produce substance in the power of substance, they frankly and openly respond that the said power of substance is an accident placed in the category of quality — and so accident immediately generates substance, which is precisely the position they themselves reject. Second: the said power of substance is either in the accident or outside it. If the first, then nothing in the accident is not accident or something of accident, and

the first argument recurs. If the second, then nothing acts by its proper action through what is outside itself — just as no one walks through an ambulatory power existing in another but through one's own power existing in oneself; therefore accident in no way attains the production of substance through the power of substance itself.

You will say that this power is something virtually distinct from the accident, by which it is elevated to produce substance, even though it is nobler and of a higher order — just as when a creature is assumed by God as an instrument for creating something. Against: that virtually distinct thing from the accident devised by the Complutenses, pressed by the force of the aforesaid argument, is either accident or substance, since between these, as said, there is no middle; but it is neither, since through them it is distinguished from both; therefore it is nothing, and something is fictitiously supposed to be because of the need to escape the argument. Nor does its elevation help at all, since that which is by its nature incapable of producing substance cannot be made apt and capable of such production — just as Scotus says that a fly cannot be elevated to create an angel; and not incongruous with this is that saying of Christ the Lord (*Matt.*) recently cited: *Do they gather grapes of thorns, or figs of thistles?* An accident therefore does not overstep the limits of its power, which extends only to the production of accident.

You will say again: this holds for an accident separated from substance, but not for accident joined to the substance to which it is subordinated and conjoined. For many things conjoined to others operate in ways they cannot when separated from them; and thus a united power is stronger, and wonderful things are brought about by applying actives to passives, as I showed (*1 3 Phys., quaest. 2*). Against: nothing is newly added to a conjoined accident except conjunction and subordination, which, since it is a relation, does not belong to the genus of active things; therefore if a separated accident does not possess the power of producing substance, neither does it when conjoined to substance itself. For conjunction cannot confer on it a power of which it is incapable — just as a fly does not acquire the power of writing even when assumed and conjoined to the hand of a man, because it is of itself incapable of writing.

But if you object and say that an accident is an instrumental cause of substance, and substance is the principal cause — against: an instrument does not attain the terminus of the principal cause but acts only dispositively, as I handed down (*1 4 Phys., quaest. 5, artic. un.*). Furthermore, if substance generates substance as principal cause, then it is per se active, since it exercises per se influence on the substantial effect — which Cajetan and other leading Thomists deny.

You will say: an accident is a partial cause and concurs together with substance toward the generation of substance — just as the intelligible species and the intellect are two partial causes of intellection. Against: one partial cause does not act unless the other partial cause concurs simultaneously — thus the intellect

does not understand without the concurrence of the intelligible species, and the father does not generate offspring without the simultaneous concurrence of the mother; but an accident exerts its action before substance does, for alteration — which is the action of accident — precedes generation — which is the action of substance; therefore accident cannot be a partial cause of substance. Moreover, substance can generate substance without accident — for if a subject were aptly disposed and duly prepared, with no accident intervening, the substantial agent would introduce its substantial form into it — as fire immediately ignites tow and dry wood. Therefore accident cannot be a partial cause of substance, since the latter cannot produce its effect without the other partial cause.

Third assertion: substance generates substance. The Doctor is its author as cited above. Proof first: earth generates grass, water generates fish, a plant generates flowers, a tree generates fruit, and animals procreate their like, as we daily observe; but all of these are substances, as may be seen in the catalogue of the predicament of substance, and as narrated by the divine Chronicler in the Pentateuch. St. Damascene supports this (*3 Fidei, cap. 15*): *Action is the efficacious motion of substantial nature.* And a little after: *Those whose nature is the same have also the same action; and those whose action is one, their substance also is one.* And below: *The holy Fathers have concordantly said that those of the same substance have the same action.* Aristotle assents (*2 Phys., T. 26*): *The sun and man generate man;* but the sun and man, to whom generation is attributed, are substances. He argues (*1 De gen., T. 54, 55*) against those who removed all efficiency from substantial forms. (*2 Anima, cap. 1*) defines the soul as *the first act of an organic body having the potency of life;* and (*cap. 3 of the same book*) the soul is the principle by which we live, sense, understand, and are. But the soul is substance and the immediate cause and origin of the aforesaid operations; and united to the body it constitutes the whole to which the remaining actions belong — principally generation (*1 Met., cap. 1*): *Generation is of singulars — of Socrates, Plato, and the other individuals of human nature.*

You will say: these and similar authorities prove only that substance is the radical and remote principle of generation, not the immediate and proximate one. Against (*7 Met., T. 32*): *For the generation of substance it suffices that substance pre-exist — as if an animal is to be generated, it is enough that an animal precede, with no quantity or quality existing;* in this way substance immediately and proximately generates substance; therefore the aforesaid testimonies are understood of the proximate and immediate principle. Furthermore, God acts immediately through his substance, since he is incapable of accident; therefore the same is applied to the created agent. Indeed, from created substance there proceed immediately its proper passions and powers, which are really identified with it, as the Doctor shows (*2 dist. 16, quaest. un.*). And the herb that is formally cold is virtually hot; likewise wine is virtually hot and in winter formally cold; and water that has been heated returns to its native coldness — and these and similar things proceed immediately from substance, since there are no accidents pre-

existing that could produce said effects; substance therefore is the immediate and proximate principle of acting.

Second: an accident immediately produces an accident — as heat produces heat; therefore substance immediately generates substance. The consequent holds, since substance is not of a lower and worse condition than accident — indeed it is of a nobler and more excellent one; therefore if the latter is capable of immediate action, so too is the former. You will say: the rational soul and the Angel surpass all sublunary living things in nobility, and yet these latter generate but the former do not; likewise, although substance is more excellent than accident, it does not rightly follow that if the latter is the immediate principle of operating, so too is the former. Against: the reason why Angels cannot generate their like is that generation presupposes something from which it arises, but Angels are created, and creation is production from nothing — that is, with no subject presupposed. Therefore there is no obstacle to substance being the immediate principle of acting — especially because there is a greater excellence in the rational soul and the Angel such that no created agent can attain the production of them, as Scotus states (*quaest. 1, Prol.*); but this does not take away the principle of acting from sublunary substances. Third: that is the proximate productive principle of substance to which the substantial effect is assimilated — since the agent endeavors to assimilate the effect to itself as much as it can, and it is a celebrated maxim that the work of nature is to generate its like; but the generated substance is assimilated to the generating substance — as a son to his father or mother; therefore substance immediately and proximately generates substance.

You will say: the argument concludes for the radical and principal principle, not for the proximate and immediate one, which is accident in the generation of substance. Against: substantial form immediately gives being — for it is the first act conferring formal and essential being on matter and determines and specifies it; therefore it also immediately gives the power to operate. Hence the soul, which is the chief among forms, is the immediate principle of vegetating, sensing, and understanding (*2 Anima, cap. 2*). Finally, assimilation of effect belongs to the proximate, not the remote, cause — to the particular, not the universal; hence Aristotle states (*1 Met., T. 1*) that generation per se is of this man — of Socrates — and of man only per accidens. Likewise, the generated man is not assimilated to the sun but to the generating man, who is his particular and proximate cause; therefore substance is the immediate principle of generation.

Objection I: Aristotle (*1 De sensu et sensili, cap. 4*) writes that fire acts as hot, not as fire; but heat is an accident; therefore heat is the generative principle of fire, which is a substance. Confirmation I, from (*1 De gen., T. 51*): action is exercised between contraries; but contrariety belongs to accident and not to substance. Confirmation II: the heat of iron produces fire, which is also generated from reflected solar rays and from the friction of two bodies; but fire is a substance.

Confirmation III: imperfect animals — as frogs, flies, gnats, and fleas — are generated from the hot and the moist; therefore an accident is the effective principle of substance. I respond that fire has two actions: one is heating, which arises from the heat of fire; the other is igniting, which proceeds from the substance of fire. Therefore when the Philosopher says that fire acts as hot, he is to be understood of the first and not the second action, and I showed in (*lib. de elementis, quaest. I, artic. 2*) already. To confirmation I: action occurs between contraries dispositively, not effectively; hence contrary qualities dispose but do not actively concur toward generating substance. To confirmation II: fire is not produced by the heat of iron but by fire lying hidden in its pores. To the other experiences I say that light and the other accidents are dispositively related, not actively, in the generation of fiery substance. To confirmation III: the same is to be said; but from what those said animals are procreated I will show in its proper place.

Objection II: substance operates through its potencies and faculties; but potencies are accidents — namely qualities, since they are numbered in the second species of quality; therefore an accident attains the production of substance. Confirmation from (*9 Met., T. 3*) and (*12 Met., T. 26, 28*): act and potency are of the same genus — that is, of substance or of accident; therefore generation of substance belongs to accident. I concede the major and distinguish the minor: if potencies are taken as facilities and agilities for acting, I concede; but if they are taken as active principles and powers of acting, I deny — for in this sense they are really identified with the substance of which they are the potencies (*2 dist. 16, quaest. un.*). To the confirmation I say that passage is to be interpreted, with Scotus there, of objective potency and entitative act — not of active potency and formal act.

Objection III: if the consecrated host is duly heated and moistened, a worm is generated — which is not generated from substance, because according to faith no substance of bread exists in it; therefore it is generated from accident alone — from heat and moisture. I respond that given the hypothesis, God would create new matter from which the said worm would be generated from pre-existing matter. For the author of nature supplies the defect of the secondary cause when it fails. I replied in the same way in a similar case (*lib. 2 Phys., quaest. 1, artic. 3, ad 3*) with Scotus (*4 dist. 12, quaest. 6, D*) and (*Quol. 10*).

Article VI: Whether Substance Can Generate Accident

Our two masters, Noperi (*disp. 7 Phys., quaest. 6, artic. 3, 4*) and Poncius (*ibid., disp. 38, quaest. 3*), assemble this question fully and carefully. I for my part dispatch and resolve this difficulty quickly and briefly, setting aside verbosity and chaff. The question can be raised in two ways: whether substance can produce accidents in itself, or also whether it can produce accidents in another subject. On this matter two chief opinions prevail among philosophers. The first is that of the Thomists, cited and followed by the Complutenses (*disp. 10 Phys.*), who

hold that substance is in no way productive of accidents — whether in itself or in another subject. The latter is that of Scotus and his disciples (*dist. 36, quaest. un.*) and (*4 dist. 12, quaest. 3*), with whom agree Suarez (*disp. 18 Met., sect. 2*), Hurt (*dist. 9 Phys., sect. 3*), Arriaga (*disp. 11, sect. 2, subj. 5*), and many others, teaching that substance is the immediate productive principle of accidents.

Note first, from Scotus (*1 Post., quaest. 25, §. Ad quaest., vers. Sed alio modo*) and Sarnano (*quaest. 1 univers., p. 16, 17*), that something can proceed from another in two ways. In one way through transmutation or through motion and change — in this way natural effects are produced from their causes, which are really distinguished from one another by real and mutual distinction; and the action by which such effects are made is described as a relation extrinsically accruing to the transmuting thing with respect to the transmuted, as I wrote in (*Epitome, lib. 1, quaest. 4, artic. 9*). In another way through simple emanation — as are the passions that arise from the essences and natures of things: as risibility, capacity for tears, and the other properties that flow from human nature, as well as its potencies, powers, and faculties; and likewise the divine attributes, which are said to spring from the divine essence and which are formally distinct from it and from one another, as I showed in the (*Tractatus de attributis, disp. 3, quaestione secunda*). To these may be added those things that arise through natural resultance and consequence — as relations, which arise once the extremes are posited: thus, given two white walls, a relation of similarity arises between them, and a relation of dissimilarity between other black walls.

Note second that from one and the same essence and nature there arise several passions and potencies, in a certain order observed among them — as admirability, risibility, and capacity for tears from humanity, and from the rational soul the intellect and the will — not because one is the cause of the other, but because one presupposes the other and one requires the prior action of the other. Hence that maxim is celebrated: *nothing is willed unless previously known*, and likewise: *nothing is in the intellect that was not first in the sense*. For the higher and spiritual potencies presuppose the actions of the lower and material powers and virtues, on account of the natural order and necessary connection that they have with one another in the present state. But these powers and faculties are really identified with the substance from which they flow, and are therefore really substances and formally distinct (*from what will be said in the book on the soul*).

Note third that some actions are vital — namely vegetation, sensation, and intellection — while others are not vital — as illumination, lightning, and the like. Likewise, some are immanent and others transient, of which more will be said in the proper place.

First assertion: substance immediately produces accident. This is Scotus's view as cited, which he proves from (*7 Met., T. 31*), where it is read that for generating substance it is necessarily required that substance precede, just as a cause

precedes its effect — so that if an animal is to be generated, an animal pre-exists as its cause; but for the production of an accident — such as quantity and quality — it is not necessary that quantity and quality precede, because their proximate cause is the preceding substance. The same is suggested (*4 Meteor., cap. ult.*) And St. Damascene is cited by the Doctor in the fourth passage adduced above. Poncius in the cited passage sets little store by these testimonies. But since they are from the most authoritative authors whose footsteps he professes to follow, they are not to be scorned — especially because they are supported by most powerful arguments and most certain experiences. In the first place, in efficient and effectable accidentals one must stop at the first, since a regress to infinity is always to be avoided; but we experience heat generated by fire, and cold by water, and this heat by that heat, and the heat in a hand caused by hot iron; therefore, if this heat is caused by that heat, and that heat by the heat of fire, it follows that this last heat is immediately caused by fire, since no other cause precedes besides fire. Furthermore, it is clearly proven by evident experience that heated and boiling water is reduced to its native coldness, the cause of which can be none other than the substance of that same water — for if God were to remove from it everything else except the heat, the substance of that same water remaining together with the said heat, that same water would become cold, caused by no other efficient cause than the same water itself, since nothing else is supposed to exist besides the substance of water and the heat caused in it by fire.

The Complutenses reply (*disput. 10, quaest. 7, §. 7*) that this happens per accidens and not per se — namely, to remove the impediment that is heat, which prevents coldness from issuing from water through natural consequence, from the force of the first and preceding act of being. For water from its primeval constitution is such as to be cold, since coldness results from its nature; hence if it is heated, it afterwards returns to its prior coldness. Against: once the heat that impeded water from becoming cold is expelled, when water has become cold, by what is this newly produced coldness in water caused? Not by the heat, which perished, since it is its contrary; nor by the preceding coldness of the same water, since it was consumed by the supervening heat; no other cause is possible than from its substance. For the prior coldness that water received at its production was caused by its substance — just as the heat of fire, the humidity of air, and the dryness of earth; therefore the posterior coldness too, removed by the heat of fire, is produced by the very substance of water. Especially, since the posterior coldness is numerically distinct from the prior one: a new effect obtains a new cause, that is, one having a new causality — even though the cause itself remains the same in itself — as is clear in a plant producing new flowers and in a tree producing fresh fruits each year. Moreover, if at its first creation God were not to concur toward such coldness, but did so after some interval of time, then the coldness produced would not be from the preceding act of being but from a subsequent act of being; and likewise if the first act of being were

interrupted and a second came to be, from this second and not from the first would the coldness proceed. Add that since every accident is *ens entis* — being of being — and presupposes a subject, consequently every accident would flow from a prior act of being; but the said authors, with the Thomists, do not admit this, so it ought not to be admitted by them either.

From these considerations it follows that the passion — which in the Thomist school is an accident — is produced by an action different from the action of the substance and subject from which it proceeds, both because it is an accident, according to the Thomists, really distinct from the subject in which it inheres, and because it is a different terminus from its subject, which requires a true and proper action by which it is produced. Moreover, if heat is produced by another agent — such as the sun — it is plainly caused by a different action from the action of fire, since they are distinct agents; therefore when it proceeds from its own substance, it is brought about by another real action. And this is especially clear if the subject is first produced, and after some interval of time its passion comes to be — for through the prior action the subject receives being, and through the posterior action its passion comes to be. However, in the view of Scotus it must be said otherwise, since he teaches that a passion is really identified with its subject and only formally distinguished from it. For action is a relation of the transmuting thing to the transmuted, which cannot occur between a subject and its passion — for it obtains only between things that are really separated from each other.

Second assertion: one accident is the cause of another accident — not as an instrumental but as a principal cause. Both parts are handed down by the Doctor in the fourth place cited above. The first part is proven first: the heat of fire — which is an accident — produces heat in water; the light of the sun — likewise an accident — causes heat in the air and in the earth; and it is commonly said that motion is the cause of heat, and motion is an accident; and whiteness disperses and blackness concentrates vision; and moreover by all are conceded active qualities, which are the immediate causes and principles of none but other accidents. Second, from (*2 Caeli, cap. 3, T. 17*): being is for the sake of operating; but accidents are, since being universally taken is divided into substance and accident; therefore accidents are active and operative. Hence very many of them are immediate principles of others — as, besides those just listed, many hold that contemplation causes delight, knowledge causes desire, the intention of an end causes the willing of means and their attainment, and the knowledge of principles causes assent to conclusions; therefore the active power of accident ought not to be denied.

The second part — which argues against Fonseca (*5 Met., cap. 2, quaest. 6, Sect. 6*) and the Coimbrans (*2 Phys., cap. 70, quaest. 18, at the end of artic. 3*) — on behalf of Scotus as cited and others whom the Complutenses cite and follow (*praealleg., quaest. 8, §. 2*) — is proven first: that which acts by its own power is a principal

cause, as is clear from the description of a principal cause in contrast to the definition of an instrumental cause; but an accident acts by its own power, as is clear in the case of heat, which by its own power produces heat — and the same must be maintained of cold and of other active qualities; therefore accident produces accident as a principal cause. You will say: an accident acts in the power of substance, since it is its power and is subordinated to it as an instrument to a principal agent. Against: if an accident is separated from its subject — which we know to be possible, indeed to have been done in the Eucharist — it acts by its own power; for the whiteness of the consecrated host disperses vision, and if it is heated its heat heats, without any concurrence of the subject, since it does not exist there; therefore accident is established as the principal cause of the production of accident, whether it be joined to or separated from its subject. Moreover, that subordination of accident to subject does not take away the intrinsic power that the accident possesses — just as the subordination of man to the sun and to God does not take from man his own power and potency which they share for bringing forth their own effects. Second: the principal cause endeavors to render the effect it produces like itself — for this belongs to a natural agent; but an accident produced from an accident is assimilated to the producing accident — as heat to heat and moisture to moisture — especially because the produced accident does not exceed the powers of the producer, since they are of the same species and are proportionate. Finally, if substance is the principal cause of generating substance — as the said authors do not deny — it does not seem incongruous that accident should cause accident as a principal cause.

Third assertion: substance can generate accident both in itself and outside itself. Both parts are suggested by the Doctor as cited and (*2 dist. 9, quaest. 2, §. Ad argumenta 2 quaestionis, Q*). The first part is proven first: fire is hot with a heat emanating from itself and existing and residing in it; and the same must be maintained of the humidity of air, the coldness of water, and the dryness of earth. And it is especially evident in water, which when heated returns to its coldness produced by itself and received in itself. Second: sensation — which is an accident — is produced by sense and resides in it; hence sense is divided into active and passive. Likewise intellection — which is likewise an accident — is caused by the intellect and remains in it; hence the intellect is distributed into agent and patient, which is really substance, from what will be said in the book on the soul.

The second part is shown, first, from wood heated by the heat of fire, from a hand heated by the same, and from hot and boiling water — for in these alien subjects heat is received, which is also produced by the sun and resides in air and earth; therefore an accident can be produced outside its proper subject — especially because the sun, which is only virtually hot, induces heat in sublunary things, by which they formally become hot. The same can be said of pepper, wine, and other things that cause heat in the stomach and other subjects.

Second: in the view of Scotus (*2 dist. 9, quaest. 1, §. Ad quaest. istam B*), one angel speaks to another through the infusion of the concept of the object about which he speaks; but the concept is an intentional accident; and it is not incompatible that any intellection should be received in an intellect that did not produce it, since it is a quality and hence an absolute accident really distinct both from the one producing it and from the one receiving it. Moreover, what is sufficiently in first act, unimpeded, can pass into second act and introduce it into a suitable and aptly disposed subject; but substance is a sufficient principle and immediate efficient cause of accident, as I showed above, and outside it there is a capable subject, as is clear from fire heating a hand and water in a pot; therefore substance can immediately cause an accident outside itself. For accident is produced in a twofold manner — by substance and by accident — whatever Poncius may contend against Mastrius.

Fourth assertion: an accident is properly conserved by the substance to which it is suited and congruous. This is indicated by the Doctor in the fourth passage cited and is proven: substance is the place and seat of accident, since it is its subject and cause; but a place is conservative of the thing located in it, and a cause conserves its effect as much as it can, as is clear from fruits produced by a tree, from the offspring of animals, and the like. Furthermore, an accident depends in being and in coming to be upon substance; hence it is called *being of being*; therefore it is properly conserved by substance. Moreover, outside its proper subject an accident perishes — as heat in water, cold in fire, and moisture in earth; but in its proper subject an accident is conserved — as heat in fire, cold in water, moisture in air, dryness in earth, and light in a luminous and bright body; and hence there is an immense conflict among sublunary things, so that each may preserve its accident. What is more, an accident not only serves substance by disposing matter for the introduction of its form into it, but is also its ornament and perfection; and each thing preserves its aids and ornaments — which is what accidents are with respect to substance.

Objection I, against the first assertion: substance, from what was asserted in the preceding article, produces substance; therefore it does not produce accident. The consequent holds, because each thing produces effects according to its own genus; therefore just as an accident does not attain the generation of substance in the Scotist school, so likewise substance does not generate accident, which is of a different kind from it. Confirmation: from one simple essence there do not proceed many and diverse principles and operations; but substance is a one simple essence, which subsists in the indivisible; therefore from it there cannot proceed so many powers, potencies, and faculties, which are accidents of the genus of quality. I concede the antecedent and deny the consequent; for its proof I say it holds in univocal causes but not in equivocal ones — as heat is produced from the light of the sun, from fire, and from motion; and also certain imperfect animals are generated through putrefaction and propagation. To the confirmation I deny the major: from one divine essence, which is most simple,

many attributes emanate; from one rational soul, several potencies; likewise from one root, several shoots; and from one cause, several effects can be produced. It is therefore not surprising if from one substance there proceed several accidents.

Objection II, against the second assertion: an instrument is defined as that which acts in the power of the principal cause, as is clear from a pen forming letters and words in the power of the writer; but an accident operates in the power of substance — as light heats in the power of the sun, and heat heats in the power of fire; therefore accident is an instrumental cause in causing accident.

Confirmation: as a thing stands to being, so it stands to operating, according to the common adage of the philosophers; but accident, depending upon substance in being since it inheres in it, therefore also depends in operating, and hence is an instrumental cause in the production of accident. I concede the major and distinguish the minor: through actual motion — as a saw is actually moved by the one cutting wood, I deny; through the actual power it has in itself, I concede; thus an accident is not properly an instrument of substance, because it is possessed of its own and intrinsic power in a state of rest, which an instrument lacks, as the Doctor hands down (*4 dist. 1, quaest. 1, DD*) and (*quaest. 5, F*) and (*dist. 6, quaest. 6, E*). To the confirmation I say the major can be interpreted as follows: if a thing is natural, its operation is natural; and if a thing is free, its operation is free — but it does not rightly follow that if a thing has being from another, it therefore operates through that other's own and intrinsic power. For it suffices if it has given and communicated to it the power of operating — as a father gives being and the power of acting to his son, by which the son afterward operates without the father. Hence the said adage is to be interpreted in much the same way as that of (*2 Met., cap. 1, T. 4*): *As a thing stands to being, so it stands to being known*. For knowledge conforms to the thing it is about; likewise operation follows the thing whose operation it is; therefore if the thing is natural, the operation is natural, and if it is free, the operation exists as free. Likewise, if the operation proceeds from sense, it is sensation; and if it proceeds from intellect, it is intellection.

Objection III, against the third assertion: qualities called active are sufficient active principles without the cooperation of the substance in which they reside; therefore substance does not exercise influence on their effects and operations. The antecedent is shown: if heat is separated from fire in which it inheres, it would undoubtedly heat without fire; therefore even when it is conjoined to fire, it heats without any concurrence of fire itself. Confirmation: the sacramental species, if heated, can of themselves return to their prior coldness without the aid and influence of a subject, since they lack a proper subject; therefore active qualities act on their own without the intervention and concurrence of the substance in which they are subjected. I deny the antecedent; for its proof I say that given the hypothesis, it would quickly pass away and perish — just as light quickly perishes when separated from the luminous body, which is a plain

indication that the subject exercises influence together with the aforesaid accidents toward their effects. To the confirmation I say this is brought about by the surrounding air and other surrounding things, or by the author of nature supplying the defect of the creature through the force of the preceding miracle, since the said accidents exist without a subject by divine power — just as if they are corrupted and something is generated from them, God will produce and create new matter from which it may be generated, as I was saying above with Scotus (*4 dist. 12, quaest. 6, D*).

Question III: On Corruption

Article I: Whether Corruption Exists and What It Is

That corruption exists — quite apart from the fact that it is confirmed by the experience of the death of living things and other sublunary things, whose corruption is observed with the eye — is clearly and lucidly shown from the generation of natural things, which newly come to be and are not produced without the destruction of preceding things. For in order that the agent may introduce a new form into matter, since two forms are simultaneously incompatible, it must expel the preceding form — which cannot be accomplished without the dissolution and corruption of the prior composite. It is therefore evident that corruption is to be admitted, which Scotus presupposes (*4 dist. 12, quaest. 6*) and in other places. Moreover, generation and corruption are opposed changes: the former is positive and acquisitive, the latter privative and deprivative. And it is written by Aristotle (*1 Top., cap. 14*) that the science of opposites is the same; therefore since I showed in the first question of this book, article I, that generation exists, it is consequently clear from the opposite that corruption exists as well — for upon admitting one opposite, the other opposite is also to be admitted. What corruption is does not seem so evident and plain, yet from what was said (*ibid., artic. 2*) the present difficulty can readily be resolved. For according to Aristotle (*5 Phys., cap. 3*), corruption is a change from substantial being to substantial non-being — as from the being of man to the non-being of man. According to the mind of Scotus, however, corruption is the relation of the corruptor to the corrupted, and this is clear from its opposite. For just as generation is precisely the relation of the generator to the generated, so corruption is the respect of the corruptor to the corrupted. The other things that were said above about generation are, in like manner but in reverse order, to be said about corruption. The same is to be understood and done with the objections and their solutions — nor do I judge anything further need be added.

You will ask first: is corruption natural? I respond that corruption can be called natural insofar as it proceeds from natural and intrinsically acting causes in the mixed body — in which sense Scotus (*2 dist. 19, quaest. un., §. Concedo A*) writes that the death of Adam, even in the state of innocence had he remained there, would have been natural, because the natural heat acting on the radical moisture

and counteracting and suffering in turn is finally consumed and extinguished, from which natural death follows — as is seen in the old and decrepit; but properly speaking it is not natural, because neither does matter desire per se the corruption of the form it has, but only per accidens, insofar as it cannot receive a new form without the prior one being expelled. And conversely, death is called violent insofar as it proceeds from extrinsic causes harming and destroying the living mixed body — as one who perishes by poison or by the sword is said to die a violent death.

You will ask second: is corruption intended per se by nature? I respond negatively. For nature does not intend per se the destruction of itself, nor evil — which is what death is, called the evil of nature. Hence Aristotle (*1 Eth. 1*) and Dionysius (*de divinis nominibus 4*) submit that no one operating intends evil. Likewise, monsters are said to come about not per se but per accidens. And privation (*1 Phys., T. 73*) and thereafter is called the principle of natural things per accidens.

Article II: Whether the Generation of One Is the Corruption of Another

This celebrated and frequently chanted saying from (*1 De gen., cap. 3, T. 17*) — *the generation of one is the corruption of another* — is widely trumpeted among philosophers; how it is true will become quite clear from what follows.

Note, from Scotus (*2 dist. 1, quaest. 3, §. Ad 1 argum. principale, K, in solutione 3*), that the said maxim is not to be understood of the first nor of the last generation. For the first generation is the production of the whole first composite, after which, precisely and immediately, the destruction neither of itself nor of another follows — since it is presupposed to be the first generated thing; nor is it about the last corruption and generation, since the mixed body last generated, even if it is dissolved into elements, will nonetheless no longer generate any further mixed body — as will happen after the Day of Judgment, when all sublunary generations will cease and time will be no more (*Apoc. 10*).

Assertion: the aforesaid proposition — *the generation of one is the corruption of another* — is not true formally, nor identically, but concomitantly and illatively. This assertion is divided into two parts and deduced from Scotus in the passage cited above. The first part is proven first: things that are in privative opposition are not true, neither formally nor identically — as is evident, since neither is the seeing person blind, nor is the blind person seeing, whether formally or identically; but generation and corruption are in privative opposition, since generation is a progression from substantial non-being to substantial being, and corruption is a transition from substantial being to substantial non-being; therefore the said proposition is true neither formally nor identically. Second: things that receive diverse definitions are not the same formally, as I have repeatedly emphasized; but generation and corruption receive diverse

definitions, as I indicated above. Furthermore, generation can exist without corruption — as the generation of the divine Word, and the first generation at the beginning of the world; and the last corruption at its end, as I intimated in the preceding note; therefore the said proposition is not true in an identical nor in a formal sense.

The second part is proven first, from Sacred Scripture (*Ioan. 12*): *Unless a grain of wheat falling into the ground die, it remains alone; but if it die, it brings forth much fruit* — where the perennial generation of wheat and its concomitant and consequent corruption is seen. Second: for an agent to generate something, it must necessarily expel the prior form and introduce a new one into matter, since two forms cannot simultaneously inform the same matter in number; and through the expulsion of the prior form corruption occurs, and through the advent of the new form generation is had; therefore concomitantly and illatively the generation of one is the corruption of another, and vice versa — the corruption of one is the generation of another, as is clear from the continuous change and vicissitude of things.

Objection I: generation and corruption are not distinguished from one another; therefore the said proposition is formally or at least identically true. The antecedent is plain: for they are one and the same change, since fire acting on water generates air from that same water, and thus there is only one change — for from one, as one, only one proceeds. I deny the antecedent and its proof: for they are two changes, according to the double *terminus ad quem*. For one is from the being of water to the non-being of water — and corruption occurs; another is from the non-being of air to the being of air — and generation is had. How from one several things can proceed has been explained above.

Objection II: when a man dies, his form — which is the soul — does not perish, since it is immortal; nor does matter, since it is ingenerable and incorruptible (*1 Phys., T. 82*). Therefore the aforesaid maxim is not always true. I respond that in the death of man, the man is corrupted — who is something third distinct from the soul and the body; and a cadaver is generated, which consists of matter and the form of corporeity; and from the cadaver worms are generated, and from the worms earth, as daily experience shows. Objection III: in nutrition the form of the nourishment is corrupted and no other form is generated, since the rational soul persists; therefore the maxim just rehearsed is not universally true. Confirmation: sometimes something is generated without the corruption of anything — as when a man is nourished from the sacramental species; therefore the said proposition fails in some cases. The antecedent is denied: for when food is corrupted, blood is generated, and from blood, flesh — as will be made clear when we treat of nutrition. To the confirmation I say that when the sacramental species are corrupted, God creates new matter from which new forms are drawn out and new composites conforming to the said species are made, as is clear from the (*Tractatus de Eucharistia*). What is more, this holds in the case of

contrary accidents: for if cold is corrupted, heat is generated, and conversely, if heat is corrupted, cold is generated — as is clear in winter and summer; but in other accidents it does not seem to hold: for light ceases without another accident being produced. However, generation of accidents is not generation simply speaking but only in a qualified sense (*4 d. 11, quaest. 3, sub P*).

Article III: Whether in Corruption Dissolution Occurs All the Way Down to Prime Matter

The Doctor Irrefragabilis (*4 p., quaest. 17, m. 4*), Albert (*2 p. Summa, de homine*), and their common disciple Aquinas (*1 p., quaest. 16, 17*) and many others, positing a single form in any composite — whether animate or inanimate — hold that in every corruption dissolution is effected all the way down to prime matter. On the other side, the prince of the subtilists (*4 dist. 11, quaest. 3, artic. 2*) and the leader of the Nominalists (*Quol. 2, quaest. 11*), recognizing several forms in every living whole, deny that in the death of any living thing dissolution is effected all the way down to prime matter. Assenting to this are those who hold that the proximate and immediate subject of accidents is matter — among whom are counted Suarez (*disp. 14 Met., Sect. 3*), Toletus (*1 De gen., quaest. 7*), and several other recent thinkers.

Note first that some composites are simple — as the elements — while others are mixed, which are subdivided into inanimate — as stone — and animate — as man. And since all of these are subject to corruption, it is certain among all that matter persists because it is incorruptible; that the prior form perishes; and that the posterior form is produced through new generation — which occurs because of the simultaneous incompatibility of two forms in the same matter in number. The question, however, is this: in the corruption of any sublunary thing, does some substantial or accidental form remain in matter, or none at all? — such that corruption falls proximately and immediately on matter, because it is informed by a single substantial form, and no accidental form is received immediately in it, so that nothing at all in the generated thing pre-existed in the corrupted one. Or, rather, if a plurality of substantial forms is admitted in matter, does one of them, being corrupted, leave another remaining in matter? Or, if the plurality of substantial forms is denied, is some accidental form admitted as immediately inhering in matter, which persists in matter after the corruption of the substantial form, in the same matter informed by a new substantial form? The former sense is defended by the authors of the first view; the latter is pursued by the patrons of the second view.

Note second, from Scotus as just cited, that in every animate whole there are two substantial forms: one, called the form of the mixed body and of corporeity, which constitutes the mixed body in the being of a body; and another, called the soul, which constitutes the mixed body in the being of an animated and living thing — from what is to be proven in the book on the soul. These forms are subordinated to one another, and one presupposes the other. For the form of

the mixed body is ordered to the soul and the soul requires it; so much so that the form of the mixed body, with respect to the matter it informs, is called an act, but with respect to the soul to which it is subordinated, it stands as matter. This Aristotle aptly suggests at the close of (*4 Meteor.*), admitting intermediate and subordinated forms, the last of which is absolutely form and act, while the others seem to play the role of matter — as the Doctor acutely proves in the passage noted (§. *Aly concedentes*, T. 5).

Note third that, given the plurality of forms in a natural living thing, some accidents follow one form and others follow another. From the fact that the composite shares in a soul, it lives, senses, understands, and performs the other works of life; and from the fact that it has the form of the mixed body and of corporeity, it is quantified, figured, white or black, and so on. Hence if the soul is separated from the body, vital actions no longer proceed from that body; yet other accidents persist in that same body — such as quantity, quality, a scar, and things of this kind that existed while the said body was informed and alive with a soul — which is a plain indication that the form of corporeity still remains in it, which those aforesaid accidents accompany, and those accidents inhere and reside in this whole composed from matter and the form of the mixed body; and if the said form perishes, both that whole and consequently the aforesaid accidents must be destroyed — for when the subject is destroyed, all things that are in the subject are destroyed.

Assertion: in the corruption of that which possesses only one form, dissolution is effected all the way down to prime matter; but in others that have several forms, if they are corrupted, dissolution down to prime matter does not occur. This is indicated by the Doctor in both works at the place reviewed above, by Ballol (*ibid.*, *quaest.* 4), Anthony Andrew (*8 Met.*, *quaest.* 3), John of Mairs (*1 De gen.*, *quaest.* 2), Tataret, the Parisian doctors, and others in the same place. The first part is common and is easily and evidently proven: what is composed of one matter in number and one form in number is dissolved only into those same things — just as a proposition composed of a single subject and predicate is dissolved into those same things only, because there is nothing else remaining into which it could further be dissolved; therefore the whole that consists of one matter and one form, if dissolved, is dissolved immediately into these two alone; and matter is incorruptible, while the form united to it perishes; therefore when the composite of these perishes, dissolution is effected to matter. Furthermore, in such a composite either a substantial or an accidental form persists, since between these there is no middle; but not the prior form — otherwise corruption would not occur, for the substantial form must perish if the substantial whole is to be dissolved — nor the posterior, because since the accidental form is subjected in the whole alone, when the whole is destroyed everything that is in it is destroyed — including the accidental form; and so in such a whole, if it is destroyed, dissolution occurs to matter alone.

The second part is proven first, from Aristotle (*De gen.*, T. 24): the same accidents that were in the corrupted thing remain in the generated thing; but such accidents do not inhere immediately in matter, as has been said elsewhere, but in the composite from the surviving form, called the form of the mixed body and of corporeity; therefore the whole animate thing, if corrupted, does not undergo dissolution to prime matter. Furthermore, (*2 Anima*, T. 6): the soul is the first act of an organic body; but the body is not matter, since it is a third something coalescing from matter and form; therefore when an animate thing is corrupted, dissolution is not made immediately to matter, since the form of corporeity still persists, through which the body is constituted in the being of a body. You will say: there the Philosopher through *body* in the definition of the soul understands matter furnished with organs, not a whole composed from matter and some form. Against: before the soul is united to the body, the body must be produced and formed — and in its formation nature labors and sweats greatly; so it first exists under the form of a seed, then under the form of an embryo, and then under the form of a body duly disposed and suitably organized, into which the soul is introduced or drawn out. But before the advent of the soul such matter was not without form — for matter is never found bare and stripped of all form; and after the living thing informed by a soul is corrupted, the said body remains inanimate, possessing some form that is not the soul — which perishes if it is material, or departs if it is spiritual; therefore there is another form, called the form of the mixed body or of corporeity.

Second: all our knowledge takes its origin from the senses; hence that much-repeated saying: *nothing is in the intellect that was not first in the sense*. But sense, rightly disposed and well applied, does not err. And we observe in a dead man the same quantity, figure, scar, the same members, parts, hair, and things of this kind that were in him when alive — which clearly indicate and openly manifest that it is one and the same body, with the unity and identity of the form of corporeity, which also existed when he was alive; therefore in the corruption of a man and of any other animate thing, dissolution does not occur down to prime matter. You will say: they are not the same but similar and related. Against: quite apart from the fact that this conflicts with sense and experience — for we feel the very same heat that after the departure of the soul still remains in the dead body, and we see numerically that same color of which it was a participant while alive — a productive cause of such newly produced effects must be assigned, and none whatever can be given. For it cannot be the heavens, nor God, nor any other particular natural agent, since none is apparent, no necessity is compelling, no reason urges, no authority commands — indeed, the opposite is evidently seen. For the same dead herb preserves the same color, odor, flavor, and power, which physicians use to heal wounds and cure diseases; therefore in the corruption of animate things there is no immediate dissolution into prime matter.

Third: during the three days of the death of Christ the Lord, his body was the same that was born of the Virgin, that hung on the Cross, that rose again, that remains in heaven now, and that is consecrated in the host — as St. Ambrose and other Fathers cited by Bassol write. But it was the same not through the soul, which descended to the underworld, but through the form of corporeity with which it was endowed while alive; therefore there is another form called the form of the mixed body or of corporeity. From these and many other arguments to be adduced in (*1 & 2 De anima*), the negative conclusion is drawn: in the death of inanimate things, an immediate and proximate dissolution into prime matter does not occur.

Objection I, against the first part of the assertion: from (*1 De gen., T. 24*) — when air is generated from water, the same diaphaneity and humidity remain in that air; and (*2 De gen., T. 25*) — the transmutation of symbolic elements is easier than that of dissymbolic ones, because symbolic qualities remain while dissymbolic ones do not; therefore according to Aristotle, in the corruption of simple and inanimate things, an immediate and proximate dissolution into prime matter does not occur. I respond that the same accidents in number do not persist but only in species. And the transmutation of simple bodies is quicker and easier in symbolic ones than in dissymbolic ones, because, as I stated in (*lib. de elementis*), in the former smaller things need to be overcome and in the latter greater ones. You will say: the aforesaid testimony was adduced by me to prove the second part of the foregoing assertion; therefore the same accidents in number persist in the generated that were in the corrupted — not only the same in species — otherwise that authority would serve the opposite rather than the proposed conclusion. I say it is valid only for animate mixed bodies, not for simple and inanimate ones that enjoy only one form.

Objection II, from (*1 De gen., cap. 4, T. 24*): corruption is a transmutation of the whole into the whole, no sensible subject remaining; therefore no accident persists in the generated thing that was in the corrupted one — otherwise some sensible thing would remain, which the Philosopher there expressly denies. What is more, the same Stagirite in (*Praedicam., cap. de substantia*) had previously stated that when primary substances are corrupted, it is impossible for anything to remain; therefore in any corruption of a natural thing, nothing remains but bare matter. I respond by an interpretation of that passage — namely, that corruption of one specific whole into another specific whole is meant: as when an animal is corrupted, this specific thing called an animal is corrupted and there is produced another specific thing informed by the form of corporeity and called a cadaver. You will press: if that mixed body which retains the same accidents persists in the corruption, then some sensible subject remains — which Aristotle there plainly denies. I say that the same accidents endure not indeed in the specific whole already corrupted — for both it and what was in it are corrupted — but in the generated thing, which is another specific thing that has the same accidents following the form of the mixed body, as I observed

above. The same is to be said to the other testimony: when individual things are corrupted — such as are primary substances — all things that are in them are likewise corrupted. Nevertheless, if there were some primary substance or some substantial whole whose form persists in it, then in that very thing would also remain the accidents that accompany that said form and are subjected in that whole.

Objection III: if there were several forms in the same composite by reason of which the whole, when corrupted, would not be dissolved into prime matter, it would plainly follow that the composite is not one per se but only per accidens. For that which accrues to a thing already constituted in act from matter and form is a being per accidens; and this inconvenience and absurdity is judged by all to be incurred by those who adhere to the negative part of this question; therefore the affirmative part rather than the negative is to be subscribed to. The sequent major is to be denied: for the argument concludes about disparate and perfect forms, not about subordinated and intermediate ones. For the form of corporeity is subordinated to the soul and is imperfect; hence without the soul it does not preserve the whole from corruption — indeed the whole, when the soul perishes or departs, is in continuous corruption, as is clear from a cadaver.

Book II: On Intension and Remission

This book is completed in two questions, of which the first is on intension and remission, the second on rarefaction and condensation. Regarding the first, a triple doubt can be raised — concerning substance, quantity, and quality; and indeed the difficulty concerning quantity was set out and resolved already, both in the (*Logic, quaest. de quantitate*) and in (*Phys. 1, 5, quaest. 1*). The remaining two are to be examined and settled in this place.

Question I: On Intension

Article I: Whether Substance Admits of More and Less

Philosophers on this article are found to be divided into two camps: some — as Toletus (*3 De anima, quaest. 18*), the Complutenses (*disp. 12 Log., quaest. 5*), and Durandus (*2 d. 32, quaest. 3*) — defend the negative position; while others — as Anthony Andrew (*11 Met., quaest. un.*) and (*in expos. 1 sex principiorum*), John of Mairs (*cap. de substantia, quaest. 3, dub. 1*), and Cajetan (*1 p., quaest. 85, artic. 7*) — embrace the affirmative; to whom assent Scotus (*8 Met., quaest. 3*) and Maurice there.

Note first, from the Doctor just cited, that to admit of more and less in any form means nothing other than to be greater or smaller than another — not in greatness of mass but in greatness of perfection in the nature of the thing, or in the complement of perfection. Hence every specific form shares a certain

latitude of degrees, communicated to its individuals according to more and less. For one individual possesses more of its degrees than another, by reason of which it is said to be more excellent and perfect than the other — and to understand this better, note the following.

Note second that degrees are of a twofold difference — specific and individual. Specific degrees are intrinsic and essential, by which a species is constituted in the being of such a species: and one species is nobler than another — as man is constituted in the being of man by his intrinsic, essential, and specific degree, and is distinguished from a brute and from anything else that is not man. The individual degree is a portion of perfection by reason of which one individual is more perfect than another — as Peter surpasses Andrew in nobility with respect to the perfection degree itself, and hence exerts and produces more noble and excellent actions and operations. And to make clearer what this degree is:

Note third that the degree or intrinsic mode of a form is described by the Scotists — notably by Anthony Andrew (*8 Met., quaest. 6*) and Trombeta (*tract. formalit., part. 2, fol. 35, pag. 2*) — as: a portion of perfection of the specific form, beyond its quidditative concept, essentially including the specific form within its essential concept, included really within the concept of the individual. These words, though many, are set down not for prolixity's sake but for clarity and explanation. It is called a *portion* because it is not the whole form but its perfection; it is placed *beyond its quidditative concept* because the specific nature abstracts and prescends from every perfection degree, though it is predicated of every degree as a superior of every inferior. There is added *included really within the concept of the individual*, since every individual of such a specific nature includes some degree of it. Another more common description of degree or mode is also given: *what is added to a thing does not vary the thing*. For since a degree does not enter into the essence of a thing but follows it, therefore whether it is added to it or abstracted from it, the specific nature itself is not changed essentially but only accidentally — just as if a fourth degree is added to whiteness having three degrees, the whiteness itself is not changed in its essence but only perfected with respect to that degree newly accruing and perfecting it.

Assertion: substance admits of more and less — not with respect to specific being but with respect to individual being. The Doctor assents (*ibid.*) and (*1 d. 17, quaest. 3*). Proof I, from Aristotle (*1 Praedicam., cap. de substantia*), asserting that primary substance is more substance than secondary. If you say this is to be understood with regard to the reception of accidents — that is, because primary substance more substands accidents than secondary — you do not satisfy the point, because substance, named from subsisting, does not lie under accidents, as is clear in the case of God. Furthermore, quantity stands under more accidents than quality, and yet the former is not said to be more of an accident than the latter; nor, if one quantity receives more accidents than another — as singular quantity than universal — is it for that reason called more quantity.

Therefore the said interpretation does not seem to conform to the text and mind of Aristotle. There is also the Parisian Article, in which these words are read: *If anyone should say that the soul of Christ in pure naturals is not more perfect than the soul of Judas. Error.* But a soul is a substance, and one is more excellent and noble than another, as the University of the Sorbonne sanctions; therefore it is not to be denied that substance admits of more and less. Nor does it avail to say that the article is to be interpreted with respect to accidental being and not with respect to substantial being — namely, that the soul of Christ excels the soul of Judas because it participates in more excellent knowledge and nobler habits; for that is not the mind of those doctors who drew up the said article. No one denies that in gratuitous gifts and nobler accidents the soul of Christ surpasses the soul of Judas — but that canon stands about natural and substantial things, as is plain to one examining and reading it.

You will say: the said article does not cross the Seine — just as the Cologne article does not cross the Rhine and the Oxford one the Thames. Against: in a similar case Scotus argues (*2 d. 2, quaest. 6, §. Contrà hoc, near the beginning*): a view publicly condemned in some university, even if it is not heretical, is suspect; therefore, since the most celebrated Parisian senate has established the aforesaid canon, the opposite position seems suspect, or at least not so probable and plausible. Nor does St. Augustine depart from this (*1 lib. de sermone Domini in monte, cap. 23*), saying: *All natures in their own order, beautiful are they in their degrees.* If therefore substantial natures possess degrees and one is eminent over another, it is plainly deduced that they admit of more and less, in the view of Augustine. The Master (*2 dist. 32*) and Richard (*ibid., artic. 4, quaest. 1*) suggest the same. Nor does Aristotle dissent (*2 de generatione animalium, cap. 3*), saying: *as the soul is more or less perfect, so it prepares the body.* Scotus subjoins (*3 dist. 9, quaest. un.*) that the nature of Christ is the best and his soul is the most perfect of all. Hence Simplicius rightly commends Archytas (*in Praedicam., cap. de quantitate*) as a patron of the assertion set out above.

Second: a nature capable of being communicated to several things according to more and several reasons and degrees admits of more and less; but substance can be participated by many according to various reasons and diverse degrees; therefore it admits of more and less. The major is proven from the opposite: for if it were communicated to several things in one equal degree, all its subjective parts and inferiors would be equal and alike — which is false and contrary to experience, since among men one is subtler, more clever, and stronger than another; among trees one is more fruitful; among plants one more flowering; and among herbs more vigorous; and so with the rest. The minor is clear in the case of human nature, which is participated by many singulars and individuals, and of fiery nature, which is communicated unequally to many individual fires — one being more active than another; and if two are joined together at the same time, they heat and burn more quickly and swiftly — which proceeds from the greater number and plurality of degrees which they together united possess.

You will say: all of this proceeds from the various and diverse dispositions and preparations of the subjects upon which the said natural agents act — as is clear in the case of dry wood, which is more easily kindled and burned by fire than moist and wet wood; and in the case of apt and duly disposed organs, by using which one person operates more conveniently, more readily, and better than another using the same badly affected and impeded organs. Hence Scotus (*1 Post., quaest. 2, §. Ad quaestionem dicitur*) subjoins that the intellective soul does not per se admit of more and less but per accidens, by reason of a body better disposed and more aptly complexioned; hence one person is more eminent and clever than another. Against: given all the requirements for acting, a natural necessary cause necessarily acts as much as it can; and if two trees are planted at the same time in the same soil and are cultivated in the same manner by the same farmer, yet one will be more vigorous, larger, and more fruitful than the other; and twins procreated from the same parents and instructed by the same teachers and nourished with equal food operate differently — one is good and devoted to learning, the other evil and ensnared in vices — even if both have been equally disposed and are equal in everything; nevertheless they produce various and diverse actions, and one excels the other; but this eminence and excellence proceeds from nothing but a more excellent nature and a nobler soul; and therefore substance is capable of receiving more and greater degrees. As for Scotus in the passage cited above, he speaks in someone else's view and not in his own, as he frequently does in that work — hence he writes: *Ad quaestionem dicitur*.

Third: a nature illuminated and capable of being communicated to several things is capable of many degrees; for whatever is unlimited and infinite is a participant in degrees, as is clear from the divine nature, which is communicated to three Persons, containing and possessing infinity of degrees of perfection; but a specific substance is unlimited and indeterminate with respect to more singular and individual things; therefore it is possessed of many perfection degrees. You will say: it is limited and contracted through various and more haecceities, not through the multitude and variety of perfection degrees. Against: more excellent and excellent actions do not proceed from haecceities and singularities — which are conditions of the agent, not principles of acting — but from natures endowed and adorned with principles and powers of acting; therefore nature and not singularity is the participant in degrees, even though it is contracted and limited by individual differences. Furthermore, a more perfect nature is one communicable to more individuals than to one alone, according to Augustine (*4 Trin., cap. 1*); but a specific substance is divisible into and communicable to several individuals. Moreover, one species of substance is more perfect than another — as an Angel than a man, and a man than a brute; therefore also one individual of the same species surpasses another in nobility and perfection. Finally, it serves the adornment and beauty of the universe that individuals be unequal in virtue, nobility, and perfection — just as are the

species of things, one of which we plainly see and experience to be more excellent and eminent than another.

Objection I: Aristotle (*1 Praedicam., cap. de substantia*) writes that it is proper to substance not to admit of more and less; and (*8 Met., T. 10*) subjoins that species stand as numbers — and to number nothing can be added or subtracted without changing the species; therefore the same must be maintained of substance — which would not be true if it were capable of receiving degrees. I respond by a distinction and interpretation of those passages: with respect to specific being, I concede; with respect to individual being, I deny. This the same Philosopher seems to smell out (*3 Met., T. 11*) and (*10 of the same work, T. 26*), recognizing equality of perfection within a species. You will say: Scotus (*quaest. 15 Praedicam., near the end*) says that primary substance is called maximally substance not because it possesses degrees but because it substands more accidents than secondary substance. It must be replied that Scotus there only wants primary substance to contain more than secondary substance — just as a species contains more than a genus — which is true; and if the nomenclature of substance is derived from subsisting, without doubt primary substance substands more than secondary; but not if it derives its notion from *per se* subsisting, as I was arguing above.

Objection II: what accrues to a thing already constituted in its being is an accident — for it is called an accident because it befalls a thing, and does not constitute it nor enter into its intrinsic being; but the said degrees accrue to a primary substance already constituted in its singular and substantial being; therefore they are not substantial and intrinsic to it but accidental and extrinsic. I distinguish the major: if it is of another genus and really distinct from that to which it accrues, I concede; but if it is of the same genus and really identified with it, I deny — as are perfection and individual degrees, with the assent of Scotus (*1 d. 17, quaest. 3, §. Ad istam q., YY*) and (*Quol. 6, §. Contra ista, ad M*). And this can be illustrated from the degrees of whiteness, which accruing to it perfect it and are not said to befall it. Therefore to the distinction of the major I distinguish the minor.

Objection III: if substance were capable of degrees, there would be *per se* motion toward substance — which Aristotle denies (*5 Phys., T. 10*); therefore, etc. I respond with Scotus by denying the sequent. For although toward substance there is no *per se* continuous and successive motion — because substance does not acquire the said degrees temporally and successively as quality does — yet there is a *per se* change toward it, because at the instant in which an individual substance is produced, such perfection degrees are co-produced and follow upon it.

Article II: Whether Quality Is Intensified and Remitted

It is the common view of philosophers that quality is intensible and remissible — and for this to be rightly and conveniently grasped, note the following.

Note that accretion is twofold: extensive and intensive. The former is that by which quality is extended through the parts of the subject in which it inheres — as heat is diffused to heat all the parts of wood. The intensive is that by which quality is perfected and increased by the reception of new degrees — as heat having four degrees, if a fifth is added to it, is intensified and increased; conversely, if some degree is removed from that heat, it is remitted and diminished. Note further that the terminus of extensive accretion is mass-quantity, while that of intensive accretion is quality — which some call the quantity of virtue or perfection. Moreover, in quality two kinds of parts are found: essential or specific, which are not intensified or remitted, since essence subsists in the indivisible and does not admit of more and less; and material and individual, which are capable of intension and remission.

Assertion: quality is a form capable of intension and remission. This is defended by the Doctor (*8 Met., quaest. 8, quaest. 3*), in which many useful and subtle matters are treated, and (*1 dist. 17, quaest. 3*), and it is common to the other scholastics there. Proof first, from Aristotle, who (*Lib. Praedicam., cap. de qualitate*) writes that it is proper to quality to admit of more and less; and what he teaches (*4 Phys., T. 84*) and (*4 Top., T. 20*) in these words: *if simply, the simply follows; if more, the more follows — as to white there follows that it is white by whiteness; therefore to more white there follows that it is more white by whiteness*; and therefore if a form in a subject is capable of intension and remission, it is likewise capable of intension and remission in itself. Second: we observe air to be more luminous, a wall more white, we sense water to be warmer, snow colder, we hear song sweeter and a man more learned — and such things manifestly and evidently show us that quality is capable of intension and remission. Furthermore, it is impossible for any form to be participated by many things according to a multiple reason and variety of degrees unless it admits of more and less: for to be able to have a plurality of degrees means nothing other than to be able to be intensified and remitted; but quality is of this kind — for now cold is more vigorous, since it possesses more degrees of coldness; and light is likewise more intense and heat more burning — for no other reason than that it participates in more degrees. I conclude therefore that quality is intensible and remissible — with the agreement of Augustine (*Ad Bonifacium*) and before him the Apostle (*Ad Philip. 1*): *I pray that your charity may more and more abound*; and (*Apoc. 22*): *Let the just man be yet justified*.

Objection: if quality could be intensified and remitted, one whiteness would be more whiteness than another — since an intense whiteness would possess some degree lacked by a remiss whiteness; but this seems false; therefore so too the latter. The major sequent is denied: for given the hypothesis, it would indeed be a greater whiteness, but not more whiteness — because *more* is said of

participants in a form, not of the form that is participated by many. Or say that *greater* is valid with respect to individual being, not with respect to specific being.

Article III: In What Manner the Intension of Quality Occurs

This is a great and arduous difficulty, both on account of the subject matter itself and on account of the multiplicity of opinions — which are adduced and refuted by Albert (*1 dist. 17*), Mayr, Maior, and other scholastics there. I set forth and examine four more celebrated and important ones. The first is attributed to Godfrey (*Quol. 11, quaest. 3*), Burley (*Tract. de intensione form.*), and Durandus (*dist. 17, quaest. 7, num. 25*), who hold that the intension of quality is effected through the corruption of the pre-existing quality and the production of the subsequent one — so that if there were whiteness as four and whiteness as five accrues, the former as four ceases and this latter as five remains; in remission the opposite occurs — the more perfect quality is corrupted and the less perfect persists, as whiteness as four remains and whiteness as five is corrupted. The second is defended by Aegidius (*Quol. 2, quaest. 14*), affirming that quality is intensified through the removal and purification from its contrary — which is to say that a quality is intensified when its contrary is diminished: as heat is intensified when cold ceases, and heat itself is remitted when cold increases. The third is that of St. Thomas (*2 2, quaest. 24, artic. 3*) and his disciples, who hold that the intension and remission of quality occurs through greater and lesser rooting in the subject — so that a quality is more intense which more perfectly affects the subject in which it inheres, and more remiss which is participated by the subject more imperfectly. The fourth is handed down by our Doctor (*1 dist. 17, quaest. 3*), St. Bonaventure (*ibid., part. 2, quaest. 2*), Alexander (*Summa de virtutibus, collat. 69*), Ockham (*quaest. 6, dist. praealleg.*), Richard (*artic. 2, quaest. 2*), and the others commonly, who teach that the intension of an accidental form occurs through the addition of degree to degree in the same part of the subject.

Note that the latitude of degrees — which, from what was said and noted in the first article of this question, is twofold: extensive and intensive — makes one unity, not indeed an essential one as from genus and difference or from matter and form, nor an accidental one as from accident and subject, but a homogeneous unity coalescing from similar parts — just as from heterogeneous and dissimilar parts a heterogeneous unity is constituted, such as an organic body composed from head, neck, and the other members; so from many degrees simultaneously united there is one quality — such as one whiteness and one heat — with the unity and totality of homogeneity. You will say: several individuals and singulars do not make up one individual and singular — as two stones do not make one stone, nor two men one man; likewise two individual and singular degrees do not constitute one individual and singular quality. I say this holds for complete and perfect individuals, of which one is not referred to or ordered toward another, as the examples adduced clearly show; not so for

other incomplete and imperfect ones — for from these singulars a complete singular whole is made: as from this matter and this form, from this body and this soul, this living and animated thing comes to be; likewise from several degrees simultaneously joined and co-existing and singular there is made one singular and individual total whole — something homogeneous and similar — which precedes the composite from matter and form, because as the Doctor rightly observes (*1 Reportat. dist. 17, quaest. 6, §. Ad rationem dico*), if such a composite is dissolved, its extremes and both its parts still enjoy a composition of the same kind and a homogeneous unity.

First assertion: the intension of quality occurs with the preceding entity of it remaining. This is Scotus's view as cited in both works (*quaest. 3, §. Ad q. igitur*). Proof first, from Aristotle (*1 De gen., T. 31, 35*), affirming that augmentation is an addition to a pre-existing magnitude. This is also indicated by the word *intension* — for unless the pre-existing quality persisted, through the production of a new entity, not the quality itself would be intensified but it would simply be produced anew — just as when water is produced it is not said to be augmented, but when another water is added to it already produced and pre-existing, as is clear from one river flowing into another — as the Durance into the Rhone and the Ticino into the Po — in which it manifestly appears that the augmentation and intension of water presupposes the permanence of the pre-existing water; likewise the intension of quality requires the preceding quality to persist — as heat as six pre-requires pre-existing heat as five. Furthermore, intension is the same as perfection, and to be intensified is the same as to be perfected, as Augustine suggests (*Ad Bonifacium*) in these words: *Charity merits to be increased, that when increased it may merit to be perfected*. What is asserted of charity is to be maintained of other qualities — whether material or spiritual; therefore when quality is intensified and perfected, it is not destroyed, but would be destroyed if the pre-existing quality were to perish through the advent of new quality.

Second: if another quantity of mass is added to a preceding one, the prior persists with the posterior — as is seen with the eye: if a new part is added to a plank, both the old and new parts remain together. The same therefore must be asserted of the quantity of perfection, since the reason is equal in both, with the agreement of Augustine (*6 Trin., cap. 7*): *In those things that are not great in mass, to be greater is the same as to be better*.

Third: a cause exercising influence on an effect must necessarily exist, according to the saying: *a cause in act has an effect in act*; but the preceding quality — such as an intellectual or moral habit — is the cause of an act, for habit concurs as a partial cause to produce the act, as the authors of the first view do not deny; therefore the pre-existing habit persists with the advent of the act, which is a new quality added to it. And this is especially clear in the case of supernatural habits — notably grace, which never ceases, whether in the way or in the homeland, as the Postillator on (*1 Cor. 13*) rightly says.

Fourth: the same reasoning must be used for intension as for remission of quality, as the opponents too concede; but in remission, if the more perfect quality — such as the highest degree of cold — is corrupted by a double highest heat, there is not afterwards found that from which a remiss degree of cold is produced; for not from heat, since heat is not per se productive of cold; nor from a universal agent, to which one ought not have recourse without necessity and compelling reason — as Scotus and Maior especially note in the present question — especially since sense and experience teach us the opposite, as happens in our matter. For we observe warm and boiling water gradually remitted, and we sense by hand its heat decreasing little by little without any intervening productive cause. Moreover, things of the same reason mutually help and preserve each other, as is clear from two fires joined together reinforcing each other; but the heat of fire and of the sun, and likewise the first and second degrees of heat are of the same reason; therefore when one accrues, the other is not destroyed. And this is clearly shown from two torches lit, whose lights placed together in the same hall illuminate and light it more greatly, and if one is taken away the light of the other remains — though not as intense. Likewise two lights cause in one opaque body two shadows, and if one of them is taken away only one shadow remains. Therefore in the intension of quality the preceding quality is not destroyed. These and other things that the Doctor and his disciples marshal plainly and openly show the opposite view to be false, improbable, and impossible.

Second assertion: quality is not intensified through the removal of the contrary quality. This is Scotus's view (*ibid.*, §. *Contrà istam opinionem ante XX*). Proof first: there can be intension or remission without any admixture of a contrary — as is clear in the case of habit, which is the last predicament, which admits of more and less, as a horseman is more armed than a foot soldier, even though nothing is contrary to it. Therefore intension does not proceed from purification and removal of the contrary. You will say: from (3 *Top.*, cap. 4, locus 9) — *more white is that which is less mixed with black* — therefore a quality is intensified when the contrary is removed from it. I say this is to be understood causally and concomitantly, not formally and precisely, as if the intension of quality demanded the removal of the contrary. Second: quality can be intensified with no contrariety intervening — as light in air is intensified, to which nothing is contrary; and I asserted that some portion of pure element can be found under the concavity of the lunar orb and at the bottom of the sea when I treated of the elements; therefore also a pure quality without mixture of a contrary quality — such as the highest heat or the highest cold. Moreover, supernatural habits are intensified — as charity and glory in the Blessed, in whom nothing contrary whatsoever exists; therefore the intension of quality does not proceed from purification of the contrary.

Third assertion: nor is quality intensified through greater rooting in the subject. Scotus as cited agrees, (*before* §. *Ad istam q. sub VV*) and all hold this — except the

Thomists, some of whom, seeing the improbability of the Thomistic view, withdraw from it and say that St. Thomas and Scotus disagree only in their manner of speaking and in words. Others endeavor to defend that opinion — which, since it has no appearance of probability and truth, they go off in various and diverse modes of explanation, which being vain and futile, I am reluctant to adduce and refute. Now the said assertion is proven. I: that rooting of an intensible quality in the subject either is distinguished from the intensible form or is not. If the latter, then the intended conclusion is obtained — since when the rooting is greater or lesser, the quality will likewise be greater or lesser — which the opponents reject. If the former, then it is distinguished either as an absolute or as a relative form. If absolute, it is either quantity — and this is not so, since quantity does not admit of more and less — or it is quality, and the opponents fall into the doctrine of Scotus which they are impugning. If relative, likewise the proposed point is obtained, because a relation does not admit of more and less except by reason of the foundation on which it rests. Hence a white wall is said to be more similar to another white wall because of the greater whiteness by which it is affected and in which its greater similarity is founded — a relation by which it is referred to another white wall. You will say: it is a greater existence that the quality participates in the subject. Against: existence is really identical with the essence of which it is the existence, as is shown in the (*Metaphysics*); therefore if the existence of quality admits of more and less, so too does its essence and entity. Furthermore, existence is common to every produced thing outside its causes; therefore if intension occurs through greater existence, every thing that exists would undergo intension — which is false. Moreover, existence belongs to a thing at the beginning of its production — but intension does not, as is established as certain by all; therefore intension is not to be sought from the existence of quality.

Second: sometimes an intense quality is less rooted in the subject than a remiss quality; therefore the intension of a form is not sought through greater rooting in the subject. The antecedent is proven: redness arising from shame is more intense than redness caused by nature, such as in the sanguine temperament — yet the latter is more rooted in the subject than the former; therefore greater rooting in the subject is irrelevant to the intension of quality. Hence there are refuted those who hold that greater rooting means the quality more firmly and tenaciously existing in the subject — since a tertian fever is more intense than what is commonly called a hectic fever, even though the former is more easily removed from the subject than the latter, which persists in it until death. Also refuted are those who affirm that the said greater rooting is the greater union of quality with the subject. For fire and its heat are more closely united with the tow that they heat and burn than with iron — even though they subsequently inhere more tenaciously in the latter. Union, as said elsewhere, is formally a relation, which does not admit of more and less; therefore the intension of a form does not proceed from a greater union of quality with the subject. Finally,

not to be heard are those who understand by greater rooting the more perfect participation of the form by the subject in which it is subjected, and who add that it is a new mode accruing to the subject. For the subject is such through such a form — as a wall is white through whiteness — and is more such through the same greater form — as a wall is more white through a greater whiteness received in it. Moreover, the acquisitive motion tends toward the *terminus ad quem* by which it is specified; but the intension of a form is an acquisitive motion, since the form is intensified and perfected by it; therefore intension does not derive from the perfection and participation of the subject, nor from a new mode of the subject. Most of all, because the intension of a form can occur without a subject and its mode — for if the consecrated host is heated and new heat is added to it by the approximation of fire, it will become warmer with no subject existing; therefore the intension of quality does not derive from a greater participation of the subject or a new mode of it.

Fourth assertion: the intension of an intensible form is caused through the addition of degree to degree. Scotus is its patron as cited (*ibid.*, §. *sexto*, T. 3) and (*in Rep.*, *quaest.* 6). Proof first, from (4 *Phys.*, T. 85) and (1 *De gen.*, T. 31, 33), where it is read that augmentation is effected through the addition of a new entity added to the pre-existing one. And this is clearly apparent from the refutation of the others. Second: we clearly observe water increasing by the addition of new water, quantity by the accession of new quantity, light by the advent of new light, and so with the rest; therefore the same must be maintained of the intension of any intensible form, since the same reason runs in this and in those. Third: we experience that a weight presses and loads more if a new weight is added to it — lead presses more if other lead is joined to it; heat heats more if other heat is conjoined to it; and water boils and seethes more if another fire is placed under it; therefore when a new degree is added to the preceding one, intension occurs. Fourth: to a new merit God grants new grace, which is united to the preceding grace. Hence the Council of Trent (*cited by Arriaga, disp.* 3, *sect.* 1, *subsect.* 3) decrees that grace is increased through good works. And the Church, in a certain prayer, prays God to give grace to both the just and the unjust, saying: *We beseech you, O Lord, pour your grace into our minds*. But to the just and holy God gives new grace through their new good works; therefore if grace grows by the addition of new degrees, the same must be said of the other qualities, both spiritual and material.

Objection I, on behalf of Godfrey: the terms of a motion are incompatible (5 *Phys.*, T. 20). But the preceding quality and the subsequent quality receive the terms of their motions, since they are produced by two productions; therefore intension is effected through the corruption of the preceding quality and the production of the subsequent one. Confirmation: local motion, sound, and voice are intensified through the corruption of a pre-existing part and the acquisition of a new part; therefore the same must be affirmed of the other qualities. I respond by explaining and distinguishing the major: of first terms, such as form

and its privation, I concede; of concomitant terms, such as the prior and posterior degrees of an intensible form, I deny. To the confirmation I concede the antecedent and deny the consequent; the reason is that those are successive things whose parts never coexist simultaneously but continually pass away — with the prior ones corrupted, the posterior ones succeed being produced; but these latter are permanent; therefore the prior and recent degrees exist and remain simultaneously.

Objection II, on behalf of the Thomists: (*4 Phys., T. 84*) — *from hot there becomes more hot, without any new hot being made in matter that was not hot when it was less hot*; therefore through the intension of heat, no new heat accrues to the preceding one. Confirmation: like applied to like does not augment it — as tepid added to tepid does not increase and intensify the pre-existing tepid; therefore quality is not intensified by the application of a new degree. I respond that the testimony is to be interpreted not simply but in a qualified sense: when something becomes hotter, it does not become hot absolutely — since it is presupposed already to be hot — but it becomes more hot, because heat is intensified by the addition of new heat. Just as when a white wall is whitened more, it does not become a white wall — since it was already white — but becomes more white. This is deduced from Scotus (*praecit., in Rep., quaest. 6, ad 2*). To the confirmation I deny the antecedent with the same Doctor (*ibid., in solutione 3*) — for the smallest drop of water added to another drop intensifies it, as experience shows; likewise the smallest degree of heat applied to another degree of heat undoubtedly increases it. Therefore if a degree of heat in warm water is joined to another degree of heat, that degree is intensified.

Objection III: one rational soul is more perfect than another, and one angel surpasses another in perfection; and yet neither soul nor angel possesses a latitude of degrees of this kind; therefore neither does quality participate in such degrees. It must be replied that both the soul and the angel enjoy their own degrees — but differently — for to them there belong substantial perfection degrees, all simultaneously at the first moment of their creation; whereas these are accidental degrees to be acquired through motion and an interval of time.

Article IV: Whether the Degrees of Intense Quality Are Homogeneous

Suarez (*disp. 46 Met., Sect. 1, T. 30*) and Hurt (*hoc loco, disp. 5, sect. 2, §. 98*), to whom Durandus seems to have gone before (*1 d. 17, quaest. 7, num. 25*), deny that the degrees of an intense form are similar and homogeneous. The opposite is taught by Scotus (*1 d. 17, quaest. 3*) and (*in Rep., quaest. 6*), Mayr (*ibid., d. 18, quaest. 2, artic. 1 & 2*), Orbellis, and the other Scotists, Ockham (*quaest. 7*) and Gabriel there and other Nominalists, and also Vazquez (*Tom. 1, in 1. 2, disp. 28, cap. 6*), Arriaga (*hic, disp. 3, sect. 3*), and the rest from outside both schools.

Note and recall from what was said elsewhere that a whole is twofold — heterogeneous and homogeneous: the former coalesces from parts of a different kind, as the human body from head, neck, and the other members that make up and perfect it; the latter from parts of the same kind — as all water, all of whose parts are water, and all fire, all of whose parts, if separated from each other, are fires, even though when conjoined they do not obtain the denomination of the whole — and most especially when separated, because they cease to be parts and put on the notion of a whole. But such parts are not subordinated to each other, nor is one act and another potency, but they are capable of being united with one another and make up a whole said to be one with the unity of continuity and homogeneity — which is bipartite into extensive, as that which is quantified in terms of mass-quantity, and intensive, as that which is quantified in terms of the quantity of virtue and perfection.

Assertion: the degrees of an intense form are similar and homogeneous. This is Scotus's view as cited in both works, and it is common and true. Proof first: the parts of water, fire, and the other homogeneous things are similar and of the same kind; therefore the parts and degrees of intense quality are homogeneous and similar. The antecedent is clear, because they share the same name and the same notion — just as individuals of the same species do; and this is made clearer if they are separated from one another, for then they put on the notion of the whole — since it is then true to affirm and say: this is water and that is water; likewise this is fire and that is fire. Even more so, because they enjoy the same property and power — for the parts of water and all the water cool and moisten; and the parts of fire and all the fire heat and burn. And simultaneously they are united and help and protect each other against contraries and mutually sustain each other. Second: the same reasoning must be used about that which is quantified by the quantity of virtue as about that which is quantified by mass-quantity, as was shown above; but that which is quantified by mass-quantity has homogeneous parts, as is clear from a plank and other continua, whose parts are joined by a common term; therefore the same must be affirmed of that which is quantified by perfection quantity — as is clear from light, heat, cold, and other intense qualities, whose parts and degrees are similar and of the same kind. Third: if there are two bronze globes of equal weight, they will be equal in heaviness; but if simultaneously united they will press more heavily, as experience shows; and if separated from each other they will press less heavily, each always preserving its own equal heaviness; therefore if the degrees of heaviness are similar and homogeneous, likewise the degrees of the other qualities will be similar and of the same kind — as is clear from two lit lamps which, joined or disjoined, retain their degrees of light as similar and of the same reason. Fourth: if a person dear to and acceptable before God has three degrees of grace and afterward performs good works — with a remiss act and lesser effort, however — another degree of grace is owed to him by which the preceding degrees are intensified — just as water added to water is intensified,

even though the subsequent be less than the pre-existing, as is clear in rivers entering the sea and in rain by which those rivers swell, all of whose waters are similar and homogeneous; therefore this same thing is to be said of the degrees of any intense quality.

You will say: this does not hold for operative and productive qualities producing effects of the same kind — as heat produces heat and light produces light — but does hold for those not productive of effects like themselves — as grace does not produce grace, and glory does not produce glory. Against: that one thing is productive of another, or not productive, does not remove or posit homogeneity or heterogeneity. For the Angel and the rational soul do not generate their like, yet they are assimilated; and the heavens are homogeneous even though they do not generate other heavens; light generates luminosity, all of whose degrees are similar and of the same reason — so say the same of fire, heat, and others of the same form. I conclude therefore that the degrees of intense quality — whether prior or posterior — are homogeneous and similar.

Objection I: if the degrees were similar and homogeneous, an intense quality and a remiss quality would be of equal perfection and power — but this cannot be defended; therefore neither can that. The sequent major is proven: if the degrees of quality are extended, they are equally perfect as if intensified, because through extension they do not lose their power and perfection, nor through union do they acquire new perfection and vigor. I deny the sequent major; for its proof I say that united and intense degrees are more efficacious and excellent than disjoined and remiss ones — because a united power is stronger than the same power dispersed. And nature simultaneously joined and bound together prevents a vacuum from being made by the first angel, even though there is no power on earth that can be compared to it (*Job 41*) — which I mentioned (*lib. 6 Phys., quaest. 3, artic. 2*). In this sense perhaps Ecclesiastes (*ch. 4*) subjoins: *A threefold cord is not easily broken*.

Objection II: several degrees in the same part of the subject intensify quality; therefore several parts of quantity mutually penetrating likewise intensify quantity — but this is not conceded; therefore neither should the former be admitted, if the degrees are homogeneous; but it is admissible if they are heterogeneous. I concede the antecedent and deny the consequent: because quality, since it admits of more and less, is capable of intension; while quantity, since it does not admit of more and less, is not capable of intension but of extension.

Objection III: an agent cannot overstep the limits of its own power and activity, as all philosophers hold for certain; but if the degrees of quality were homogeneous, a natural agent would act beyond its power and exit the sphere of its own activity. For example, white as two could cause two degrees of whiteness in another white thing of similar kind having likewise two degrees of whiteness, thus making it white as four; and then it could bring about other degrees —

even the eighth and highest — which seems inconvenient and absurd; therefore the said degrees of intense quality are not homogeneous. I concede the major and deny the minor. For the similar and equal in power does not act on its similar, nor on its equal in potency and power, as experience shows. For white as two, since it already has and possesses two degrees and does not tend and incline toward them — because once the terminus is acquired, motion ceases — but only toward those others that a stronger and higher agent can introduce. Therefore no inconvenience follows from establishing homogeneous degrees — indeed, if heterogeneous degrees were posited, inconveniences clearly follow, as what I adduced above plainly shows.

Objection IV: through a more intense vision God is seen more perfectly and clearly by the Blessed; but if the degrees are homogeneous and equal, one Blessed having two degrees of vision would see God equally perfectly and clearly as another having four degrees — because one degree is not more perfect and greater than another but they are of equal power and perfection; therefore, etc. I concede the major and deny the minor; the reason is that although the degrees are equal in power and perfection, they are not so in number. Therefore one who has more degrees of beatific vision is more blessed than one who has fewer — just as he is richer who has more money and possessions than another who has fewer.

You will ask: which qualities are intensible and remissible? I say principally the qualities of the first species — such as acquired habits, as knowledge, and infused ones, as grace — and those of the third species, as love, hatred, joy, sorrow, and the like, of which more is said in the *Logic*.

Article V: Whether the Degrees of Quality Are Distinguished from One Another

Assertion: the degrees of intense quality really differ from one another. This is suggested by Scotus (*1 d. 17, quaest. 3*) and (*in Report., quaest. 4*) and thereafter, against some whose name Mayr (*d. 18 of the first, quaest. 2, artic. 2*) suppresses. Proof I: things that really differ are those of which one can be produced without the other being produced — for this is the principal and manifest indication of real distinction; but the first degree can be produced without the second degree being produced, since after the production of the first degree the agent can be impeded by the contrary and desist from the production of the second degree; therefore the degrees really differ from one another. Second: among things of which one can remain and persist in being while the other is corrupted, there is a real distinction — as is clear from the definition of real distinction given elsewhere; but one degree can remain and another be destroyed — since the first degree can persist in its being and the second degree can be corrupted, as occurs in the remission of quality, when namely the great and intense heat of boiling water is remitted and cold is intensified as the water returns to its coldness; therefore, etc.

Objection I: really distinct things do not make one per se, unless one is by way of potency and the other by way of act; but intense quality is something one coalescing from a plurality of degrees; therefore the degrees from which it coalesces are not really distinct. I distinguish the major: about those that make one with the unity of composition, I concede; about others that constitute one with homogeneous, integral, and gradual unity, I deny.

Objection II: if there were several really distinct degrees, with the multiplication of those degrees, quality would likewise be multiplied — since with the multiplication of inferiors, the superior is multiplied; but intense quality is not multiple but one; therefore neither are the degrees really distinct from one another. I deny the major. For the posterior can be plurified without the plurification of the prior; thus with one cause existing, there are several of its effects, and under one genus several species are comprehended; and one species has several individuals. Hence, although intense quality is one with the totality of homogeneity, it is nevertheless multiple with partial multiplicity — just as the sea is one in total and many in partial.

Article VI: Whether Intension and Remission Differ from One Another

Every intensible form is likewise remissible. What can be intensified can likewise be remitted, and vice versa. Hence intension is the acquisition or acquisitive motion of degrees of quality, while remission is the loss or privative motion of degrees of quality. This is clear in the case of water's heat, which becomes more heated and boils and seethes when fire is placed under it, and when the fire is removed the heat gradually diminishes and it returns to its prior coldness.

Assertion: intension and remission are distinguished from one another. This is suggested by the Doctor in the places cited above. Proof first: motions are distinguished according to their terms, from what was said (*lib. 8 Phys., quaest. 2, artic. 1 & 2*); but intension and remission have distinct terms — since the terminus of intension is positive while the terminus of remission is privative, as is clear from the description of each given above; therefore intension and remission differ from one another. Second: intension and remission differ from one another just as generation and corruption do; but generation and corruption differ from each other, as is clear from the first book of this treatise (*quaest. 2, 3*); therefore likewise intension and remission. The major is clear from the beginning of this article: for intension is the acquisition of new degrees, while remission is the loss of certain pre-existing degrees.

Objection I: Aristotle (*5 Phys., T. 18*) numbers remission among positive motions; therefore intension and remission do not differ as a positive and a privative motion. I respond that the Philosopher is to be understood not precisely and formally but connotatively and fundamentally — insofar as remission

designates some surviving degrees, according to which remission can be called a positive motion.

Objection II: intension and remission stand to each other as generation and corruption, from what was asserted above; but corruption is the destruction of the whole into the whole, no sensible subject remaining, as I showed in the place just cited; therefore also connotatively and fundamentally remission is not a positive motion. I respond that remission is a partial corruption — that is, of some degrees only — but not a total corruption, as is rightly deduced in the argument.

Question II: On Rarefaction and Condensation

That rarefaction and condensation exist is plain to our eyes. For we observe fire being rarefied, water condensed, oil, milk, and things of this kind. What they are, what they include, toward what they tend, and where they reside is not so obvious and accessible; hence we have established the following articles to illuminate and decide these matters.

Article I: Whether Through Rarefaction New Quantity Is Produced and Through Condensation Old Quantity Is Lost

Four principal opinions of philosophers, discordant and discrepant, are reported and examined, of which the first is that of certain ones whose names the Doctor reticences (*4 d. 12, quaest. 4, §. Quantum ad istam*), who hold that rarefaction is effected through tiny and subtle corpuscles entering into the pores of the rarefied thing, and condensation through the departure of the said bodies from the pores of the condensed thing. To these assent Arriaga (*disp. 16 Phys., sect. 10, subsect. 2*) and Poncius (*disp. 55, quaest. ult., concl. 5, num. 47*). The second is that of Godfrey (*Quol. 11, quaest. 3*) and Burley, related by the marginalists — Scotus as just cited (*§. Hic est una opinio*) and Pomponatius (*1 De gen., quaest. 10*) — who hold that through rarefaction the whole preceding quantity is corrupted and a new larger one is produced in the rarefied thing. The third is that defended by Bassol (*4 d. 12, quaest. 3*), Marsilius (*1 De gen., quaest. 15*), Hervaeus (*Quol. 1, quaest. 5*), and not a few others, who affirm that in rarefaction some part of new quantity is produced and in condensation some part of the preceding quantity is lost. Toletus follows this (*4 Phys., quaest. 11*) and thinks it to be true and that of Aristotle, whose patron is also Scotus (*ibid., sub B, §. Quantum ad istam*) and (*in Repor., quaest. 5, §. Dico tamen*). The fourth is handed down by John of Mairs (*1 De gen., quaest. 4, scibili primo*), Mayr (*4 d. 12, quaest. 4*), Ruverio (*1 De gen., cap. 5, tract. de rarefactione, quaest. 1*), the Coimbrans (*quaest. 17, artic. 3*), and very many others, asserting that in rarefaction no total or partial quantity is acquired but only a greater local extension, and in condensation a lesser one. From these our Doctor in the places cited above does not seem to be very far distant.

Note first that rarefaction and condensation are taken in two ways. First, broadly, for any loosening and dilation, or constricting and compression, of any rarefiable and condensable thing — in which sense a sponge full of air or water is said to be rarefied, and when the air or water is expelled from it, it is said to be condensed. But this acceptance is common and improper — and was the only one recognized by many of the ancients, who held that there were empty pores in a body, which we maintain to be filled with thin and subtle body. Second, strictly, for the enlargement of joined parts occupying a larger place, or for the compression of those same connected parts occupying a lesser space. And it is of rarefaction in this acceptance — which is the proper one — that the discussion is in the present place. For in this way wax is rarefied by heat and condensed by cold, and likewise whatever else is rarefiable and condensable.

Note second that there are three principal causes of rarefaction and condensation. One is heat and cold, as St. Bonaventure notes (*2 d. 14, quaest. 3, n. 67*). For we experience heat to rarefy what is rarefiable and cold to condense what is condensable — as I was just explaining about wax, which, when placed near fire, rarefies, and when placed near snow, is densified. The same is also clear in the case of chestnuts, acorns, gunpowder, and other such things, which through heat and fire are rarefied and seek a larger place, and also instantly crack and are reduced to sparks and ashes. Moreover, it is clear from water in a pot, which when cold is contained in a small place, but when it heats it rarefies and tends to a larger place, and boiling and seething it leaves the pot itself. The second cause is generation — principally of elements, some of which increase and rarify in summer, as fire and air; while others decrease and condense — as water and earth; while in winter the opposite occurs, since the former diminish and the latter increase. The third is local motion, by which air is assailed by winds and, reduced to a narrow place, is condensed; when these cease, it spreads into a more ample place and rarefies.

Note third that material accidents are drawn out from the potency of the subject. For what is actually cold was potentially cold, and what is actually hot was potentially hot — and so this is to be affirmed of the rest — in much the same way as substantial forms are drawn out from the potency of matter, as was shown in (*lib. 2 Phys.*); likewise accidents are drawn out from the potency of their subjects by a natural agent. Hence quantity — which is the first accident following upon corporeal substance, drawn out from whose potency it is — is proportioned and adequate to it; so much so that as it increases, quantity increases, and as it decreases, quantity decreases. Therefore in rarefaction the said substance is increased and so too its quantity, and in condensation that same substance is diminished and similarly its quantity is lessened; and Toletus as cited above affirms that Aristotle (*4 Phys., T. 84*) expressly held this doctrine.

First assertion: rarefaction does not occur through the ingress of subtle bodies into the thickness of the rarefiable body, nor condensation through the egress

of the said bodies. This is touched on by the Doctor in the passage mentioned (§. *Quantum ad ista, sub B*). Proof first: a body can be rare without the said subtle bodies; therefore rarefaction does not occur through bodies of this kind. The antecedent is plain: for certain parts of the heavens are sparse, which do not shine, while others are dense, which shine — namely the stars. But in the former, no such subtle bodies exist, since the heaven is a simple body alien to the ingress or egress of those bodies — incorrupt and separated from their origin, transit, and destruction. You will say: the heaven from the beginning of its volition was so constituted that some of its parts are sparse and others dense; but sublunary bodies that are rarefiable and condensable require or respect bodies of this kind that are subtle and tenuous. Against: if those bodies are not necessary for rarefying one body, they are not necessary for another — just as if quantity is not the cause for individuating and singularizing a celestial substance, it is not the cause for sublunary and terrestrial substance either. Likewise, if greater rooting in the subject is not the cause of the intension of grace and glory of the just, nor of another quality — such as whiteness or blackness. Therefore if the said bodies do not cause rarity in the heavens, they cause it neither on earth. Second: rarefaction would be the juxtaposition of those subtle bodies — for one would be applied to another, by reason of which it would be rarefied; but this is false — just as the doctrine of the ancient philosophers who held that generation is an aggregation of atoms. Furthermore, those bodies are capable of rarity and density, since they are of the same kind as the other rarefiables and condensables; therefore a cause of their rarity and density must be assigned — which is not had through other bodies, else one would proceed to infinity; therefore another cause, to be named below, is to be established. Moreover, without the ingress of such bodies, wax enclosed in a vessel rarefies and is condensed by cold — for given that the vessel is sealed and stopped on all sides so that those bodies cannot enter the same vessel, still rarefaction of wax occurs from the surrounding heat, and when that heat ceases, condensation of the same wax; therefore it is vain and futile to admit those bodies as the cause of rarity and density in rarefiables and condensables, since rarity and density can exist without them. Finally, if a body were extended or compressed according to all its parts, and God were to prevent any subtle body from being introduced within the said parts or from leaving outside them, that same body would rarefy or condense without those tenuous corpuscles entering or leaving; therefore those bodies are irrelevant to rarity and density.

Second assertion: in rarefaction the whole preceding quantity is not corrupted and the new subsequent larger one is not produced. This is Scotus's view as cited. Proof first: the subject persisting, its passion and property likewise persists — as, with man remaining, his risibility also remains; but in rarefaction the physical composite, which is the subject of quantity, persists, as sense and experience show; therefore its passion and property — which is quantity — likewise persists; and therefore in rarefaction the old quantity does not perish

nor does a new larger one succeed. Second: with accidents persisting, their subject persists — for accidents do not migrate from subject to subject, nor can they by their own nature exist without a subject; but in rarefaction the accidents that were in the subject before it was rarefied persist — such as color, odor, flavor, and other things of this form, as is clear in rarefied wax; therefore so too does their proximate and immediate subject, which is quantity. To this also pertain the arguments I adduced to prove that in an intense quality the preceding quality is not corrupted but persists with the addition of new degrees.

Third assertion: in rarefaction some part of quantity is newly generated unto the pre-existing, and in condensation some part of quantity is lost. The Doctor holds this as cited — especially toward the end. Proof first, from the definition of rare and dense, which all unanimously and commonly receive from Aristotle (*4 Phys., cap. 9, T. 8, 4*) — *the rare is that which under great dimensions has little matter; the dense is that which under small dimensions has much matter*. This is corroborated from (*4 Phys., T. 84*): *the rare is that which was more in potency to be dimensional, and has become actually more dimensional*; but it cannot be actually more dimensional except through greater quantity — just as a river cannot be greater except through more water in it, nor a larger burning furnace except through more fire burning in it. Therefore when rarefaction occurs, a new part of quantity accrues to the pre-existing quantity of the rarefied thing, and when condensation is effected, some part of the quantity of the condensed body is lost.

Hurt replies (*cit.*) by a distinction, saying that the said testimony does not hold in first and remote act, but in second and proximate act — which is circumscriptive and local dimensional extension, not the internal extension of the parts of the rarefied body and quantitative extension. And into the same thing seems to fall what Ruverio and others say about there being a new mode, not a new quantity. Against: where the formal effect is, there is its formal cause — as is clear, for wherever there is animation, there is a soul, and wherever there is whitening, there is whiteness; therefore if in rarefaction there is new dimension and extension, there is likewise new quantity; but the cited authors concede that in rarefaction of a rarefied thing there is new and greater dimension and extension; therefore there is also new and greater quantity — since the formal effect is not separated from the formal cause, nor the mode from the modified thing. Furthermore, quantity is defined as *being per se extended and the position of parts outside parts*; but in rarefaction there is found a greater extension of parts and a greater position of those same parts, as sense and experience show; therefore also a greater quantity.

Second: the intension of a form does not occur without a new degree added to it, as I proved in the preceding question, article III; therefore the extension had through rarefaction is not effected unless through a new part of quantity joined to the pre-existing one. The consequent is clear *a pari*: for just as a form is intensified by the addition of a new degree, so it is extended by the addition of a

new part of quantity. The opponents who deny the parity reply because quantity is extended with nothing added to it — as is clear from a sponge, skin, and the like, which are extended and constricted unchanged and unaltered without receiving and accessing anything new. Against: quite apart from the fact that those opponents adduce this parity to prove that intension is effected through the advent of new degrees and they bring examples from extension and rarefaction taken broadly — of which I made mention in the place just recalled — they are attacked as follows: that motion by which a body passes from dense to rare is acquisitive of something — and of nothing else but quantity, since it becomes greater, which pertains to quantity; therefore in rarefaction some quantity is acquired that was not previously in that body. You will say: some quality is produced by which that same body rarefies. Against: rarefaction does not tend toward quality but toward quantity — as Aristotle testifies (*1 Praedicam., at the end of cap. de qualitate*) — and given that some quality is produced, this does not prevent some quantity from also being generated, since a new extension occurs, which pertains to quantity. Moreover, in nutrition some part of substance and quantity is generated unto the pre-existing nourished thing, as the opponents do not deny; therefore likewise in rarefaction some quantity is adjoined to the rarefied thing, through which the body is further extended and increased. You will say: there is produced not new quantity but a certain mode subsequent to quantity. Against: that mode has already been rejected by us as vain and futile. Furthermore, if it existed, it would be placed in one of the ten categories — but not in the three prior ones, as the aforesaid authors themselves acknowledge, nor in the rest, which are constituted not through modes but through relations extrinsically accruing, from what was asserted in (*Log., lib. 3, quaest. 8, artic. 1*). Moreover, that mode does not differ from local extension, as the above-mentioned philosophers indicate; therefore it is refuted by the same reason by which local extension was rejected above.

Furthermore, it is not without probability that in rarefaction only the said *ubi*-type extension is acquired — which I have defended in many courses, and it does not seem very alien to Scotus, who seems doubtful and uncertain in the places mentioned; and no ignoble disciples of his openly and earnestly defend it and conveniently and easily meet the opposing arguments.

Objection I: from (*4 Phys., cap. 9, T. 84*) — in rarefaction nothing new is acquired by the rarefied body and in condensation nothing pre-existing is lost. For the same wax that was contracted and dense from cold is dilated by heat and spread to occupy a larger space and place. I respond by interpretation and distinction of that testimony: in rarefaction and condensation nothing new comes or departs with respect to the matter, the parts subjected to it — I concede; with respect to quantity and other accidents — I deny; for there, as the Coimbrans observe (*1 De gen., cap. 5, quaest. 17, artic. 1*), Aristotle hands down the definitions of rare and dense, saying *rare is that which under great dimensions has little matter, and dense that which under small dimensions participates in much matter*. Therefore

the said testimony serves us rather than harms us: for the same matter or body remaining, through rarefaction a greater dimension is acquired — which pertains to quantity — and through condensation, the same subject persisting, some of its dimension perishes — which is proper to quantity.

Objection II: if new quantity accrues to a rarefied body unto its old pre-existing quantity, since both are accidents they require a subject in which they inhere; therefore either one is in the other — and thus a penetration of dimensions is given, which is impossible — or one withdraws from the subject as Godfrey holds, or rarefaction does not occur through all the parts — which is against the hypothesis; and since no other way appears in which rarefaction occurs, it is rightly deduced that neither a whole new quantity nor a part of it is acquired by the rarefied thing, nor is either of them lost in the dense thing. I respond that a part of quantity in the rarefied thing is adjoined to the pre-existing quantity in much the same way as water is added to water and fire to fire. For I affirmed above that intension and extension are assimilated: just as the former occurs through the addition of degree to degree, so the latter through the addition of part to part. Therefore no inconvenience is inferred from what has been adduced and narrated.

Objection III: if rarefaction tended toward new quantity, it would not be distinguished from augmentation, since the latter likewise tends toward new quantity, and the identity of a motion is sought from the *terminus ad quem*; but both of the said motions would have the same *terminus ad quem* — namely quantity; therefore no difference would be intercepted between the said motions — which is false. The major sequent is to be denied: for augmentation is the accretion of the subjected matter and of quantity simultaneously — as is clear in animate things that grow through internal reception and in inanimate things that increase through juxtaposition; whereas in rarefaction there is only the addition of some quantity, as I made plain above.

Objection IV: if the consecrated host — which is not incompatible — is rarefied by heat applied to it, it would acquire some quantity that it did not previously have, in which the Body of Christ would not exist — since the Body of Christ exists only in the consecrated parts; but it seems inconvenient that there should be some part of the host in which the Body of Christ does not exist; therefore through rarefaction new quantity does not accrue to it. I concede the major and deny the minor. For just as other accidents accrue to the consecrated host — such as heat, division, fracture, and the like — in which the Body of Christ does not exist, so likewise no one should wonder that in the new quantity acquired through rarefaction there is no Body of Christ the Lord — as Hurt notes (*disp. 4, sect. 2*) after Scotus as cited.

Article II. Whether Rarity and Density Belong to Quantity or Quality.

Those who recognize no new quantity in rarefaction assign rarefaction and condensation to the category of qualities. Those who hold that in rarefaction the whole quantity or a part of it is acquired anew, and that in condensation it is lost, refer rarity and density to quantity. For the explanation and resolution of this difficulty:

Note, from Scotus (*in praedicam. quaest. 3. §. Notandum in cap. de qualitate*) and from Anthony Andrea (*in expos. sex principiorum, cap. 6*), that rare and dense are taken in two ways. In one way, they denote the extension of parts, and this in turn has two modes: either as the extension of parts in place, which is position, or as the extension of parts within a whole, which belongs to quantity — quantity being divided into that which has positional arrangement of parts and that which lacks such positional arrangement, as may be seen in the *Predicamenta*, in the chapter on quantity, where this division of quantity is set forth. In the other way, rare and dense denote the extension of the parts of matter, produce an effect that is presented to the senses, and are perceived by sense itself; in this manner they constitute a quality residing in the third species of quality.

The assertion is: rarity and density belong to the predicament of quantity. This is the position of the Doctor (*4. distinct. 12. quaest. 4*). It is demonstrated first from Aristotle, who in the *Predicamenta*, in the chapter on quality, excludes rare and dense from the genus and series of quality. Second, extension of parts within a whole belongs to quantity, as is evident from the definition of quantity; and in rarefaction the parts are extended within the whole, as was shown in the preceding article; therefore rarity and density are placed in the category of quantity. Third, motion is specified by its terminal point, as has been stated elsewhere; and the terminal point of rarefaction is new quantity, by reason of which the parts of the rarefied body are extended in relation to one another and to a larger place. Moreover, in the preceding article I maintained that in rarefaction a certain part of quantity is produced anew, which is attached to and generated together with the pre-existing quantity. Furthermore, rarity and density are located either in the predicament of quantity, or of quality, or of position: not in the category of position, since it is an extension of parts toward a place; nor in the predicament of quality, because they presuppose quality — and what presupposes a thing is not that thing itself, just as an accident that presupposes a subject in which it inheres is not itself that subject. Rarity presupposes quality, for instance heat, by which what is dense becomes rare, as I observed above. Therefore rarity and density reside in the predicament of quantity.

One objects, citing Aristotle (*4. Phys. 84. and 7. of the same work, 11*), who enumerates rarity and density among tangible qualities. The same view is held by Augustine (*lib. categ. cap. 12*), Damascene (*in Phys. cap. 22*), Porretus (*lib. sex principiorum, cap. 6*), and very many others. I reply that these and similar

authorities are to be understood in accordance with the distinction set out in the foregoing note, namely insofar as they are tangible and passive qualities, but not insofar as they exhibit a positional arrangement of parts within a whole or in place.

One objects secondly that nothing is contrary to quantity, on the authority of Aristotle in the chapter on quantity; but rarity and density are contraries, as the same Philosopher indicates (*4. Phys. 85. and 2. de partibus animalium, cap. 1*); therefore they are counted in the catalogue of quality. I grant the major, and distinguish the minor: considered in themselves, I deny it; considered by reason of the things contained in them, I grant it. For within them are contained heat, cold, and the other qualities. The cited passages of the Philosopher are to be interpreted accordingly.

Article III. Whether a Large Thing Can Be Made from a Small One without Rarefaction and without the Addition of New Matter.

Almost everyone, with a few exceptions, denies that this can be accomplished by natural power. Regarding supernatural power, however, the opinion of the Doctors is not uniform. For St. Gregory of Nyssa (*orat. 1. de resurrectione*), Peter Lombard (*2. dist. 18*), Durand, and others at the same place embrace the affirmative; while Mayr, Bassol, the Carthusian, and the Ariminensian follow the negative at the same distinction cited above. Maior, Gabriel (*ibid. quaest. vn. art. 3. Dub.*), and the Conimbricenses (*1. de gen. cap. 5. quaest. 18*) defend both as probable, though they incline toward the negative.

The assertion is: a large thing cannot be made from a small one, even by divine power, without rarefaction or the accession of new matter. This is touched upon by the Doctor (*2. dist. 18. quest. vn. in fine*). It is demonstrated first: what is enclosed within the essential definition of something cannot be removed from it by the supernatural and absolute power of God without destroying it — just as if the rational were removed from a man, which enters his essential and quidditative definition, his nature is taken away. Now in the definition of the great is posited a greater quantity than in the definition of the small; for the great and rare is defined as that which has little matter and much dimension, and the small and dense as that which has much matter and little dimension, as is evident (*4. Phys. 84*). It is therefore impossible for a small thing to become large without rarefaction, by which new quantity is acquired as stated in the preceding article, or without the arrival of new matter — as water grows when more water is added to it, and fire increases when another fire is joined to it.

Second, in no way and by no power can a formal effect exist without its formal cause, just as an animate thing cannot exist without a soul, nor a white thing without whiteness. But largeness is the formal effect of magnitude, which is quantity; for a thing is large by reason of its magnitude, just as a quantum thing is quantum by reason of quantity, and a white thing is white by reason of

whiteness. Therefore a large thing is not made from a small one unless new quantity is added, which is had through rarefaction, or new matter, through which augmentation comes about. Whence Augustine (*10. de gen. ad lit.*): "What is more absurd than to suppose that there exists any body which, while retaining the quantity belonging to its nature, grows in all directions unless it is rarefied?"

Third, the very same manner of philosophical reasoning is to be applied here as to the rib of Adam from which Eve was formed (*Gen. 2*), to the oil of a certain widow multiplied (*4. Reg. 4*), and to the loaves in the Gospels (*Joan. 6 and Matt. 14*). These did not increase without the accession and intervention of new matter. For, as Augustine rightly adds (*in Ioan.*): the evangelical loaves were multiplied by the blessing of Christ the Lord in much the same way as crops are increased from sown seeds; and that they grow by the addition of new matter no one calls into question. The same must therefore be affirmed in the present case.

One objects first: it is a greater and more excellent work to create from nothing than to make a large thing from a small one; but the former is possible, as I showed in the book on the creation of the world; therefore so too is the latter. I reply: the first is possible because it involves no contradiction; the second, however, is impossible because it entails being quantum without quantity, just as being white without whiteness.

One objects second: what is not included in the essence of matter can without any contradiction be removed from it; but largeness or smallness is not of the essence of matter, since, as has been stated elsewhere, quantity is neither coeval with matter nor a passion of it, but belongs to the composite. Therefore there is nothing to prevent a small thing from becoming large without rarefaction and without quantity. I grant the major. To the minor I say that matter cannot be made large or small without quantity; the reason being that greater or lesser belongs to quantity, since through quantity a thing is called large or small, just as through likeness a thing is called like, and through unlikeness unlike.

One objects third: if a small thing cannot be made large unless new matter is added to it, and if the matter that arrives is greater, it does not seem to be made from the original matter but rather from the newly arriving matter — thus if a great quantity of water is poured into a little wine, it is no longer wine but water. Likewise, a body of Eve suitable and proper in size would not have been made from Adam's rib, since God's works are perfect. The inference is to be denied; for from a small seed a great tree is produced, and from a tiny spark a great fire. This is signified by the Savior (*Luc. 3*) concerning the grain of mustard, which though small grows into a great tree. As for the further objection, I say that it pertains to mixture, which is treated in Book IV.

Book III. On Action and Reaction.

Those things which I discussed in Logic on action and passion must be presupposed and previously understood, especially in the Epitome (*lib. 1. quest. 4. art. 9*). The remainder is here to be carefully and precisely examined and decided. Two questions are raised in this book: the first on action, the second on reaction.

Question I. On Action.

Article I. Whether Action Is in the Agent or in the Patient.

The first opinion is that of Henry (*Quol. 4. quest. 4*), Capreolus (*2. distinct. 1. quaest. 2. art. 3*), and many others, who hold that action is lodged in the patient. The second opinion is held by Scotus (*4. dist. 13. quest. 3; 2. dist. 3. quaest. 5. lit. s; 3. dist. 3. quest. 6. in fine; quest. 9. lit. O; and lib. de anima, quest. 3*), Anthony Andrea (*9. Met. quest. 4; and in exp. lib. Sex princ.*), two recent authors (*disp. 7. Phys. quaest. 3. art. 1*), and from the Thomists Cajetan (*1. p. quaest. 25. art. 1*), who teach that action resides in the agent.

Note first, from Scotus (*Quol. 13*), that action is commonly divided into immanent and transient action. Immanent action is described as that whose term remains in the agent, for example, the act of speaking and the act of intellecting, which is directed to intellection as its term — an intellection that inheres in the intellect which produces it through the said act of speaking and intellecting. Similarly, the production of vision is an immanent action, because vision, which is its term, remains in the eye as in its subject. Transient action is defined as that whose term goes outside the agent, as house-building is a transient action whose term is the constructed house, which stands apart from the builder. The division of action just stated is thus derived from consideration of the term: if the term remains in the agent, the action is called immanent; if it comes to be outside the agent, it is called transient. The Canon (*3. Phys. quaest. 2*) observes that an action of this kind takes its name only from its effect or term, and gives the example of charity, which, though it is a noble action, nonetheless takes its name from love, which is its effect. Nor should we omit the division into action that leaves a work behind it, that is, a permanent work — as building leaves a constructed house — and action that leaves no work behind it, that is, no permanent effect, such as singing and lyre-playing, whose term and effect quickly passes and flows, since these consist in a transient motion, as is evident in the utterance of words and the emission of voice. Aristotle mentions this (*1. Eth. 1 and 6. of the same work, 4; 1. Magn. mor. cap. ult.; and 9. Met. T. 16*).

Note second that action can be used in two ways. In one way, for the relation that comes from outside to the transmitter, in relation to the transmitted — this is properly action of the genus of action, according to which the agent is formally denominated agent. In another way, for the enacted action, that is, for

the thing produced by action, which is called action of the genus of quality, as Scotus writes (*1. dist. 17. quaest. 2. §. Qui vellet, ante N.; and 9. Met. ante exp. in cap. 4. T. 41*). This latter is itself held to be twofold: either the form or thing produced by action remains in the agent and is called immanent action, such as intellection, of which (*9. Met. T. 16*); or the form or thing produced by action goes beyond the bounds of the agent and resides outside it, and is called transient action, such as the constructed house, of which at the end of the preceding note.

The first assertion is: action taken formally in the first sense, as a relative form, is lodged as subject in the agent. This is Scotus's position (*ubi supra*), and it is proved first from (*3. Phys. 20*): "An agent is that from which something else proceeds; a patient is that which proceeds from another." Therefore action is that by which the agent is formally denominated agent, which is the relation of the transmitter to the transmitted, and this relation exists in the agent. Again, from (*8. Met. T. 16*): "Active potency is the principle of transmuting another insofar as it is another." Therefore action is the transmutation of another insofar as it is another — since it is the act of transmutative active potency residing in the agent. Whence in the book *On Sleep and Waking*, chapter I, it is added: "The act belongs to the same thing as the potency; but the potency of acting is in the agent; therefore action too inheres in the same thing."

Rubius objects (*3. Phys. quest. 6*) saying that those testimonies show only that action is from the agent, not that it is in the agent — which is what is under dispute among the philosophers. I reply: in (*2. de anima, 24 and 29*) it is expressly stated that the act is in that of which it is the act; therefore the cited passages cannot rightly be interpreted as referring only to being from the agent and not being in the agent as in a subject. Nor does it help to suggest that those texts speak of immanent action and not transient action, since in those very passages transient action is also discussed — action which terminates in immanent action. For vision, intellection, and the remaining immanent actions presuppose and presume transient actions through which they are produced, as I made clear above in the foundational principles.

Second, that which formally denominates the agent is lodged in the agent as subject, as is evident from whiteness, by which a wall is formally called white, inhering in the wall itself. But the agent is called and formally denominated agent by action, as fire is a heating agent by heating and water a cooling agent by cooling. Therefore action is lodged in the agent as subject. Nor does the response of certain thinkers help here — those who say that the agent is denominated by action only by extrinsic denomination. For although the objects toward which actions are directed are denominated extrinsically — as a seen wall and a cognized stone — nonetheless vision is formally in the eye and cognition in the intellect, by which the intellect is formally denominated

cognizing and the eye seeing. Therefore the agent is denominated agent by action formally and by intrinsic denomination, not by extrinsic denomination.

Third, where the foundation of a relation exists, there too the relation is formally found — as in Peter the foundation of paternity is present, namely the power of generating, and in that same subject paternity is present through the son generated by him. And this holds even in divine matters, for paternity is formally in God the Father, in whom is the power of generating the Son. Now in the agent is found the foundation of action, which, as was stated, is a relation coming from outside of the agent toward the patient, and its foundation is the active transmutative potency. Therefore action itself, which is founded in that active potency, is also in the agent.

Fourth, two opposed forms cannot exist simultaneously in the same subject, as is evident from heat, cold, and other things that are incompatible in the same subject at the same time. But action and passion are two opposite forms or entities: for that reason the same thing cannot be simultaneously, with respect to the same thing, both agent and patient — for instance, both heating and heated, both cooling and cooled. But it is established that passion is in the patient; therefore, by the opposite argument, action is in the agent. Moreover, something that was not an agent becomes an agent, as fire, which was not heating wood, becomes the thing heating wood and consequently changes. But to be changed is to be otherwise disposed through the reception of something new; and the heating fire receives nothing in itself except heating, which is its action. Therefore action has its seat in the agent. Whence certain thinkers not unreasonably infer that Aristotle held the world to have been created by God from eternity, because he was unable to conceive of God being able to act in time without a new action coming upon God himself — which would make him mutable. Lest he make God mutable, he posited him as the craftsman of things from eternity, as may be seen (8. *Phys.*) and in other places in his teaching; and thus he is thought to have held that action resides in the agent.

The second assertion is: action taken in the second sense, insofar as it is a form that does not go outside the agent, remains in the agent; but insofar as it passes outside the agent, it is lodged in the patient. This assertion is twofold, and is held by the Doctor cited above. The first part is proved from (9. *Met. T. 16*): "Operations that are the ends of potencies, such as vision, intellection, and the like, are located in the same potencies from which they proceed." But the potencies are in the agent; therefore its actions taken in this sense are there too. Second, the perfection of any subject remains in that of which it is the perfection — as vision in the eye, contemplation in the intellect, and grace in the will. But action taken as the enacted thing is the perfection of the agent of which it is the action; and for that reason the agent tends toward it as its end, from the Aristotelian passage just cited. Therefore it inheres in the agent.

The second part is proved: the form that is produced by motion proceeds from the agent and is received in the patient, as heat produced by heating proceeds from fire and is received in the wood, from which the wood itself is heated; similarly the coldness of snow is received in and inheres in the hand; likewise building inheres in the built thing and weaving in the woven thing, on the authority of the Stagirite (*3. Phys. 19*). Finally, motion is in the movable thing, as was stated in the book on motion. Therefore action of this kind is lodged in the patient.

One objects first: Aristotle (*3. Phys. from T. 18 through T. 24*), treating of action and passion, says most particularly at T. 19 and 20 that teaching and learning are in the learner — but teaching is the action of the teacher, and the learner is the patient, the one receiving the teaching. Therefore action is lodged in the patient. He asserts the same at (*2. de anima T. 139*) and in other places. I reply that the Philosopher is to be interpreted as speaking of enacted or produced action, which is of the genus of quality, not of productive action, which is of the genus of action and is what we are discussing here. And this is plainly indicated by the Stagirite at the cited T. 22, where he distinguishes action from passion, teaching from learning.

One will say: Aristotle (*3. Phys. T. 21*) plainly writes that action and passion are one motion; but motion is in the movable thing, which is the patient; therefore the said interpretation and distinction does not fit the Philosopher's text. I say that they are one motion materially, not formally. For he says there that action and passion are one motion, just as the motion of one ascending and one descending is one motion, and just as the distance from one to two and from two to one is one distance. But it is established that the motion of one ascending and one descending is not one formally, since they are opposite motions, but rather materially, by reason of the space traversed and interposed. It is likewise clear that they are not one motion subjectively, for the subject of the ascending is the one ascending and the subject of the descending is the one descending, and these two are not formally the same.

One objects second: from (*9. Met. 16*), action is divided into immanent and transient; but if all action were in the agent, this division would be empty and vain, since all action would be immanent and no action transient — which conflicts with Aristotle and the common opinion of philosophers. I reply that this partition of action is not one of a univocal into its univocates, but of an equivocal into its equivocates, and is derived from consideration of the term: if the term resides in the agent the action is called immanent, if it proceeds outside the agent it is called transient, as I noted in the first remark.

One objects third: action is motion (*3. Phys. 22*), for to act is to move, and the agent is the mover; but motion is not in the agent but in the patient. For motion is the act of the movable insofar as it is movable, from the cited location (*7. T. 18*). Therefore action is not located in the agent. I reply by explaining and

distinguishing the major: with respect to action taken as a form passing outside the agent, I grant it, in accordance with the second part of the second assertion. With respect to productive and formally understood action, I deny it.

Article II. Whether Action at a Distance Is Possible.

Two chiefly divergent opinions of the scholastics are read in this article. One is that of the Angelic Doctor (*1. p. quaest. 8. art. 1*), Cajetan, Bannez at the same place, Suarez (*disp. 18. Met. sect. 5*), and many recent thinkers, who deny that action at a distance is possible. The other is handed down by the Subtle Doctor (*1. dist. 37. quaest. vn.; 2. dist. 9. quest. 2. B.; 4. dist. 44. quaest. 2. Ad 3. principale*), Mayr, Bassol, Lychetus, Pilus, Ockham, Gabriel, Maior, and the other Scotists and Nominalists, who affirm that action at a distance occurs.

Note that an agent sometimes acts upon what is near and what is far in a single action — as fire by heating heats the air close to it and a hand distant from it; but sometimes acts upon what is near by one action and upon what is far by another, as the sun illuminates neighboring orbs by its light and by another power and action generates a man distant from it (*2. Physic. 26*): "the sun and man generate man." From this it is deduced that in an agent of this kind there exist a twofold principle and potency of acting: one by which it acts on what is near, another by which it acts on what is remote — as the sun by its heating power heats sublunar things and by its generative power generates gold in the womb of the earth. The reason why an agent operates first on what is near rather than what is far is given as twofold by the Doctor. One is that nearer things are more proportioned and more readily disposed than more remote things to receive the act and influence of the agent — thus we observe that the sun first illuminates mountains and hills before plains, and first heats the earth before generating ore in the bowels of the earth. The other is the weakness and feebleness of the agent: since it cannot immediately induce a form into pre-existing matter, it must first prepare and dispose that matter by one action and then introduce the form by another. Hence (*9. Metaphysica, 15*) Aristotle adds that a sublunar agent first alters before generating, which occurs on account of the imperfection and weakness of its potency, which first attains what is more imperfect before what is more perfect, and first the middle before the extreme, and first the proximate before the remote. If it possessed a perfect potency, it would introduce its form immediately and directly into disposed matter.

The assertion is: action at a distance is possible. So Scotus (*cit. and in Reportata, 1. dist. 37. quaest. 2*). It is proved first: there exist several agents that act at a distance; therefore action at a distance is not to be denied. The inference holds. The antecedent is shown as follows: the sun is distant from the earth and yet generates gold in its bosom, as all philosophers admit; and it does not produce that gold by its motion, light, heat, or any other quality — both because these do not reach that far, and also because they are accidents which, as has been stated, cannot generate a substance. Again, a magnet attracts iron distant from itself,

amber attracts straw, and a woman by the casting of her eyes fascinates a man. Whence (*Gal. 3. 0*): "O foolish Galatians, who has bewitched you?" The basilisk kills a man by its gaze and hiss. Again, according to Isidore, cited by Berchorius (*lib. 10. reduct. mor. cap. 63*), if a wolf sees a man before the man sees the wolf, it induces hoarseness in that man and deprives him of his voice — as the poet puts it: "the wolf saw him first." Furthermore, the torpedo fish stuns the hand of the fisherman without transmitting numbness through the rod or net. Finally, sympathetic powder produces remarkable effects at a distance. Therefore action at a distance is to be admitted.

The opponents reply that even the sun penetrates with its light into the depths and bowels of the earth and generates minerals there, just as it brings forth living things and everything else, both perfect and imperfect, on the surface of the earth — which is why it is called the father of living things and the universal cause. Arriaga (*disp. 7. Phys. sect. 6. subsect. 1*) adds that both the sun and other agents act upon a medium through occult and unknown qualities; and even if the effect of the cause occurs at the extreme and remote point, it still does not occur without action in the medium — a medium which is sometimes incapable of the action by which the effect is produced at a distance, as happens in the numbness caused in the hand of the fisherman and not in his line and rod. The same must be affirmed of fascination and similar phenomena.

On the contrary: the earth, as was stated elsewhere, is dry and cold; even if its surface is heated by the sun, that heat cannot reach its interior. For if the far greater and more powerful heat of a burning furnace cannot reach the earth's interior, as is established by certain experiment, then certainly neither can the heat mentioned reach that bosom. All the more so in summer, when heat burns most, the earth is colder in its interior, as the waters of springs and wells make plain to us — for they then grow cold, and warm in winter. As for what Arriaga adds: it is of no weight; for apart from the fact that those qualities behave only dispositively and not actively with respect to the generation of a substance such as gold or any mineral, they produce no effect in the medium in the experiments adduced, as is plain — even if it is perhaps necessary that they pass through the medium, they do not operate within it, as Arriaga himself seems to sense when he says that the medium is incapable of it, just as the light of the sun pervades the heavenly bodies without heating them, because they are not receptive subjects capable of receiving heat. Since therefore the effect is observed in what is distant while no effect is discerned in what is proximate, positing an effect in the medium is groundless and gratuitous, since there can be no productive cause of it.

Second, it is established by certain experiment that the bottom of a kettle is cold while the water contained in it boils. Similarly, if oil is poured into paper and the paper is placed above burning coals, eggs placed on the paper can be fried and mushrooms cooked while the paper itself remains intact. Therefore an

agent can act at a distance without acting upon the medium immediately adjacent to it. Arriaga, in the passage cited, is troubled by the first experiment and can scarcely comprehend it; he would doubtless deny the second as well if it were presented to him. But the former is from Aristotle (*Sect. 24. problem. quaest. 3 and 8*) and from highly approved authors, and is not without probability and reason. For if in winter the surface of the earth is cold while its interior is warm, as warm and steaming waters indicate, why can it not likewise happen that the water near the bottom of the kettle is cold while that at its rim is heated by the fire beneath and boils? Moreover, in summer the lowest region of the air is warm while its middle band is cold, even though the sun reaches both with its rays. Therefore the said experiment is not foreign to truth. As for the second, it is obvious to sight, and what Arriaga adduces against it is of no weight — so much so that it would be tedious to cite and refute it.

Third, the imagination or phantasy resides in the head and moves the appetite, which is in the liver, and other faculties distant from it in location. And it also imbues with extraneous qualities those things that are far from it, as Hippocrates and Avicenna especially note (*lib. de anima, sect. 4. capit. 4*). Whence the celebrated adage: "imagination causes the fall."

Fourth, projectiles are moved by a force impressed by the one who throws them, and when actively set in motion they recede and move away from the thrower. Again, if God did not exist everywhere, he could still act where he does not exist, since his power is his will, which can operate equally in what is near and in what is remote and at the extreme point, but not in the middle if he so wills. To say with Molina (*1. part. quaest. 8. art. 1. disp. 2*) that God may indeed at his pleasure act at this or that time and place, and freely determine himself to act as he wills, but that his influence cannot be present at the extreme point unless he also imparts it in the middle, is asserted without ground — since the will of God, being most free, is not bound to the middle or to the extreme, but can at his good pleasure act at the extreme without acting at the middle, especially since the order of things can be changed and inverted by God himself, and he does invert it when he wills, being an agent above nature. Furthermore, in created things a potency that acts on the middle can be distinguished from another that acts on the extreme. For if the sun did not illuminate the earth, it could still generate gold in the earth's bosom. And in fact it illuminates the heavenly orbs without heating them, while it floods the sublunar things with both light and heat. Finally, one angel can speak to another angel at a distance without causing anything in the medium; therefore action at a distance is possible.

One objects first: Aristotle (*7. Met. 9*) writes that nothing mediates between the mover and the moved; and (*1. de gen. 43 and 78; 1. Met. cap. 2*) he adds that the agent acts immediately upon what is proximate and mediately upon what is remote. Therefore action at the extreme is not possible unless it is had first in

the middle. I reply that the Philosopher there is discussing an agent that operates through prior qualities. For in that case the action occurs first in the medium before the extreme, as the sun first illuminates the earth before heating it, and first heats it before concurring in the generation of sublunar things. Absolutely speaking, however, it is not necessary that an agent act first on what is near before what is remote, except for the two reasons set out in the preceding note.

One objects second: each agent enjoys its own proper sphere of activity, beyond which it cannot operate, since its power is limited and finite. And this is easily and clearly shown by induction: a single candle cannot illuminate an entire city, nor can a small fire heat a large house. And if an agent could act at a great distance, it would have no sphere of activity, since it would not appear why it should act on this distance rather than that one, on a lesser or greater remoteness. Therefore action at a distance is not to be granted. I grant the major and deny the minor. For in accordance with the greater or lesser power of the agent, action occurs at a lesser or greater distance and interval — as a magnet attracts iron and fire heats and burns at such and such a distance and not beyond. And therefore a sphere of activity is rightly assigned within which the agent can act and beyond which it cannot.

One objects third: the sun cannot illuminate the earth unless it first illuminates the air. Likewise it cannot generate frogs and other imperfect animals unless the earth is first disposed and duly prepared by moisture and heat. Therefore an agent cannot act at the extreme unless it first acts on the middle. I reply that indeed the sun, before it generates by its generative power, adapts the underlying matter by its illuminative and heating power, as I noted above in the remark. But absolutely speaking this is not necessary, because if the sun does not act through the first potency it can act through the second. Whence the sun indeed illuminates the heavenly orbs but does not heat them; the sublunar orbs it both illuminates and simultaneously heats, while generating minerals in the interior of the earth without reaching it by either light or heat.

One objects fourth: Anselm (*in Monol. c. 22*) plainly writes that God is everywhere because he operates everywhere. Therefore an agent cannot act unless it is present to the thing to be made, just as God does not operate unless he is present. The antecedent is supported by the authority of sacred Scripture: (*Ps. 136*): "If I ascend into heaven, you are there; if I descend into hell, you are there." And (*Acts 19*): "He is not far from each one of us; for in him we live and move and have our being." I reply that Anselm does not there give the precise cause, just as Augustine (*1. 83. 99. quaest. 78*) does not give the more powerful cause when he says that craftsmen cannot create anything, because they work from pre-existing matter. For the reason why God is everywhere is his immensity; thus Anselm's argument proceeds by way of an extrinsic locus, and its consequence is not formal but material, because God's attributes are really

identical with each other. Moreover, since his will is his omnipotence, Scotus accordingly adds that if, per impossibile, God were not everywhere, he could still act where he was not present, and thus would act at a distance.

Article III. Whether Action and Passion Require Contact between Agent and Patient.

The common teaching of the philosophers holds that action and passion of agent and patient require contact. In what manner this is to be understood and how it occurs will be illustrated and explained in what follows.

Note first that some agents and patients are spiritual, such as God, the angel, and the rational soul; while others are corporeal, such as heaven, the elements, and mixed bodies. Moreover, some agents act upon others by real action — as fire heats fire by heating, which is a real action — while others do so by intentional action: thus whiteness acts upon the sense of sight or the eye by producing in it its own species, which is an intentional action, as will be discussed in the book on the soul.

Note second that for the action of an agent upon a patient, contact is necessary; for each must in turn touch the other. Two kinds of contact are distinguished: formal, also called mathematical contact, which is that by which bodies touch each other through their surfaces, as two planks joined together, whose last parts touch; and virtual contact, also called physical contact, which is that by which an agent touches something else through its own power, as the sun touches the earth through its light. This teaching is intimated by the Doctor (*4. dist. 44. quest. 2. §. Ad argumenta sub Q.; and dist. 45. quaest. 2. G. ad finem*).

The assertion is: formal contact is not necessary for an agent to act upon a patient; virtual contact suffices. This is defended by the Doctor (*cit.; 2. dist. 9. q. vn. C.*), and is deduced from the preceding article and is easily proved: proper contact occurs through quantity, that is, between those things whose last parts touch each other (*de gen. cap. 6*); but a spiritual agent lacks quantity, as well as matter and other things that belong solely to material things. Therefore for an agent to act upon a patient, mathematical contact is not necessary. Moreover, many agents, especially sensible ones, act through prior dispositions — as fire first heats and dries wood before introducing its form into it; while others, which act at a distance, first prepare the underlying matter through prior qualities before producing the intended effect, as the sun disposes the earth by light and heat for the generation of many things. It is therefore sufficient for the production of an effect that the agent touch the patient by physical and virtual contact.

One objects: from the common opinion, quantity is not of the genus of active things; therefore neither in sensible nor in spiritual things is contact through quantity required for an agent to act upon a patient. I grant the antecedent and

distinguish the consequent: quantity is not required as a principle and reason of acting, I grant; as a condition of the agent, I deny. For corporeal agents must participate in quantity, by reason of which contact occurs, and thereafter action. One will press further: if by divine power whiteness were separated from substance and quantity, it would be able to produce its species in the eye; therefore quantity is not required as a condition of the agent. The antecedent is urged: just as the eye can see whiteness separated from substance and quantity, so whiteness itself could produce its species in the eye, since no contradiction is involved. The inference from the antecedent is to be denied. For the action of a material thing necessarily requires extension, which comes from quantity. Given that hypothesis, whiteness would not alter the eye, nor could the eye see it, as is evident from the body of Christ the Lord in the Eucharist, which cannot be seen by us.

Article IV. Whether the Same Thing Can Act upon Itself and upon Its Like and Unlike.

Under the proposed heading a twofold difficulty is woven together: one, whether the same thing can exercise action upon itself; the other, whether like things can act upon each other. These two problems are to be dealt with and decided briefly by means of what we shall presently set forth and hand down, leaving aside the opinions of others.

Note first that some actions are perfective and others corruptive. A perfective action is one by which the agent is perfected, as the intellect is perfected by intellection and the will by volition. A corruptive action is one by which the agent is corrupted, as a man perishes through excessive study and ceaseless labor, and a stone is corrupted by excessive moisture. Furthermore, action is divided into univocal — by which an agent produces a form of the same nature as the form it itself possesses, as ignition is called a univocal action through which fire produces fire — and equivocal, by which an agent produces a form of a different nature and species from the one it possesses, as the intellect generates intellection, which differs from it since the intellect is a substance while intellection is an accident.

Note second that dissimilar things are those that participate in dissimilar qualities, as the hot and the cold; while similar things are those that possess similar qualities, as two hot things or two cold things. Some things can be similar in quality yet dissimilar in degree of that quality, as what is hot at degree two and what is hot at degree four; others are similar both in quality and in degree, as things hot at degree four; others are similar in both respects but dissimilar in acuteness and efficacy of acting, as iron that is hot at degree two and tow that is also hot at degree two. For since heat in iron is in dense matter, it acts more easily and quickly; while heat in tow is in rare matter, and acts more slowly.

The first assertion is: an agent can act upon itself by a perfective action but not by a corruptive one. This is indicated by the Doctor (*1. dist. 28. quaest. 3. §. praeterea. infra C.*). The first part is proved: water that has been heated acts upon itself when it returns to its native coldness, which is its perfection and passion. Again, the intellect acts upon itself, producing in itself the intellection of itself and of other objects. Therefore by perfective action an agent can act upon itself. The second part is shown: nothing destroys itself; on the contrary, everything preserves itself as best it can, as the Apostle intimates (*Ephes. 5*): "No one ever hated his own flesh, but nourishes and cherishes it." For that reason each thing flees its contrary, resists it, and as far as in it lies fights against it and, if possible, vanquishes it. If something is corrupted in itself, that is per accidens — as fire, consuming oil, is itself corrupted when the oil fails; and animated living things ultimately die through nutrition, because finite power is weakened by ceaseless action and at last consumed.

The second assertion: the same thing does not act upon itself by a univocal action, but it does so rightly by an equivocal action. This is intimated by the Doctor (*2. dist. 25. quaest. vn. §. Ad 1. rationem*). The first part is proved: nothing can generate itself, from Augustine (*1. Trin.*): "Nothing is more absurd than for something to cause itself." Therefore nothing can act upon itself by a univocal action; otherwise it would produce the same form that it already has in itself, which is inconvenient and absurd. The second part is proved: the same thing can by acting receive what it lacks, since it is capable of it; and an agent by equivocal action lacks the form it strives to produce and receive in itself, as the intellect lacks the intellection it strives to have. Therefore by equivocal action an agent can act upon itself.

The third assertion: that which is similar in quality and degree does not act upon what is similar in the same quality and same degree; but it does act upon what is similar in a different degree. This assertion is twofold and not at odds with the Scotist school, against Marsilius (*1. de gen. quaest. 19*) and Toletus (*ibid. cap. 7. quaest. 13*). It is proved first from Aristotle (*1. de gen. 50*), who says that the agent acts upon the patient as upon something other; but what is similar in quality and degree has no patient that is other and in some way dissimilar and contrary, since it shares the same quality and degree. Therefore, etc. Second, an agent acts from the victory it has over the patient (*1. de gen. cap. 7; l. de motibus animalium*); but what is similar in quality and degree does not surpass the other, since both are equal. Therefore one cannot act upon the other.

The second part is shown: an agent endeavors to assimilate the patient to itself as much as it can (*1. de gen. 51*), and to render the patient perfect just as the agent itself is. Therefore what is similar in quality can act upon what is dissimilar in degree only. And all this can be confirmed by the experience of a hand heated by the warmth of the sun, which can be heated further by the heat of fire, which is more intense and efficacious than the warmth of the sun, by reason of which it

heats the hand yet more. For this reason, one agent can act upon another for two causes: by contrariety, and by a certain similarity, as Augustine indicates (*serm. 19. de sanctis*) saying that physicians heal the sick in two ways — by contraries, following the saying "hot things are cured by cold," and by similars, applying like to like; thus the flesh of scorpions anointed with oil cures scorpion stings, theriaca made from the flesh of a serpent counters serpent bites, and drinks infected with poison, taken in drink, expel them.

One objects first: heat at degree four in iron, which is dense matter, heats more than heat at degree four in tow, which is rare matter; therefore the former can act upon the latter; and consequently what is similar in both quality and degree can act upon what is similar in the same quality and degree. I reply that heat existing in iron certainly heats more easily and quickly than heat in tow, for the reason given above; but I deny that the one acts upon the other, because for an agent to act upon a patient it must surpass it in something, otherwise there would be no end of the action, but after a complete struggle between contraries and after victory is won and the patient is assimilated to the agent, the action would begin anew.

One will press further: the heat of iron generates fire, while the heat of tow does not; therefore the heat in iron is more active. This could be corroborated by the light of the sun, which generates fire in a concave mirror but not in the air; therefore the same must be said of the heat of iron and of tow. I must reply that it is not the heat of the iron that produces fire but fire lurking in its pores. To the other I say that in the said mirror there are dispositions by which the sun produces fire, while such dispositions are not present in the air.

One objects second: hands equally warm, when joined together, become warmer than if they had been kept apart, as experience proves; therefore like acts upon equally like. I reply that this greater warmth proceeds from the heart, not from the heat of the hands; for the heat of the hands is usually tempered by the surrounding air, and therefore when the hands are joined they receive it better and preserve better the same heat coming from the heart itself. Perhaps in this way is to be understood that saying from Ecclesiastes IV: "If two lie together, they keep warm; but how can one keep warm alone?" And the adage: "virtue united is stronger than when dispersed."

One objects third: from (8. *Top. cap. 7*), a greater power exists in a larger body than in a smaller one; therefore the power in a larger body can produce a greater effect than that in a smaller body. I reply that this is to be interpreted extensively, not intensively. One will say: (3. *Phys. cap. 3. T. 42*), if one element were of infinite mass, it would burn the remaining elements and convert them into itself; and Aristotle attributes this not to greater intensity of active qualities but to infinite mass and quantity of matter. I reply that if infinite mass were not impossible, neither would infinite intensity be impossible; and so that infinitely

large fire would destroy the other elements. But since the former is impossible, so too is the latter, as I have argued elsewhere in the question on the infinite.

Article V. Whether Action Always Proceeds from a Proportion of Greater Inequality.

This article is proposed and debated under another heading, namely whether, for an agent to act, its activity must be greater than the resistance of the patient — on which there exist two opinions among philosophers. The first is that of Burley (*3. Phys. com. 16*), Vallés (*contr. 44*), and Toletus (*1. de gen. quaest. 13. 15*), who hold that action does not always proceed from a proportion of greater inequality. The second is the common one of the other philosophers, notably Niphus (*1. de gen. com. 195. quaest. 3*), Ramusio (*cap. 9. quaest. 3*), Poncius (*disp. 54. quaest. 3*), and the Complutenses (*disp. 8. quaest. 3. § 3*), who affirm that action always proceeds from a proportion of greater inequality.

Note first that an agent and patient can be compared to each other in two ways. In one way, when the activity of one is greater than the resistance of the other — and this comparison is called a proportion of greater inequality. In another way, when the activity of one is less than the resistance of the other — and this comparison is called a proportion of lesser inequality. The question at hand is whether for action a greater activity of the agent than the resistance of the patient is required, or whether a lesser activity of the agent than the resistance of the patient may suffice.

Note second that resistance is commonly understood to mean nothing other than the obstacle or impediment by which the patient prevents the agent from acting upon it — as heaven resists fire lest it be heated and burned. Two kinds of resistance are distinguished. One is called positive resistance, by which the patient reacts upon the agent through a contrary quality — as fire heats water and water in turn cools fire, and fire dries water while water moistens fire. The other is called privative resistance, which is properly resistance, and formally is nothing other than non-suffering, that is, privation of passion — and so to resist formally means nothing other than not suffering from the action of the agent, in which way iron resists cold because through this it does not suffer that cold. Resistance of the patient can arise for two reasons. The first is the weakness of the agent's power, as a large stone resists a boy who cannot move it or lift it, because his power is small. The second is the deep-rootedness and firmness of a form in a subject: because the form is tenaciously united and bound to matter, the agent cannot expel it so as to introduce another — as the diamond resists fire and other natural agents, which cannot corrupt it. This entire teaching is derived from Scotus (*2. dist. 2. quest. 9. Ad 4. Z.; and 4. dist. 1. quest. 5. §. Ad 1. ergo q. F.*). Furthermore, resistance can be recognized from the fact that a thing is hard and dense. For everything hard and dense resists what would corrupt it; while, conversely, what is rare and soft does not resist, as is evident from wax, which receives the imprint of whatever agent impresses it.

The assertion is: the action of contraries always proceeds from a proportion of greater inequality. This is not contrary to the principles of Scotus. It is proved first: if the activity of the agent were equal to the resistance of the patient, no action would result. Therefore action presupposes a greater activity of the agent than the resistance of the patient. The antecedent, apart from being confirmed by experience — of cannon balls, by which the strongest walls of cities are not damaged, and of other similar things which we observe daily before our eyes — is further argued: action proceeds from the victory that the agent has over the patient; therefore a greater power of the agent is required than the resistance of the patient. For it is necessary that the agent surpass the patient; otherwise no action would result.

Second, to resist properly and formally is not to suffer; therefore if the patient does not suffer from the agent's power, neither does the agent act upon the patient, and thus no action follows. But if action proceeds, it proceeds only from a proportion of greater inequality.

One objects first: from (*1. de gen. cap. 9*), whatever agent shares in matter can be acted upon by the power of the patient; therefore it is not necessary that the agent be more active than the patient is resistive. The inference is argued: otherwise there would be no reaction or re-suffering, which is to be admitted in the following question — and the example of water thrown into fire makes this plain, for the fire consumes the water while the water itself weakens the same fire. I grant the antecedent and deny the inference. To the proof I say that reaction occurs not with respect to the whole but with respect to a part, as will become clearer at the cited location.

One objects second: a drop of water hollows out the hardest stone, and a rope cuts and wears away the smooth stones of a well; but the resistance of the stone is greater than the activity of the drop of water and the rope. Therefore it is false that action always proceeds from a proportion of greater inequality. The inference is: a small stone falling from a height injures a large stone in some degree; but the resistance of the large stone is greater than the activity of the small stone. Therefore it is not necessary that the agent be more active than the patient is resistive. The Doctor (*2. d. 2. q. 9. P.*) replies that the first drop of water does not hollow out the stone, nor does the second, but many drops together gradually soften the stone, and then the last drop, by virtue of the preceding ones, hollows out the stone — so that in this way the water is more active than the resisting stone, as that much-repeated saying indicates: "A drop hollows out a stone, not by force but by frequent falling." The same must be maintained of the rope that wears away the stone. To the inference I say that this proceeds from the great force, long descent, and weight of the stone, as well as from its own power.

Question II. On Reaction.

Article I. Whether Reaction Exists.

Libri Theorem (43. *cap.* 4) records certain thinkers who deny reaction, and they are divided into two groups: some among them, including Maior (1. *d.* 17), cited by Rubius (*tract. de reactione cap.* 9. *quaest.* 9), deny reaction absolutely. Others, such as Niphus (1. *de gen. com.* 195. *q.* 3), reject only reaction between contrary qualities — for instance, when fire heats water, they deny that water reacts upon fire through coldness, but admit reaction through moisture. The more common opinion of the other philosophers, however, is that reaction and re-suffering are to be admitted. For the comprehension of this:

Note that reaction is a reciprocal action, that is, an action of the patient by which the patient acts upon the agent. Two kinds of reaction are distinguished: one according to a contrary quality, as when fire acts upon water through heat and water reacts upon fire through coldness; another through a dissimilar quality of a different nature, as when fire acts upon water through heat and water reacts upon fire through moisture. Reaction, therefore, falls between things that participate in elemental and corruptive qualities; and for this reason there is no reaction between spiritual and incorporeal things, because spiritual things lack elemental qualities. Furthermore, reaction does not properly occur when the patient is at too great a distance; likewise when it is very weak and disproportionate. Finally, reaction does not arise in intentional agents: when an object produces its species in a potency, the potency does not react upon the object; nor does reaction arise when the light of the sun heats the earth, since the earth does not react upon the light.

The assertion is: reaction and re-suffering are to be granted. This is handed down by the Doctor (1. *d.* 17. *q.* 3. §. *contra istam positionem. sub RR. Tertia*; 4. *d.* 44. *q.* 1. *Quantum ergo. D. concl.* 3.; 3. *d.* 16. *q.* 1. §. *Ad q. ad C.*; 2. *d.* 15. *q.* *vn.*; *d.* 19. *q.* *vn.* §. *Concedo sub A*), where treating of the state of Adam in innocence, he writes that if Adam had persevered in that state, unless transferred to heaven by divine power, he would ultimately have been worn down by old age and died — giving as the reason that natural heat acting upon the radical moisture and converting nourishment into the substance of what is nourished itself suffers and in reacting re-suffers, and in re-suffering is weakened, and at last consumed, and natural death occurs. The proposed assertion is proved as follows.

First, from (1. *de gen.* 52. 53), where in order to illuminate reaction Aristotle brings forth the example of water poured into wine, which diminishes the power of the wine so that it becomes diluted and watery, while the wine itself is re-acted upon by the water. Galen affirms the same (3. *de causis symptomatum, c.* 3). Second, mixture exists, by which a mixed thing is generated; therefore reaction is to be admitted. The antecedent is obvious. The inference is proved: a mixed thing is produced through the fracture and remission of qualities; and

that fracture and remission comes about through mutual removal, namely hot acting upon cold and conversely. Moreover, the elements continually struggle among themselves, which is why sometimes heat, sometimes cold, moisture or dryness prevails and dominates; and that struggle involves reaction and re-suffering. Therefore reaction and re-suffering are to be admitted. Experiences confirm this: snow compressed in the hand cools the hand and is itself warmed by that hand. Likewise, cold water thrown into warm water in a kettle cools it and makes it lukewarm. Furthermore, red-hot iron thrown into cold water heats the water itself, while its heat is diminished by the coldness of that water. Reaction and re-suffering are therefore not to be denied.

One objects first: either the agent and patient are of equal power or of unequal power — not the first, because the agent does not act except from predominance and victory over the patient (*Arist. l. de motu animalium*); nor the second, because what is weaker and less powerful cannot act upon what is stronger and more powerful. Therefore reaction and re-suffering are to be rejected. I reply that given the hypothesis, the patient can react upon the agent according to a part, though not according to the whole, and thereby by the power of the patient some proximate and posterior part of the agent is weakened and debilitated. For if water is thrown into a great fire, though it may not extinguish the whole fire, it extinguishes some part of it, or at least in some way weakens it. Or one may say that in that case the patient acts upon the agent not indeed by a perfect but by an imperfect action.

One objects second: the same thing cannot be moved by contrary motions (8. *Phys. cap. 6*); but if reaction were admitted, the same thing would be moved by contrary motions. Therefore it is not to be admitted. The major is plain; the minor is shown: the same air would be heated by fire and cooled by water; therefore it would undergo contrary motions. I distinguish the major: with respect to the same consideration, I grant; with respect to different considerations, I deny. The minor is to be distinguished accordingly: for the air would be heated with respect to fire, and cooled with respect to water. Moreover, there is no inconvenience in two contraries being simultaneously in the same thing in a remiss degree and not at the highest, as I showed in the book on the elements (*quaest. 3. art. 5*).

One objects third: an agent endeavors to assimilate the patient to itself as much as it can; but if reaction were admitted, the agent would not assimilate the patient, since the reaction of the patient upon the agent would impede that assimilation. I grant the major and deny the minor. To the proof I say that perfect assimilation is impeded, but not imperfect assimilation. For though the agent, as far as it can, strives to assimilate the patient to itself, it is nonetheless checked and impeded by the action of the patient — just as the motion of the first mobile is held back and slowed by the motions of the inferior orbs.

One objects fourth: a drop of water thrown into a burning furnace is immediately absorbed by the fire; therefore it is an evident sign that reaction does not occur, since otherwise that water would react upon the fire, which does not appear. I reply that in the foregoing note I observed that reaction requires proportion between agent and patient, and such proportion is not found between a small quantity of water and a great fire. The power of the water is very small; therefore it is no wonder if it does not react upon the fire. Or one may say that the said drop of water does react slightly upon the great fire, as is evident from the crackling sound that fire emits when it absorbs that water.

One objects fifth: contradictories cannot simultaneously be true of the same thing, since one is the negation of the other; therefore neither can contraries simultaneously be true of the same thing, as Aristotle indicates (*10. Met. T. 9*), since one is the privation of the other — as heat is the privation of cold, and cold is the privation of heat. I grant the antecedent and deny the inference. To the proof I say that contraries properly so called are positive entities placed in the predicament of quality, which is the catalogue of real positive entities, as I made plain in the location recently mentioned, art. I.

Article II. Whether a Quality Existing in a Medium Is Intensified.

Patrons of both sides, both affirmative and negative, are not undistinguished, as is remembered by modern authors, notably the Conimbricenses (*1. de gen. cap. 9. quaest. 1. art. 1*) and Rubius (*ibid. quaest. 8*).

Note that altering qualities are of two kinds. Some are directed directly toward something else, as heat directly heats water proximate to it; others tend indirectly toward something else, as the light of the sun turning back from a wall set before it. Now a reflex act of a quality can come about in two ways: first, because of an object standing in its way, by reason of which it turns back, as a visible species from a mirror to the eye, and an audible species from a concave place to the ear. Second, by reason of the obstruction of a contrary quality standing in its way and surrounding it, as the coldness of water, surrounded and impeded by the heat of the surrounding air so that it cannot extend further, turns back. Notice further that the intensification and increase of a quality situated in a medium can be investigated in two ways: whether it is intensified by the principal cause producing that quality, or by the opaque body standing in its way.

The first assertion is: a quality existing in a medium is intensified through reflection. This is deduced from the Doctor (*2. d. 13. quaest. vn.*). It is proved first: a homogeneous thing confined in a narrow place is intensified, as is evident from water, which if too great in a narrow place becomes deeper; and qualities capable of intensification are homogeneous; therefore, impeded from spreading through the parts of the subject in which they exist into a wider place, they are intensified — and hence a quality existing in a medium is intensified through

reflection. The major is clear; the minor is proved by the example of light existing in a small room, which is more intense than it would be in a large house — for it illuminates and makes the room brighter than a large house, as experience shows.

Second, power and action upon what is near is stronger and more efficacious than upon what is remote, and the degrees that an agent would produce in more remote parts it produces in nearer and more proximate parts; but through reflection a quality is not extended toward what is distant but turns back to the same medium. All the more so: united virtue is stronger than when dispersed; but through reflection the degrees of quality are more united. Therefore through reflection a quality is further intensified.

The second assertion: the intensification of a quality is not produced by the body standing in its way, but by the principal cause that produces that quality. This is held by the Doctor (*ubi supra*; 4. d. 10. *quaest.* 9. §. *Ad argumenta. D.*). It is proved first from (8. *Phys. T.* 31), where Aristotle gives the example of the motion of a ball bouncing back from a wall set in its way — whose motion of bouncing back is not caused by the wall but by the one who propelled the ball, and the greater the impulse, the greater the rebound. Therefore by the same reasoning, the cause of the intensification of a quality is not the opaque body standing in its way, but its principal cause — as when light is intensified in a medium, the cause is not the opaque body but the luminous body, say the sun or a lamp, producing that light.

Second, a visible species produced and turning back through a mirror set opposite to it is produced not by the mirror but by the object of which it is the species and image (2. *de anima, cap. de visu*). Therefore light, which is intensified by a body standing in its way, is not produced by the body resisting it, but by the luminous body; and the reason can be given that what produces by a direct line also produces by a reflected line, on account of the impediment of an opaque body, as Scotus intimates (9. *Met. quaest.* 15. §. *Ad tertium*; and explicitly 2. d. 13. *quest. un. §. Quantum ad 3*).

One objects first: the same thing remaining the same always produces the same thing (2. *de gen. T.* 56); but a quality situated in a medium remains the same, and so does its productive cause; therefore such a quality is not intensified through reflection. I reply that the adduced axiom from the major is to be interpreted thus: if it remains always in the same mode and nothing accedes to it — and to the minor I say that the quality in the medium is indeed the same, yet a new degree is added to it through a produced reflex act, and thus it does not always remain in the same mode.

One objects second: an agent is not more intense in nearer parts than in more remote ones; for fire does not appear hotter in what is near than in what is remote; for a quality at degree two does not produce an effect in nearer parts

except at degree two. Therefore through reflection it cannot produce an effect at degree four; and so a quality is not intensified through a reflex act. I reply that the argument holds of a quality acting along a direct line, but not of one acting along a reflected line, which is what we are discussing here.

Article III. Whether a Quality Is Intensified through Antiperistasis.

This article is instituted and decided by many recent thinkers (*1. de gen. cap. 9. quest. 1. art. 2*), Rubius (*quaest. 7*), and Poncius (*disp. 54. quest. 5*). For its comprehension and understanding:

Note that antiperistasis is a Greek term meaning in Latin the same as the surrounding resistance of a weaker contrary by a stronger surrounding and encircling contrary — or, which comes to the same thing, an antiperistatic action is the strengthening and intensification of a weaker contrary quality by a surrounding and opposing contrary quality. This is evident in summer in the water of a well, which is colder than in winter; and conversely, the same water in winter is warmer than in summer, on account of the presence of contraries.

The second assertion: a quality is intensified through antiperistasis. This is consistent with Scotus's writings and dissents from Cardinal Cardano (*2. de subtilitate, near the end*). It is proved first: the waters of springs and wells are warmer in winter than in summer, and conversely colder in summer than in winter; and this intensification occurs through antiperistasis. The major is established by experience. The minor is proved: the reason why well water is warmer in winter than in summer is that warm exhalations remaining in the earth, on account of the retreat of the sun and the coming of winter, are enclosed by cold, which then prevails intensely in the upper parts of the earth; and conversely well water is colder in summer because the coldness of the earth is besieged by the heat that then prevails and burns most intensely. Therefore a quality is intensified through antiperistatic action.

Second, the belly of an animal is warmer in winter and digests nourishment better, as Hippocrates affirms (*aphoris. 15*); and this occurs through antiperistasis, since the natural heat and vital spirits are encircled by the cold that prevails at that time.

Third, in summer the middle region of the air is colder, and for this reason hailstones are generated there, which arises from nothing other than the heat of both the uppermost and lowest borders of the air surrounding it. Therefore a quality is intensified through antiperistasis.

The second assertion: the cause of antiperistasis is not per se the surrounding contrary but only per accidens. This does not diverge from the Doctor, nor do his disciples dissent. It is proved first: what is productive of something is not destructive of the same thing, as is established by induction from natural agents; but a surrounding contrary is corruptive of the contrary quality that is

intensified — as is evident from fire with respect to water and its coldness. Therefore it cannot be the productive cause of that same quality.

Second, from opposing and contrary principles and causes there proceed only opposing and contrary effects, as is evident from hot and cold, moist and dry; otherwise the same and what is different would share the same principles and causes. But the surrounding contrary is a principle opposed to and fighting against the intensified quality that is opposite and contrary to it. Therefore it is not a per se cause but a per accidens cause — that is, because it impedes the quality from extending and progressing further.

The second assertion: the cause of the antiperistatic effect is sometimes intrinsic and sometimes extrinsic. Neither Scotus nor his followers seem to depart from this. It is proved first from (*1. Meteor. sum. 3. cap. 2*), where the Philosopher writes that underground places are warmer in winter because the surrounding cold drives back and impedes the heat, left there from warm exhalations, from departing — by reason of which those places are rendered warmer than in summer.

Second, the reason why the belly of an animal is warmer in the winter season is that its pores are closed and the native heat is once more besieged by the external cold. Therefore the cause of antiperistasis is sometimes internal and sometimes external.

One objects first: Galen (*3. de simplicium medicamentorum facultatibus cap. 7*) writes that it is a false apprehension of sense that leads one to judge water to be colder in summer and warmer in winter — since water is absolutely cold in both winter and summer. The inference is: water appears cold in summer because it is touched by warm hands, not because it is really more cold. I reply that Galen was mistaken in this, as experience shows. That in winter spring water is warmer is indicated by the steam seen rising from it; and all persons of good health discern and maintain that the said water is warmer in winter than in summer. To the inference I say that, though the hand is warmer, we still experience a greater coldness of water in summer than in winter, as is evident from hands equally warm.

One objects second: condensation and rarefaction are causes of greater warmth and coldness. For what is denser is warmer, and what is rarer is colder; therefore no other causes of antiperistasis need be sought beyond condensation and rarefaction. The antecedent is proved: the air exhaled from the lungs is warmer than air that exits through a narrower mouth, as is confirmed by experiment; and this happens only on account of condensation and rarefaction. The inference: air set in motion by a fan refreshes and cools us in summer; and this proceeds from nothing other than the condensation and rarefaction of the air. Therefore condensation and rarefaction are causes of greater warmth and coldness. I reply: although condensation and rarefaction contribute greatly to

causing warmth and coldness, I deny that they are the precise causes. To the cited experiment I say that this happens and proceeds from the coldness of the surrounding air, which renders a person's breath cold. As for the air being equally warm or cool whether it exits from a wider or narrower mouth, this is clearly established if one places one's hand over one's mouth — one will feel equal warmth from both. To the inference I say that it arises because the air that touches us is warm, and through the fan it moves away and another air, colder than the preceding, succeeds it; for this reason it cools us somewhat for a time.

Book IV. On Mixture and the Mixed Body.

Aristotle (*1. de gen. cap. 10*), after the disputation on action and passion, proceeds to the treatment of mixture; following in his footsteps, in this book we shall briefly pursue what the philosophers discuss concerning mixture and the mixed body.

Question I. On Mixture.

Article I. Whether Mixture Exists.

Certain thinkers cited by Aristotle (*1. de gen. cap. 10. T. 82*) deny that mixture is possible; opposed to these are Aristotle himself and the other philosophers at the same place, who affirm that mixture is to be admitted.

Note that mixture is taken in two ways: first, for a heap of many things that are brought together, retaining their own forms and their entire being — in the way that grains of wheat in a granary, sheep in a flock, and coins in a purse are mixed. Second, for the coming together of elements from which, once altered, a mixed body is produced through the action of a third cause, namely the heavens, as Aristotle intimates (*1. Meteor. cap. 2*). It is in this sense that we speak of mixture here, which Scotus (*1. Rep. disp. 3. quaest. 3*) divides into perfect and imperfect mixture, explained and declared by him in that place.

The assertion is: mixture is to be admitted. Defended by the Doctor (*cit.*), presupposed by the same (*1. Met. in exp. cap. 2. sum. 3; and 2. dist. 15. quest. un.*). It is proved first: a mixed body exists, as is visible to the eye; therefore mixture also exists. The inference holds from the concrete to the abstract: if there is a white thing, whiteness also exists; and if there is a man, humanity exists. Therefore if the mixed body is granted, mixture is equally to be granted, since the mixed body is made mixed by mixture. Second, certain imperfect animals are generated from putrid matter, such as gnats and fleas; and their production is a mixture from water, air, and the like, as experience shows of obscure and foul places in which those animals are generated and dwell. Third, artificial mixture exists; therefore natural mixture is to be granted. The antecedent is evident from juices extracted by distillation, and from herbs, trees, and the like;

likewise from figures and images fabricated. The inference holds. Add also the mixture of wine and water in the sacred synaxis.

One objects first: if mixture were possible, either through mixture the elements and their parts would mutually interpenetrate, or their juxtaposition would occur; but Aristotle refutes both (*1. de gen. cap. 10*) against certain ancient philosophers. Therefore mixture is impossible. I reply that neither of the alternatives proposed in the argument follows; but, as the Doctor says (*2. d. 15. quaest. un.*), from altered and corrupted elements, through the action of a third cause, a mixed body is generated, which I pursued at length in the book on the elements.

One objects second: if mixture existed, it would be either natural or violent; but neither is possible. Therefore mixture is impossible. The major is clear. The minor is shown: through mixture heavy things would ascend and light things descend, and they would fight and contend among themselves to form the mixed body; but the ascent of heavy things and the descent of light things is violent. Nor can mixture be violent, since the generation of a mixed body is natural. I reply that mixture is natural, not with respect to the elements as the argument proves, but with respect to the natural agent that intends to produce a mixed body according to its genus and species.

One objects third: wine mixed with water retains its own form and its own substantial being; therefore in mixture the elements need not be corrupted. The antecedent is proved by Genesius (*lib. de natura hominis*), who says that a sponge soaked in oil, and water mixed with wine, will extract pure water. Therefore in mixture the forms of what is mixed persist. I reply that the argument is true of imperfect mixture, as happens in diluted wine, but not of perfect mixture, which is the subject of discussion here. Thus are to be interpreted Aristotle (*1. de gen. 7. 84*) and Scotus (*4. Repert. passu alleg.*).

Article II. What Mixture Is.

The Stagirite (*1. de gen. cap. 10. T. 90. in fine*) defines mixture in these words: "Mixture is the union of altered miscibles." This definition suffers many criticisms from certain thinkers, notably Scaliger (*exercitat. tertia*); therefore, in order to vindicate it from them:

Note from Scotus (*2. dist. 15. quest. 1. §. Ad 1. in oppositum. F.*) that the participle "altered" placed in the description of mixture denotes that in mixture the alteration of the miscibles precedes. For as I said of generation, which alteration precedes, the same must be affirmed of mixture. For the production of a mixed body, it is necessary that the elements struggle among themselves, be altered, remitted, and fractured according to their parts; and thereafter through the action of a third cause the mixed body is produced. Furthermore, mixture is called a union or transmutation: for the elements are transmuted into the mixed body, and therefore mixture can more precisely be defined as the generation of

a mixed body from altered miscibles. Three conditions are required for proper mixture. The first: the miscibles must be active and passive; and therefore there is no mixture between medicine and health, since health is not mixed with the body. The second: the minimum of one miscible must be mixed with the minimum of another; otherwise there would be juxtaposition, not mixture. The third: a large quantity of one must not be separated from a small quantity of another; otherwise augmentation or destruction would result — thus a drop of water thrown into a great fire does not mix but utterly perishes.

The assertion is: mixture is rightly defined as the union of altered miscibles. This is supported by Scotus as cited above. It is proved first: what is constituted by genus and difference is rightly defined; and the said definition is of this kind; therefore it is a good definition. The major is clear. The minor is shown: union or transmutation is the genus; the remaining words serve as the differentia, as I made plain in the foregoing note.

Second, a legitimate definition contains nothing superfluous and nothing deficient, and reciprocates with the defined, as I said in the Logic in the article on definition; and such is the definition of mixture, as is evident to one who runs through all its parts as set forth above. Therefore the said definition is a correct one.

One objects first: a definition is not given through something equally unknown or less known, since it was invented to make a thing clear; but the cited definition is given through something equally unknown, for it expresses "altered miscibles," which are equally unknown as mixture itself. I grant the major and deny the minor. To the proof I say that Aristotle first explains what a miscible is and what miscibles are, before he describes mixture, and therefore it is defined through what is better known.

One objects second: a circle is to be avoided in a definition; but in the cited definition a circle is committed. Therefore the definition is not valid. The major is obvious. The minor is argued: mixture is expressed through altered miscibles, and altered miscibles are expressed through mixture. I grant the major and deny the minor. For the altered miscibles are placed as material and dispositive cause — or as others say, as efficient cause; and therefore there is no circle, because mixture is expressed through altered miscibles, but altered miscibles are not explained through mixture as the argument intends.

One objects third: mixture is not constituted from altered miscibles; therefore mixture is not the union of altered miscibles. The antecedent is proved from (3. *de gen. animalium cap. 11*), where Aristotle says that birds are generated from air, fish from water, and beasts from earth. Therefore for the production of a mixed body it is not necessary that the elements be mixed, since one element suffices for the generation of a mixed body, on the authority of Scotus (*ubi supra*). I deny the antecedent. To its proof I say that Aristotle there signifies the predominance

of the element air in birds, of water in fish, and of earth in beasts, but does not deny that elements concur in the production of the mixed body. Or I say that the Stagirite is only assigning the place in which those animals dwell: for birds dwell in the air, fish in water, and beasts on land.

One asks: whether mixture is to be distinguished from generation. I reply affirmatively. For it differs from it as the superior from the inferior: every mixture strictly taken is a generation, but not every generation is a mixture, just as a genus is wider than a species.

Question II. On the Mixed Body.

Article I. What Is the Cause of the Mixed Body.

Certain recent thinkers hold that the effective cause of the mixed body is the miscibles themselves, that is, the four elements struggling among themselves. But Scotus (2. d. 15. q. vn.) and the Abbot (2. de animalib. Tract. 1. c. 8) teach that the principal cause of the mixed body is the universal agent, and the dispositive cause is the elements struggling among themselves.

Note that mixed bodies, which seem to be produced through alteration, are of two kinds. Some are animate, which cannot by any means be produced by the elements or by the heavenly bodies, since both elements and mixed bodies and heavenly bodies lack soul; and therefore they cannot be principal causes of living things, but can only be dispositive causes, by reason of which the universal agent can introduce a form into matter that is disposed and prepared. Others are inanimate mixed bodies, which cannot be generated by the elements, because either the elements themselves are corrupted, or their forces and powers are so fractured that they can in no way be the principal effective causes of those mixed bodies; but they are generated by the heavenly bodies, as I stated elsewhere concerning gold, silver, and the like.

The assertion is: the principal productive cause of mixed bodies is not the elements struggling among themselves but the universal agent. This is the position of the Doctor (*passu prarecensito*). It is proved as follows. First, the elements, on account of their mutual and ceaseless struggle, either remain corrupted or weakened and fractured with respect to their powers and faculties; but a mixed body cannot be caused in act by what is corrupted, because what is corrupted does not exist, and an effect in act requires a cause in act (2. Phys. 38). Therefore the mixed body cannot be produced by corrupted elements, nor by weakened ones, since a weak agent cannot attain a firm and valid effect, such as a mixed body. It is therefore necessary that the mixed body be made by another, stronger and more powerful cause, namely the universal agent. Second, every cause is either univocal or equivocal; but the elements cannot be the univocal cause of the mixed body, since the mixed body is of a different nature from them; nor can they be the equivocal cause, since an equivocal cause is more

noble than its effect, since it contains it virtually — but mixed bodies surpass elements in nobility. Therefore elements are not their principal causes. Third, a mixed body is either animate or inanimate; but elements can produce neither an animate nor an inanimate mixed body, as is clearly established from the foregoing note.

One objects: when a particular cause of some effect can be assigned, one need not have recourse to the universal cause — for that would ill befit a philosopher who inquires into the proper and peculiar causes of things; but a proper and particular cause of the generation of the mixed body can be given, namely the elements struggling among themselves. Therefore to have recourse to the universal agent, such as the heavens, is improper. I grant the major and deny the minor. The reason for the denial is clearly shown in the proof of the assertion.

Article II. Whether Elements Are in the Mixed Body.

In this article three more celebrated opinions of the philosophers prevail. The first is that of Avicenna (*1. suae sufficientiae, c. 1*) and Philoponus (*1. de gen. ad text. 74*), who affirm that the elements exist in the mixed body according to their integral and perfect substantial forms, but according to their fractured and remitted qualities. The second is that of Averroes (*3. Caeli, com. 67*), Achillini, and others, who hold that the forms and qualities of the elements remain in the mixed body in remiss and diminished being. The third is defended by Scotus (*2. d. 15. q. vn.; and in Reportata ibid.*), Mayr, Lychetus, and others at the same location, who maintain that the elements do not formally persist in the mixed body, but virtually and potentially only.

Note first that, for the controversy to be more clearly and distinctly grasped, the heading of this article can be taken in two ways. In one way: whether the substantial forms of the elements remain in the mixed body in act — and this sense is examined in the present article. In another way: whether the qualities of the elements persist in the mixed body in act, whether at their maximum or in a remiss degree — and this sense will be considered in the next article.

Note second that in mixture three things intervene. The first is mutual alteration through the action and passion of contrary qualities. The second is the action of active qualities upon passive qualities — as is the action of heat and cold upon moisture and dryness. The third is the production or generation of the mixed body, which is posterior to the alteration and to the action of active qualities upon the passive ones. In this way is produced the disposition and preparation, so that thereafter mixture or the generation of the mixed body occurs.

Note third that there are four entities in any mixed body. The first is the entity of matter, which is the same as the matter of the elements; for matter is the common subject of the forms both of the elements and of the mixed bodies. The second is the entity of form, which is essentially distinct from the forms of the elements; for just as any mixed body is essentially different from the

elements, so any form of a mixed body is distinguished from the forms of the elements. The third is the entity of the whole mixed body, which results from matter and form united together, as I proved (*1. 2. Phys. quaest. 4. de composito*). The fourth is the entity of accidents, which follow upon the mixed substantial composite.

The first assertion is: the substantial forms of the elements do not remain in the mixed body in their formally perfect being. This is the position of the Doctor cited above. It is proved first from (*1. de gen. T. 84; and 2. de partibus animalium, cap. 10*), where Aristotle denies that the elements persist in the mixed body. Second, if the substantial forms of the elements actually existed in the mixed body, the mixed body would be a quintuple substantial suppositum; but this is judged by all philosophers as a great inconvenience and absurdity. The entailment of the major is clear, because according to the quintuple substantial form a quintuple suppositum is had. The minor is argued: for the mixed body would not be a being per se but per accidens, having several disparate substantial forms. Third, each thing is one because it is of one species; but if the integral and perfect substantial forms were in the mixed body, the mixed body itself would be of different species, just as the elements are; and it is plainly false that one and the same thing participates in diverse natures specifically distinct. Therefore, etc.

The second assertion is: the substantial forms of the elements do not endure in the mixed body in a remiss and fractured being. This is defended by the Doctor (*passu memorato*). It is proved first from Aristotle (*1. praedicam. cap. de substantia*), who says that substance does not admit of more and less — that is, with respect to its specific and essential being, as I made plain in that place. Therefore since the forms of the elements are substantial, they are in no way found in the mixed body in a remiss and fractured being.

Second, it seems incredible, and indeed impossible, that over a great interval of time, at the bottom of the ocean, the form of fire in an imperfect being should not yet have perished and been corrupted by the contrary form of water, which is there most efficacious and of the greatest power. Therefore it is better maintained with the common opinion that the said forms of the elements, whether at their maximum or in a remiss degree, in no way remain in the mixed body.

The third assertion: in the mixed body there exists only one substantial form, by which the mixed body is constituted in its being as a mixed body and is distinguished from everything that is not the mixed body. Scotus (*ubi supra*) supports this. It is proved first: one mixed body is essentially distinct from another — as stone from tree, man from lion; and this essential distinction is derived from the proper form belonging to one and not to another, since matter is the common subject of each form. Therefore in one mixed body only one substantial form is found. Second, unless the mixed body were constituted by

only one substantial form, the mixed body would not be generated but merely altered; but it is commonly maintained that through mixture something substantially new is generated, which is called the mixed body. Therefore the mixed body is constituted by its proper form, by reason of which it differs from the elements. Third, from each mixed body there emanates one principal proper quality, as risibility from man and roaring from a lion; and this passion or property arises chiefly from the form of the mixed body. Therefore in the mixed body there exists only one substantial form constitutive of the mixed body.

One objects first: Aristotle (*1. de gen. 84*) writes that the miscibles remain in the mixed body; but the miscibles are the elements; therefore the elements are in the mixed body, and these cannot exist without their forms. Therefore one rightly concludes that the elements remain in the mixed body according to their substantial forms. The inference is confirmed first: the same Philosopher (*ibid. T. 38*) adds that a drop of wine thrown into an amphora full of water is not mixed but destroyed, for the reason that the miscibles remain in the mixed body, but a drop of wine thrown into a large quantity of water does not remain. The inference is confirmed second: from (*5. Metaphysica, cap. 3. T. 4*): "An element is that from which, as something inherent, something comes to be." Therefore if the elements are inherent in the mixed body, it follows that they remain in it according to their substantial forms. I reply that Aristotle is to be interpreted as meaning that the elements are in the mixed body according to conformity, not according to substance. This will be made clearer in the next article. Or I say that he said this not in his own opinion but in that of others — namely Empedocles, Anaxagoras, and other thinkers who held that the elements actually and formally exist in the mixed body. To the first confirmation I say that a drop of wine thrown into a great quantity of water is indeed not mixed but destroyed, because no conformity and no similar quality remains in the wine; but in the mixed body there are present conforming and similar qualities to the qualities of the elemental forms, by reason of which the elements are said to be in the mixed body virtually and potentially. To the second confirmation I say, with Scotus (*ibi in com.*), that that definition of element applies not to the four common elements but to prime matter alone. Or say that the mixed body is made from elements, which are presupposed to exist, in order for the mixed body itself to be generated from them.

One objects second: from (*1. de gen. in fine*), mixture is the union of altered miscibles; but if in the production of the mixed body the elements are altered, it is plainly inferred that they endure in the mixed body according to their substantial forms. The inference is confirmed first: the mixed body is moved by the predominant element; but one thing cannot move another unless it actually exists; therefore since the predominant element moves the mixed body, it must not be denied that the elements are formally and actually in the mixed body. The inference is confirmed second: from (*3. Caeli, T. 67*), the elements from

which the mixed body is formed persist in the mixed body itself. I reply that this is true by way of presupposition, not formally — which is to say: the alteration of the elements is presupposed for the generation of the mixed body, as I made plain in the preceding question, article II. To the first confirmation I say that the said predominance is not according to the proper quality of the element existing in the mixed body, but according to conformity — that is, in the mixed body there resides a predominant quality that is more similar to one element than to another, as in the choleric temperament there is a predominating temperament more similar to fire than to water or another element. To the second confirmation I say that Aristotle speaks there in the opinion of Empedocles and other ancients who held that view.

One objects third: each thing is composed of those things into which it is resolved, as is evident from man, who is composed of soul and body and is resolved into them; but the mixed body is resolved into elements; therefore it is composed of elements. The inference is confirmed: as letters are to syllables, so elements are to mixed bodies; but syllables are composed of letters; therefore mixed bodies too are constituted from elements. I distinguish the major: of separative resolution, as the cited example shows, I grant the major; of productive resolution, I deny the major. I grant the minor. For if what is generated is resolved into what is corrupted, and what is corrupted into what is generated through the production of the subsequent form and the corruption of the preceding form — as when a man is resolved into a corpse and worms — in this kind of resolution the preceding forms do not exist in what is newly generated and produced. To the confirmation I deny parity: the reason is that letters are integral parts of syllables, while elements are active and dispositive principles for the generation of the mixed body.

One objects fourth: we experience that from a mixed body, say wood placed near fire, if it has been soaked, water exits; but that water is not produced by fire, since fire is destructive and not productive of water; therefore that water was inherent in the wood, and consequently elemental forms exist actually and formally in the mixed body. The inference is confirmed first: from roses and other flowers, water is extracted by distillation; therefore the form of water is actually in them. The inference is confirmed second: from iron and stone struck together, fire is struck out; therefore fire was formally and actually in the stone. I reply that the water that exits from wood exists in the pores of the wood itself and is expelled from it by the heat. And this is shown by the fact that only soaked wood emits water, not dry and parched wood. And if water flows from green wood, it is not formally elemental water, but a certain humor and sap, which is a kind of mixed body. To the first confirmation I deny that rose water and similar distilled things are elemental water, as their powers and properties indicate. To the second confirmation I say that fire is not actually in the flint but potentially, just as a natural form, before being drawn out of matter by an agent, is said to be in matter potentially.

One objects fifth: if elemental forms did not actually compose the mixed body, the mixed body would not be a mixed body but a simple one, like any element; but the mixed body is distinct from any element, since the latter is simple while the former is mixed. Therefore elemental forms are found in the mixed body. I reply that it is called a mixed body not because it has a form composed of the forms of the elements, but because for its generation it is necessary that the elements be previously mixed. Wherefore according to form, a mixed body is as simple as any element, and it presupposes the mixture of elements, by reason of which it is called a mixed body.

Article III. Whether the Elements Remain in the Mixed Body According to Their Qualities.

No one is ignorant that the elements exist in the mixed body in some manner, both on account of the authority of Aristotle (*1. de gen. 84*) and elsewhere, and on account of the arguments set out in the objections of the preceding article. The difficulty, however, is in what manner and by what mode the said elements persist in the mixed body. Almost all philosophers agree that the elements are in the mixed body virtually; they dispute among themselves, however, about what it means for the elements to be virtually in the mixed body. For Thomas Aquinas (*1. p. q. 76. art. 4*), Cajetan at the same place, and Vega (*1. de arte medendi c. 6*) maintain that the elements are virtually in the mixed body means nothing other than that their qualities are found in the mixed body in a remiss and fractured being. Scotus (*2. d. 15. q. vn. §. Dico igitur B.*), however, and his disciples at the same location, and from among the Thomists Javellus (*8. Met. quaest. 4*), Soncinas, and many others teach that for the elements to virtually remain in the mixed body means nothing other than to be contained eminently in it — just as the vegetative and sensitive souls are virtually and eminently in the rational soul — or, which amounts to the same thing, the elements are in the mixed body according to conformity and proportion of power.

Note first that for the elements to be in the mixed body according to proportion and conformity of power can be understood in two ways: in one way, at their maximum — and this sense is defended by no one. In another way, in a remiss degree — and this is the sense that Scotus and the other authors named above maintain.

Note second, from the Doctor (*4. Met. in exp. T. 27; and 1. d. 7. q. vn. §. Ad argum. principalia sub X.*), that medium is twofold. One is called a medium through the negation of extremes: thus virtue is in the middle, because it recedes from the extremes — as liberality mediates between avarice and prodigality, since it recedes from both. The other is called a medium through participation in the extremes, that is, one composed from the extremes, though not by a proper composition but by conformity to extremes — in which way the color red is intermediate between white and black, not because it participates partly in the nature of whiteness and partly in the nature of blackness, since redness is a

quality as simple as whiteness and blackness, but because it has a greater conformity with the extremes than the extremes have with each other. For redness agrees more with whiteness and blackness than whiteness and blackness agree with each other. Likewise the elements are said to be in the mixed body through conformity, because the mixed body agrees more with the elements than the elements agree among themselves. And the elements are said to be in the mixed body according to the proportion of power, because the qualities of the mixed body are more proportioned to the qualities of the elements than the qualities of the elements are to one another.

The assertion is: the elements are in the mixed body not because their qualities exist in it in a remiss and fractured being, but according to conformity and proportion of power. This is supported by the Doctor (*ubi supra*). It is proved first from Aristotle (*1. de gen. T. 84*), who says that the elements are not found in the mixed body actually, but their power — which is not, however, identical with it but similar and akin to it, as I shall presently show. Second, when a subject is corrupted, all things in the subject are corrupted — which is accepted as a commonly received maxim by all philosophers. But the elements are corrupted in the generation of a mixed body with respect to their substantial forms; therefore also with respect to their qualities; and therefore no quality of theirs remains in the mixed body, except according to similarity and conformity. Third, accident does not pass from subject to subject, as philosophers also commonly admit. Therefore the qualities of the elements, which are accidents, do not pass from the elements into the mixed body, and thus they are not lodged in the mixed body as subjects. Furthermore, the heat of fire, if excessive, is destructive of the mixed body. The same must be affirmed of the coldness of water and the other qualities of the elements; but the qualities inhering in the mixed body preserve and sustain it as much as they can. Therefore it is evidently established that the said qualities are not elemental.

One objects: Aristotle (*2. de partibus animalium, cap. 2*) maintains that the elements exist in the mixed body according to their powers and qualities; he had already stated the same (*1. de gen. T. 84*). Therefore in the Peripatetic school the qualities of the elements persist in the mixed body. I reply that these and similar testimonies of the Philosopher are to be interpreted not according to identity but according to similarity and conformity — or not formally but virtually, in roughly the same way that the sensitive soul is virtually contained in the intellective soul.

One objects second: in a mixed body, say a man, there is heat; in a stone there is cold; in a fish there is moisture; and in wood there is dryness; and these qualities are elemental; therefore the elements exist in the mixed body according to their qualities. The inference is confirmed: those qualities are found more excellently in the elements than in mixed bodies; therefore they are found in both. I grant the major and deny the minor; for they are of a different nature, whose cause is

that elemental heat alters and disposes toward the production of fire, while the heat of the mixed body alters and prepares for the generation of flesh, as the Doctor rightly observes (*nuper cit. G. §. Ad primum*). The same reply is to be given to the confirmation. For just as the form of the mixed body is more perfect than the form of the element, so the quality of the former excels the quality of the latter.

Article IV. Whether Temperament to the Exact Balance Can Exist in a Mixed Body.

Avicenna, Averroes, and others, cited by recent thinkers, deny that it is possible for temperament to the exact balance to exist in any mixed body. Fernelius (8. *Physiolog. c. 4*), Vallés (1. *contra. c. 7*), and many others, however, affirm that temperament to the exact balance can exist in man and in other mixed bodies.

Note, according to Galen and other physicians, that temperament taken universally is the harmony or concordance of the four primary qualities reduced to a certain mean, so that according to the diversity of forms a diverse temperament and proportion of those qualities is had. According to the mind of Scotus, however, temperament is the suitable disposition of the fitting qualities by which the form of the mixed body is preserved in its matter. For if those qualities in the mixed body are well-tempered, the mixed body is preserved; but if excess or defect occurs in any principal part of the mixed body, unless aided by medicine, the death of the animated living thing ensues. Temperament is commonly divided into uniform and non-uniform: the uniform is that in which all the said qualities are in equilibrium — that is, in complete equality and balance — and is called temperament to the exact balance because in it the said qualities are weighed, as it were, in equal measure and weight. The non-uniform is that in which the aforesaid qualities do not enjoy equal degree, but one or two predominate and dominate. This latter temperament is subdivided into simple and composite: the simple is that in which only one quality dominates; the composite is that in which two qualities exceed and surpass the other two, and it is fourfold according to the fourfold combination of qualities. The first is the igneous or choleric, in which heat and dryness dominate. The second is the aerial or sanguine, in which heat and moisture abound. The third is the aqueous or phlegmatic, in which coldness and moisture prevail above the others. The fourth is the terrestrial or melancholic, in which coldness and dryness exceed. Temperament in which there is an excess of one or two similar and conforming qualities is called temperament to justice, because such qualities correspond to the requirements of the nature of the mixed body and its parts — as the brain is cold, the heart warm, the mouth dry, the flesh moist, etc. For just as in (3. *Eth. 3*), in a well-ordered republic rewards are distributed according to the merits of each, so in the order of mixed bodies the rule of justice is observed, so that the temperament of all is not the same, but varies according to the nature of each mixed body and its parts.

The assertion is: temperament to the exact balance is possible in a mixed body. This is touched upon by the Doctor (*4. d. 49. quaest. 13. §. Respondeo sub B.*) and defended by Tataretus (*2. de gen. quaest. 2. dub. 1. in fine*). It is proved first from Aristotle (*sect. 5. problem.*), who affirms that mixed living bodies tempered to equality fall ill easily and are easily healed, while those not tempered to equilibrium rarely fall ill and are difficult to cure. Second, qualities can participate in an equality of degrees of intensification or remission, just as they can also participate in their inequality, as is evident; therefore the said temperament to the exact balance can be granted. Indeed, it is probable that Christ the Lord possessed it, since he was the most healthy and perfect of all, and his complexion was the most noble and excellent; and perhaps Adam, in the state of innocence, when the lower part was obedient to the higher. Third, if one contrary exists, so too can the other (*1. T. 44; and 2. of the same, T. 18*). Therefore since there exists a mixed body unequally tempered, likewise there can exist a mixed body equally tempered, and thus temperament to the exact balance is not incompatible with a mixed body.

One objects first: from (*1. de gen. cap. 10. n. 89*), in every mixed body one element predominates and its power is more intense and eminent in it. Therefore given such predominance, no temperament to the exact balance exists. Scotus himself (*nuper cit.*) seems to hold this view. I reply that although in fact and for the most part this may occur, with respect to what is possible there is nothing preventing the existence of a mixed body in equilibrium. Thus are to be interpreted the cited testimonies of the Stagirite and of Scotus.

One objects second: in man and other animate beings there are parts greatly diverse in temperament — such as the liver, heart, brain, nerves, and the like — so that from these temperament to the exact balance cannot result. Therefore the said temperament is impossible. I reply that although in any particular part of the mixed body this temperament to the exact balance may not be possible, it is not incompatible with the entire mixed body, if all its parts are compared to one another and the degrees of qualities in each are considered together. And this can be explained by the weights of a clock, of which one, though not equal to another, are all ordered to equilibrium so as to complete a total and regular motion.

Article V. Whether the Same Thing Can Naturally Be Reproduced.

The occasion for examining this difficulty is provided by Aristotle (*2. de gen. cap. ult.*) who says that generations are circular — meaning that in generations there is a return and repetition, not indeed to the same things numerically but specifically, as some of his interpreters explain the passage — and therefore the common body of philosophers inquires whether the same thing numerically can be reproduced. On this question I find three opinions, two extreme and one middle.

The first is that of certain philosophers, notably the Platonists, cited by Scotus (*4. d. 43. quaest. 3. §. Hic sciendum. A.*) after Augustine (*12. Ciuit. cap. 13*), who hold that after the great year — that is, after thirty-six thousand years — all things return the same numerically, not only according to substance but also according to accidents, because all the heavens will return to the same position. Given the hypothesis of Ptolemy in the *Almagest* that the starry heaven moves one degree contrary to the diurnal motion per hundred years, it follows that the motion of that same heaven from west to east will be completed in the space of thirty-six thousand years.

The second is that of Thomas Aquinas (*4. contra Gentes cap. 81*), Capreolus, Paludanus, and others (*4. d. 43*) and Suarez (*3. p. disp. 45. sect. 6*), who deny that any corrupted effect can naturally be reproduced the same numerically.

The third is that of Scotus (*4. cit. q. 3. §. Tertia opinio*), Richard (*q. 1. art. 3. ad 6*), and many others, who teach that by natural power certain effects can numerically be reproduced.

Note that this controversy can be examined either with respect to natural power, as is investigated in the present article; or with respect to supernatural power, as regards permanent being, treated in the following article; or as regards successive being, treated in the last article.

The first assertion is: not all things will return the same numerically. So Augustine (*praecit.*) and Scotus (*ubi supra*). It is proved first from sacred Scripture: (*Rom. 6*): "Christ, raised from the dead, will never die again; death no longer has dominion over him." (*1 Thess. 4*): "We shall always be with the Lord." (*Ps. 11*): "You, O Lord, will keep us; you will guard us from this generation forever." Scotus adds from the same Psalm cited: "The wicked walk in circles" — that is, they speak of circular returns. And (*Apoc. 10*): "Time will be no more."

Second, if such a circulation of things were admitted, no beatitude would exist, because man would return to his former miseries and calamities. For either the blessed man thinks he will never return to his former state full of labors and sorrows — and so he is blessed by a false opinion — or he thinks he will indeed return to his former state — and so he fears, and is not blessed, since the blessed person is secure in eternal happiness.

Third, science would be recollection, which Aristotle refutes (*1. post. T. 4*), saying that it is impossible for the noblest habits to exist in us without our knowing it. Moreover, free acts are not necessarily subject to the causality of the heavens; therefore neither the same men numerically nor their same acts numerically would return, as the Platonists suspected, according to Augustine (*praealleg.*), who writes: "Plato and the Academy taught their disciples through countless ages past — and the same Plato, and the same city, and the same school, and the same disciples were found again." Scotus adds more (*cit.*).

The second assertion: it is probable that by the powers of nature certain things can return the same numerically. This is supported by Scotus (*passu memorato*, §. *Tertia opinio*). It is proved first from (1. *Caeli*, T. 22; 8. *Met.* T. 11): "If the agent is the same and the matter is the same, the effect will be the same." But the same agent and the same matter of the same effect, once produced and reproduced, can exist — as if a hand is placed near fire and is heated, and then the heat perishes when the hand is removed, and if the same hand is placed near the same fire again, the same heat numerically follows. Therefore sometimes the same effect numerically can return.

Second, the agent and matter have as much power for the corrupted effect as they previously had for producing that same effect, because a cause virtually contains its effect; and the agent and matter are indifferent to producing this or that effect, or one already produced. Therefore there is no incompatibility with the reproduction of some effect.

Third, if water is distributed into many parts, its numerical identity perishes; for each part of the water is water, and each makes one whole really distinct from another. But if those parts are again united, the same water numerically as before returns. Likewise a fever remits and the same fever returns. Again, the parts of a perfect animal can be naturally repaired; therefore so too can the whole animal. The inference seems clear. The antecedent is shown: if an ear is cut off from a man, once separated from that man it perishes, because the soul no longer vivifies it; but if it is reunited to the same man — as Christ did for Malchus (*Matt.* 27) — the same ear returns alive with the life it previously had. Furthermore, as I maintained in the book on causes, the same effect numerically can be produced severally by several causes of the same order, nor is it necessary for them that there be the same numerical action, since action is extrinsic to the effect.

One objects first: (*Eccles.* 1): "There is nothing new under the sun; nor can anyone say: See, this is new; for it has already been in the ages before us." The inference is confirmed: the heavens beginning their motion from one point return to that same point; therefore they will cause the same numerical effects; and thus the same things as before will return. The inference holds: the same natural causes applied in the same way and unimpeded produce the same effects, according to the saying (2. *de gen.* 26): "The same thing remaining the same always produces the same thing." I reply that this is to be interpreted of God's decree, his intellect and will — because from eternity he determined all things that he produces in time, and all these things are present to God, not indeed in real existence but in objective being. To the confirmation I deny that the heavens return to the same point from which they began to move, as Scotus notes (*cit. sub B.*), citing Thebit, and as other astronomers carefully observe against the Platonists.

One objects second, against the second assertion: from (2. *de gen.* 6. 11. T. 70): "Those whose substance perishes do not return the same numerically"; (5. *Phys.*

c. 4. T. 37): "The same health does not return numerically"; and in (*l. praedicam. c. de oppositis*): "From privation to habit there is no return" — and a similar point is made (9. Met. T. 14). Therefore one and the same corrupted thing numerically cannot be restored. I reply that the first testimony is to be interpreted as applying for the most part, but sometimes there is nothing to prevent the same thing numerically from returning — so Scotus answers (*cit. q. 1.; and in Report. q. 2. ad 2.*). To the other I say it is more to the opposite point: for if health continued through the day remains the same, why should health that was present in the morning and interrupted at midday and returned in the evening not be the same? To the third it is to be interpreted of immediate return, not mediate, as I explained (1. 2. Phys. q. de privatione).

One objects third: a whole depends upon the union of its parts, but the same union once interrupted does not return; for what is interrupted does not return the same — for if the same returned, that would be a repetition, which is incompatible with identity. I reply that for the numerical identity of an effect the same union is not required, since neither the same action nor the same cause is required, as I showed at length in the book on causes cited above. Whence the Doctor (*in 4. nuper alleg. §. Aliter. D.*) explains this of the same location numerically, which can be acquired by straight and circular motion.

Article VI. Whether Supernaturally the Same Numerically Permanent and Corrupted Effect Can Be Restored.

Marsilius (2. de gen. q. 18), Durand, and a few others (4. d. 43) hold that no compound and mixed permanent body, other than man, that has once perished can ever be restored; and before them the Sadducees held this, as we read (*Matt. 22*), denying the universal resurrection of men. The opposite is maintained by Scotus (4. d. cit. q. 1), Bonaventure (*ibid. q. 5*), Bassol, Mayr, and other scholastics at the same place, and Thomas Aquinas (*Quol. 4. n. 5*), who teach that all permanent things that have perished can by divine power be restored the same numerically.

It is argued first from Scripture: (*Job 19*): "I know that in the last day I shall rise again from the earth." And (*1 Cor. 15*): "We shall all rise." And it is an article of faith, as is evident in the Apostles' Creed: "The resurrection of the flesh," and in the Nicene Creed: "I await the resurrection of the dead."

Second, from Augustine (22. Ciuit. c. 20; and *serm. 19. de verbis Domini*): "If we were reduced to nothing, God could make us exist, just as he makes us exist though we never previously existed." He says the same (*serm. 19. de sanctis*). And Gregory (*hom. 18. in Euang.*): "It is far less for God to restore what he made than to have created what did not exist."

Third, there is no incompatibility on the part of God, whose power is infinite; nor on the part of corrupted things, which of themselves do not imply a

contradiction in being produced again — just as before they were produced they were producible. Whence Augustine (*in exp. Ps. 62*): "If God made us who did not exist, it is a great thing for him to restore us when we did exist." And in the book on the words of the Apostle (*serm. 10*): "It is more to make what never existed than to restore what did exist." And on time (*serm. 52*): "Abraham considered that God, who granted that one be born from old people who did not yet exist, could also restore from death one who had been."

One objects first: from (6. *Eth. c. 3*), Agathon's saying is accepted by Aristotle: "God alone is deprived of this — to make undone what has been done." Therefore it is incompatible that corrupted things the same numerically can be called back to the present. I reply that indeed God cannot make it so that things that have been done were not done; but it is not rightly inferred that God cannot cause these same things to be present again through reproduction. For just as through the first making they were made, then destroyed, so through another making they can be restored the same numerically — as is evident from (*Joan. 11*) concerning Lazarus, who, having died, was called back to life by the voice of Christ the Lord, saying "Lazarus, come out," and immediately he who had been dead came forth.

One objects second: the same thing cannot have a double existence and a double duration, as is obvious; but if the same thing numerically could return, it would enjoy a double existence and a double duration — namely one it had through the first production, and another it would participate in through the second production. I distinguish the major: simultaneous and continuous, I grant; interrupted and discontinuous, I deny — as is evident from Christ the Lord, who after death rose and lived again.

One objects third: if God acted externally of necessity, he would have no less power than he now has acting freely; but if he acted externally of necessity, he could not restore the same thing numerically; therefore neither can he do so acting freely. I reply that the hypothesis is impossible. Given one impossible and absurd thing, many follow (1. *Phys. T. 10. 13. 25*). Or, if the major is granted, he could still restore the same thing numerically, provided the same matter and the other requisite conditions were disposed as in the case of man. This according to Aristotle is held by Scotus (*ubi supra*).

Article VII. Whether by Divine Power the Same Numerically Successive Being Can Return.

Those favoring the negative are Thomas Aquinas (*Quol. 4. art. 5*), Rubius (*de gen. tract. de reproductione quaest. 4*), and the Complutenses (*ibid. disp. 13. quaest. 2*), who hold that it involves a contradiction for the same numerically successive being to be restored. Those favoring the affirmative are the Aureolus (4. *d. 43*), Bassol at the same place, Mayr (4. *d. 44. quaest. 3*), who are preceded by Scotus (4. *d.*

43. *quaest. 1. §. Ad argumenta L.*), who maintain that the same numerically successive being can be divinely restored.

It is proved first: what does not imply a contradiction can be done by God, from the common assertion of the scholastics, especially Scotus (*nunc cit.*; *d. 10. q. 2. §. Dico ergo F.*). But for the same numerically successive being — for example motion or time — to be reproduced implies no contradiction; therefore it is possible. The major is conceded by the adversaries. The minor is proved: the same numerically permanent being can be restored; therefore so too can a successive being. The antecedent is admitted by those same opponents. The inference is proved: just as a permanent being is virtually contained in its cause, so too is a successive being, as will be more apparent from the resolution of the objections adduced below.

Second, motion is specified by its term, as was well decided in the book on motion; but God can reproduce the same numerical term of motion; therefore he can also reproduce the same numerical motion. The major is clear. The minor is shown: God can restore the same numerical body that has the same numerical location and the same local presence; therefore also the same numerical motion through which it acquired such a local presence.

Third, if the same extremes of a relation are restored, the same numerical relation will arise and return, as is evident from Christ the Lord who has the same numerical relation of filiation to the Virgin Mother after his death as before his death, as Scotus notes (*ubi supra*). But motion, formally understood, is a relation coming from outside to the movable thing with respect to the mover, as remains proved from the book on motion cited above. Add that if the same subject numerically can be restored, so too can its accidents, which follow upon that subject. For when the principal is given, the accessory elements are also given, as jurists write; and by the adversaries the same substance numerically can be restored; therefore also its accidents, among which are numbered motion and time.

One objects first: what is intrinsically and essentially continuous cannot be restored the same, because if it is interrupted its continuity is destroyed; but a successive being is continuous (*5. Phys. cap. 4. T. 39*). Therefore a successive being cannot be restored the same numerically. I deny the major. For if a continuum is interrupted it will indeed cease to be; yet nothing prevents God from restoring the same thing numerically, which will then be continuous as before — since its parts will preserve the same continuity in relation to each other.

One objects second: the same numerical motion cannot be restored unless the same numerical time is restored, since time follows from motion just as light follows from the sun; but the same time cannot numerically return, because real, positive time is essentially ordered to imaginary time, which cannot be changed or restored by God; therefore if true time ceases to be, it cannot be

restored. I reply that even if the major were materially true, it is not formally true, because time does not come from motion but motion comes from time. Yet if the major is admitted, the minor is denied: because a proper and real being — such as time is — does not essentially depend on non-being, such as imaginary time is.

One objects third: it requires no less power to preserve an existing thing from perishing than to restore a corrupted one — as the adversaries do not deny; but God cannot preserve a successive being from being corrupted, for otherwise it would not be successive but permanent, which is impossible. Therefore, etc. I reply that the major holds if it is understood of a thing according to the being that it has; and because a thing either has permanent being or successive being, if God can in his own mode preserve both, he can also restore both. But if the major is taken otherwise — namely that a successive being should remain and be conserved not successively but permanently, as the argument presses in the instance and as is indicated in the minor proposition — then the major is false.

Book on Meteors.

Meteors are certain imperfect mixed bodies that are generated in a high place. For in Greek *μετέωρον* means in Latin "sublime," as is rightly observed by Zabarella, Tataretus (*1. Meteor. quaest. 1*), Scibilis (*1. in fine*), Joannes de Magistris (*quaest. 2. scibili z.*), and the Parisian (*ibid. in exp. Text. not. 1*). The science of meteors is therefore the cognition of sublime things, namely those that are produced and observed in a high and elevated place — that is, in the highest or in the middle region of the air. Although some meteors occur in a low and humble place, and certain others are treated by Aristotle in his work, nevertheless, since those that are seen in the heights are more numerous, more noble, and more excellent, they take their name and title from them. In this book five questions are raised: the first on meteors in general, the second on fiery meteors, the third on aerial meteors, the fourth on aqueous meteors, and the fifth on terrestrial meteors.

Question I. On Meteors in General.

Article I. On the Causes of Meteors.

The efficient cause of meteors is the heavens, through their influence and motion. The remote material cause is the four elements, especially water and earth; the proximate material cause is vapor and exhalation. The formal cause is that by which a meteor is constituted in its essential being and distinguished from everything that is not itself. The final cause is the good of the universe.

Vapor is a moist and warm exhalation that issues from water and moist places. For when water is heated by the power of the sun, a certain smoke is drawn up, which is called vapor, and from it little clouds, clouds, rains, hails, and things of that kind are formed — as we experience when the water of a kettle is heated: for by the power of the fire's heat a certain smoke is raised from the water itself, which is called vapor by the philosophers, and is mentioned by the Doctor (*2. d. 15. quaest. vn. §. Dico ad quaest. sub B.; and in Report. d. 14. quest. 3; and 1. d. 2. quaest. 3. Report. §. Ad 1. principale*).

Exhalation is a warm and dry exhalation drawn out from the earth and dry places by the power of the solar rays. For from heated earth, which is porous, something resembling smoke seems to be extracted, which is called exhalation. From it are formed fiery meteors, which by others are called ignited impressions; if the parts of those meteors are very closely bound together and drawn by the force of the sun to the highest region of the air, they generate comets; but if the parts are not joined by any bond but are scattered among themselves, they produce gusts or winds.

The assertion is: there are two kinds of meteors — one formed from vapor, the other from exhalation. So Aristotle (*1. Meteor.*) and the other philosophers

commonly, from whom Scotus (*cit. and in his other works*) does not depart. It is proved: there are only two proximate materials of meteors; therefore there are only two kinds of meteors. The antecedent is evident from what was just said: either meteors participate in warm and moist matter, or in dry and warm matter — which is to say, they are formed either from vapor or from exhalation. Moreover, in the next article it will be shown that vapor and exhalation differ specifically and essentially from each other; therefore the twofold genus of meteors just enumerated is established.

One objects: there are as many kinds of meteors as there are combinations of their constituent parts, as is evident from the number of qualities and other things; but there are four combinations of meteors — for they are formed either from warm and moist, or from dry and moist, or from moist and cold, or from warm and dry. Therefore four kinds of meteors are to be numbered. The major is to be denied, both because what is cold cannot be raised on high, and because warm and dry things cannot come together in one; and therefore from these no meteors properly speaking are formed.

Article II. Whether Vapor and Exhalation Are Essentially Distinct.

The heading of this article can be understood in two ways. In one way: whether vapor and exhalation differ from each other essentially or only accidentally. In another way: whether they are separated essentially or only accidentally from the elements. On this question two positions of the philosophers prevail. The first is that of Averroes and Philoponus (*2. de gen. com. 18*) and the Louvain masters (*l. 1. tract. 2*), who hold that vapor and exhalation differ from the elements and from each other only accidentally. The second is defended by Joannes de Magistris (*1. Meteor. quaest. 4. dub. 3*), Tataretus (*ibid. quest. 1. scibili 4.*), and others, who affirm that vapor and exhalation are separated essentially both from the elements and from each other. Scotus (*4. d. 12. quaest. 4. §. Quantum ad istam opinionem. Sub B.*) supports them.

The first assertion is: vapor and exhalation are essentially distinguished from the elements. This seems the express mind of Scotus (*nunc memorati*). It is proved first from Aristotle (*1. Meteor. cap. 9*), who says that vapor can be changed into water; but what is changed into another thing is essentially distinguished from that into which it is changed, as may be seen in the perpetual and daily alternation and change of things. For nourishment is turned into flesh, and flesh is essentially different from nourishment that has been turned into it. And the same judgment is to be made of everything else.

Second, every mixed body is essentially different from the elements, as I showed in the book on the elements; but vapor and exhalation are certain mixed bodies, though imperfect; therefore, etc.

Third, what is produced from another as from its matter is distinguished from that from which it is produced. For the same thing cannot be both efficient and

effect with respect to the same thing; but vapor and exhalation are formed from the elements, as I made plain in the preceding article; therefore they are essentially distinguished from them.

The second assertion is: between vapor and exhalation there is an essential difference. This is not contrary to Scotus (*ubi supra*). It is proved first: diverse passions argue essential differences, as I rarely noted in the foregoing; but vapor and exhalation have diverse properties. For vapor moistens and easily dissolves into water or air; while exhalation dries and easily turns into earth or fire. Therefore they essentially differ from each other.

Second, what seeks different places indicates a different essence, as I said when treating of the elements; but vapor can be raised only to the middle region of the air, while exhalation ascends to the highest border of that same air, as appears in comets. Furthermore, a not negligible indication is that they proceed from different elements: for vapor arises chiefly from water, and exhalation chiefly from earth. Therefore an essential distinction between them is to be acknowledged.

One objects first: Aristotle (*2. de gen. cap. 4*) says that smoke, which is exhalation, is made from earth and air; therefore exhalation is not essentially different from the elements of which it is composed. I reply that exhalation is made from them as from its matter, as I said in the preceding article. It does not therefore follow that it is not essentially distinguished from the elements. For perfect mixed bodies are made from elements, from which they are essentially different — as no one denies.

One objects second: the same Philosopher (*1. Meteor. cap. 3*) writes that vapor is a concretion of water, that is, separated parts of water; therefore in the Peripatetic school vapor is not essentially different from the element water. I reply that Aristotle indeed maintains that vapor is a concretion of water and is raised again by the power of the sun, but does not mean that vapor coincides with water — on the contrary, it is essentially distinguished from it, as I intimated above.

Article III. In What Place and at What Time Meteors Are Formed.

Note first that the place of fire is all that space contained within the concave surface of the lunar orb down to the convex surface of the air. The place of air is the interval that extends from the concave surface of fire to the convex surface of the sea and earth. The place of water or sea is from the concave surface of air to the convex surface of the earth. And the place of earth is from the surface of the water and air to the center of the earth itself.

Note second that three regions of the air are numbered: the highest, the middle, and the lowest. The highest is from the surface of the sphere of fire down to that part of the air that cannot be heated directly by the eminently warm heavenly bodies. The lowest is from that part that cannot be heated by those bodies down

to the earth. The middle is from that part that cannot be heated by reflection of the solar rays down to that which can be heated directly by fire and the aforesaid orbs. The highest is warm, both on account of the native heat of the air and on account of the external heat of the fire adjacent to it. The lowest is also warm, on account of the reflection of the sun's rays and on account of the warm exhalations. The middle is cold, because it cannot be heated directly by fire and the aforesaid heavenly bodies, and also because of antiperistasis and the great abundance of vapors returning to their natural coldness.

The first assertion is: meteors are not formed in the sphere of fire but in the sphere of air, water, and earth. Scotus (*in both works*, 2. d. 27. q. 2) does not disagree. Regarding fire, it is proved: if anything extraneous is raised to fire, it is immediately consumed and burned on account of fire's great activity; and fire is the lightest of all things, while all meteors have some heaviness since they are mixed bodies, though imperfect; therefore they cannot reach its orb.

Regarding air it is a matter of common knowledge. For we hear thunder, see lightning, and experience thunderbolts and other things of this kind, which are evidently known to occur in the air.

Regarding water it is not obscure, since it is sweet, or salty, nitrogenous, bituminous, and moist — from which qualities and affections a great disposition for the generation of meteors is had. Hence, by the power of the sun, we observe vapors being raised from water on high.

Regarding earth it is easily shown: for it is cavernous, spongy, and bituminous; and therefore from it, by the heat of the sun, exhalations are carried upward; and thus winds blow and earthquakes are sometimes heard.

The second assertion is: meteors are generated at all times, but especially in spring and autumn. The Doctor (*cit.*; and *ibid. dist. 4. quaest. 3*) does not dissent. It is proved first from Aristotle (*1. Meteor. cap. 4*), where he expressly upholds the proposed assertion. Second, it is established by experience concerning comets, which are observed by us in autumn and not at other times. All the more so: in winter and summer there is not so great an abundance of vapors and exhalations as is seen in spring and autumn. For in winter cold and moisture prevent the sun's heat from carrying vapors and exhalations upward; and the heat of summer dries out the earth and consumes vapors, preventing them from tending to a higher place.

One objects first: the air is by its own nature warm; therefore its heat prevents vapors raised to its middle region from returning to their natural coldness; and consequently neither is its middle region colder, nor is there so great an abundance of vapors in it. I reply that the air by its natural warmth cannot prevent this, for the reasons we set forth above in the second note.

One objects second: nothing violent is perpetual (*1. Caeli* 7. 28); but the coldness of the middle border of the air is extrinsic and violent to it; therefore it is not perpetual — yet it endures always. Therefore it is a sign that the vapors existing in it are not reduced to their original coldness. I reply that the maxim of the Philosopher is to be interpreted of sublunar mixed bodies, not of the elements and their places; for between these there exists a perpetual struggle and perennial conflict for the generation of mixed bodies and the good of the universe.

Question II. On Fiery Meteors.

Article I. What Fiery Meteors Are.

Fiery meteors, also called ignited impressions, are many, corresponding to the multiple form and figure they take from warm and dry matter disposed and affected in different ways. They are called fiery because they are kindled and inflamed by fire or by the burning heat of the sun. Among the fiery meteors the most notable are: pyramids, columns of fire, burning sheaves, lit candles, blazing lances, leaping goats, firebrands, twisting dragons, perpendicular fire, lambent fire, will-o'-the-wisps, Saint Elmo's light, the stars Castor and Pollux, comets, lightning, thunderbolts, and things of that kind. Since the matter of these meteors is smoky, warm, and dry, it can easily be kindled and inflamed by fire or the sun. If the matter is wide and long, sheaves, torches, and lit candles are produced; if it is extended greatly in length and emits sparks, leaping goats and flying lances result; if it does not emit sparks, a firebrand is formed; if it runs through the middle, shooting stars and traveling fires are produced. If the matter is thin and slightly inflamed, meeting no obstacle, a will-o'-the-wisp results, which moves as something fleeing moves and follows it, as is sometimes observed in cemeteries. If it coalesces from fat and viscous matter, light arises; if there is only one, it is called Saint Elmo's light; if two appear simultaneously, they are called Castor and Pollux.

The first assertion is: fiery meteors are formed in the air. Handed down by the Doctor (*2. dist. 14. quaest. 3. §. dico ad quest. Sub A.*). It is evident from experience. For in summer such ignited impressions are observed by us — some exist in the highest region of the air, such as comets; some in its middle region, such as lightning and thunderbolts; and others in the lowest, such as lambent fire and the will-o'-the-wisp.

The second assertion is: fiery meteors are sometimes moved by circular motion, sometimes by straight motion. The Doctor (*praecit.*) does not disapprove. The first part is confirmed by experience concerning comets, which are moved by the motion of the heavens, which is circular. The second part is obvious from shooting stars, which are carried downward. Likewise, the light passing through the smoke of an extinguished candle descends downward to relight the

extinguished candle; and sometimes fiery meteors appear in the lowest border of the air.

The third assertion is: the said meteors are produced chiefly in summer, whether by day or by night, but are seen by us only at night, because the light of the sun, being greater, overshadows their lesser light so that they cannot be perceived by us. The Doctor (*cit.*) does not oppose this. The reason for the proposed assertion is that these meteors are generated from warm and dry exhalations; and warmth and dryness prevail more in summer than at any other time.

The fourth assertion is: meteors of this kind differ from each other accidentally. This does not conflict with the writings of the Doctor. It is argued: they differ by more and less, for some are more inflamed than others; and more and less do not vary the species, as I said in the Logic, in the question on quality. Again, they differ in heat and color, which are accidents. Furthermore, they differ according to the greater or lesser quality of matter and according to diverse figure — all of which argue only an accidental difference.

The fifth assertion is: such meteors are placed in the category of substance. The school of the Subtle Doctor does not depart from this. For meteors are imperfect mixed bodies, as I noted above, which are substances, and thus reside in the category of substance.

Article II. On Comets.

The philosophers, both ancient and modern, dispute very vehemently and sharply about the nature of comets, as may be seen in Plutarch (*3. de placitis, cap.*) and Albert (*lib. 3. tract. 4. cap. 8*). Among the various and diverse opinions, I select two principal ones for examination. The first is that of ancient philosophers who held comets to be of a heavenly nature, and these are themselves divided. Some think that a comet is a conjunction of several wandering stars, which appear tail-like to us because they are close to the sun. Others hold that it is only one wandering star. Nor are there lacking those who affirm that the coma of a comet consists of elemental matter while the comet itself is composed of heavenly matter. The second opinion is received and defended by Aristotle (*1. Meteor. cap. 7*), the Parisians, Tataretus, Joannes de Magistris at the same place, and others, who teach that a comet is formed from the sublunar matter of exhalations.

Note that Aristotle (*cit.*) describes a comet as a great abundance of exhalations, whose parts are very closely packed and coagulated together, carried to the highest region of the air by the power of the sun. Various and different comets are generated according to the variety and diversity of matter and figure. For if the parts of the comet are rare, a hairy comet is formed; if some part is dense and extended lengthwise, a tailed comet results; if some parts are rare and the rest thick, a bearded comet emerges. Furthermore, one comet is black, which

portends the death of many; another is red, which foretells the death of princes, wars, and storms; another is white or silver, which predicts abundance of things. Comets appear in autumn because a great quantity of exhalations is required for their formation, and a considerable interval of time is needed for such an accumulation to be raised to the first region of the air and for the parts to join together and be kindled by the fire there. A comet endures for at least fifty or seventy days; sometimes six months; sometimes a year, or even two.

The first assertion is: a comet is not one of the wandering stars, nor a conjunction of several planets. This assertion is twofold and presupposed by the Doctor (*cit.*). The first part is argued first: wandering stars always move in the circle of the Zodiac, but a comet is not moved in this way, as astronomers observe; therefore it is not to be numbered among the wandering stars. Second, if a comet were a wandering star, several comets could never be seen at the same time; but we did observe them in the year 1617, when in the east appeared a bearded comet and at midday under our zenith a white or silver comet. Therefore a comet is not to be ranked among the wandering stars.

The second part is shown: if conjoined planets were distinct, they would appear to us; but the parts of a comet when separated are not seen by us, as experience confirms. Second, many times planets are conjoined to each other and yet no comet is produced: therefore it is evident that a comet is not a conjunction of several planets.

The second assertion is: a comet is not of a heavenly nature but of a sublunar one. This assertion is also twofold, which the Doctor (*ubi supra*) does not reject. The first part is proved first: what is heavenly is incorruptible, as I showed in the book on the heavens; but a comet dissolves and is corrupted after the interval of time assigned at the end of the preceding note. Therefore a comet does not participate in a heavenly nature. Second, what grows and diminishes does not possess heavenly nature, since growth and decrease indicate corruption; but a comet is increased by the addition of new matter and decreased by the subtraction of pre-existing matter and its dissolution. Therefore a comet does not take on a heavenly nature.

The second part is Aristotle's at the passage cited above, and is proved first from St. Damascene (2. *fidei* c. 7) in these words: "Comets arise frequently, along with certain signs of the deaths of kings, which are not from those stars that were made from the beginning of things, but are established by divine command at the opportune time, and are then dissolved again." Second, when comets appear, famines, storms, and things of this kind occur; and this arises from nothing other than the matter that is raised by the force of the sun from the earth, leaving the earth itself dry and parched. Therefore a comet consists of matter and sublunar nature.

One objects first: Albumazar testifies that a new star once appeared above the sphere of Venus; and Hali reports that he saw another in the fifteenth degree of Scorpio when the sun was in the fifteenth degree of Taurus. Likewise, in the year 1574, in Cassiopeia, a great star was seen which vanished after two years; and stars of this kind are comets; therefore a comet is of a heavenly nature. Certain thinkers reply, among them St. Damascene (*cit.*), that those stars were miraculously created by God to warn men and to make them take heed and abandon evil ways. It can better be said that those stars did not truly exist in the heavens but below the moon, as certain astronomers of those times observed, and that they were comets which appeared to be in the heavens because of the great distance that existed between them and the earth. Nor is this improbable, since clouds and some other meteorological phenomenon also appear to us to be in the heavens, or at least to reach the heavens, though in reality it is not so.

One objects second: what is moved by circular motion has a heavenly nature, since circular motion is a passion of the heavens; but a comet is moved by circular motion, as is evident to any observer; therefore it is of a heavenly nature. I deny the major. For fire is moved by a circular motion, though it is not endowed with a heavenly nature. Moreover, circular motion is not a property of the heavens in the fourth sense; therefore it belongs to other things as well.

One objects third: if a comet were composed of sublunar matter, it would endure little; but it is established from what was said that it persists for a long time. Therefore it is a sign that it is not composed of sublunar matter. The inference is confirmed: the middle region of the air, which is cold, would impede such exhalations from ascending upward to the highest region of the air. Therefore a comet does not draw upon sublunar matter. I reply that the reason why a comet sometimes endures long has already been given — namely because its parts are tenaciously bound together. To the confirmation the reply is much the same: since the parts are very light, dry, and warm, they overcome by the power of the sun the coldness of the middle region of the air and tend toward the highest, where they remain for some time, as I noted above.

One asks: whether the star that appeared to the Magi (*Matt. 2*) was a comet or something else? Chrysostom (*hom. 6. in Matt.*) and Nicenus (*dialogo de anima*) say it was an angel in the form of a star. I myself, with Lyran (*in Postil.*), think that it was some meteorological phenomenon compacted by divine or angelic power, which was moved by an angel to lead the Magi and show them the manger of the Lord — just as the Hebrews were led through the desert by a column of fire by night and by a column of cloud by day (*Exod. 13*).

Article III. On Thunder.

Anaxagoras and Empedocles hold that thunder is the extinction of fire proceeding from the coldness and moisture of a cloud. Aristotle, however (2. *Meteor. cap. ult.*), asserts that thunder is a sound emitted in a cloud by reason of

the warm and dry exhalation enclosed between the sides of the cloud, which, seeking to exit, violently moves the cloud itself or breaks it, thereby producing a crash, and a sound is heard that is called thunder.

Note that for the sound of thunder to be emitted, a dense, cold, and watery cloud is required, and in it a warm and dry exhalation is enclosed, which, lest it perish, seeks an exit; finding none on account of the surrounding contrary — namely coldness and moisture — it shakes the cloud or breaks it. But if the exhalation enclosed in the cloud is small, it indeed moves the cloud but does not break it, and therefore a small sound is produced and heard. But if the exhalation is great and breaks the cloud, a great sound is heard, like the tearing of cloth or paper.

The assertion is: thunder is not the extinction of fire in a cold and watery cloud, but the sound emitted from the violent striking of a warm and dry exhalation enclosed between the sides of a cold and moist cloud. So Aristotle (*praecit.*), from whom Scotus in his works does not depart. The first part is proved first: if thunder were the extinction of fire in a cloud, such an extinction would not be clear and bright but smoky and dark, which conflicts with experience. Second, thunder precedes the extinction of fire in a cloud; therefore thunder is not the extinction. The antecedent is proved: clouds collide against each other before the exhalation is kindled and inflamed; and for this reason in the following article it will be shown that lightning is posterior to thunder. I add that iron and flint are struck against each other before fire is struck out; therefore thunder too is emitted before fire is extinguished in the cloud.

The second part is proved first by analogy: smoke enclosed in wood, seeking an exit and finding none on account of the presence of a contrary, bursts the wood itself and emits a crash. Therefore it is apparent that exhalation enclosed within the sides of a cloud and besieged by coldness and moisture exerts force, from which the sound called thunder arises. Second, a flame of fire, impeded by surrounding coldness, emits a sound. Therefore likewise the said exhalation, in order to exit, shakes the parts of the cloud and emits a sound. Finally, fresh chestnuts thrown into fire crack and emit a sound: the same must be maintained of exhalation enclosed in a cloud, and also of other things enclosed violently in the head or belly of an animal, which, forced to exit, make a crackling sound. Therefore the said exhalation is thunder.

One objects: Aristotle (*2. post. T. 10*) and elsewhere not infrequently uses this definition of thunder: "Thunder is the extinction of fire in a cloud"; therefore in the Peripatetic school this definition is not to be rejected. I reply that Aristotle cited it as a commonly received one and one common at that time, not as proper and true — since in this passage, which is the proper one, he plainly rejects it as false.

One asks: which thunderclaps are to be feared? I reply that if lightning flashes and thunderclaps occur simultaneously they are to be feared, because there is great violence from a great abundance of kindled exhalations that are discharged most swiftly from the cloud; but if there is some delay between the lightning flashes and the thunderclaps, they are not to be feared, because no great force is applied, since a great quantity of kindled exhalations is not present.

Article IV. On Lightning.

Anaxagoras holds that lightning is fire proceeding from the heavens. Empedocles thinks it is fire kindled by the solar rays. Aristotle (*2. Meteor. cap. ult.; and 3. of the same work, cap. 1*), however, asserts that lightning is a kindled exhalation affected by fiery heat.

Note that certain philosophers draw a distinction between lightning, a lightning flash, and ignition. They call an exhalation that exits a cloud while inflamed "lightning." They call an inflamed exhalation borne through a cloud a "flash." And they call an exhalation very greatly kindled and inflamed, which, cast down most swiftly upon bodies, strikes those bodies, a "thunderbolt." Whatever may be said about this distinction, it is certain that lightning is that flash which, exiting from a cloud, is clear and bright.

The first assertion is: lightning is not fire emanating from the heavens, nor fire kindled by the solar rays. This assertion, which is twofold, does not oppose the school of Scotus. The first part is proved first: in the heavens there is no fire, as was shown in the book on the heavens; therefore no fire exits from the heavens that would be called lightning. Second, it does not appear why this fire should arise in one cloud rather than another; likewise why such fire should gleam in one part of the heavens rather than another. Therefore it is improbable to suppose that lightning is fire coming from the heavens.

The second part is argued: when the sun neither shines nor sends its rays into a cloud and into the earth — as happens at nighttime — lightning still occurs. Therefore it is plainly established that lightning is not the said fire kindled by the sun.

The second assertion is: lightning is a kindled exhalation tinged with fiery color, exiting violently from a cloud. The Doctor does not oppose this. It is argued first from analogy: from the striking of two bodies fire is excited, by which sometimes great forests are kindled and burned. Therefore from the collision of two clouds an exhalation is kindled, which is called lightning by the philosophers. Second, from thunder lightning follows, just as from the striking of a stone fire is struck out. Therefore lightning means nothing other than a kindled exhalation excited from the collision of clouds and departed from them.

One asks first: is thunder always produced when lightning is seen? I reply affirmatively. The reason is that exhalation is never inflamed without a collision of clouds, and thus thunder occurs. Why then is thunder not heard yet lightning is seen? The reason is that sight sees farther than hearing hears, and sight is more noble than hearing; or because that sound is small and on account of the distance of the clouds cannot reach our ears.

One asks second: does thunder occur before lightning? I reply affirmatively. The reason is that the shaking and collision of clouds occurs before the exhalation is kindled, just as the striking of iron and flint occurs before fire exits from the flint.

One asks third: why is lightning seen before thunder is heard? I reply that the reason is that sight in seeing is swifter and more active than hearing in hearing. This is evident in the firing of cannon, where the flash is seen before the sound is heard. Likewise in rowing, the oars are seen to move before their splash is heard.

Article V. On the Thunderbolt.

Popular opinion holds that a thunderbolt is a stone delivered by fire. The philosophers, notably Aristotle (*3. Meteor. 1*), maintain that a thunderbolt is a kindled exhalation, moved violently, discharged downward from a cold and watery cloud.

Note that a thunderbolt is produced when a great and subtle exhalation is violently emitted and expelled by the coldness of a cloud. It is divided into the penetrating and the burning. The penetrating is that which, by reason of its excessive subtlety, pervades porous bodies, leaves them intact, and consumes hard things that offer it stronger resistance — as it melts the sword while the scabbard remains intact; keeps the wine in a broken cask; and consumes the silver in a purse without consuming the purse. The reason is that it breaks hard things that resist it, while soft things, not resisting it, it barely injures. The burning is that which burns the bodies upon which it falls — as sometimes a man struck by a thunderbolt is reduced to ashes; and in this way lofty towers and the pinnacles of high temples are burned. Furthermore, thunderbolts are of different kinds — dividing and blackening — and this division, like the preceding, is taken according to the effects that the thunderbolt produces. If a thunderbolt divides one body from another, it is called the dividing kind; if without burning it affects a body with blackness, it is called the blackening kind.

The assertion is: a thunderbolt is not a stone delivered by fire, but a great subtle kindled exhalation violently discharged downward from a cold cloud. This does not conflict with the writings of Scotus. It is proved first: a thunderbolt penetrates many bodies, as I noted above; but if it were a stone, it could not penetrate dense and opaque bodies on account of its thickness and hardness. Therefore a thunderbolt is not a stone delivered by fire. Second, with no

external sign or blow apparent, an animal struck by a thunderbolt dies; but if a thunderbolt were a stone, it would leave the mark of the blow. Therefore since nothing apparently is left by the touch of a thunderbolt, one rightly concludes that a thunderbolt is not a stone but the subtle exhalation described above. And if sometimes a stone falls together with the thunderbolt, that stone is nothing other than a cloud converted and hardened into a stone — just as in the human body a stone is sometimes formed. Indeed, Albert (*1. 3. tract. 3. cap. 23*) writes that in the middle region of the air metals are sometimes produced, namely iron.

One asks first: why does a thunderbolt consume bones but not flesh? I reply that the reason is that flesh is soft and does not resist it; but bone is hard and resisting, which is why the thunderbolt consumes it. This can be explained by reference to cannon balls, which in their explosion break hard things but leave soft things unharmed. Add that the said effect proceeds from the penetrating thunderbolt, which pervades and permeates porous and soft bodies.

One asks second: why is wine sometimes consumed in a cask while the cask itself remains intact? I reply that the reason is that the said exhalation of the thunderbolt is very warm and dry, and it consumes the wine, which is moist; but it does not injure the cask, because it passes through its pores on account of its extreme subtlety.

One asks third: why, when a cask is burned, does wine still persist? I reply that the reason is that the thunderbolt in that case is of the burning kind; for by reason of its burning, from the viscosity a certain membrane is formed, which, congealed with the wine, prevents the wine from spreading. The said wine can last four days until that membrane is ruptured; but if anyone should drink from it, he will die, because through the thunderbolt the wine is rendered poisonous.

One asks fourth: why, before a thunderbolt falls, does a wind sometimes blow beforehand, sometimes accompany it, or follow it? I reply that the reason is that the parts of the air are stirred by the speed of the thunderbolt, or because some parts of the exhalation are not kindled and thus produce wind.

One asks fifth: why are fruits touched by a thunderbolt poisonous? I reply on account of the matter of the thunderbolt, which is poisonous and sulphurous. Whence a thunderbolt gives off a sulphurous odor.

One asks sixth: why, if a poisoned man is touched by a thunderbolt, does he lose his poison? I reply that the reason is that contrary effects proceed from contrary agents — as wind sometimes extinguishes a candle and sometimes relights one already extinguished; and similarly wind sometimes opens a door and sometimes closes it.

One asks seventh: why does a man sometimes struck by a thunderbolt not die, whereas other animals if struck by a thunderbolt perish? I reply that this arises

from his excellence. For man is the most excellent and noble of all animate beings; and similarly it is related that the eagle is not touched by a thunderbolt, being the queen of birds.

One asks eighth: why does a fetus in its mother's womb die while the mother herself does not die? I reply that the reason is that the fetus is tender and weak, but the mother is not — she is strong and robust — just as the bud of a vine perishes from cold and frost while the vine itself lives.

One asks ninth: why, if a sleeping man is struck by a thunderbolt, does he die with his eyes open; but if he was awake, does he die with his eyes closed? I reply that the reason for the first case is that when a sleeping man is struck he opens his eyes to see the object striking and harming him; but having no time to close his eyes, he remains with them open. The reason for the second case is that a man who is awake, hearing the crash of thunder and seeing the great lightning flash and all the terrible things around him, closes his eyes lest so great an evil harm him further — and thus he remains dead with his eyes closed.

One asks tenth: what is the remedy against a thunderbolt? Pliny (*l. 2. c. 15*) replies that one should take laurel, which is never struck by a thunderbolt, or something from the sea calf. I myself think the better remedy is to seek underground places, because it has been observed that a thunderbolt can reach the earth to a depth of five feet. Hence we observe that higher places are more exposed to the thunderbolt, according to the saying: "Envy seeks the highest things; the highest winds blow; the highest things are struck by the thunderbolts of Jove."

Question III. On Aerial Meteors.

Article I. On the Vortex and Other Aerial Appearances.

Many aerial impressions are observed by us on a clear night, among which are especially numbered the vortex, the opening, the area or corona, and red or blood-colored hues.

Note first that the material cause of the aforesaid meteors is an exhalation carried upward, and the efficient cause is the stars and all luminous bodies that shed their light upon the parts of the exhalation; the formal cause is the light; and the final cause is the beauty of the universe. The manner in which those meteors are formed is as follows: since exhalation has certain dense parts and certain rare parts, if the light of some heavenly body falls upon them, it affects them differently. For if in the middle the exhalation is dense and the surrounding parts are rare, and if the light of some heavenly body shines over them, and if the density is great, a vortex is produced — for what is dense and not illuminated by light appears black or deep. Whence I have noted elsewhere that painters, when they wish to represent the depth of a well, place black in the middle and surround it on all sides with white. But if the density of the exhalation is small, it is called an opening; and if the density of the exhalation is

illuminated on all sides by the light, it is called an area or corona, which the Greeks name *ἄλων*. But if the exhalation is small and in some manner inflamed, red and blood-colored hues appear.

Note second that there are two kinds of colors: true colors, which arise from the mixture of the primary qualities, of which Aristotle speaks (*1. de sensu, et sensili*); and apparent colors, which are produced from light diversely modified, as is evident from the colors on the neck of a dove exposed to sunlight, of which (*in the second and third book on Meteors*). To this category belong the blood-red and other colors that appear in the air.

The assertion is: the aforesaid meteors are observed by us chiefly in summer on a clear night. This is evident from experience and can be confirmed from the first note, in which we noted the manner of their production; and the school of the subtle Doctor is not contrary.

One asks first: why are the aforesaid meteors seen by us only at night? I reply that the reason is that by day the light of the sun, being greater, overshadows the lesser light of the other heavenly bodies so that those impressions cannot be seen by us — just as by day we do not observe stars for the same reason.

One asks second: why, when such meteors appear, are certain voices heard similar to human voices? I reply that the reason is that at that time many exhalations exit from the earth, which, passing through a narrow passage, emit a sound, as is evident from wind blowing and gusting through a narrow place. Sounds of this kind appear to be human according to the imagination of the hearer, just as the sound of a bell seems to signify what the hearer imagines.

One asks third: why do these impressions appear to be in the heavens? I reply that this happens because our eye cannot recognize the distance that exists between the heavens and those impressions and figures. As is established from clouds, which appear to be in the heavens, though in reality they are not. Add that the common people call the sky "airy," "cloudy," "clear," and the like.

Article II. On Other Aerial Impressions.

Among aerial apparitions are numbered rods and parhelia, which are now to be explained by us. Certain perpendicular lines are observed by us, which by the common name are called rods or ropes — which are nothing other than solar rays proceeding perpendicularly from the sun through a discontinuous or perforated cloud, or through a cloud that is indeed continuous but rare in one part and dense in another; in this way such lines are produced and are called rods or ropes.

Parhelia are those meteors which, according to the etymology of the name, are beside the sun, or parhelions — that is, beside the sun: from *παρήλια*, as if *παρὰ ἥλιον*, which means "beside the sun." For such a spectacle is described as an image of the sun expressed in a cloud, because it is produced when a cloud is at the

side of the sun and through the reflection of the solar rays to that cloud, a likeness of the sun emerges. Hence sometimes two suns have been seen, and sometimes three — not because in reality there are several suns, but because the image of the sun itself was imprinted in several clouds in the manner I have just explained.

Article III. On the Rainbow.

Philosophers disagree about the nature of the rainbow in various and diverse senses, as may be seen in Plutarch (*3. de placitis, cap.*) and Albert (*lib. 3. tract. 4. cap. 8*). Some hold that the rainbow is the likeness of the sun expressed in a concave cloud. Others write that the rainbow is a vapor raised upward from the earth, which is spherical because it is drawn from the spherical earth and is congealed above by the cold; and when the sun is opposite to it, the rainbow is produced. Avicenna and Algazel think it is formed from the air moistened by rain, which the air receives as a certain shimmer by reason of the moisture, and thus the rainbow appears. The more common opinion of the philosophers is that the rainbow is a dewy cloud struck by the solar rays.

The first assertion is: the rainbow is neither a cloud nor the sun, but a dewy cloud struck by the solar rays. The Doctor does not disagree in his writings. The first part is proved: when the sun is shining, the rainbow is not always present; similarly, when a cloud exists in the air, the rainbow is not always seen. Therefore neither the sun nor the cloud is the rainbow. The second part is evident from what was said, especially in the foregoing note: for given a dewy cloud and the sun's rays shining upon it from the opposite side, the rainbow is produced.

The second assertion is: the colors that appear in the rainbow are not true colors but merely apparent and representative ones. This is consistent with the teaching of Scotus. It is proved: true colors, as has been stated elsewhere, arise from the mixture of the primary qualities; but in the rainbow there is no mixture of primary qualities — for in it there are the light of the sun and the cloud, which do not retain primary qualities. Moreover, the same reasoning must be applied to the colors of the rainbow as to the colors on the neck of a dove exposed to sunlight; but the colors of the latter are apparent, as experience teaches. Therefore so too are the colors of the former. Furthermore, the colors of the other meteors, as was maintained above, are apparent; therefore so too are the colors of the rainbow.

One asks first: is the rainbow the most noble of meteors? I reply affirmatively; and this is deduced from sacred Scripture, especially (*Ecclus. 1*): "See the rainbow and bless him who made it; it is very beautiful in its brightness."

One asks second: is there a lunar rainbow? I reply affirmatively, though it rarely occurs. For, as the Philosopher observes, over the space of fifty years only two lunar rainbows have been seen at night.

One asks third: did the rainbow exist before the universal flood, given that God says in (*Gen. 4*): "I set my bow in the clouds, and it shall be a sign of the covenant between me and the earth"? I reply that it did exist, because its cause existed — namely the sun and a dewy cloud — and consequently also its natural effect, which is the rainbow. But the rainbow is said to be a sign that there will no longer be a universal flood, by God's institution and will. It also appears to be a natural sign of rain if it shines in the morning, and truly a sign of fair weather if seen in the evening. Furthermore, sometimes several rainbows appear — that is, two or three.

Article IV. On the Milky Way.

On the milky way, which is as much as to say the milky circle or the Milky Way — which is called by rustics and the uneducated the Way of St. James — philosophers dispute very much and in various ways. The Pythagoreans hold that the milky way is that burned part which was made by certain planets deviating from the Zodiac, which through the white color appears white and milky. Anaxagoras and Democritus think that the milky way is those stars which at night, without the interposition of the earth, are illuminated by the light of the sun — in which way that part, illuminated by the sun's light, appears white, while the remaining parts, on account of the earth's shadow, do not appear white. Nor are there lacking other ancients who suspect that the milky way is produced by the reflection of our vision toward the sun. And Aristotle (*1. Meteor. c. 8*) asserts that the milky way is a great kindled exhalation sustained continually in the air by constant fuel, like a comet. The more common opinion of the other philosophers, however, is that the milky way is an enormous quantity of tiny stars, which on account of their smallness cannot be seen by us individually.

Note that the parts of the heavens are of three kinds. Some are rare, which cannot be illuminated, since they cannot retain light in themselves; therefore they appear to be of a sky-blue color. Others are dense parts, which on account of their density receive light in themselves; from their number are the stars, which appear to us as bright or at least white. Still other parts are intermediate, being neither very rare nor very dense. Therefore sometimes between them and us exhalations and vapors are interposed, which appear to make them larger; and if such vapors and exhalations are absent, they appear smaller — though in reality they always remain of the same quantity and figure.

The first assertion: the milky way is not a part burned by the heat of wandering stars deviating from the Zodiac; nor is it that part which at night is illuminated by the light of the sun. The Doctor does not contest this.

The first part is proved first: the heavens as a matter of fact are incorruptible and are not subject to any external impressions, as was abundantly shown in the book on the heavens. Therefore the milky way is not burned by the deviation of certain planets from the Zodiac. Second, a burned part appears not white but

black, as is established from coals and other things burned by fire; but that part called the milky circle is not black but white. Therefore, etc.

The second part is argued first: the sun runs its course in different ways; therefore if the milky circle arose from illumination, such a circle would change at night just as the illumination of the sun changes; but the milky way remains in the same position and place, as all observers and astronomers note. Second, the shadow of the earth does not impede the light of the sun: for as astronomers observe, the shadow of the earth reaches only to the sphere of Mercury.

Therefore the other parts of the firmament are not impeded by the interposition of the earth from being illuminated by the splendor of the sun and becoming white like the milky circle; but the opposite is evident. Moreover, the sun greatly exceeds the earth in size, as is evident from the appendix on the sphere near its end. Therefore the earth cannot prevent the other parts, besides the milky way, from being reached by the light of the sun.

The second assertion: the milky circle is not produced from the reflection of our vision toward the light of the sun; nor is it a great exhalation continuously sustained in the air by constant fuel; but it is an enormous multitude of tiny fixed stars in the firmament, which on account of their extreme smallness cannot be seen by us individually, and therefore that part appears to be of a white color. This does not oppose the teaching of Scotus.

The first part is proved first: even if there were no reflection of our vision toward the sun, the milky circle would still exist; for it is impossible that it should depend on our vision, which is entirely extrinsic to it. And if all mankind perished, no one doubts that such a milky way would persist. Therefore it is by no means caused by the reflection of our vision toward the sun. Second, in water and in a mirror, in which there is no reflection of our vision toward the sun, the milky way appears. Therefore it is wrongly supposed that such a circle is caused by the reflection of our vision toward the sun.

The second part is shown first: any exhalation whatsoever, whether great or small, does not endure always, since after some interval of time it falls to the earth, as is evident from a comet; but the milky circle always remains wholly intact. Therefore it is evidently established that it is not some meteor. Second, each meteor grows or diminishes and is of a sublunar nature; but the milky way always remains the same, in the same position and place, with the same figure and quantity. Therefore it cannot be an exhalation residing in the air.

The third part is shown first from the diligent observation of astronomers, who are more to be believed than Aristotle in accordance with that maxim: in his own art the expert is to be believed. Astronomers have observed the said circle to be of a heavenly nature and therefore subject to no corruption. Second, we experience that parts that shine with light from afar appear white, as is evident from the sea, mountains, and towers struck by the solar rays. On the contrary,

what is not flooded with light appears black, as is evident from night, underground places, and the like. Therefore since the milky way is very far from us and appears white, and since that whiteness does not arise from the sun as is established from what was said, one concludes that it is nothing other than an enormous quantity of tiny stars.

One objects first: a not inconsiderable exhalation in the manner of a hairy comet appears in the air, which is called the milky circle; therefore just as a comet is an exhalation and of a sublunar nature, the same must be maintained of the milky way. I reply: if the argument held, one would conclude that just as a hairy comet does not always appear but eventually fails and is no longer seen, so too the milky way after some interval of time would cease to exist — which conflicts with experience. For from the creation of the heavens until now, the said circle has always persisted in the same mode.

One objects second: the milky way sometimes appears larger and sometimes smaller; therefore it participates in an elemental nature, which now grows and now diminishes. I reply that the said circle always exists in the same position, with the same quantity and figure, provided no obstacle is interposed; but when an obstacle is interposed — namely when in the air there is a great abundance of exhalations, which appear to make it larger — that is the occasion of this appearance. And this we experience with the sun, moon, and the other heavenly bodies, which on account of excessive exhalation or vapor interposed between us and them appear larger, though in themselves they always persist in the same mode and with the same magnitude.

Question IV. On Aqueous Meteors.

Article I. On Cloud and Rain.

The proximate material of an aqueous meteor is vapor, which is raised upward by the power of the sun and, if condensed by cold in the middle region of the air, becomes a cloud. For a cloud means nothing other than a vapor condensed by the surrounding cold. But a cloud dissolved into water is rain. Since heavy things tend downward, and when the external heat that existed in the condensed vapor perishes, the cloud becomes heavy and consequently, dissolved into various droplets, is borne downward and it rains. Three kinds of cloud are distinguished: white, black, and red or blood-colored. The white cloud is light, containing no water, and is sterile; for that reason it is easily scattered and disappears by winds or the heat of the sun. The black cloud is full of water; it is fertile, and pours out into water or rain. The red cloud takes its redness either from red places from which it is drawn, or from other things that ferment in the air. But if after rain there remains some cloudiness borne over the earth, it is called a cloudlet, which is a sign of clear weather. Rain is divided into shower and nimbus: a shower is when smaller and more frequent drops fall to earth; a nimbus is formed when the drops of rain are larger and denser. The drops of

rain are round because they are watery, and water is round and homogeneous, as is evident from drops that remain on the leaves of cabbage or other things.

One asks first: in what place do clouds reside? I reply that they exist in the middle region of the air, as is evident when a man standing on a mountain sometimes observes clouds and cloudlets in the valleys.

One asks second: why do frogs, locusts, and other imperfect animals sometimes fall together with rain? I reply that they are generated by the universal agent through the dispositions found in some matter transported to the middle region of the air — just as we have stated elsewhere that in it stones, metals, and things of that kind are sometimes generated. This is observed in obscure and foul places, in which many imperfect animals are generated, such as flies, gnats, and fleas.

One asks third: what are the signs of rain and fair weather? I reply there are many. First, a sign of rain is the redness of the sun in the morning; and conversely, a sign of fair weather is its redness in the evening. Second, when the sun and moon are pallid in color, that is a sign of rain. Again, if at the rising of the sun only black clouds cover the sun itself and immediately vanish, that is a prognostic of rain; but if those clouds persist long, it is a sign of fair weather. Again, the singing of frogs and the crowing of crows in the morning indicates rain; their singing in the evening foretells fair weather. Furthermore, if fleas and flies bite more sharply, they portend rain. More examples are in Virgil (*1. Georg.*).

Article II. On Other Aqueous Impressions.

Among aqueous meteors are numbered snow, dew, frost, ice, and hail, about which we must now briefly speak.

Snow is a cloud immediately conceived by cold. For before a cloud dissolves into water, it is compressed by the vehement surrounding cold, and thus falls to the earth in the manner of wool-flowers.

Dew is a moderate vapor raised a little from the earth, which, on account of the smallness of the heat raising it and the coldness of the supervening night, is borne downward only during the temperate season and appears in the morning.

Frost is likewise a small vapor raised a little from the earth, which on account of the surrounding cold is compressed and, in the manner of snow, falls and appears in the morning at wintertime, yet in clear weather.

Ice is water congealed in pools, marshes, or rivers, on account of the admixture of some terrestrial exhalation. For since the earth is dense and is mixed with water, with the approach of cold, the water itself turns into frost or ice.

Hail is rain transformed into frost through the antiperistasis of heat coming from the earth; and for this reason it is probably defended that hail is produced in the lowest region of the air. For when it descends, a noise is heard in the air,

which indicates that it is generated nearby. It occurs in summer and autumn because the heat going out from the earth, when joined with the coldness arriving from the middle region of the air, is compressed, and rain water becomes hail.

One asks first: why does it rain in valleys when it snows in the mountains? I reply that the reason is that in valleys there is warmth, which melts the snow; but in the mountains cold prevails, which compresses the snow itself. For the same reason it does not snow at sea, because in the sea there are warm vapors and exhalations that immediately dissolve the snow.

One asks second: why is snow white? I reply that this proceeds from the aerial parts that exist in it, as well as on account of the coldness remaining in it. For that reason those who inhabit cold regions are white; while those who inhabit warm ones are black. And if snow sometimes appears to be of another color, the reason is that it is melting; therefore it departs from whiteness.

One asks third: does crystal form from snow? I reply affirmatively. For it is hardened by frost over a long period of time, and from this more strongly congealed state crystal is born, as Augustine writes especially (*in exp. Ps. 147*). Scotus does not depart from this (8. *Met. in com. cap. 2*).

One asks fourth: in what region is crystal formed? I reply that it is produced in the middle region of the air. And this is sufficiently apparent in mountains, which, existing in the second zone of the air, at their summits are burdened with the said snow almost at all times.

Article III. On Honey, Manna, and Sugar.

Virgil (4. *Georg.*) calls honey a heavenly gift: "Immediately the heavenly gifts of aerial honey." From him Pliny and others seem not to be far removed, who think that honey is the sweat of the heavens, or the saliva of the stars, or the juice of the air purging itself. It seems to distil upon the surface of flowers and leaves, which bees collect, prepare, and compose in a wondrous way. Hence honey hangs on trees in Arabia and India in the manner of salt. Indeed, it is reported that at Avignon in the year 1341 a great abundance of honey fell from the heavens and existed on the leaves and branches of trees in the manner of gum. It is made from moist vapors with the admixture of very minute terrestrial particles.

Manna is a certain white liquid that is called a honeyed morning dew, and it is made from the mixture of terrestrial particles raised upward, cooked by aqueous moisture. By the common people manna is understood to be that food which God provided for the Hebrews in the desert, which was round in the shape of coriander, as is evident (*Exod. 16; and Sapient. 16*). Whether this differs in species from natural manna, some dispute; but I subscribe to the negative position. For a different agent and a different action do not constitute effects

specifically different, as is evident from a man created by God and generated by another man; likewise from fire produced by fire and by the sun, which are of the same species. If any difference does exist between them, it is to be regarded not as essential but as accidental — such as variety of flavors and the sustenance of different persons.

Sugar is generated in much the same way as honey and manna, by heavenly influence, with the assistance of certain instruments and canes, fire being applied beneath, by which it is reduced to density and whiteness.

Article IV. On the Sea.

Aristotle treats of the sea (2. *Meteor.*) not because it is a meteor — since it was established by God (*Gen.* 1), and any great gathering of waters is called a sea (*Joan.* 6), regarding the sea of Galilee which is that of Tiberias, though it is and is called the lake of Genezareth, as Lyran (*in Postil.*) notes — but because it has an admixed saltiness, which is numbered among meteors. The sea receives various divisions; the chief one is into the Ocean Sea, which surrounds the earth on all sides and, according to what it encompasses, takes various and diverse names; and the Mediterranean Sea, which bursting from the Ocean between the Pillars of Hercules spreads through the middle of the lands and was under Julius Caesar divided into thirty parts, as the Parisians testify at this location. More details may be found in the geographers.

It is moved by many motions. First, it is assailed and disturbed by winds, according to their variety and multiplicity. Second, it moves from east to west, as sailors experience, especially the Portuguese, who in one month go to the Indies, but do not return without the interval of three months. This motion perhaps arises from the motion of the first mobile. For just as fire and air in their spheres are moved in this way, as is evident in comets existing in them, so too is the sea — though not as evidently, since water is a coarser and lower element, not so subject to our eyes with respect to the whole. Nor does this seem improbable, since the earth alone is firm and stands forever, as was stated (1. *de elementis, quaest.* 5. *art.* 4. *in fine*), while the rest are rotated and borne around by divine motion. Third, from north to south: the reason is that the earth is higher in some parts and lower in others; and therefore the sea flows to a lower place. Moreover, in the north more water is generated on account of the greater abundance of coldness and moisture; while in the south it is diminished and lost on account of excessive warmth and dryness. Add that rivers — more copious and large in the north, fewer and smaller in the south — burst into the sea.

Fourth, the motion of flux and reflux, whose cause is held to be the moon — as Scotus writes after Ambrose (4. *Exam. cap.* 7) and Basil (*ibid. hom.* 6): (2. *dist.* 14. *quest.* 3. §. *Dico ad quaest. ad B.*). Each day the sea flows and ebbs twice by the power of the Moon. For when the Moon ascends above the hemisphere, from the point of the east to the southern point it flows; from the southern point to

the point of the west it ebbs. And from the point of the west to the point directly opposite the southern point it flows again; and from that point to the other point it ebbs again. Furthermore, the Moon by its special influence, through its middle light, is the cause of the elevation of certain parts of the sea: for the said light is refracted upon encountering a denser medium; and the more it approaches the perpendicular and direct line, the more it is refracted.

Moreover, that the Moon dominates over moisture is manifestly confirmed by experience. The saltiness of the sea is a terrestrial, dry, and scorched exhalation separated by the heat of the sun and the blast of the winds, as is evident by analogy from lye, sweat, and urine, which are likewise salty — just like sea water.

One asks first: why are some springs salty? I reply that this is produced from the saltiness of the earth, or because such springs pass through underground passages from the sea.

One asks second: why are rivers not salty? I reply that the reason is that in them there is no scorched and dry exhalation; or if there is any, it is purged by the earth; or perhaps because rivers continually flow to the sea and never remain still, so as to be scorched by the heat of the sun.

One asks third: whence do springs originate? Some respond that certain springs arise from rain waters received in the cavities of the earth; others reply that they come from the sea, as seems to be the famous and wonderful spring of the Closed Valley near the Isle of Venus near Avignon, where Petrarch, captivated by love for Laura, composed his songs. Others, including Aristotle, think they arise from cold air and corrupted vapors.

Question V. On Terrestrial Meteors.

Article I. On the Earthquake.

Two things above all are investigated concerning the earthquake: what an earthquake is, and what its cause is. Passing over the various and diverse opinions of the ancients, cited and refuted by recent thinkers together with Aristotle (*2. Meteor. cap. 7*):

The first assertion is: an earthquake is a shaking of the earth arising from an exhalation enclosed in its interior, which seeks an exit and, not finding one, shakes the earth — from which there results a pulsation or tremor, which are its species. The Doctor does not contradict this. It is proved first from Aristotle, who, having rejected the opinions of the ancients at the location just cited, establishes this conclusion. Second, just as on account of the exhalation enclosed in a cloud the cloud itself bursts and a crash is emitted, called thunder, so on account of the exhalation enclosed in underground places and having no exit, the earth is moved and a sound is produced, called the earthquake. Third, the same manner of reasoning is to be applied to a breath enclosed in the earth that cannot exit, as we apply to gunpowder enclosed in cannons: when kindled

and inflamed, on account of the narrowness of the space and its levity, it exits with a great noise and a roar is produced. The same must also be said of exhalations enclosed in the belly of an animal: for the belly is inflated by them, and such a breath, exiting, emits a sound called flatulence.

The second assertion is: the cause of an earthquake is a warm and dry breath enclosed in the bowels of the earth. So Aristotle (*praecit.*), from whom Scotus does not depart. It is proved first: when there is a great abundance of exhalations enclosed in the bosom of the earth, earthquakes occur, as is established by experience, especially in spring or autumn. Therefore the cause of an earthquake is a warm and dry breath enclosed in the bowels of the earth. Second, cavernous and spongy regions frequently undergo earthquakes; therefore it is an evident sign that such a breath enclosed in them is the cause of the earthquake itself.

The second assertion: there are two species of earthquake, namely tremor and pulsation. So Aristotle (*ubi supra*), and the Doctor does not disagree. It is proved: either from the exhalation enclosed in the earth, the earth is agitated in a circle — that is, now in this direction, now in that — and an earthquake arises called tremor; or from the exhalation detained in the earth, the earth itself is pushed upward and an earthquake arises called pulsation. Therefore there are the two species of earthquake just named.

One will say: it is incredible that a thin and slight breath such as the said exhalation should have such power as to move and shake the enormous mass of the earth, overturn houses, and cast down mountains, as happens in an earthquake. Therefore another cause of the earthquake must be sought. I say that this should be no cause for wonder; since we experience that winds, though thin, nevertheless move enormous rocks, uproot trees with their roots, and devastate large buildings. Likewise, exhalations enclosed in a body inflict great pains, produce sicknesses, and if not treated bring death. Therefore it is very probable that when there is a great abundance of these exhalations, the said effect is caused.

One asks: how many effects does an earthquake have? I reply that its principal effects are four. The first is observed when the water of a well becomes more turbid and gives off a foul odor. The second is when that well water boils and is borne upward. The third is when the sea swells without the blast of winds. The fourth is when there is an untimely calm in the air.

Article II. What Wind Is.

It is difficult to know and hard to comprehend what wind is, as the sacred pages indicate (*Ps. 134*): "He produces winds from his treasures" — that is, from places hidden to men, according to the interpretation of Lyran at that place; or from the hidden causes of nature, as Augustine intimates at that location in these words: "Because a wind blows, old man, because of what cause it blows or from

what treasury of reason it has come forth, you do not know." And (*quaest. 59. novi testamenti*): "Whence a wind comes or where it goes, we do not know." And a little before: "Wind is heard but not seen." For that reason the philosophers diverge into various and diverse opinions. Some think that wind is air moved and agitated. Some maintain that it is the impulse of flowing air. Others say it is the flux of air. Aristotle (*1. Meteor. cap. 13*) hands down that wind is a warm and dry exhalation moved laterally or sideways around the earth.

Note that by the power of the sun there are raised from earth or water not only vapors to the middle region of the air, which are converted into rain, but also exhalations — which, if they are not bound by any bond, are driven by the middle region of the air (which is cold), and since they are light they cannot tend downward; and therefore they are stirred sideways. Wind begins to move around clouds, being first driven by them, and then comes to us, to the sea, and to the earth. Hence when no wind is blowing, we observe clouds moving, because the wind blows to them first; and then at the beginning it is stirred a little, and afterward blows violently, because other exhalations are added to it which cause greater wind.

The first assertion is: wind is not air in motion, nor impulse, nor the flux of that same air. The Doctor does not disagree. It is proved first: when cannons are discharged, the air is vehemently stirred and agitated, and yet at that time there is no wind. Therefore it is a plain sign that wind is not air in motion. Second, when towers collapse headlong, the air is most greatly stirred; and yet at that time no wind is present. Moreover, air is moist and warm, as I stated in the book on the elements (*quaest. 5. art. 2*); but wind is warm and dry. Furthermore, air is an element, while wind is an imperfect mixed body; for it is listed by all among meteors, which are imperfect mixed bodies. Therefore wind is not air in motion, nor any of the things adduced in the proposed assertion.

The second assertion is: wind is a multitude of warm and dry exhalation raised from the earth and rolled around the earth itself. The Doctor does not depart from this. It is proved first: at that time great winds blow when a great abundance of exhalation exists, as is established by experience when comets appear. Therefore wind means nothing other than a warm and dry exhalation moved obliquely around the earth. Second, wind very greatly dries when it blows around the earth. For we experience that by the blowing of winds the earth is rendered dry and arid, and moist things become dry. Therefore wind is a warm and dry exhalation. Again, in us the intestine is sometimes inflated by warm and dry exhalations, which are commonly called winds. Therefore in the world, winds are nothing other than exhalations of this kind, warm and dry.

One objects first: air is the most mobile of things from any extrinsic agent; but wind too is easily moved by the extrinsic agent — for it is driven in this or that direction. Therefore moved air and wind coincide. The inference is confirmed from Damascene (*2. fidei, cap. 8*), who says that wind is the movement of air. I

reply that wind can be called moved air, not per se and formally, but only denominatively — because when wind blows the air is moved. To the confirmation I say that Damascene is to be interpreted accordingly; for a little later the same saint adds: "Wind is a multitude of warm and dry exhalation moved around the earth."

One objects second: wind is driven by a cloud; but air is also driven by a cloud — indeed, wind is produced by the agitation of air, especially by bellows and fans. Therefore wind is the same as air in motion. I reply by the same distinction by which the preceding objection was dissolved: it follows only that wind is moved air denominatively, not formally.

One objects third: from the sea arise many winds, from which vapors ascend, not exhalations; therefore wind is rather vapor than exhalation. I reply that in the sea, on account of the admixture of earth and the scorching of water by the power of the solar rays, many exhalations arise, as is evident from its saltiness. Therefore I deny that no exhalations are raised from the sea; and since they have vapors mixed with them, the winds that proceed from them are moist and warm.

One asks first: why do some winds move in a circular manner? I reply that two causes can be assigned. The first is that they are stirred by the influence of the planets, which revolve in a circle; therefore the winds too are set in circular motion. The second is that the exhalations, which are the matter of winds, are driven downward by the coldness of the middle region of the air; and since they are light and warm and cannot be borne downward, they are therefore moved circularly.

One asks second: why do winds move more quickly at the end than at the beginning? I reply that the reason is that at the end there is a greater multitude of exhalations; therefore as the exhalation increases, so too does the blowing of the winds.

One asks third: why do greater winds blow from the south and north than from the east and west? And why do winds prevail more in spring and autumn than in summer and winter? I reply that this occurs through the absence of the sun. For the sun by its absence does not consume the vapors and exhalations existing in the south and north; therefore they abound more there than in the east, where vapors and exhalations are dissipated by the presence of the sun. Similarly, winds prevail more in spring and autumn because at those times a greater abundance of vapors and exhalations is had than in summer and winter.

One asks fourth: why are some winds cold and others warm, since they arise from a warm and dry exhalation? I reply that winds are intrinsically warm and dry, as is evident from the definition of wind just given; but extrinsically they are cold and moist. This can arise from the places from which they proceed. For that reason the north wind is cold, because it proceeds from a cold region; while

the south wind is warm, because it flows from a warm place. Furthermore, some winds render the air clear, such as the north wind — Aquilo — because it is near us, and therefore expels clouds; while others make it cloudy, such as the south wind — Auster — which comes from far away and therefore brings clouds and rain to us.

Article III. How Many Kinds of Wind There Are.

On the number of winds there is no little dispute among the philosophers. For some establish only four winds; others twelve; others twenty-four; while the common opinion counts thirty-two winds.

They are divided into general winds, which blow everywhere, and provincial winds, which blow mainly in some province or region. Then into ordinary winds, which blow in the customary manner, bringing no harm to sublunar things, and turbulent winds, which blowing beyond measure cause the greatest damage to those same sublunar things — for sometimes they overturn buildings and uproot trees, and for that reason are called tempests and storms.

Furthermore, they are distributed into cardinal or principal winds, which blow from the cardinal points of the world, and collateral or intermediate winds, which are interposed between the principal winds. The principal winds are four, and there is reference to them (*Matt. 24*): "from the four winds," and Augustine cites them (*in exp. Ps. 59*): Subsolanus, Auster, Favonius, and Septentrio.

Subsolanus is that which blows from the east, so named because it blows under the sun. To the right of Subsolanus is Vulturnus, and to its left is Eurus. Auster is that which blows from the south, so named because it draws forth or nourishes clouds. To it are joined two others, of which one is called Euro-Auster because it has Eurus on one side and Auster on the other; the other is called Austro-Africus, because on one side is Auster and on the other Africus. Favonius is that which blows from the west, so named because it warms the grasses of the earth; to its right is Africus and to its left Chorus, so called because it produces, as it were, a chorus of winds. Septentrio blows from the north, or under the Little Bear. To its right is Circius, and to its left Aquilo, which constricts waters and scatters clouds.

It is probable that winds are comprehended in the twelvefold number just reviewed. This is evident from the experience of sailors, who seem to encounter no other winds besides those enumerated — though perhaps other winds are found; at least those described are the principal and better-known ones.

One asks: how many turbulent winds are there? I reply there are three, which are called Ecnephias, Typhon, and Praester. Ecnephias is a great warm and dry exhalation, which, bursting the cloud in which it is enclosed, is violently borne downward; therefore it brings shipwreck to sailors and no little damage to other living things. Typhon is an exhalation more subtle than Ecnephias, which, passing through a narrow opening, violently tends downward and brings great

troubles to mortals. Praester adds nothing to the said Typhon beyond kindling and inflammation.

Books on the Soul.

Preface.

Having completed the treatise on natural body taken in general terms, in the eight books of Physics; and on the ungenerable and incorruptible body, in the four books On the Heavens and the World; then on the generable and corruptible body, in the two books On Generation and Corruption; and subsequently on the imperfectly mixed body, which is examined in the four books of the Meteorology — orderly method now demands that we treat of the animated body, which is dealt with principally in the three books On the Soul. That the treatment of the soul is one of the chief parts of philosophy, St. Augustine teaches above all others in book II of On Order, chapter 8, with these words: "There are two questions above all in philosophy: one concerning the soul, and the other concerning God. The first causes us to know ourselves; the second, our origin. The first is more agreeable to us; the second, more dear. The first renders us worthy of eternal life; the second makes us blessed." The first is diligently examined by the royal Psalmist (*Ps. 118*), "My soul is always in my hands"; the second is sought out by the same (*Ps. 33*), "I sought the Lord and he heard me." We shall constitute five books on the soul: the first will treat the prolegomena to the science of the soul; the second, the soul in itself; the third, the vegetative soul; the fourth, the sensitive soul; and the fifth, the intellective or rational soul.

Book I. On the Prolegomena to the Science of the Soul.

Just as in our other works we have been accustomed to investigate certain preliminary matters before entering into the inner chambers of the subjects to be treated, so at present we set forth a prelude to the science of the soul, so that afterwards all the remaining matters pertaining to it may be approached more conveniently and easily.

Question I. On the Object of the Science of the Soul.

Article I. Whether the Soul Is the Object of the Books On the Soul.

The first opinion is that of Albert, Thomas, praised in the present context, question 3; Toledo, question 4; Ruverius and Poncius in the proem On the Soul — all holding that the total and adequate subject of these books is the soul itself. The second is that of Apollinaris, *ibid.* question 3, and the Coimbrans in the proem, who think they resolve this difficulty by a single distinction: namely, that if the books On the Soul are taken together with those called the Parva Naturalia, which are as it were a kind of appendage to them, then the total

subject of the whole must be set down as the animated body; but if they are taken separately from those, they say the adequate subject is not the animated body but the soul. The third opinion is that of Scotus (*1 Met. quest. 1*); John of Masters (*1 On the Soul, quest. 1*); Tataretus, *ibid.* at the end; the Venetian commentator; Piccolomini; the Complutenses, *quest. unica*; and many others teaching that the total and adequate subject of these books is the animated body.

Note and recall from what was said in the Logic, book I, question 3, article 1, what the subject of a science is and how many kinds it has, and also what and how many conditions are necessarily required for it. Then observe that these books share the same subject as those inscribed On the Parva Naturalia — which treat of sense and the sensed object, of sleep and waking, of the length and shortness of life, and such matters — since it is one continuous work, as Toledo rightly notes, cited, conclusion 2, given that in all of these the same principles and properties of the natural body are considered.

First assertion: the soul is not the adequate subject of the Books On the Soul. This is suggested by the Doctor (*Quodl. 9, § de 2. ante F, and 4 d. 44, quest. 2, § Ad quest. A*). It is proved first: the adequate subject of these books is that which possesses all the conditions necessary and required for it; but the soul is not such, therefore it is not the adequate subject of the said books. The major is evident. The minor is proved: the properties considered in this science do not belong to the soul, such as having the power of seeing, hearing, being angry, showing compassion, and the like. Nor does the response of Toledo and the Coimbrans avail, cited at Question I, Article I, that the aforementioned distinction suffices to resolve the proposed difficulty. For these passions and operations are also predicated of the soul, because the soul itself is their principle. This response, moreover, is not to the point, since the question is not about the subject by which (*subiectum quo*), which is the soul, but about the subject which (*subiectum quod*), which is the animated body. I argue thus: the soul is never said to be nourished, to be angry, to see, to hear, to weave, and so forth of this kind (*Aristotle, 1 On the Soul, T. 64; Scotus, 4 d. 44, quest. 2, A*). And this is especially evident in the separated soul, which lacks these passions and actions. Moreover, the subject of the whole of physics is not the form of the natural body but the natural body, according to Scotus, or mobile being, according to St. Thomas; therefore likewise the subject of these books is not the form of the animated body, which is the soul.

Second: the partial subject of some total science ought to be a species of the subject of that total science; but the soul is not a species of natural body or mobile being; therefore the soul is not the subject of these books. Toledo, at the cited passage, responds by denying the major, since in a science one does not always treat of species of its generic object, but sometimes of principles and causes, as in the present case one treats of the soul, which is the principle of animated things. The Coimbrans add that it is sufficient for the subjects of the

parts of any science to be included in some way in the subject of the whole; otherwise one would say that mobile being is predicated of sense and the sensible object, of respiration, and of the motion of animals, which is false. Against the second response of Toledo, where he says the subject of these books is the same as that of the *Parva Naturalia* — granting this — I argue thus: Aristotle ought to have treated of the nobler species of natural body, which is the animated body; but he did so nowhere except in these books and in the aforementioned *Parva Naturalia*, as is evident to anyone who reads all of Aristotle's works. Therefore either Aristotle's treatment is deficient, or Toledo's response is empty and vain. For if he treated of the principles and causes of the animated body, he was also obligated to treat of that in which such principles and causes inhere and of which they are predicated, which is the animated body. As for what the Coimbrans add, it is not to the point, because our major is taken of the specific subject of a part of a total science, as in *Logic* the demonstrative syllogism stands to the syllogism taken generally — not of just any thing contained under the subject, such as respiration, the motion of animals, and the like.

Third: the subject of a science is presupposed to exist (*1 Post. T. 2*); but the soul is defined (*2 On the Soul, c. 1*); therefore the soul is not the adequate subject which of this work. Toledo responds that science presupposes of its subject what the name signifies, not what the thing is. He adds further that it befits a science to define its subject, though not to demonstrate it. Against this: the prior knowledge of what the name signifies is common to all constituents of a demonstration, both to the property and to the principles and the subject; therefore not only the nominal definition but also the real definition must be foreknown about the subject, since its definition is the principle and cause for inquiring into the knowledge of the property and its inherence in the subject — which is to be understood of demonstration a priori, not a posteriori. All the more, because Toledo, book II, question 3, asserts that the definition of the soul is offered by Aristotle through a priori demonstration.

Second assertion: whether these books *On the Soul* be taken separately from or together with the *Parva Naturalia*, the soul is not their total subject. This is indicated by the Doctor at the passages cited in the first assertion, and is proved first: they constitute the same book and continuous work, and for that reason are considered the sixth book of natural philosophy. Therefore the aforementioned distinction and separation is vain and inept. Second: where the same properties are found, there is the same subject, as everyone agrees; but in these and in those books the same properties and attributes are examined, as is evident to any reader. Therefore that distinction is futile and vain.

Third assertion: the animated body is established as the total object of these books. The Doctor holds this expressly (*Met. at the cited passage*), and Aristotle does not dissent (*1 On the Soul, T. 19*). It is proved first: in the whole of physics the

total subject is the natural body (*lib. 1 Phys. quest. 3, art. 4*); therefore in the science of the soul, which is a part of it, the subject is the animated body. The antecedent was shown at the cited place. The consequence is derived: the immediately subjective part of any genus is a species of it; but the animated body is the proximate subjective part of natural body — for natural body is divided into animated and inanimate by Aristotle (*T. 19, just cited*) — and this is visible in the tree of Porphyry. Therefore the animated body is rightly determined to be the adequate subject of these books.

Second: all the conditions required for the total subject of these books belong to the animated body; therefore it cannot be denied that it is the adequate subject of the said books. The antecedent is easy to prove. For of the animated body it is presupposed whether it exists and what it is; its properties are demonstrated in these books; and everything treated in them is referred to it, as is evident by induction through each of the individual items.

You will object first: that is the subject in a science of which the definition is sought and assigned (*1 Post. c. 1, 9*); but in these books the definition given is not that of the animated body but of the soul (*2 On the Soul, c. 1*), and Aristotle proposes this at the beginning of the first book and acknowledges that he has accomplished it in the book *On Sense and the Sensible*. Therefore the soul is the total subject of the aforementioned books. I respond through a distinction and explanation of the major: concerning the subject by which and the principal partial subject, I grant it; concerning the subject which and the total subject, I deny it. The Philosopher treats in this work of the soul not precisely in itself but in its relation to the animated body, which is the whole. Therefore it is ineptly inferred that the soul is the subject of these books because it is defined in them — just as one would wrongly say that motion is the subject of physics because it is defined by physics. And the same would have to be affirmed of place and time, which is manifestly false and absurd.

You will object second: the science of the soul is nobler and more excellent than the other sciences, for no other reason than that it treats of the soul, which excels in nobility among physical things; but if the animated body were the object of these books, the science of the soul would not excel the others, because that part which treats of animals would surpass the others, since in the category of substance a lower thing like an animal is more excellent than the animated body. I respond: the science of the soul is called more excellent both because it treats of the soul and especially of the rational soul, and also because it treats of the animated body, which is nobler than the soul itself which is its part — for the whole is more excellent than its parts taken separately or together, as is established with Scotus (*3 d. 22, quest. unica, § Ad 1. argumentum alterius opinionis sub I*).

You will object third: these books are inscribed "*Peri Psyches*," that is, *On the Soul*; therefore the soul is established as their subject. I respond that the

inscription and denomination is generally taken from the subject by which and from the nobler part, which is the soul. Thus St. Augustine acknowledged that he gave the title of his books *On the City of God* from the more excellent part (2 *Retract.* c. 43). Moreover, the same saint notes that a part is sometimes used for the whole (*lib. 3 de consensu Evangelistarum*, c. 24). Thus "soul" is used for "man" at (*Romans 13*): "Let every soul be subject to higher powers," that is, every man, according to the interpretation of the same Augustine (*tract. 105 in Joann.*) and Lyran, *ibid.* in the *Postilla*. Therefore it can not improperly be said that soul is taken for the animated body.

Article II. Whether It Belongs to Physics to Treat of the Soul.

In this not inconsiderable difficulty, there are three modes of speaking among the Peripatetics. The first is that of Simplicius in the prologue to the *Physics* and Themistius *ibid.*, holding it to be the task of a mathematician to treat of the soul. This is to be understood in a sound sense. For they do not think it belongs to Music or Geometry to treat of the soul; rather, since the soul as regards the vegetative degree is in matter, and as regards the intellective degree is free from matter, it is said to be a matter for mathematics, because of the soul one has an abstraction like that of mathematics, namely intermediate between physics and mathematics — although it is not proper mathematical abstraction, since mathematical abstraction concerns only accidents, whereas this concerns substance, since the soul is a substance. The second opinion is defended by Boethius in the prologue to the *Categories*; Philoponus, 1 *On Generation*; Toledo, 1 *On the Soul*, question 2; and Ruverius, question 1 — who use this distinction: namely, that if the soul is considered according to the being it has in common with the body, it is a subject for physical consideration; but if it is viewed according to its proper intellective being, it belongs to Metaphysics. The third opinion is that embraced by Scotus (*Quodl.* 9, § *de secundo ante D*); Lychetus and Gadius *ibid.*; with whom Alexander concurs in the beginning of the *Meteorology*; Averroes (2 *Phys. com.* 26); Avicenna; and many others, teaching that the treatment of the soul, with respect to all its degrees, belongs to physics.

Note first, and recall from what will be said below, that there are three kinds of soul: the vegetative, the sensitive, and the intellective. The first is in plants, the second in brutes, and the third in man. Philosophers have gathered that these are multiple from their diverse operations. The vegetative is known by growth, the sensitive by cognition, and the intellective by intellection. Where the sensitive is, there the vegetative is virtually; and where the intellective is, there the vegetative and sensitive are virtually contained — but not the converse. All souls together with matter constitute living and animated composites, just as the other forms do by informing their subjects, although there is some difference among them. For the first two operate dependently on matter, so that without matter itself they can neither exist nor operate, since the living composite is the immediate and proximate operative agent (*Aristotle*, 1 *On Sleep and Waking*, c. 1;

and 1 *On the Soul*, T. 66). But the intellective can elicit certain operations without the body, such as intellection and volition, which proceed from it and inhere in it itself (2 *On the Generation of Animals*, c. 9). And therefore it is said to be immaterial not only from its entity but also from its operation, which it produces without matter.

Note second: the soul can be considered in two ways. In one way, according to its own essence and operations, whether dependent on matter or free from matter — and thus the soul is a subject for physical consideration. In another way, according to its general and transcendental predicates — and thus it belongs to Metaphysics, as Scotus establishes in a parallel case (*quest. 1 prol. § contra istam rationem*). Nor does it help to say with some that the soul according to its essence belongs to physics and according to intellection to Metaphysics. For truly, if its essence is treated by physics, then its operations too are examined by the same science, as is clear in Metaphysics, in which one treats of God and the Angels and their operations. Nor does it please me what others say — that as regards the sensitive degree it is the province of physics, and as regards the intellective degree, of Metaphysics. This is indeed a futile and vain distinction, since the intellective degree, too, informs the body and through this constitutes man, or the rational animal. Nor do those who distinguish the intellective from the rational degree please me, since in man the rational and intellective degrees are exactly the same.

First assertion: the vegetative and sensitive souls are subjects for physical consideration. This is indicated by the Doctor (*Quodl. 9, § de secundo*). It is proved first from Aristotle (1 *On the Parts of Animals*, c. 1; and 2 *On the Generation of Animals*, c. 3; and also 6 *Met. T. 2*), teaching that the parts of physics are to treat of the aforementioned souls. Second: it is the task of physics to treat of all natural forms (2 *Phys. T. 1*) and of those subject to coming to be and passing away (1 *Phys. T. 82*); and such are the souls just named; therefore their treatment belongs to physics.

Second assertion: physics likewise treats of the rational soul, considered according to its substance and essence. This is touched upon by the same Doctor, *ibid.* It is proved first from Aristotle, who in book III *On the Soul* is almost entirely occupied with inquiry and discourse on the rational soul. Second: the rational soul is the form of the organic body, because it truly informs the human body; therefore it falls under physics. Moreover, the definition of the soul given by Aristotle (2 *On the Soul*, c. 1) is rightly adapted to it. Furthermore, the science that contemplates the whole certainly also meditates on its parts; but physics contemplates the whole man; therefore also his parts, among which the chief is the rational soul. Add the decree of the two Councils, the Lateran and the Vienne, in the Clementine, c. de summa Trinitate, defining that the rational soul is the true and proper form of the human body.

Third assertion: the operations of the rational soul that are free from the body belong to the province of physics. The Doctor holds this explicitly (*Quodl. cit. ante D*). It is proved first from (*7 Met. T. 8*) and other passages cited by Ferchius (*1. 2 vestigatione 6, c. 2*), in which it is clear that the said operations belong to physics. The Council of Vienne, under Clement V, de summa Trinitate et fide Catholica, adds weight, where those are condemned who hold that the rational soul, under the intellective degree, is not the form of the body; and Alphonsus a Castro (*2 adversus haereses, verbo anima*) reports that a certain Peter John fell into this heresy. Second: as regards the intellective degree, the rational soul is the true form of the human body and is distinguished from the other souls; and the definition of nature, which is the principle of motion and rest, belongs to it; therefore as regards the intellective degree it falls under physics. Third: the doctrine that considers the essence of something also considers its properties and operations, as I showed elsewhere; but physics treats of the essence of the rational soul; therefore also of its intellective degree and intellection. Especially since the soul in the body understands all things dependently on the body — hence that celebrated text (*On the Soul, T. 39*): "the one who understands must contemplate the phantasms." And in the state of separation, even if not actually, at least potentially and by aptitude, it regards the body. Similarly, the accidents of the Eucharist, although not actually in a subject, this does not prevent them from being natural accidents inclined to inhere in a subject.

You will object first: Aristotle (*2 Phys. T. 3*) writes that there are three things with which physics is concerned: namely, nature, natural being, and being according to nature. He adds the same (*1 On the Heavens, T. 1*). But the soul is not a nature, according to Simplicius, because it is not a principle of motion and rest; nor is it a natural being, since it is not a composite; nor being according to nature, because only operation and passion are called beings according to nature. Therefore the soul does not belong to physics. I respond that, whatever Simplicius may say, the soul is a nature, as is clear (*2 Phys. T. 7 and 13; and 8 of the same work, T. 27*), where the Philosopher says that animals have in themselves the principle of their motion, and affirms that this comes about through nature. Zabarella, Mercenarius, Toledo, and Faber (*Theor. 33*) establish this same point.

You will object second: physics treats of corruptible and generable forms (*1 Phys. T. 83*); but the rational soul is ungenerable and incorruptible (*1 On the Soul, T. 6; and 2 On the Generation of Animals, c. 3*), since it is not educed from the potency of matter. Therefore its consideration does not belong to physics. I respond first by conceding the major; but for that reason the rational soul is not excluded from its consideration, since the text does not say that physics treats only of material forms. I respond second: although the rational soul is not subject to generation and corruption, nevertheless, since it is ordered to matter or body, which it informs, it is on that account a physical form and falls within the number of physical things. This Aristotle seems to sense when he says (*2 Phys. 26*): physics

extends to the soul which, although it can be separated from matter, nevertheless exists in matter, since it informs that very matter.

You will object third, from (*1 On the Parts of Animals, c. 1*): physics does not treat of every soul, but only of the soul inseparable from matter; but the rational soul is separable from matter; therefore physics does not treat of it. I respond with Alexander and his followers that in that place the Philosopher's question is not only about the soul of animate beings — since he treats at length of this in the books *On the Soul* — but about the soul insofar as it encompasses intelligences, which in a broad sense are called souls, and are commonly called intelligences, the movers of the celestial spheres; and since these are abstract substances, the same Philosopher rightly excludes them from physics. Hence at (*2 On the Heavens, c. 2*), the intelligence moving a heaven is called its soul. And at (*1 On the Soul, c. 1, T. S*), giving examples of souls, he says: "as the soul of the horse, of man, and of God." It is however held for certain by all that God is not informed by any informing soul. The same is suggested at (*6 Metaphysics, c. 1, T. 2*). Or one must respond secondly: physics does not treat of every soul as regards its common and general aspects, I grant; as regards its essence and physical properties, I deny — as Tataretus rightly observes in the present context, and as Scotus seems to touch upon (*Quodl. 2*).

You will object fourth: physics contemplates those things that are in the natural body; but the intellective degree is not in the natural body, especially when the rational soul is separated from the body; therefore at least as regards the intellective degree, the rational soul is not examined by physics. I respond: physics considers not only body and what is in the body, but also the parts of the body, whether conjoined or separate; and therefore nothing prevents the intellective degree and the state of separation of the rational soul from being capable of inspection by physics. Or say that physics is occupied with the proper predicates and attributes of the soul, not with its common and transcendental ones, as I made clear in note 2 above.

Question II. On the Nature of the Science of the Soul.

Article I. Whether the Science of the Soul Is a Science.

All those things are to be recalled to memory which were noted concerning science, its meanings, divisions, and necessary conditions in the *Logic*, book I, question 2, article 2; and book V, question 4. With these recognized and presupposed:

The science of the soul is a science. This is presupposed by the Doctor and defended by the other philosophers. It is proved first: there is a science of the animated body, because it is a knowable object having demonstrable properties; but the science of the soul concerns the animated body, as was decided in article 1 of the preceding question; therefore the science of the soul is a science.

Second: if there is a science of the genus, there is also a science of the species, because the scientific object is both generic and specific, since both participate in demonstrable properties; but of the natural body, which is the genus, there is a science, namely physics, as I showed (*lib. 1 Phys. quest. 1, art. 1*); therefore also of the animated body, which is its species. Furthermore, certain and evident cognition of the soul and the body informed by it is acquired through its proper cause, as will be evident in the course of these books. But certain and evident cognition of a necessary thing through its proper cause is science properly so called, as I showed at length (*Log. lib. 5, quest. 4*). Therefore the science of the soul is placed among the true sciences.

You will object first: what is not sensible either per se or per accidens is not knowable, since our intellect perceives only what falls under sense (*1 Post. 14*); but the soul falls under sense neither per se nor per accidens; therefore it is not knowable, and accordingly there is no science of it. The minor is argued: substance, such as the soul, is not sensible, for sense concerns accidents per se and per accidens the composite, of which the soul is a part. I respond that the major is not universally true, since of God and the Angels there is science, even though they are in no way sensible. Moreover, it can be said that the soul is sensible, not by reason of its nature but by reason of its effects, which fall under sense. Especially because according to us the science of the soul is not of the soul precisely, but of the animated body.

You will object second: the same thing cannot be both knowing and known; but if there were a science of the soul, the same soul would be both knowing and known, since there would be a science of it as a known object. The major is evident, because the same thing cannot be at once agent and patient. I respond that the major holds for the same respect; not however for different respects. Insofar as the soul contemplates itself, it is said to be agent; insofar as it reflects upon itself, receiving such cognition in itself, it is said to be patient and known. Or I say: the major holds for univocal agency, but not for equivocal agency, as happens in the present case.

You will object third: science is of the whole, since the object of science is generic or specific; but the soul is a part of the animated composite; therefore there is no science of the soul. I respond that the major holds for total science, not for partial science, such as that which is precisely of the soul. Or say that the science of the soul is not of the soul alone but of the animated body, as was already decided above.

Article II. Whether the Science of the Soul Is Nobler and More Certain Than the Other Sciences.

Aristotle in the proem of this work numbers the science of the soul among things good and honorable; and from his words its interpreters took occasion to examine and decide this difficulty, which can be raised in two ways. First,

whether the science of the soul is more certain and nobler among the parts of the whole of physics. Second, whether the science of the soul is more certain and more worthy than the other sciences, such as pure mathematics and metaphysics.

Note first: a science can be called more worthy and more honorable than others in two ways. In one way objectively, that is, because its object is worthier than the objects of the other sciences. In another way entitatively, that is, because it is generated through nobler and worthier demonstrations — in which sense that science is more excellent which is acquired through demonstration *propter quid* than that which is generated through demonstration *quia*. Furthermore, note from (*1 Eth. c. 8*) that good is threefold: useful, pleasurable, and honorable. The useful is what is sought for the sake of another, as a bitter potion is a useful good because it is taken by a sick person for the sake of recovering health. The pleasurable good is that whose presence brings delight, as the beatific object, which is contemplated by the blessed, who enjoy it. The honorable good is that which by its own excellence draws and allures the lover, as science, by reason of its excellence, attracts the one who knows it to its attainment. Hence Cicero said: "If virtue could be seen with the eyes, it would excite a wonderful love of itself."

Note second: a science can be said to be more certain in two ways — either simply, because it proceeds from more certain principles and from a more evident object; or according to proportion, and in this sense any science is equally certain, because every science must proceed from true, certain, and necessary things. Furthermore, note that every science, whether of good or of evil, is good, because any science is a perfection of the intellect; whereas on the contrary, error and ignorance are an imperfection of the intellect, and all ignorance seems evil — hence that saying: "Every evil person is ignorant."

First assertion: the science of the soul is among good and honorable things. This is suggested by the Doctor (*quest. 3 prol.*). It is proved first from Aristotle, who at the beginning of book I On the Soul places the science of the soul among honest and honorable goods. Second: what perfects our intellect and is desired for its own sake is an honest and honorable good; but the science of the soul is such, since it investigates the nature of the soul, its capacity, properties, and powers. Therefore the science of the soul is rightly numbered among honorable goods. Add that through the science of the soul man arrives at knowledge of himself, which is greatly commended by the ancients, and that often-repeated saying is received: "Know thyself." David pursued this carefully (*Ps. 119*): "My soul is always in my hands."

Second assertion: among the parts of physics, the science of the soul holds the first place. This is deduced from Scotus at the passages cited by us (*lib. de Caelo, quest. 1, artic. 7, Aff. 2*). It is argued first: the nobility and excellence of a science is derived from its nobler and more excellent object, as I noted not infrequently in the preceding discussions; but the object of the science of the soul is worthier

and more excellent than any other object of physiologia, because every animated thing surpasses any inanimate thing, as I showed at the passage just cited. Second: man surpasses all physical things in nobility, as St. Augustine affirms above all others (*1. 34 contra Faustum, c. 2*); and the science of the soul treats of man, as is evident from books I–III On the Soul.

Third assertion: Metaphysics surpasses the science of the soul in nobility, and mathematics in certainty. This is deduced from Scotus, *ibid.* The first part is proved first from (*6 Met. T. 2*), where Metaphysics is called Theology and the Queen of the sciences. Second: Metaphysics is concerned with God as its chief partial object; likewise with the Angels; and furthermore Metaphysics treats of first principles and proves the principles of the other disciplines; therefore it excels the science of the soul and the other sciences. The second part is argued first from (*2 Metaphysics, T. 16*), where the Philosopher writes and asserts that the mathematical disciplines surpass the other sciences in certainty. Second: that science is more certain which proceeds through more certain demonstrations; but the mathematical disciplines proceed through more certain demonstrations, namely demonstrations *propter quid*, while the science of the soul proceeds through demonstrations *quia* and *a posteriori*, that is, from effect and operation. Third: more certain to us is the cognition of accidents than of substance, both because in our present state we cannot have a quidditative concept of substance itself, as is drawn from the Doctor (*1 distinct. 3, quest. 3, K; O. distinct. 22, quest. 1*), and pursued by Faber (*Theor. 9–8*); and also because the objects of the senses are accidents, among which is quantity, which is the subject matter of mathematics. Therefore the science of the soul is surpassed in certainty by mathematics.

You will object first: in book VIII of the Physics one treats of the first mover, who is God, and in the book On the Heavens one treats of the intelligences moving the celestial spheres; but God and the intelligences are nobler than the soul and the animated body; therefore the science of the soul does not pre-empt all parts of physics. I respond: physics does not treat of God and the Angels *per se*, but *per accidens*, insofar as they move the celestial bodies; whereas the science of the soul treats *per se* of the soul and the animated body, investigating its essence, powers, faculties, and operations.

You will object second: the science of the soul is concerned with what each person experiences in himself — for it is about the soul, vital operations, and such things, which are evidently in us. Hence Augustine, cited by Ruverius here, question 1, adds: "I do not know whether one who does not know that he has a soul actually has one." Therefore the science of the soul is more certain than the other doctrines. I respond that the argument concludes for a *posteriori* science, not *a priori* — and it is by reason of a *priori* science that mathematics and metaphysics are said to be more certain than the science of the soul. I add the caution of Augustine (*in Ps. 73*): "How do you know that one is alive, whose soul I do not see? You will answer: because he speaks, because he walks, because he

operates. Fool — from the works of the body I recognize a living being; from the works of the soul can you not recognize the Creator?"

Book II. On the Soul in Itself.

Aristotle follows in this work the same method he prescribes to be observed (*1 Post. c. 1*), namely, presupposing of the subject whether it exists. Indeed in the present case he does not examine whether the soul exists, since its operations and effects — namely, vegetation, sensation, and intellection — are evident to all. Therefore, leaving aside the question whether the soul exists, one rightly investigates what it is, beginning from its essential and quidditative predicates, which are common and universal. Three questions are moved in this book: the first is on the essential predicates of the soul; the second, on the parts of the animated body; and the third, on the powers and faculties of the soul.

Question I. On the Essential Predicates of the Soul.

Article I. Whether the Soul Is a Substance.

Certain authors, related by Ferchius (*vestigatione 6, c. 1, n. 2*), following Galen (*1. 2 de locis affectis, c. 6*) and Alexander, think the soul is a *krasis*, that is, a temperament of the four primary qualities — which, being an accident, they must accordingly acknowledge to be an accident. Aristotle attests that Empedocles and other ancients held this view (*1 On the Soul, T. 54*). And Theodoretus (*1 de divinis decretis*) recounts that certain sectarians, namely Carpocrates and Epiphanes, inclined toward this error. Not far from them seems to be Plato in the *Timaeus*, who holds the soul to be a number of sounds and harmony (*as Augustine indicates in de vera Religione, c. 42*), although perhaps Plato himself spoke metaphorically. The common opinion, however, is that of Aristotle (*1 and 2 On the Soul, c. 1*), Scotus, and others teaching that the soul is a substance.

Note that substance is used in two ways. First, for the foundation and base of any edifice, whether corporeal or spiritual — in which sense (*Hebrews 11*): "Faith is the substance of things hoped for, the evidence of things not seen." Second, for what subsists per se — and in this sense it is properly substance, which is divided into partial and total, or into matter, form, and the composite (*6 Metaphysics, T. 2*): the former are partial substances; the latter is a total and complete substance.

Assertion: the soul is properly a substance. So Aristotle at the passages named above; St. Augustine agrees (*1 contra Secundinum, c. 13*); and the Doctor assents (*3 d. 22, quest. unica, § Ad 1. principale, R*). It is proved first: what constitutes a composite substance is itself a substance, because a composite substance does not coalesce from substance and accident — otherwise it would be a being per accidens; but the soul constitutes the living and animated composite substance,

since it is the chief part of the animated composite; therefore the soul is a substance, although partial and incomplete. Second: through the soul the animated body is distinguished from the inanimate body — for as is seen in the tree of Porphyry, body is divided into animated and inanimate; and that distinction is not accidental, because it is a substantial division; therefore the soul, which is the constitutive and distinctive differentia of the animated from the inanimate, is truly a substance. Third: what exists per se and subsists independently of the body is a substance, as is clear from the definition of substance; but the rational soul exists per se and subsists when separated from the body, as no Catholic denies. Therefore the rational soul is a substance — and the same must be affirmed of the vegetative and sensitive souls.

You will object first: a substance is a being existing per se; but the soul does not exist per se, since it exists in the body; therefore the soul is not a substance. I respond — with the major conceded — by distinguishing the minor: by inherence, I deny it; by information, as a part in its co-part, I grant it.

You will object second: a substance is a being that underlies accidents, derived as it is from "to underlie"; but the soul does not underlie accidents — since the proximate and immediate subject of accidents is, as was said elsewhere, the whole composite, not the soul; therefore the soul is not a substance. I respond that although this etymology of substance is true in some cases, it is not true in all, for God is a substance yet underlies no accident. Therefore it is better to say that substance is derived from subsisting per se. Or I grant the major and deny the minor: for the soul is the subject of its own proper accidents, such as intellection, volition, and the like — though not of common accidents, such as material accidents. Or say that the soul is the subject by which (*subiectum quo*) of accidents, not the subject which (*subiectum quod*).

You will object third: a substance can at least by divine power be separated from everything with which it is joined; but the vegetative and sensitive souls cannot, even by divine power, be really separated and segregated from the bodies they inform, since they are generated with their generation and corrupted with their corruption and destruction; therefore it is an evident sign that the said souls are not substances. I respond that the reason the aforementioned souls cannot be really abstracted from bodies is that they depend in their coming to be and in their being on matter. Hence, just as the other material forms cannot be separated from matter for the same reason, so similarly the vegetative and sensitive souls perish with the perishing of their bodies. All the more so because, as Ferchius (*cited lib. 3*) notes, there are not lacking those who think that even the said souls can be really separated from the matter and bodies they inform.

You will object fourth: the soul is that by the perishing of which the animal perishes; but by the destruction of the animal's temperament the animal is destroyed, as is evident; therefore the soul is a temperament of the primary qualities. Confirmation: the soul is the principle from which diverse passions

and affections proceed — such as hatred, love, and the like — which arise from diverse temperaments: the choleric are prone to anger, the melancholic to sadness, the sanguine to joy, and the phlegmatic to illness. I distinguish the major: as form, I grant it; as disposition, I deny it. The animal's life depends on both, but most of all on the soul. To the confirmation the same distinction must be made. For from the varied disposition of matter arise diverse temperaments, and diverse effects proceed.

Article II. What Kind of Substance the Soul Is.

Most of the ancient philosophers, thinking that nothing exists in nature besides matter and body — whether coarser or more subtle — hold the soul to be a body; as Augustine sometimes followed (*5 Confess. c. 13; and lib. 6 of the same work, c. 1*). Into the same opinion those seem inclined who suspect the soul to be a particle of the divine essence and substance — a view which Alphonsus a Castro recounts and refutes (*secundò adversus Haereses, verbo Anima, haeresi 4*). But Aristotle (*1 On the Soul, c. 5, T. 72*), his interpreters, and all later philosophers teach that the soul is a substance distinct from matter and body.

First assertion: the soul is not matter, nor body, but a partial substance distinct from them. This assertion is threefold and is deduced from Scotus (*2 d. 9, quest. 2, § Ad argumenta 2. quaest. P; and Quodl. 9*). The first part is proved first: matter is common to both sublunary and celestial bodies; therefore the soul is not matter. The antecedent was proved in the book *On the Heavens (quest. 1, art. 1 and 3)*. The consequence holds, because sublunary and celestial things would be of the same species, since they would share matter, which is of the same species in these as in those, as I proved there in article 3. Second: the soul is an active principle, since vital actions proceed from it; but matter is only a passive principle, being the subject of forms (*1 Phys. T. 82*); therefore the soul is not matter. Third: if the soul were matter, there would be no distinction between animated and inanimate things, since all of them share matter; but all acknowledge an essential difference between animated and inanimate things; therefore the soul is not matter.

The second part is suggested by Augustine (*1 de immortalitate animae, c. 7; and 1. 83 quaest. 54*), saying: "The soul is better than the body." It is proved first: what is in another is distinct from what is not in another — for the same thing, simultaneously and with respect to the same, cannot be both in another and not in another, otherwise there would be a contradiction; but the soul is in the body, and the body is not in the soul nor in something distinct from the soul, as Aristotle argues convincingly at the cited passage. Therefore the soul is not a body. Second: the act of a body is not a body, because the same thing cannot simultaneously be informing and informed, actuating and actuated; but the soul is the act of the body, since it informs and actuates the body, as will be clearer in what follows. Moreover, a body can remain without the soul, as is seen in a corpse; therefore the soul is not a body. The consequence holds, because if the

soul were a body, while the body persists the soul too would persist — the opposite of which we experience.

The third part follows from the preceding parts. But since a separate article is to be established below to prove and decide this, I judge that it is to be passed over here.

Second assertion: the soul is not of the substance of God. This is presupposed by the Doctor *ibid.* and shown first from Sacred Scripture (*Gen. 2*): "He breathed into his face the breath of life." If therefore the soul is the breath of life, it is not the substance of God nor of his substance, just as the breath proceeding from a man's mouth is not the substance of man nor of his substance. Second: if man were of the substance of God, he would be equal to God himself, just as the Son of God, who is of the substance of God the Father, is equal to him and participates in his attributes and predicates, and would thus be all-knowing, all-powerful, and immutable like God — which is false, since, as Job testifies (*Job 13*): "Man does not remain in the same state." Third, from the Council of Braga, c. 5, defining thus: "If anyone believes that human souls or Angels are from the substance of God, as Manichus and Priscillian held, let him be anathema." Furthermore, the rational soul is created, as the sacred text cited signifies (*c. 1*): "God created man in his own image and likeness." And the image and likeness of God is posited in the soul and its powers and acts, as was said elsewhere; and creation properly is making from nothing, as is clear from (*2 distinct. 1, quest. 1*). It is therefore concluded that the soul is not from the substance of God.

You will object first: matter is receptive of accidents; but the soul receives sensible and intelligible accidents; therefore the soul is matter. The major can be denied. For the proximate and immediate subject of accidents is the composite, from what was asserted in (*5 Phys. quest. art. 4*). And when accidents that are peculiar and proper are subjected in the soul, it must be said that the soul is their subject by which (*subiectum quo*), not the subject which (*subiectum quod*), such as is the composite. All the more, because being a common subject of accidents does not argue identity of things, since such accidents do not pertain to the quiddity and nature of the things themselves, but are entirely extrinsic.

You will object second: what are material are bodies or at least corporeal; but the vegetative and sensitive souls are material and divisible into not only integral and quantitative parts but also entitative parts; therefore they are bodies or corporeal. The major can be denied. For accidents that follow upon the substantial whole are called material even though they are not bodies. Therefore the vegetative and sensitive souls are called material and corporeal because they depend in their being and coming to be on matter and body — just as material accidents do.

You will object third: St. Augustine (*22 City of God*) writes that Aristotle held the soul to be a fifth body, beyond the four elements and far superior to them. And

this can be deduced from (2 *On the Generation of Animals*, c. 3). Therefore in the Peripatetic school the soul is a body. I respond: Augustine reported this from the opinion of Cicero (1. 1. 99. *Tusc.*), falsely imputed to Aristotle, as is evidently clear from Aristotle himself (1 *On the Soul*), where he is entirely occupied in refuting the ancients who held the soul to be an accident, or matter, or body. To the testimony of the Philosopher I say that he only intends there that through natural heat the soul converts nourishment into the substance of the living and animated body.

Article III. Whether the Soul Is Subsistent.

Vazquez (3 p. disp. 32, c. 4); Molina (1 p. art. 2, q. 29, disp. 3); and Fonseca (5 *Met.* c. 8, q. 5) hold that the soul enjoys no proper subsistence of its own, but that only the composite enjoys total and complete subsistence. Scotus however (*Quodl.* 4, § *contra illud*, M; and *Quodl.* 5, § *Ad primum istorum*, V); Lychetus, Gadius, and others *ibid.* teach that the soul enjoys its own partial and incomplete subsistence.

Note from the Doctor (*Quodl.* 9, § *de secundo sub A*) that subsistence is divided into total and partial. Total subsistence is the twofold negation of incommunicability, both as a quo and as a quod — that is, a substance which subsists per se through total subsistence can be communicated to another neither as a form nor as a total nature, because it is rendered entirely incommunicable and independent, both actually and aptitudinally — which is to say, the substance that subsists thus depends on another neither actually nor aptitudinally. Partial subsistence is non-inherence in another, which belongs to a partial substance that neither actually nor aptitudinally inheres in a subject — and in this it is distinguished from an accident, whose proper characteristic is to inhere in another. Aristotle suggests this in the Ante-predicaments, saying: "Substance is not in a subject; an accident, on the contrary, is in a subject."

Assertion: the soul does not subsist through total subsistence, but only through partial subsistence. This is defended by Scotus, *ibid.* The first part, which is against Origen (1 *Peri Archon*, c. 5), is proved first: the soul is a partial substance; therefore its subsistence is partial. The antecedent is known, because the soul is part of the animated body. The consequence holds, because subsistence follows upon substantial entity: if the latter is partial, the former likewise is partial; if it is total, the former too will be total. Second: the rational soul when separated from the body tends by natural desire toward union with the body; and such natural inclination arises from nothing other than the fact that it subsists partially and desires total and perfect subsistence, which belongs to the composite alone; therefore the soul does not subsist through complete and perfect subsistence.

The second part is proved first from St. Athanasius at the Council of Nicaea against Arius, defining that substance, as distinguished from accident, is a being that has the capacity to subsist. Second: every substance is subsistent, since it is

defined as a being subsisting per se; but the soul is a substance, as is clear from article 1 of this question; therefore the soul has its own partial subsistence.

Third: what is in another by information and as a part acquires its own partial subsistence — since if it is separated from the whole, it still subsists per se; but the soul is in the body by information and as part of the physically animated body; therefore the soul subsists through partial subsistence.

You will object first: what subsists per se can be separated from that in which it is; but the vegetative as well as the sensitive soul can in no way be separated from the bodies they inform; therefore at least these souls do not participate in partial subsistence. I respond that the major is to be glossed: provided it does not depend on matter in its being and coming to be — as is the case with the aforementioned souls. Just as creatures subsist per se if they are substances, even though they cannot exist without God, because they depend on him in their being and coming to be. Similarly, substantially entitative parts subsist per se, even though one cannot exist without the other.

You will object second: what subsists per se is created, because subsistence is had through a proper and peculiar action, such as creation; but the vegetative and sensitive souls are not created, since they are educed from the potency of matter; therefore they do not subsist per se. The major is to be denied. For grace is created, yet does not subsist per se, since it is an accident whose characteristic is to inhere in a subject.

You will object third: if the rational soul enjoyed its own proper subsistence, through the union of humanity with the divine Word the very subsistence of the soul would have been destroyed, because the humanity of Christ was assumed to subsist through the subsistence of the divine Word; but this is not conceded; therefore neither is the other to be admitted. The consequence of the major is denied, because that humanity was united to the Word in the unity of incommunicable, suppositional, and personal subsistence — not in partial and incomplete subsistence, such as the partial subsistence of the rational soul is.

Article IV. What the Soul Is.

Having rejected the opinions of the ancient philosophers who held mistaken views about the soul, Aristotle brings forward in the middle the definition of the soul (*lib. 2, c. 1*), saying: "The soul is the first act of an organic body having the potency for life." This definition must be explained and defended against the attacks of adversaries, above all the Platonists, by whom it is assailed.

Note first from Scotus (*4 distinct. 1, quest. 2*) that definition is used in two ways. First, for the declarative account of any being whatsoever, whether real or of reason, whether positive or negative and privative, that acquires the name of being. Second, properly for the declarative account and statement of a real positive being, universal per se, and composite, with physical or metaphysical composition. In this sense the soul cannot be defined, since it lacks both kinds

of composition and is itself a part of a physical composite. Hence the aforementioned definition of the soul is called exact and essential — so much so that no better or more exact one has hitherto been found.

Note second, for greater understanding of the said definition, that all its words and particles must be explained. It says "act," on account of matter, which is potency. "First" is placed, both on account of accident, which in relation to substance is called second act, and also on account of operation, which is second act. "Of an organic body" is added — not meaning matter affected by organs, as most interpreters take it, since matter is not a body but part of an organic body; nor is matter organic, otherwise that particle "organic" would not be rightly placed. Therefore, by those words "of an organic body" is meant not a mathematical body but the composite of matter and the form of the mixed substance, which, rightly disposed and duly organized, is the suitable subject for the soul — as Aristotle indicates, saying that the soul is the act of the body, that is, the form of the body. But about this more fully below, when we shall treat and inquire whether the soul informs bare matter or whether it requires in matter the form of corporeity beforehand. "Having the potency for life" is added, which can be more correctly expounded of life in first act according to (2 *On the Soul*, T. 36): "To live for living things is to be," than of life in second act, which is the vital operation emanating from the soul itself, as Aristotle warns (9 *Eth. c. 7*): "We are our operations, and we are by living and acting actually."

Assertion: the definition of the soul set forth above is rightly given by Aristotle. This is indicated by the Doctor (1 d. 17, *quest. 2*). It is proved first: for a good definition three things are required. First, that the definition distinctly and clearly explain what the defined term designates confusedly. Second, that the definition be mutually convertible with the defined. Third, that it contain nothing superfluous or defective. But these three conditions belong to the said definition, as is evident to one going through each of the individual particles adduced and explained in the first note. Second: a correct definition is had through genus and differentia, or through quasi-genus and differentia, in those things that do not have their own proper genus and differentia, as is clear in the Epitome (*lib. 2, quest. 7, art. 2*); and the definition of the soul is given through quasi-genus and differentia. For "act" is placed as genus, and the remaining particles serve the role of differentia. Add that no better or more exact definition has hitherto been found, even by those who attack it; therefore the said definition is to be retained.

You will object first: Aristotle, after assigning the definition of the soul, adds that he has defined the soul *en toutoi*, that is, "in figure," as some interpret it; but a definition in figure is not essential and exact, but only descriptive and in rough outline; therefore the aforesaid definition of the soul is not legitimate. I respond by not accepting that interpretation, but embracing the translation of Argyropylos, who renders *en toutoi* as "in common." And indeed rightly, for it

suits the text of Aristotle, who defines the soul taken in common and generally — and this is not hidden from Scotus at the cited passage. This is confirmed from (*lib. 1 de Historia Animalium, c. 1*), where the Philosopher proposes to treat of the proper differences of animals, of which he says one must treat "in figure," that is, in common, and then of each of their genera more exactly. He writes the same (*1 de Praedicamentis, c. 5; and 1 Eth. c. 3; and 10 of the same work, c. 6; and 7 Met. T. 7*).

You will object second: the definition of the soul must belong to every soul, as the laws of a good definition require; but the said definition does not fit every soul, such as the rational soul, which, when abstracted and separated from the body, is not the act of a body; therefore it has not been properly given. I respond — with the major conceded — by denying the minor. For even if the rational soul does not actually inform the body when separated from it, it is sufficient that it can inform it and tends toward it.

You will object third: the aforesaid definition belongs to things other than the soul; therefore it is not appropriate and fitting. The antecedent is argued: it belongs to an Angel assisting a body, in which it moves the body itself and exercises other vital operations. I deny the antecedent. To its proof I say that an Angel does not inform a body but assists it and moves it in the manner in which a sailor moves a ship and a charioteer a chariot.

You will object fourth: the soul is the most powerful perfection of the animated thing; therefore the soul is not a first act but a second, because second act is more perfect than first, according to that: "each thing exists for the sake of its operation." Hence Aristotle (*1 Eth. c. 12; and lib. 10 of the same work, c. 6 and 7*) teaches that happiness, which is the ultimate end and the greatest of all perfections, consists in operation, which is second act. I grant the antecedent and deny the consequence. To that maxim I say it is to be interpreted of the formal end, not of the objective end.

Article V. Whether the Second Definition of the Soul Is Legitimate.

All Peripatetics acknowledge that the second definition of the soul is good, given by Aristotle (*2 On the Soul, c. 2, T. 19*) in these words: "The soul is that by which we live, sense, are moved in place, and understand." More clearly: "The soul is the principle of living, sensing, moving in place, and understanding." Although all interpreters of Aristotle receive this definition as correct and true, yet they disagree among themselves about the manner in which it is to be received. For Aegidius, in the cited text, thinks it is a fourfold definition contained in one, corresponding to the fourfold species of souls. Simplicius thinks it fits the rational soul alone. The common opinion of the other philosophers holds it to be a single definition only, adapted not to the rational soul alone but to the soul taken generally.

Note: Aristotle, in order to clarify the first definition of the soul, devised the second definition proposed by us at the beginning of this article. For from the fact that the soul is the principle of living, sensing, moving in place, and understanding, it is easily understood that the soul is the first act of an organic body having the potency for life. For from operations and effects we arrive at cognition of the cause. This later definition, moreover, is not to be taken copulatively — for in that case it would belong only to the rational soul — but disjunctively, which is to say: the soul is the principle of living, or sensing, or moving in place, or understanding. Furthermore, note that the principle placed in this definition is not the principle which (*principium quod*), since this belongs to the animated composite, but the principle by which (*principium quo*). Therefore it is rightly said that the soul is that by which we live, sense, are moved, and understand. Furthermore, this principle is not extrinsic, like a charioteer moving a chariot or a sailor a ship, but intrinsic and an essential and chief part of the physically animated composite.

Assertion: the aforesaid definition of the soul is not fourfold contained in one, but is a single definition, not fitting the rational soul alone but the soul taken generically. This assertion is threefold, suggested by the Doctor (*1 d. 17, quest. 2, § contra istam, FF; and 2 d. 16, quest. unica*). The first part is argued first from Aristotle in the present context, who explicitly asserts that he is giving another definition different from the preceding one, which is its manifestation and declaration; therefore there is only one definition of the soul, not four. Second: there are not four species of souls, for the soul is distributed only into vegetative, sensitive, and intellective; therefore there are not four definitions of the soul contained in one. The antecedent is evident. The consequence is derived because, according to the number of souls, the number of definitions is assigned.

The second part is proved first from Aristotle, who at the cited passage acknowledges that he is defining the soul in common; therefore he is not providing a definition fitting the rational soul alone, otherwise he would be departing from his stated purpose. Second: the said definition, as I noted above, is not to be taken collectively but disjunctively; but taken disjunctively it is not adapted to the rational soul alone; therefore etc.

The third part follows from what was said in the two preceding parts: if there is only one definition of the soul, and it belongs not only to the rational soul, it is rightly inferred that it fits the soul in common.

You will object first: something other than the soul is the principle of living, moving in place, and understanding; therefore the said definition of the soul is not fitting and legitimate. The antecedent is proved from (*Acts 17*): "God is declared to be the principle in whom we live, are moved, and have our being." I deny the antecedent. To its proof I say it is to be explained of the extrinsic principle — not of the informing and intrinsic principle of the said operations.

Or say with Lyran, in the Postilla, that God is the efficient cause, while the soul is the formal and intrinsic cause.

You will object second: the soul is the principle of vital operations; therefore the soul is their principle which (*principium quod*). The antecedent is evident; the consequence is proved: that is the principle which to which operations and actions are truly attributed; but vital actions are attributed to the soul; therefore it is their principle which. I grant the antecedent and deny the consequence. To its proof I say that actions belong ultimately to the supposits as their denominative subjects, and therefore the animated composite is the principle which, while the soul is the principle by which.

You will object third: the rational soul, when separated from the body, is truly a soul, yet is not the principle of vegetating, sensing, and the other vital operations; therefore it is wrongly said that the soul is the principle of the said actions. I respond: in the state of separation, even if the rational soul is not the actual principle of the aforesaid operations, it is nonetheless their potential and aptitudinal principle — which is sufficient for it to be called and to be the principle of the same operations.

You will inquire whether the said definition is essential and quidditative, or accidental and descriptive? I respond that it is descriptive, since it is given through a principle and a potency of operating, which presupposes the essence and nature already constituted in its essential and quidditative being, from which the powers, faculties, and potencies of operating flow. Aristotle suggests this when he testifies that he attributes the prior definition through hidden and obscure things, but the later one through clear and manifest things — namely, effects and operations — which are more apparent to us than causes and their principles, since they are more sensible and nearer to our senses. This will be further illustrated and made clear from the following article.

Article VI. Whether One Definition Can Be Demonstrated Through the Other.

Averroes, in the present context, thinks that in the aforesaid definitions of the soul the Philosopher uses no demonstration, and that one definition cannot be demonstrated through the other. The generality of philosophers, however, holds that Aristotle does demonstrate one through the other; yet they contend among themselves about the manner of demonstration. For Aegidius, Cajetan, and Albert hold that the first is demonstrated through the second by an a priori demonstration. The others, such as the Parisians in the exposition of the text; Tataretus *ibid.*; Ruverius (*lib. 2 de anima, quest. 10*); and the Complutenses (*disp. 3, quest. 3, § 2*), teach that the former is demonstrated through the latter by a demonstration quia and from the effect.

First assertion: Aristotle in giving the said definitions of the soul uses demonstration. This is indicated by the Doctor (*1 d. 17, quest. 2, § Contra istam conclusionem ante FF*). It is proved first: Aristotle at the beginning of chapter 2 of the present work book II On the Soul, promises that he will bring forward a definition of the soul that will serve as a middle term for demonstrating the other definition set forth in the first chapter of the same book. Therefore Aristotle demonstrates one definition through the other. Second: through the effect of something its cause can be demonstrated by a demonstration quia and from the effect; but the later definition of the soul is from effect and operation — namely, vegetation, sensation, and intellection. For in this way the demonstration is constructed: Everything that is the principle of living, sensing, and understanding is the first act of an organic body; but the soul is such a principle of vegetating, sensing, and understanding; therefore it is the first act of an organic body.

Second assertion: the first definition of the soul is demonstrated through the second, a posteriori. This is suggested by the Doctor just cited, where he says: "From this, that the soul is that by which we live and sense, it is concluded that the soul is act and the form of the thing acting thus." It is proved first from Aristotle (*2 On the Soul, c. 2*), asserting that the second definition of the soul is had through things more knowable to us, which are effects and operations — and according to these the demonstration quia and a posteriori is made. And *ibid.* (*T. 36–37*), setting forth individually the actions and operations of the individual souls; therefore the later definition is given through the operations and effects of the soul — namely, vegetation, sensation, change of place, and intellection; therefore the prior definition is demonstrated through the later one by a demonstration quia and from the effect. Second: a thing is constituted in its substantial and essential being before being in its operative and effective being; but to be the act of an organic body is the essential being of the soul, and to be the productive and operative principle is something consequent; therefore the prior definition of the soul is demonstrated through the later one by demonstration quia. And this is corroborated: just as being relates to operating, so the principle of being relates to the principle of operating; but to be the first act of an organic body is to be the principle of being — for in this way it constitutes, actuates, and animates the body; whereas to be the principle of vegetating, sensing, and the like is to be the origin and efficient cause of operations. Furthermore, because a thing has such being and is of such essence and nature, for that reason it has such a principle of operating — and not the reverse. Therefore, because the soul is the first act of an organic body, for that reason it is the principle of vital operations; therefore the second definition demonstrates the first a posteriori and from the effect.

You will object first: Aristotle at the beginning of chapter 2 promises that he will seek and give a definition that distinctly expresses the cause of the thing; therefore the later definition shows the former a priori and demonstrates it by a

demonstration from the cause and propter quid. And this seemed fitting — that Aristotle should provide the definition proceeding from effect to cause rather than from cause to effect — and Cajetan above others teaches that he has done this. Some respond that that text is to be expounded of the final cause, for the end of the soul is operation: sight exists that we may see, the intellect that we may understand, and the soul that we may operate. With this granted, it can be said that Aristotle there brings forward a demonstration through the final cause. Or say that the later definition of the soul contains the cause, because vital operations proceed from the soul as from a cause, at least a radical one, and concerning these demonstrations are made from the effect and a posteriori.

You will object second: it is prior for a thing to be in itself and to have being in itself than to regard another, because a thing is constituted in its being before being ordered to another; but to be the principle of vital operations is for the soul to be in itself precisely and absolutely, whereas to be the act of an organic body is to be in order to another distinct from the soul itself; therefore the second definition rightly demonstrates the first a priori. I distinguish the major: of complete and total beings, I grant it; of incomplete and partial beings, I deny it. For an incomplete and partial thing implies an order to another, so that from the two a whole may be made — and thus from soul and body the animated whole is composed.

Article VII. How Many Species of Souls There Are.

There exists a great variety and disagreement of opinions among philosophers about the species of souls. Some, whom Plato in the *Timaeus* and Anaxagoras seem to favor, suspect there is one soul in species, which through various organs and diverse dispositions elicits various and diverse operations — vegetating in the body of a tree, sensation in the body of a brute, and intellection in the body of a man. Some, to whom Aegidius and Cajetan adhere in the present context, imagine there to be four species of souls: vegetative, sensitive, locomotively motive, and intellective. Others constitute two souls specifically distinct: the sensing and the understanding. But the generality of philosophers, with Aristotle (*2 On the Soul, T. 30 and 31*), establishes three species of souls: vegetative, sensitive, and intellective. From what source, however, this threefold number is drawn is not one and the same mind and sense for all, as will be made plain below in conclusion 2.

First assertion: there are three species of souls. This is suggested by the Doctor in both works (*2 d. 15, quest. unica*). It is proved first from Aristotle (*2 On the Soul, T. 30 and 31*), recording only three souls: the vegetative, sensitive, and intellective. St. Augustine agrees (*8 de Civitate, c. 8*) and hints at the following reason in his commentary on Ps. 144. Second: there are as many specifically distinct species of souls as there are their essential differences, since through diverse essential and quidditative differences distinct species are constituted essentially; but there are only three specific and essential differences of souls,

namely vegetative, sensitive, and intellective; therefore there are only three species of souls. Furthermore: there are three diverse operations proceeding from three really and essentially distinct principles; therefore three species of souls are numbered. The consequence holds from effect to cause. The antecedent is shown: for there are vegetation, sensation, and intellection, which are really distinct and found in subjects really and essentially distinct; therefore their constitutive and distinctive principles are really and essentially distinct, as the Subtle Doctor argues fully and acutely in a parallel case (*1 d. 26, quest. unica*).

Second assertion: the specific threefold number of souls is not derived from the three ways in which the soul raises itself above matter. This is deduced from the Doctor *ibid.* and opposed to St. Thomas (*1 p. quest. 77, art. 1*). It is proved first: if the specific distinction of souls were taken from the diverse manner of raising itself above matter, there would be more than three species of souls — but this the adversaries do not admit; therefore neither should they grant the former. The major is argued: a dog, for example, raises itself above matter in a nobler way than a midge or fly; yet the dog is comprehended under the same genus of sensitive soul as the midge and fly. Furthermore, an elephant likewise raises itself above matter in a more excellent way than an oyster, since, as Athenaeus testifies, the elephant is very docile and almost capable of learning; yet notwithstanding this, the said animals are taken under the same genus of sensitive soul. Second: a diverse and varied mode of things does not vary or diversify things, and therefore does not argue specific or generic difference, since a mode, as was said elsewhere, is described as what, added to a thing, does not vary the thing; therefore from the said mode no essential and specific distinction of souls is gathered.

You will object first: the rational soul is not one in species; therefore there are not three species of souls. The antecedent is admitted: the rational soul is part of a species, since it and the human body constitute man, who is a species. Add that the vegetative soul is multiple and distributed into various genera — of roots, herbs, plants, and trees. Similarly the sensitive has under it innumerable winged, aquatic, and terrestrial creatures. Man, however, is the lowest and most specific species. Hence the soul does not seem rightly to be divided into two subalternate species and a third that is lowest. I respond that, properly and strictly speaking, neither the rational nor the other irrational souls are species, but parts of species and quasi-species — because a part is sometimes used for the whole, as at (*Gen. 6*) man is called "flesh," and at (*Ezekiel 13*) "soul." As for what is added about the rational soul being the most specific species while the other souls are subalternate species — this is no obstacle. For discrete quantity is divided into number and speech, the latter being the lowest species. Likewise, when, where, and position, although they are highest genera, have few species and no intermediate subalternate ones. Again, animal is divided into brute and man: the former into many species, the latter into only one that is the lowest.

You will object second: there are four genera of animate things — vegetative, sensitive, locomotively motive, and intellective — as Aristotle acknowledges in the present context; therefore there are also four genera of souls. For if animate things are fourfold, then souls too are fourfold, since a thing is not animated unless animated by a soul. I grant the antecedent and deny the consequence. The reason is that the fourfold division of animate things is derived not from diverse souls but from diverse potencies really distinct from one another. For it can happen — and indeed in fact does happen — that certain animals do not move from place to place, such as those affixed to rocks, and do not have the local motive potency; while others do move from place to place and possess the local motive potency, like a dog. But the threefold specific distinction of souls is derived from three essential and specific differences, of which I made mention above.

You will object third: what vegetate also sense; therefore the vegetative and sensitive do not differ essentially from one another. The antecedent is proved: certain trees attract certain juices; others expel them. Again, certain ones flee the company of others, as the olive flees the oak, the vine the laurel and the cabbage, the fern the reed; while others mutually cherish and embrace one another, as the vine the olive and the elm. Add that when the vine is cut, it seems to shed tears; therefore what vegetate do not differ in species from what sense. I respond that these and similar things are produced through sympathy or antipathy, as Pliny notes and records (*1. 26 hist. nat. c. 1*). But things that vegetate live, as is read at (*John 12*): "Unless a grain of wheat falling into the ground die"; and (*1 Cor. 15*): "What you sow is not quickened unless it first die." Augustine confirms this (*1 de Civ. c. 20*), adducing that (*Ps. 77*): "He killed their vines." And at (*11 of the same work, c. 6*) he adds that plants live by vegetative life, distinct from sensitive life; whose reason Aristotle gives (*3 On the Soul, c. 12, T. 66*): "The matter of plants is extremely earthly; and therefore is incapable of sense." Furthermore, in sentient beings sleep and waking are found, which we experience to be absent in plants. As for what is added about the vine emitting moisture — I say this occurs not because it has sense, of which it is devoid, but because of the abundance of the said moisture; hence at another time (spring excepted), if its shoots are cut, it emits no moisture.

You will inquire whether the aforesaid division of souls is univocal? Aristotle responds (*2 On the Soul, c. 1*) that it is univocal, and there compares it to a figure that participates in one common univocal concept belonging to all figures and to individual ones — so the common univocal concept of soul is established as belonging to all souls.

Article VIII. Whether the Soul Is Indivisible.

Thomas Argentinas (*1 d. 1, quest. 8*) reports that Gerard Odo holds all souls — whether vegetative, sensitive, or intellective — to be divisible. On the contrary, Simplicius and Ammonius (*3 On the Soul, com. 20*) hold that all souls are

indivisible. St. Thomas (*1 p. q. 76, art. 8*), Cajetan *ibid.*, and others of the same school hold that the souls of imperfect animals are divisible, while the souls of perfect animals are indivisible and incapable of division. The Subtle Doctor, however (*4 d. 1, q. 5; and d. 44, q. 1, art. 1*) and many others assert and decide that all souls besides the rational are divisible and capable of being cut.

Note first: a thing can be divisible in three ways. First, divisible into essential parts — in which way a composite is divided into matter and form, from which as essential parts it coalesces. Second, into potential parts, that is, into potencies, powers, and faculties — in this way the rational soul is distributed into intellect and will as its potencies and powers. Third, into integral parts — in this way the human body is distributed into head, arms, and the other members.

Furthermore, note that there is another division, explained elsewhere by us, into entitative and quantitative parts. For a material substance has in itself substantial parts — called entitative — prior to being affected by quantity, by virtue of which it is divisible into integral and quantitative parts. In the present discussion, the question is whether the soul coalesces from such entitative and quantitative parts, into which it is formally divisible and capable of being cut.

Note second: a nobler and more perfect soul requires more excellent and superior dispositions for its introduction and information of the body; more organs are required for the exercise of vital operations by the soul of a horse than by the soul of a frog and a midge. Similarly, more things are required for the infusion of the rational soul than for the production of the soul of a horse. Hence perhaps Aristotle (*de Senectute, c. 1*) adds that the souls of the *entoma* — that is, annulated animals — are indivisible, because if they are cut through the middle they still live, which does not happen with perfect animals. Again, if some parts of plants or branches of trees are cut off and planted, they still become green and germinate — perhaps for this reason, that the seminal power in them is diffused through all their parts; not so, however, in the other animated things, which have a determinate and fixed place in which their seed is preserved, as Aristotle suggests (*2 On the Soul, T. 20, sum. 1, c. 2*).

Assertion: all souls, both vegetative and sensitive, whether of perfect or imperfect animals, are capable of being cut and divisible — except the rational soul, which is incapable of being cut and indivisible. This assertion is twofold, maintained by the Doctor at the passages cited at the beginning of this article. The first part is proved first: what is material and corporeal participates in the properties of material and corporeal being, because where there is the nature of a thing, there consequently are its passion and affection, since these follow from and spring out of that nature; but the sensitive and vegetative souls are material and corporeal in everyone's opinion; therefore they participate in the properties of material and corporeal being, of which kind is quantity, whose property is divisibility. Second: what is educed from a divisible and cuttable subject is itself divisible and cuttable, since it receives its nature and property from something

divisible and cuttable; but the vegetative and sensitive souls are educed from the potency of matter, which is divisible and cuttable; therefore the souls themselves are divisible and cuttable. Moreover, the said souls are corrupted by the corruption of the bodies they inform — for they are mortal and corruptible; therefore also divisible. Again, it is confirmed by experiment in plants and trees: if some parts — such as branches — are cut from them, they still live and sprout. This is plainly a clear sign that the same souls are divisible and capable of being parted.

The second part is proved first: every immaterial and incorporeal thing is impartible and indivisible, as are God and an Angel; but the rational soul is immaterial and incorporeal, as faith teaches and the reasons to be adduced in the last book argue; therefore it is incapable of being cut and indivisible. Second: the rational soul is whole in the whole and whole in each part of the body, as will be shown in the next article; therefore it is indivisible. The antecedent and consequence are clear, since it is proper to an indivisible thing not to be ascribed and attributed to any particular part. Add that it is not educed from the potency of matter but is created — which plainly indicates that the soul itself is impartible and indivisible.

You will object first: every soul that informs is divisible; but the rational soul is an informing form; therefore it is divisible. The major is shown: the informing soul is received into the matter it informs; whatever is received is received according to the mode of the receiver; but the matter into which the soul is received is divisible; therefore the soul is likewise divisible. I deny the major. To its proof I say that that axiom is to be interpreted thus: whatever is received is received according to the mode of the receiver — that is, according to the aptitude, capacity, and proportion of the receiver; not however that what is received assumes the nature and property of the receiver, otherwise an accident, which is received in a substance, would be a substance and subsistent, just as the substance itself is subsistent. Likewise, if the rational soul is received in a mortal body, it would be mortal, just as the body is mortal — which smacks of error and heresy.

You will object second: if the rational soul, because it is spiritual, is indivisible, then likewise the sensitive soul will be indivisible, because it is spiritual, as is gathered from Sacred Scripture (*Gen. 7*): "All in which there was the breath of life died." And (*Ecclesiastes 3*): "The spirit of beasts descends downward." I respond that "spirit" is used broadly there — just as at (*Ps. 148*) wind is called spirit, according to the interpretation of Lyran in the Postilla: "Fire, hail, snow, ice, and the spirit of storms."

You will object third: a part cut off from a man still lives; therefore the rational soul that is present in that part is divisible. The antecedent is proved from the tongue of St. Paul, which was avulsed from his body and spoke. Also from St. Denis, who carried his body in his hands for two miles. The same is narrated of

St. Mithrius, patron of Aix. Moreover, if a member is amputated from a man, it still lives and moves. This is especially experienced of the heart, which if it is torn from a man still palpitates. I respond that those movements occur through heat and vital spirits, which also persist for some time in the parts that have been cut off, as is evident of the heart. For the vital spirits existing in the said parts excite motion, even though the soul is not truly still there. To what is added about the tongue of St. Paul and the heads of SS. Denis and Mithrius — I say this was accomplished miraculously and by the power of God, who can do all things.

You will object fourth: if a worm is pricked in the tail, it withdraws itself entirely, which is a sign that its soul is incapable of being cut and indivisible — otherwise it would not collect itself entirely but would only remove and withdraw the part that is pricked. Since then it feels pain in the whole body, it is plainly inferred that its soul is impartible and incapable of being cut. St. Augustine seems to sense this (*de quantitate animae*, c. 31). I respond that this happens because it possesses a continuous body and soul, and by natural sympathy — so that if one part is harmed, the other parts feel pain — as Augustine notes (*1. 21 contra Faustum*, at the end of c. 8–9), and Aristotle is not far from this (*de Iuventute*, c. 1). To the testimony of Augustine I say that he speaks there doubtfully; but assertively at the passage just cited against Faustus, where he favors our view.

Article IX. Whether the Soul Is Whole in the Whole and Whole in Each Part of the Body.

Although from the preceding article this difficulty seems to have been decided and settled, nevertheless for greater ease and a richer doctrine, it pleases us to investigate this matter particularly and to confirm it with authority and reason. Those who maintain that all souls are divisible consequently deny that the whole soul is in the whole and the whole in each part of the body. Those who assert that the rational soul is indivisible and impartible certainly affirm that it is whole in the whole and whole in each part of the body — but not so for the other souls. I am aware, moreover, that certain philosophers, such as Xenocrates, hold the soul to be in the head; others, like Parmenides, in the chest; some in the heart, like Andreas Caesalpinus (*5 Peripatetic Questions*); and there are those who think the soul exists in a fixed and determined place of the body, like a spider, so that according to opportunity it may range and traverse all the parts of the body to perform the functions of life.

Note that sometimes the soul is said to be in the head or in the heart, not because it truly exists only in those parts and informs only those parts — but because in them it exercises better and nobler vital operations, on account of better organs and more excellent dispositions that are present in those same members. In this way intellection is said to occur in the head and not in the foot, because in the head there are organs suitable for producing intellection. Similarly, the nobler vital actions are said to arise from the heart, both because

it is the source of heat and because it is the workshop of the vital spirits. Hence Christ the Lord says (*Matt. 15*): "Out of the heart come thoughts," etc.

Furthermore, note that the subject of the soul is twofold: total and adequate, which is the whole body, which is informed by the whole soul; and partial and inadequate, which is any member and part that is animated by the soul.

First assertion: the rational soul is whole in the whole body and whole in each part of the body. So Scotus (*1 d. 8, q. 1, § Ad q. respondeo, D; and 4 d. 1, q. 5, § contra opinionem istam B*). It is proved first from St. Augustine (*1. 1 contra Manich. c. 19*): "Just as God is whole in the whole world, and whole in each part of the world, so the rational soul is whole in the whole man and whole in each part of man." He writes the same (*de immortalitate animae*) and (*6 Trin. 6*) and (*1 contra epistolam fundamenti, c. 16*); and Damascene (*1 fidei, c. 17*) agrees. Second: what is simple and spiritual is whole in the whole and whole in each part of that in which it is, because what is simple and spiritual lacks entitative and quantitative parts; but the rational soul is simple and spiritual; therefore etc. Third: what is indivisible and impartible is not divided upon the division of parts — otherwise there would be a contradiction. But the rational soul is indivisible and incapable of being cut, as I showed in the preceding article; therefore it is whole in the whole and whole in each part of the body.

Second assertion: the vegetative and sensitive soul is whole in the whole body and part in each part of the body. This is suggested by the Doctor (*4 d. 44, quest. 1, § Quantum ergo, D*). It is proved first: the aforesaid souls are material and corporeal; therefore a part is in a part and the whole in the whole body. The antecedent is at hand, because they extend and are divided upon the division of the whole and parts of the body they inform. Second: the said souls are mortal and corruptible; therefore divisible, upon the division of the matter they inform; and therefore each of them is whole in the whole body and part in each part of the body that it informs.

You will say that those souls extend not by reason of entity but by reason of quantity. Against this: where the whole irrational soul is, there is the whole quantity; and where a part of the soul is, there is a part of the quantity. For in this, corporeal substance is distinguished from incorporeal, because the former has entitative and quantitative parts, of which the latter is devoid. Furthermore, it seems absurd to say that the soul is whole, according to essence, in each part, and that the soul is divided upon the division of quantity. For if a part of the quantity is not the whole quantity, neither is a part of the soul the whole soul. For the same thing, according to the same respect, cannot be at once whole and part.

But if you say that for no other reason is the divisible soul whole in the part, according to essence, except because it has parts of the same nature — against this: this does not prevent the divided soul from being according to its essence in each part. For just as part of water, which is of the same nature as the whole

water, is not called the whole water, so neither is a part of the soul called the whole soul with respect to its substance and essence.

Third assertion: any soul whatsoever, whether divisible or indivisible, informs the whole organic body. The Doctor holds this (*1 d. 38, q. 3, § sed tunc, H; and 4 d. 43, q. 2, § Respondeo, cap.*); Faber (*Theorem. 82, c. 1*); and others commonly, against Albert and Plato — as Alcinous testifies (*de doct. eius c. 23*) — who think the soul exists only in a principal member, such as the heart. It is argued first from Aristotle (*2 On the Soul, c. 1, T. 6*), who, defining the soul, says it is the act of the organic body. But a part of the body, such as the head or the heart, is not a body but a member of the body; therefore according to Aristotle the whole organic body is the total and adequate thing capable of being perfected and informed by the soul. He suggests the same *ibid.* (*T. 9*), saying: "As sight is to the eye, so the soul is to the whole animal." And (*T. 20*) he adds: "The soul is in all the members of the body, just as the power of germinating in a plant is diffused and spread through the whole body." Second: where the potencies and powers of the soul are, there the soul is by information; but in the whole body the potencies and faculties of the soul are present; therefore in the whole body the soul exists by information. The major is clear, because the soul and its powers are formally distinct from one another; and what are formally distinct cannot even by divine power be separated. The minor is at hand, because each part of the animate is nourished, grows, senses, and exercises other vital operations. Third: the informing soul is a quidditative and constitutive part of the living and animated body; but if the soul itself did not inform the whole body, it would not be its essential and quidditative part; therefore it informs the whole body. The major is clear, for just as from matter and a non-living form there is made one whole *per se*, which is the natural composite, so from the soul and the organic body there is made the whole living and animated thing. The minor is shown: according to the adversaries, the soul is not in the whole body according to its substance, but only in one chief part of the body; therefore it constitutes only in essential being that part which it informs — especially because form confers formal and essential being by presenting itself to the subject matter.

You will say that the soul is virtually in the other parts of the body, which is sufficient for it to be called the form of the living and animated body. Against this: although God by his power is in a body and an Angel in the celestial sphere he moves, nevertheless he is not said to be an essential part of it and to inform it, but only to assist it; and he is in all things through presence, power, and essence, but not through information, as the generality of scholastics teach. Therefore the aforesaid response is empty and null.

You will object first, against the first assertion: if the whole intellectual soul were whole in each part of the body — as in the eye — then, if the eye itself were cut off, the man would die, and thus the said soul would not remain in the other parts; but this conflicts with experience, since we see that men still live when

their hands, arms, and feet are cut off. Therefore the rational soul is not whole in each part of the body it informs. I distinguish the antecedent: the whole soul is in the eye as in an inadequate subject, I grant; as in an adequate subject, I deny. This is deduced from Scotus (*1 d. 28, quest. 3, § sed tunc est aliud, H*). But if a principal member — such as the heart or the head — is cut off, the man cannot live and the rational soul cannot persist, because the suitable and necessary dispositions for its persistence are no longer present in the other less principal parts; but when those parts are removed, it still persists — as Scotus excellently sets forth (*4 d. 11, quest. 3, a little before II*). But annulated and segmented animals when cut still live, because they require lesser dispositions, for they are continuous and participate in parts that are nearly homogeneous and similar, as Aristotle notes (*de Iuventute, c. 1*).

You will object second: if the rational soul were whole in each part of the body, then each part of man would be a man, because in each part there would be the whole and perfect soul; but where there is a perfect soul, there is a perfect animal — and there would be as many men as there are parts of his body, which is manifestly false. The consequence is denied. For the soul denominates only its adequate subject, which it informs adequately — namely, the organic body, which is heterogeneous and dissimilar (*as is clear in Aristotle, lib. 1 de Historia Animalium, c. 1*). The parts of the body are denominated in some way — namely, animated — by the denomination taken from the soul, by which they are informed.

You will object third: a simple and indivisible thing is adequate only to an indivisible and incutable thing; but the rational soul is indivisible; and each part of the body is cuttable and divisible; therefore the rational soul cannot inform a body that is divisible and partible into essential and integral parts. I distinguish the major: of quantitatively indivisible, I grant; of substantially indivisible, such as the rational soul, I deny — as is clear from the Angel, who, although indivisible, exists definitively in a divisible place, as the Doctor rightly sets forth (*2 d. 2, q. 6*).

You will object fourth: St. Jerome, explaining those words of Christ the Lord (*Matt. 15*): "Out of the heart come thoughts," writes that the soul has its seat not in the brain, as certain philosophers think, but in the heart, according to Christ's teaching. Therefore the soul is located in a fixed and determined part of the body. I respond that this is to be interpreted inadequately, not adequately. The soul is said to be in the heart because the heart is the workshop of the vital spirits, the source of heat, and the root of vital operations. Hence that saying of the Philosopher is celebrated: "The heart is the first thing living and the last thing dying." Again, just as a plant is said to have its life in its root, so an animal has its life in the heart as its principal member.

Article X. Whether There Are Several Souls in the Same Living Thing.

James Zabarella (*1 de Facultatibus Animae*, c. 8) and Gandavensis (*7 Phys. q. 8*) posit in a brute two souls — the vegetative and the sensitive — and in man three: the vegetative, the sensitive, and the intellective. Plato preceded them (*in the Timaeus and 9 de Repub.*) and Galen (*8 de Usu Partium*, c. 1), distinguishing the said three souls even by location — the intellective in the brain, the sensitive in the heart, and the vegetative in the liver. Ockham (*4 quest. 7; and Quodl. 2, quest. 10*); Mair (*2 d. 17, quest. unica*); and Mirandula (*1. 33 de Eversione Singularis Certaminis*, sect. 2) place in man two souls — the sensitive and the intellective. And formerly certain sectarians, such as the Manicheans (*as Augustine reports, 6 contra Faustum*, c. 8), held one soul to be good, produced from the good principle from a particle of God, and another to be evil, fashioned from the evil principle. The general Council of Constantinople (*act. 10, can. 11*) mentions and rejects this. The common opinion is that of Scotus (*4 d. 11, q. 3*); Alexander of Hales (*2 p. q. 62, m. 2*); Thomas (*1 p. q. 76, art. 3*); and the other theologians and philosophers, teaching that in one living and animated thing there is only one soul.

Note from Scotus, cited; Tataretus (*2 On the Soul, quest. 1, dub. 3*); and John of Masters *ibid.* (*q. 2*): whenever two forms stand in such a relation that one virtually contains the other, they are incompatible in the same subject simultaneously. The said authors add that one form virtually containing another means nothing other than that the form itself is the principle and cause of all the effects and operations that the other form can produce — as the sensitive soul virtually contains the vegetative because it operates whatever the vegetative operates. Similarly, the intellective virtually contains the sensitive and vegetative, because it accomplishes whatever both of them accomplish and acts. For what is nobler and more excellent than another virtually contains that other and has the power and potency of producing whatever the less noble and lower can accomplish — and something more. This is clear of the rational soul, which by virtue contains the other souls, since it does all that the others do and much more. Likewise of God, who virtually and eminently contains creatures — doing what creatures do and all other things that involve no repugnance.

Assertion: in one animate thing there is only one soul; and indeed in man there is one intellective soul, which virtually contains the vegetative and sensitive; and in a brute there is one sensitive soul, which virtually contains the vegetative. The Doctor holds this *ibid.*; and before him, St. Augustine (*de Spiritu et Anima*, c. 4; *and thence lib. 11 de Gen. ad litt. c. 35*), with these words: "In one body one soul, and three powers: intellect, will, and memory." It is proved first from Sacred Scripture (*Matt. 10*): "Fear not those who kill the body but cannot kill the soul." And (*John 10*): "I lay down my soul for my sheep." But if there were three souls in man, Christ would not rightly have said "the soul" in the singular but "the souls" in the plural; and each man has his own soul, just as Christ has his; therefore in each man and each animate there is established only one soul. Second, from the Lateran Council (*c. Firmiter, de Summa Trinitate et Fide Catholica*) and the VI General Council, in which it was decreed that the divine Word assumed the

parts of human nature, which are body and rational soul. And it is defined in the General Council, in which those who hold the opposite are struck with anathema. Third, from the Fathers. For besides Augustine just cited, Nicenus (*de Creatione Hominis*, c. 12) confirms the said assertion with this comparison: "Just as one cithara player, through the diversity of strings on one cithara, produces diverse sounds, so one intellectual soul, existing in one body, through distinct potencies and various organs, produces diverse actions and operations." Gregory the Great (*hom. 12 in Ezech.*); Lactantius (*1 de Ira Dei*, c. 11); and Hugh of St. Victor (*lib. de Spiritu et Anima*) concur. Fourth, from Aristotle (*1 On the Soul*, c. 4, T. 66; and c. 5, T. 91; and 2 of the same work, T. 31), teaching and saying that just as the triangle is in the quadrangle, so the vegetative and sensitive are in the intellectual. But it is established that the triangular figure does not exist formally in the quadrangular; therefore neither does the vegetative and sensitive exist formally in the intellectual.

Fourth: if there were three distinct souls in man, one would not impede the action of another, since distinct forms have distinct powers and potencies, of which one depends on another neither in being nor in operating. But experience teaches us that sense sometimes impedes reason — as Scotus testifies (*3 d. 15, quest. unica, sub H*) after Augustine (*14 Civ. c. 16*): "A vehement sensible delight impedes the use of reason." And Aristotle (*7 Eth. c. 9*): "Immense pleasure very often steals away the intellect of the wise." Hence, a few sentences later, our Doctor cited adds: "If in Martyrs exposed to the greatest torments their intellect had the use of itself, that was from the special grace of the Creator." It is therefore evident that in man there is one soul adorned with many potencies and virtues. Add that vehement and intense contemplation retards the actions of the senses and impedes nutrition, as is established of those who are given to and intent on great study and speculation; therefore without doubt one and the same soul performs all these functions.

Sixth: given the hypothesis, man would be a threefold individual — for through the vegetative soul he would be a plant or tree; through the sensitive, a brute; and through the intellectual, a man — and he would be under diverse species and not distinguished from them, which is absurd. Hence Aristotle (*1 On the Soul*, T. 91) adds that there cannot be one animal where there are several souls. Moreover, if in man two souls were admitted, then since Christ the Lord was truly and perfectly man, at his death the vegetative and sensitive souls would either have been corrupted, or remained in the sepulcher with his body, or descended with the rational soul to the limbo, or would have existed separately in some fixed place. Not the first, because he would have seen corruption, which conflicts with (*Ps. 15*): "You will not allow your holy one to see corruption." And what he once assumed he would at some point have let go, which contradicts St. Damascene (*3 fidei*, c. 26): "What he once assumed he never let go." Not the second, because the body of Christ would not have lain dead but living in the sepulcher. Not the third nor the fourth, since otherwise the vegetative and

sensitive could be really separated from the body, like the intellective — which is commonly rejected as false and absurd.

You will object first, from Aristotle (*2 de Gen. Animalium*, c. 3): man first lives the life of a plant, then the life of an animal, and finally the life of a rational being. But there Aristotle speaks of priority of time, and not of the operations of those souls but of their very essences, as Zabarella holds — and this is drawn from the words of the cited text: "An animal and a man are not made simultaneously, nor an animal and a horse simultaneously." Therefore according to Aristotle, in man there are three really distinct souls according to substance and essence. St. Thomas (*1 p. q. 118*), Toledo (*2 On the Soul*, quest. 7), and the Coimbrans (*de Gen. quest. 21, art. 3*) respond that the vegetative and sensitive are first in time, and that, on the advent of the intellective, they are corrupted — since the order of nature demands that one proceed from the imperfect to the perfect. Against this: if this response were valid, an individual of a genus would exist in reality outside its species for some interval of time, or man would be first in time a plant, then a brute, and finally a man. The first is false, since there is found in the nature of things no individual that is not immediately the individual of some species. The second does not please, both because the divine Word would at some point have been a plant, then a brute, and finally a man — which no theologian asserts — and also because it is not evident by what the lower souls would be corrupted. For an imperfect is not corrupted by a perfect unless contrary qualities are induced, with whose presence the preceding form cannot persist. Nor do they seem to be incompatible with one another, because it can be said that one with respect to the other plays the role of matter, and the other has the place of form, and thus they are intermediate and subordinate forms. Therefore I respond otherwise: Aristotle is to be expounded not of essence but of operation. The reason is that more things are required for producing the operations of the rational soul than for exercising the works of the vegetative and sensitive, and more for the sensitive than for the vegetative. Therefore the Stagirite rightly infers: man first lives the life of a plant — that is, he first administers the operations of the vegetative, not that man is first a plant or tree before being a brute, as Philoponus interprets it, followed by Albert (*Summa de Homine*), though Zabarella dissents *ibid*. And the same Aristotle suggests this (*2 de Gen. Animalium*): "Man, before he becomes more mature, has the upper part of the body greater than the lower; and the more he grows, the lower parts become longer than the upper. While he is an infant he crawls on all fours; then he stands erect and walks on two feet; and when decrepit he is said to walk on three, because he uses a staff." The contrary happens.

You will object second: where there is an operation, there is its principle and root, since there cannot be an effect without some cause; but in man there are operations of the vegetative and sensitive souls — for man vegetates and senses; therefore in man the vegetative and sensitive souls are present formally, as principles and causes of the said operations. I distinguish the major: formally or

virtually, I grant; always formally, I deny. For the warming of the earth comes from the sun, and yet neither heat nor warming is found formally in the sun but only virtually; so similarly in man there are vegetations and sensations that proceed from the rational soul, which virtually contains the vegetative and sensitive souls, as Scotus indicates (*Collatio 1*).

You will say: man formally vegetates and senses; but what contains another virtually is not formally such — as God, who virtually contains creatures, is not formally a creature; and the sun, which virtually contains heat, is not formally hot; therefore the aforesaid response is invalid and vain. I say there is a disparity, because God so virtually contains creatures that he can produce and create them; not so the rational soul, which virtually contains the vegetative and sensitive souls, since it cannot produce and cause them. The soul is said to virtually contain them because it can act and operate what they act and operate — namely, to vegetate, to sense, and the like. Or I say that God does not formally have the vegetative and sensitive potency as the rational soul and man do — especially since he himself is incapable of this, just as the sun is incapable of heat and the other contrary qualities.

You will object third: contrary operations and opposing effects cannot come from one and the same source, as Scotus argues (*3 d. 15, quest. unica*) from Avicenna (*6 Naturalium, c. 2*). But man experiences in himself opposing actions and contrary effects — for sense conflicts with reason and vice versa, as St. Paul testifies (*Gal. 6*): "The flesh lusts against the spirit, and the spirit against the flesh." And Aristotle confirms this (*2 Magna Moralia, c. 9*), saying: "The irrational part impedes the rational from acting." I distinguish the major: of an agent with a single power and potency, I grant; of an agent with several powers, faculties, and potencies, I deny. But the rational soul is distinguished by several powers and potencies, as is clear from intellect, will, and the other potencies and faculties of the soul. St. Augustine excellently suggests this (*18 tract. in Joann.*) with these words: "Through the eyes one can see, through the ears hear, through the hands work — diverse members, diverse offices of members; that member cannot do what this one can; yet on account of the unity of the body, the eye sees for itself and for the ear, and the ear hears for itself and for the eye."

You will object fourth: man is mortal and corruptible — not, however, through the rational soul, which is immortal and incorruptible; therefore through the vegetative and sensitive souls, which are found in him. I respond that it is not for the assigned reason that man is mortal and corruptible, but because of the body, which is corruptible, according to that (*Wisd. 9*): "The body that is corrupted weighs down the soul."

Article XI. Whether, Besides the Soul, There Is a Form of Corporeity in the Animate.

The negating part is embraced by St. Thomas (*1 p. q. 76, art. 4*); Cajetan *ibid.*; Ferrariensis (*2 contra Gentes, c. 58*); Argentinas (*4 d. 13, q. 1, art. 1*); Gregory (*2 d. 17, quest. 2*); and many others teaching that in any living and animate thing, only the soul informs matter, presupposing no form of corporeity. These however are divided in two: some, like St. Thomas (*2 On the Soul, ad text. 4*), hold that the soul informs matter affected by organs for the administration of the works of life; others, like Gregory, think the soul informs matter connoting suitable organs for exercising the functions of life. The affirmative part is defended by Scotus (*4 d. 11, q. 3, art. 2*) and his disciples; Richard (*2 d. 17, art. 1, q. 5*); Mair (*d. 16*); Bacon (*3 d. 19, quest. unica*); Piccolomini; Zabarella; and not a few others, asserting that the soul informs matter through an antecedent form of corporeity, and therefore in any animate thing, besides the soul, there is a form of corporeity.

Note first: the form of corporeity — which is also called by others the form of the mixed substance and of the cadaver — is really distinct both from matter and from the soul. For the form of corporeity constitutes matter in the being of a body, while the soul constitutes the body in the being of a living and animated thing. Therefore in any living and animated thing, according to Scotus, there is a twofold form: one is the form of corporeity, and the other is the soul. The former stands in the manner of matter; the latter plays the role of form, because the first is subordinated to the second. This teaching is not obscurely set forth by Aristotle (*4 Meteor. near the end*), affirming that there are intermediate and subordinate forms, of which the prior ones are underlying and subordinated to the posterior ones, while the last plays the role of form and the rest have the place of matter. And therefore not without reason do some call the form of corporeity the "vicarious" form, because in the absence of the soul it holds its place.

Note second, from Scotus cited: being simply can be taken in two ways. In one way as opposed to non-being — in which sense any being whatsoever, whether substance or accident, is called being simply, and non-being does not merit the name of being simply; hence Aristotle (*1 de Gen. T. 12*) adds that from non-being simply nothing comes to be (*as also at 1 Phys. 33*): from nothing, nothing comes to be. In another way, as opposed to being according to something — and thus only substance is being simply, and accident is being according to something. For substance is constituted first in substantial being, and afterwards receives accidents into itself, since it is the base and foundation of other beings. Furthermore, it is to be recalled from what was said (*1 de Gen. q. 3, art. 3*) that in corruption there is no resolution all the way down to prime matter. For many accidents that were in the generated thing persist and remain in the corrupted thing, as was there abundantly explained and proved.

Assertion: the soul does not inform pure matter, whether it be affected by organs or connotes organs suitable for the functions of life, but presupposes the form of corporeity. So Scotus *ibid.* It is proved first from Aristotle (*1 On the Soul*,

T. 6): "The soul is the act of the organic body" — that is, the substantial and essential perfection of the body; therefore the soul does not inform pure matter but requires the form of corporeity beforehand. For the perfection of something presupposes the perfectible; but the soul is the substantial and essential act and perfection of the body; therefore it presupposes the body already constituted in the being of a body — otherwise it would not be the act of the body but the efficient cause of the body itself. Furthermore, the soul does not inform a body unless it has first been organized. For it is the teaching of all that the soul bestows life on the organized body, and that some interval of time passes in order that the same body be suitably and duly organized; but matter is not a body but part of a body.

You will say with Suárez (*1 de Anima, c. 2*) that the body is not the subject of inherence but of composition, and indeed not of actual but of potential composition. Against this, from (*4 Top. c. 11*): the body is part of the animal, and the whole animal is composed of body and soul; but the parts of a whole are presupposed to exist actually so that the whole may come to be; therefore the body is truly and fully a body with its own proper form of corporeity before being united to the soul. Furthermore, the body is what is informed by the soul; but it cannot actually be informed by it unless it actually exists; therefore the body participates in its own form of corporeity independent of the soul. All the more so, because after the separation or recession of the soul from it, the body persists in the being of a body with all its parts, form, figure, and other accidents, as is seen with the eye. Therefore the body possesses its own proper form of corporeity. And this is plainly shown by the fetus before it is animated, in which the said form, figure, and other aforementioned things are plainly visible — which cannot be produced by the soul not yet educed or introduced. St. Augustine lends support (*13 Civ. c. 24*), speaking of the creation of the rational soul which God breathed in (*Gen. 2*), says: "He gave and placed it in man, that is, in the body." And he adds: "This second body, which God fashioned from the dust, to which a soul was given so that it might become an animate body — that is, a man in a living soul." And (*lib. 83 quest. 54*): "Whatever is vivified by the soul is a body." And the same Doctor expresses the form of the cadaver (*lib. 10 contra Faustum, c. 10*).

Second: several substantial changes require several substantial forms, since the formal terminus of a substantial change is a substantial form; but in the production and generation of any animate thing, several substantial changes are required. For from non-being of a body a body comes to be, and from non-being of an animate thing an animate thing comes to be. But the formal terminus of the prior change is the form of corporeity, and the formal terminus of the later change is the soul. Therefore the soul requires and presupposes the form of corporeity. For we experience that animate things first produce a body through the seminal principle, devoid of life; and then that same body is animated and lives through the soul educed by the generator or introduced by

the creator. And therefore the process goes from the form of the seed to the form of the embryo, from the form of the embryo to the form of corporeity, and from the form of corporeity to the soul by which it is animated and lives. From this process of nature it is clearly established that the soul presupposes the form of corporeity, without which the soul would not inform or vivify the body subjected and presupposed to it.

Third: many accidents that were in the generated thing remain in the corrupted thing — for if a man is wounded and dies, the same scar persists in his dead body that was there while he was alive; and such a scar and the other accidents visible in the said body are subjected in the composite of matter and the form of corporeity, since the subject of accidents, as was asserted and proved elsewhere, is not matter but the composite coalesced from matter and form.

You will say that those are not the same accidents but similar and akin ones. Against this: a sense well disposed and suitably approximated to its proper object is not deceived about it; but the eye sees in the cadaver the very same wound, the very same figure and quantity; in an apple cut from the tree, the same color, odor, and flavor; and in another branch of the same tree, one green and another dry; and similar things that cannot be denied except by a perverse person. Furthermore, if they are not the same accidents, their certain and determinate efficient cause must be assigned — especially since they sometimes arise from the blow of a sword, of lightning, or of artillery; and since in reality no such cause can be assigned, it must be affirmed that those very same accidents remain in the corrupted thing that were in the generated thing, and accordingly their proximate and immediate subject is the body informed by the form of corporeity.

Fourth: what is formally unextended and incorporeal cannot formally confer extended and corporeal being; but the rational soul is unextended and incorporeal; therefore it cannot bestow extended and corporeal being; but man is formally extended and corporeal; therefore this extended and corporeal being is received from an extended and corporeal form, of which kind is the form of corporeity. Especially because, after the departure of the rational soul from the body, the human body still remains extended as it was when it was informed by the rational soul itself; therefore the said extended and corporeal being comes from the form of corporeity.

You will say with Cajetan and other Thomists that the rational soul is equivalent to an extended and corporeal form, and virtually confers extended and corporeal being. Against this: a form cannot produce an effect repugnant to itself — otherwise fire could freeze and water could heat; but to be extended and corporeal is repugnant to the intellective soul, which is unextended and incorporeal; therefore it proceeds from another form than the rational soul. Furthermore, an informing form cannot confer on what is informed any other being than the formal being that it itself has, since it confers upon the subject

matter its formal and essential being; but the formal being of the rational soul is unextended and incorporeal; therefore it does not give the body corporeal and extended being. Fifth: in the three days, the body of Christ was without the rational soul, because Christ the Lord was truly dead; but that very body was the same body then as the one that came out of the Virgin's womb, that hung on the cross, and that rose from the dead — as the holy Fathers assert, chiefly Ambrose, and it is placed at (*d. 2 de Consecr.*); but it was not the same body through the rational soul, which had descended to the limbo; therefore through the form of corporeity. Cajetan responds that it was the same by the identity of the suppositum of the divine Word. Against this: if the body itself had been let go by the Word, so that it was no longer made a suppositum by the Word itself, it would still have been a body and that very same one that came forth from the Virgin, lay in the sepulcher, and rose again, and appeared to the Apostles — not by the identity and unity of the divine suppositum; therefore by the identity and unity of the form of corporeity.

You will say with Suárez that it was the same body sensibly, because the same sensible accidents remained in it, namely the same quantity, figure, wounds, and the like. Against this: accidents do not persist in something unless the same form persists, since accidents reside not in matter but in the composite; therefore it is not rightly said to be the same body sensibly. Furthermore, it is not rightly said in the Eucharist that the substance of bread and wine remains because the same accidents of bread and wine persist. Therefore that body was not the same sensibly, as Suárez imagines.

You will object first: being is from form, and one being is from one form — hence that often-repeated saying: "Form gives being to the thing"; but the animate is one; therefore it is from one form, which is the soul. I distinguish the major: completely and adequately, I grant; incompletely and inadequately, I deny. Which is to say: the ultimate form, which is the soul, confers the ultimate complement, and the whole animate is denominated and specified from it. But nothing prevents it from receiving another being from another subordinate form, by reason of which it is constituted in the being of a body — as is plainly apprehended when the soul is separated from the body, for then the body remains constituted in the being of a body without the soul that informed it. This can also be illustrated from the metaphysical specific difference, which completely and adequately constitutes the lowest species, from which the species itself is denominated — although other higher differences are required and presupposed beforehand, and the same species is denominated from them, as Scotus indicates (*Theor. 12*) and Mauritius explains there.

You will object second: from two acts there is made one per accidens (*2 On the Soul, T. 7; and 7 Met. T. 49*); and two forms are two acts, for a form actuates matter; therefore if two forms were to inform the same matter, the living and animate thing having two forms would be one per accidens, which is false. I

distinguish the major: from two acts not subordinated to one another there is made one per accidens, I grant; from two acts of which one is subordinated to the other, I deny — as I explained sufficiently in note 1.

You will object third: if the form of corporeity were granted, it would be admitted on account of some operation, because form exists for the sake of operating; but this kind of form does not operate, since only the soul is the principle of operations; therefore such a form of corporeity is idle and vain. I grant the major and deny the minor, for it helps in producing material operations. Hence a cadaver placed upright descends downward like any other heavy thing. Likewise it avails for the exercise of organic operations, which are said to belong to the whole conjoined being; for without the body, vegetation, sensation, and the like cannot be accomplished.

You will object fourth: a more perfect form virtually contains the less perfect, and the superior the inferior — as the quadrilateral contains the triangle (*2 On the Soul, T. 31*). Therefore the soul, which is nobler, virtually contains the form of corporeity, which is more ignoble and inferior. I distinguish the antecedent: of the containing of the inferior in the superior by excess of perfection, I grant — as man is contained in an Angel; for that reason Gregory (*hom. 29 in Ev.*) writes: "Every creature has something man has — to be with stones, to live with trees, to sense with animals, and to understand with Angels." Of the containing of the effects of the inferior, I deny. For in this way the soul cannot confer corporeal and extended being, but requires and presupposes it.

You will object fifth, from (*1 de Gen. 2, 3, and 4*): the subject of generation and substantial transmutation is not a being in act but in potency — that is, simple matter; but given the form of corporeity preceding the soul, it follows that the subject of generation is a being in act, or a composite of matter and form, of which kind is the body; therefore the said form of corporeity is not to be conceded. I respond that Aristotle there speaks of the generation of inanimate mixed substance, not of the generation of animate mixed substance, which is the subject of discussion here.

Question II. On the Parts of the Animated Body.

Although in plants and trees it is not difficult to know which parts are living and animated — since it is established that all those parts share in a soul that grow green, increase, and germinate, among which are counted leaves, flowers, fruits, branches, bark, roots, and the like — nevertheless there exists no small controversy about which parts in animate beings enjoy a soul. For animate beings have bones, flesh, blood, nails, hair, and the like, of which we must now treat.

Article I. Whether Blood Is Animated.

The prior opinion is that of Cajetan (*1. 2, q. 54*); Medina (*3 p. q. 5, Part. 2*); Toledo (*2 On the Soul, q. 4*); the Complutenses (*disp. 6, q. 1*); and Báñez (*1 de Gen. c. 4, q. 8, art. 3, not. 2*), affirming that blood is animated. The later opinion is that of Scotus (*4 d. 8, q. 1, sub B; and 3 d. 3, q. 2, § Sed contra hoc arguitur; and in Report. 4 d. 10, q. 4*); Alexander of Hales (*2 p. q. 25, m. 7*); St. Bonaventure (*4 d. 44, q. 1*); Richard *ibid.* (*art. 1, q. 2*); Mair (*d. 43, q. 4*); Bassol (*d. 44, q. 1, art. 2*); St. Thomas (*1 p. q. ult. art. 1 ad 3*); Suárez (*2 On the Soul, c. 3*); Cavellus (*disp. 1, sect. 9*); Galen (*lib. 2 de Elementis*); Fernel *ibid.* (*c. 2*); Seneca (*lib. 2 de Naturalibus quaest.*); and many others, denying that blood is endowed with a soul.

Note first: blood admits of many meanings. It is taken first for progeny — hence it is commonly said: "he is of my blood" and "my blood-relative." Hence St. Augustine (*22 contra Faustum, c. 35*) adds: "The wife of Abraham was procreated from the blood of her father." And Virgil sings (*6 Aeneid*): "The Trojans of high blood." Second, for life — in which sense the Church in the hymn for one Martyr at vespers sings: "Shedding his blood for you, he possesses the eternal gifts." And the Poet (*2 Aeneid*): "He poured out his life with his blood." The same Augustine suggests (*de Sermone Domini in Monte, c. 23, lib. 2; and lib. 4 quaest. ex Leuit. c. 17, quest. 57*). Third, for sin — thus David sings (*Ps. 50*): "Deliver me from bloods," that is, from sins or iniquities, according to the interpretation of the same Augustine *ibid.*; for "blood" is called iniquity, because iniquity is committed through blood. Towards this St. Paul (*1 Cor. 15*) perhaps looks, saying: "Flesh and blood shall not possess the kingdom of God." Fourth, for the warm and moist humor generated in the liver, diffused in the veins and arteries for the nourishing of the members and the sustaining of life. And it is of blood so understood that we speak in the present discussion.

Note second: a thing can be a part of a living animal in two ways. In one way strictly — and thus that part is said to be of the body of an animal which is informed by the soul and is truly living and animated, and pertains to the primary constitution of the animal's body, such as flesh, bone, and the like. In another way broadly — and thus whatever part contributes to the integrity and preservation of the animate is called a part, according to the Doctor (*in 4 at the cited passage*). And blood is counted among the parts of the human body, inasmuch as the human body itself is nourished, fostered, and sustained by blood. Such parts, however, are said to pertain to the secondary constitution of the animated body. For this reason the Council of Trent (*sess. 13, can. 1 and 2*) commemorates the blood of Christ the Lord among the parts of the body. The Council of Ephesus suggests the same (*can. 5*), and in the letter to Nestorius. Aristotle lends support (*3 de Historia Animalium, c. 2*), counting blood among the similar parts of the animal, and indeed the most important, because through blood life is restored and preserved, and when it is consumed the animal naturally dies. Furthermore, observe that among the similar parts of an animal, some are solid and pertain to the consistency of the other parts, such as bones; some are fluid and contribute to the tempering, nourishment, and preservation

of the animal itself, such as humors, among which are blood and the vital spirits, through which vital operations are performed and species are conveyed to the internal organs, just as through air they are conveyed to the external ones; while others serve for the ornament of the animal, such as hair, nails, and the like.

Assertion: blood is not animated. The Doctor holds this at the passages cited above. It is proved first from Aristotle (*2 de Partibus Animalium*, c. 3, at the end), asserting that blood is in the veins like water in a vessel; but water does not have the same form as the vessel in which it exists; therefore blood is not informed by the same form as the veins in which it is contained; but the veins in everyone's opinion are animated; therefore blood is not animated. The same is gathered from (*8 of the same work*, c. 5) and (*3 On the Soul*, T. 45). Second, from Augustine (*lib. 3 quaest. q. 57 in Levit.*): "This temporal life is contained in the body principally through blood"; but what is contained does not seem to participate in the same form as what contains it, as is evident of wine contained in a cask and similar things; therefore, since blood is contained in the body, it does not possess the same form as the living and animated body.

The Complutenses respond at the beginning of the cited article that the said testimonies are to be interpreted of containment not taken strictly but broadly — just as marrow is in the bone and bone is in the flesh, even though both the marrow and the bone are animated; so similarly blood exists in the veins, which does not prevent it from being animated. Against this: Aristotle and Augustine are to be expounded of that containment of which they explicitly speak — and they speak of vase-like containment, saying that blood is held in the veins as in a vessel; but what is taken in something as in a vessel participates in a different form from the very vessel in which it is contained, as was shown above by examples. Furthermore (*4 Phys. T. 41*), Aristotle says that place contains the located thing; but it is evident that the located thing is of a different form from the place; therefore the same Philosopher there is to be understood of proper containment taken strictly. As for what the Complutenses add about the marrow in the bone and the bone in the flesh — it is not valid, because those are contained in these and these in those not as content in container, but as part in co-part, like form in matter; and such parts pertain to the primary constitution of the animated body, as I observed above. Furthermore, marrow is nourished by blood and is continuous with the bone, from which it is preserved, and it has the quality of flesh, most agreeable and delightful to the taste. So the comparison brought forward by the cited authors is impertinent, and they do not adequately address the adduced authorities.

Third: the nourishment of an animate thing does not possess the same form as the animate thing itself possesses; but blood is the nourishment of the animate; therefore blood is inanimate. The major is from Aristotle (*8 de Partibus Animalium*, c. 5) and is the dogma of physicians, who affirm that when blood fails, the animal is nourished by the other humors — namely phlegm, black bile,

and yellow bile — though not as well and conveniently. The reason is given because nourishment passes into the substance of the nourished thing, and therefore is corrupted and there is a certain generation; for nutrition is partial generation, as Scotus teaches (*4 d. 44, q. 1, art. 1*). And the generation of one thing is the corruption of another. For this reason Christ the Lord (*John 12*) warns: "Unless a grain of wheat falling into the ground die, it remains alone; but if it die, it bears much fruit." The minor is given by the same Aristotle (*3 On the Soul, T. 45*). The sign of this is that when blood fails, the animal fails and dies — like a lamp from which the oil is withdrawn, whose light perishes, since oil is its fuel by which it is nourished and preserved.

The aforementioned authors respond by distinguishing and saying that this holds of nutritive blood, not of natural blood. Against this: the distinction of a twofold blood is voluntary and gratuitously devised. It conflicts, first of all, with the generality of physicians and philosophers. It is also contrary to reason. For both the one and the other blood are of the same species, and differ only accidentally — namely, the natural blood is pure and well-digested, while the nutritive is impure and undigested. But this is an accidental difference, just as is seen in pure wine and watered wine, in gold and silver pure and impure and mixed with dross. Fourth: the animated parts are connected and continuous with the other parts of the same animated body, since the animated body itself is one continuum constituted and compounded from all of them. But blood is disconnected and discontinuous from the other parts of the said animated body — both because it is flowing and permeable through its members, and also because it is expressly asserted by Aristotle (*2 de Partibus Animalium, at the end of c. 3*) with these words: "Blood is not continuous and akin to flesh, but is contained in the heart and veins, as in a vessel." Therefore blood is devoid of soul and life.

The same cited philosophers interpose and say that blood, though not immediately, is nonetheless mediately continuous with the other members of the animal, since blood participates in certain coarser parts called fibers, which are continuous with the veins, and the veins with the flesh. Against this: the fibers are of flesh, bone, and nerve; therefore blood is not continuous with them, since those can exist without this, because this is fluid while those are persisting and permanent, hard and solid in some way. Furthermore, coarse and dense do not differ essentially from rare and tenuous, as I showed elsewhere; therefore if the said parts are animated, so too are all the others — and therefore wrongly is blood distinguished into natural, which is animated, and nutritive, which is inanimate. And subsequently into its coarser parts, which are connected with the veins, and its finer and fluid parts, which are separated from them — since blood taken in any way whatsoever is of the same nature and species, and can be entirely separated from the animal's body, while the latter with all its parts and members remains and subsists in the being of a body, though not in the being of a living and animated thing.

Fifth: there comes to bear a theological argument. In the consecration, under the species of bread the body of Christ the Lord comes by virtue of the words, and by concomitance his blood comes, as the Council of Trent has sanctioned (*sess. 13, c. 3*). But if blood were animated, under the species of bread the very blood of Christ itself would come by virtue of the words. For animated parts pertain to the primary constitution of the animated body, as I observed in the second note. Therefore it is concluded both philosophically and theologically that blood lacks soul and life.

Nor does it help to say, with Arriaga and the Complutenses *ibid.*, that this is to be expounded of solid parts, not of fluid parts, of which kind blood is. For this begs the question. For it is certain that blood is a fluid part, and the question is whether it is an animated part or not; and the said authors respond that it is a fluid part, and therefore comes under the species of wine by concomitance. For what is being asked is whether a fluid part enjoys a soul; if it were animated by virtue of the words of consecration, it would be the blood of Christ — which the said Council denies and defines as being by concomitance only. I add, against those same authors, that if his body is given in the manner of food, then certainly his blood is given in the manner of drink, as is clear from (*Matt. 26*): "Drink from this, all of you. For this is my blood of the new testament, which will be poured out for many."

You will object first: what is a part of an animate thing is animated; but blood is a part of an animate; therefore blood is animated. The major is evident, because since the animate is a certain whole informed by a total form, its parts must participate in the same form, which is the soul. The minor rests on the testimony of Aristotle (*3 de Historia Animalium, c. 2*), counting blood among the homogeneous and similar parts of the animal. I distinguish the major: of a part pertaining to the primary constitution of the animal, I grant; of a part pertaining to the secondary constitution and integrity of it, of which kind blood is, I deny. This distinction was introduced and abundantly explained in the second antecedent note. To the distinction of the major, the minor is to be distinguished and explained accordingly.

You will object second: what exercises the works of life is living and animated; but blood performs the works of life; therefore blood is animated. The major is evident from effect to cause. The minor is at hand: blood is moved, palpates, and seethes. Hence the Stagirite (*1 de Historia Animalium, c. 1; and 3 of the same work, c. 19*) explicitly asserts that blood is animated. I add that (*Lev. 17*): "The soul of all flesh is the blood." Augustine concurs (*lib. 2 contra Adversarium Legis; and epistola 146; and lib. de Spiritu et Anima, c. 2*); and Damascene (*2 de Fide, c. 12*). I grant the major and deny the minor. To its proof I say that such operations do not proceed from within but from without — that is, from the soul, which is in the animated members, not in the blood — just as when water boils, that boiling proceeds not from the water but from the fire placed under it. To Aristotle I say

he is to be expounded of animation not properly but metaphorically, in the manner in which a living stone and quicksilver are so called. To the passage of Sacred Scripture it is thus understood: the soul is in the blood as in nourishment by which the animal is sustained, fostered, and preserved. Hence Augustine, commenting on that text (*q. 17*), adds: "Life is in the blood, because it depends on it in many ways — for it is nourished and fostered by it; but it is not formally in it as in an animated body." This is sufficient for it to have been rightly prescribed that sins of souls be expiated through the offering of blood on the altar. Damascene and the others, if adduced, are to be interpreted accordingly.

You will object third: what is hypostatically united to the divine Word is animated, since the Word assumed only animated parts; but blood is united to the Word hypostatically, as John (*3 de Celebratione Missarum*) teaches; therefore blood is animated. I respond that the major is not universally true. For from Scotus (*3 d. 2, q. 1, l. 2*): even a rational nature that is not living could be assumed by the Word — indeed even parts taken separately. In fact, in the three days the parts of Christ's body were hypostatically united to the same Word, even though they were not then animated, because Christ was truly dead.

You will object second additionally: fat is blood congealed by cold, as Galen testifies (*2 de Temperamentis*); or according to Aristotle (*1 de Gen. Animalium, c. 2*), fat is blood digested through good nutrition. But fat is animated; therefore so is blood. I grant the major and deny the minor. For just as seed — as will be said in the next article — is not animated, so too fat is not. For it is a superfluity left over from nutrition, and an excrement, as Aristotle affirms (*1 de Gen. Animalium, c. 18 and 19*). Moreover, when food fails, this very thickness and fatness serves as nourishment for the members of the living and animated body, as Rondelinus says (*1. 3 de Piscibus, c. 14*).

Article II. Whether Seed and Milk Are Animated.

Two things are proposed to be examined and decided in the title of the present article: the first is whether seed is informed by a soul; the second, whether milk likewise is — and both are to be settled.

Note first, from Scotus (*2 d. 18, quest. unica, F*): seed is described as an imperfect body not intended by nature for its own sake, but for the sake of another — namely, so that another similar in species may be generated. It is explained: it is called an imperfect body because the natural agent through seed intends to produce a perfect body. It is added: not intended for its own sake but for the sake of another, because seed is the superfluity of a living animate thing — what is left over, namely, after its nutrition has been had. The final cause is designated by the addition: so that another similar in species may be generated. For the end of seed is the generation of another thing similar in species to the generated. Moreover, two processes are noted: one ascending, the other descending. The prior goes from the imperfect to the perfect — namely, from the form of the

seed to the form of the embryo, from the form of the embryo to the form of the duly organized body, and from the form of the body to the form of the soul. The later process goes from the perfect to the imperfect — that is, from the form of the soul to the form of the cadaver, from the form of the cadaver to the form of the worm, from the form of the worm to the form of earth — and thus it is resolved all the way back to prime matter.

Note second: there is some difference between blood and seed. For in blooded animals, seed is produced from well-digested blood. So that this may be understood, observe the manner of its making: food is first broken down by the animal's teeth — hence physicians say the first digestion takes place in the mouth. Then the same food, thus broken down, is sent to the stomach, where it is cooked and the second digestion takes place. For the food thus cooked in the stomach is called chyle; and if any of it has been purged, it is sent to the bowel; but what has been good for the living thing is carried through the mesenteric veins to the liver, where it is cooked again and the third digestion takes place, and there it acquires its redness from the liver itself, which is red. Afterwards it is transferred through the cava and portal veins to all the parts and all the members of the animal, and existing in them is converted into the substance of the animate — and this is its nutrition. But if anything remains, it turns either into fat or into seed, which is transferred to the suitable vessels and those that preserve it, and from it generation takes place.

Note third: milk does not differ essentially from menstrual blood, but only accidentally — that is, in fatness, color, sweetness, and the like — as Aristotle teaches above others (*4 de Gen. Animalium*, c. 48), calling milk blood well digested and not corrupted. Clement of Alexandria concurs (*lib. 6 Paedagogi*, c. 6), saying that milk is blood according to substance, with only the color changed by a strong spirit. This is suggested from the fact that milk for the most part is derived from the menstruum. For in females, when the fetus is conceived, the menstrual flux ceases, so that from it the fetus itself may be nourished and increased. And the more it ceases, the greater the fetus grows, and the milk is consumed. For it is attracted through the veins and transferred, and is deposited in the breasts, where it is cooked again and receives whiteness, sweetness, and the other accidents. I said "for the most part derives from the menstruum" because it sometimes happens that milk flows from males, who do not undergo the menstruum. For it is reported that on the island of Lemnos, from a goat's udders so much milk was milked that a cheese was made from it, as Aristotle narrates (*3 de Historia Animalium*, c. 20).

First assertion: seed is not actually animated. So Scotus (*4 d. 44, q. 1, a. 2 ad 1, Q; and 2 d. 20, q. 2 sub C*), preceded by Aristotle (*2 On the Soul*, c. 1, T. 10; and *2 de Gen. Animalium*, c. 1); Albert (*2 p. Summa de Homine*, praised q. 7); Met. (q. 19); Fernel (*7 Physiolog.* c. 13); and many others, against Plato in the *Timaeus*, Paracelsus (*lib. de Semine*), and certain others. It is proved first: what is contained in something as

in a vessel does not possess the same form as the vessel — as is clear of water in an amphora and wine in a cup; but seed is in certain members of the animal as in a vessel, for nature has provided certain vessels in which seed is contained. And therefore seed is not intended by nature for its own sake as a suppositum, but for the sake of another similar in species to be generated, as I made plain in the first note explaining its definition. Second: the nourishment of an animate thing is not animated, as I showed in the preceding article concerning blood; but seed is the residue of nourishment of a living being, as I declared above in note 2; therefore seed does not actually participate in a soul. Third: seeds of herbs, plants, and trees kept at home do not live; therefore neither do the seeds of animals. The antecedent is established by experience, for they are not nourished nor do they grow. Furthermore, seed cut off from an animal does not live, as the adversaries themselves concede; therefore neither does seed while joined in the animal. The consequence holds, because both seeds participate in the same form and the same properties and accidents. Fourth: if seed were animated, either it would have the same individual soul as the whole suppositum lives by, or a different one. Not the second — otherwise there would be two different souls in one and the same individual suppositum, which is false. If the first, it follows that in generation no new form is induced from the potency of matter, but only the prior one is enlarged and extended to inform another body. And I thus argue this: the seed cut off from the animal is truly seed and in no way loses its character of seed; indeed, placed in a suitable location, it seems more to have the character of seed, since it then performs that function for which it was established by nature. Therefore it is informed by the same form it previously had — otherwise it would no longer be seed, because it would receive another form. But the prior form cannot be corrupted unless another comes anew, for the corruption of one thing is the generation of another.

Second assertion: milk lacks a soul. The Doctor does not dissent *ibid.* It is proved first from Aristotle (*4 de Gen. Animalium*, c. 8), affirming and calling milk blood well digested and not corrupted. Second: milk and blood differ only accidentally, from the third note; but blood lacks a soul, as was proved in the preceding article; therefore so does milk. Third: milk for the most part is the menstruum well purified, with filth and sediment removed, as I made sufficiently manifest at the passage just cited. But the menstruum does not differ essentially from blood; therefore neither does milk. And accordingly, since the menstruum is inanimate, likewise milk is inanimate.

You will object first, against the first assertion: what has the power of producing an animate thing is actually animated; but seed has the power of producing a living and animated thing, as daily experience teaches; therefore seed is actually animated. I respond that the major can be denied. For the sun in the opinion of many has the power of engendering a frog, even though the sun itself lacks a soul. But if the major is conceded, the minor is to be distinguished: seed

participates in the principal power of generating an animate thing, I deny; the dispositive power, I grant.

You will object second: seeds of herbs, plants, and trees are nourished, grow, and germinate when kept at home, as is evident of garlic, onions, and the like. But nourishment, growth, and germination are vital operations proceeding from a living and animated thing; therefore seed is actually living and animated. I distinguish: certain things are both seeds and fruits at once — of roots, stalks, and plants, such as the just-mentioned ones — and that these live and are animated, I grant. Others are seeds only, and that these enjoy a soul and life, I deny. Hence Aristotle (*2 On the Soul, c. 1 and 2; de Gen. Animalium, c. 1*) adds that no seed is animated and lives.

You will object third, against the second assertion: diverse actions and distinct properties argue a distinct nature and essence, as no one denies; but milk and blood possess diverse actions and also distinct passions — for blood is red and hot, while milk is white and cold; therefore it does not follow that if blood is inanimate, milk likewise is inanimate. I grant the major. To the minor I say that this argues only an accidental difference, not a substantial one — about which the contention stands.

Article III. Whether Hair and Nails Are Animated.

The first opinion is that of St. Thomas (*4 d. 44, quest. 1, art. 2, quaestiuncula 3*); Javellus (*2 On the Soul, quest. 10*); Báñez (*1 de Gen. c. 4, quest. 8, art. 4*); and others affirming that hair and nails are animated. The second opinion is that defended by Fernel (*2 Physiolog. c. 2*); Galen (*lib. Artis Medicae*); Fracastorius (*lib. de Anima*); Toledo (*2 On the Soul, quest. 4, c. 2*); with whom Scotus (*4 d. 8, quest. 1*) seems to concur — all denying that hair and nails are endowed with a soul.

Note first, from Isidore and Bercharius (*lib. 2 Reductorii, c. 61*): hair, so called from "head hairs," are also called locks, tresses, and various other names. In their production nature proceeds thus: from the animal's nutrition there remain certain sediments and excretions, thick and dry, along with sooty vapors enclosed in the narrow pores of the skin and retained in confined channels, which take on the elongated shape of those channels and press themselves outward and come into the light in orderly fashion. And although they are excrementitious, they nonetheless contribute to the ornament and elegance of the animal, as St. Augustine notes above others (*in Ps. 34, concl. 1; in Ps. 51*). In much the same way nature seems to comport itself in the formation of nails. For the veins, nerves, tendons, and ligaments of the fingers emit, from the residue of nourishment, a certain excretion, thicker, drier, and harder, at the extremities of the fingers, hands, and feet, and there it solidifies and hardens more, and at length turns into and becomes nails — which in some way contribute to the protection and ornament of the animal, as St. Augustine notes (*lib. 22 de Civ. Dei, c. 24*).

Note second: some, although they willingly concede that hair is not animated and alive, nevertheless deny this of nails, because in these are seen certain fibers and small veins or quasi-roots, in much the same way as such small veins appear in the roots or fronds of trees, through which nourishment is conveyed to those parts being nourished. All the more so because by their being struck and torn out we are affected by no small pain — which would certainly not occur unless nails enjoyed a soul. But the opposite is more probable and likely, and therefore is to be held. For the said indications do not compel. Even in certain stones and other non-living things certain fibers and small veins are seen, yet they are not considered to be living. Likewise, in the pulling out of hair we are tormented by pain — yet the adversaries concede that hairs are inanimate. For such pain is caused from the contiguity of parts with one another, not because they possess life — just as if iron is thrust into flesh and retained there, when it is pulled out it causes pain.

Assertion: both nails and hair lack soul and life. This is in accord with Aristotle and Scotus cited above. It is proved first: what is not a part of the animal according to potency and substance is not animated; but nails and hair are not parts of the animal either according to potency or according to substance; therefore they are not animated. The major is evident: for what is not a part of a natural body plainly does not participate in the form of the natural body; likewise what is not a part of a living body cannot enjoy a soul and life. The minor is at hand, since the said hair and nails serve for the ornament and assistance of the animal, and therefore are not animated. Second: what is superfluous, to be expelled, and an excrement of the nourishment of the animate is not animated. But hair and nails are such, as I showed in note 1. Therefore they are inanimate. The major is known: because the parts of the animate are not expelled from it, and what passes into the nourishment of the animal is not rejected by it — which is not preserved in hair and nails. The minor is from Aristotle (*lib. 3 de Historia Animalium, c. 11*). Third: in living things there is always some work of life, since the work of life is the necessary effect of the animate; but hair and nails produce no work of life — for they grow by juxtaposition, as experience confirms of the bodies of certain deceased persons, and as is seen in the body of Blessed Angela of Clavasio, Cunei, and Blessed Anthony of Strona, Assisius at rest, in whom nails and hair grow. But such accretion comes about by juxtaposition, in much the way that water is increased by the addition of water. Furthermore, when nails and hair are cut, provided that the flesh is not touched and harmed, no pain is inflicted on the animal; therefore they are not animated.

You will object first, from Aristotle (*1 On the Soul, T. 79; and 3 of the same, c. 13*): hair is called a part of the animal. And (*3 de Historia Animalium, c. 11*): in certain animals, nails reach such hardness that they do not differ from bones; but bones are animated; therefore so are nails. I respond to the two prior testimonies: hair is a secondary and excrementitious part of the animal, not a primary and per se

intended by nature. Therefore they lack souls. To the third testimony I say that the similarity of the Philosopher holds with respect to hardness, not with respect to animation. Therefore I grant that nails sometimes harden as much as bones, but I deny that nails are animated as bones are.

You will object second: when the heat of the animal fails, hair likewise fails and falls out, as is established in the aged. Therefore hair is animated — otherwise it is not apparent from what cause their falling would occur. I respond that this comes from the connection and contiguity that they have with the animal's flesh. Hence when heat and moisture fail, hair likewise fails.

You will object third: nails and hair grow, as daily experience shows; therefore they are animated. The consequence holds, because growth is a sign of soul and life. I respond that nails do not grow by internal absorption — which is required for something to be truly and intrinsically animated. I add that the animate grows according to a triple dimension, while hair and nails grow only in length — which undoubtedly means they are neither animated nor living.

You will object fourth: teeth are animated, as all philosophers affirm with Aristotle (*3 de Gen. c. 4*), and indeed rightly, since they are notable parts in the fabric of the animal. Therefore the same must be affirmed of hair and nails, since the same reasoning is evident in both. Confirmation: nails have certain fibers and small veins through which nourishment passes and they are nourished; but what is nourished is without doubt animated; therefore soul and life are not to be denied to them. I grant the antecedent and deny the consequence. The reason is that teeth are bones, by the common opinion of philosophers — not so nails, as is evident from their section. To the confirmation I say that even if fibers and small veins appear in nails, they are nonetheless not animated — as is clear of stones in which such fibers and veins are seen, even though they lack soul and life, by the common consent of all.

Article IV. Whether the Organic Parts of an Animal Have Forms Specifically Distinct.

This doubt is usually proposed under another title: whether there are partial forms? On this there are two extreme opinions. One is that of Alexander of Hales (*1 p. quest. 59, m. 2*); St. Thomas (*2 contra Gentes, c. 64; and 1 p. quest. 76, art. 5 ad 3*); Ruverius (*2 On the Soul, c. 3, quest. 7*); and the Complutenses (*disp. 6, quest. 2, § Secundo*) — and others — denying that the members and organic parts enjoy forms distinct from the soul of the animal by which the whole animal itself is informed and lives. The other is that of Scotus (*4 d. 11, quest. 3; and 7 Met. quest. 10*); Anthony Andreas *ibid.* (*quest. 17*); Mair (*2 d. 16, quest. unica*); and many others, affirming that the members and organic parts of the animal participate in distinct partial forms from the form of the whole and from the soul by which the animal lives.

Note: the organic parts of the animal are of a twofold difference — some are homogeneous and the rest heterogeneous. The former are similar, of the same nature and denomination — so the parts of bone are and are called bones, and the parts of flesh are and are called flesh. The latter are of diverse nature and name — such as the head, neck, arms, feet, and the like — which have diverse complexions, properties, and operations. Among these members, some are principal — such as the heart, brain, and the like — while others are less principal, such as the hands, feet, and the like.

Assertion: the organic parts of an animal possess forms specifically distinct from one another and from the common form, which is the soul. The Doctor holds this *ibid*. It is proved first from Aristotle (*3 de Partibus Animalium, c. 4*), affirming that the heart is the first part of the animal — which is to say, the heart is produced earlier than the other members of the animal's body, before the soul comes to inform its body. In that prior moment the heart has its own form, because nothing sublunary and substantial exists that lacks its own substantial form; but then the heart does not participate in the form of the soul, since the soul is supposed not yet to exist. Therefore it enjoys its own proper form of the heart, by reason of which it is distinct from the forms of the other parts of the animal's body.

Some respond — whose names Mair (*at the cited passage*) passes over, and the Complutenses (*cited*) follow — that the heart and the other members of the animal have among themselves a distinction not essential but only accidental. Against this: no matter, whether total or partial, is found naturally without form; but in the heart there is partial matter, as is evident; therefore also a partial form; and this is not accidental, because since matter is a substance, certainly its form is a substance too; and therefore since one substance differs from another substance substantially, it is plainly inferred that the said distinction is not accidental but substantial. Again: the total and adequate thing capable of being perfected is the organic body — hence (*2 On the Soul, c. T. 6*) the soul is defined as "the first act of the organic body." But the organic body coalesces from dissimilar and heterogeneous parts, among which the heart holds the chief place. The whole organic body and its parts are required and presupposed before they are informed by the soul. Therefore since this body is a substance and its parts are substantial, it is soundly concluded that they differ substantially from one another.

Second: diverse temperament, figure, and operation argue a diverse form and substance — for through these we arrive at knowledge of the latter. Hence Aristotle adds (*1 On the Soul, T. 11*): "Accidents contribute greatly to knowing the substance." But the organic parts of the animal participate in diverse temperament, are distinguished by distinct figure, and elicit different operation. For the heart is hot and is the workshop of the vital spirits; the brain is cold and

the source of the animal spirits; flesh is moist and soft; bone is dry and hard; and so of the rest. Therefore they possess diverse partial substantial forms.

The aforementioned authors respond and say that this proceeds from accidents and dispositive qualities. For dispositions are present in the head and in its organs for sight, hearing, and the other sensations — but not in the feet and other members of the animal's body. Therefore such diverse operations do not arise from diverse substantial but from diverse accidental forms. Against this: diverse accidents reveal and manifest diverse substantial forms, since substance is hidden from us and matter is passive; therefore operation is attributed to form and to the whole composite; therefore, seeing various and diverse accidents and operations, we detect distinct substantial forms and composites — as Aristotle rightly discusses (*1 On the Soul, T. 64 and following*). Hence a plant has a diverse figure from a tree, a tree from man, man from a lion, and so of the rest. And likewise they act and operate diversely — which plainly proceeds only from forms specifically or generically distinct.

Third: if any organic part of the animal is cut off from it, it still retains its own form that it had when conjoined with the other members and parts. For if a bone is moved, it appears as the very same bone, with the same form and figure that it previously had. But that form does not proceed from the soul, as is evident, because the soul is separate and segregated from it. Therefore each organic part of the animal possesses its own proper substantial form. It does not help to say that this proceeds from accidental forms that are subjected in matter. For matter, from what was said, is not the proximate and immediate subject of accidents; and matter is never found without some substantial form. Therefore if any organic part separated from the whole animal is found, it enjoys its own proper partial substantial form. Add that this is also seen in artifacts — for the image of a painter possesses several specifically distinct forms, such as white color, black, and the like; therefore this is also not improperly affirmed of natural things, with this difference, however, that those forms are accidental while these are substantial.

You will object first: a dead hand and a living hand are equivocally a hand, as Aristotle testifies (*4 Meteor.; 7 Met. T. 35*). But if the hand had a peculiar form distinct from the soul, a hand would not be equivocal to the dead and the living, because both would participate in the same form of the hand. Therefore the organic parts do not possess forms specifically distinct. I respond that the hand and any other organic member of the animal can be considered in two ways. In one way, insofar as the hand implies an order to the soul actually informing that hand — and in this way the living and dead hand are equivocal, since the living hand is informed by a soul which the dead hand lacks. In another way, absolutely, insofar as it has the form of a hand — and in this way both are univocated in the form of the hand. Through this distinction the testimony of Aristotle is expounded.

You will object second: there seems to be a greater distinction between animate organic parts than between inanimate organic parts; but animate organic parts possess one common form, namely the soul; therefore so do inanimate ones. The major is argued: because the former have distinct operations — the eye vision, the ear hearing, and so of the rest — which argue distinct souls from which they proceed; the latter elicit one common action and operation; yet notwithstanding this, only one form is participated in by them. Therefore etc. I deny the consequence of the major. For one soul, through distinct powers and potencies, can elicit and exercise distinct operations; therefore from diverse operations one does not rightly infer diversity of souls. But truly, from diverse temperaments and passions, diversity of forms is soundly derived according to the diverse organic parts, as is clearly shown by what we adduced above.

You will object third: what is continuous does not have parts possessing diverse forms — as is clear of wood, gold, and the other continuous things participating in exactly the same common form; but the body of an animal is continuous, for all its parts are continuous with one another, as is seen with the eye. Therefore such parts do not enjoy distinct forms. I respond that the major, on which the adversaries press, is not entirely true. For a branch of a tree is continuous, even though one part of it is living and another dry, sometimes. Similarly, sometimes the feet of the human body are dry, while its other members are healthy and living. To the minor it can be said that the body of an animal is not simply continuous, but mixed and intermediate between continuous and contiguous, because its parts are bound and connected together among themselves.

You will object fourth: if such organic parts had forms specifically different, they would constitute one per accidens and one by aggregation, for from several disparate acts there is made one per accidens. But in the common opinion the composite of the animal is one per se; therefore its parts do not possess specific forms. I deny the consequence of the major, since those partial forms are subordinated to the common form, which is the soul. And therefore from them one per se is well made.

You will object fifth: each substantial form together with matter constitutes a suppositum; therefore if in it there were several substantial forms, it would be deduced that it, coalesced from them, would be a multiple suppositum and hypostasis — which is false, as no one denies. I respond that not just any substantial form constitutes a suppositum, but only the total, complete, and perfect form. Therefore it is wrongly inferred that from several partial forms specifically distinct from one another, one suppositum is multiple.

Article V. On the Parts of the Human Body.

A synopsis of the individual parts of the human body is commonly called anatomy, which I have now decided to touch upon, leaving its exquisite treatment and diligent and careful investigation to its masters and professors. I

begin rather from the parts of the human body than from the parts of the natural body taken generally or of any other animate and animal, because the said parts of the human body are nobler and more excellent, and because its fabric is more admirable and more divine.

By some, the whole human body is divided into three cavities: the first is called the head, the second the thorax, and the third the limbs. By others, a fourfold distribution is made of those parts. The first is into essential and integral parts. The former are those that essentially constitute the whole — such as body and the rational soul in man, and in any other natural composite, matter and form. The integral parts, which integrate, perfect, and adorn the whole, are the head, neck, arms, hands, etc.

The second distribution is into spermatic, nutritive, and excrementitious parts. The spermatic parts are those fashioned from the seed by progenitors, and are called primigenial because they were produced from the beginning of the fetus. The nutritive parts are those generated through nutrition and connected to the prior or primigenial parts. The excrementitious parts are those that proceed from superfluous nourishment — such as seed, milk, hair, etc.

The third distribution is into containing, contained, and impulse-producing parts. The containing parts are those that hold other parts within their compass — such as membrane, skin, hide, and the like. The contained parts are those held under others — such as the liver, heart, lungs, and the rest. The impulse-producing parts are those that excite the other parts — such as the vital spirits that pulse the arteries.

The fourth is into heterogeneous or dissimilar parts, which are of diverse nature — such as flesh, bone, etc. — and homogeneous or similar parts, which are of the same nature — such as flesh and its parts, which are flesh, just as water and its parts are water. But the most important similar parts are reckoned as seven: bone, cartilage, ligament, tendon, membrane, skin, and flesh. To these can be referred the four humors, spirits, seed, and milk. Bone is a terrestrial, dry, cold, and hard substance, and also animated. For it is nourished and grows by internal absorption. In bones the whole fabric of the body is supported and sustained. For they are the buttresses and foundations of the other parts and members of the animal's body. Cartilage is a substance softer than bone, which can be bent and folded. Some cartilage is situated at the extremities of bones, as is evident of the cartilage of the nose; other cartilage is not attached to the extremities of bones, such as the cartilage of the ear. Ligament, as its name indicates, is a certain substance connecting or binding bones, lest they be moved from their proper places. Tendon is derived from "tending," because, as its very name indicates, it stretches the member to be moved like a cord, and is intermediate between ligament and nerve — for it is softer than ligament and harder than nerve. Membrane is the covering that sheaths the parts and members of the body. Skin is the membrane that covers the whole body or some part of it. It is

divided into outer skin — called the epidermis — which is visible to our eyes; and inner skin — called the dermis — which we do not see quite so easily. Flesh is a certain soft substance in the body produced from blood. It differs from fat, because although fat too is made from blood, it is nevertheless produced by cold through a kind of congealing; while flesh is formed by heat through drying.

The four humors are blood, phlegm — that is, pituita — black bile, namely melancholy, and yellow bile, that is, choler — all of which serve nutrition and are simultaneously mixed, as the generality of physicians asserts, against Aristotle (*2 de Partibus Animalium*). Spirit is a certain subtle substance, and is called spirit because of its tenuous quality and readiness to act. These spirits are observed at the incision of a vein, for by the power of the spirits themselves blood exits from the cut vein. They are divided into innate and inflowing. Innate spirits are subtle substances produced from the beginning of the fetus for its consistency. Inflowing ones are those that flow in together with the blood and assist the innate spirits. Furthermore, the inflowing spirits are subdivided into natural, vital, and animal. The natural ones flow together with the blood in the vein and assist nutrition. The vital ones are those that proceed from the heart as from the source of life. The animal ones are those that derive their origin from the brain and contribute to the performance of sensations. Scotus treats of these to some extent (*4 d. 49, quest. 16, § Alius intellectus*), saying that they are diffused through the whole body and through those pores where there is no solid flesh.

The principal dissimilar parts are reckoned as four and are called the muscle, vein, artery, and nerve. The muscle is a heterogeneous part woven from a covering, flesh, fibers, and ligaments. It is divided into broad, deep, and oblong muscle. The vein is a heterogeneous part woven from a single covering, a receptacle of nutritive blood. It is divided principally into the vena cava and the portal vein — and into many others, the smallest of which are called capillary veins. The artery is a dissimilar part invested with a double covering, a receptacle of vital blood. It arises from the heart. Two arise from the very heart — from the left side of it — one of which is called the venous artery and the other the aorta. The venous artery is carried to the lungs and provides them with arterial blood and purges the sooty residues. The aorta is that which enriches the other parts of the body with vital influx. The nerve is a heterogeneous part, a vehicle of the animal spirits, through which the soul seated in the brain governs and regulates the whole body. It takes its origin from the brain — against Aristotle, as physicians teach, who, as more experienced, deserve trust, especially since this is seen in anatomical dissection.

Now it remains to declare the parts insofar as they are rightly disposed by nature and aptly ordered. Three parts are observed principally in the fabric of the human body: the head, the thorax, and the limbs. The head is divided into the hair-bearing part — so called because it is adorned with hair — and the non-hair-bearing part, because it lacks hair. This encompasses the forehead, eyes,

nose, cheeks, temples, lips, ears, and the rest. The former is subdivided into the sinciput, that is, the anterior part of the head; the vertex, that is, the summit of the head; and the occiput, namely the posterior part of the head. They are then subdivided into containing and contained parts. Again, the containing parts into common — such as the skin and the membrana carnea — and proper; the latter are distributed into external ones, such as the pericranium and the cranium, in which the brain is preserved as in a helmet; and internal ones, which are the two meninges encompassing the whole brain — of which one, because it is harder, is called the dura mater; the other, because it is more delicate, is called the pia mater. The contained parts are the cerebrum and cerebellum. The former is in the anterior part of the head and is larger; the latter is in the posterior part of the same head and is smaller, as its name indicates. In the brain there are observed certain cells in which the senses reside, of which mention will be made individually in its proper place when we treat of the senses.

In the thorax there are two skins — the epidermis and the dermis. There are certain fat tissues, the serratus muscles, the mastoid, and the bronchus. Also visible are two breasts, especially in females. The diaphragm presents itself, which is like a wall interposed and contains in itself the vital operations by means of a certain universal membrane, which according to its relationship to different places receives different names. Insofar as it regards what is below, it is called the septum and the peritoneum; insofar as it regards what is above, it is called the pleura and the subcinging membrane; and in the head, the meninx. Then follows the heart, which is the beginning and source of life, consisting of two parts — one broader, called the base or head; the other narrower and pointed, called the cusp or apex. In the heart itself are found two ventricles, the same number of auricles, and four small vessels. In the right ventricle are seen two veins — the vena cava and the portal vein; in the left, two arteries — the venous artery and the aorta. And to the heart are given the two said auricles, perhaps so that its heat may be moderated and cooled as by two bellows. Then come the lungs, whose material is soft and spongy; they expand and then contract, since they are conceded by nature for respiration. Like the bellows of an organ they expand to draw in cold air, and contract to expel warm air. David perhaps suggests this (*Ps. 118*): "I opened my mouth and drew in the spirit." And Augustine expresses it (*lib. 4 contra Iulianum, c. 14*): "The lungs are like bellows, by which we alternately inhale and exhale vital breaths." And in the commentary on (*Ps. 102*): "The lung of the breast, the liver, is a kind of bellows of the panting spirit that we breathe, the spirit of the received air, which is expressed in voice and sound when we articulate words." Nor are the rough artery — which serves for respiration and for forming the voice — and the esophagus — which is the channel through which nourishment is transmitted to the stomach — to be omitted. The muscles of the larynx and neck, the uvula, the spine, twenty-four ribs (twelve on one side and twelve on the other). The liver follows, in which the

natural faculty resides and the rooting of the veins; the spleen, and the rest, which are explained by the anatomists.

The limbs — also called the lower belly — are divided into containing and contained parts. The containing parts are the epidermis and dermis, and the adipose and carnosae membrane. The contained parts are numbered: the navel, the omentum (that is, the membrane that adheres to the bottom of the stomach), the intestines — one of which is called the duodenum, because its length is measured by twelve fingers; another is called the jejunum, because since it is longer than the colon, it never seems full; the third is the ileum; the fourth, the cecum; the fifth, the colon; and the sixth, the rectum, which expels excretions by a straight passage. Their binding is called the mesentery. There follow the urinary canals, the bladder, the spermatic vessels, and the rest, of which the anatomists treat abundantly.

Question III — On the Powers of the Soul in General

Now that the soul has been examined in itself and in general terms, and the parts of the animated body as well, the orderly method of inquiry requires that we investigate the soul's powers, forces, and faculties, with the help of divine grace. For to exist is prior to what follows upon existence, as the Doctor touches upon (*4. dist. 10. quaest. 7. §. Respondeo A. 2.*).

Article I — By What the Powers of the Soul Are Produced

There are those who hold that the powers of the soul are produced by the generator of the animated composite, as by their proximate and immediate principle. The common opinion of the Philosophers, however, maintains that the forces, faculties, and powers of the soul are produced immediately and proximately by the soul itself.

Note first, following Scotus cited just below (*in exp. 9. Met. cap. 2.*), that certain powers belong to inanimate things — such as the power of fire to heat and of water to cool — while others belong to animate things, such as the nutritive and augmentative powers. Among the latter, some arise from the soul, as the intellect and will arise from the rational soul; others arise from the body, such as the power of local motion; and still others arise from the whole composite, such as the vegetative and sensitive powers and the like, of which Aristotle makes mention (*1. animae, 64.*) and Scotus (*12. Met. in expof. T.13.*), saying that powers other than the intellect and will are organic and belong to the whole composite, and that in separation they do not remain except as in their root.

Note second, that by the soul's powers we understand the immediate principles of vital operations — thus the intellect is the proximate and immediate principle of intellection, the will of volition, and the sense of sensation. Hence the Doctor adds (*3. d. 34. q. vn. ante §. His suppositis sub H.*) that a power is that by which the capable being is capable and strong. Now, something can be produced

by another in two ways: either through motion and change, in which case the product is really distinct from the producer, as effects are from their causes; or through simple emanation, or real resultance, as powers arise from the soul and from the whole animated composite — just as the heating power arises from fire and the cooling power from water. In this way the divine attributes are said to blossom forth from the divine essence. Scotus describes this twofold mode of production (*1. post. quest. 25. §. Ad quest. vers. Sed alio modo*), as does Sarnanus (*quest. 1. univers. pag. 16. 17.*).

Note third, that from one and the same simple soul, multiple powers arise — as the intellect and will proceed from the rational soul — in a certain order. For the intellect proceeds from the intellective soul prior to the will, after the manner of several effects essentially ordered from the same cause and proceeding from it, of which one presupposes another — not because one is efficiently caused by the other, as motion is said to cause heat, but because between the two there is a natural presupposition, and one is more immediately close to the cause or at least presupposes fewer conditions. Thus we understand before we will — not because intellection is the cause of volition, but because intellection requires fewer prior conditions than volition does. And so the intellect naturally emanates from the soul prior to the will, as the Doctor indicates (*1. distinct. 2. quest. 7. O.*) and in many other places.

First assertion: Some powers arise immediately from the soul, others from the whole composite, and all arise mediately and remotely from the generator. This assertion is twofold and is held by the Doctor in the places cited above. It is also suggested by Saint Augustine (*lib. 1. contra Iulianum, cap. 3.*), saying: "If we seek the origins of wills, what presents itself but natures, which God has established as good?" The first part is proved as follows. That is the immediate and proximate principle of something which, when first posited, immediately brings about the thing, and when first removed, immediately takes it away. Now, when the soul is posited, the inorganic powers are immediately posited; and when the whole composite is posited, the organic and material powers are immediately posited — which seems evident to everyone. Therefore, the soul and the whole composite are the immediate and proximate principles of all the aforesaid faculties and powers.

Second: the soul is not more ignoble than the forms of the elements, since it is the principle of life; and the animated composite is not inferior to the inanimate composite. Now the forms of the elements, and the elements themselves, are the proximate and immediate principles of their own powers — fire of its heating power, water of its cooling power. Therefore, likewise the soul, and the living animated whole, are the immediate principles and origins of the said forces and powers.

The second part is explicitly defended by the Doctor (*1. post. quest. 56. §. Ad 1.*) and is supported by the common maxim of the Philosophers: whoever gives

being gives what follows upon being. And by the legal maxim: whoever gives the principal gives the accessory. Now the generator produces the animated being, and therefore mediately and consequently produces its forces and faculties. Furthermore, whoever produces a corporeal substance also produces its passions and accidents — such as quantity, quality, and the like. Now the generator produces an animate being similar to itself, and therefore consequently produces the forces and powers that accompany and follow upon it.

First objection: Aristotle writes (*7. Phys. 1.*) that nothing is moved by itself. But if the soul and the animated being were to produce their own powers and faculties, they would be moved by themselves toward the production of those powers. Therefore those powers do not proceed from them. I respond and say that Aristotle's dictum holds of things produced through motion and change, but not of those which proceed through simple emanation — such as the forces and powers of the soul and of the whole animated composite, as I made clear in the second note.

Second objection: From one, as one, only one can proceed, on the authority of Averroes (*8. Phys. com. 46.*). But the soul is a single, simple substance, and the animated being is likewise one. Therefore multiple forces and powers cannot proceed from them. I respond by way of distinction: from one having only a single principle, only one can proceed — this I concede; from one having multiple principles, I deny it. Thus from the single sun there arise the power of illuminating and the power of heating, and from one cause multiple effects proceed.

Article II — Whether the Powers of the Soul Are Distinct from One Another and from the Soul Itself

The first opinion is that of Ockham (*2. quest. 24. v.*), Gabriel, Gregory, and other Nominalists, who hold that the powers of the soul are entirely identical with the soul itself — so that the rational soul is not distinct from the intellect and will which are its powers, but is itself the intellect and will, connoting the operations of those powers. For the soul, insofar as it understands, connotes the intellect; and insofar as it wills, connotes the will.

The second opinion is that of Alexander of Hales (*2. p. q. 65. m. 2.*), Thomas (*1. p. quest. 77. art. 1.*), Toledo (*2. anima, quest. 9.*), Rubeius (*ibid. cap. 3. quest. 1.*), and many others, who hold that the powers are really distinct from one another and from the soul.

The third opinion is defended by Scotus (*2. dist. 16. quest. vn. & 4. dist. 44. quest. 2.*), Tataretus (*2. de anim. quest. 2. art. 2.*), John of Magistris, Poncius (*disp. 58. quest. 11.*), and very many others, who teach that a formal distinction intervenes between the soul and its powers.

Note first — and recall from what was said above in the preceding article (*ex Scot. 4. dist. 10. quest. 7. §. Dico A.*) — that just as man is composed of soul and body, so he participates in certain spiritual powers which arise from the rational soul alone, such as the intellect and will, and in certain material powers which belong to the whole composite, such as the visual power and the like, as Aristotle writes (*l. de sensu, Sensato, cap. 1.*). And indeed, among those belonging to the whole composite, some are said to be more corporeal — namely, those which follow upon the nature of the mixed body — while others seem to approach more nearly the nature of the soul, inasmuch as they follow upon and accompany the animated body. With this distinction in place, we must accept what the same Doctor teaches (*in 4. dist. 44. quest. 2.*): that inorganic powers — so called, perhaps, because they do not require a bodily organ for the exercise of their operations — are really identical with the soul but formally distinct from it; whereas organic powers, which do not belong to the soul in themselves but only radically and partially, and belong rather to the whole composite of soul and body, are really distinct from the soul, since the soul can exist without them. Hence the soul in the state of separation possesses no organic power and cannot exercise the act of any organic power that involves a body.

Note second, following the same Doctor in the passage just mentioned (§. *Rationes ista A.*), that the word "power" is taken in one sense as a principle of operating — and thus from (*5. Met. T. 17. & 9. eiusdem T. 2.*), power is divided into active and passive. In another sense it is taken as distinguished from act: and in this sense not only are power and act of the same species, but even of the same numerical instance, from (*9. Met. 11. & 3. Phys. 8.*). For that individual which is now in act is the very same that was previously in potency — for example, as objective potency. It follows from this that it is entirely false that power, taken in the first sense — which is described as the principle of transforming another, insofar as it is another — should be of the same genus as act. For substance produces an accident, which is of a different genus from the substance itself (*ex 7. Met. in fine*). Wherefore the Thomists do not argue correctly when they infer: acts and operations are accidents, therefore the productive power is also an accident. For even according to Saint Thomas, substance produces substance — though not immediately, but through the mediation of accidents. It is thus possible for a power to be a substance while the act is an accident.

First assertion: The soul and its powers are not entirely identical. This is handed down by the Doctor in the places cited above. It is proved first from Aristotle (*1. animae 91.*): in one living being there is one soul, but multiple powers. And (*2. eiusdem, cap. 3. T. 27.*): there are three genera of souls, but five genera of powers. And (*ibid. T. 9.*): if the eye were an animal, its form would be the visual power. Saint Augustine supports this (*1. de spiritu, & anima, cap. 4.*): one soul, many powers and forces. And in the same place he compares the soul to the triune God, following the threefold number of the powers — intellect, will, and memory. The same saint adds (*lib. 1. contra Iulianum, cap. 3.*) that intellectual

natures are the origins of wills. Now the origin is evidently distinct from what originates from it, as a tree from its fruit and a root from its shoot. And (*l. 4. contra eundem, c. 4.*) he adds that created nature is always good, but the will is good if it performs good works and evil if it does evil. Augustine therefore distinguishes the will and the other powers of the soul from the soul itself.

Second: what is entirely identical and undistinguished from another has everything predicated of the one also predicated of the other — as if man and rational animal are identified, whatever is said of man is also said of the rational animal. But what belongs to one power of the soul does not belong to another: the intellect understands, but the will does not understand; the will wills, but the intellect does not will.

Third: what emanates from another does not coincide with that from which it emanates — just as an effect is not identified with the cause by which it is caused. But the powers of the soul emanate from the soul itself, as has been proved in Article I of this Question. Therefore, and so on.

Fourth: a natural principle differs from a free principle. The intellect is a natural principle, and the will is a free principle. Therefore the intellect and will, which are powers of the rational soul, are distinct from one another. The major premise is evident because a natural principle is determined to one outcome, while a free principle is indifferent and undetermined toward opposite acts and opposite objects. Moreover, in the Trinity itself, the Word is produced through the intellect and the Holy Spirit through the will. Therefore, if the intellect and will did not differ, the Holy Spirit would proceed through the intellect just as well as through the will, and similarly the Word would be produced through the will just as through the intellect — which is plainly false and erroneous, as I showed in the treatise on the Triune God (*disp. 1.*). Therefore the distinction between the soul and its powers and faculties must be upheld.

Second assertion: The powers and forces of the soul do not really differ from one another or from the soul itself, but only formally. This assertion has two parts, and its chief advocate is Scotus in the places cited above.

The first part is proved first from Aristotle (*2. anima, T. 17.*), who calls the powers parts of the soul and its perfections. For if the powers were really distinct from the soul, they would not be its parts — since the soul is a substance, and powers really distinct from it would be accidents, in the Thomistic view. Furthermore, the same Aristotle raises the question whether the intellect is separable from the soul. If the powers were really distinct from the soul, there would be no such question, since an accident is without doubt really separable from its substance. Aristotle adds many other considerations in the same place. From all of these it is plainly deduced that Aristotle in no way posited a real distinction between the soul and its faculties. Toledo, failing to notice this (*praecit.*), thinks the opposing opinion is the Peripatetic one. Second (*ex 1. Phys. 52.*): entities should not be

multiplied beyond necessity — unity is better than multiplicity, and nature provides what is better (2. *de gener.* 50.). But if the soul and its powers were really distinct, they would be many entities really distinct from one another. Since it is better and more excellent for the soul to be one real thing identified with its powers, it is clearly to be inferred that no real distinction is to be introduced between the soul and its powers.

Third: if the powers were really distinct from the soul, they could at least be supernaturally separated from it and placed in a stone or some other subject — so that a stone would have an intellect, and the soul would be like a trunk, stripped and deprived of all power and faculty, and would therefore not be the principle of vegetation, sensation, or intellection. This conflicts with the nature of the soul as it was described and defined above. Moreover, the soul, which is a substance, would not be immediately active and operative, but would act and operate only through accidents. But I have shown elsewhere that substance is immediately active and operative. Therefore its forces and powers are not really separated from it. Finally, the soul would not immediately be beatified, because it would not immediately see God or enjoy him, but only through the mediation of accidents — which, according to the Thomists, are the intellect and will. But this and similar consequences have been rejected in the treatise on beatitude.

The second part follows from what has been said. For in the first assertion I proved that the powers are not entirely identical with the soul. And in the first part of this second assertion I showed that no real distinction intervenes between the soul and its powers. Therefore a formal distinction must be affirmed. Furthermore: what possesses distinct formalities and definitions, and what cannot be separated from one another even by divine power, differ formally — as I have shown at length elsewhere. Now the soul and its powers are of this kind, as is clear from what has been said. Therefore they differ formally.

First objection: Augustine (12. *Civit. c.* 6. & *l. de spiritu, & anima, c.* 4.) and Isidore (11. *Etymol.*) offer these words: "The soul is vital when it vegetates, is sense when it senses, is spirit when it contemplates, and is soul when it understands."

Therefore the soul is in no way distinct from its powers, except as regards distinct names and connotations, as those Fathers seem to indicate quite plainly. I respond that perhaps those Fathers held that the soul and its powers are one and the same reality but differ formally. Hence in the passage from the City of God Augustine confuses fear, sadness, and other affections of the mind with the will — which are established as distinct from the will itself. The testimonies of Augustine cited in the first assertion show the same thing.

Further instance: The same holy Doctor, speaking to God in (7. *Conf.*), says: "For the will and power of God is God himself." Therefore, if in God the power and the attributes are identified with one another and with the divinity, the same must be asserted of the soul and its powers. I say that both are identified really

but distinguished formally, as I pursued at length in the treatise on the One God (*disp.* 2. 9. 2.).

Second objection: Aristotle (*l. praedicam. c. de qualitate*) places natural powers in the category of quality. Therefore Aristotle considers natural powers to be accidents; and accidents are really distinct from the substance in which they inhere. Therefore the powers of the soul, which are accidents, are really distinct from the soul itself. I respond that Aristotle must be interpreted as speaking of powers taken not as principles of acting and operating — for in that sense they reside in the predicament of those things of which they are principles — but as natural aptitudes and readiness for acting and operating. For that reason he gives the example there of the runner and the boxer, who have this kind of ease and readiness for running and boxing.

Third objection: The visual power is really distinct from the auditory power. Therefore what is affirmed of these should equally be affirmed of the other powers. The antecedent is proved because someone can be blind without being deaf. Therefore there is an auditory power without a visual one, and consequently the one is really distinct from the other — since, as was said, a clear sign of real distinction is when one can be separated from another. I concede the antecedent and deny the consequence, because the powers now mentioned are powers of the whole composite, not of the soul alone, as I noted above in the first note. Or I say it holds of proximate powers but not of remote ones. For one who is blind lacks the proximate power of seeing, but not the remote power — as is evident in the case of the blind men healed by Christ the Lord (*Matt. 11. Caeci vident, Surdi audiunt, &c. & Ioan. 9.*), the man born blind who says: "When I was blind, now I see."

Article III — Whether the Distinction of the Powers Is Derived from the Distinction of Acts and Objects

In this article I encounter two ways of speaking, of which the earlier is followed by Bannez in the same place, Toledo (*2. de anima, q. 8.*), the Complutenses (*disp. 7. q. 1. §. 2.*), and Rubeius (*c. 3. q. 8.*), all of whom affirm that the powers of the soul differ by their relation to acts and objects. The later way is embraced by Scotus (*Quol. 13. post HH. & 2. dist. 16. q. vn. & 3. d. 24. q. vn. in fine, & 1. Met. q. 6.*), Iandun (*2. de anima, q. 8.*), Hervaeus (*Quol. 1. q. 10.*), Mercenarius, Mayr, Lychetus, and many others, who deny that the powers are distinguished essentially and intrinsically through acts and objects.

Note first that the controversy here is not whether the powers are distinguished in an absolute sense by acts and objects — everyone takes that for certain — but about the mode by which the powers are distinguished according to acts and objects. The Thomists hold that acts and objects distinguish powers a priori and essentially, so that they belong to the very essence and quiddity of the powers — not because they are intrinsic forms of the powers, as Toledo says (*cit.*), but that

there is a certain relation to acts and objects, such that each power in its essence includes a relation to its act and object, and this is the differentiating factor of each power, which varies with the variety and diversity of objects. The Scotists, on the other hand, hold that acts and objects do not distinguish the powers essentially, intrinsically, and a priori, and that the relation to acts and objects does not belong to their quiddity and essence; rather, the powers are constituted in the being of powers through their own proper and intrinsic differences, which are manifested through the acts and objects toward which they terminate.

Note second, following Scotus (*1. d. 39. q. art. 2. C.*), that disparate powers can be related to one another in three ways. Either they are entirely disparate and contradistinct, or they are subordinate. If they are subordinate, they are either in the same genus — such as a higher and a lower cognitive power — or in different genera, such as cognitive and appetitive. In the first way, disparate powers have entirely distinct objects, since none of them operates per se with respect to the same object around which another power is engaged — such as the external senses: sight, hearing, smell, taste, and touch. In the second way, disparate powers possess primary objects that are subordinate to one another, so that the superior power can per se have an act regarding whatever the inferior power can, and thus the primary object of the superior power contains under it the object of the inferior power. Hence the primary object of sight, in its generality, is contained under the primary object of the common sense. In the third way, powers are so related that the appetitive power is commensurate with the cognitive in operating with respect to whatever objects — so that the primary object of both would be the same and under the same formal aspect on the part of the power. But if the appetitive has an act with respect to some cognizable things and not others, then the object of the appetitive will be inferior and more contracted than the object of the cognitive — as is the case with the intellect and the will. If, however, the will is posited as having an act regarding everything intelligible, the same object would be posited for both intellect and will, and under the same formal aspect. But if this is not the case — if the will only elicits an act regarding things intelligible that are an end or ordered to an end, and not regarding purely speculative objects — then the object of the will is in some way more contracted and limited than the object of the intellect.

First assertion: The essential and intrinsic distinction of the powers is not derived from their acts and objects, but only from what is extrinsic and manifesting. This is defended by the Doctor in the places cited above.

The first part is proved first: what is posterior to a power is not its essential constitutive and distinguishing principle, since what is prior, as prior, does not receive its being from what is posterior. But acts are posterior to powers, because acts arise from them. Therefore from acts the intrinsic and quidditative distinction of the powers is not drawn. The Complutenses and Rubeius respond (*cit.*) that although a power is prior to an act in the genus of efficient cause, it is

not prior in the genus of final cause, since act and operation is the end of the power, on the authority of Aristotle (9. *Met.* T. 16.). Against this: the end is an intrinsic cause, just as the efficient cause is; but the dispute concerns the formal, intrinsic, and essential cause. Therefore the response is inadequate.

Furthermore, as was said in the treatise on causes (*q. de causa finali*), the end causes according to intentional being; but in the present inquiry we investigate the real being from which the real, essential, and quidditative unity and distinction of a power is drawn — and this is not the being of the final cause, whether according to intentional being or real being.

Second — which is nearly the same as the first argument, and is drawn from Scotus (2. d. 1. q. 5.) — the first act precedes in itself and per se, by nature, and afterward follows the being of the principle of the second act. But powers are first acts and productive principles of second acts. Therefore powers do not per se primarily and essentially differ through second acts. The major premise is supported by the Doctor in the place cited: every being that is the principle of some action performs such an action because it is such a being and of such a nature — as is evident of the sun, which is the principle of generating many mixed bodies, and whose quidditative and essential distinction from those mixed bodies is certainly not that power or principle of producing them, but is the form and essence of the sun itself, by which it is essentially and quidditatively distinct from the said mixed bodies. The minor premise is evident and sufficiently clear from what was said in the preceding article, in which it was made apparent that the powers of the soul are not accidents but are really identified with the very substance of the soul.

Third: what is extrinsic and outside the formal nature of something does not distinguish it essentially and intrinsically from other things, as is evident. But act and object are outside the formal nature and quiddity of a power. For even if, per impossibile, there were no object, the power would still exist. Moreover, the object is a partial cause of acts, and one partial cause does not intrinsically and quidditatively include another partial cause. Furthermore, the term is outside the nature of the ground and of what terminates; but the act and object are the term of the power. Therefore a power does not derive its essential and quidditative unity and distinction from act and object.

The second part is established first by the authority of Aristotle (2. *animae*, T. 33.) and of the Doctor both in the places cited and in (2. *distinct.* 3. *quaest.* 8. §. *Ad argumenta sub N. in solutione ult.*), both affirming that powers are distinguished by acts, and acts by objects — which is understood a posteriori and as manifesting, as is clear from what is read there. Second: through long inquiry and evident experience it has been established that from acts and objects the extrinsic and manifesting unity and distinction is derived. We observe by experience that one who meditates also judges and reasons, but one who cannot meditate can neither judge, reason, deliberate, nor reason discursively — as is the case with

brutes. From this we rightly conclude that those acts belong to the single intellectual power, whose primary and adequate object is everything intelligible. Likewise, whoever can will can also refuse to will, love, and hate; and one who cannot will can also not refuse to will, love, and hate. We further infer that there is but a single power that elicits all these acts, which is called the will. Similarly, a certain animal is nourished but does not generate; from this we conclude that the generative power is distinct from the nutritive power. The same must be judged of the remaining powers in relation to their acts and objects. Thus manifestly and a posteriori we arrive at knowledge of the distinction of the powers through acts and objects.

Second assertion: The powers are not distinguished by their relation to their objects, but through their own intrinsic and formal principles. Scotus favors this in the places cited above.

The first part, which is opposed to Cajetan and Toledo, is proved first, as an argument against them: those authors assert that the powers are absolute entities of the second species of quality, and then they maintain that they are relative entities including a relation in their essence. They therefore plainly contradict themselves. Nor does it help to say that a power is something absolute with a relation. For that cannot be the case. As Scotus excellently proves against Henry (2. d. 16. q. vn. G.), what is absolute cannot per se constitute a unity with what is relative. But a single operation per se has a single principle. Therefore it is impossible for a relation to enter into the intrinsic and essential nature of that principle. Now intellection and volition are each a single act per se; therefore each has a single power and a single principle per se.

Second: what is a single principle per se is prior to the operation and can exist without it without contradiction — just as a cause can exist without its effect. But a relation can neither exist nor be understood without its term, which in our case is the operation. Therefore the relation and relation of a power to its act and object is not included in the essence of the power.

Third: a respect is not per se of the nature of a receptive and passive power. Therefore neither is it of the nature of an active power. The consequence is perspicuous. The antecedent is proved because matter, which is a passive power, receives form immediately through its essence and not through a relation. Therefore a relation in no way enters into the essence of a passive power. Furthermore, what is per se a part of a composite constituting a per se unity with it is not per se a part of a relation, because a relation does not make per se unity with what is absolute. But the passive power, which is matter, together with form constitutes a whole that is an absolute being. Therefore also in the active power, of which we speak, no essential relation or disposition is included.

You will say, with Rubeius (*praecit.*), that in substance and in any absolute being, some transcendental respect is not repugnant — as in a creature there is a

relation to God who creates it, and in knowledge there is a relation to the knowable object, as Aristotle (*lib. praedicam. c. de ad aliquid*) seems to indicate. Likewise it is not unfitting for an essential relation and disposition toward its act and object to inhere in an active power. Against this: being, taken universally, is distributed adequately into absolute and relative, as two distinct members of it — just as animal is divided into rational and irrational. Therefore what is intrinsically and essentially absolute does not include relation. For what is absolute is toward itself, and relation is toward another. And if any relation is contained in what is absolute, it is subsequent to and concomitant with the absolute, because a thing is toward itself before it is toward another. And so the relation of identity or diversity follows upon substance, and the relation to the knowable accompanies knowledge, which is a quality. The same must be said of the relation of the creature to the Creator and of other such relations — they are not of the essence of those whose relations they are.

The second part is proved first from the refutation of the opposing opinion. Since no other distinction appears by which the powers could essentially differ from one another, it is perspicuously inferred that they differ by themselves — that is, by their own proper entities — in approximately the same way as the divine processions differ by themselves, as Scotus teaches (*1. dist. 13. quest. vn. §. Ad quaest. respondeo O.*).

Second: the formal principle of one power is not the formal principle of another power, setting aside any act and object. Therefore one power differs from another through its formal principle. The antecedent is evident: the formal principle of the intellect is not the formal principle of the will, and vice versa, with any other thing — act or object — set aside.

Third: every absolute being differs from others through its own proper and intrinsic difference, as is evident by differentiation. But powers — whether they are qualities, as the Thomists hold, or are really substances, as the Scotists hold — are absolute beings. Therefore they possess proper and intrinsic differences through which they essentially differ from others.

Fourth: a cause is first constituted in its essential and formal being before the relation of the caused thing comes to it. Therefore powers, which are causes of acts, are first constituted in their essential being before they receive the relation of the acts which they elicit. Now a thing derives its unity and distinction from that from which it derives its entity. Therefore, since powers precede acts and objects according to their essential and quidditative being, it consequently follows that they draw their essential distinctions not from acts and objects, but from their own intrinsic and formal principles.

First objection, for Toledo's view: A thing is constituted by that through which it is essentially distinguished from another. But a power differs from other genera of the same predicament by its relation to act and object. Therefore a power

essentially includes the said relation. The major is evident. The minor is at hand: since a power, which is in the genus of quality, differs from other genera in nothing else except that it is the immediate formal principle of acting and operating. I concede the major and deny the minor. In response to its proof, I say that a power, according to its formal being, is not in the predicament of quality or in any other predicament of accident, but is placed reductively in the category of substance — just as the passions of substance are placed in the predicament of substance. Or if it be conceded that a power is nothing other than an immediate principle of operations, it is nonetheless denied that through such a relation to act and object and to the thing around which it operates, the power is constituted in its essential being. For a power is constituted in its essential and quidditative being prior to the arrival of that relation of an act toward the power itself. Moreover, because Toledo concedes that a power is an absolute being — since, according to him, it is a quality — every absolute being is in its absolute being prior to receiving the relation that comes to it, as I have insisted above.

Second objection: No one can conceive of a power without understanding its relation to act and object, as Aristotle (*5. Met. 12.*) indicates — he who, defining power, defines it only through act and object. Therefore if the intellect does not otherwise understand the nature and essence of a power except through conceiving the relation to act and object, that very relation surely belongs to its essence. I respond by denying the antecedent: every absolute being is conceived first in itself before it is conceived in its order to another, as the Doctor teaches (*2. d. 1. quest. 6. §. dico tunc.*). Wherefore that relation is not of the formal concept of a power, but follows upon and accompanies its entity. Otherwise a power would be located in the category of relation, not in the predicament of quality, as the Thomists assert.

You will say that neither act nor object is the essence or difference of a power, but that from these the difference of the power is derived — which is a certain relation to act and object: not a relation that is an accidental relation, but a principle of relation that is rightly called an essential relation. Against this: it is false that the intrinsic and essential difference of a power is derived from act and object, since act, as was said, is posterior to power — and from what is posterior as such, the essential difference of what is prior cannot be taken. Moreover, although an act is prior in intention, it is posterior in execution, since it is its end — from which an extrinsic difference is drawn. Furthermore, it is false that an essential relation is the difference of a power. For, apart from the fact that there seems to be a contradiction in this assertion when it is said that the relation is the difference of the power and then that it is not the relation but the principle of the relation — since the principle of a relation is not the relation but rather its cause — if you respond that this holds of essential relation but not of accidental relation, the objection stands: it is not apparent how a relation can be the cause of a relation. For since both are relations, one cannot be the cause

of the other, since relation is not of the genus of active things. And if you wish to call the principle of an act an essential relation, you say this without justification and without any foundation — it is an evasion of the argument.

If you reply again that some absolute accidents have no extrinsic respect and are not defined by reference to something outside themselves, while others, although absolute, include some order and respect toward the outside — such as powers, acts, habits, and things of this form — and these cannot be defined without some extrinsic element: not because those external things and respects are of their essence, but as the essential principle of those respects; against this: what does not enter into the essence of something can be defined without it. But that respect and relation, as conceded, does not enter into the essence of a power. Therefore it can be defined without such a respect and relation to act and object. The major is established from the function of a good definition, which is to explain distinctly the nature of a thing and not what is outside the nature of the thing — otherwise the definition would be defective. Since, therefore, it is admitted that that relation is outside the essence of the power, it must certainly be conceded that the power can be defined without it. As for the dictum of Aristotle cited above, it has already been expounded as concerning the extrinsic, manifesting, and a posteriori distinction.

Book III — On the Vegetative Soul

Question I — On the Nature of the Vegetative Soul

Now that we have treated the individual souls, the vegetative soul presents itself first for investigation — both because it is more common and universal, and because its operations precede the operations of the remaining souls. Hence Aristotle adds (*2. de gen. animalium, cap. 3.*): "Man lives first the life of a plant, then the life of an animal, and afterward the life of a rational being."

Article — What the Vegetative Soul Is and How Many Kinds It Has

First assertion: The vegetative soul is the first act of an organic body that potentially has vegetative life. This is consonant with Aristotle and Scotus as cited above (*1. 2. q. 1. art. 4.*), where all its parts were explained except the last, which is added here to establish the distinction between it and the sensitive and intellectual souls. It can also be defined a posteriori: the vegetating soul is the principle of living — that is, of vegetating — and is described more explicitly in these words: the vegetating soul is the principle of nourishing, augmenting, and generating. This description of the vegetative soul is likewise evident from what was said in the article cited just above (*art. 5.*). It is distinguished from the other souls in that it is only the principle of vegetating, while the others are not only the principle of vegetating but also of sensing, local motion, and understanding.

Second assertion: The vegetative soul is specifically multiple. This is presupposed by Aristotle and Scotus. It is supported first by the fact that specifically distinct operations argue for specifically distinct forms (*ex 1. animae, 13.*). Now there appear to be multiple operations specifically diverse among vegetating things, since one plant produces one power and operation, another produces another. Likewise, diverse fruits come from diverse trees, as experience establishes. Therefore specifically distinct vegetative souls are found in them. Second: bodies diversely organized and configured indicate souls specifically distinct. For each soul requires suitable organs and appropriate members for the exercise of its operations, and vegetating things possess diverse bodies, distinct members, parts, and shapes — as we observe in the cherry, pine, poplar, and the rest. Therefore multiple vegetative souls specifically distinct are found. This reasoning is suggested by Aristotle (*1. anima, cap. 3. T. 53.*) and Scotus (*1. d. 2. quaest. 7. in responsione ad 1. principale. & 3. d. 4. in principio corporis q. & 4. d. 11. quaest. 3. art. 2. CC. §. Ad rationes pro 1. opinione.*). Antonius Andreas (*7. Met. q. 17.*), Faber (*Theor. 73. cap. 4.*), and Lychetus in his commentary on the first of the Sentences cited above also support this.

First objection, against the first assertion: Aristotle (*2. anima, 43.*) defines the vegetating soul thus: the vegetating soul is the principle of generating what is similar to itself. Therefore the definition we have given of the vegetative soul conflicts with Peripatetic doctrine. I respond that Aristotle gives the definition of the vegetating soul from its most excellent work, which is to generate what is similar to itself, and does not describe it absolutely as I have done above. Wherefore Aristotle declared only one thing there, whereas I have attempted to bring forward everything that contributes to a clear understanding of the vegetating soul.

Second objection, against the second assertion: The diverse members of a single living being do not argue for diverse souls, since, as was said, one soul animates and vivifies multiple organically distinct parts. Therefore diverse specific diversity of vegetative souls is not rightly inferred from diverse organic bodies. I respond that this holds of members that integrate and constitute one body, but not of members and parts from which diverse bodies are composed and coalesce. For in that case, from diverse bodies having diverse members, vegetative souls specifically distinct are found.

Question II — On the Powers of the Vegetative Soul

Article I — How Many Kinds of Power the Vegetative Soul Has

There are those who assign four forces and faculties to the vegetative soul — namely the nutritive, augmentative, generative, and natural heat. The common opinion of the Philosophers, however, maintains that there are only the three enumerated above, excluding natural heat from their number.

Note first that in the investigation and examination of any matter, two orders can be observed: that of nature and that of doctrine. We follow the former in the present inquiry, treating the nature and quiddity of the vegetating soul, then its powers, and finally its acts. Aristotle follows this order in treating the soul in general — investigating first its essence and definition, and afterward its powers, acts, and object. The latter order he employs in the same place (*T. 33. of the second de anima*), where he first takes up the object, acts, and powers of the vegetating soul, and then examines its essence and nature.

Note second that food is described by Aristotle (*2. anim. 7. 43.*) as the contrary through whose transformation the animated being receives growth and one is generated from another. Three conditions are required for food in the proper sense, as touched upon by Scotus (*4. d. 44. q. 1.*) and explicitly by the same Philosopher just cited. The first is that it be contrary to what is nourished, because since nourishment must be converted into the substance of the nourished being, it must be contrary — since change does not occur unless there is in some way a contrary. Though there is no lack of those who think, as the same Philosopher notes (*ibid. T. 44.*), that it ought to be similar to what is nourished. The opposing view is more probable, however, because in nutrition one is overcome by the other and transformed into its substance — and victory is achieved over what is contrary. The second condition is that it be among those contraries whose change is such that the change of one augments the other. Therefore, since from white black comes to be, and in that case there is no augmentation, the one is not food and nourishment for the other. The third condition is that the change not be reciprocal. For food is indeed converted into the substance of the nourished being, but the nourished being is not converted into the substance of the food.

Note third, following the same Aristotle (*cit. 7. 47.*), that food can be considered in three ways. First, according to substance — and in this way it is the object of nutrition, since substance is restored through substance. Second, according to quantity — and in this way it is the object of the augmentative power. Third, insofar as it is the residue and surplus of nutrition — and in this way it is the cause of generation: not of something numerically the same, but of something else similar in species. I say it is a surplus — not like excrement, but as something remaining after the nutrition and restoration of the individual. For after the individual has been sufficiently nourished, if anything remains, it is not converted into its own substance but is transmitted to the seminal vessels that preserve it for the generation of something similar in species.

Assertion: There are three powers of the vegetating soul, as enumerated above; natural heat is merely its instrument. This is derived from the Doctor (*in 4. cit. q. 1.*). The first part is proved first: there are three things required for the animated vegetating being; therefore there are three powers. The antecedent is supported as follows. For a vegetating being to live and be preserved, it must be nourished

— and so it requires a nutritive power. Furthermore, such a living being cannot exist under a very small quantity; therefore it requires a determinate and fixed quantity and magnitude, and thus necessarily has an augmentative power by which it may properly increase. Finally, one and the same individual cannot be perpetual, although it is eager for perpetuity; and so it necessarily has a generative power, through which the generator generates something similar to itself and is perpetuated in species. Second: there are three acts and three distinct objects with which the vegetating animated being is engaged; therefore the three powers enumerated above exist. The antecedent is shown: the acts are nutrition, augmentation, and generation. Likewise, food according to its substance, as it is quantified, and as residue of the vegetating being. The second part is proved: the vegetating soul uses natural heat to exercise its vital operations, just as fire uses it for heating — and such heat is an instrument of fire. Therefore likewise natural heat is an instrument of the vegetating being. Furthermore, heat is an accident, and the powers of the soul are really identified with the very substance of the soul, as has been asserted and proved elsewhere. Therefore natural heat is not a power of the vegetating soul, but its instrument.

First objection: The augmentative power cannot exist without the nutritive. Therefore two powers distinct from one another should not be posited. The antecedent is evident: nothing can grow unless it is nourished. I concede the antecedent and deny the consequence. For although the augmentative force presupposes the nutritive — since the one is always conjoined with the other — it does not follow that they are not distinct from one another. For the volitional power presupposes the intellective, even though they differ from one another. Likewise, the heating power presupposes the illuminating power, even though it is the common opinion of the Philosophers that these two differ from one another.

Second objection: The nutritive power can exist without the generative — as is evident in the case of certain living beings that are nourished but do not generate, since they are sterile, such as eunuchs. Therefore these powers are not found to be distinct in the vegetating soul. I respond that although certain animals cannot generate, it does not follow from this that the generative power does not belong to the vegetating soul. For this either happens due to some impediment, or due to imperfection and defect, as is evident in those that arise from putrid matter.

Third objection: The object of the nutritive, augmentative, and generative powers is the same. Therefore there is only one power of the vegetating soul. The antecedent is proved: food is the same object of those faculties, as I indicated in the third note. Therefore those powers are not separated from one another. I deny the antecedent. In response to its proof, I say that the object is the same materially but formally distinct, as I made plain in the passage cited. And so Aristotle must be interpreted in the same way (*2. anima, c. 4. T. 42. & 2. de*

gen. animalium, c. 4.), saying that the faculty of nourishing, augmenting, and generating is the same — that is, really and materially, but not formally and essentially.

Article II — How the Aforesaid Powers Are Distinguished

Although from the preceding book (*l. 2. quaest. 3. art. 2.*), the knot of this difficulty seems already nearly solved, many nonetheless suspect and attempt a different mode of resolution here. For Iandun in the present place (*quaest. 13.*), Albert (*2. parte summae de homine, quaest. de motu nutritiuo, art. 2.*) — to whom Thomas (*1. p. q. 78. art. 2.*), Cajetan, Javellus, and Ferrara seem to give their assent — and Fernelius (*1. 5. physiolog. cap. 5.*) hold that the faculties and powers named above are really distinct from one another and from the soul. But Philoponus (*2. anim. ad T. 47.*), Suessanus (*in com. T. 42.*), Vallesia (*2. contr. c. 20.*), Durandus (*1. d. 3. part. 2. q. 2.*), and not a few others do not acknowledge a real distinction among these powers.

Note first that we know of three operations of the vegetating soul, drawing their origin from the three powers assigned above — namely nutrition, augmentation, and generation. For since natural heat always acts upon the radical moisture and strives to consume it, certain parts of the living being are consequently lost, and these are repaired and restored through nutrition. Furthermore, since the living being endowed with the vegetative soul is small in the beginning of its formation, it must acquire for itself a fixed and proper quantity and magnitude, which is effected through augmentation. Finally, since the individual is subject to corruption and death, lest the totality of sublunary living things should perish, there is generation, through which each thing is preserved and perpetuated in its species.

Note second that accretion in a vegetating being can be taken in two ways: in one way, as the acquisition of greater quantity in the living being — and in this sense an animated being is said to grow up to a certain limit; in another way, as the acquisition of new quantity, whether greater, lesser, or equal — and in this sense augmentation always occurs in the living being. For just as the living being is always nourished as long as it lives, so new quantity is added to it through nutrition.

Note third — and recall from what was said in the preceding book (*l. praecedente, q. 3. art. 2.*) — that some powers are of the soul alone, such as the intellect and will; others belong to the whole composite, such as the faculties of vegetating and sensing, which, since they arise from the whole animated being as from a partial root, originate partly from the soul and partly from the body — as Aristotle suggests (*1. anima, 64.*) and after him Scotus (*12. Met. in expof. T. 13.*); and these, in the state of the soul's separation from the body, do not remain in the soul itself except as in a root — not a total root, but only a partial one. The same is indicated (*9. Met. in expof. T. 2.*).

First assertion: The nutritive power does not really differ from the augmentative, but only formally. This is derived from the Doctor (2. d. 16. q. vn.). The first part is supported first by the arguments we adduced in the passage cited just above (l. 2.) to prove that the powers of the soul taken generically are not really separated from the soul and from one another. Second: nutrition cannot take place without augmentation occurring. Therefore the sign is that the powers described above are not really distinct. The antecedent is shown: nutrition is the acquisition of new substance and new quantity; and so one operation cannot occur without the other. Consequently, just as the said operations are inseparable, so too are their powers and forces.

The second part is proved first: because they are engaged with distinct objects formally. For the nutritive force regards the substance of food, while the augmentative regards its quantity. Therefore between them there is a formal distinction. Second: they have diverse definitions, which formal distinction requires. Therefore they differ formally. The antecedent is at hand: the nutritive is the power of transforming food into the substance of the nourished being by means of natural heat; while the augmentative is the power by which the animated being is augmented through reception inward, likewise through the mediation of natural heat.

Second assertion: Between the nutritive and generative power there is no real distinction but only a formal one. This is suggested by the Doctor in the passage cited above. The first part is established first by the authority of Aristotle (2. *animae*, 42.), saying that the power of nourishing and generating is one — that is, really. Second: nutrition is a partial generation, as I indicated above; therefore the power that generates the whole and the power that generates a part do not possess a real distinction. The arguments adduced in the passage just mentioned also belong here.

The second part is shown first: nutrition regards the proper individual, whereas generation regards another individual numerically distinct. Therefore those powers differ formally. Second: nutrition is a partial generation, and generation is the total production of a living being. Moreover, the animated being is always nourished as long as it lives, but does not always generate. Therefore a formal distinction between these powers must be conceded.

Third assertion: Organic powers, which are said to belong to the whole composite, differ really from the soul and body; but from the whole composite itself they differ only formally. This is consonant with the doctrine of Scotus in the places cited above. The first part is indicated by Aristotle (1. *animae*, 64.) and thereabouts, where he plainly teaches that anger, weaving, and things of that kind are to be attributed not to the soul but to the whole composite. Therefore, if the principle and cause of those actions and works is not the soul but the whole made up of soul and body — which differs really from both — it is plainly inferred that those powers are really distinguished from the soul and body

themselves. Furthermore, the real separation of certain things without doubt argues for a real distinction between them, as is plainly shown by the description of real distinction adduced and explained elsewhere. But body and soul are really separated, as is evidently established in the death of a man, in which the soul is really separated from the body. Therefore the powers named above are really separated from the body and soul themselves.

The second part is well known, since powers belonging to the soul alone or to the body alone differ from them only formally. Therefore the same must be affirmed of powers belonging to the composite alone — since there is equal reason for both. The antecedent was shown in (*l. 2. q. 3. art. 2.*), where the powers of the soul in general were treated and the formal distinction was decided.

First objection, against the first assertion: A vegetating living being does not always grow, yet it is always nourished throughout the whole course of its life. Therefore the nutritive power is really distinct from the augmentative power. The antecedent is at hand: every animated being is limited and defined by a fixed term of its magnitude or smallness, as was asserted elsewhere. I distinguish the antecedent: a living being does not always grow by accretion taken in the first sense — I concede; taken in the second sense — I deny, as I made plain in the second note.

Second objection, against the second assertion: Every animated being is nourished throughout the whole time of its life, but does not always generate, as experience testifies. Therefore the nutritive faculty really differs from the generative. I concede the antecedent and deny the consequence. For this indicates only the formal distinction that I established between those powers. And that the animated being does not always generate certainly comes from some obstacle or defect, as is evident in eunuchs.

You will ask what powers serve the nutritive power. I respond, following Augustine (*1. de spiritu, & anima, cap. 20.*) and Damascene (*2. fidei, cap. 16.*), that four quasi-handmaids can be assigned to it: the attractive, the expulsive, the retentive, and the digestive. The attractive is that by which food is drawn toward the animated being lest it flow away and impede the nutritive operation. The expulsive is that which discharges waste and harmful food outward. The retentive is that by which beneficial food is retained and converted into the substance of the nourished being. The digestive is that which, by the mediation of natural heat, digests the attracted food.

Question III — On the Acts of the Vegetating Soul

Article I — Whether the Acts of the Vegetating Soul Are Distinct from One Another

The number of three powers of the vegetating soul has been handed down and explained in the preceding article. Now the number of acts of that same

vegetating soul must also be assigned — and it is likewise threefold: nutrition, accretion, and generation. The question is whether these acts coincide or differ from one another. Certain persons — such as Marsilius (*1. de gener. q. 10.*) and Albert of Saxony (*ibid. q. 9.*) — think they are distinguished only verbally and in name alone. The rest, however, commonly acknowledge a distinction among the said acts.

Note that as long as an animated being grows, it is also nourished — because accretion presupposes and requires nutrition. This is evidently clear in plants, trees, and animals, which in the beginning are small but gradually increase in all their parts. Moreover, natural heat continuously acts upon the radical moisture, and therefore the parts that are lost must be restored and repaired through nutrition, with new ones generated in their place.

First assertion: Nutrition is distinguished from augmentation. This is defended by the Doctor (*4. d. 44. quest. 1. in calce art. 1. paulo post L.*). It is proved first: acts are distinguished at least a posteriori by the objects around which they are engaged. Now nutrition and augmentation possess diverse objects. Therefore they are distinguished from one another. The major is evident from what was said (*l. 2. quaest. 3. art. 3.*). The minor is shown: nutrition is occupied with the substance of food as its object; accretion is occupied with its quantity. Now it is established that substance and quantity are distinct objects, concurring effectively in producing distinct acts. Second: augmentation is a motion that occurs in time, while nutrition occurs in an instant (*ex 5. Met. 18.*). But occurring in time or in an instant argues a distinction. Therefore, since the said acts occur in this way, a distinction intervenes among them. Third: prior and posterior differ. For the same thing cannot be simultaneously prior and posterior with respect to the same thing. But nutrition precedes augmentation — for an animal must first be nourished before it grows, since accretion follows nutrition just as quantity accompanies substance. Therefore a distinction is found among the acts named above.

Second assertion: Nutrition differs from generation. This is derived from Scotus (*cit.*). It is proved first: an animated being is nourished as long as it lives, as I noted in the preceding remark. But generation does not always occur but only at a fixed and determinate time, as experience testifies. Therefore nutrition and generation are not identified. Second: things that participate in distinct definitions are distinguished from one another, because the definition expresses the nature of the thing — and in accordance with the distinction of natures, distinct definitions are assigned. Now distinct definitions of nutrition and generation are given. For generation is the origin of a living being from a living being, with a principle of life joined. Nutrition, on the other hand, is a partial production — that is, a partial generation of a part — to a pre-existing whole animated being that is to be nourished. Therefore a distinction between nutrition and generation must be posited.

First objection: Nutrition and augmentation occur in an instant. Therefore these acts do not differ from one another. The antecedent is supported: by the same nourishment by which the animated being is nourished, it also grows. For an addition to something cannot be made without accretion also occurring for it. But through nutrition a new addition of parts occurs; therefore accretion also occurs. I deny the antecedent. For nutrition is a change that is instantaneous, whereas augmentation is a motion that is temporal. Add also that generation and illumination are momentaneous, even though they differ in other respects.

Second objection: Nutrition is a partial generation of new parts alongside the pre-existing and prior parts, as Scotus teaches in the passage cited above. Therefore nutrition is not distinguished from generation. I concede the antecedent and deny the consequence. For nutrition regards a part, while generation regards the whole. Furthermore, nutrition regards the proper individual, while generation regards another individual newly to be produced. From this the distinction between the acts named above is apparent.

Article II — Whether Something New Is Generated Through Nutrition

The Doctor (*4. d. 44. quaest. 1.*) recalls the opinion of the Master of the Sentences — namely, the author of the *Historia Scholastica* (*cap. 37.*) and of Hugo of St. Victor (*Tract. de Sacram. parte 6. cap. penult.*) — who suspect that nothing of food passes over into the substance of human nature. For they hold that what belongs to the truth of human nature is only what we receive from our parents at the beginning of generation; while the food we consume is merely a kindling of natural heat — so that the food itself nourishes and adheres to the natural heat in approximately the same way that oil adheres to a wick, lest the light of the lamp go out.

Against this opinion almost all Philosophers and Theologians rise, teaching that food passes over and is transformed into the substance of what is nourished through nutrition. Although there is some disagreement among them. For Thomas holds that nourishment is changed into the substance of the nourished being with respect to the parts of matter but not with respect to the parts of form. Scotus, however, in the passage cited above affirms that food is transformed into the substance of what is nourished, both according to the parts of matter and according to the parts of form.

Note first that in the animated being, some parts are said to be according to matter, and others according to form. The former are those which directly flow in and out, having no longer within themselves the power of converting food into their own substance. They are called parts according to matter — not because they lack form, since no matter or part of matter is found stripped of form, but because just as matter does not act, so likewise these parts do not act but are passive and corrupted. The latter are called parts according to form,

because they have the power of converting food into their own substance. For just as form acts, so these parts act — they are not in the proximate disposition for flowing in and out; rather, by their own power they restore and repair the lost parts.

Note second that this difficulty can be raised not only about soft and alimentary parts, but also about solid and spermatic parts. About the former it is taken as certain that they are newly generated alongside the pre-existing ones. About the latter it is affirmed by Aristotle (*1. de gener. c. 5.*). The reason is that all parts, both hard and soft, are nourished and augmented, and likewise diminished and decreased. Therefore the same judgment must be rendered about both. I add that all are mortal and corruptible, and therefore subject to augmentation and diminution, as our daily experience teaches.

First assertion: Something new passes into the substance of the nourished being through nutrition. Scotus supports this in the passage cited above. It is proved first: the vegetating principle has the power of converting food into the substance of the nourished being. Therefore something new is generated for the nourished animated being through nutrition. The antecedent is supported from nature: for such a principle has been granted by nature so that the parts lost and consumed by natural heat acting upon the radical moisture may be repaired. The consequence holds: for the limbs of an animal are larger when the animal has already lived for some years than when it was generated a few days before. Such accretion of parts and members does not come about without a new acquisition of new substance and quantity. Therefore, and so on.

Second: unless something new were added to the nourished being through nutrition, a miraculous multiplication and augmentation would occur — just as the loaves of the gospel were multiplied and augmented in the desert (*Ioan. 6.*). But no miracle is admitted without necessity. Therefore through nutrition some parts are generated for the nourished living being.

Third: unless the parts of the living being were repaired through nutrition, it must be conceded that the primordial and spermatic parts are immortal and incorruptible, while the alimentary parts are mortal and corruptible — and thus of a different genus from one another, since the corruptible and incorruptible differ in genus (*10. Met. in fine.*). But it is absurd for there to be in an animal some incorruptible flesh and some corruptible flesh. For this flesh and that flesh do not differ specifically from one another. Therefore it must be admitted that through nutrition some parts are newly generated for the nourished being.

Second assertion: Through the conversion of food into what is nourished, a new form of flesh comes into being — rather than the matter of the food being informed by the pre-existing form of flesh, its own form having perished. The Doctor supports this (*ubifuprà, A.*). It is proved first: an extended and divisible form is extended to the extension of matter and divided along with its division,

and does not regard matter indivisibly and without extension — otherwise it would be indivisible, simple, and unextended, like the rational soul, which is false. Therefore, when the matter of a nourished animated being is augmented, its form is also augmented; and when some part of the form is corrupted, some part of its matter also perishes. Consequently, when some part of matter is generated alongside the prior matter through nutrition, in the same way some part of form is generated alongside the prior form; and just as that part of matter is newly produced, so likewise that form is new, which informs new matter — otherwise it would not now be extended any more than before. The antecedent is clear from Aristotle (*1. praedicam. cap. de quantitate*), where it is stated that the whiteness existing in a surface is as extensive as the surface.

Second: if after nutrition there are more parts of matter in the whole than before, either the new part of matter exists in the whole without a form — which is absurd, since nothing of matter can exist without form by universal agreement — or it exists under a new form, and the intended conclusion is had; or it exists under the prior form, and then either that form ceases to perfect the part of matter it previously perfected — in which case the same part of form migrates from one part of matter to another, which is absurd — or that prior part of form simultaneously perfects both the old and new part of matter, thus perfecting at the same time two perfectible things, each of which is adequate to it. For a part of matter is the adequate perfectible of a part of form; and consequently, since those two parts of matter are two adequate perfectibles of that part of form, it is manifest that the form cannot inform both the prior and the posterior part of matter simultaneously.

Third: an extended and divisible form is educed from divisible and extended matter and subject; therefore, just as the whole soul is educed from the whole subject and the whole matter, so a part of the form and soul is educed from the corresponding part of matter. Consequently, through nutrition a part of matter is not generated without at the same time a part of form also being generated for the nourished animal.

First objection: The rational soul informs every part, even one newly added to the human body, without requiring a new form to be produced. Therefore the same must be affirmed of the parts that come to any animal through nutrition — namely that they are parts according to matter, not according to form. The parity of the antecedent must be denied, because the rational soul is indivisible and immaterial, while the other souls and forms are divisible and material. And so one part of form informs one part of matter, while the whole form and soul informs and animates the whole matter in which it is found.

Second objection: Aristotle (*1. de gener. cap. de accretione, T. 34.*) writes in explicit words that the parts of an animated being persevere according to species, while the parts according to matter flow in and out. Therefore in Peripatetic doctrine, parts according to matter, not parts according to form, are acquired through

nutrition. I respond that the passage of the Philosopher must be expounded according to the sense of the note premised above, in which the parts according to matter and according to form were clearly explained. Nor is there anything further to add by way of commentary on that testimony.

Third objection: If parts were newly produced alongside the animated being through nutrition, the animated being would be one thing by contiguity or continuity, or at least one by aggregation. But this is rejected by all Philosophers. Therefore nothing new is added to the nourished being through nutrition. I respond that it only follows that the animated being is one by generation, because the parts acquired through nutrition succeed in the place of the lost ones and restore the animated being.

Article III — Whether the Same Individual Persists from the Beginning of Its Origin to Its End

Those who embrace the part of the Master of the Sentences affirm that the same individual, which is continually nourished, persists from the beginning of its birth to its last period — because the same radical moisture and the same parts remain that were received from its progenitors. Those who follow a different path from the Master are not without some difficulty and struggle with the question of how the individual remains the same from the beginning of its origin to the end, if its parts are always flowing in and out.

Thomas, weighing this difficulty, affirms that it is the same individual, because its parts according to form endure, even though they pass away according to matter. But the Subtle Doctor in the place cited above, holding that the parts of an individual flow in and out not only with respect to matter but also with respect to form, teaches that the same individual remains from the beginning of its life to death, because the whole remains even though its parts are continually changed and repaired.

Assertion: The animated individual that is nourished and augmented remains the same from the beginning of its origin to its death. This is defended by the Doctor in the passage cited above. It is supported first from Aristotle (*1. de gener. cap. 5.*), who affirms that the subject which is nourished and grows always perseveres the same until its dissolution. And (*3. polit. c. 2.*): a city is always said to be the same, even though some are always born and others die. Second: that same thing persists throughout the whole course of its life which endures according to the whole — because the true and real identity of something is derived from the identity of the whole. Now the same individual persists throughout the whole course of its life according to the whole, even though some parts flow away — as is evident of a tree, which is said to be the same even though some of its parts are cut off; and of the same river, even though its parts continually flow away. Therefore the same individual persists from the beginning of its origin to the end of its life, even though its parts flow in and out.

Third: the identity of something is derived primarily from the identity of matter and form. But the whole matter and form persevere in one and the same individual. Therefore the same individual persists. The major is well known, because those are intrinsic and essential parts of the whole. The minor is clear: for even though its parts are altered and become impure, as is evident of the parts of an old man, nonetheless the same parts endure according to the same matter and form. Moreover, from what was said above, the elements are generable and corruptible according to their parts, but ingenerable and incorruptible according to themselves as wholes. Therefore the same must be affirmed of the individual living and animated being.

First objection: If the said assertion were true, the individual would be the same not by reality but by equivalence. But what is investigated here is the true and real identity of the individual. The consequent is shown because in the place of the lost parts, other parts newly acquired succeed — just as we said of place, which is the same by equivalence, as I asserted elsewhere when treating ex professo of the place of the ambient body. For as those bodies that are ambient recede, others equivalent to them come in their place; and since these are equivalent to those, the body is said to be in the same place by equivalence. I deny the consequent. In response to its proof I say there is a disparity: because by the force of wind, all the prior parts of the ambient air recede together, while others come in place of the prior ones. But in an animated being this does not happen in the same way, because only certain small and lean parts of the living being perish, while almost all the remaining parts of the same living being endure. For this reason the same individual truly persists — just as, even though hair, nails, and other parts of the fingers are cut away, the same individual always remains. The same must be affirmed of the parts that flow in and out of the animated being through nutrition.

Second objection: If all the parts of the animated being flow, the principal parts — such as the heart — would not be the seat of the soul, as Philosophers affirm with Aristotle, since such parts would also be subject to flowing in and out. But this appears false, since the same heart, the same head, and the other chief members remain. Therefore, and so on. I deny the consequence of the major. For the reason why the heart is called the seat of the soul is not that its parts are immune from flowing in and out, but because it participates in more excellent and noble dispositions for the exercise of the nobler works of life.

You will ask first whether the same numerical individual can be restored. I respond negatively: for there is no return from privation to habit by ordered power. By the absolute power of God, however, it is not repugnant — as is evident from John XI concerning Lazarus, and Mark XVI concerning Christ the Lord. The reason is that there is no repugnance either on the part of God or on the part of the corrupted thing, which, as it was possible before it existed, so after its being is lost it still retains the possibility of being made anew.

You will ask second what life is. I respond, with Aristotle, that it is the permanence of the vegetating soul along with natural heat and radical moisture in an organic body — or one that virtually contains the vegetating soul. And death, conversely, is the cessation of that same soul in the organic body. There are two kinds of death: natural death, which comes about from the exhaustion of the radical moisture consumed by natural heat; and violent death, which comes about through the sword, poison, and innumerable other ways.

You will ask third what health is. I respond that it is the proper temperament of all the parts of the animated being. And correspondingly, disease is the intemperate condition of all the members, or of some member, of the animated being — and if the affected part is a principal one, death follows unless an appropriate remedy is applied.

You will ask fourth what respiration is. I respond that it is the drawing in of cooler air to expel warmer air, for the tempering of the heat of the heart. All animals that have lungs breathe; the rest, which lack them — such as fish — do not breathe.

You will ask fifth what is the most noble work of the vegetative soul. I respond that it is generation, according to that saying (2. *de anima* T. 34.): "The most natural, or most noble, work is to generate something like itself." And (4. *Met.*): "Each thing is perfect when it is able to generate something like itself."

You will say: God cannot generate another God. Therefore that maxim is not universally true. The Doctor responds (1. *Met. in expof.* 6. 1.): another God cannot be made or generated, because a plurality of Gods is repugnant.

You will urge: an Angel can be made, but it cannot generate something like itself. I say this is not true when the product is so perfect that it requires an equivocal cause for its production — as is the case with an Angel.

Article IV — Whether Both Parents Concur Actively in the Generation of Offspring

It is not in doubt that the father takes an active role in the production of the fetus. The question is whether the mother also actively concurs in the formation of offspring. On this matter, Thomas (3. *p. q.* 32. *art.* 4.), Durandus (3. *d.* 3. *q.* 1.), and Capreolus (*ibid.* *d.* 5. *q. vn.* *art.* 4.) assert that the mother acts only passively in the procreation of the fetus. The Subtle Doctor, however (3. *d.* 4. *q. vn.* & *Quol.* 15. *art.* 2.), the Seraphic Doctor (*ibid.* *quaest.* 1.), Mayr, Bassolis, Lychetus, and very many others — preceded by Hippocrates (1. *de genitura*), Galen (*l. de spermate*, & 1. 2. *de virtutib. naturalibus cap.* 3.), and other physicians — teach that the mother actively concurs in the generation of offspring.

Note that the question is not whether the mother is the principal active principle of generating offspring — since all admit that she is not such a

principal principle — but the whole dispute is whether she is a less principal active principle.

Furthermore, observe that in the formation of the fetus, following Scotus in the place cited above, many motions intervene. For first the seed is shed by the generator and transmitted to a place suitable for generation; then it is condensed there, and likewise figured, organized, and perfected. Hence the question is whether the mother takes an active or only a passive role in the said motions.

Assertion: The mother actively concurs in generating offspring, though less principally. This is held by the Doctor in the passage cited above (*¶ 1. d. 17. q. 2. §. sed tunc sub LL.*) and is indicated by Saint Augustine (*Tract. 2. in Ioan.*). It is supported first: male and female are of the same species, as Aristotle writes (*10. Met. 15.*); and those of the same species participate in the same active principle and the same power of generating. Therefore since the father takes an active role in the formation of offspring, the same must be affirmed of the mother in the manner explained above. Second: what assimilates offspring to itself actively concurs in the formation of that offspring, because the efficient cause strives to render the effect similar to itself. But offspring sometimes resembles the mother more than the father. Hence perhaps Aristotle says (*9. Eth. cap. 7.*): "Because mothers know more certainly that children are their own, they labor more in their generation, and therefore love them more." Therefore the mother cooperates in begetting the fetus. Third: seed is considered by all to be the active principle of offspring. The mother emits seed for the forming of the fetus, as physicians testify — and anatomists observe that in females there are certain spermatic vessels that preserve the seed. Therefore the mother must not be denied a less principal active power for begetting offspring.

First objection: Aristotle (*1. de gen. animalium, c. 19. ¶ 10.*) teaches that the mother acts only passively in the begetting of offspring. Therefore in the Peripatetic school the mother is not an active principle of offspring. Some respond that Aristotle speaks of the more principal active principle, not of the less principal one which is in question here. But this response contradicts Aristotle, who in explicit words — both in the place cited and elsewhere — teaches that the mother behaves only passively in the generation of the fetus, and illustrates this with an example (*passu cit. cap. 2.*). You will press: the same Philosopher (*7. Mor. ad Eudemum cap. 3.*) says that mothers love children more than fathers do, because they consider them more their own work. And (*8. Eth. cap. 12.*) he premised that parents love children as something from themselves, while children love parents as something from which they spring. It must be said that those passages are to be expounded with reference to the furnishing of matter and to upbringing, not with reference to the activity of the generation of the offspring itself. Wherefore in this and in certain other matters noted

elsewhere, Aristotle must be departed from, and the physicians followed as more experienced — as Scotus admonishes in the passage cited.

Second objection: If the mother were to act actively in the formation of offspring, she would emit seed just as the father does. For seed is considered by all to be the active principle of the fetus. But the mother does not emit seed (*Arist. 1. de gen. animalium, cap. 12.*); and what the mother herself pours forth appears to be a watery and rare humor that has no seminal character. Therefore the mother is not an active principle of offspring. I concede the major and deny the minor. In response to its proof I say that it is true seed, though not as perfect as the father's seed.

Third objection: What merely supplies matter to offspring does not cooperate in its production. But the mother only supplies matter upon which the father's seed acts. Therefore the mother does not actively concur in begetting offspring. I concede the major and deny the minor in part — for the mother, though less principally, partially cooperates in generating offspring, as has been sufficiently proved above.

Article V — Whether Things Generated Through Putrefaction Are of the Same Species as Those Generated Through Propagation

Averroes (8. *Phys. com.* 46. & 1. *de gen. cap. 1.*), Iandun (7. *Met. quaest.* 15.), and some others deny that those generated from seed are of the same species as those generated without seed. Scotus, however (1. *dist. 2. quest. 7. §. Ad 1. argumentum principale. R.* & 3. *dist. 14. quaest. 3. §. contra. Propè initium*), Antonius Andreas (7. *Met. q. 8.*), Faber (*Theorem. 71.*), and the rest, both within and outside his school, assert that those generated through putrefaction and those generated through propagation participate in the same species and nature.

Note that among sublunary living beings, some are perfect — such as man and the lion — and these must not be thought to be procreated from putrid matter, since so many parts and organs are required for their constitution and integrity that only a proper, univocal, and excellent cause can produce them, especially their souls, which — as will be said below — are produced by God. Others are imperfect — such as plants, mice, and the like — which are generated either from seed or without seed; and these are what the present doubt concerns, not the former. What is said in the second Politics about certain men generated from the earth or in another manner is not from Aristotle but from Euripides and Ovid, and is fabulous.

Assertion: The living beings said to be generated equivocally are of the same species. This is held by the Doctor in the passage cited above (& 7. *Met. in exp. cap. 6.* & T. 23. & *ibid. in exp. cap. 9. T. 90.*). It is proved first from (7. *Met. T. 23.* & 5. *de historia animal. c. 1.* & 6. *eiusdem, cap. 15.*), where Aristotle writes that there are some that come from mud and sand, even of those genera that are also

generated from intercourse. Therefore according to Aristotle, those generated equivocally are of the same species. Second, from Saint Augustine (*3. Trin. cap. 9.*): something generated through putrefaction propagates others that in turn propagate, and so the generator and the generated are univocal. Therefore those propagated from seed and those produced from putrid matter possess the same specific nature. The antecedent is evident from birds, bees, and many others, which, having been generated by chance, afterward produce and emit seed from which others of the same nature and species are procreated. Third: those that have the same body, the same power, passions, and accidents are contained under the same species — for these plainly manifest the same specific nature, as Aristotle indicates (*1. animae, T. 53.*). Now those generated from putrid matter and those generated from seed have the same organic body, the same nature, properties, and accidents — as is evident from a mouse generated by putrefaction and a mouse generated by propagation from another mouse. Likewise from plants that grow by chance in the mountains and those sown elsewhere by scattering their seed into the ground. Moreover, fire generated by another fire is of the same species as fire produced from flint or from the rays of the sun. Therefore animated beings too are contained under the same species, whether generated from putrid matter or procreated from seed.

First objection: Aristotle (*1. de gen. animalium, cap. 1. & 5. of the same work*) in express words writes that those generated from putrid matter are not of the same species as those arising from seed — as from the union of lice, nits are procreated; from the union of flies, little worms; and from the congress of fleas, a certain kind of worm resembling them. Therefore our assertion conflicts with Aristotle. I respond that Aristotle there only enumerates those generated from putrid matter, some of which are infertile, while others are fruitful, generating things similar to themselves and participating in the same species — as was sufficiently shown from the same Philosopher above.

Second objection: Those generated from diverse matter are of diverse species — otherwise anything would be generated from anything. But those generated through putrefaction and those generated through propagation possess diverse matter, because the former arise from putrid matter and the latter from seed. Therefore they participate in a diverse species. I deny the major, because the specific unity or distinction of things is derived not from matter but from form, as has been evidently demonstrated elsewhere.

You will ask what part of the animal body is first formed. Hippocrates and Galen respond that it is the liver. Aristotle, however, writes that it is the heart, which is the source of natural heat and vital spirits. Hence the saying is celebrated: the heart is the first to live and the last to die. The eye, on the contrary, is said to be the last to live and the first to die.

Book IV — On the Sensitive Soul

A separate question on the nature of the sensitive soul is not raised here, since from what was said in the first two books on the soul in general it is easy to understand what must be affirmed in the present matter. The sensitive soul is defined in two ways: first, *a priori*, thus — the sensitive soul is the first act of an organic body that potentially has vegetative and sensitive life; second, *a posteriori* — the sensitive soul is the principle of vegetating and local motion. All the parts of both definitions given above were abundantly explained in the passage cited just above.

Question I — On the Production of the Sensitive Soul

Article I — Whether the Soul of Imperfect Animals Is Produced by the Heaven

The Seraphic Doctor (2. *dist.* 8. *quest.* 1. *art.* 2.) and his teacher, the Doctor irrefragabilis Alexander of Hales (7. *Met. ad Text.* 23.), hold that the souls of imperfect animals are produced by the Heaven. The contrary opinion is defended by the Subtle Doctor (4. *dist.* 12. *quaest.* 2.), Bassolis in the same place, and the others of the same institute and school, who teach that the souls of the said animals in no way emanate from the Heaven as their efficient cause.

Note that by imperfect animals, of which there is talk in the present context, are understood primarily those animals generated from putrid matter — some of which are produced on land, some in the sea. For Aristotle (1. 6. *de historia animalium*, *cap.* 16.) narrates that eels come from putrid slime. Pliny also reports this of oysters (10. *historiae naturalis* 68.). And from corroded wood come moths; from the moisture of the air come butterflies, cicadas, ants, and the like.

Assertion: Imperfect animals and their souls are not produced by the Heaven, except dispositively. The Doctor supports this in the passage cited above. It is supported first: a living being is not produced by what is not living, as has been said repeatedly in the foregoing. But the Heaven is not living, as was asserted elsewhere; and these animals are living. Therefore they are not produced by the Heaven. Second: what is nobler is not effected by what is more ignoble, according to the well-known saying that no one gives what he does not have. But the Heaven is more ignoble and imperfect than any imperfect animal — for every animated being is superior to any inanimate one, since the grade of life is more excellent and distinguished than the grade of nature. Therefore the Heaven is not the maker of these animals, except dispositively. Third: the Heaven acts upon these lower beings only through light, heat, and motion, as I said when treating of the influence of the Heaven. But light, heat, and motion — since they are accidents — cannot attain the production of those souls, which

are substances. Therefore another efficient cause of the said animals must be sought.

First objection: Scotus (*1. dist. 7. quaest. vn. §. una indeterminatio. E. & 2. dist. 1. quest. 6. §. Dico. Sub B. & dist. 9. quest. vn. §. Ad quaest. infra B. & 4. dist. 49. quest. 16.*) says: if the Heaven were to produce a worm from this matter... Therefore in the Scotist school the Heaven is the principle and efficient cause of those animals. I respond that the cited testimonies of the Doctor must be interpreted according to the distinction already given — namely dispositively, not effectively.

Second objection: It belongs to the same cause to dispose matter and to introduce or educe form from the disposed matter. But the Heaven is the dispositive cause of matter for the introduction of the sensitive soul of these animals; therefore it is also the inductive or eductive cause of the same soul. I deny the major. For accidents in our view are the dispositive causes of substance to be produced, yet are not its efficient causes. Likewise, the man who generates disposes matter but does not create the rational soul.

Third objection: In Genesis 30 it is said that from looking upon variously painted rods, variously colored offspring were produced by flocks. And Augustine (*l. 1. 99. Super Genesim, quaest. 92.*) narrates from Hippocrates that a certain woman, resembling a beautiful image that she had in her bedroom, gave birth to a very beautiful boy unlike either parent or the type. Saint Jerome adds in the present context that Spaniards use this art, placing handsome horses before mares at the time of conception. Quintilian adds that a matron was accused of adultery because she had given birth to an Ethiopian child — but was freed from the charge when an image of an Ethiopian was found in her bedroom. I respond with Lyra in the Postil on the said passage that these and similar things are attributed to the power of the imagination — according to the proverb: imagination causes the event.

Fourth objection: In certain islands very remote from the mainland there live certain animals that arrived there neither by swimming nor by transport, since the distance is great, and there are fierce beasts there — such as lions, tigers, wolves, and the like. Nor is it satisfactory to say that they were created there by God from the beginning of the world — for they would have perished in the universal flood. Therefore we must have recourse to the Heaven as their efficient cause. In confirmation, Pliny (*l. 8. hist. cap. 42.*) — indeed Augustine himself (*21. Civit. cap. 5.*) — and Virgil report that mares conceive from the blowing of the west wind. Aristotle (*6. de hist. animalium*) in Syria and Pliny (*cit. c. 44.*) in Africa add that mules give birth. Marcus Varro, Dionysius, and many others hand down the same. Augustine responds (*16. Civit. cap. 7.*) that those beasts were transported there by human industry for the sake of hunting, or were carried there by the ministry of Angels. As for the fact that in some regions mules are fertile and in others not, this is attributed dispositively to celestial influences —

just as in some regions certain animals are born and live, while in others they do not. Perhaps with this in mind Virgil sings (*1. Georg.*): "Here grain crops, there the vine flourishes more happily." The same must be said in response to the confirmation. If Pliny holds otherwise, his account is treated as a fable, on the testimony of Justin (*l. 43. suae hist.*). Especially because those animals are perfect and cannot be produced except through seed or immediately by God, as I showed in the last article of the preceding book.

Article II — Whether the Sensitive Soul Is Produced from the Seed of the One Who Sheds It

Very many Philosophers hold that the sensitive soul is produced by the seed of the one who sheds it. They think that seed is the efficient cause of the organization and animation of perfect animals. Scotus, however (*2. d. 18. quest. vnic. §. Restat nunc videre. E. & §. Dico igitur. 1.*), Lychetus, Gratianus of Brescia in the same place, Faber (*Theor. 69.*), and others affirm that seed is in no way the cause — not even of organizing so many diverse members, let alone of producing the soul itself — except dispositively. That is to say, seed only disposes toward a further and more perfect form; while God immediately educes the sensitive soul from that matter disposed by the seed, and together with the organized body the sensitive soul constitutes the whole and perfect animal.

Note that among the sensitive souls of animate agents, some are equivocal — they generate animate things of a diverse character and species, as the mare and the ass generate a mule, which participates in a species diverse from others. The rest are univocal — they produce offspring of the same species, as man generates man and the lion generates the lion. Among these, some are oviparous, generating things similar to themselves through eggs; while others produce their offspring through seed — of which Augustine makes mention (*l. 3. 99. in Leuiticum, quest. 38.*).

First assertion: Seed is not the efficient cause of the sensitive soul, nor even of the organization of the body, except only dispositively. The assertion is tripartite, and is defended by the Doctor in the passage cited. The first part is proved first: a living being is not produced by what is not living — as I have said and proved many times in the foregoing. But seed is not living in act, as is evident (*1. 2. quaest. 2. art. 2.*), where I showed that seed and milk are devoid of soul. Therefore seed is not the productive principle of the sensitive soul. Second: an effect in act has a cause in act, as is established from the book on causes. But when the sensitive soul is produced or has been produced, seed no longer exists, because it has already been corrupted. For in the place cited (*1. 2. quaest. 2. art. 2.*) seed is transformed into the embryo, and from the embryo it passes into an organized body, from which the sensitive soul is educed. Therefore seed is not the cause of the sensitive soul. Third: just as a mixed body is not effectively generated from corrupted elements — for what is corrupted,

since it no longer possesses being, also cannot participate in the power of acting, and a mixed body is, as was said elsewhere, produced through the action of a third thing, that is, of a universal agent — so likewise it must be affirmed that corrupted seed does not cause the sensitive soul.

The second part is shown: what is uniform and homogeneous is not the principle and cause of the diversity of effects, as is evident from fire and water, which are uniform and homogeneous. But seed is uniform and homogeneous, as is evident to the observer. Therefore it is not the maker of so many diverse organs and dissimilar parts that are seen in the organic body of a whole and perfect animal.

The third part is supported: every cause has its effect, since nature permits nothing idle. But seed is a cause intended and furnished by nature for generating something similar in species, as I noted in the passage cited just above. Therefore some effect must be attributed to it — which is not the sensitive soul, nor the organization of the body, but the disposition toward organization and toward the introduction of the sensitive soul.

Second assertion: God is the maker of the sensitive soul and of the organization of its body. The Doctor holds this in the place cited, and Augustine assents (*l. 83. qq. quaest. 10.*), saying that the body is from God. If, therefore, the body is from God according to Augustine — which is the lesser work — consequently the sensitive soul, which is the more excellent work, is from God as well.

Furthermore, the said assertion is proved as follows: when no sufficient productive cause of some effect is found among created things, recourse must be had to God, who is the author of nature and supplies what secondary causes cannot accomplish. But no efficient cause of the sensitive soul and of the organization of its body is found in the nature of things, as I showed in the prior assertion. Therefore it must be affirmed that God is the maker of both effects. This is corroborated by Averroes (*2. Caeli*), who in difficult and arduous matters has recourse to God. Indeed, Galen adds that the power of seed is divine — as if to say that God operates by his power through seed as the dispositive cause. And Augustine (*22. Civit. cap. 23.*) calls the power of seeds marvelous. And he adds there that God, joining and connecting the incorporeal and corporeal natures — the former set over, the latter set under — in wonderful ways, makes the animated being.

First objection: If the sensitive soul were immediately produced by God, it would therefore be created, like the intellective soul. But the sensitive soul is not created. Therefore it is not immediately produced by God. I deny the consequence, for there is a distinction between the production of the sensitive and the intellective soul. The intellective is made from nothing, and therefore is created; the sensitive, however, is educed from the potency of matter — that is, from the suitably organized body — and therefore is not created.

Second objection: If the brute does not concur in the production of the sensitive soul, then it is not the parent of the brute generated by it. But commonly the generating brute is called the father of the generated brute. Therefore it attains the production of the sensitive soul. I deny the consequence. For just as the man who generates does not produce the rational soul, yet is called the father of the child generated by him, so also a brute is called the father of what it has begotten, even though it has not attained the production of its sensitive soul. For it is sufficient that, through the seed shed by the progenitor, proper preparation and disposition be made for the organization of the body of that soul and for educating it from that body. Aureolus explains this excellently (*1. dist. 31. art. 2. propositionem secundam*).

Third objection: If seed is not the active principle of the sensitive soul and its body, then from any seed any animal could be generated, since it does not actively concur in the production of the animal. But this conflicts with experience — for from human seed a lion, an ox, or another animal is not generated. Therefore, and so on. I deny the consequence of the major. For, as I noted above, seed is the dispositive principle. Therefore human seed disposes in one way, while leonine and bovine seed disposes in another. Wherefore it does not follow that from any seed any animal is generated, because of the various and diverse dispositions that the various and diverse seeds provide.

Question II — On Sensible Objects

Article I — What the Common Sensible Is and How Many Kinds There Are

So that what we propose in the title of this article may be more conveniently and readily perceived and understood, I observe that the sensible is the object around which sense is engaged. And sense is a vital power that perceives the sensible object. The sensible is divided into the per se sensible and the per accidens sensible. The latter is what is not perceived by sense in its own right but by reason of another — such as substance, which is sensed through its accidents. The former is what is attained by sense as such — such as color, sound, and the like. Furthermore, the sensible is distributed into the common sensible and the proper sensible. The common sensible is what is attained by several external senses — such as magnitude, figure, and the rest enumerated below. The proper sensible is what is perceived by only one external sense — such as color by sight and sound by hearing. Five kinds of proper sensible are enumerated, corresponding to the fivefold external sense — namely the visible, audible, gustable, olfactible, and tangible.

Assertion: There are five common sensibles — motion, rest, number, magnitude, and figure. This is what Aristotle holds (*2. animae, cap. 6. T. 64.*), against Galen (*1. de dignoscendis pusibus*), who excludes motion from the number of sensibles. And it is derived from Scotus (*4. dist. 45. quaest. 3. Ad 1. sub F. & d. 12.*

quaest. 2. §. Hic sunt. B. & q. 3. §. Ad principale. CC.). It is proved first: there are as many distinct common sensibles as there are diverse objects that are perceived by several senses, as is established from the description of the common sensible given in the preceding note. But there are five distinct objects that can be attained by several senses. Therefore there are five common sensibles as named above. The major is perspicuous. The minor is at hand: for the things attained by several senses are motion, rest, the discretion of things, quantity, and their image — which are the five common sensibles just enumerated. Second: a plurality and multitude of things must be reduced to certain principal headings in order to remove confusion and indistinction among them — as is done with universals, predicaments, and the like. But there are many common sensibles, as experience establishes. Therefore they must be reduced to those five just enumerated. Whatever the Perspectivists add — such as situation, distance in relation to motion, roughness, smoothness, curvature, and straightness — is conveniently and aptly reduced to figure. And so the said quinternary number of common sensibles must be retained.

First objection: Motion is in continuous flux — indeed, it is considered by many to be flux itself. But flux is perceived not by sense but by reason. Therefore motion does not belong among the common sensibles. I concede the major and distinguish the minor: according to its formal and perfect nature — I concede; according to its material and imperfect nature — I deny. For men plainly see people walking, water flowing, stones falling downward, and the like, which daily experience teaches us.

Second objection: Living beings devoid of reason do not count, as Aristotle writes (*Sect. 30. problematum.*). Therefore number is not attained by them, and consequently number should not be included among the common sensibles. I respond by explanation and distinction of the antecedent: brutes do not count by adding, subtracting, and repeating in the way that men do — I concede; they do not reckon — that is, they do not know discrete things, such as three stones, three men, and the like — I deny. For just as our bodily eye discerns many things distinct and separate from one another, so also the eye of the beast recognizes what is distinct and diverse.

Third objection: Rest is the privation of motion. But privation is not discerned by any sense. Therefore rest is not discerned by sense; and so rest is improperly numbered among the common sensibles. I respond that rest in the present context is not taken as the lack of motion but as the subsistence of a thing in a place, in which the privation of motion is grounded.

Article II — Whether the Common Sensible Produces a Species of Itself Distinct from the Species of the Proper Sensible

Ferrariensis (*2. de anima, quest. 11.*) and Michael de Palatio (*ibid. cap. 6.*) hold that the common sensible does not impress a species of itself in sense distinct from

the species of the proper sensible, but that the common sensible is attained by sense through the very same species of the proper sensible. Thomas (*2. de anima, lect. 13. & 1. p. quaest. 78. art. 3. ad 2.*), Bannez in the same place, and not a few others — whom the Complutenses follow (*disp. 9. de anima, quest. 2. §. 2.*) and Poncius (*disp. 59. quaest. 9.*) — hold that the common sensible is perceived by sense through a modified species of the proper sensible. Scotus, however (*4. dist. 12. quest. 3. §. Ad principales rationes. CC.*), Bassolis (*ibid. quest. 2.*), Iandun (*2. de anima, q. 18.*), the Gandavensis (*quaest. 17.*), and many others affirm that the common sensible is known by sense through a species distinct from the species of the proper sensible — so that the common sensible produces its own proper species in sense, distinct from the species of the proper sensible.

Note, following the Doctor just cited, that the common sensible, although it causes its own proper species, nevertheless cannot cause it without the accompanying proper sensible. Not because the common sensible does not precede the proper sensible — so that the one could be separated and detached from the other — but because it is not prior in acting upon the sense. The reason for this is perhaps that sense regards its proper object first before anything else, and therefore cannot receive any other act unless it first receives the act of its proper object. Wherefore sense does not perceive a secondary object, as it is a common sensible, unless the primary object — which is the proper sensible — has first been perceived. Just as a singular thing is perceived before a universal in the order and series of confused cognition, as I made plain elsewhere.

Assertion: The common sensible generates in the sense a species of itself distinct from the species of the proper sensible. Scotus supports this in the passage cited, as the reader of his text will see — whatever Cavallus may say (*in annot. 3. ad quest. 6. de anima num. 10. concl. 3.*). It is supported first from Aristotle (*2. animae, ad finem cap. 6.*), saying that the common sensible moves and alters sense — which cannot be accomplished except through a species and likeness of itself distinct from the species and likeness of the proper sensible. Second: diverse and distinct objects produce diverse and distinct images and likenesses — both because they are their seeds and effects, and because many diverse objects representing themselves appear plainly in a mirror. But the common sensible is an object distinct from the proper sensible, as is established from the preceding article. Therefore it produces a distinct species from the species of the proper sensible. Third: distinct sensations arise from distinct sensible species, because distinct causes produce distinct effects. Now distinct sensations arise from the common sensible and from the proper sensible. For if a tower is seen from afar, its magnitude is indeed perceived by sense, but the color of that very tower is not seen at all. Magnitude, however, belongs to the genus of common sensibles, and color belongs to the number of proper sensibles. Therefore the species of the common sensible, distinct from the species of the proper sensible, must be posited. Add also that the universal is distinguished

from the singular, as is clear from the description of each given elsewhere. Therefore the species of the one is distinguished from the species of the other.

Against this the Complutenses (*cit.* §. 4.) object and say that the species of both sensibles is the same, but is modified and determined toward representing the common or the proper sensible. Against this: a mode, as was asserted elsewhere, does not alter the thing of which it is a mode. But the common and proper sensible are things and distinct objects. Therefore they have distinct species, not merely modified ones. Especially because one can be had without the other — as I demonstrated above of magnitude and color and their species.

First objection: Magnitude is quantity, which belongs to the genus of the passive. Therefore, since magnitude belongs to the number of common sensibles, it plainly follows that it does not generate a species of itself in sense distinct from the species of the proper sensible. I respond that magnitude, which is quantity, is passive with respect to real action, but not with respect to intentional action, of which we speak here.

Second objection: Both sensibles — common and proper — can be known through a single species. Therefore another species, one for the common sensible and another for the proper sensible, is not to be devised and multiplied. The antecedent is at hand: for the proper sensible determines and modifies the common sensible; therefore the latter can be attained through the species of the former. I deny the antecedent. In response to its proof, if it is admitted in any way that the common sensible is determined and modified by the proper sensible, still, since they are objects distinct from one another, distinct species emanating from them are required in order for them to be known by sense.

Article III — Whether, Besides the Impressed Species, the Presence of the Sensible Object Is Required for External Sensation

In this article it is presupposed, from what will be said below, that sensible species are given — described as images or likenesses of sensible things, concurring partially in eliciting sensation. Given these, the difficulty can be raised in two ways. In one way, concerning natural power: the affirmative part is defended by Auriolus (*in prol. art. 3.*), Buridan (*2. de anima, quest. 21.*), and thereabouts, and others whom Mayron suppresses by name (*quest. 18. prol.*); the negative part is embraced by Scotus and his followers (*Quol. 13.*). In the other way, concerning supernatural power: two opinions also exist here. The first is that of Ockham (*Quol. 6. quest. 6.*) and Gabriel (*2. dist. 3. quaest. 2.*), who hold that it is impossible for an external sensation to occur without a present object. The second is defended by Scotus (*4. dist. 10. quaest. 9. §. Ad quaestionem. B.*), Maior (*1. dist. 3. quaest. 1. concl. 1.*), Molina (*1. part. quest. 55. art. 2. disp. 2. m. 5.*), Rubeius (*2. de anima quest. 13.*), and very many others, who affirm that no contradiction is involved in having an external sensation of an absent object.

Note, following Scotus (*1. dist. 2. quest. 7. §. Sed hic restat. sub FF. & 2. dist. 3. quest. 9. §. Ad quest. igitur. C. & Quol. 13. art. 2. §. circa secundum. I.*) — to whom Durandus (*quest. 3. prol.*) and the common run of Philosophers assent — that cognition is twofold: one is intuitive, the other abstractive. The former is of an object present and actually existing in itself, or existing eminently in another. An example of the first: the vision of an eye seeing a color actually existing. An example of the second: the vision of a blessed soul seeing creatures eminently contained in God. The latter is of an object not existing in itself, or absent, or not virtually contained in another — such as the cognition of a rose in winter, or of another thing known that neither exists nor is present nor is eminently contained in another. Whatever Auriolus says to the contrary, who does not accept the common description of intuitive and abstractive knowledge. Nor should the distinction of intuitive cognition into immediate and mediate be rejected, as the Conimbricenses (*2. de anima, cap. 6. q. 3. art. 1.*) hold — for as was said elsewhere, God's cognition of future contingents is indeed intuitive but not immediate, only mediate; and the cognition that blessed souls have of creatures when they see them intuitively in the Word does not appear to be immediate, since they do not always see them in themselves and in their own proper existence and presence. Nor does it help to say with the same Authors cited that cognition in another known thing is not intuitive — as Caesar is known in his statue. For even if this is true, because such cognition is in a figure and likeness of him: nonetheless the said cognition of creatures in the Word is had of them as virtually contained in the Word itself. And this is not how the cognition of Caesar in his statue or image or in any other representative of him stands.

First assertion: It is impossible by natural power for external sensation to occur unless the object actually exists and is present to the sense. The Doctor holds this (*cit. & 7. Met. quaest. 13. §. Aliter, & 1. Report. dist. 3. quaest. 4.*). It is proved first from Aristotle (*2. de anima, T. 60. sum. 4. cap. 1.*), who establishes the distinction between the object of sense and that of intellect: the object of sense is the singular existing in itself, while the object of the intellect is the universal abstracting from actual existence. Therefore in the Peripatetic school, external sensation is not accomplished unless the object actually exists and is truly presented to that sense.

You will say that the singular does not per se import actual existence, since the singular means nothing other than a nature determined and contracted through haecceity — which is its individual difference and the constitutive and distinctive principle from anything else that is not an individual and singular. And this is clearly apparent in any series of predicables, at the base of which the singular resides, separated and abstracted from all existence. Against this: the singular abstracted from actual existence is not known by sense but by the intellect, and not by intuitive cognition but by abstractive cognition — which is not what is at issue in the present context. Furthermore, intuitive cognition is called the cognition of vision; but an object is not actually seen unless it actually

exists. Therefore external sensation does not bear upon an object unless it is actually present. Second: the species of the sensible object does not know the object unless the sensible object itself is present. Therefore the presence of the actually existing object is required for it to be caused. The antecedent is established by experience: for the species received in the eye from a wall, if the wall is not actually present, no longer appears — just as is also seen in a mirror. For what is not actually present to the mirror is not seen in it. Therefore the same must be affirmed of external sensation, which is not produced by sense unless the object actually exists and is present to it.

You will say, with Aristotle (*1. de somnis, cap. 2.*), that a certain quality accompanies external sensation — as is evident when we come from the light of the sun into the shade, for a certain light then remains that seems to be seen in the eye. And Augustine confirms this (*11. Trin. cap. 1.*), saying: "Often when we gaze for a long time at the sun or any luminous body and then close our eyes, certain bright colors appear to us, variously changing themselves and diminishing more and more in brightness, until they cease. These are the remnants from the brighter light that shone more clearly and distinctly when it was joined to the luminous body." Augustine therefore thinks that external vision occurs with the luminous body absent. Against this: that happens because of a lesion to the sense — since the sense suffers from a vehement sensible, as is evident when we gaze with fixed eyes at the light of the sun. For certain motions, alterations, and agitations occur, by reason of which certain sensations seem to be produced in us that in reality are not produced, but it is the deception of the imagination judging that the vision still persists around the same object — as sometimes happens in those who are sleeping, dreaming, sick, delirious, seized by fear, and deceived, who seem to hear sounds and see terrible things that are not there, as Aristotle indicates (*2. anima, T. 138.*). Therefore such sensations are false, deceptive, and erroneous. Nor does it appear that Aristotle and Augustine, when rightly weighed, hold otherwise.

Second assertion: By supernatural power, external sensation can be produced through an impressed species, with the sensible object absent. This is what Scotus holds (*4. d. 10. quest. 9. I. Ad quaest. ergo. B.*). It is proved first: what is absolute can exist without what is relative, because what is absolute is prior to what is relative. But external sensation is an absolute entity, since it belongs to the genus of quality; while the presence of the sensible object is a relation. Therefore external sensation can occur without the presence of the sensible object. You will say that a relative cannot exist without its term and correlative — just as there cannot be a father without a son. But external sensation regards the external sensible object present and actually existing, as is evident from its definition given in the preceding note. Therefore external sensation cannot occur without a present object. Against this: although this holds for relatives according to being, it does not hold for relatives according to saying and those of the third kind, as I observed in its proper place. For science and the knowable

are relatives of the third mode, and science can exist with its knowable object absent — indeed, all science abstracts from any existence of its object. Likewise it does not seem incongruous for there to be an external sensation of something not existing, since it belongs to the class of relations of the third kind. Second: God by his absolute power can effect whatever secondary causes can effect, as has been sufficiently discussed elsewhere. Therefore he can supply the causality of the present sensible object, and consequently sensation will rightly occur without the object being present — with God, of course, causing what the sensible object would cause if it were present. Moreover, for sensation only the sense and the sensible species are required, as will be evident below. But God can produce any species of any sensible object — just as he produced intelligible species in the minds of the Angels. Therefore this falls within the scope of divine power.

First objection, against the first assertion: Scotus writes (*Quol. 13. art. 2.*) that God cannot produce intuitive knowledge without the real presence of a really existing object — and cannot cause me to see a stone with intuitive vision unless the stone is really present in its own proper presence and existence. The same he commits to writing (*4. d. 49. quaest. 1.*). The opposite, however, the same Doctor seems to affirm (*4. dist. 10. quaest. ult.*), saying that God by his power can cause vision of the body of Christ in a non-glorified eye, even though that body is not present to that eye. I respond by making a distinction, expounding the Doctor — namely that in the prior passages he speaks of God's ordered power, while in the latter he speaks of his absolute power. And in this way there is no contradiction in the writings of the same Doctor.

Second objection: After the projection of a thrown object, when the thrower is absent, a certain quality called impulse remains in the projectile. Therefore the same can occur in external sensation — namely that it be provided even with the sensible absent. The parity must be denied. For the latter depends in its becoming only on the thrower; the former, however, depends in its becoming and in its being — and therefore, unless the sensible object actually exists, it cannot be.

Third objection, against the second assertion: No power can exceed the limits of its object, since as was said, powers are specified by objects. But the object of sense is the singular existing and present. Hence the celebrated saying among Philosophers: sense is of singulars and intellect of universals. Therefore even supernaturally, external sensation cannot occur unless the object exists and is present to the external sense. I concede the major. As to the minor, I say that the object of sense is indeed a singular — but not a present singular; rather, a singular absolutely, as I made plain in the first assertion.

Fourth objection: The external sense has been provided by nature so that we may sense objects present to it — tasting honey by taste and touching actually by touch. But if sensation could occur with the object absent, we would taste honey

without honey and touch the tangible without the tangible, which is impossible. In confirmation: external sensation is intuitive, which regards a present object — and in this it differs from abstractive cognition. Therefore it is not had except of a present object. I respond by the distinction already given: by ordered power — I concede; by absolute power — I deny. To the confirmation I say that, given the hypothesis, it would be intuitive, not immediate but mediate, as I explained in the preceding note.

Article IV — Whether Sense Can Err Regarding Its Proper Sensibles

The Epicureans — as Marcus Tullius reports (*in 23. qq. Academicis*) — hold that sense never errs regarding its proper sensibles. The Academics, on the contrary — as Augustine reports (*Tomo 1. suorum operum*) — hold that sense always errs regarding its proper sensibles. The common opinion of the other Philosophers holds that sense sometimes errs and sometimes does not err regarding its proper sensibles, given certain conditions.

Note first that the question here is not whether formal error belongs to sense — for that kind of error belongs to the second operation of the intellect, which judges falsely that something belongs to something that in reality does not belong to it, as when it is said that man is a stone. The question is rather whether the error of apprehension is proper to sense itself — which occurs when the sense itself apprehends something otherwise than it is, as when it apprehends the sun to be of two feet in size, whereas astronomers demonstrate it to be of a much greater size. Now judgment, taken broadly, is considered by Aristotle (2. *Top. cap. 2.*) and indicated by Scotus (1. d. 3. *quaest. 4.*) to be accommodated to both sense and intellect.

Note second that four conditions are required for sense not to be deceived regarding its proper sensibles. The first is that the organ of sense be rightly disposed — in default of which a sick person perceives sweet things as bitter and bitter things as sweet. The second is that no obstacle be present in the medium — in default of which a face or hand appears red if seen through interposed red glass. The third is that there be a due distance between the sense and the object — hence a tower too distant from sight appears to be of black color, though it is in fact of white color. The fourth is that the object of sense be proportionate to the power — that is, that it be able to move the sensitive power — which is why atoms are not seen by us except through the rays of the sun passing through a window.

Assertion: Sense does not simply err regarding its proper sensible, though it can err in apprehending this or that otherwise than it is. This is suggested by the Doctor (1. d. 3. q. 4. §. *De tertiis. sub G.*). The first part is supported first from Augustine (15. *Trin. c. 12.*): "Far be it from us to doubt the truth of what we have learned through the bodily senses. For through them we have learned the sky, the earth, and what is known to us in them, etc." Second: sense has whatever is

required for truly knowing its object, provided the conditions enumerated in the second note are observed. Therefore, absolutely speaking, sense does not err with respect to it. The antecedent is at hand, since it is a natural power duly approximated, unimpeded, and rightly disposed. Third: the sciences are founded on the cognition of sense — according to the well-known saying (*l. de sensu, & sensato, c. 1.*): "Nothing is in the intellect that was not first in sense." But in the sciences there is no error, as is evident in logic (*quaestione ult.*). Therefore neither does sense err regarding its proper sensible. And this does not conflict with our faith, which is also acquired through the ministry of the senses — as is evident (*Ioan. ult.*): "Because you have seen me, Thomas, you have believed." And (*1 Ioan. 1.*): "What we have heard and seen with our own eyes and our hands have handled, concerning the Word of life." Aristotle supports this (*8. Phys. 22.*), saying that one whose thought is dull is one who withdraws trust from the senses.

The second part — which is Scotus's (*1. Met. q. 4. §. contra unum.*) — is proved first from Aristotle (*2. animae 161.*), affirming that sense is rarely deceived regarding its proper sensible. Therefore Aristotle holds that sense sometimes errs — when it apprehends an object otherwise than it is. For instance, when fingers are crossed and the hand touches one ball, touch apprehends two balls, though in reality there is only one ball. Second: the intellect sometimes corrects sense, as Scotus notes (*4. Met. in exp. T. 21. & 1. d. 3. q. 4. §. De tertiis cognoscibilibus. G.*). Therefore sense sometimes errs, as is evident in Augustine (*15. Trin. c. 12.*): the eye is deceived when an oar in water appears to be broken, and to a person sailing, a tower appears to move. The same Doctor holds this (*12. de genesi ad lit. c. 25. & 1. 83. qq. q. 9. & l. 3. contra litteras Petiliani Donatistae, c. 21.*). The antecedent is excellently shown by the Doctor in the first passage cited — chiefly about the staff that appears broken to the eye in water, though it is intact and straight. The intellect reasons thus: nothing harder is broken by contact with something soft that yields to it; but the staff is harder than the water that yields to it, as both sight and touch clearly experience. Therefore if an error should occur in sense, the intellect is able to correct it.

First objection, against the first part of the assertion: A rightly disposed sense, duly approximated to its proper sensible, still errs. Therefore sense is deceived regarding its proper sensible. The antecedent is shown: the eye sees the rainbow close to it and the neck of a dove in the light of the sun, and in both cases it apprehends true colors, which are however apparent colors, as I showed (*1. Meteor. q. 3. a. 3.*). I respond that sense indeed sometimes errs, but the intellect can correct it, as the Doctor treats this lucidly in the place cited.

Second objection, against the second assertion: Sense perceives the object through a sensible species, and the sensible species is a natural image representing the object as it is. Therefore sense never errs. I respond that the argument holds true if all the conditions adduced and explained in the second note are observed, but is false if any of them is absent.

You will ask first whether sense can perceive several things at once. I respond affirmatively. For sight can see multiple colors, and hearing can hear multiple sounds. It perceives one thing better than many. Hence that saying is celebrated: "A sense that attends to many things is less effective toward each one."

You will ask second whether a vehement sensible injures sense. Aristotle responds affirmatively (*2. anima, c. 2.*), and experience confirms it — as is evident in one who gazes with fixed eyes at the sun at midday, whose vision is harmed; and in the gunner who becomes deaf from the vehemence of the noise of cannons. The reason is that sense requires for sensation a due temperament, which is dissolved by the great force and frequent assault of sensibles. But why does this not happen to the intellect, which is instead perfected by what is most perfectly intelligible? The reason is that the intellect is spiritual, while sense is corporeal — its temperament is overturned and altered by a vehement sensible.

You will ask third whether a sensible placed upon the sense produces sensation. I respond that for touch and taste, yes; for the other three, no. Thus the visible placed upon the eye impedes vision. The reason is that those senses require a medium in order to exercise their sensation.

Question III — On the External Senses

Article I — What the External Senses Are

The external senses are described as material faculties fixed to an external bodily organ. This amounts to the same as the definition of sense given by Saint Damascene (*2. fidei, c. 18.*): sense is a power of the soul that apprehends or knows material things. They are called external not because they protrude at the extremities of the body — for Aristotle affirms (*1. de sensu, & sensato*) that sight is not at the extremity of the pupil — but because they appear outwardly to us, or because they are altered by external objects with no other thing interposed: sight by color, hearing by sound.

Assertion: There are five external senses — sight, hearing, smell, taste, and touch. These are mentioned by Aristotle (*2. animae, T. 128.*) and Scotus (*2. d. 3. q. 8. Ad 3. & q. 6. de anima.*). They are also enumerated by Damascene (*fidei, c. 12.*), Augustine (*11. Civit. c. 16. & 1. de gen. contra Manich. cap. 14. & 11. Trin. ante c. 2. & 12. de gen. ad lit. c. 16.*). It is proved first: material and corporeal powers are enumerated according to the number of organs, as no one denies. But there are five distinct organs, as is evident to the eye and will be more apparent below when we treat of each in particular. Therefore there are five external senses, through which, as through the body's messengers, diverse things are reported — as Augustine says (*Tract. 99. in Ioan.*). Second: powers are distinguished and manifested according to the distinction of objects, as has been shown elsewhere. But there are five formally distinct objects of externally sensible things — namely the visible, audible, olfactible, gustable, and tangible — which Augustine

hands down (2. *de lib. arb.* c. 3.) and explains (1. 83. qq. q. 64. & l. *de duabus animabus*, c. 2. & in *exp. Psal.* 147.). Moreover, there are five media of sensing — namely earth, water, air, fire, and flesh — through which external sensation is produced, as Aristotle teaches before others (*in praesenti.*). Therefore there are five external senses.

First objection: Not all animals possess external senses. Therefore five external senses are not given. The antecedent is proved: certain animals — such as the mole — lack sight, on the testimony of Pliny (1. 2. *hist. natur.* c. 69.); and others lack hearing — such as bees, as Aristotle reports (1. *Met.* c. 1.). I concede the antecedent and deny the consequence. For it is not necessary that all animals possess these five senses — just as it is not necessary that all animals have the power of local motion. It suffices that some enjoy all of them, as is established from the case of man, the lion, and similar beings.

Second objection: Taste and touch do not differ from one another. Therefore five external senses should not be admitted. The antecedent is shown: taste is a kind of touch — for we do not taste flavors unless we touch them. I respond by distinguishing the antecedent: taste taken broadly is a kind of touch — I concede; taken strictly — I deny. For they possess formally distinct objects and a distinct definition, as is clear from the assertions made above.

Third objection: Sight regards corruptible and incorruptible things, sublunary and celestial things. But one and the same power cannot regard all these things. Therefore sight is not one sense but multiple, according to the multiplicity of objects. If the major be conceded, I say as to the minor that all these things fall under one formal objective aspect — which is visibility. Therefore from the unity of the formal object the unity of the visual power is rightly deduced.

You will ask first from what origin the external senses derive. The physicians — notably Galen (1. 6. *de placitis Hypocr. & Platonis*) — respond that the external senses arise from the brain, because when the pathway that proceeds from the brain is blocked, external sensation is impeded. Therefore, they say, it is a clear sign that the external senses proceed from the brain.

You will ask second whether the external senses of all living beings are of the same species. I respond affirmatively. The reason is that their formal object is entirely the same, though there is some accidental difference among them — namely in perfection. For the sight of the eagle is more perfect and acute than the sight of the ox and other animals.

You will ask third whether the senses of man exceed in perfection the senses of brutes. Hippocrates responds by making a distinction. If the discussion concerns the substance of these senses, in man they are more perfect, because they arise from more perfect causes — namely the rational soul and the human body, and from the whole composite, which is man, who excels and surpasses all other living beings. But if discussion concerns the accidental being of those senses,

some animals possess more excellent senses than man, on account of the better dispositions of their organs. And Canellus suggests this (*in 6. quaest. de anima, concl. 2.*), saying that man surpasses all other animals absolutely in all senses, even if in certain respects he is surpassed by some. Hence the following verses are composed: "In hearing the boar surpasses us, in sight the lynx, in taste the ape, the vulture in smell, the spider in touch."

You will ask fourth what order the external senses observe among themselves. I respond that in the order of origin, the first is touch — because it is the foundation of life — then taste, smell, hearing, and sight. In the order of dignity and perfection, sight holds the first place, followed by hearing, smell, taste, and touch.

Article II — Whether the External Senses Need a Medium to Produce Sensation

This difficulty was touched upon in the third question of the preceding question and nearly resolved. Now, however, it must be examined exactly and decided clearly. Two divergent opinions of the interpreters of Aristotle exist on this matter, of which the first is defended by Averroes (*in praesenti com. 116.*), affirming that all external senses require a medium for producing external sensation. The second is supported by Alexander, who holds that the first three senses — sight, hearing, and smell — require a medium for producing sensation, but not the other two — taste and touch.

Note that the medium of a sense is that through which the sensible object acts upon the power and organ of sensation. Now it can act — or alter the sense — either according to real being, which is called being in reality, as when fire heats touch; or according to intentional being, by diffusing the sensible species into the sense itself, as is evident of the visible object, which sends its species into sight through which sight itself sees the color presented to it and the object. Furthermore, sensation can be produced by the sensible placed upon the sense — imperfectly, or perfectly. And this distinction reconciles many who disagree with one another about Aristotle's axiom (*2. anima, c. 7. T. 75.*), saying that a sensible placed upon the sense does not produce sensation — that is, imperfect or perfect, as Toledo especially observes (*ibi q. 2. 1. 3. 0. 35.*). And in this sense Scotus perhaps speaks (*quaest. 4. de anima*), and Canellus explains it (*ibid. in suis annot.*).

First assertion: It is probable that the first three external senses — sight, hearing, and smell — do not exercise sensation without some medium being present. It is proved first from Aristotle (*2. anima, c. 6.*), who plainly teaches that the said senses require a medium. Second: there is the common saying, written out (*in 2. de anima, c. 7. T. 75.*): a sensible placed upon the sense does not produce sensation — which is established by experience. For with hands placed over the eyes and ears and nose blocked, sight, hearing, and smell are impeded — which

are the sensations of the said senses. Therefore these senses require a medium for producing sensation. Third: for seeing, light and air are necessary — and so if either is absent, vision is not accomplished. Therefore sight requires a medium for producing vision.

Second assertion: It is likely that taste and touch do not require a medium for eliciting their sensations. It is proved: no touching or tasting takes place unless the tangible is immediately touched by touch and the gustable by taste — as experience makes plain of food digested in the mouth and of the hand immediately touching the primary qualities. Likewise of two planks immediately touching one another. Furthermore, if the hand be placed over a fire, it is improbable that the skin senses heat through the mediation of air and that the fire itself does not exclude the medium air, if it is present. And the same is evident in taste. For no one can taste honey if a medium is interposed between taste and honey. Therefore these two latter senses do not require a medium to produce sensation.

First objection: From Aristotle (*2. anima, c. 7.*), proving that there are five external senses because there are five media through which quintuple sensation is accomplished. Therefore if Aristotle's argument is valid, it must be admitted that all external senses require a medium for exercising their sensations. I respond that Aristotle there speaks of the internal receptive media in the organs and sensories of the external senses — such as the sensible species concurring in producing sensations. But we are here treating of external media that must be interposed between the sensible object and the exterior sensitive power, and which we have asserted above to be unnecessary for taste and touch.

Second objection: The same Philosopher (*proximè cit. T. 75.*) proffers this maxim: a sensible placed upon the sense does not produce sensation. Therefore every sense necessarily requires a medium for the production of its sensation. I respond that the proposition cited is not universally true — taste and touch are excepted, as was asserted and proved above.

You will ask whether the external senses perceive their own sensations — that is, whether sight sees its own vision and hearing hears its own hearing. I respond negatively. The reason is that the external senses are not comparative and reflexive powers with respect to their own acts, and therefore do not attain their own sensations. Especially because sensations are not sensible objects but media through which the sensible objects themselves are sensed and perceived by the senses.

Article III — Whether the External Senses Can Perceive a Spiritual Object

Although all in fact concede that the external senses cannot attain any spiritual object — and they affirm the same of any other material power — some, among

whom is Arriaga (*disp. 5. de anima, sect. 2.*), and Poncius does not seem far distant (*disp. 59. q. 5. in fine concl. 2.*), admit this as possible and think that no contradiction is involved. The common run of Scholastics, however — expressly Scotus (*4. d. 49. q. 11. §. Ad argumenta ante K.*) and the rest of both his school and the other — teach that external and internal sense is in no way able to perceive spiritual things.

Assertion: Neither in fact nor as possible can external senses attain anything spiritual. The assertion is bipartite, and is defended by Scotus in the place just cited. The first part is proved first by the experience of sight, which does not see the rational soul, nor an Angel, except in a body assumed by it — and the same must be judged of the other senses. Second: the intellect bound to the senses cannot perceive except material things. Hence that saying exists: "Nothing is in the intellect that was not first in the sense." And (*3. de anima, T. 39.*): "One who understands must contemplate phantasms." But such phantasms are sensible and material things, which the agent intellect renders spiritual. Therefore sense does not bear upon spiritual things.

The second part is supported first: every power cannot exceed the limits of its total and adequate object. But if sense could attain something spiritual, it would exceed the limits of its total and adequate object. Therefore that is impossible. Poncius responds (*cit.*) that this is a *petitio principii*. For what is asked here is whether a power can be elevated by God to consider something outside its object. Against this: it cannot be that the object of a power is adequate and not adequate, total and not total. But if sense could perceive something spiritual, its object — which is the sensible — would be adequate, because it is a sensitive and material power; and it would not be adequate, because it would overstep the limits of the sensible itself and be elevated to the spiritual and immaterial. Therefore that is repugnant. The major is at hand, because powers and habits are specified by their total and adequate objects (*2. anima, T. 33.*). Furthermore, an organic power cannot be non-organic — otherwise it would be organic and non-organic, which implies a contradiction. But sense is an organic and material power; and if it were elevated to perceiving a spiritual object, it would be non-organic and spiritual — as is evident from the intellect, which is a non-organic and spiritual power perceiving an immaterial and spiritual object. Second: God cannot be seen with the bodily eye — hence he is called invisible, on the authority of Augustine (*1. contra Adimantum. c. 28. & tract. 24. in Ioan.*): "He is not of such a substance as can be seen by eyes." Therefore if sight cannot perceive God or any other spiritual thing, the same must be affirmed of the other senses.

First objection: Everything created is in obediential potency to God, for doing whatever God wills. Therefore since sense is a created being, it is in obediential potency for perceiving a spiritual object, and consequently it is not repugnant for an external sense to be able to attain something spiritual. I respond that obediential potency, as was said elsewhere, is not active but passive. And the

omnipotence of God admits of everything possible — but not of the impossible, such as sense attaining the spiritual and immaterial.

Second objection: Job 19: "In my flesh I shall see God my Savior." To which Augustine (22. *Civit. cap. 29.*) seems to give his assent. But this testimony is taken of material vision and the bodily eye. Therefore it is not repugnant for sense to perceive spiritual things such as God. I respond that that and similar passages must be interpreted of Christ the Lord, who according to his humanity can be seen by the bodily eye, but not according to his divinity, which is seen by the eye of the mind and intellect.

Question IV — On Intentional Sensible Species

This question is placed between the preceding and subsequent ones, because sensations cannot be rightly perceived unless knowledge of these intentional sensible species is had. Therefore it is properly woven in between those two.

Article I — Whether Intentional Sensible Species Are Given

The first view is held by Ockham (2. *quest. 7.*), Gabriel (2. *dist. 3. quaest. 2.*), and Durandus (*quest. 6.*), to whom the other Nominalists agree in sense and assent, rejecting both sensible and intelligible species. The second view is defended by Scotus (1. *dist. 3. quaest. 6.*), Bargius, Lychetus, Vigerius, Faber, Vulpes, and the rest of the Theologians and Philosophers who admit both sensible and intelligible species.

The various senses in which the word "species" is taken must be recalled from what was set forth in the Epitome of Dialectic (*lib. 1. quaest. 3. art. 4.*). In the present context, however, species is taken as an objective representation — or image and likeness of a thing — which is a quality deputized for the object, concurring partially in producing sensation. This is called the impressed species because it is impressed upon the sense, and is also called intentional because it is intended by the sensitive power in order that sensation may occur. The sensation itself is called the expressed species, which is the formal expression of the sensible object and by which sense is formally cognitive. What I have said about the sensible species must likewise be affirmed in the same way of the intelligible species.

Assertion: Sensible and intelligible species must be conceded. This is handed down by the Doctor in the passage cited, though in (*quest. 17. de anima*) he seems to defend the opposite. Augustine preceded him (10. *Conf. cap. 8.* & 12. *Civit. cap. 7.* & 7. *de gen. ad lit. cap. 21.* & 1. *contra epistolam fundamenti, cap. 19.*). It is proved first from Aristotle (2. *animae, T. 121.*), affirming that sense is the receptive of species. And (*T. 124.*) and (3. *eiusdem operis, T. 28.*) and thereabouts, teaching both sensible and intelligible species. Second: the reason why a sensible placed upon the sense does not produce sensation is that a medium is required through which the species is conveyed to the sense to produce sensation. Therefore for

producing sensation, a sensible species is necessary. The antecedent, apart from being proved in the preceding article, can still be urged: unless a sensible species is had in the sense, even if a medium is interposed between sense and the sensible object, sensation is not accomplished. Therefore for sensation itself, the sensible species is necessary. Third: the sensitive power cannot produce sensation by itself alone — otherwise sense would always sense, as the eye would always see. But it is evident that sense does not always exercise its sensation unless it has the species of the sensible thing; indeed, if the species is lost, sense can no longer sense. Therefore sensible species must be given. Fourth: a power that is indifferent and undetermined must be actuated and determined by something that actualizes and determines it — as is evident from matter, which is actuated and determined by form. But the sensitive power is indifferent and undetermined toward sensing this or that sensible thing. Therefore it must be determined and activated by a sensible species received in it. To this are added the experiences — chiefly of sight — since in water, mirrors, and other transparent bodies, from behind some opaque body blocking, images, figures, and the like appear. Moreover, through optical instruments, objects duly approximated and rightly disposed are better and more clearly seen by the eye than without them — by reason of which sight is augmented, which cannot be accomplished without species. Furthermore, in the discharge of a cannon, the ignition of the powder is first seen and afterward its strike and boom is heard, because the species of the sound is afterward conveyed to hearing — as I observed (*1. Meteo. q. 2. a. 4.*). Moreover, in the case of an odor, it is conveyed first to those nearby and then to those farther away. And such sensations are not produced by senses without sensible species. Therefore sensible and intelligible species of this kind must be conceded.

First objection: Aristotle (*l. de sensu, & sensili c. 2.*) reproaches Democritus and other ancient Philosophers who affirm that sensible species are received in sense so that sensations may be produced. Therefore Aristotle refutes the said sensible species. I respond that the Stagirite argues against those ancient Philosophers — not because they admitted such species, but because they held that sense is only a passive power and does nothing at all toward the production of sensation. We, however, hold that sense is indeed receptive of species, yet actively concurs, together with the sensible species, in producing sensations.

Second objection: What leads to cognition of the object must be known prior to the object, since it is the medium through which the object itself is known. But the sensible species is not known by the senses — for sight does not see the species of color, nor does hearing hear the species of sound. Therefore such species are superfluous. I respond that the major holds of the medium that is known — such as a creature through which God is known; for the creature itself must be known prior to God. But it does not hold of the medium of knowing — such as the species, which is the means of knowing and the likeness of the sensible object. And this is evident from a mirror, which represents diverse

objects; yet it is not necessary that the mirror be known first before the objects represented in it are seen.

Third objection: If sensible species were given, many accidents differing only in number would be multiplied in the same subject — such as in the same medium and the same organ. But this seems repugnant. Therefore so does the former. I concede the consequence of the major and deny the minor, as I made clear and proved in Logic in the question on relation — where I showed that in the same father there are multiple paternities in number, and in the same medium multiple lights distinct only in number. And this will be more apparent in the Metaphysics, where it will be shown that accidents are not individuated by their subjects.

You will ask first by whom the sensible species are produced. I respond that they are produced by the objects of which they are likenesses and images.

You will ask second in what subject the sensible species inhere. I respond that they inhere in the medium and in the organ of the sensitive power. For such species are conveyed from objects through the medium to the sense in which they reside.

Article II — What the Sensible Species Are

Some hold that sensible species are the natures and quiddities of objects. Others think they are atoms or corpuscles emitted from objects to the senses. Nor are there lacking those who affirm that they are formal likenesses of objects. The common opinion of the other Philosophers holds that sensible species are representative and effective images of objects, concurring partially in the production of sensations.

First assertion: Sensible species are not the natures and quiddities of objects. This is derived from the Doctor (*1. d. 3. quaest. 7. §. Ad auctoritatem Philosophi. AA.*). It is proved first: if the species were the natures of objects, since they are in sense, the natures of objects would consequently be in sense — and so the natures of the lion, the dog, and the rest would remain in sense. But how false this is is evident of itself and from that saying of Aristotle (*3. anima, T. 38.*): "Not the stone but the species of the stone is in the intellect." Therefore such species are not the essences and natures of objects. Second: what is outside the sense according to its own nature is not in the sense — since one and the same thing cannot simultaneously and with respect to the same be both in sense and outside sense. But the nature of the object is outside the sense — a tree, for instance, is outside the eye; while the species of the tree is in the eye, just as the intelligible species of the stone is in the intellect. Third: nothing can exist without its own essence — for nothing is more intimate to a thing than its essence. But a species can exist without the object — as the species of a corrupted object is in the phantasy. Therefore the species is not the very nature and essence of the object.

Second assertion: Sensible species are not atoms or corpuscles transmitted from objects to the sense. This is drawn from the Doctor (*Quol. 13. §. Ad argumentum principale. LL. & Quol. 14. in fine 6. de tertio & §. Ad ista. HH.*). It is proved first: multiple bodies cannot simultaneously exist in the same place, as I said in the treatise on place. But multiple species simultaneously exist in the same place — in the same medium and in the same organ, as was said and proved elsewhere. Therefore sensible species are not the said corpuscles conveyed from objects to sense. Second: what inheres in another is not a body but an accident, and a body is a substance that is a being subsisting through itself. But sensible species inhere in the medium and in the sense, which is the receptive power of them. Therefore they are not the said corpuscles.

Third assertion: Sensible species are not formal likenesses of objects, but representative, effective images concurring partially in producing sensations. The assertion is bipartite and is held by Scotus in the passage cited. The first part is supported first: the formal likeness of an object is nothing other than the very cognition of the object itself — which is called the expressed species. But there is a wide distinction between the species and the cognition of the object — that is, between the impressed and the expressed species — as I indicated above. Therefore the sensible species, or impressed species, is not a formal likeness of the object. Second: what is a cause of something cannot with respect to the same be its effect — otherwise the same thing would be the cause of itself. But the sensible species is a partial formal cause of the formal likeness of the object, or of the cognition of the object itself. Therefore it cannot be the formal likeness of the same object.

The second part follows from what has been said. For the species is a deputy of the object, performing its function — namely representing the object itself, and together with the sensitive power causing the sensation. Therefore the sensible species is a representative likeness of the object of which it is the species.

Objection: Sensible species are formally similar to sensible objects. Therefore they are their formal likenesses, of the same nature — since likeness is founded on identity. I distinguish the antecedent: representatively, effectively, and intentionally — I concede; really, physically, and formally — I deny.

Second objection: Various colors appear in the air and on a wall through reflection — as when light is reflected toward green plants, the wall takes on color; and when a red silk veil is hung in a window with the sun shining, the whole house becomes red. Therefore the sensible species is a formal image of the sensible object. I concede the antecedent and deny the consequence. For it can be said that this occurs not because species are seen by us, but because the air is diffused mixed with species — just as through green glass everything appears green. Or say with Scotus (*2. d. 13. q. vn. §. Quantum ad 3. art. F. G.*) that sometimes a species is visible — as he explains concerning the gleam emitted

from an eye moved in the dark, which is visible, though it is only the species of light.

Article III — Whether Species Are Divisible

The present difficulty can be raised both of sensible and intelligible species, which in what follows are to be established and decided in two assertions. For its declaration and decision, two notes are premised.

Note first that a species can be said to be indivisible in two ways: in being, or in representing. In being, if its nature, essence, and entity are incomposite and indivisible — as are God, an Angel, and the rational soul. In representing, however, if the whole species represents the whole object and a part does not represent a part. Conversely, it is divisible if the whole species represents the whole object and a part represents a part — and this is understood only of the sensible species, not of the intelligible species, which has no parts.

Note second that a natural agent duly approximated to a patient, rightly disposed and unimpeded, acts throughout the whole sphere of its activity, according to its whole power and virtue. Thus if water cools and moistens the earth in so much space and no more, the whole water is said to cool and moisten the whole of that earth and each of its parts — and not one part acts upon another and another upon another, and so on. Just as the light of a lamp illuminates the whole room and not one part illuminating another: so a species is diffused through the whole medium and space appropriate and proper to it, in which the object of which it is the species can be sensed, and is contained within the range of its power and activity, with no obstacle interposed.

First assertion: Sensible species are divisible. This is derived from the Doctor (2. d. 13. q. vn.). It is shown first: what is material is divisible, since everything material is quantified, and everything quantified is divisible (5. Met. c. de quanto.). But sensible species are material — for they are emitted from a material and corporeal object. Therefore sensible species are divisible. Second: what is educed from the potency of a divisible subject is divisible, since from what is divisible only what is divisible proceeds. But sensible species are educed from the potency of a divisible and material subject, as is evident by induction. Therefore they are divisible.

Second assertion: Intelligible species are incomposite and indivisible. The Doctor does not depart from this in the passage cited above. It is proved first: what inheres in an incomposite and immaterial subject is incomposite and indivisible, since what is indivisible does not receive what is divisible. Hence an Angel, being indivisible and immaterial, does not receive material and divisible accidents. But intelligible species are subject in an indivisible and immaterial subject — namely the intellect. Therefore they are incomposite and indivisible. Second: everything immaterial and spiritual is impartible and incomposite, since it lacks entitative and quantitative parts. But intelligible species are

immaterial and spiritual — for they are produced by the agent intellect, which is spiritual, and received in the patient intellect, which is likewise spiritual. Therefore intelligible species are indivisible.

First objection, against the first assertion: Light and heat are produced indivisibly from the sun and from fire, and not one part from another part, but the whole light from the whole sun and the whole heat from the whole fire. If sensible species were divisible, one part would plainly be produced from one part of the object and another from another part, and the whole species from the whole object — which does not seem plausible. Therefore sensible species are not divisible. The major can be denied: for one part of light beams from one part of the sun. And this is clearly shown when the sun is eclipsed — for then we enjoy only one part of its light. Likewise when a part of fire is taken from the whole fire — then it neither illuminates nor heats as much as before, on account of that part taken away and removed from it. But since such species are intentional and emanate from objects suddenly, continuously, and not discretely and successively, and almost imperceptibly, therefore one part is not said to be produced from another, but the whole species from the whole object, in the manner explained in the second note.

Second objection: A small part of an object seen from afar is not seen at all; but the whole object is very much seen. Therefore a part of the object does not cause a part of the species, but the species is produced absolutely from the whole object — and so sensible species are not divisible. I respond that the reason why a small part of an object, if it is very distant, cannot be seen by us, while the whole object is seen by us, is that the visible object must be proportionate to the visual power. Since a small part of an object is disproportionate to sight because of the undue distance, it cannot therefore be seen. But the whole is proportionate to sight itself, and therefore is seen by us. And this can be illustrated by atoms, which are not seen by us because they are so tiny — while other bodies not so small are certainly seen by us.

You will ask whether species admit of more and less. I respond affirmatively — for they are qualities, whose passion it is to admit of more and less. Hence some represent objects more clearly, and others more obscurely.

Question V. On Sight

A full and perfect knowledge of sight cannot be had without knowledge of light and illumination, which pertain to its object, as Scotus especially establishes (*1 Met. 9.2. §. Ad aliud, quod*). Therefore, the things said about light must be investigated first, and then the remaining matters pertaining to this same sense must be treated.

Article I. Whether light is an accident or a substance.

Thomas (*1 p. 9.67. art. 3*) recounts the opinion of those who think that light is the substantial form of luminous bodies — an opinion that perhaps coincides with the one Aristotle mentions (*2 anima, c.7.T.69*), namely that light is a body. The common view, however, held by Aristotle in the place just cited, by Scotus (*2.d.13.9.vn*), by Mayr in the same place, by Alensis (*3.p.9.69. m.2. art. 3*), and by others, is that light is an accident belonging to the category of quality.

Note I, from Gabriel (*2.d.13 9.vn*), that the name "light" was imposed chiefly to signify that by which colors are made manifest so that they can be seen — that is, that by which the visible in potency becomes actually visible. It is also transferred to everything by which the knowable is made manifest, as in Ephesians I: "All things that are reprove are made manifest by light," and thereafter: "Everything that is made manifest is light." In this sense God, the angel, faith, grace, and glory are called lights.

Note II, that these three — lux (light as source), luminosum (the luminous body), and lumen (illumination) — stand in such relation that lux is the origin of lumen, the luminous body is the subject of lux, and lumen is the species or effect of lux. Thus lux illuminates the body in which it resides, then renders itself luminous, and afterwards illuminates other things. Observe further that three things emanate from a luminous body: the ray, the splendor, and the brilliance. A ray is that which proceeds from a luminous body terminated at some object. Splendor is a ray reflected off an opaque body. And brilliance is light mixed with darkness. On all these matters in full detail, see the writers on optics.

First Assertion: Light is not a substance. So hold Aristotle and Scotus in the places cited above. This is proved, first, because what is per se sensible is not a substance, since, as I said above, substance is sensible only per accidens; but light is per se sensible, being directly seen by our eyes; therefore light is not to be numbered among substances. Second, what is an accident of something is not a substance, for substance happens to nothing (*1. Phys. 27*); but light is an accident of the sun and of fire. The sun can indeed be darkened, as in Matthew XXIV: "The sun shall be darkened, the moon shall not give her light." Likewise, fire in its proper sphere does not shine, since it is exceedingly rare there. Moreover, the fire of hell is said to be filled with darkness; therefore light is not a substance.

Second Assertion: Light is not a body, but an accident belonging to the category of quality. This is defended by Aristotle and Scotus in the places cited above. The first part follows from the prior assertion: for if light is not a substance, it is not a body either. What does not possess the higher essential predicate does not possess the lower one either, as is plain from the dictum de nullo; therefore, if light is not a substance, it is certainly not a body, which is comprehended under substance, as is clear from the Porphyrian tree. Furthermore, if light were a body, two bodies would naturally be in the same place simultaneously, namely

light and air, since light is in the air. Again, a body is made up of matter and form; but light is devoid of matter; therefore it is not a body.

The second part is inferred from the assertions above: since light is neither substance nor body, it follows that it is an accident — and nothing other than a quale, because through light luminous bodies are denominated as having a certain quality; therefore light is a quality.

First Objection: Aristotle (*5. Top. cap.3*) writes that light is fire; but fire is a substance; therefore light is a substance. And in section XI of the Problems, question XIII, he calls solar rays and light "bodies." Favorable to this view are Augustine (*3. de lib. arb. cap. 5*) and (*7. de gen. ad lit. c. 1*), John of Damascus (*2. fidei, 6.7*), Hugo of St. Victor (*1. defacram. c. 9*), and the Seraphic Doctor (*2. d. 13. art. 2. 9. 1*), who defends this as a probable position, adducing and resolving the testimonies and arguments on both sides. I reply that Aristotle either spoke in the opinion of others, whom he attacks in the passage from *De Anima* just cited, or used "light" to mean the luminous body — as in *Genesis I*, where "light" is said to be created on the first day, meaning the luminous body which was made manifest through light as its nobler quality. The Fathers cited above can be interpreted in the same way. Or, on this point they need not be followed, since it is not a matter of faith, and on our side we have authors of no lesser authority.

Second Objection: What produces a substance is itself a substance, because in the Scotist school a substance is generated only by a substance; but light and illumination generate substance, such as gold and things of that kind; therefore light is a substance. I grant the major. I distinguish the minor: dispositively, I grant it; efficiently, I deny it. This distinction was stated and explained elsewhere.

Third Objection: What is nobler than material substance is itself a substance, because nobility follows the thing whose nobility it is; but light surpasses material substance in nobility, on the authority of Augustine (*2. de lib. arb.*): "Light holds the first place among bodies." Therefore light is a substance. I grant the major. I distinguish the minor: absolutely, I deny it; in a qualified sense, I grant it. This is how Augustine must be interpreted. For as I have said elsewhere, active qualities surpass matter in nobility in a qualified sense; but absolutely speaking, matter, even passive matter, is more excellent not only than qualities but even than any other accidents.

Fourth Objection: Nothing is contrary to light and illumination; but to a quality something is contrary, as is plain from the enumeration of the properties of quality; therefore light and illumination are not qualities but substances. I grant the major. I deny the minor. Not all qualities have a contrary — for example, sensible and intelligible species do not — since having a contrary is not a property of quality in the fourth mode.

Article II. Whether illumination is both a real and an intentional quality.

Thomas (*1. part. quest.67.art.3*), Cajetan, Bañez (*de anima, quast.1.§.B*), Ruvo (*tract. de sensu, cap.7. quast. 2*), and very many others assert that illumination is a real and purely physical quality. Scotus, however (*2. d. 13. quest. vn. §. de 2.dico*), Dib., the Complutensians (*disp. 10*), C. Faber (*Theor.66*), Piccolomini (*l. d. visu cap.8*), Zabarella (*1.1. de visu, cap.9*), Cavallius (*disp. 2. de anima, sect.9.dub.1*), and the rest of the same school teach that illumination is not only a real quality but also an intentional one. For easier and more convenient understanding of this:

Note I, from the Doctor just cited under B, that "intention" is used in two ways. In one way, for the act of a vital power tending immediately to an object — in this sense, when the intellect perceives a real object it is simply called a first intention; but when it compares one known object to another, it is called a second intention, as I explained at length in my Epitome (*1.1. quast.1. art.10*). In the other way, for the medium and representative principle of an object, by means of which the cognitive power tends toward the object itself and effectively concurs in a partial way toward producing the vital act. It is intentional being understood in this second sense — the sense in which it is participated by sensible and intelligible species — that is under discussion here.

Note II, that something can have real and intentional being simultaneously: for example, a sign, on the authority of Augustine (*1. de doctrina Christiana, cap. 1*), has real being because it is perceived directly by sense, and has intentional being because it is the medium through which one is led to the knowledge of another thing. In the same way, illumination participates in real being because it is per se sensible, and acquires intentional being because it is the species of a place. This same Augustine expressed when he said (*tractatu 35. in Ioan.*): "Light both shows other things and shows itself."

Assertion: Illumination is a real quality and also an intentional one. The assertion is two-part, defended by Scotus and agreed to by Augustine just cited. The first part is shown, first, because illumination is placed in the third species of quality — namely, it is a passible quality; but every passible quality placed in the genus of quality is real; therefore illumination is a real and physical quality. Second, what has real effects is itself real, as is evident; but illumination has real effects — it illuminates, heats, liquefies wax, hardens clay, and so forth; therefore illumination is counted among real qualities.

The second part is proved, first, from Averroes (*2. anima, conc.73 and 75; de sensu et sensato, not far from the beginning*), who affirms that illumination is a species received in the eye so that the eye itself may see; but a species has intentional being, as I noted at the end of the first notation; therefore illumination is an intentional quality. Aristotle himself (*2 anima, T. 68*) suggests the same when he says that light is per se sensible, a thing that has no other species than

illumination. And in the book on sense and its object (*cap.* 2) he adds that illumination is a species received in the eye by which sight sees. Second, if illumination did not have intentional being, when placed upon a sense it would impede sensation — which conflicts both with experience and with Aristotle in the passage just cited — for if illumination is received in sight or in hearing, it in no way hinders vision or hearing. Furthermore, illumination persists as long as the luminous source is present, lacks a contrary, and coexists with another illumination — all of which are marks of a sensible species.

First Objection: Illumination denominates the subject in which it exists — for example, illumination existing in air denominates the air as luminous — but what has intentional being does not denominate the subject in which it exists: the species of whiteness inhering in the eye does not denominate the eye as white; therefore illumination is not an intentional quality. I grant the major. I distinguish the minor: with respect to that which has only intentional being, I grant it; with respect to that which has both real and intentional being simultaneously, I deny it. Such is illumination, as is plain from the second notation. Or I say with Scotus in the place cited, that intentionals and many others do not acquire proper denominative names — for example, the subjects of odors, flavors, and colors — as Mauritius notes (9. 29. *Universalium fol.* 55. *columna secunda*). Therefore it is no wonder if the species of whiteness in the eye does not denominate the eye as white.

Second Objection: What has a real effect is real, since a real effect proceeds only from a real cause; but illumination causes a real effect, namely it heats; therefore illumination is a real quality. I reply that illumination is indeed a real quality, as I showed in the first part of the Assertion; and it is also an intentional quality, as the arguments I brought forward in the second part demonstrate.

Third Objection: What is per se sensible does not have intentional being, since the intentional is not cognized by sense — the visible species is not seen by the eye; but illumination is per se sensible, since it is seen by our eyes; therefore illumination is not an intentional quality. I reply that the major holds for that which has only real being, but not for that which possesses both real and intentional being, as illumination does.

Fourth Objection: If illumination produced throughout the whole medium were an intentional species, it would represent the sun, or its light, or both, in the magnitude, position, and figure that they actually have — just as the species of any other object represents what it is a species of. Therefore, from any part of the medium, or from any position, it could be seen by the eye, which contradicts experience. I reply that illumination is not the species of just any object, but only of light — as Scotus saw well. Therefore the objection and the rest that certain more recent thinkers urge against us fail.

You will ask I, how many kinds of ray are there? I reply that there are three: direct, reflected, and refracted. A direct ray is one that is diffused through a diaphanous medium until the power of the luminous body ceases to advance further. A reflected ray is one that, upon encountering an opaque body, rebounds and retreats in the opposite direction. A refracted ray is one that is diffused through a medium neither entirely transparent nor entirely opaque, and is bent along the perpendicular line.

You will ask II, how many kinds of illumination are there? I reply that there are two: primary and secondary. Primary illumination is that which proceeds immediately from the light source. Secondary illumination is the shadow of primary illumination. There is moreover a difference between shadow and darkness: shadow is the privation of primary illumination, whereas darkness is the absence of both primary and secondary illumination.

You will ask III, whether the illumination received in the eye is itself seen by the eye? I reply in the negative. For only the illumination that is outside the eye is seen. The reason is that the visual power does not extend to what is within the eye; otherwise, the sensible placed upon the sense would produce sensation — which was denied above as applying most especially to sight. Yet Scotus (*d.45. quast. 3. §. de 2 art. 1.4. Sententiarum*) seems to allow that the act of vision can be seen by sight.

Article III. Whether illumination is necessary both on the part of the object and on the part of the medium for the act of seeing.

Avicenna (*6. naturalium, parte 3. cap.1*) asserts that illumination is necessary only on the part of the object. Averroes (*2. de anima, com. 67*) thinks that illumination is necessary only on the part of the medium, in which he is followed by the Complutensians (*disp. 10. quast.5. §. 2*). The common opinion, however, held by Scotus (*2. d. 13.9.vn. §. De secundo dico sub C* and *1.d.3 quast.6. §. contra istam opinionem*), the Coimbrans (*2. de anima, cap.7. quest.4. art. 2*), and others, is that illumination is required for seeing color both on account of the medium and on account of the object.

Note I, that the diaphanous is used in two ways. In one way, for what is merely transparent and lacks light of its own — such as water and air. This is how the diaphanous is described by Aristotle (*2. anima, cap. 7*): that which is visible not by its own light but by the light of another. In the other way, for what participates in light, even if it is not translucent — in this sense the stars are said to be diaphanous as participating in light. Scotus notes (*4.d. 49. quest. 15. §. Ad primum. 6*), from the same Avicenna cited, that light, illumination, and color have different receptive subjects, and that something can less readily be receptive of light and illumination together than of light and color together. For the subject of lux is opaque and dense; the subject of lumen, on the other hand, is permeable and transparent. Hence the denser part of the heavens is luminous,

namely the star. The subject of color, however, is dense, because color only exists in a bounded transparent body. To understand this better and more easily:

Note II, that color is described by Aristotle in two ways: in (*2. anima, cap. 7*), color is that which actually moves the diaphanous; and in (*1. de sensu et sensato, cap. 4*), color is the boundary of the transparent in a bounded body. More plainly: color is a secondary quality arising from the mixture and tempering of the primary qualities. Color is moreover divided into true and apparent — of which I made mention in (*1. Meteor.*) when discussing the rainbow. Furthermore, some colors are extreme, such as white and black; others are intermediate, such as green, red, and so forth.

Assertion: Illumination is required in order to elicit vision, on the part of both object and medium. The assertion is two-membered, upheld by the Doctor in the places cited above and in the Report there. The first part is proved, first, from Aristotle (*2. anima, cap. 7. 7.73*), who affirms that color is the boundary of the transparent and that an object suffused with light is seen — so that in the Peripatetic school illumination is required for seeing a colored object. Second, it is confirmed by experience: in the dark of night, if some object is illuminated with light we see it, but what lacks light we in no way see, as the Doctor explains (*2. d. 7. quast. vn. §. De secundo ante 1*). Furthermore, if the eye is illuminated but the object lacks light, the object is not seen — so the object, in order to be seen, must be bathed in light. Moreover, if an object is drenched in greater light it is seen more clearly, and if illuminated with lesser light it is seen less distinctly, as is evident; therefore illumination is necessary for perceiving an object.

The second part is shown, first, from the same Aristotle (*cit. T. 67*), who concludes that nothing is visible without light, and that every color is visible through light. And in the third book of the same work (*T. 18*): "Light makes colors that exist in potency to be colors in act." I reply therefore that the reason why a sensible placed upon a sense does not produce sensation is that for sensation — above all for sight — a medium is required, as is clear from what has been said; and sight cannot reach its object unless the medium is illuminated in some way.

Therefore illumination is also required on account of the medium. Moreover, for the object to be perceived by sight, a species that is impressed upon it is necessary; but a species of the visible thing cannot be impressed in the eye except through the medium — for the species must necessarily be transmitted through the medium to the eye. Therefore illumination is in every case necessary on the part of the medium.

First Objection: Color is per se visible (*2. anima T. 66*); therefore no illumination is required to see it. I reply that color is by its own nature visible in potency, but actually visible through light, on the authority of Aristotle (*3. anima, T. 18*).

Second Objection: For hearing, smelling, touching, and tasting, illumination is not required; therefore neither is it required for seeing an object. I grant the

antecedent and deny the consequent. The reason can be offered that sight is the most excellent of the external senses, and therefore requires more conditions — just as more is necessary for the formation, education, and perfection of a human being than for the production and preservation of other animals.

Third Objection: Experience shows that those who are in darkness can see an object suffused with light at a distance from them, even though there is no illumination in the medium or in their eyes. Moreover, if illumination were required in the medium, the dimmer and more imperfect it were in the medium, the less and more imperfectly the object would be seen; but this does not happen, so long as the illumination in the existing object does not fail or diminish — therefore illumination is not necessary on the part of the medium. I reply that there is indeed some illumination in the medium, which we do not see because of its minuteness — just as atoms, when the sun shines in our hemisphere, are not seen by us because of their smallness. That such illumination necessarily exists in the medium and reaches the organ of sight is plain from what has been said: vision requires a medium and the species of the object; otherwise the sensible placed upon the sense would produce sensation. Furthermore, an agent acts only within the sphere of its activity, and if the visible object, even suffused with light, is too distant from the eye, it is not seen, because that illumination cannot reach the eye itself. The sea likewise surges when stirred by wind only as long as the wind lasts and only to the limit the wind moves it, and no further — a sign that the power of the wind is not diffused and extended to other parts of the sea. The same is plain when a stone is thrown into water, which surges in proportion to the force impressed upon it by the thrower. As for what is further alleged, I say that the little is reckoned as nothing, and because the illumination of the medium is faint it is not seen to contribute to the increase of the vision of the object; and because the sight is not then distracted by objects in the medium, it turns with all its effort toward that extreme luminous object, and its power thus united is stronger and produces a more perfect vision. Therefore illumination is always required in the medium and in the organ for seeing, since sight above all demands this — given what has been said most especially about the sensible placed upon the sense not producing sensation.

Article IV. What the object of sight is.

Some writers, whose names Mayr (2. d.13. 9. 2) withholds, think that light is the total and adequate object of sight. Others, whom Arriaga (*disp.5. de anima, sect. 3. subsect. 2*) follows, think it is color. Still others, among whom are Scotus (2. *Report.d. 13. 9. vn*) and his disciples, assert that the adequate object of sight is something common, abstracting from and prescinding both from light and from color.

Note I, that illumination, lux, and color are absolute entities, or qualities really distinct from one another, inhering in subjects that are not distinct. Lux is the

quality really inhering in the luminous body, by which a body is formally denominated luminous. Lumen is the quality whose subject is the luminous medium, extending to the extension of the medium itself, which through it is formally called luminous. Color, however, is a secondary quality consequent upon the mixture of a colored body, caused by the varied and diverse commingling of the primary qualities, really inhering in a bounded body, by which that body is formally called colored. Note further that illumination can be seen without color, and lux without lumen — but not the reverse. Scotus adds (*1. d. 3. quast. 6. §. contrà istam opinionem ante C*) that color in some way contains lux, because lux is in a bounded body, and therefore in one and another illumination causes different representative species — one in greater illumination and another in lesser.

Note II, from the same Doctor (*1. d. 3. quast. 3. §. Ad rationes in oppositum. E* and *Quol. 8. §. Ad ista. H*), that the essential and formal character to which a sense such as sight relates as its objective form is not relative but absolute, as Aristotle suggests (*2. anima, T.66*). Therefore the visible, being relative to the visual power, is not formally and primarily of itself the object of sight, but of itself secondarily — just as the mobile is not the formal and adequate object of all of natural philosophy, because it is not the essential and quidditative form of natural body but rather its primary property and affection. A circumlocution can be made by taking the property for its root and essential form, as Aristotle himself does in (*5. Met. c. de quanto*), defining quantity through divisibility, which is a property of quantity itself; and in (*2. degener. 7*) he says that the forms of the elements are the primary qualities, which, being accidents, cannot be the constitutive forms of the elements, which are substances.

Assertion: Neither illumination nor color is the primary and adequate object of sight, but something more common and abstract, embracing both — which is unnamed, but may be called the visible, in the way I was explaining in the second notation. The conclusion is three-part, defended by the Doctor in the places cited above and in Collations XI, XII, and XX. The first part is proved: illumination does not contain everything that falls under the visual power; therefore illumination is not well established as the total object of sight. The antecedent is at hand, since color is visible, yet is not illumination. The second part is shown in nearly the same way: sight is directed toward many things that are not colors nor colored, namely the celestial bodies; therefore, since color does not encompass all that sight attains, it is rightly deduced that color is not its primary and adequate object. The third part is gathered from the two prior ones and is strengthened by them: since the total and adequate object of sight is neither illumination nor color, it is soundly inferred to be something more universal than these, abstracting from them both and prescinding from them, which may be named the visible — comprehending and being commensurate with everything that falls under the visual power and is regarded by it.

Objection: Aristotle (*2. anima, T.63*) plainly establishes that the object of sight is color and that of hearing is sound; therefore the contrary opinion opposes the Peripatetic school. The same seems to be the mind of Scotus (*1. d. 3. quast. 3. §. contra istud. B and E and before §. sed restat*). The reason can be offered from the same Doctor (*ibid. quast. 6. antè C*): color contains lux, since it is in a bounded body; but containment is required for the object of any power or habit, as I have shown at length elsewhere; therefore color is the object of sight. I reply that Aristotle must be understood as speaking of the partial, not the total, object. For in that place he means that illumination pertains to the visual power, even though it is not color but a quality distinct from color, as I explained in the first notation. Scotus must be understood in the same way. Furthermore, that containment of color is not virtual, potential, or formal — the kind required for the object of a power or habit — of which Scotus speaks in the Prologue (*9. 3*).

Article V. Whether sight is the most excellent of the external senses.

That sight excels the other external senses is affirmed by Aristotle (*1. Met. cap. 1*) and confirmed there by Scotus in his exposition of that passage and (*4. d. 1. quast. 2. N*); Bercharius (*4. parte, l. 1. cap. 7*) and the other authors assent. The reason is that sight is the most capable of cognition, the most discerning, and the herald of love, and it seems to be immaterial since it is immuted by intentional immutation and receives intentional species. This same point is suggested by Augustine (*1. 4. contra Iulianum cap. 14*), saying that the last three senses — smell, taste, and touch — are more corporeal and in a certain way more coarse. The same holy Doctor notes that sight is taken in the sense of a general sense (*1. 2. qq. supra Exod. quast. 72*) on the basis of Exodus XX: "The people saw the voice," and in Genesis XXIV: "When Jacob saw that there was food in Egypt," though he was absent from Egypt. One may add that sight perceives at the greatest distance, and that its object is wider and more excellent, since it extends to both sublunar and celestial things. Hence its deprivation causes the greatest sadness and grief — to which perhaps Tobias was referring when he said (*5*): "What joy is there for me, since I do not see the light?"

You will say: Aristotle (*lib. de sensu, sensato, in fine, cap. 1*) writes: "The blind from birth who have hearing are wiser than the deaf from birth who have sight." I say that sight serves more for science through discovery, while hearing serves more for acquiring science through teaching.

You will say again: Pope Leo in his Easter sermon prefers touch to sight with respect to the certainty of cognition. I say this must be interpreted not absolutely, but with respect to a certainty to be experienced more fully through both sight and touch than through sight alone.

You will press: touch demonstrates more differences than sight. For touch is directed toward contraries, while sight is perceptive of only one contrary, namely white and black (*2. anima, T.107*). I say that there are more visibles than

tangibles. And a tangible quality is also visible, but not the reverse; and so sight perceives more than hearing.

You will urge: that sense is nobler which we love more and whose opposite we hate more (*lib. 2. priorum, cap.21*); but we hate the opposite of touch more, because the opposite of touch destroys the animal, whereas the opposite of sight does not. I say that this rule fails by an instantiation on its own terms. For it is better to live well than simply to live, yet we hate the opposite of living more than the opposite of living well, because the opposite of living destroys both living and living well. Hence Aristotle (*7. Top. cap.2*) limits that rule thus: "unless when one includes the other." For the rule does not hold when what is more to be chosen includes what is less to be chosen — as living well includes living. Likewise, sight includes touch, and the opposite of touch destroys both touch and sight.

Article VI. Whether vision is accomplished by the reception of a species in the eye from the object.

The opinion of Empedocles, of Plato (*in opificio Dei, cap.8*), and of other Academics once prevailed, holding that vision is accomplished by extramission — that is, by a certain light and brilliance emitted from the eyes toward the visible object. The contrary view is taught by Aristotle (*2. anima, T.74* and *lib. de sensu et sensili, cap.2* and *1. Top. cap.12. 14*), the Scotists, the Thomists, and the other Peripatetics, who affirm that vision is accomplished by intussusception — that is, by the species of the visible object received in the visual power, concurring partially together with the visual power toward producing vision.

Note that there are four kinds of visible objects: some are diaphanous and devoid of light, such as water; some participate in a certain amount of light but have something opaque, such as the glow-worm, which shines on one side but not at all on the other; others enjoy a firm light that is diffused to illuminate other things, such as luminous bodies; and the remaining kind possesses a faint light which is in some way diffused to illuminate other things, such as illuminated and irradiated bodies.

Assertion: Vision is accomplished by the reception of an impressed species in the eye, which is the partial principle for producing vision itself. This is deduced from Scotus (*1. dist.3. quast.4. §. De tertiis cognoscibilibus sub G*). It is proved, first: sensible species required for the production of sensation are given, as I proved in question IV of this book, article I; but vision is a sensation; therefore, for vision to be produced, the sensible species of the visible object must necessarily be received in the eye. This is corroborated by the fact that in a mirror, behind the person looking, an object is seen; but this kind of vision is not accomplished by extramission of the visual power, since sight emits nothing there, as is evident — therefore vision is accomplished by intussusception and not by extramission. Second, it is improbable and incredible that so great a light and

brilliance should issue from small eyes as to illuminate the most distant heavens and the other objects that fall under sight; but if vision were accomplished by extramission, so great a light would need to issue from the eyes to illuminate those objects — which appears not only improbable but impossible. Third, the light of the sun, though great, cannot be reflected except to the first region of the air; therefore the light of the eye cannot be reflected to the heavens, since it is far smaller, weaker, and feebler. It is impossible for a small light from the earth to reach the heavens, given the great and immense distance. Add that, although some eyes emit some light — such as the eyes of cats and wolves — other eyes, namely human ones, are entirely devoid of light. Vision, therefore, is not accomplished by light emitted from the eyes toward visible objects.

First Objection: Aristotle (*3. Meteor. cap.3*) seems to allow that sight emits light toward the visible object, through which vision is accomplished; therefore Aristotle does not dissent from the doctrine of Plato. Confirmation I: in the same place he mentions Antipheron, who claimed always to carry before him and see his own image and figure, and even by day and night to perceive many phantasms, which he could not have seen except by extramission. Confirmation II: from (*5. degener. animalium, c.2*): small and sunken eyes see better and more sharply than large and wide ones, and indeed with the eyelids contracted the eyes themselves see objects more clearly and distinctly; therefore vision is accomplished by extramission. I reply that Aristotle there speaks not in his own view but in the opinion of Plato. For in the places cited at the beginning of this article, treating this difficulty systematically, he rejects that position of Plato and establishes his own view, supporting it with proofs — especially in (*lib. de memoria et reminiscencia, cap.2*). To confirmation I, I say that the man saw those objects not with his own eyes but with a disordered imagination, as the same Aristotle expressly states in the passage just cited. Thus the frenzied, with their troubled senses, speak both of those present and those absent whose images they carry in their phantasy. To confirmation II, I say that in that case the sensible species and the visual power are united, and because united power is stronger, therefore sunken eyes see better and more distinctly than wide and large ones. The same must be said of contracted eyelids.

Second Objection: Augustine (*6. de Musica*) in express terms teaches that vision is accomplished by a brilliance issuing from the eyes toward visible objects. Confirmation: the eyes of those who cast the evil eye transmit something harmful into those upon whom they gaze. Hence Paul (*Galat. 3*) adds: "O foolish Galatians, who has bewitched you?" Therefore, as the evil eye is cast by the emission of a harmful quality, vision likewise is accomplished by emission. I reply that Augustine belonged to the Platonic sect and favored it greatly; therefore on this and certain other matters he should not be followed. The same holy Doctor recounts a remarkable occurrence in (*lib. de cura pro mortuis gerenda, cap. 12*), telling of a man named Curma from the township of Tullia near Hippo, who, while ill, lost his senses and lay nearly dead for several days; upon reviving,

he testified that he had seen many things, and first opening his eyes, he said: "Let someone go to the house of Curma the blacksmith and see what has happened there." When they went there, the blacksmith was found dead, just as he had foretold. This happened either by chance, or by report, or by revelation. Consult Richard (*quol.3. quast. 12*). As for the other point, we are speaking of what helps for seeing, not of what harms it.

Third Objection: A near object is seen better than a distant one, as experience shows; but if vision were accomplished by reception of a species, a distant object would be seen just as clearly and distinctly as a near one, because the species represents the near object and the distant object to the sight in the same way. I reply that a natural agent acts more quickly and more powerfully on what is near than on what is far, as is plain from fire, which heats nearby things more quickly than remote ones. Therefore, following the form of the argument, granting the major, I deny the minor: for the species, being a natural agent, represents and acts upon what is near more perfectly and distinctly than upon what is far, as is plain from a mirror, which represents nearby things more clearly than distant ones.

Fourth Objection: We observe that from our eyes in the dark there shines some splendor; indeed the eyes seem to be fiery; therefore vision is accomplished by extramission. I reply that this happens because the eyes are small polished and smooth bodies, participating in the crystalline humor. It must not, however, be denied that certain animals, such as cats, see by this kind of brilliance at night; yet this is not true absolutely, nor do the eyes participate in the nature of fire, for otherwise the heat of fire itself would dissolve their temper.

Article VII. In which part of the eye vision is accomplished.

Philosophers dispute vigorously about in which part of the eye vision is accomplished. Some think that vision is accomplished in the reticular tunic, others in the arachnoid, some in the vitreous humor, others at the junction of the optic nerves; but most commonly it is held to be in the crystalline humor, or the pupil of the eye.

Note I, that the eye is constructed from five tunics, three humors, and seven muscles. The first tunic or membrane is called the specular, so named because it is pellucid and shining, like a mirror. The second is the reticular or retina, which is composed of many veins and arteries in the manner of a net — hence it is called retina and reticularis. The third is the uvea, because it has the likeness of the flowers of the grape. The fourth is the cornea, because it bears the image of a horny plate — it is lucid and glassy. The fifth is the albugineous, because it acquires a white color. The first humor is the crystalline, because it is lucid like crystal. The second is the vitreous, because it is similar to glass. The third is the aqueous or albugineous, because it has the likeness of water and of the white of an egg. The crystalline humor is placed in the middle, surrounded by the

specular tunic; then follows the vitreous humor, encompassed by the reticular tunic; then comes the aqueous humor, encircled by the remaining tunics. There are then seven muscles in the structure of the eye, by which the eye itself is held in place and strengthened. Moreover, in the eye is noted a round figure, suited for seeing from every part and in every direction, wherever and whatever the visible object may be.

Note II, that two nerves, called optic or visual, derive from the brain, as Augustine touches on (*7. de gen. ad lit. cup. 17*). These nerves maintain the following order: departing from the brain and lying apart from one another, they afterwards unite, and before reaching the eyes, separate from one another again. Through these nerves animal spirits are transmitted from the brain to the eyes so as to assist vision, and through these same nerves the species are conveyed from the external senses to the internal senses; and therefore they contribute greatly to seeing.

First Assertion: Vision is not accomplished at the conjunction of the optic nerves. This is deduced from Scotus (*1. d. 3. quest. 4. §. De tertiis sub G* and *4. d. 10. quest. 9. antè §. Hic dicitur*). It is proved, first, from anatomical observation: the aforementioned nerves sometimes do not unite together, as Vesalius testifies (*1.4. de fabrica corporis humani, cap.4*); and yet vision is not impaired, but takes place as it would if such nerves were united — therefore vision is not accomplished at the conjunction of those nerves. Second, when one eye is closed while the other remains open, vision becomes sharper, because, as Aristotle notes (*sect. 1. problem, quast.4*), the visual power is united into one and thereby vision is rendered more perfect — which would not occur if vision were accomplished through the union of those nerves.

Second Assertion: Vision is caused in the eye, and in that part called the pupil or crystalline humor. Scotus does not depart from this (*ubisupra*). It is shown, first, from Aristotle (*1. de historia animalium, cap 9* and *1.4. of the same work, cap.8* and *5. de gener. animalium cap. 1*), who affirms that vision is accomplished in the aforementioned crystalline humor. Second, so marvelous a construction of the eye is arranged and ordered for constituting and preserving sight; therefore vision is accomplished in that part of the eye which is most apt and fitted for seeing, which is the crystalline humor or pupil. Hence the pupil is greatly commended in sacred Scripture, for example in Psalm XVI: "Keep me as the apple of your eye," and Zechariah II: "He that toucheth you toucheth the apple of my eye," and Lamentations II: "Let not the apple of your eye cease." Therefore vision is generated in the pupil or crystalline humor, since this part is in the middle of the eye itself — bright, clear, and diaphanous — and most suited for seeing.

First Objection: The visual power is only one in each animal; but the eyes are two; therefore vision is produced only at the conjunction of the optic nerves — and this consequent is deduced because if such nerves are severed, sight is

weakened or entirely lost. I reply that the visual power is one, distributed into two eyes, just as a tree is divided into two branches. Nature in her providence created two eyes in one animal so that it can see from both sides; and if one is injured, the other sound and intact exercises vision. As for what is additionally alleged, I say that those nerves are indeed necessary for seeing — just as the specular tunic, the muscles, and the other things enumerated above — yet from this it does not follow that vision is generated at their conjunction.

Second Objection: In that which is devoid of life, vision or any other vital operation is not accomplished; but the crystalline humor lacks life; therefore vision is not caused in it. I grant the major. I deny the minor. For this is true of the fluid humor, but not of the quasi-congealed humor, such as the crystalline humor is.

Third Objection: What is colored cannot be apt and fitted for vision to occur in it, for otherwise vision would be false — since everything would appear to us to be of the same color as that in which vision occurred, just as one who looks through red glass sees everything as red; but the crystalline humor is colored; therefore vision cannot occur in it. I grant the major. I deny the minor. For although the crystalline humor is pellucid and bright, it is not colored — because light, brightness, and splendor are not colors, as is established from what has been said above.

Article VIII. Whether in a mirror the object is seen, or its image.

Assertion: In a mirror the object is seen, not its image. So hold Scotus (2. d. 13. *quest. vn. E* and 4. d.10. *quast.9. sub D*), Mayr (*quest. 15. 19. prologi*), Toledo (2. *de anima, cap. 27. quast.34*), Ruvo (*Tract. de sensu visus, quast.ult*), Antonius Andreas (*supra sex principia, cap.6*) in part, and many others — against Thomas (*quast.8.de veritate, art.5*), Capreolus, and the other Thomists, who affirm that in a mirror both are seen, namely the object and its image. It is proved, first: in a mirror is seen that which falls under the object of sight, because a power does not extend beyond its object; but the species of an object is not contained under the object of sight, since its object is illumination and color, as was said in article IV of this question; therefore it is not the species of the object but the object itself that is seen in the mirror. Second, what is discerned in a mirror is discerned by reflected vision, since it is reflected from the opaque surface of the mirror, as everyone notes, especially the writers on optics; but it is the object itself, not its species, that is reflected; therefore the object is seen in the mirror. Furthermore, an image is diffused through the whole mirror; but what is seen is not seen in the whole mirror, as is evident to the observer; therefore the object itself is seen in the mirror.

First Objection: If the object were seen in the mirror, it would plainly be seen in its proper place, position, and magnitude — but experience testifies to the contrary; therefore in a mirror the object is not seen but its image. Mayr in the

passage cited responds that one who sees himself in a mirror directly looks upon himself through a reflected act, although the external sense judges that the species is there, because it is accustomed to seeing things along a straight and not a reflected line.

Second Objection: In a flat mirror placed horizontally, the upper part of the thing seen appears above and the lower below. And in a broken mirror, simple things are seen as double, and in certain mirrors one object is seen as multiple; therefore in a mirror the image of the object is seen. One may say that this diversity, duplicity, and multiplicity arises from the position or structure of the mirrors, and also from the manner in which the image by which the thing is viewed returns. More may be found in the writers on optics.

You will ask whether the sight of a man and that of an eagle differ in species. I reply in the negative, with Scotus (*2.d.1. quest.6. §. potentiam addi licet. D*): for just as the intellect of a man and an angel are of the same species because they share the same object, even though their natures differ in species, so the sight of man and eagle acquire the same species, even though their natures are distinguished in species.

Question VI. On Hearing

Article I. Whether sound is the object of hearing.

Assertion: Sound is the total and adequate object of hearing. This is taught by Aristotle (*2. anima, 77*) and Scotus (*1. d. 3. quast. 3. ante §. sed restat E*). It is shown, first: that about which a power is primarily and per se concerned is its primary and adequate object, as I have made plain elsewhere from the first of the Posterior Analytics; but hearing is primarily and per se concerned with sound. For hearing is defined as the external sensitive power that perceives sound alone. Therefore sound is the total and adequate object of hearing. Second, the visible, in the way I explained in the preceding question, article IV, is the adequate object of sight. Therefore the audible likewise is established as the adequate object of hearing — and this is sound.

First Objection: What is a common sensible is not the object of hearing, since the external senses, of which hearing is one, have proper sensibles; but sound seems to be counted among the common sensibles, as Aristotle signals (*2. anima, 85*) when he says that sound is a motion — and motion is placed among the common sensibles; therefore sound is not the object of hearing. I grant the major. I deny the minor. In proof of the minor, I say that Aristotle must be interpreted causally, not formally — as will be evident in the following article.

Second Objection: What is not perceived by hearing is not its object; but sound is not perceived by hearing; therefore it is not its object. The major is plain, since a cognitive power is perceptive of its object. The minor is shown: either the numerically same sound would be perceived by many, or a different and

numerically distinct sound by each. Not the first, because the numerically same accident, such as sound is, does not migrate from subject to subject, nor does it inhere in different subjects. Nor the second, because it is the numerically same sound that is perceived by many. I grant the major. I deny the minor. In proof of the minor I say that it is the numerically same sound that is perceived and attained by many, through distinct species received in them. For just as the same object is seen by many through distinct sensible species, so the same sound is heard by many through distinct species received in their ears.

You will ask what place hearing holds among the external senses. I say it holds second place. For after sight, hearing follows. Since it is the organ of learning, on the authority of Aristotle (*l. de sensu et sensili*), it is valuable for leading the civil life. And "faith is by hearing" (*Rom. 10*) — so that if sight is nobler, hearing seems to be more useful.

Article II. Whether sound is a motion or a quality distinct from it.

The common view of philosophers holds that sound is not a motion but a quality distinct from it and consequent upon motion. For easier understanding and explanation of this:

Note that some bodies are sonorous — such as hard bodies, for example brass — while others are silent and produce no sound, such as soft bodies, for example wool. Three bodies moreover are required for producing sound: the striker, the struck, and the intercepting medium. Furthermore, four conditions are necessary for sound to be produced: the first is that the striker and the struck be hard bodies, for lack of which butter and honey produce no sound, being soft. The second is that they be smooth and flat. The third is that they be concave. The fourth is that the motion of the striker and the struck occur quickly, for if it is accomplished slowly no sound is produced.

Assertion: Sound is not the motion of rebounding air, nor what is sensed through the ear, but a sensible quality arising from the collision of two bodies, or from their division, received in a body suited for receiving it. The assertion is three-membered, in agreement with Scotus, defended by the Scotists (*2. de anima, cap. de auditu*), expressly by Cavallius (*disp. 2. sect. 10*). The first part is proved, first: motion is a common sensible, from what was asserted elsewhere; but sound is a proper sensible, since it is perceived by hearing alone; therefore sound is not a motion. Second, the properties of sound differ from the properties of motion. For sound is grave or acute; motion is not — it is fast or slow. Furthermore, motion belongs to no category, being counted among the post-predicaments; but sound resides in the category of quality. Again, motion is formally a relation, from what was said in (*1. de motu*); but sound is a quality, which is an absolute entity. Finally, sound is caused by motion (*2. anima, T.78*); therefore sound is not a motion. The second part argues against Poncius (*disp. 60. quest. 2. conclusione 2*) and is proved: if the ear is afflicted and pricked with

pain, it is felt by the ear itself, yet pain or the like is not sound. Likewise motion, crash, and things of that kind are sensed through the ear, yet motion is not sound according to Poncius there — and conversely. The third part is shown: that by which something is denominated as having a quality is a quality, as is plain from the description of quality; but through sound something is denominated as having a quality — for a bell that sounds well is called good; therefore sound is a quality. Again, vision is a sensible quality; therefore so is sound, or the act of sounding. The antecedent is known from what has been said and will be more fully evident in the next book when we treat of intellection and the mental word. The consequence holds because the reasoning is the same for both, just as it also is for smelling, tasting, and touching. The remaining particulars of the definition of sound given above are sufficiently clear and evident from the stated notation.

First Objection: Aristotle (*2. anima, T.85*) defines sound with these words: "Sound is a stroke and motion of rebounding air"; therefore according to the Philosopher, sound is a motion. I reply that this must be interpreted causally and not formally — meaning that motion is the cause of sound, just as it is the cause of heat. For from the motion of two bodies colliding with one another, sound is produced. That this is the mind of Aristotle is clear from another passage, where he says that odor is an evaporation, even though evaporation is not formally odor but its cause.

Second Objection: Sound does not denominate the subject in which it exists; therefore sound is not a quality. The consequent is plain: through quality the subject is denominated as qualified, from (*lib. predicam. cap. de qualitate*). The antecedent is at hand: the air in which sound inheres is not denominated as qualified through it. If the antecedent be granted, the consequent is denied. The reason is that intentionals do not denominate the subjects in which they inhere; and since the species of sound is conveyed through the air as a medium, it follows that it does not denominate the air. Moreover, I noted in the preceding question, article II, that there are quite a few accidents that do not denominate the subjects in which they exist.

You will ask I, what is required for hearing? I reply: a striker, a struck body, a medium, and a species that is conveyed through the medium to hearing.

You will ask II, whether hearing takes place as quickly as sight? I reply in the negative. The reason is that sight is not only nobler than hearing but also swifter in acting. Hence I observed in (*1. Meteor.*) that in thunder we perceive the light or lightning before we hear its crash.

You will ask III, what media are suited and fitted for producing sound? I reply: air and water. And indeed air is the more principal and fitting medium; and thus in air an integral and perfect sound is heard, but not in water on account of its density. That sound is heard in water is attested by Aristotle (*1.4. de historia*

animalium, c.8), saying that fishermen do not speak while fishing lest they be heard by the fish, which, if they perceive the sound of words, immediately flee. The same Pliny writes (1.9. *hist. cap.* 2), affirming that fish breathe, sleep, and hear — and therefore flee from the oars of triremes.

You will press: Aristotle (2. *anima*, *cap.* S.T.81) says that water is not receptive of sound; therefore air is the only subject and medium of sound. I say that Aristotle must be interpreted as speaking of the principal medium and subject, which water is not but air is. Hence in air sound is heard clear and distinct; not so in water, where sound is heard indistinctly and imperfectly. That this is how Aristotle must be interpreted is evident from the same text (*ibid.* T.79), where he plainly teaches that sound is heard in both air and water.

You will ask IV, whether bees lack hearing? Aristotle (1. *Met.* 1) replies in the affirmative; and yet when a sound is made the bees themselves return to the hive. Scotus responds in his exposition of the text that this happens not because they truly hear the sound, but because the air moves them. It seems plausible that they lack perfect hearing; yet they are not entirely devoid of imperfect hearing, as experience seems to show.

Article III. On Echo.

For the origin and nature of Echo to be well and fully grasped, two notations must be placed before us.

Note I, that sound is twofold: direct and reflected. A direct sound is one that travels directly to hearing with no obstacle interposed. A reflected sound is one that, upon encountering an intervening body that resists it, rebounds — and thus Echo is produced, or the reflected voice, when the direct sound rebounds from a cavernous and hollow body back to the place from which it came. Moreover, owing to the diverse and many windings, the voice is reflected many times — and thus, as Pliny testifies (1.36. *hist. nat. cap.*15), at Olympia in the portico, one voice was returned the same seven times.

Note II, that there are two passages in an animal proceeding to the inner parts: one is straight, through which food is transmitted to the stomach, and is called the gullet. The other is oblique, winding, and circular, through which respiration takes place, and it is very narrow. Hence if anything enters it, the animal coughs and never rests until it exits. Therefore, when phlegms descend from the brain and enter this passage, the animal dies of the disease called apoplexy. Through this passage one reaches the lungs, which are like bellows of the heart, through which warm air is emitted and cold air is drawn in. When air is expelled by some force through this passage — commonly called the rough artery — voice is formed, with the assistance of the other natural instruments necessary for forming it: namely the uvula, palate, tongue, teeth, lips, and the like. Hence Aristotle (2. *anima*, *in fine cap.* 8) defines voice with these words: "Voice is a stroke

of air drawn in through respiration, with the imagination of signifying something." Augustine suggests the same in his exposition of Psalm III.

First Assertion: Echo is a reflected voice, which, upon meeting a cavernous body that resists it, returns to the one who uttered it. This is not opposed to Scotus, and is defended by the Scotists in the place just cited, who prove it there by the likeness offered by the Philosopher: as a ball rebounds from a wall toward the one who threw it, so Echo strikes a winding and cavernous body and resiles toward the one who uttered that voice — but the stroke of a ball rebounding from a wall is reflected; therefore Echo returning from some cave to the one who uttered it is a reflected voice. It is further shown from the Doctor (2. d. 13. 9. vn. §. *Quantum ad 3. D*): an agent unable to act further along a straight line acts along a reflected line, as is seen in the sun acting through light when an opaque body is set against it. Therefore, if someone emits a voice that does not travel further directly on account of an opaque, cavernous body, it follows that the same voice returns to the one who uttered it — by which means Echo is produced, as is evident from experience in valleys and cavernous places. Hence Ovid sings: "She repeats the sounds, sends back the words heard. Before, she says: I shall die ere you have power over me — she returned nothing but: you have power over me." And: "He waits for sounds to which she may send back his words."

Second Assertion: Hearing is accomplished in that part of the ear called the innate air. The Doctor does not dissent from this, and it is defended by his followers in the place cited above. It is proved, first, from Aristotle, both here (7.83) and in (2. *de partibus animalium*, cap. 10), where he expressly sets forth these words: "We admit that the sensory organ of hearing is air." Second, from Galen (1. 8. *de usu partium*, cap. 6.14): hearing is accomplished in the part which is most apt and fitted for hearing; but that subtle substance called the innate air is more suited for hearing to occur in it, because the more spiritual and noble a part is, the nobler and more excellent is its operation — and the said part is such; therefore hearing is accomplished in it, of which Ovid wonderfully sings (3. *Met.*): "She lies hidden, is seen in no light. She is heard by all — sound is it that lives in her."

Objection: What is inanimate cannot produce a vital operation; but air is inanimate; therefore in that part called air, hearing — which is a vital operation — is not accomplished. I grant the major. I distinguish the minor: of air properly so called, I grant it; of air improperly taken and by analogy, I deny it — such as the air of which we are speaking here.

You will ask I, what is required for hearing to be accomplished? I reply: beyond the cartilaginous parts that appear externally, and the other windings like a cochlea, and moreover the two nerves proceeding from the brain to the organ of hearing, there are three small bones, one of which is in the manner of a hammer, another in the manner of an anvil, and the third like a stirrup.

You will ask II, why all who are deaf from birth are also mute. I reply that the reason is that through defect of hearing they are unable to learn any language.

Question VII. On Smell

The object of smell is odor, just as from what was said in the preceding question, article II, the object of hearing is sound. Smell is described as the external sense that perceives odor alone, which among the said external senses occupies the third place — as the Peripatetics affirm with Aristotle (*2. anima, c.9.T.92*).

Article: Whether odor is a substance or a quality.

Heraclitus, as Aristotle testifies (*lib. de sensu et sensili, c.*), and Plato in the Timaeus suspect that odor is a certain smoky substance. Aristotle, however, in the place just cited, Alexander in the same place, and all the Peripatetics teach that odor is a secondary quality arising from the tempering of the primary qualities with the dry predominating, which through the action of heat immutes the olfactory power.

Assertion: Odor is not a smoky substance but the prescribed quality. Scotus and his disciples do not seem to depart from this (*2. anima, c.9.7.92*). It is proved, first: the object of each of the external senses is an accident, as is plain by induction; but odor is the object of smell, as the common opinion of philosophers affirms; therefore odor is not a smoky substance. Second, the object of an external sense is a proper sensible, which is per se sensible; but what is per se sensible is an accident, from what has been said elsewhere; therefore since odor is a per se sensible entity, it follows that it is an accident — namely the quality described above.

First Objection: What nourishes an animal is a substance, since nutrition is a generation and a substantial action; but odor nourishes an animal — for Pliny reports (*1.7. hist.nat.c.2*) that in the Indies certain peoples live on odor alone. Aristotle is also cited as saying that a certain man lives on air and sun. And Olympiodorus adds that a man can lead a life on odor and air. I grant the major. I distinguish the minor: of odor taken precisely alone, I deny it; of odor together with substance conjoined, I grant it. And if Pliny and the others named think otherwise, they are not to be believed.

Second Objection: The same Aristotle (*sect. 12. problem. question.5*) asserts that odor is an exhalation; but an exhalation is a vaporous substance; therefore odor is a smoky substance. I reply that either the Philosopher must be interpreted according to the distinction we have just offered, or he did not speak formally but subjectively — meaning that odor is inhered in the exhalation, which is a smoky substance.

You will say: the odor of an apple that is spread around and diminished by handling is either a smoky substance, or, if it is an accident, it passes from

subject to subject, which cannot happen. I say that the odor does not separate from the apple, but rather that the finer and more subtle parts of the substance evaporate — in which parts the odor is carried.

You will ask I, what are the media through which odor is conveyed? I reply: chiefly air, as we experience with the odor of flowers, which is wafted to us through the air. Then water, as is plain from fish, which smell their food before eating it.

You will ask II, from what are odors produced? I reply: from odorous bodies, through the mixture of the primary qualities with the dry predominating. Hence in spring and summer, because dryness prevails, odors are most strongly exhaled; conversely, in winter there are no odors, on account of excessive moisture. But if an odor is produced in damp places, it is fetid and harmful, and sometimes so noxious to an animal as to kill it.

You will ask III, in what part does smelling occur? I reply: in the mamillary caruncles or tubercles, because these parts are most suited for smelling to be accomplished in them — whatever Galen may object, who thinks it occurs in the anterior part of the brain.

You will ask IV, whether odor acts according to real being or according to intentional being? I reply: sometimes it acts according to real being, as is plain when the odor of incense reaches the nose; but sometimes according to intentional being — hence we smell the odors of flowers at a great distance. And Pliny (*lib. 10. hist. capite 6*) tells that vultures and crows smell the stench of dead bodies from many miles and therefore proceed to them. Thomas and Jerome testify the same.

You will ask V, whether the sense of smell is more perfect in man than in brute animals? Aristotle responds (*2. anima, cap.9* and *lib. de sensu, sensato, cap.4*) that the sense of smell in man is duller and less perfect than in other animals. This is confirmed by experience. Dogs sense and know the tracks of hares, partridges, and other animals through smell, and also seek their own masters even when absent by the sense of smell. But man cannot perceive and sense these and similar things. The reason is that his olfactory faculty resides near the brain, which is the coldest and most moist of organs. Cold and moisture depress the sense of smell; and since man is an animal with a large brain, he must participate in a less perfect sense of smell.

Question VIII. On Taste

Article I. What taste is, and how many kinds of flavor there are.

Taste is described as the external sense that perceives flavor alone. Its adequate object is indeed flavor, just as the total object of smell is established to be odor. Flavor, moreover, is defined as a secondary quality arising from the tempering

of the primary qualities and the mixing of dry earth together with moisture, with heat cooking them together. Three things, moreover, are required for flavor: the first is terrestrial dryness, as experience shows; the second is aqueous moisture — for what is mixed with aqueous moisture is rendered savory; the third is heat, through whose mediation the terrestrial is cooked together with the moist. Eight species of flavor are enumerated by Aristotle (*lib. de sensu et sensili, cap.5*): namely sweet, bitter, oily, salty, pungent or sharp, astringent, sour, and acidic. Sweet is found in honey and figs; bitter in opium and wormwood; oily in milk and butter; salty in salt and seawater; sharp in lemons; astringent in sorb-apples; sour in oil; and acidic in vinegar. It is disputed between Aristotle and Galen, however, which of the aforesaid are the extreme flavors. Aristotle writes that they are sweet and bitter; Galen asserts that they are sharp and acidic. This controversy can be resolved and reconciled in the following way and distinction: if the flavors are considered with respect to taste and according to their own nature, Aristotle rightly says that sweet and bitter are the extreme flavors. But if they are considered with respect to the tempering of bodies, Galen speaks well when he says that sharp and acidic are the extreme flavors, as may be seen in (*lib. 4. de simplicium medicamentorum facultate, cap.10*).

First Objection: Ashes are bitter, yet there is no moisture in them; therefore flavor is not aptly defined as a quality arising from the mixing of moisture with dry earth. I reply that ashes are more insipid than savory, and if there is any bitterness in them, it proceeds from the matter of the burned wood. Or I say that in flavor, aqueous moisture is for the most part mixed in, although this does not always happen, as in the case of ashes.

Second Objection: Extreme sensibles injure the sense; but sweet flavor does not offend the sense, as is plain; therefore sweet flavor is not extreme among flavors. I reply that intense sensibles do indeed for the most part injure sense; yet this does not occur in flavors, since they are secondary savory qualities. Although if a flavor is excessively sweet it sometimes harms an animal.

You will ask I, whether taste acts according to real being or according to intentional being? Aristotle responds (*2. anima 102*) that it acts according to real being, because for taste no external medium is required. It is necessary that food be applied immediately to taste.

You will ask II, in which part does taste occur? I reply: in the tongue, especially at its tip (*1 de hist. cap. 11* and *2. de partibus, cap.17*). For when we wish to sample something briefly, we roll it to the tip of the tongue; but when we do not wish to taste something else, we transmit it immediately to the stomach.

Article II. Whether taste differs from touch.

Paulus Venetus (*2. anima, cap.10*) and Aegidius Romanus (*ibid. in com. T.103*) confound taste with touch, to the extent of wanting them to be one and the same sense adorned with two names. Aristotle, however, (*in the place just*

mentioned T.112 and 128 and *lib. de sensu et sensibili, cap. 4*) and the Scotists and his other interpreters teach that taste is distinct from touch.

Note that touch is taken in three ways. In one way, for the contact of two bodies whose surfaces immediately touch one another — we say that one board touches another because their surfaces touch. This is what Aristotle has in view (*5. Phys. lib. 26*) when he says that those bodies touch each other whose extremities touch one another. In the second way, for the contact of a vital power perceiving an object — in which sense, because taste and touch attain their objects immediately without any external medium, taste and touch are not said to differ in this respect. In the third way, for the tactile power, which is concerned with tangible qualities — and in this way touch is separated from taste and the other senses.

Assertion: Taste is an external sense distinct in species from touch. This is not displeasing to Scotus (*2. dist.3. quast. 8. ad 3*), who enumerates and accepts five external senses distinct from one another, as I showed in question III, article I of this book. It is proved, first: from the distinction of objects, the distinction of powers is argued and gathered a posteriori, from what has been said elsewhere; but taste has an object distinct in species from the object of touch — for the object of taste is flavor, and the object of touch is the tangible qualities; therefore taste differs from touch. Second, diverse organs indicate diverse senses, because the number of senses is ascertained from the number of organs; but the organ of taste is distinguished from the organ of touch — for touch is diffused through the whole body, while taste resides at the tip of the tongue. And moreover, taste is sometimes lost while touch continues intact and whole; therefore they differ from one another.

First Objection: Aristotle (*lib. de sensu et sensibili, cap. 2*) in plain words says: "Taste is a kind of touch, and the tasteable is something tangible"; therefore according to Aristotle taste is not separated from touch. I reply that Aristotle must be interpreted as speaking of touch in the second sense — not of touch in the third sense, as I made plain in the preceding notation. Or he must be understood not formally but suppositively, because taste always presupposes touch, as Cavallius notes (*in annot. quast.6. Scot. de anima*).

Second Objection: Taste attains water; but water is not savory, since water is an element devoid of flavor; therefore taste is concerned with tangible qualities, just like touch — and thus the one is not distinguished from the other. I reply that what is tasted is not pure water but mixed water, which taste perceives and senses. Therefore this argument does not trouble us.

Question IX. On Touch

Touch is described as the external sense that perceives tangible qualities. Touch is, as Aristotle says (*3. anima, T.66*), the most necessary of all for leading the life

of an animal — for fleeing harmful things and embracing advantageous ones. Its object seems to be the tangible qualities. Those who have softer flesh are endowed with greater intelligence; those who have harder flesh are slow and dull (*2. anima, 94*).

Article I. Whether touch is one or multiple senses.

The Philosopher and Simplicius, notable Peripatetics (*2. de anima, 7.108*), to whom Thomas (*1. part. quast.78. art.3. ad 3*), Poncius (*disp.60.quast.4. concl. 5*), and many others assent, think that touch is only one sense. Others, however — such as Avicenna (*6. naturalium, parte 2*), Averroes, Toledo (*in the place just cited*), Scotus (*quaestione 1. de anima*), John of Magistris, and other Scotists in the same place — think that touch is a twofold sense.

Note that something can be one in two ways. First, with intrinsic and formal unity: in this way each thing enjoys its own unity according to its own entity. Second, with extrinsic and objective unity: in this way that is one which is concerned with only one object, and that is multiple which is concerned with many objects. By this distinction the proposed and present difficulty is resolved.

It may be said that touch is one with intrinsic unity, but multiple with the multiplicity of objects. The first part is shown: being and one are convertible, since one is a property of being; but touch is a being; therefore it is one with intrinsic and transcendental unity. Add further that every power is one, not only with the common unity that is transcendental, but also with the proper unity by which it is such a power, distinct from every other power and from anything else. But touch is a sensitive power, since it is numbered among the five external senses. Therefore touch is one with the unity intrinsic to it. The second part seems to be that of Aristotle (*2. anima, T.107*), who says that touch is not one but many. And it is proved: a power that acquires many objects is not one but multiple, since from what was asserted elsewhere, a power is multiplied in proportion to the multiplication of objects; but touch participates in many objects — namely the tangible qualities, one of which cannot be reduced to another; for heat is not reduced to cold, nor dryness to moisture. Therefore, since touch is perceptive of such qualities, it follows that it is multiple with objective multiplicity. Moreover, from what will be said in the next article, the sensory organ of touch is established as the whole body of the animal, which is multiple with the multiplicity of parts — so that it seems not wrongly attributed a multiple touch as well.

You will say: that power is one whose object is one, as I have urged more than once; but the object of touch is one — namely the tangible; therefore touch is only one sense. I grant the major. I deny the minor. For although the tangible is called by one name as the object of touch, in reality it is not one object — since there is not found any tangible that is univocal to all tangible things. The reason

is that tangible qualities do not agree in any common univocal. Hence Aristotle in his *Logic* places contraries among the post-predicaments.

You will press: if multiple senses of touch are admitted, the fivefold number of external senses will not be valid — which conflicts with the common doctrine asserting that there are only five external senses. I deny the inference. For touch is one sense with intrinsic unity — which suffices for there to be no more than five external senses enumerated — even though there may be many touches with extrinsic and objective plurality, as I explained above. Or say that there is one touch really, but two formally — just as, according to some Scotists, the intellect is one really but twofold formally, namely agent and patient.

Article II. Where the sensory organ of touch is located.

Themistius in his paraphrase (*c. 39*) and Simplicius (*2. anima, T.116*) locate the organ of touch in the heart. Alexander and Philoponus (*7. 124*), however, establish the sensory organ of touch in flesh and skin. Scotus (*q.2. de anima*), Galen (*1. de usu partium, cap.16*), and others commonly teach that touch principally resides in the nerve proceeding from the brain, with flesh as its internal medium.

Note from anatomy that a certain nerve proceeds from the brain, which is diffused and spread through the whole body of the animal and is divided into various and diverse branches and branchlets — in much the same way as in the leaves of trees, especially fig trees, certain small veins and fibers appear and are seen, through which vital spirits are conducted and appear to vivify the parts and members. Note further that there is a twofold medium: one internal, which is a part joined to the remaining parts of the living being — such as flesh; and another external, which is not a part of the living being but is outside the living being itself — such as the air or water that are external media for seeing and hearing.

Assertion: The organ of touch is the aforementioned nerve, and its internal medium is flesh. This is defended by the Doctor in the place cited and by his disciples there. It is proved, first, from Aristotle (*2. anima, T.109* and *de partibus*), who affirms that flesh but not the said nerve is the sensory organ of touch. Second, that is rightly considered the sensory organ of touch which is most suited for touching; and such is the aforesaid nerve. For when an unpleasant object touches that nerve, we feel more intense pain than if it touches the other parts; therefore the sensory organ of touch must be placed in that nerve, and in flesh as its internal medium.

First Objection: Aristotle (*1. de hist. animalium, c 4* and *2. de partibus animalium cap.*) decides that the sensory organ of touch is flesh; therefore in the Peripatetic school the organ of touch is not a nerve but flesh. I reply that Aristotle there speaks recitatively, not assertively. For the same Philosopher, treating systematically of the sensory organ of touch (*2. anima cit. T.109*), plainly denies

that flesh is the organ of touch. He does the same in (*2. de partibus animalium, cap. 10*). Indeed in (*lib. de sensu et sensili. cap. 2*) he locates touch in the heart, because he thinks the nerves arise from the heart — though anatomy shows that the nerves themselves proceed from the brain.

Second Objection: If flesh is pricked, pain is felt; therefore the organ of touch resides in flesh and not in a nerve. I reply that the sensory organ of touch is in flesh not by reason of itself, but by reason of the nerve hidden beneath the flesh. Or say that it is in flesh as in its internal medium, not however as in its proper organ.

Third Objection: Certain parts of an animal feel intensely when touched — such as the heart and lungs — yet they are devoid of nerves; therefore it is evident proof that the sensory organ of touch is not to be placed in the nerves. And moreover, certain animals lack nerves and yet possess the sense of touch just like other animals do — since no animal can exist without enjoying touch. Such are fish; therefore it is plainly shown that the sensory organ of touch is not a nerve. I reply that those parts mentioned above do not have nerves so patent and evident as the rest, but they nonetheless truly have nerves, as is plain to the observer. For there small nerves or certain fibers are seen, in which touch is accomplished. As for what is alleged of fish, the same must be said on the authority of the Stagirite (*3. de historia animalium, cap. 5*), who attributes proper and true nerves to fish.

Question X. On the Internal Senses

That there are internal senses is the common doctrine of all philosophers. For it is confirmed by experience that brutes remember what they have seen, heard, and smelled. A dog knows its master, hears his voice, and remembers him even after some time has passed. Likewise it remembers a place in which it was beaten and flees from the one who struck it. Furthermore it abandons harmful things and follows advantageous ones. Again, a sheep apprehends a wolf as its enemy, and a mouse a cat. From these and similar things it is easily and plainly deduced that animals devoid of reason, as well as those endowed with reason, have internal senses.

Article I. How many internal senses there are.

Philosophers dispute greatly about this article, to such a degree that their opinions seem as many as their heads. First, Alexander of Hales (*2. parte, quast. 70. m. 2*) and Tataretus (*2. de anima, quast. ult. dub. 2*), as well as Poncius (*disp. 61. quast. 1. concl. 1*), affirm that there is only one internal sense, which acquires various and diverse names, and is called multiple with respect to the many operations it exercises and the manifold disposition of organs — on account of which it seems to be multiple, while in reality it is only one, having many offices and operations. Some, among whom is Fonseca (*5. Met. sect. 13*).

quast.7), think there are only two internal senses: namely the common sense and phantasy. Some count three internal senses — namely the common sense, phantasy, and memory. Many add a fourth: the estimative power. Others, beyond the four just enumerated, establish a fifth, namely the cogitative power, as can be seen in John of Magistris (*2. de anima, quast. 8. dub.3*).

Note I, that they are called internal senses for two reasons. The first is that they are moved and immuted neither by external objects, as sight and the other external senses are. The second is that they exist within the brain. For their organs are contained in the brain itself, and hence are not seen by us from without.

Note II, from anatomy, that the brain is divided into two halves, one on the right side and one on the left. It is also divided into the anterior part of the head, called the sinciput, and the posterior part of the same head, called the occiput. Moreover, in the anterior part of each half there are two sinuses and concavities; and in the posterior part, which is the occiput, there is found another sinus or ventricle. In the first sinus resides the common sense, which perceives all the objects of the external senses and discerns them as present and judges about them. In the second sinus dwells the phantasy or imaginative power, which not only perceives all the objects that the common sense and the other senses attain as present, but also as absent — and it apprehends, discerns, and estimates them, namely whether they are suitable or unsuitable. In the third sinus, however, is located the memory, which preserves the individual species of all the objects that are transmitted from the external senses through the common sense and through phantasy to the memory itself, which dwells in the occiput — as John of Damascus testifies (*2. fidei. cap. 20*). Note further that the aforesaid sinuses and their passages are full and filled with vital and animal spirits, through whose mediation the sensitive powers are assisted in their operations as occasion demands.

First Assertion: There are neither only one nor only two internal senses. This assertion is two-part, which does not conflict with Scotus in the following assertion, whatever Cavallius may say (*quast.9. de anima, concl.4*). The first part is proved, first, from Aristotle (*2. anima, 7.55*), who affirms that there are many internal senses. And in the book on memory and recollection, he adds that beyond the other internal senses, the sensitive memory must be admitted; therefore in the Peripatetic school there is not only one internal sense.

Augustine (*lib.2.de lib.arb.cap.7*) is favorable, expressly teaching many internal senses. Second, what belongs to the common sense does not belong to phantasy, since they perform different offices. For the common sense is immuted by the external senses; when these cease from their operation, it is unable to — Third, some easily perceive things and with difficulty remember them; therefore it is not the office of the same sense to perceive objects and to remember them — and thus there is not only one internal sense.

The second part is shown, first, from the same Aristotle in the passages adduced in the first part of this assertion, in which, beyond the common sense and phantasy, he admits the sensitive memory. Augustine has the same view (*1.1. Musica.cap.4* and *2. de lib. arb. c 5*). Therefore there are not only two internal senses. Second, distinct definitions of the internal senses argue for distinct senses, as I have often urged; but distinct definitions are offered for the common sense, phantasy, and memory, as is plain from the second notation; therefore the twofold number of internal senses is not valid.

Second Assertion: There are neither more nor fewer than three internal senses: the common sense, phantasy, and memory. Scotus does not seem to depart from this. For in (*1.dist.3. quest. 6. §. Contra istam paulo ante F*) he mentions the common sense; and a little later, phantasy; and in (*4.dist. 43. quast. 3*), the sensitive memory. Augustine suggests the same, not only in the places cited in the superior assertion but also in (*11. Trin.7*), where he explicitly enumerates the three aforesaid internal senses. Aristotle preceded them, both in the places cited and in (*2. anima, T.145* and *3. of the same work, T.31*). It is proved, first: the internal senses are as many as the internal sinuses and organs of those senses. From the ternary number of these, the ternary number of those is rightly gathered. But there are only three internal organs — or three sinuses and concavities — mentioned and explained in the second notation; therefore there are only three internal senses as enumerated. Second, the estimative power and the cogitative power, which some distinguish from the aforesaid senses, coincide with phantasy. For phantasy estimates and judges about objects both present and absent, as is plain in dreams. And it meditates and thinks; therefore other internal senses beyond those three named above need not be devised.

First Objection: Saint Augustine (*lib. de spiritu et anima, capite 4*), having enumerated the five external senses, acknowledges one internal sense, which he calls imagination; therefore in the opinion of Augustine only one internal sense should be established. I reply that there Augustine admits one internal sense — namely phantasy — but does not deny the other two, which he expressly posited and taught in the places just cited. Hence the holy Doctor in that passage affirms one and does not reject the other two.

Second Objection: Aristotle (*lib. de memoria et reminiscentia*) writes that phantasy and memory are affections of the first sensitive — but the first sensitive is the common sense, according to the same Philosopher; therefore phantasy does not differ from the common sense, and consequently there are not three internal senses. I reply that the Philosopher must be interpreted not really and formally, but presuppositively and effectively — meaning that phantasy and memory presuppose the operation of the common sense, just as the common sense itself requires and presupposes the operations of the external senses. And therefore properly and precisely, phantasy and memory are not affections of the common sense.

Third Objection: What acquires the same object are not distinct powers, because the unity of objects indicates the unity of powers; but phantasy and the common sense participate in the same object — for whatever the common sense perceives, phantasy attains as well; therefore they are not distinct powers. I reply that the argument concludes with respect to disparate powers, such as the external senses; but not with respect to subordinate powers, such as the common sense and phantasy. For these are ordered to one another in such a way that whatever the inferior sense attains, the superior sense attains as well, and something more. Therefore it is no wonder if the common sense cognizes all the objects of the external senses, which are likewise perceived by phantasy, which is a superior power.

Article II. Whether the internal senses are active.

The opinion of Jandun (*2. de anima, qua.16*) and Papollaris (*ibid. q.13*) and others is that there are passive internal senses really distinct from active ones. The second opinion is that of Albert (*lib. de apprehensione in initio* and *in summa de homine*), who affirms that the internal senses are only passive, while the sensible species are active and productive of sensations. The third is defended by Plotinus (*sixth Ennead, cap. 4*) and Simplicius (*in expof. 7.51. 52*), who think the internal sense is only active and the total principle of sensation. The fourth is deduced from Scotus (*1.d.3.quest.7* and *2.de anima quest.12*), Cavallius in the same place, Tataretus, John of Magistris, and many others, who teach that the internal sense is the principal partial active principle of sensation, while the sensible species is the other active principle, less principal — and that both together constitute one total and adequate principle of sensation.

First Assertion: The internal senses are not really divided into active and passive; but the same senses are called active and passive from different respects. This is drawn from the Doctor just cited. It is proved, first, from Aristotle (*2. anima ad text.127*) and following, where he says that sensing is being acted upon, and afterwards adds that when the sense senses it acts; therefore according to Aristotle, the same sense is active and passive, though in different ways. For it is active insofar as it produces sensation, and passive insofar as it receives sensation in itself, or because it first receives the sensible species before it senses. Furthermore, the same Philosopher (*ibid. ad Text.124*), inquiring why plants do not sense, replies: because they lack the sensitive power — but the sensitive power is active, since it produces sensation; therefore with respect to different things the same sense is active and passive. Second, if the senses were really distinguished into active and passive, there would be more senses than have been enumerated in the preceding article; but no senses other than the aforesaid are commonly counted; therefore the senses are not distributed into active and passive. Again, there are no organs distinct from those of the passive senses for the active senses; therefore neither is there any real distinction between those senses. Furthermore, the same agent from different

considerations is called patient, as is plain with the eye, which as it sees is called active, but as it receives vision or the sensible species is called passive. Therefore the same must be affirmed of the internal senses. Moreover (*1. Phys. T.40*): entities are not to be multiplied without necessity; but there is no necessity for multiplying the internal senses into active ones really distinct from passive ones; therefore the aforesaid division of senses into really distinct active and passive is vain and void.

Second Assertion: The sensible species received in the organ is not the total principle of sensation, such that the sensing power behaves purely passively with respect to it. This is drawn from the Doctor cited and (*3. dist.4. quast. un*). And Aristotle (*in the place cited above* and *lib. de sommo et vigilia, cap.1*) says that sensation is the action of the whole conjoined — that is, of the whole animated composite — to whose efficient production the sense or sensitive power concurs actively. It is proved, first: if the species alone were the total cause of sensation, if it were divinely separated from the sensitive organ it would of itself, without the organ, produce sensation — because a sufficient cause, acting per se and requiring nothing to concur toward its action, wherever it is placed, when not impeded, can act. Therefore a species separated from the sensitive power would emit sensation — which is as absurd as is sufficiently and abundantly plain to anyone even slightly versed in philosophy. The antecedent is known: for if heat, for example, were separated from fire, it would heat; and whiteness and the other accidents in the Eucharist have their effects, even though they exist without a subject; therefore the same would occur with the sensible species, if by divine power it were separated from the sensitive faculty. Second, given the hypothesis, the medium through which the sensible species would pass would sense — but this is false, since if the medium is air, it can in no way sense; therefore the same holds for what was deduced from it.

You will say, denying the inference of the major, since for sensation an apt and capable subject is required — the kind the medium through which the said species is conveyed is not. On the contrary: such an apt and suitable subject for sensation works nothing toward its accomplishment but only receives the species; but the medium likewise receives the species in the same way; therefore it would sense as well. Third, the powers of the vegetative soul are active — namely the generative, nutritive, and augmentative, as is established from the preceding book; therefore the sensitive powers, which are the senses, are likewise productive principles of sensation, since the reasoning is the same in both cases. Furthermore, a vital operation proceeds from a vital principle — for in this it is distinguished from other non-vital operations; but sensation is a vital operation, as is plain; therefore it is produced by the sense, which is a vital power. Moreover, what denominates something in any way flows from it: but sensation denominates the sense — for through sensation the sense formally senses and through it is said to sense; therefore sensation originates from the sense as from its productive and effective principle.

Third Assertion: Nor is the sense alone the productive cause of sensation; the sensible species is also required as the other partial cause of it. Scotus lends support (*1. distinct.3.quast.7*). It is proved, first, in nearly the same way as sensation is to intellection in the character of vital operation: but intellection, from what will be said elsewhere, is not accomplished by the intellect alone but also by the intelligible object, according to Augustine (*2. Trin. 2 and 9 of the same work, ultimo*): "From the object and the intellect, knowledge is begotten." And the same (*ibid., cited by the Doctor in the place cited above*): "From the visible and the one seeing, vision is begotten." Therefore from the sensible species and the sense, sensation arises. The major is plain because, setting aside the rest that belongs to intellection as intellection, in the character of an operation proceeding from a power of the soul or of the whole animated being, they proceed along the same path — which Aristotle indicates when he says: "sensing is being acted upon, just as understanding is." But if the sense were simply the total cause of sensation, sensing would not be being acted upon but acting and operating, nor would anything else be required for exercising sensation. Second, given the natural cause of some effect, and with it not impeded, the action immediately follows; but given the sense held back by nothing, if the object or its species is not present, the sense cannot sense; therefore it is not the total cause of sensation.

You will say: the object or its species is required not in order to act, but in order to dispose and determine the sense for sensing. For the power must first be informed by the species before it acts and operates. On the contrary: whether the object is placed in the character of a sine qua non cause, or in the character of a term, or in the character of a disposer and exciter, I argue: there are only four genera of causes (*2.Phys. 28 and 5. Met.2*). Therefore, those existing perfect in themselves, unimpeded, and sufficiently approximated, the effect caused by them follows, if they are natural causes. Therefore if the sense is the total cause of sensation and its receptive subject — since it always exists in act and exists as a natural cause — it would always have actual sensation, and would always cause it, which is false. Third, what assimilates the effect to itself concurs actively in producing it; but the sensible object assimilates sensation to itself — indeed sensation is rendered more similar to the sensible object than to the sensitive power; therefore the sensible object or its species is the partial active cause of sensation. Finally, a universal and indeterminate cause must be determined to acting by another cause, as is plain in the case of the sun, which would not cause sublunar effects unless inferior and sublunar causes determined it to producing this or that effect; but the sense is indifferent to any sensation of any sensible object whatsoever; therefore it must be determined by the objects themselves or their species. This determination, however, is action properly so called, and its effect can be nothing other than sensation; therefore both the sense and the sensible species concur in producing sensation.

Fourth Assertion: Sensation formally is an action. The Doctor holds this (7. *Met. quast. 14. §. Contrà responsionem* and *quast.18. §. Respondeo* and *quol.13. 15*). It is proved, first, from Aristotle (2. *anima*, 37. 7. 125 and *lib. de sensu et sensili, cap.2* and 9. *Met.16*), who calls sensations and intellections operations and immanent actions. Second, what is produced by a vital principle is a vital action — just as an action that emanates from a non-vital principle is a non-vital action; but sensation proceeds from a vital principle, namely the sense, which is a vital power; therefore sensation is an action. It can also be called a passion insofar as it is received in the sense, by reason of which the sense itself is called passive, as I noted above. The Scotists moreover use this distinction: namely that sensation is an action of the genus of quality, not however of the genus of action.

First Objection: An agent and a patient intellect are given (3. *anima 17*); therefore an active and passive sense must also be conceded, since the reasoning seems the same in both cases. For as the intellect stands to intelligibles, so the sense stands to sensibles; but the intellect is divided into agent and patient; therefore the sense also must be distributed into active and passive. I grant the antecedent. I deny the consequent. The reason of disparity is that an agent intellect is given to render the material species spiritual — the sense does not stand thus, since it receives a material species, the sense itself being likewise material. Therefore the same parity does not run with respect to intellect and sense.

Second Objection: Aristotle (2. *anima*, 140) teaches that sense is acted upon when it senses; therefore the sense is only passive, because to sense is to be acted upon. I reply that Aristotle must be interpreted not formally but prerequisites — meaning that for the sense to formally sense, it is necessary that it receive the sensible species, by reason of which it is said to be acted upon. Or also, in that it receives sensation in itself, just as a wall receives whiteness through which it is formally called white. Therefore, from different respects, the sense is called passive and active, as I noted above. Hence the same Philosopher, in order to suggest to us that the sense is not only passive, adds (2. *anima*, 7.125): "to smell is not to be acted upon by the odorous, because it is to sense" — by which words he intimates that sensing is not formally to be acted upon.

Third Objection: Sensation is a vital action that proceeds only from a vital principle; but the sensible species is not a vital principle; therefore the sensible species is not a productive principle of sensation. I reply that the objection holds for the principal principle; but not for the less principal principle — of which kind the sensible species is. Therefore sensation is called a vital operation not on account of the sensible species, but on account of the sense, which is the principal active principle.

Article III. In which part of the animal the internal senses are located.

Aristotle and Galen dispute most acutely about the seat and location of the internal senses, especially the common sense. Aristotle (*2. de gener. animalium, cap.4*) and elsewhere locates the common sense in the heart, in which he is favored by Jerome (*Ad Fabiolam*), Averroes (*2. de partibus animalium, cap.7*), and Jandun (*quast.9. de sommo et vigilia*). Galen, however (*8. de usu partium, cap. 3*) and following, establishes the common sense and the other internal senses in the brain. In agreement are Bercharius (*1. Reduct. moralis, cap.6*), Cavallius (*quost.10. de anima, concl. 2*), Poncius (*disp.61. concl.2*), and many others.

Note I, that Aristotle and Galen agree on some things and disagree on others. Both agree that the common sense resides where the principle and origin of sensing is. Furthermore, both admit that the source of the nerves is the principle of sensing, since through the nerves the animal participates in sensitive and motive faculties. However, these two authors disagree in that Aristotle considers the heart to be the principle and workshop of nerves, veins, and arteries; while Galen thinks the brain is the origin and source of the nerves, and therefore places the common sense in it.

Note II, that in matters that fall under sense and experience, it is better to follow those who have experience than those who lack it — as Scotus does (*3. dist. 4. quast. vn. §. Ad argumenta, pro opinione prima*), where, recounting the opinion of the Philosopher about the mother with respect to the fetus — namely whether she bears herself actively or passively in the formation of the fetus — since the Philosopher himself thinks the mother behaves only passively in the formation of the fetus, our Doctor abandons the Philosopher himself and follows Galen as the experienced one, because the way of those who have experience is safer and more certain, especially when the reasons on the opposing side can be easily dissolved. Therefore in the present case it is no wonder if philosophers commonly abandon the view of Aristotle and embrace the opinion of Galen, since through anatomical dissection it is plainly evident and seen that the origin of the nerves and the principle of sensing proceeds not from the heart but from the brain.

Assertion: The common sense and the other internal senses reside not in the heart but in the brain. Scotus is cited (*quast. 10. de anima*), and it is proved, first: where the sensory nerves take their origin, there the internal senses have their seat — as the Stagirite himself also acknowledges; but the sensory nerves take their beginning from the brain, as is seen from experience in anatomical dissection; therefore the internal senses are located in the brain. Second, if the heart of an animal is suddenly removed from its other members, we still observe some sensation being produced in the head of the same animal. For it is related that some people, with their hearts cut out, still spoke — and speech is a sensation, which can only arise from a sense; therefore the internal senses are placed not in the heart but in the brain. Third, when the head and brain are injured, the internal senses are damaged and sensations are impeded; and

remedies are applied not to the heart but to the brain. Moreover, those who indulge in excessive study suffer pain not in the heart but in the head. Therefore the internal senses are to be located in the brain.

First Objection: What is the principle of sensation must be a part continuous with the other parts and members of the animal, so that sensation and motion may properly occur; but the brain is a part discontinuous from the others, being in the head as in a vessel; therefore the internal senses do not reside in the brain. Confirmation: what does not sense cannot be the origin and seat of the internal senses; but the brain does not sense — for if it is touched, it does not feel pain; therefore the brain is not the place of the internal senses. I grant the major. I deny the minor. For the parts of the brain are continued with the nerves and the other members through which sensation is accomplished, as is plain in anatomical dissection. To the confirmation: I grant the major, I deny the minor. For although the brain does not sense so intensely on account of its tempering, which is soft, it nonetheless truly senses; and if a wound in it is great, the animal is afflicted with intense pain.

Second Objection: The heart is the principle of life. For in it are the vital and animal spirits; therefore the heart is the principle of sensation, and consequently the internal senses reside in it. I reply that the heart is indeed the principle of the vital spirits, but not of the animal spirits, since the animal spirits proceed from the brain, as experience confirms. Therefore, according to the physicians and truth, the heart is the seat of the vital spirits, the brain of the animal spirits, and the liver of the blood.

Third Objection: The heart is located in the middle of the body of the animal, like a king in the middle of his kingdom; therefore the heart is the principle of the internal senses. I reply that even if it be admitted that the heart occupies the middle seat in the body of the animal, from this it does not follow that it is the origin of the internal senses. For the belly is in the middle of the animal, and yet no one affirms that the aforesaid senses take their origin from the belly itself. Indeed, the brain is established as their principle because it is in the head — as in a citadel, and like the sky in the world. Therefore the objection brought forward has no force.

Fourth Objection: Men who are out of their senses are called *excordes* or *vecordes*; therefore men who are sound of mind are to be called *cordati* — for no other reason surely than that the heart is the origin and source of the internal senses. I reply that although this is sometimes conceded, men more frequently are said to be without a brain, and the common saying is held: "a beautiful head, but without a brain." And: "when the head aches, all the other members ache."

Fifth Objection: Matthew XV: The Lord Christ says: "Out of the heart proceed evil thoughts" — and thoughts pertain to phantasy, which is one of the internal senses; therefore the internal senses arise from the heart. I reply with Lyra in his

postilla that this passage must be interpreted of the spiritual heart, which is the intellect — which, with the will not resisting, is inclined to evil and is called the origin of evils.

Article IV. Whether the internal senses engage in discursive reasoning.

Some, listed and refuted by Alphonsus de Castro (*lib.3. adversus haereses, verb. Bestia et Brutum*), into whose error and heresy Laurentius Valla (*lib. de dialect. cap.9*) and Plutarch seem to fall by attributing reason and discursive reasoning to brutes, think that the internal senses — whether of a brute or of a human being — are capable of discursive reasoning. Others, whose leader is Avicenna (6. *naturalium. parte 4. cap.2*), followed by Thomas (1.p. *quest.78. art.4*) and Cajetan in the same place — though they deny that brutes engage in discursive reasoning — nonetheless think that the cogitative power of man is capable of discursive reasoning. The more common view, however, is that of Scotus (2. *distinct 42. quast.4. §. Ad primum R. in solutione 2*), Lychetus, and Gratian of Brescia in the same place, who teach that the internal senses both of brutes and of human beings are devoid of reason and discursive reasoning.

First Assertion: Brutes are incapable of reason and discursive reasoning. So Scotus in the place just cited. It is proved, first, from sacred Scripture, Psalm XXXI: "Do not become like the horse and the mule, which have no understanding." But where there is no understanding, there can be neither reason nor discursive reasoning. Sacred Scripture, however, testifies that beasts lack understanding; therefore they likewise lack reason and discursive reasoning. Then Psalm XLVIII: "Man when he was in honor did not understand; he is compared to the beasts of burden and is made like them." The likeness that sacred Scripture draws between man and beasts consists in this: that he did not understand — therefore the difference that holds between man and brute is established in this, that man possesses reason and understanding, while the brute lacks it, of which a man falling into sin also becomes devoid. Then he does not understand, like a beast of burden — to which at that point he is compared. Second, from Augustine (1. *Musicae, cap.2* and 1. *de lib. arbitrio, cap.7* and 8): "Man surpasses the beasts by reason." Third, Aristotle (2. *anima, T.157*): "Nothing can be persuaded to brutes, because they are deprived of reason." And (*lib. de memoria, reminiscencia, cap.4*): "No animals recollect except man, because they neither syllogize nor reason." Fourth, for an animal to engage in discursive reasoning, it must necessarily cognize the principles of reasoning, because without principles one cannot have those things that are deduced from them; but the internal senses cannot cognize the principles of discourse; therefore they do not possess reason and discursive reasoning. The major is plain. The minor is evident: the principles of discourse, from what was asserted in logic, are two: the dictum de omni and the dictum de nullo — and since these are universals, and the senses attain only singulars, it is plainly inferred that no sense of brutes is suited for

discursive reasoning. Fifth, reason and discursive reasoning belong to rational beings; but brutes are irrational. They are constituted through the difference opposed to rationality, since the animal is divided into rational and irrational; therefore brutes cannot reason and syllogize. Moreover, to whom discursive reasoning belongs, to the same person belong understanding, and likewise will, prudence, and the other habits; but neither will, nor prudence, nor the other moral or intellectual habits are adapted to brutes, since their souls are material and corporeal. Likewise they would be capable of grace and sin, merit and demerit, punishment and eternal glory — all of which and similar things are far from brutes; therefore reason and discursive reasoning cannot be accommodated to brutes, as Augustine elegantly expounds (*lib.83.99. quest.j. 13*).

Second Assertion: The cogitative power of man does not possess discursive reasoning. This is drawn from the Doctor in the place cited and (*1. dist.34 quest.6.¶. Contra istam opinionem ad A*). It is proved, first: the same must be said of the cogitative power of man as of the cogitative power of a brute, because both are material and corporeal; but the cogitative power of a brute is devoid of reason and discursive reasoning, just as its other senses are, as I showed in the preceding assertion. Therefore so is the cogitative power of man, since the reasoning is equally clear in both. Second, a ratiocinative and discursive power cognizes universals, because discourse is composed of universals, as Scotus well pursues in the first book cited above, and this is supported by the two principles mentioned in the prior assertion; but the cogitative power of man cannot perceive universals, since only the intellect attains universals — according to the common saying: "sense is of singulars and intellect of universals"; therefore it is incapable of reason and discursive reasoning.

First Objection: What is capable of prudence and other habits is capable of reason and discursive reasoning; but brutes are endowed with prudence and other habits, which cannot inhere unless in those capable of reason and discursive reasoning. For in (*1. Met. 1*) bees are said to be prudent; indeed serpents, by the mouth of the Lord Christ (*Matt.10*): "Be prudent as serpents." And Genesis III: "The serpent was more cunning" — that is, more prudent — "than all the beasts of the earth." And Proverbs VI: "Go to the ant, O sluggard, consider her ways, and learn wisdom." Therefore brutes are not to be exempted from reason and discursive reasoning. I grant the major, I deny the minor. In proof of the minor, I say that those testimonies must be interpreted of prudence taken not properly but improperly — meaning that the aforesaid animals participate in a certain shadowy prudence and the vestige of certain intellectual habits. So Augustine (*11. Ciuit. cap.27*) and Scotus (*1. Met. quast 3*) intimate.

Second Objection: Some animals are teachable and docile; therefore they engage in discursive reasoning as well. The antecedent is plain from Aelian, Athenaeus, and Bercharius (*lib 14 reductorij moralis, cap.6*), who relate marvelous things about certain brutes — namely the dolphin, the lion, and the elephant,

which forms and traces letters — and such things do not seem to be able to be accomplished without reason and discursive reasoning. I grant the antecedent, I deny the consequent. In proof of the consequent I say that all these things happen by natural instinct and a certain habituation, and perhaps there is in them a certain likeness and vestige of reason, as Augustine in the place just cited seems to suggest.

Third Objection: A dog placed at a crossroads, when a hare has passed through one of those three roads, having explored two of them, comes to the third, which it traverses, and catches the hare; therefore the dog engages in discursive reasoning. The consequent holds: for the dog seems to argue thus — "the hare did not pass through the first road, nor the second; therefore the third." But this deduction is discursive; therefore reason and discursive reasoning are not to be removed from certain animals. I reply that the dog enters the third road not because it reasons but because it smells the odor of the hare. For having smelled the first two roads, as experience confirms, and not sensing the odor of the hare in them, it smells the third, and sensing the odor of the hare itself, it pursues, catches, and kills the hare. In the same way can be dissolved the objection of Bacon (*2. dist.25. art. penultimo*) about the fox, the ape, and the other cunning animals, which seem to perform wondrous things. Nor should what Augustine says (*1. Musicae cap.3*) be passed over: "In brutes there is no art, because there is no reason."

Question XI. On the Sensitive Appetite

Scotus makes mention of the sensitive appetite (*quast.4. prol. §. Dico igitur sub B* and *1. distinct.17. quast. 2. §. Hanc viam sequendo T* and *2. distinct.6. quest.2. §. In ista quest. D* and *E* and *Quol.2.B* and *2. dist. 17. quest. vn.§. Istam quaestionem B*). This animal seeks good things and avoids evil things, receives what is suitable and flees what is unsuitable. For the sensitive appetite is defined as the sensitive power by which an animal pursues good and what is suitable, and flees evil and what is unsuitable.

Article I. Whether the sensitive appetite is distinguished from the cognitive power.

Thomas (*1. p. quast.78. art.2* and *3*), Cajetan, and others in the same place acknowledge a real distinction between the sensitive appetite and the cognitive power. Scotus, however (*3. distinct. 17. quest.vn*), Cavallius (*disp. 2. de anima sect. 2*), and others in the same place establish not a real but a formal distinction between the appetite and the knowing power.

Note from the Doctor just cited that appetite is divided into innate and elicited. The former is the natural inclination and propensity of any thing — in this sense a heavy thing desires a place downward, and a light thing upward. The latter is an active faculty by which a living being desires what is suitable for it

and pursues it, and turns away from what is unsuitable and flees it — as I was saying above in describing the appetite. It is further subdivided into natural and free. The former is that by which an animal naturally and necessarily desires what is good for it. The latter is that by which a rational animal spontaneously and freely desires and wills something, which it can not will and cease from pursuing. Of the latter there is no difficulty here; it is of the former — which is called the sensitive appetite, mentioned in Genesis IV: "Its desire shall be under you, and you shall rule over it"; Romans VII: "I see another law in my members, fighting against the law of my mind"; and Galatians V: "The flesh lusts against the spirit, and the spirit against the flesh." It is about this that John of Damascus writes, cited by the Doctor in the first book (*dist. 17. quest. 2. paulo ante §. Ad argumenta, quae falta sunt, et ante V*), saying: "It is led, it does not lead" — meaning that the sensitive appetite does not dominate its own action, which is to lead; but with respect to its action it is determined by an agent to a definite operation, and this is to be led — in the interpretation of Scotus in the place cited above.

First Assertion: The sensitive appetite is distinguished from the cognitive power — not indeed really, but formally. The assertion is two-membered, as Scotus suggests in the place just cited and (*quest. 1. de anima, §. Ad 1*), where he says: "Where there is the sensitive, there is the appetitive; yet one power is sensitive, another appetitive." The first part is shown, first: the free appetite, which is the will, is distinguished from the intellect, which is the spiritual cognitive power; therefore the sensitive appetite, which is the natural and necessary appetitive power, is likewise distinguished from the material cognitive power. The antecedent is conceded by all who maintain real distinctions among philosophers. The consequent holds because the reasoning is the same in both cases. Second, the sensitive appetite follows the sense, just as the property of laughter follows the human being; but the property of laughter is distinguished from the human being as a property from its subject — as will be made plain in metaphysics. Furthermore, a thing is first known before it is desired, because the appetite — both sensitive and intellective — is not directed toward what is unknown; therefore since the cognitive power is prior to the appetitive, and everything prior is distinguished from the posterior, it is plainly inferred that the sensitive appetite differs from the knowing power. And moreover, the moral virtues are placed in the sensitive appetite, from the Doctor (*3. dist. 15*), and not in the cognitive power; therefore the one is distinguished from the other.

The second part is established from what was said in book II, question II, article II, where I showed that the powers of the soul differ from the soul itself and from one another not really but formally. And likewise how the powers of the whole animated composite — of which kind these powers are — are distinguished from the composite itself and from one another; and I judge that nothing else need be added here, beyond what was said and proved there.

Second Assertion: There are as many appetites as there are senses. This is defended by the Doctor in the third book cited, and it is indicated in (*12. Met. T.39*), where it is said that every intelligible is desirable; therefore every suitable sensible is also desirable — just as every being is knowable. And so, since every sense is cognitive, it is also appetitive; and there are as many appetites numbered as there are senses. Furthermore, distinct apprehensions are had from distinct senses, as is plain with respect to the individual external senses — for one apprehension belongs to sight, another to hearing, another to smell, taste, and touch; therefore one appetite belongs to sight, another to hearing, and so forth for the rest. Moreover, just as each thing participates in its own entity, so it has its own inclination, and consequently its own pleasure: sight thus inclines toward the beautiful visible thing, desires it, is pleased with it, and delights in it; therefore according to the multiplicity of senses, appetites are multiplied. Again, in matter there are as many appetites as there are forms to be received in it, as I said in the question on matter. Finally, in the rational soul, because there is one intellect, there is also in it one appetite, which is the will. It is concluded therefore that appetites are numbered in proportion to the number of senses.

First Objection, against the first assertion: Aristotle (*3. anima, T.29*) does not seem to distinguish the sensitive appetite from the cognitive power; therefore the contrary opinion contradicts the Peripatetic school. I reply that Aristotle does not establish a real distinction between the cognitive and appetitive power, but does establish a formal distinction, as I asserted above in the second part of the proposed Assertion.

Second Objection: Different offices and purposes argue for a real distinction between those whose offices and purposes are thus diversified; but the cognitive and appetitive powers exercise different offices and regard different ends, as is plain; therefore a real distinction is interposed between them. I reply that the major is to be understood of a formal distinction, not however of a real distinction — which the Thomists strive to introduce into those powers and faculties.

Article II. Whether the concupiscible appetite is distinguished from the irascible.

Gabriel (*3. dist.25 and 26. quest.1. art. 3. dub.1*), Suárez (*5. de anima, cap.4*), and Poncius (*disp.61. quast.2. concl.2*) think that the twofold appetite proposed at the beginning of this article differs only rationally — that is, with respect to diverse acts. Scotus, however (*3. distinct.34. quest. vn. §. Notandum sub G and in Report. ibid.*), and Thomas (*1. p. quest.81. art.2*) and the disciples of both, preceded by Plato (*4. de Report.*), Aristotle (*1. magnorum mor. cap. 13*), and Galen (*6. de usu partium, cap. 18*), think that between the concupiscible and irascible appetite there falls a real distinction.

Note and recall from what was said in book II of this work, question III, article IV: that the distinction of powers is gathered a posteriori and manifestly from distinct acts and objects; and that I showed above that the multiplicity of the external and internal senses is to be derived from the multiplicity and diversity of organs; and that the difference of material from immaterial powers consists in this, that the latter derive their origin from the soul alone — as is plain of the intellect and will proceeding from the rational soul — while the former proceed from the whole animated composite, and therefore persist when this composite persists and perish when it perishes. Furthermore, when the mind of any Doctor is expressed and clear through his words, it should not be pulled and twisted toward an alien and contrary sense, as the Doctor signals (*1. distinct 8. quest.5. §. De intentione C*). But it is plain in Scotus cited above that the concupiscible and irascible appetite are really distinguished — as Cavallius well saw (*disp.2. de anima, sect.7*). Therefore Poncius in the place cited undeservedly strives to draw Scotus to the opposite opinion, as he also does concerning the appetite, saying that according to Scotus there is only one appetite — whereas Scotus himself plainly and clearly teaches that appetites are multiplied in proportion to the multiplication of senses and cognitive powers. The arguments that Poncius adduces for himself, being of no weight and force, I am reluctant to report and refute — since truth, like light, drives away darkness, and the two cannot persist together at the same time. I therefore think that Poncius and Suárez as well either have not read Scotus, or if perhaps they have read him, have understood him badly.

Assertion: Between the concupiscible and irascible appetite there intervenes a real distinction. So Scotus in the place cited above. It is proved, first: where there are distinct organs, there are distinct organic powers, as is established from the external and internal senses, which acquire distinct organs; but in the sensitive part, the concupiscible and irascible have distinct organs. For the same thing cannot be moved simultaneously by different motions in the same organ. The pain of the concupiscible is with contraction, while the pleasure opposed to it is with dilation; but the pain of the irascible occurs with heating, because anger is an enkindling of the blood around the heart; therefore these two appetites are really distinguished. Second, what presupposes and what is presupposed really differ from one another — as three presupposes two, and those three that presuppose and those two that are presupposed are really distinguished from one another; but the irascible presupposes the concupiscible, and the object of the former presupposes the object of the latter. The same is also affirmed of the acts of each, as the Doctor excellently pursues in the place cited, saying:

"Whenever the irascible has its act, two dislikes are there: one of the concupiscible and another of the irascible. The disliked of the concupiscible is to lack food, from which disliking sadness follows in the concupiscible, which as it were recoils from the disliked but does not repel it. There is also another disliked there — namely that which takes away food — which pertains to the

irascible, not by a recoiling act but by a repulsive one. But while it is not actually repelled, there is sadness pertaining to the irascible." More in Scotus there. Again, if some good is desired by the concupiscible under the aspect of something impossible to obtain, there will be pain of the concupiscible, but not of the irascible — because from the second book of the Rhetoric: "No one is angry about what is impossible." Moreover, the object of the concupiscible is good absolutely; but the object of the irascible is the arduous good, which is offensive and to be avenged; therefore a real distinction stands between those two aforesaid sensitive appetites.

First Objection: The passions of both appetites are the same; therefore there is one and the same appetite, utterly undistinguished. The antecedent is proved from Cicero (4. 99. *Tuscul.*): "Hatred is inveterate anger." But hatred pertains to the concupiscible and anger to the irascible. Likewise from John of Damascus (2. *fidei*, c.16): "Anger consists of sadness." But it is plain that anger is attributed to the irascible and sadness to the concupiscible. I deny the antecedent. In proof of the antecedent I say that this is true causally but not formally — meaning that protracted anger causes hatred, yet is not formally hatred. Likewise anger causes sadness, namely when the angry person is unable to take vengeance on the one who offended.

You will say: in the one who loves, the blood seethes just as in the angry person; therefore love and anger are not diverse passions. I say that this happens in different ways. For the blood boils in the one who loves with sweetness and pleasure; but in the angry person, with bitterness and displeasure.

Second Objection: By the same weight and gravity, a stone falls downward and removes what prohibits and impedes, and by the same motion breaks a thread and seeks its center. Again, the same heat of fire heats water and resists cold. Furthermore, the same imaginative power apprehends good and evil; therefore the same appetite regards what is suitable and unsuitable, advantageous and harmful. I grant the antecedent, I deny the consequent. The reason is that the irascible internally struggles against the concupiscible, as is plain in the just, who restrain their concupiscences and are angry in containing and suppressing them. But the natural impulse of a stone and its inclination toward a downward place does not struggle against itself in the same way, with the same power driving off impediments. As for what is alleged about the imaginative power, I say that the concupiscible too is directed toward what is suitable and harmful; but not toward what is arduous and offensive, as the irascible is.

Third Objection: In the rational appetite, the concupiscible does not differ from the irascible; therefore neither does it in the sensitive appetite, since the reasoning seems the same in both cases. I grant the antecedent. I deny the consequent. The reason the Doctor offers (*pasfu alleg.H*) is that the sensitive appetite resides in the sensitive and corporeal part; but the rational appetite keeps its seat in the intellective and spiritual part, which is inorganic. Therefore

there is only one rational appetite, distinguished with respect to different offices — just as a portion is distinguished into a superior and inferior portion; and also the same intellect regards both principles and the conclusions drawn from them. Therefore, although there is one spiritual cognitive power, there are nonetheless many material cognitive powers, as is clear from the external and internal senses. For what is dispersed in inferiors is united in superiors.

You will ask which of the aforesaid appetites is to be preferred. Henry (*quol. S. quastion.15*) responds that the concupiscible excels the irascible, for the reason that the concupiscible is directed toward good absolutely, while the irascible is directed toward good in a qualified sense — insofar as it is useful and offensive. And the irascible exists for the sake of the concupiscible: for one is angry because a good is being removed from his concupiscible. Add further that the concupiscible is directed toward the end and the irascible toward the means to the end. Or say that the irascible surpasses the concupiscible in nobility, because the latter is prior and the former is posterior in generation. And those that are posterior in generation are in the same order more perfect, as is plain with the will, which is posterior in generation to the intellect and nobler than it. And moreover, the irascible tends toward the arduous good that is offensive — in which the brave and magnanimous especially shine — which the concupiscible does not, being common to brutes. Again, what are more common are reckoned less noble; but the concupiscible is more widely diffused than the irascible; therefore the latter seems to surpass the former. Finally, patience is the noblest fortitude, which resides in the irascible. The irascible therefore seems to be to be placed before the concupiscible.

Article III. In which part the sensitive appetite resides.

The Peripatetics together with their chief locate both appetites — the concupiscible and the irascible — in the heart, as the Coimbrans report from Vesalius (*disp.6. Eth. quast.2. art.2*). The leader of the physicians, Galen (*de locis affectis lib.3*), thinks that the concupiscible appetite has its seat in the liver and the irascible in the heart. Some more recent thinkers — such as Hurtado (*disp.17. Sect.12*) and Arriaga (*disp.5. sect.4*) — place the appetite, both concupiscible and irascible, in the brain. The Scotists, however, who with Scotus (*3 dist. 34.quast.un*) hold that there are as many appetites as there are senses, consequently assert that the aforesaid appetites exist wherever the senses exist.

Assertion: Both appetites enumerated above are to be located in the brain. This does not conflict with Scotus in the place cited above, and it is easily deduced and shown from what has been said and asserted above. For in question X of this book, article III, the senses reside in the brain; therefore so do their appetites. The consequent holds because from the first article of this question, senses and appetites do not really differ from one another but only formally. And what differs formally are inseparable and occupy the same place; therefore since the sense remains in the brain, so too do its appetites. Furthermore, the free and

rational appetite, which is the will, does not acquire a different location from the intellect — for both remain in the same rational soul; therefore the same must be asserted of the sensitive appetite, inasmuch as it is not separated in place from the sense, of which it is the appetite. Again, the natural appetite, suited also to inanimate things, is not separated in place from the thing of which it is the appetite — as is plain from the appetite of a stone for its center, which follows the stone wherever it is; therefore the same must be affirmed of the sensitive appetite, which follows and accompanies the sense of which it is the appetite.

First Objection: From sacred Scripture, Deuteronomy VI: "You shall love the Lord your God with your whole heart" — from which and similar passages, such as Matthew XV: "Out of the heart proceed evil thoughts," etc., it is not obscurely deduced that the sensitive appetite resides in the heart. I reply with Lyra in his postilla that those testimonies must be interpreted of the spiritual heart, which is the will — the root and cause of love and hatred, of merit and demerit — and not of the material heart, as the adversaries contend, in which they place the sensitive appetite.

Second Objection: The heart is the principle and source of life; therefore in it the sensitive appetite must be located. I grant the antecedent. I deny the consequent. For although from what has been said the heart is the origin of life and of the vital spirits, it is not however the origin of the animal spirits and sensations, of which the brain is the root and origin.

Third Objection: Certain passions — such as joy and sadness, love and hatred — are attributed to the heart; therefore the sensitive appetite does not depart from the location of the heart. I grant the antecedent. I deny the consequent. For although the heart has such passions, it does not have the other passions that belong to the other parts of the animal. Therefore the heart indeed enjoys its own appetite, but not that appetite which is adapted to the sense. For I showed above that each thing enjoys its own appetite.

Book V. On the Rational Soul.

Having treated of the vegetative and sensitive souls, it remains to discuss the intellective soul, its powers, faculties, and acts, through the following questions and the next articles. Five questions are treated in this book. The first concerns the nature of the rational soul. The second concerns its intellect. The third concerns the will. The fourth concerns the motive power. And the fifth concerns the state of the separated soul.

Question I. On the Nature of the Rational Soul.

Article I. Whether the Rational Soul Is Created.

The origin of the rational soul is arduous and hidden in the sight of God, so much so that St. Augustine, great in genius, remains undecided about it (*10. de Genesi ad lit.*, cap. 23) and in his *Retractations* frankly confesses that he does not know its principle. Perhaps with an eye to this, St. Bernard, cited by Alphonsus (*lib. 2 adversus haereses, verbo Anima*), adds: "From my own self I know that God is incomprehensible, because I do not comprehend myself." Since, then, the soul is so difficult to know, innumerable errors have arisen, both among pagans and among Christians, some of which Augustine recounts (*3. de lib. arb.*, cap. 21), and others are named by the aforesaid Alphonsus de Castro. I shall bring forward and set out only four. The first is that of those who hold that the rational soul is a certain particle of the divine essence. The second is that of those who think the rational soul is propagated by traduction — that is, by seminal power — in the same manner as other souls are produced. The third is that of Avicenna, who, according to Scotus (*4. dist. ..., quest. 1*), holds that the rational soul was created by an angel. The fourth is that of Origen (*1. Periarchon*, cap. 7), of Plato in the *Timaeus*, and of others whom Augustine cites (*11. de Civit.*, cap. 23), who suspect that all souls were created from the beginning of the world, that they sinned by withdrawing from their Creator, and that by various degrees of progress, corresponding to the diversity of their sins, they deserved various bodies — as though fetters — ranging from the heavens down to the earth. The Catholic Faith, however, teaches that the rational soul was produced by God from nothing.

First Assertion: The rational soul was not produced from the substance of the divine essence. So holds Scotus (*2. dist. 17, quest. 1, §. Responsio A.* and in *Report. ibid.*), St. Bonaventure, Richard, and other Scholastics in the same place, preceded by Augustine (*7. de gen. ad lit.*, cap. 2; *lib. 2. de genes. contra Manich.*, cap. 11; and *1. de vera Religione*, cap. 9). It is proved, first, from sacred scripture: Genesis 1, "Let us make man in our image and likeness." This image of God resides in the soul, specifically in intellect, will, and memory, as Lyranus interprets in that place. If, therefore, the soul was made by God, the act of making cannot fall upon God, nor can change, since God himself is incapable of being made and immutable: Malachi 3, "I am God and I do not change." Therefore the soul does not come from God's substance. And in chapter 2 of the same book: "He breathed into his face the breath of life." On this point Chrysostom (*hom. 11. in Gen.*) and Eucherius (*1. in Genesin*) explain that the breath which God breathed into the face of man is the soul of that man, and therefore that soul is not from the substance of God. For just as the breath that comes from a man's mouth is not from the substance of the man himself but from the surrounding air, so the soul proceeding from God as a breath is not from God's own substance. Augustine adds (*1. contra adversarium legis et prophetarum*, cap. 14): "That breath of God which animated man was made by him, not from him, because neither is a man's breath a part of the man, nor does the man make it from himself, but from air inhaled and exhaled."

Second, from the Council of Braga I, cap. 1, in which the aforesaid error was condemned in these words: "If anyone believes that human souls or angels have come forth from the substance of God, as Manichaeus and Priscillianus said, let him be anathema." Leo I likewise decreed this (*Epist. 71, cap. 5*).

Third, the divine essence is indivisible and impartible, since it is spiritual and supremely simple, utterly devoid of all composition, as I demonstrated in the Tract on the One God (*disp. 1*). Therefore the rational soul cannot be a particle of the divine substance.

Fourth, if the rational soul were produced from the divine substance, it would be produced from it either as from matter or as from form. But both modes are incompatible with the divine essence, since matter and form have partial and incomplete being, whereas the divine essence is most perfect and utterly absolute.

Fifth, the properties of the divine essence would belong to the rational soul, and so the rational soul itself would be infinite, omnipotent, blessed, and the like. Conversely, the attributes and characteristics of the rational soul would belong to the divine substance, and so it would be capable of merit and demerit, happiness and damnation, and the like — all of which are impossible and offensive to pious ears.

Second Assertion: The rational soul was produced neither from a seminal reason nor by an angel, but immediately by God from nothing. The assertion has three parts, which Scotus suggests in the works cited above. The first part is proved, first, from St. Augustine in a book of the New Testament: "I think it improper to say that the soul is generated from the body, so that the soul should be born from a soul." And in the book on the Ecclesiastical Dogmas he adds: "Souls are not sown together with bodies." Second, the corporeal and material cannot produce the spiritual and immaterial. The seminal reason, however, is corporeal and material, while the rational soul is spiritual and immaterial, according to Luke 23: "Into your hands, Lord, I commend my spirit." Augustine also teaches this (*2. Trin. 8* and *lib. 83. 99 quaest. 1*). Therefore the rational soul does not come about by traduction and propagation. Moreover, the incorruptible does not come from the corruptible, nor the immortal from the mortal. But the rational soul is incorruptible and immortal, while the seed is corruptible, as is its power. Furthermore, the form that comes to be together with a natural composite is corrupted when that composite is corrupted. But the rational soul persists and stands on its own when separated from the composite and does not perish when the composite perishes. Therefore the rational soul is not produced by traduction and propagation.

The second part has been shown and proved in Book I on the World, question 3, articles 5 and 6, where I demonstrated that no creature, whether spiritual or material, is capable of creating anything as a principal or instrumental cause.

Since, then, the angel is a creature, it consequently cannot bring about the creation of a rational soul. The chief reason is that to create anything requires an agent independent of all else, whereas a creature — whether an intelligence or anything else — is dependent; therefore it cannot be the creative cause of anything.

The third part is argued, first, from the sacred text: Isaiah 27, "Every breath I have made." The reference there is to the spiritual breath, which is the rational soul, concerning which Genesis reads: "He breathed the breath of life into his face." If, then, God alone produced it, not from something — as is said of the body, which he formed from the slime of the earth — then it is from nothing. Ecclesiastes 12: "The dust shall return to its earth as it was, and the spirit shall return to its Lord who gave it" — supplementing: through production from nothing. Hence Wisdom 2 adds: "We were born from nothing." Second, from Augustine (*lib. 1. contra Adversarium legis et Prophetarum, cap. 15* and *lib. de spiritu et anima*), who offers these words: "The soul is not an element, nor is it made from elements, but is made from nothing, and is known to its Creator alone." He writes the same in the epistle to Optatus and in (*1. 83. 99 quaest. 1*). Jerome agrees (*in cap. 12. Zachar.*), as do other Fathers and Scholastic Doctors in the same place (*2. dist. 7*). Nor does Aristotle seem to dissent (*2. de gener. animalium, cap. 3*) when he says: "The mind comes from without." The Council of the Lateran, the Clementine on the highest Trinity and the Catholic Faith, also give their support: "God from the beginning created both kinds of creature from nothing, the corporeal and the spiritual, the angelic and the worldly, and then the human, constituted as though common, from spirit and body."

Third, whatever is produced is either drawn out from the potency of matter or is created. But the rational soul is not drawn out from the potency of matter; therefore it is created. The major premise is evident from a sufficient enumeration of the parts. The minor is shown as follows: to be drawn out from the potency of matter, as stated elsewhere, means nothing other than to depend in its coming-to-be and in its being upon matter. But the intellective soul depends neither in its coming-to-be nor in its being upon matter, since it is of such a nature that, separated from matter itself, it can exist and subsist on its own. Finally, the manner of operation reflects the manner of being. Now the rational soul operates independently of matter: it understands and wills without matter, as is evident in the state of separation. Therefore it was produced from nothing.

Nor should one omit the fitting argument of the Seraphic Doctor just mentioned, reasoning as follows: the soul is the image of God tending toward God as its ultimate end, in whose clear vision and enjoyment it is to be beatified, and whom it is bound to love with its whole heart. Therefore it proceeds immediately from God himself and is created from nothing.

Third Assertion: The rational soul is infused by God into the body at the very instant when the body is duly prepared and organized, such that it never existed before its organization. This is indicated by the Doctor in the place cited above, and the opposite position is listed among heresies by the aforesaid Alphonsus and by Augustine (*lib. haeresium, cap. 70*). It is proved, first, from Leo I in his epistle (*92. to the bishop of Asturica*), who decrees as follows: "We consistently and truthfully preach that the rational soul did not exist before it was united to the body." Damascene (*2. fidei, cap. 12*), Nyssenius (*lib. de homine, cap. 29*), and other orthodox Doctors agree. Second, between the efficient and formal cause there is this principal difference: the former can exist prior to any effect, as is evident from God, who existed from eternity without any creature produced from eternity; the latter, however, cannot exist without its formal effect, as is clear from natural and material forms. Now the rational soul is a form that informs, as will be said in the following article. Therefore it did not exist before the body from the beginning of the world, but is created by God simultaneously with the body when it is suitably organized. Furthermore, the works of God are perfect (*Deut. 32*). But the soul, while it is not actually informing a body, is imperfect, because it is a part. Therefore it was not created before the body.

Again, if the soul had been created from the beginning of the world, since it possesses intellect and memory, it would now recall that state. For it is impossible, as established in (*1. post., c. 2*), that habits should exist in us and yet be hidden from us. Since, however, the soul retains no memory of such a state, it was in no way present at that time. Moreover, if it had been created then, it would have had the same powers it now participates in, and since powers are not in vain, it would have acted and performed good or evil works through those powers. But this conflicts with Romans 9, where it is explicitly said of Esau and Jacob: "For the children being not yet born, neither having done any good or evil, that the purpose of God according to election might stand, not of works, but of him that calleth." There is also the definition of the Council of Braga I, cap. 6, which decrees: "If anyone says that human souls sinned previously in a celestial dwelling and that for this reason they were cast down into human bodies on earth, as Priscillianus said, let him be anathema."

Objection I. It is written in Genesis 2 that God rested from all the work which he had accomplished, over six continuous days. Therefore God creates nothing further, and accordingly every soul is presupposed to have been created before God rested from the work he had completed from the beginning of the world. I respond with St. Jerome and Lyranus that this passage is to be understood as referring to new kinds and species of things, which God creates no further beyond those he established at the beginning of the world. That God still operates in the world, however, is established from John 5: "My Father works even until now, and I work." And I showed this at length in the Book on Causes.

Objection II, pressed further. Job 40: "Behold Behemoth, whom I made with you." By Behemoth, however, Lyranus understands the Demon in his postilla on that place. And Job is said to have been made simultaneously with the Demon. But the Demon was created at the beginning of the world. Therefore the soul of Job too. And what is said of the soul of Job must be affirmed equally of all other souls, and therefore human souls were created at the beginning of the world simultaneously with the angels and the heavens. I say that "with you" is not to be taken in the sense of association and simultaneous temporal origination, but with respect to similarity in intellectual nature, inasmuch as the soul of Job and all other human souls share in intellectual nature, even as the angels do. This is how Lyranus interprets it, with whom Gabriel agrees (*2. dist. 17, quest. 1, art. 3, near the end*). A fitting reason is also offered as to why souls ought not to have been created simultaneously with the angels and the heavens: the latter receive a perfect nature, whereas souls receive an imperfect and partial nature, tending by their own nature toward the body as their counterpart, and from both together one complete and perfect human nature is constituted. Since the human body is produced through the generation of parents, God accordingly creates the soul when the body is suitably organized, and infuses it into that body, from which union man arises.

Objection II. A man, like every other animal, is generated by means of a seminal reason. But the soul of a brute is not created from nothing. Therefore neither is the soul of a man. I distinguish the major premise: with respect to the production of the body, I grant it; with respect to the production of the soul, I deny it.

Objection pressed further. The composite and the form of the composite are produced by the same act of production, since the form is not produced except because the composite is produced (*7. Met. T. 22*), and especially because matter does not come to be, nor does form come to be, but only the composite comes to be (*1. Phys. T. 64*). But man is not created; he is generated. Therefore his soul likewise is not created. I say that the objection holds for a form that is drawn out from the potency of matter, but not for a form that is introduced into matter, as is the rational soul, which is produced by a distinct act of production separate from the production of the composite.

Objection pressed yet further. If the rational soul is produced by a distinct act of production from that of the composite, it would be produced before the composite, since a part is prior to the whole. But it was asserted above that the soul does not precede the composite, nor exist prior to it. I say that it precedes not in time but only by nature, which is sufficient to preserve everything that has been set forth above.

Article II. Whether the Rational Soul Is an Informing or an Assisting Form.

Averroes (*de anima*, com. 5) imagines that the rational soul is a single form assisting all people, and tries to show that Aristotle holds the same view, as may be seen at length and with learning in Aureolus (2. *dist.* 16, *quest.* 1, *art.* 1), who treats it at length; and Scotus touches on it (2. *dist.* 3, *question* 6, §. *Ista positio ante B.*), calling it a fiction of that cursed Averroes. And Alphonsus (*lib.* 2. *adversus haereses*, *verbo Anima*) says it is the error and heresy of a certain Peter John. No less serious appears to be the error of Pythagoras and his disciples who posited Metempsychosis — that is, the transmigration of souls from one body into another body. Plato gives this view his support in the *Timaeus* and in the last book of the *Republic*, according to Augustine (10. *Civit.*, c. 30 and *serm.* 139. *de tempore*), where he refutes that opinion, and (11. *de gen. ad lit.*, cap. 29) calls it ridiculous and harmful. And Alphonsus, cited above, includes it among the heresies of the Albigensians in heresy 8. The true and Catholic doctrine is that of Scotus (4. *d.* 43, *quest.* 2, §. *Respondeo A.* and 2. *dist.* 17, *quest.* 1), St. Bonaventure (*ibid.* *dist.* 18, *art.* 2, *quest.* 1), Richard (*dist.* 17, *art.* 1, *quest.* 3), Aureolus, and others, teaching that rational souls are multiplied in correspondence with the multiplication of human bodies, that one soul does not migrate from body to body, and that the soul is a true informing form.

Note I, and recall from what was said in Book II, Physics, question on Form, that form is divided into two kinds: assisting and informing. The assisting form is that which assists and directs something, as a charioteer directs a chariot and a sailor directs a ship. The informing form is that which gives being to a thing — its specific, quidditative, and essential being — by reason of which one thing differs from another in species, as a dog from a lion and a plant from a tree.

Note II. Aristotle indeed asserts that certain informing forms are mortal and corruptible, as experience shows through the perennial generation and corruption of sublunary living things, vegetating and sensing, which we observe daily now arising and now perishing. But whether the same holds for the rational soul is a matter of doubt, as I shall show below. We may, however, set forward and distinguish three propositions: the first is that the rational soul is an informing form; the second is that the rational soul is non-organic and incorporeal; the third is that the rational soul in itself and by reason of its own nature and essence is incorruptible and immortal. Concerning the first two Aristotle does not seem to be in doubt, as will appear from the arguments we shall adduce to prove and confirm the next assertions. Concerning the third, the same Philosopher was undecided. For this reason, following various and differing principles, he spoke variously and in differing ways, as will appear from what is said below.

First Assertion: There is not one rational soul assisting all and each of the members of mankind; rather there are as many individual human souls as there are individual and particular men, and one soul does not migrate from body to body. This is suggested by the Doctor in the passages cited above and is

forcefully defended by the Seraphic Doctor just cited, who calls the opposing view false, heretical, and most pernicious.

The first part is proved as follows. Every man has his own soul, by which he is a man and this man, distinct from all others. Therefore there is not one soul common to all men and assisting them all. The antecedent is shown: man is a species that is predicated in the what-sense of many individuals differing in number, which are its singular and individual instances. But each singular and individual instance participates in a complete singular and individual nature, which in animate beings consists of body and soul. Therefore each man has his own soul, just as he has his own human body, and accordingly there is not one common soul assisting all.

Second, one soul exercises its actions and operations through its own powers and faculties. But it is evident from the individual instances of human nature that various, diverse, and mutually opposed actions and operations proceed simultaneously — as is apparent daily in business, letters, arms, and the like. Therefore, in proportion to the number of human individuals, just so are human souls numbered.

Third, if there were one soul assisting all men, then since only the soul is capable of knowledge, either all men would be learned and educated, if that soul enjoyed knowledge and learning, or all would be ignorant and unknowing, if that soul were devoid of knowledge and learning. Likewise, since good and evil, merit and demerit, beatitude and misery, glory and punishment are derived from the will of the soul, all would be good, blessed, and glorious according to the goodness, blessedness, and glory of that soul; and conversely, evil, miserable, and unhappy according to the wickedness, misery, and unhappiness of that same soul. But these and similar consequences conflict with truth, and most especially with orthodox faith. The Fourth Lateran Council under Leo X, session 8, adds in these words: "We condemn and reprobate all who assert that the intellective soul is one and the same in all men."

Furthermore, the assisting form only moves and directs the thing it assists; it does not cause vegetative, sensitive, and intellective functions in it, as is evident from the charioteer, the sailor, and the angel moving the heavens. For the chariot, the ship, and the heavens do not vegetate, sense, and understand, as a man vegetates, senses, and understands by having a rational soul. Therefore there is plain and evident indication that the soul of man is not an assisting form, nor one that is the same in all.

The second part is proved, first, from Augustine (*1. 2. de Symbolo ad catechumenos, cap. 9, Tom. 9 of his works*), who offers these words: "Certain persons have introduced the view that souls are assigned to bodies according to merits, and that there are revolutions and cycles, which David reproaches in Psalm 11: 'The wicked walk in circles.' Those who believe such things are wicked." Second, if a

soul were to pass from one body to another, it would recall that passage and that state, and would recount what it did in that state and during that transition, just as St. Paul did (*1 Cor. 12*) when he was caught up to the third heaven and heard secret words which it is not lawful for a man to utter. And Aristotle (*1. post., cap. 2, T. 5*), refuting the view that knowledge arises through recollection, adds that it is impossible for habits existing in us to be hidden from us. If, then, a soul remained in one body and afterward migrated to another body, it would plainly recall that state and the deeds it performed there, as well as that migration. But since no recollection whatsoever is had of these things, it is plainly shown that such a transmigration of souls is empty and void.

Third, according to orthodox teaching, when a man dies, his soul is at its terminus: either it flies to heaven, or it is led below to be purged in purgatory, or for its demerits it is punished with eternal torment in hell. It is therefore a fiction and a dream to believe in the aforesaid transmigration of souls.

Second Assertion: The rational soul is an informing form. Handed down by the Doctor in the places cited. It is proved, first, from the Council of Vienne under Clement V, on the highest Trinity and the Catholic faith, chapter unicum, in these words: "We condemn as erroneous and hostile to the truth of the Catholic faith, upon the approval of the aforesaid holy Council, any doctrine rashly asserting or calling into doubt that the substance of the rational or intellective soul is not truly and essentially the form of the human body." The Fourth Lateran Council under Leo X defines the same. From Aristotle (*2. de anima, cap. 1, T. 6*): "The soul is the first act of an organic body." By "act" is understood "form," for this saying is on everyone's lips: from act and potency a whole is made, that is, from matter and form a composite is made. Under that definition of the soul the rational soul is comprehended, which is truly a soul and the most noble of all souls. This is most evident from the second definition of the soul given there (*cap. 2, T. 24*): "The soul is the principle by which we live, sense, move, and understand." Therefore, since the other souls are, according to Aristotle and in truth, informing forms, the rational soul is likewise an informing form.

Third, form is defined by all as that which gives being to a thing, actuates matter, determines, specifies, and perfects it. But the rational soul gives to man his being as a living, sensing, and understanding thing. For by it man lives, senses, and understands, and is distinguished from everything that is not a man. Therefore it is his informing form.

Fourth, every man, and any man whatsoever, is master of his own acts, so that it is within his power to will, or not to will, or to decline to will. But if the rational soul were not an informing form, man would be in no way master of his own acts, as is plain in the case of a chariot, whose assisting form is the charioteer, and the heaven, whose assisting form is the angel assigned to it by God.

Objection I. Aristotle (*2. de generatione animalium, cap. 3*) openly writes that the soul arrives at the body from outside and from without. Therefore it is an assisting form, not an informing one. I respond that Aristotle is to be understood as saying that the rational soul is not drawn out from the potency of matter, as other forms and souls are, but is introduced and infused into the body — which is the same as being created by God, as orthodox faith teaches us.

Objection pressed further. The same Philosopher says (*1. de anima, T. 92*) that one cannot imagine which part of the body the soul occupies. Therefore it does not inform the body but only assists it. I say that the aforesaid Philosopher is there only indicating that the soul is not confined to any part of the body, but is whole in the whole body and whole in each part of the body, as I have asserted elsewhere.

Objection pressed yet further. From (*3. animae, T. 4 and 6*): the intellect is unmixed and separated from matter. Therefore the soul is an assisting form. I say this is to be understood not with respect to being but with respect to operation — that is to say, the intellect operates without matter, since it is immaterial and purely spiritual.

Objection II. Ferchius (*1. 4 defens., c. 4, n. 42*) maintains and argues from (*1. anima, T. 63, 65*) that Aristotle posits a circulation of rational souls. Therefore Aristotle does not contradict Pythagoras regarding the transmigration of souls from one body to another. I respond that nothing is found in those texts that favors the Pythagorean error. Therefore, with equal facility as those passages are adduced by Ferchius, they are refuted.

Objection III. The spiritual cannot be the form of a material being, since the former cannot be extended to the extension of the latter, as it is indivisible and inextensible. But the rational soul is spiritual and immaterial. Therefore it cannot be the informing form of the human body, which is material and organic. I deny the major premise. Nothing prevents a spiritual form from informing a body that is material, just as there is no incompatibility in spiritual accidents being received in a material and corporeal subject.

Objection pressed further. An angel, which is spiritual, cannot inform matter. Therefore neither can the rational soul, since the reasoning is equally applicable to both. Scotus responds (*Quol. 9*) that there is a disparity: the angel is complete and perfect in its entity and nature, whereas the rational soul is incomplete and imperfect and is a part of the human species. For this reason the soul can inform matter and perfect the human body, from which together with the soul a man coalesces as a complete and perfect species.

Article III. Whether the Rational Soul Is Immortal.

The Sadducees, Epicureans, and not a few others, whom Alphonsus refutes (*lib. 2. adversus haereses, haeresi 7*), make the rational soul perishable and mortal. Lucretius agrees with them, according to Augustine (*lib. de utilitate credendi, ad*

Honoratum, cap. 4), and Pliny (7. *hist. naturalis*, cap. 55). Nor does Galen seem to depart far from this view in the book entitled *That the Morals of the Soul Follow the Temperament of the Body* (cap. 3. 4), where he considers the soul to be the temperament of the four primary qualities, which is dissoluble and corruptible. The remaining Philosophers, in the Academy, in the Lyceum, and in the other schools, teach the incorruptibility and immortality of the rational soul, which is one of the chief foundations and pillars of orthodox faith and Christian religion.

Note that immortality can be understood in three ways. First, as meaning complete immutability and perfect necessity, in which sense St. Paul, speaking of God (1 *Tim.*, last chapter), says: "Who alone has immortality" — that is, according to Augustine's interpretation (*Tract. 23 in Ioan.*), who alone has immutability, because he alone has true eternity. Hence God alone is immutable and supremely necessary, while all other things are mutable and contingent, for they subsist and are conserved solely by the will of God and his sustaining power. Second, immortality means that which lacks the principle of corruption and mortality, namely matter with the privation annexed to it. In this sense, things that are separated from matter — such as an angel and the rational soul — are incorruptible and immortal. Third, immortality means that which by its own inherence and assistance renders something incorruptible and immortal; in this sense Adam, had he remained in the state of innocence, would have been incorruptible and immortal by means of original justice bestowed upon him by God.

Assertion: The rational soul is immortal. It is proved, first, from sacred scripture. Ecclesiastes 12: "Man shall go to his eternal home." Wisdom 11: "God created man inexterminated, and made him in the image of his own likeness." The image of God in man, however, is placed not in the body but in the soul. Since, then, man is inexterminated with respect to the soul, it plainly follows that the soul itself is incorruptible and immortal. Matthew 10: "Do not be afraid of those who kill the body, but cannot kill the soul." And John 10: "He who hates his soul in this world preserves it for eternal life." From these and other testimonies of scripture, the immortality of the human soul is clearly and openly established.

Second, it is defined in the Third Lateran Council, session 8, which reads: "We condemn and reprobate all who assert that the intellective soul is mortal and call this into doubt, since it not only truly, essentially, and per se exists as the form of the human body, but is also immortal, as is manifestly evident from the Gospel."

Third, from the Fathers: Augustine, who composed a book on the immortality of the soul; Nazianzus (*lib. de anima*); the Nicene Father (*orat. catech.*); Gregory (4. *Dialog.*, c. 45); and all the rest, unanimously teaching the immortality of the rational soul. All Theologians and Scholastic Doctors subscribe to this. All Philosophers agree; all Poets, all peoples and nations under heaven, with one

mouth and voice proclaim the immortality of the soul. Hence the Complutensians (*disp. 16. de anima, q. 2, §. 2*) consider this universal and unanimous consent of all to be the voice of nature, clearly and plainly proclaiming the immortality of the soul, such that it is naturally and evidently demonstrated. This, to be sure, urges and presses the point, but it does not demonstrate and compel. Therefore not everyone assents and agrees; indeed many dissent and resist, as I noted at the beginning of this article and will become yet more apparent below.

Objection pressed further. St. Chrysostom (*hom. 4. de providentia*) explicitly says: "One who doubts the immortality of the soul might also doubt whether midday is daytime." Therefore, according to Chrysostom, it is known and evident that the soul is immortal. I say that he is speaking there to the faithful, for whom the soul's immortality is made known and manifestly established not by natural and demonstrative reason but by sacred Scripture and most especially the Gospel, as the aforesaid Third Lateran Council decrees. And Augustine noted beforehand (*13. Trin., cap. 9*) that immortality is known not through reason but through the Gospel, as Christ teaches in Matthew 10: "Do not be afraid of those who kill the body, but cannot kill the soul."

Fourth, in every well-ordered state a judge and governor is established who bestows rewards upon the good and just and punishes the evil and unjust. But the world is like an admirably disposed and most rightly ordered state, in which there exist the good and the evil, the just and the unjust. The former, however, are for the most part afflicted and oppressed, while the latter prosper, rejoice, and fare well. Hence Jeremiah 12, weeping, says: "Why does the way of the wicked prosper? Why do all those fare well who transgress and act unjustly?" Therefore there must be God as ruler and governor, a just judge and equitable rewarder of all the good and evil, who after death assigns to each the rewards fitting to their merits. And this would not come about unless the soul were immortal, since these things occur in the present life; otherwise God would be accused of injustice, as if punishing the just and rewarding the impious.

This argument is indeed pressing, but it is not compelling. For someone might come forward and say that it is not demonstrated that God is the ruler of the universe, the present or future rewarder of good and evil. For God is not bound and constrained to offer and repay this or that, since he is absolutely no one's debtor and can make vessels for honor and for dishonor according to his own pleasure, without any injustice. Add that some think God necessarily acts outwardly and remove divine care and providence from sublunary things — an opinion they would not hold if it were shown by evident reason that God is the ruler and governor of the world and the rewarder of all things according to the laws of distributive and punitive justice. But if what the argument intends is conceded, one must respond that virtue and justice carry with them their own good and reward, since their beauty and pleasure are so great that, as Cicero

testifies, if they could be seen with the eyes they would move all to love them. Evil and sin, however, carry their own punishment and torment on account of their ugliness and baseness, for it is as a worm gnawing at the bowels of the sinner. Hence Augustine adds (*1. Conf. 12*): "You have commanded it, Lord, and so it is, that every disordered soul is its own punishment." And David had already experienced this (*Psalms 90*), saying: "My sin is always before me" — on which Lyranus comments: "It is horrible to me, like an adversary standing continually against me in my presence."

Objection pressed further. St. Chrysostom, cited by the Complutensians and the Conimbricenses, writes: "Just as it is known that God is just, so it is evident that the soul is immortal." And Clement, in the third book of *Recognitions*, testifies that he learned this truth from St. Peter. I say that these Fathers are to be interpreted with the presupposition of faith: for the immortality of the soul is known from sacred writings, especially from the Gospel, as the Lateran Council declares in these words: "It is manifestly evident from the Gospel." The Council of Vienne under Clement V confirms this, and Augustine supports it (*epist. 3. ad Volusianum*), saying: "Who is there now so extremely ignorant, or what woman, who does not believe in the immortality of the soul and in the life to come after death?" Note here the word "believe," which pertains to faith, not to knowledge. All the more so because faith and knowledge of the same thing cannot coexist simultaneously, since the former is obscure and enigmatic while the latter is clear and evident. Moreover, the aforesaid Conimbricenses (*art. 5*) themselves assert that this proposition concerning the immortality of the soul is a matter of faith, as indeed it is. Therefore it is not demonstrated, since through demonstration one obtains knowledge; otherwise, concerning the same thing there would be simultaneously faith and knowledge, which involves a contradiction.

Nor does it help to say that this is not contradictory, because concerning God one simultaneously has both knowledge and faith — for we believe that God exists and demonstrate that God exists from effect. Therefore, it is not contradictory that immortality of the soul be acquired both by faith and by knowledge. Indeed, one who acquires knowledge that God exists does not simultaneously have knowledge and faith concerning the very existence of God, but only knowledge, as I showed in the *Summa Theologica*, Tract on the One God (*disp. 1*) — just as one who saw Christ crucified did not have faith concerning that crucified one. So too one who demonstrates that God exists has not faith but knowledge of him as existing. Likewise, if the immortality of the soul is properly known, it is not simultaneously believed. Now the said Authors assert that it is believed. Therefore it is not demonstrated and known through a necessary and evident middle, as properly speaking knowledge requires.

Fifth argument: A per se subsisting and spiritual form is incorruptible and immortal. But the rational soul is such. Therefore it is incorruptible and

immortal. I distinguish the major premise: concerning a complete and perfect form subsisting with total and complete subsistence, as an angel, I grant it; concerning a partial form subsisting with partial and incomplete subsistence, as is the rational soul, which is a part of the body and which together with the body constitutes the composite that is man, I deny it. For the point to be proved is precisely that a partial form can exist and subsist on its own without the body and endure and live forever.

Objection pressed further. A form that is unmixed and separable from matter is incorruptible and immortal, since corruption and mortality arise from matter with the privation annexed to it (*1. Phys. T. 51*). But the rational soul is separable from matter and from all else, just as the eternal is from the corruptible (*2. animae, T. 21*). Therefore by its own nature it is incorruptible and immortal. I say the major premise holds of a form that is separable from matter with respect to both being and operation; but not of one that is separable only with respect to operation, as is the rational soul, whose intellect in understanding does not depend on the body as sight depends on the organ. This is how Aristotle is to be interpreted, as appears from the same (*1. de anima, T. 66*): "The intellect is corrupted in us when something interior is corrupted." But more on the mind of Aristotle below. One may also say that the human intellect in its operation depends on the body and the sense, according to the Philosophers' axiom that nothing is in the intellect that was not first in the sense. For all our cognition and understanding takes its origin from the senses. Therefore our intellect depends on the body in both being and operation.

Sixth argument: A natural appetite and desire is not in vain and superfluous (*1. caeli, T. 32; 3. animae, T. 46*). But man naturally desires to exist and live always. For this reason, to the extent he can, he flees death, with an eye to which St. Paul perhaps adds: "We do not wish to be unclothed, but to be further clothed" (*2 Cor. 5*). Therefore the soul is immortal, since such a desire for eternal life is made known to us naturally. This is corroborated by the fact that man by his own nature desires happiness (*1. Eth., c. 17*), and it is evident that happiness is everlasting. Therefore the soul is equally immortal.

It is possible to reply that this argument is insufficient and ineffective, since it is not evident, nor is it evidently proved, that always existing and living belongs to man. Indeed the opposite is observed, for man is seen to grow old, to be corrupted little by little, and at last to die. But when the whole is corrupted, the parts must necessarily be corrupted. Therefore, although man may desire to live always, nevertheless everlasting life is not possible for him, nor can it be necessarily proved to belong to him — just as a brute avoids death and flees what causes its death, even though it is subject to corruption and death. Therefore the immortality of the soul is not necessarily shown from appetite, whether innate — which is a natural inclination to the preservation of life — or elicited — which can be directed toward something impossible apprehended as

good and fitting, and toward something erroneous if there is delusion in the apprehension and pursuit of what is desired and sought after.

Objection pressed further. The natural appetite is upright and good, since nature always tends toward the good. Hence that saying: no one looking to evil acts, but rather turns from evil and does good. If, then, someone proposes perpetual life to himself, he desires and pursues it with a natural appetite not leading to the impossible or to what contradicts and opposes itself. I say that one who desires something with an elicited appetite must first consider whether that thing can come to be or not — otherwise it will be the appetite of one who errs and is foolish. But an everlasting life of man is impossible, as is established by experience concerning all and each of the men who are born, live, and afterward die. To the inference, it is said that the natural felicity acknowledged by Philosophers is not everlasting, since some place it in goods of the body, some in goods of fortune, and others in goods of the soul, all of which decline and come to an end, as I showed in Moral Philosophy. But supernatural beatitude, which consists in the clear vision and enjoyment of God, is known to us by faith, not demonstrated.

Seventh argument: From its operation the form is argued and recognized, since form is active and matter passive. But the operation of the rational soul is intellection not only of singulars but also of universals. For it understands principles, transcendental and predicamental terms, real and rational beings, their combinations; it reasons from what is known to what is unknown; from principles and premises it draws conclusions; it syllogizes both demonstratively and dialectically; it knows that it knows and understands that it understands. These and similar acts distinguish the rational soul itself from the vegetative and sensitive souls, which only perceive material singulars, and render it like to God and the angel. Therefore, just as God and the angel, endowed with intellect and intellection, are immaterial and immortal, so too the soul. This argument is considered by many to be demonstrative and irrefutable, but it seems to Scotus and his disciples to be soluble and dialectical. For God and the angel are independent of matter in both being and operation, whereas the human soul is not — according to that passage (3. *de anima*, T. 30): "One who understands must contemplate phantasms." For it is the informing form of man, attached to the senses, which are the first guides of our cognition, and therefore dependent on the body.

Objection. Scotus (*Quol. 9, art. 2, near the end*) demonstrates from intellection, which is the operation of the rational soul, its immateriality and immortality, and adds that it is a common middle term for showing the immateriality and immortality of both the angel and the soul. Therefore, say the Conimbricenses, by natural demonstrative reason — even according to Scotus — the immortality of the soul is proved. I say that in that place Scotus only shows that the receiving subject of intellection, which is a spiritual action, is the intellective soul, which is

spiritual, and that from intellection, which is an immaterial operation, the immateriality of the soul is argued. But the same Doctor there does not say that the immortality of the soul is proved necessarily and by a demonstrative middle, as the Conimbricenses wrongly infer, but only by a probable and dialectical one, as he says (*4. d. 43, q. 2*), confirmed from Augustine (*13. Trin., cap. 9*) in these words: "By human reasoning only a few, richly endowed with genius and at leisure for study and versed in the most subtle disciplines, have been able to arrive at investigating the immortality of the soul alone." And Gregory (*4. Mor., near the end*), having employed certain probable arguments to persuade in this matter, says: "Let one who is unwilling to believe on account of these arguments believe on account of faith." And St. Paul (*Acts 17*), preaching the resurrection of Christ the Lord — which cannot occur without the immortality of the soul — before certain Athenian Philosophers of keen intellect and using natural reason, among whom was St. Dionysius, was thought to be an announcer of new demons. And in that same chapter 26 he was considered mad by Festus. And what Paul there says about the resurrection and about a grain falling into the earth is only probable, in no way capable of being demonstrated and made evident. I add that the Lateran Council defines the immortality of the soul to be manifest from the Gospel. But what is known from the Gospel is not shown by necessary and evident reason — it is believed by faith. The Council of Vienne under Clement V, in the section *porro*, establishes the same thing. Lyranus (*in cap. 14. Iob*), Cajetan (*in cap. 9. Rom. and in cap. 4. Ecclesiastes*), Vatablus (*ibid.*), Scaliger (*exerc. 907*), ALL. (*disput. 10, sect. 1, subsect. 2*) subscribe to this, and Ruverius (*tract. de anima separata, q. 4*) finds it not displeasing, along with others of outstanding standing in the law. Hence the Toletan (*3. animae, c. 5, q. 16*) and the Conimbricenses (*Tract. de anima separata, disp. 1, art. 3, near the end*) are undeservedly not afraid to censure the aforesaid Authors for rashness, when rather they themselves appear to incur rashness by daring to consider those men worthy of censure.

Objection I against the foregoing assertion. Leviticus 21: "He shall not go in to any dead soul" — that is, the priest shall not. If, then, the soul dies, it is assuredly mortal, since the consequence from act to potency holds. **Corollary I:** Ecclesiastes 3: "There is one end for man and for the beasts, and the condition of both is equal." But the souls of brutes are mortal. Therefore so too is the soul of man. **Corollary II:** Job 14 seems to foreclose the way and the hope of rising again, when it says: "But man when he shall be dead and stripped and consumed, where, I pray, is he?" If, then, nothing of a man remains after his death, his soul is mortal, as his body is mortal and the whole man is mortal. Augustine responds (*3. 99 in Levit., q. 81*) that by the presence of the soul the temporal life by which something subsisted took on its name, just as elsewhere the soul of every blood is said to be its blood. And from the same Leviticus (*cap. 24*), the same Augustine (*ibid. q. 78*) calls the soul the very life of the body, which life comes through the soul, and thereby wishes to show that a murderer strikes

the soul of a man and by striking deprives the man of life. To the first corollary, Lyranus responds and says that it is a tacit objection of the impious — specifically of the Sadducees, who deny that the angel and the soul are immortal and deny the resurrection of the dead. Or say that it is to be interpreted as referring to the composite: just as the composite of a brute is dissolved and dies, so too the composite of a man — but not the soul. For the soul of a brute is drawn out from the potency of matter and is therefore mortal; but the soul of a man is created by God and is therefore immortal. To the second corollary, the same must be said — namely, that when a man dies, the whole dies and is corrupted, but his soul remains incorrupt, since it is incorruptible and immortal, as is urged and indicated there through the future resurrection.

Objection II. The Sixth General Synod (*actione 11, in the epistle of Sophronius*) seems to sanction and define that invisibles and immaterials — among which number are the angel and the rational soul — are incorruptible and immortal not by nature but by grace. Therefore the soul is not incorruptible and immortal by its own nature. St. Bernard (*5. de consideratione ad Eugenium*) seems to hold the same view, especially concerning the angel. I respond that the aforesaid Council is speaking of immortality taken in the first sense, which belongs to God alone, as I noted in the preceding note. Hence the Church sings daily from (*1 Tim. 1*): "To the King of ages, immortal" — but not of immortality taken in the second sense, which the angel and the rational soul possess, since they are devoid of matter and of the privation annexed to it, which is the cause of mortality and corruption (*1. phys. §*).

Objection III. If the rational soul is immortal, it is so above all because it is not drawn out from the potency of matter but created, and because it is spiritual and immaterial. But there are certain forms that are not drawn out from the potency of matter but are created, and are spiritual — such as grace — and yet are corruptible. For grace is corrupted by mortal sin. Therefore the same seems to have to be said of the human soul. I grant the major premise; I distinguish the minor. With respect to efficient cause, I deny it; with respect to meritorious cause, I grant it. That is to say, the sinner merits that God no longer conserve grace in him. For this reason grace is not properly speaking corrupted; it is annihilated through the withdrawal of the divine concurrence. Or say that the discussion concerns a spiritual form subsisting per se, as is the rational soul, not a spiritual form inherent in a subject, such as grace, the act of understanding, and the act of willing, which are accidents.

Article IV. What Aristotle Holds Concerning the Immortality of the Soul.

Aristotle's interpreters fight bitterly over the question of the soul's immortality. Alexander (*de anima*), Justin Martyr, Nyssenius (*lib. de anima*), Nazianzus (*contra Eunomium*), and not a few others affirm that Aristotle made our soul perishable, corruptible, and mortal. On the contrary, Theophrastus, Ammonius, St.

Bonaventure (2. d. 19, q. 1), St. Thomas (2. contra Gentes, cap. 79), and many others hold that Aristotle considered our soul to be immune from all corruption and mortality. But Scotus (3. d. 27, q. un., §. *Istis igitur, sub G.* and 4. d. 43, q. 2, §. *de 2. propositione*, and §. *potest dici*); Heraeus (*Quol. 1, q. 11*); Niphus (*opusc. de immortalitate animae, c. 1*); the Conimbricenses (*tract. de anima separata, disp. 1, art. 2*); Cavellius (*disp. 1. de anima, sect. 12*); Poncius (*disp. 62, q. 3, concl. 2*); Bassolis (4. d. 43, q. 3, art. 3); and the other Scotists consider that Aristotle was undecided about the immortality of the soul and did not adhere more to one side than the other, but leaned now toward one and now toward the other view according to the occasion of the matter he was treating.

Note, from Bassolis just cited, that toward establishing the immortality of the soul according to Aristotle, certain passages and arguments drawn from Aristotle himself are helpful, adduced by those who in his school favor the affirmative side; and that toward defending the mortality of the soul in that same Philosopher's view, his own principles and foundations are helpful, as adduced by those in his Lyceum who adhere to the negative side. All of these arguments, on both sides, will be adduced and weighed by us below. Furthermore, it must not be omitted that Aristotle said many things not assertively but in a spirit of inquiry and doubt, and also in keeping with the opinions of the ancient Philosophers and the common view. Hence (2. *caeli, T. 60*) he writes: "About these things we have the greatest doubts; the Philosophers have always found brief sufficiencies sufficient where they could not attain to greater things, so as not to contradict the princes of Philosophy." And a little later: "The Egyptians and Babylonians tell of other stars, from whom we have many credulous reports about each of the stars. And hence the Philosophers sometimes acquiesce for the sake of their probable persuasions, sometimes for the sake of the assertions of their own principles, beyond necessary reasoning."

Arguments for the mortality of the soul are here proposed and refuted, drawn from the writings and principles of Aristotle.

The first argument: from (8. *Phys.* and 1. *caeli*), the world was made from eternity, and the generations of men are infinite. But their bodies, since they are corrupted at death, do not remain. If, however, their souls are immortal — since infinite generations have preceded — there would actually be an infinite number of human souls. But this contradicts (3. *Phys., T. 35*), where the Philosopher of set purpose refutes the actually infinite, whether in magnitude or in multitude. Lest, therefore, he admit an open contradiction, it is inferred that he holds the soul to be mortal and corruptible. It may be replied that an actual infinite does not follow, since the infinite is defined as that to which no addition or subtraction can be made. But given whatever souls you please, yet others can always be given, to infinity — which is not an actual and categorematic infinite, which Aristotle rejects, but a potential and syncategorematic one, which he does not deny.

Second argument: What has a beginning likewise has an end (*1. caeli, c. 12, T. 126*). But the intellective soul begins to exist (*12. Met., c. 3*). Therefore it ceases to exist and is accordingly mortal. It may be said that Aristotle is speaking there of the composite, which is generated and corrupted, not of the soul, which properly speaking is not generated — for if it is an irrational soul, it is drawn out from the potency of matter; but if it is a rational soul, it is created and introduced into matter aptly prepared and well disposed.

Third argument: When the composite is corrupted, it is resolved into elements; and if anything of it remains, it belongs to matter (*7. Met., T. 60*). Therefore no form remains uncorrupted at the corruption of the whole. But the rational soul is a form. Therefore it is mortal. It may be said that the Philosopher is speaking there indefinitely, just as in (*1. phys., T. 83*) he proposes to treat of generable and corruptible forms, while also treating in its proper place of the incorruptible form that is the rational soul. Therefore to that testimony I say it is true of the composite from matter and a form drawable from the potency of matter, but not of a form that is introducible — as is the rational soul.

Fourth argument: From privation to habit there is no return (*c. de oppositis, post praedicam.*), and the same thing numerically cannot return (*2. de gener., c. ult.*). If the soul were immortal, when a man dies it would be separated from his body and would then either be reunited to the body — and this the Philosopher does not know, since the future resurrection is not demonstrated naturally — or it would persist in this separated state, and since it inclines toward the body because it is its intrinsic form, it would be in a violent state. But nothing violent is perpetual (*2. caeli, cap. 3, T. 18*). Therefore it is inferred that the soul is mortal. It may be said that the soul separated from the body no longer desires union with the body, because, as Avicenna says, its desire for it is satiated from having once been joined to the body. Therefore it does not exist violently outside the body.

Fifth argument: The soul cannot understand anything without phantasms (*3. anima, T. 39*). But a soul that cannot understand except through phantasms cannot be segregated from the body. And what cannot be separated from the body is mortal. Therefore the intellective soul is not exempted from mortality. It may be said that this is true motivationally and by way of occasion, but not simply and absolutely, as I have explained elsewhere.

Sixth argument: If the soul enjoyed immortality, it would likewise enjoy perpetual happiness. But in (*12. Met., T. 39*) one reads: "God is always blessed; man, for a short time." Hence in (*1. Eth., cap. 10*), Solon is reproached because he holds that true happiness belongs to man after death. And indeed in the same work (*3. cap. 6*), after death nothing good or evil remains. It may be said that there the discussion is of the happiness had in the present life, fitting to man constituted of soul and body, and situated in created and finite goods, as I recalled above. This happiness does not belong to the soul separated from the

body. This same reply may satisfy the remaining two last testimonies and all those accumulated by Toletus (*2. de anima, q. 15*).

Arguments for the immortality of the soul are here adduced and resolved — authorities and reasons drawn from Aristotle in various and diverse places in his doctrine.

The soul is established as incorruptible (*1. anima, T. 65*) and as something divine and impassible (*ibid. T. 66*). Therefore the soul is considered immortal by Aristotle. It is responded that the Philosopher is not speaking there assertively but doubtfully, as indicated by the word "seems" that he places there, and the particle "perhaps" placed by him shortly after the text just cited. Or say that he is speaking relatively, not absolutely — that is, with respect to the organic faculty, which uses an organ; and because the organ is corrupted, that organic faculty is also corrupted. Hence there the Philosopher says: if an old man had the eye of a young man, he would see as well as a young man; but because the eye of the old man is not as whole and adequate as the eye of a young man but gradually decreases and is corrupted, he is therefore unable to see equally well. The intellect, however, since it is an inorganic faculty for the purpose of understanding and does not employ an organ, is therefore said to be incorruptible in its operation and understanding — even though in being, simply speaking, it is corruptible. Hence the same Philosopher adds in that place: "The intellect is corrupted in us when something interior is corrupted."

Second: A distinction is established between sense and intellect (*3. anima, 7*) in that a strong sensible corrupts the sense — as is evident if one gazes with fixed eyes at the sun shining at midday — while a most perfect intelligible does not injure but rather perfects the intellect, as when the intellect understands God. Therefore, if the intellect is impassible, incorruptible, and immortal, the soul is certainly immortal, since the intellect proceeds from it as its power and faculty. But a spiritual faculty cannot emanate from a material and corporeal essence and nature. It is satisfied if one says this happens not per se but per accidens — that is, by reason of the organ, which is harmed by a strong sensible and by means of which the operation proceeds that comes from the whole composite (*1. anima, 64*). But the intellect, since in understanding it does not use an organ and is a faculty of the soul alone, is therefore not harmed in understanding by an excellent intelligible, and is said to be separable in operation but not in being, since the soul is an intrinsic and essential part of the composite, or of man. The same reply is to be made to (*2. de anima, c. 17, 11* and *c. 2, 7, 21*).

Third: The soul was not produced before the body. But the intellectual soul itself can remain after the body, (*12. Met., c. 3, 7, 17*), because it exercises an action separated from the body, namely contemplation. I respond that the Philosopher is speaking there conditionally and not absolutely, as the conditional particle "if," which he repeats there, indicates: "if anything later remains"; and a little later: "if the soul be such, not all of it, but the intellect."

Fourth: The vegetative and sensitive souls are produced by the power of the seed and drawn out from the potency and womb of matter; not so the rational soul, which comes from without and approaches from outside, communicating nothing with the body, and therefore can exist without it (*2. de generatione animalium, cap. 3*), and thus is incorruptible and immortal. I respond that this was said dialectically and in the way of opinion, not assertively and demonstratively. For neither there nor elsewhere does Aristotle adduce any necessary and demonstrative reason. And whether the soul is produced by education or by creation is a matter of great doubt in Aristotle himself, as Scotus pursues at length and with care (*in 4. cit., §. potest dici, M. N. O.*).

Fifth: Matter is that by which a thing can be or not be, since it desires all forms. But the rational soul is devoid of matter, since it is spiritual. Therefore it is immortal. The major premise is Aristotle's (*7. Met., T. 22*); the minor is the same author's (*3. animae, 4*). I respond that the major premise holds for a composite from matter and form, which is properly speaking generable and corruptible, whose cause of corruption is assigned to matter with its appetite for the forms it lacks — not, however, for the soul; otherwise, since other souls are not composed of matter, they would be incorruptible and immortal like the rational soul, which is false.

Sixth: The brave man must desire death and expose himself to it for the Republic, according to the judgment of natural reason (*3. Eth., c. 11* and *9. of the same work, c. 9*). Therefore the immortality of the soul is shown by natural reason. The consequence holds: for no one, for whatever good proposed to himself, whether particular or common, ought to or can desire non-being; since, as Augustine says (*3. de libero arbitrio*), non-being cannot be desired, since desire is directed toward some being. But if the soul were not immortal, one dying would desire his own non-being, since death is the privation of the life of the whole animated composite. The response must be that the brave man ought to die for the common good for two reasons: first, because the common good is to be preferred to the particular good, such as the life of the brave man; and second, because an intense good, even though momentary, is better than a diffuse good, even if lasting a long time. The brave man acquires for himself a great good by performing the great act of virtue when he dies for the Republic — a good of which he would be deprived if he lived long in idleness and vice.

Question II. On the Intellect of the Rational Soul.

Article I. Whether There Is an Agent Intellect and What It Is.

The opinion of Philosophers concerning the agent intellect is concordant in the affirmative, with a few exceptions who are followed by Durandus (*1. d. 3, parte 2, quest. 5*). What it is, however, is a matter of disagreement among them, as may be seen in the Seraphic Doctor (*2. d. 24, art. 2, quest. 4* and *ultima*), Aureolus (*d. 17, art. 1*), Henry (*Quol. 8, quest. 12*), and the Conimbricenses (*3. de anima, cap. 5, quest.*

1, art. 1). Some, such as Alexander (2. *anima*, cap. 20) and others, hold that the agent intellect is God. Some, such as Avicenna (9. *Met.*, cap. 4), consider it to be a separate substance or angel, which they call the *Cholcodaea*. Others, such as Zimara, think it is an essential part of the soul. But Scotus (*Quol.* 15), Lychetus, Gadius there, and the other Philosophers (3. *anima*, cap. 5) commonly and unanimously teach that the agent intellect is a faculty and power of the rational soul.

Note, from Aristotle (3. *de anima*, cap. 3, T. 18), that the intellect is divided into two: the agent and the patient. The former is what renders material species spiritual. Hence it is said by Scotus, cited above, to transfer things from one order to another — that is, from the material order to the spiritual order. And by Aristotle just cited, the agent intellect is described as that "whose function it is to make all things" — that is, to make all things spiritual out of material ones. The latter, which is called both passible and possible, is what receives intelligible species in itself, and is therefore called patient, since it is the receptive faculty of species, or also because it receives the intellection of any intelligible object whatsoever. Hence it is described by Aristotle in the same place as that "whose function it is to become all things" — that is, whose office it is to receive all intelligible species and the intellections of any thing whatsoever.

First Assertion: There is an agent intellect. Handed down by the Doctor (*Quol.* 15, art. 1 and 2) following Aristotle cited above. It is proved, first: what is in passive potency for the reception of some perfection needs an active principle by which it can acquire that perfection. For nature does not fail in what is necessary; and to every passive potency there corresponds an active one, since these are correlatives, one of which being posited, the other is also posited. But the rational soul possesses a passive potency to receive the intellection of any thing, since it is like a blank tablet on which nothing has been written. Therefore it has an active principle by which it can obtain intellection for itself. This active principle of intellection is called the agent intellect. Therefore the agent intellect is to be admitted.

Second: The soul cannot of itself receive a material species of an intelligible object, because body does not act on spirit, nor is it received in spirit. Therefore, since an intelligible species received in the patient intellect is necessary for understanding — since "one who understands must contemplate phantasms" (3. *animae*, 39) — the agent intellect must be admitted, which renders the material species spiritual so that it can be received in the patient intellect.

Third: The vegetative soul participates in vegetative powers — namely, the nutritive, augmentative, and generative — and the sensitive soul in powers and faculties of sensing, which are the external and internal senses. Therefore the intellective soul also possesses its own powers and faculties, among which is the intellect; and since it is united to the body and attached to the senses, which only represent material species that cannot be received in it, the agent intellect

is assigned to it, which performs the office of transferring material species to the level of spiritual ones.

Fourth: The soul is the image of God (*Gen. 2*). But this image shines most especially in its powers — namely, intellect and will — as Augustine teaches (*14. Trin., cap. 8* and *15. of the same work, cap. 7 or 14*). Therefore the agent intellect, which purifies and renders spiritual the material species offered to it through the senses — which only perceive and represent material things — is not to be denied to it. Add also that everything produced and every effect has its own principle and cause. But intellection is a quality — something produced and caused, since it is the terminus of the intellectual faculty (*9. Met., 16*). Therefore its principle and cause is the agent or patient intellect.

Objection pressed further. If the agent and patient intellect are admitted, similarly a sensory agent and patient, a voluntary agent and patient, and so on for the rest would have to be admitted. But this division of the latter is not conceded. Therefore neither should the former be, since the reasoning appears equal for both. I say there is a disparity, because the agent intellect disposes and prepares its own object — rendering material things spiritual, making the unintelligible intelligible, and the non-universal universal, and abstracting it from material and singular conditions. But the senses and the other named faculties do not do this; they operate concerning their own objects without any disposition and preparation of those objects — as sight concerning color and hearing concerning sound. Therefore the division of sense into agent and patient is not admitted, nor any similar division of the other faculties and powers.

Objection. One intellect could exercise the aforesaid functions. Therefore either intellect is superfluous. The antecedent is shown: one and the same sight produces vision and receives it in itself; likewise one and the same intellect produces intellection and receives it in itself. Therefore the division of the intellect into agent and patient is empty and useless. I say it is probable that one and the same intellect can perform all those functions, as the Doctor hands down in the *Quodlibet* mentioned. Nevertheless the parity does not hold for sense and the other faculties, as I noted above, because the other faculties are engaged with their objects as already disposed and prepared; but the intellect, since it is spiritual and cannot of itself receive the material, and since it is bound to the senses that only attain the material and singular, provident nature for this reason gave the intellectual soul the agent intellect, which can perform all those functions. What Durandus, cited above, accumulates and objects is of no moment and can easily be dissolved from these assertions.

Second Assertion: The agent intellect is neither God, nor an angel, nor an essential part of the soul, but a faculty and its natural power. The assertion has four parts, which is inferred from the Doctor and vigorously defended by the Seraphic Doctor just cited. The first part is proved: first, from Aristotle at the

beginning of (3. *de anima*), calling the intellect "a part of the soul." But God cannot be a part of the soul, since a part involves imperfection and God is most perfect. Therefore the agent intellect is not God. Second, intellect and intellection are identical with the very essence of God. But the intellection of man is an accident, and his intellect is really identified with his substance. Therefore the agent intellect cannot be God. Third, there are many agent intellects, corresponding to the multiplicity of men. But God is one (*Deut. 6*): "Hear, O Israel, the Lord your God is one." Furthermore, God influences and illuminates every man with a general and common influx. Therefore all would participate in equal knowledge and science, if God himself were the agent intellect. Moreover, man would not be essentially understanding and rational, but extrinsically and by denomination — all of which and similar conclusions are plainly false and absurd. Therefore by no means is God to be considered the agent intellect.

The second part is ready to hand: both because the angel is not the agent intellect but the one possessing intellect; and because the angel is a complete and perfect substance incapable of being an informing form. Therefore it cannot be the agent intellect.

Objection. One might say it is an assisting form. On the contrary: an assisting form is considered assisting when the thing it assists cannot perform the functions the assisting form performs, as is evident from the sailor with respect to the ship and the charioteer with respect to the chariot. But man is essentially and intrinsically intellective only through intellect, just as he is volitional through will and sensitive through sense. Therefore the angel is not well established as the agent intellect of man, assisting him.

The third part is shown as follows: the soul is indivisible and impartible, as has been said and proved elsewhere. Therefore the agent intellect is not an essential and quidditative part of it. Moreover, the sense is not an essential part of a brute but its faculty and power. Therefore the same is to be thought of the agent intellect with respect to man.

The fourth part is argued: what emanates from the nature of something is its property, power, and faculty — as is evident from the heating power emanating from fire and the illuminating power proceeding from the sun. But the agent intellect arises from the intellective soul, and generally from intellectual nature. Therefore it is its power and faculty. Furthermore, each thing enjoys its own force and faculty: the vegetative possesses the nutritive, augmentative, and generative power; the sensitive participates in the powers of sensing, both external and internal. Therefore the intellective likewise possesses the power of understanding, since it is more excellent and superior to the other forms. Finally, the angel possesses intellect because it has an intellectual nature. Therefore man also enjoys intellect, since he is reasoning and intellective.

Objection I. The intellect is divine and impassible (*1. anima, T. 66*) and unmixed and separated from matter (*3. of the same work, cap. 1, T. 4*). But these belong to God. Therefore the agent intellect is God. **Corollary:** The agent intellect makes all things from the same (*3. anima, cap. 3, T. 18*). But God is the maker of all things, according to John 1: "All things were made through him." Therefore the agent intellect is God. I respond that not everything separated from matter is God; otherwise the angel and anything else spiritual would be God. The agent intellect is said to be unmixed in operation because it does not use an organ, unlike material faculties, which belong to the whole composite, as Aristotle clearly sets forth (*1. anima, 64*). To the corollary I say that the agent intellect makes all things — namely, sensible things, intelligible things — but not absolutely, as God, who is the maker and author of things sensible and insensible, visible and invisible.

Objection II. Aristotle (*3. anima, at the beginning*) calls the intellect "a part of the soul." Therefore the intellect is not a faculty and power of the soul itself. Scotus responds (*2. dist. 16, quest. un., §. Ideo dico*) that the intellect is called a part not in the essential sense but in the perfectional sense, emanating from the essence of the same soul — since one faculty does not include the perfection of another faculty, and for this reason the faculties of the soul are described as its parts.

Objection III. What is pure potency is not a power and faculty of the soul, because the forces and powers of the soul are real positive entities. But the intellect is pure potency, since it is like a blank tablet on which nothing is written (*3. anima, 14*). Therefore it is not a force and faculty of the soul. I respond that the intellect is called pure potency not in its entity but in its intellectual capacity — that is, because it is in potency to understand any intelligible things whatsoever and is capable of receiving the intellections of them.

First query: What is the distinction between the agent and patient intellect? The Thomists posit a real distinction. Most Scotists posit a formal distinction. It can be probably said that it is one and the same power of the soul, distinguished only by a different relation and function — for insofar as it transfers from the sensible to the intelligible, purifies material species, and causes intellection, it is called the agent intellect; but insofar as it receives intelligible species and the intellections of intelligible objects, it is called the patient intellect. Since entities are not to be multiplied without necessity (*1. Phys., 12*), if only one intellectual faculty suffices to perform all the aforesaid functions, a double one is needlessly asserted. But one intellect alone is sufficient to perform them all — just as one will, one sight, and one common sense suffice — and so another faculty, specifically a second intellect, is multiplied uselessly and without foundation. This is because one alone, not really but only formally distinct from the soul, suffices, as I said and showed concerning the faculties of the soul taken generally (*1. 2. quest. 3, art. 2 of this work*).

Second query: Whether the human intellect differs in species from the angelic intellect. It can be said probably with Scotus (*2. dist. 1, quest. 6, §. potest etiam addi D.*) that they do not differ in species. For although human and angelic nature are distinguished in species, it is not necessary that this distinction be interposed between their respective faculties and powers. For although man and eagle differ in species, it is nevertheless not necessary that their visual powers differ in species, since they are engaged with the same formal object, not distinct in species.

Article II. What Is the Object of the Intellect of the Rational Soul.

The first opinion is that of St. Thomas (*1. part., quest. 12, art. 2 and quest. 84, art. 7*), Cajetan there, Capreolus (*1. dist. 2, quest. 1*), and others of the Thomists, who hold that the adequate object of the human intellect is the quiddity of material reality. The second is that of Aegidius (*Quol. 4, quest. 10*) and certain others who think that the total object of the intellect of the rational soul is being as true. The third is defended by Scotus (*1. dist. 3, quest. 3 and 4; 4. dist. 49, quest. 8, §. Respondeo B.*; and *Quol. 14, art. 2*), Lychetus, Gadius, and the rest of his school, teaching that the total and adequate object of our intellect is being taken generally.

Note I that the object of the intellect is one thing when it is the object of natural inclination — toward the cognition of which the intellect tends by its own nature, so that any being whatsoever falls under the object of the intellect, and this is called the object from the nature of the faculty — and another thing when it is the object of natural attainment, which is attained or understood by the power of the intellect itself. Moreover, the object is divided into terminative — to which the intellect is terminated — and motive — which moves and excites the intellect to knowledge of itself. This latter is subdivided into the natural motive, which is the quiddity of the sensible thing that naturally moves our intellect to its cognition, and the supernatural, which by divine assistance it knows, as when through the light of glory it clearly beholds God.

Note II that vital faculties are of three kinds. Some are disparate, having no order among themselves, as the external senses whose objects are also disparate, distinct, and diverse — such as color, sound, and smell. Some are subordinate, maintaining some relation among themselves; and these are either of the same order — as the sensitive cognitive faculties, both external and internal, as well as the intellect — and faculties thus ordered with respect to their object are such that the higher knows whatever the lower knows and something more: the intellect attains whatever is perceived by the sense and much else besides. The remaining faculties are of a different order — one cognitive and the other appetitive — namely intellect and will, whose object seems to be the same according to Scotus (*4. dist. 49, quest. 1, §. Ad 1. quaest. ante T.*), whom Faber follows (*disp. 9, cap. 7*): for whatever is intelligible is likewise willable.

First Assertion: The first and adequate object of our intellect from the nature of the faculty is not the quiddity of material reality. The Doctor holds this in the places cited at the beginning of this article. It is proved, first: the total and adequate object of any faculty neither exceeds nor is exceeded by the faculty, as is clear from the description of the adequate object given elsewhere. But our intellect, beyond the quiddity of material reality, understands spiritual things — namely God, the angel, and things of that kind — as from Aristotle (*12. Met., last chapter*) Ferchius notes before others (*vestig. 2, cap. 12, num. 12*). Therefore the quiddity of material reality is not rightly decreed to be the total object of our intellect from the nature of the faculty.

Nor does it help to say with Javellius (*3. de anima, quest. de obiecto intellectus possibilis*) that when St. Thomas asserts the object of our intellect from the nature of the faculty to be the quiddity of material reality, he is to be interpreted for the present state of the way and of conjunction, not for the state of the homeland and of separation, in which he posits being taken commonly. For even in the present state we know God from effects, and our own soul, and the angel assisting the heavens, as is evident from Aristotle and other Philosophers who acknowledged the moving intelligences of the celestial spheres. Nor does the aforesaid distinction square with the mind of Thomas, since in (*1. part., quest. 85, art. 1*) he writes in explicit words: "It is connatural to us to know natures that have being only in matter." And the proportion which Thomas himself requires between our intellect and its object does not belong to the state of separation but only to the state of conjunction. Therefore the aforesaid distinction of Javellius is of no moment.

Second: The natural desire of any thing toward acquiring something is not in vain (*2. Met., 1*). But the intellect desires to know not only material things but also spiritual ones. Indeed, we daily strive to hunt from visible and material things the cognition of invisible and immaterial things, according to Romans 1: "The invisible things of God, understood through those things that are made, are clearly seen — his eternal power also and divinity." Therefore the total object of our intellect from the nature of the faculty is not the quiddity of material reality.

Objection. The argument concludes of the separated intellect, not of the conjoined one, of which the Thomists speak. On the contrary: no faculty can attain, even when separated and elevated, what lies outside its object — just as sight, even by divine assistance, cannot attain sound, smell, or anything else outside its object. If, then, the total object of our intellect from the nature of the faculty is the quiddity of material reality, in whatever state it is placed or elevated, it will be unable to perceive anything but the quiddity of material reality, since everything else beyond this lies outside the limits of its total and adequate object. Add that the pagan Philosophers mentioned by St. Paul, cited above, did indeed acknowledge God, but were either ignorant of or undecided

about the state of the soul's separation, as is clear from the preceding question, article 3, paragraph 4.

Furthermore, Metaphysics treats of transcendent being, which prescribes from material and spiritual reality, from the finite and infinite, from God and creature. But no one denies that Metaphysics is acquired by the forces of nature. And in (*10. Eth., cap. 10*), the Philosopher places happiness in the contemplation of abstract substances. Therefore from the nature of the faculty, the adequate object of our intellect is not the quiddity of material reality.

Second Assertion: The true is not the first and adequate object of our intellect either. Defended by the Doctor in the passage cited above, and proved, first: of the total object of something, properties or characteristics are demonstrated, as Scotus teaches from (*1. post., quest. 3. Universalium*). But the true is a property of being (*4. Met., 5*) — not a subject but something in a subject from which it emanates. Therefore the true is not to be established as the total object of our intellect.

Objection. The argument holds for the object of science, not for the object of faculty, which is what is in question here. On the contrary: faculty and science are engaged with the same thing — as intellect and Metaphysics with being — even though the faculty is more universal and common, since it extends to more things than science does; for the intellect regards not only being but all other things contained under being, both universals and singulars. Nevertheless, the faculty does not tend primarily to a property of its subject but to the subject itself falling under it: thus sight sees the wall, smell the rose, taste the apple, and so on. Therefore likewise the intellect regards and contemplates not the true but being, and whatever is comprehended under it, as its subject.

Second: A faculty does not surpass its adequate object — as hearing does not extend to anything but sound, and smell to anything but odor. But the human intellect considers and contemplates not only the true but also the good, indeed every intelligible thing. Therefore the true is not its total object.

Objection. Whatever the intellect regards, it considers under the aspect of the true, just as the will tends toward the good under the aspect of the good. On the contrary: the intellect is not thus limited so as to contemplate only the true, but whatever is knowable and intelligible. And beyond the true, there are other intelligibles — namely being, good, one, and whatever is captured within the compass of being. Therefore the intellect is not to be constricted and limited to the sole consideration and contemplation of the true. Moreover, the will presupposes and pre-requires the operation of the intellect, according to that saying chanted not once: nothing willed that is not first known. But the will can will what is not true, and not only the possible but also the impossible, as has been said elsewhere. Therefore the intellect, which is a prior faculty to the will,

can understand what is not true, and accordingly the total object of the intellect is not the true.

Third Assertion: The motive object of the human intellect for the present state is the quiddity of the sensible thing; but the adequate object from the nature of the faculty, taken generally, is being. So Scotus cited above and (*quest. 19. de anima*). The first part is argued, first, from that common axiom drawn from Aristotle (*lib. de sensu et sensili, cap. 1*): "Nothing is in the intellect that was not first in the sense." But the sense represents only the quiddity of the sensible thing. Therefore the motive object of our intellect in the state of the way is the quiddity of the sensible thing.

Second, from another axiom drawn from the same author (*3. animae, T. 39*): "One who understands must contemplate phantasms." But phantasms are sensible species offered by the imagination to the intellect. Therefore the motive object of the human intellect is the quiddity of the sensible thing.

Objection. If the quiddity of the sensible thing is the object of our intellect for the present state, since the quiddity of the sensible thing seems to coincide with the quiddity of the material thing, the opinion of St. Thomas, which was attacked in the first assertion of this article, is wrongly impugned. I say there is a wide distinction between the position of Scotus and that of Thomas: the latter holds that the quiddity of material reality is the object of the human intellect from the nature of the faculty; the former holds that the quiddity of the sensible thing is the motive object of the said intellect, not from the nature of the faculty. The reason why in the present life our intellect is so attached to the senses supplying sensible species through which it is aroused to understand is the mutual connection of the faculties, in which the higher cannot act without the prior actions of the lower: thus the external senses, then the internal ones, and then the agent and possible intellects put forth and exercise their actions. Or perhaps this manner of understanding did not exist in the state of innocence, since it is penal and befell us on account of sin, as Scotus reports from Augustine (*15. Trin., cap. 27*) in (*Quol. 14, §. de secundo P.*) in these words: "What is the cause that you cannot gaze with a fixed eye upon that light itself? Unless it be infirmity — and who made that infirmity for you? Unless it be iniquity."

The second part is proved, first: what has community and virtual containment is the adequate object of our intellect, as the Doctor excellently pursues in (*1. cited above*). But being taken generally participates in community — since it is predicated of any inferior whatsoever, either formally or identically — and in virtual containment, since under being all things are comprehended, whether created or uncreated, whether universal or singular. Therefore being thus accepted is the adequate object of our intellect.

Second: Every faculty has its own total and adequate object, as is evident from the external senses, each of which is engaged with its own total object — as sight

with the visible prescinding from light and color, hearing with sound, smell with odor, and so on. Therefore since the intellect is one of the faculties of intellectual nature, it possesses its own adequate object, which is every intelligible thing, or being taken commonly.

Objection. The object of any faculty is real univocal being, as is clear by induction from the individual objects of each faculty and power. But being is not univocal, since it is predicated of real being and of rational being, between which there is nothing univocally common. Therefore being is not to be established as the adequate object of the human intellect. I say that real being, univocal to God and creature, substance and accident, is established as the adequate object of the created intellect; and that rational being is reduced to it, as negations and privations are reduced to positive being, as I indicated in *Logic* and will become clearer in *Metaphysics*.

Objection I. The lowest intellect has the lowest object, because a faculty and its object must be uniform and conformable. But the intellect of the rational soul is lowest, since it is exceeded by the angelic and divine intellect. Therefore its object is the quiddity of material reality. **Corollary:** Between a faculty and its object there must be proportion. But our intellect, being joined to the body, has no proportion with immaterial and spiritual things, especially with God, who is infinite and immense. Therefore the quiddity of material reality is decreed to be the adequate object of our intellect. I grant the major premise; I distinguish the minor: in entity and perfection, I grant it; in capacity and receptivity, I deny it — for it is of infinite capacity, like the angelic intellect. To the corollary I grant the major and distinguish the minor: there is no proportion in entity, I grant it; in intelligibility, I deny it. For there exists a proportion of the motive to the moveable, on the authority of Scotus (*4. dist. 49, quest. 11, §. Respondeo B. and C.*).

Objection II. Faculties are distinguished according to the distinction of their objects (*2. animae, T. 33*). But the intellect and will are distinct faculties — since the former is a natural and necessary faculty, while the latter is indifferent and free with respect to opposite acts and objects — and the object of the latter is the good. Therefore the object of the former is the true. I respond that the major premise holds for disparate faculties, not for subordinate ones, as intellect and will are, even though of a different order, as I explained in note II. Therefore both have being as their object and are of equal scope, as Gadius (*Quol. 16, fol. 168, pag. 2, col. 3*) and Faber (*de paenitentia, disp. 9, c. 7*) teach, and it seems to be a problem in Scotus.

Objection III. If being were the total object of the human intellect, the intellect could know any particular being whatsoever. But the intellect cannot know by intuitive cognition the substance, God, and things of that kind. Therefore being is not the adequate object of our intellect. I respond that the sequel of the major premise is true of the object from the nature of the faculty, not of the motive object. Therefore, since God and the other entities just named do not move our

intellect either through themselves or through their species, it does not rightly follow that the human intellect can by its own power arrive at clear cognition and vision of God and other spiritual entities.

First query: Whether an intelligible species is required for understanding. I respond affirmatively: for just as a sensible species is pre-required for sensing, so an intelligible species is necessary for understanding, which determines the intellect to understand this particular thing — of which it has the species — rather than that — of which it carries no species — so as to concur actively with it in producing intellection.

Second query: What and how many are the causes of intellection? I respond that there are two: namely, the intellect and the intelligible species, as two partial causes integrating and constituting one total cause for producing intellection.

Third query: What is the principal cause of intellection? I respond that it is the intellect, and therefore intellection is named from the intellect, and vital action from the vital principle, which is the intellect itself — in roughly the same way as was said in the preceding book concerning sensation and sense, with only the words changed.

Article III. What the Mental Word Is.

There is a fierce battle among the Scholastics as to what the mental word is. Bonetus (*5. Met.*) and Aureolus (*1. dist. 27, parte 2, art. 2*) hold that the word of the created intellect is the known object. Aegidius Romanus (*Quol. 4, quest. 13*) thinks it is the intelligible species. Augustine seems to favor this view (*11. Trin., near the end of cap. 2*): "The species of the body which is seen and the impression of its image upon the sense, which is vision, or the sense thus formed." Thomas (*1. part., quest. 34, art. 1, ad 2*) and his disciples, cited and followed by the Complutensians (*disp. 21. de anima, quest. 2, §. 2*), hold it to be a term produced by intellection, and therefore that they differ from each other at least formally. But Scotus (*1. dist. 27, quest. 3* and *dist. 3, quest. 7, §. Ad auctoritatem*), Lychetus, Bargius, Vigerius, Vorilongus there, and Gadius (*Quol. 14*), to whom Suarez (*1. de Trinitate, cap. 6*), Vazquez (*1. part., disp. 38, cap. 1*), and Ruverius (*tract. de actu intellectus possibilis, quest. 3*) assent, teach that the mental word is actual intellection.

Note I that "word" is used in various ways by authors. First, for a voice conjugated through tenses, in which sense grammarians take and use it. Second, for the Person of the Son of God: so it is taken in John 1: "In the beginning was the Word." Third, for the concept of a known thing, in which sense one thing is called the mental word and another the vocal word, which is the sign of the internal word that is the mental word — as the Stagirite signifies (*1. Periherm., cap. 1*): "Vocal sounds are signs of those things that are in the soul" — that is, of concepts and intellections which are in the mind or intellect.

Note II that intellection coincides with spiritual knowledge and cognition, in which three things intervene: namely, action, passion, and quality. For just as in the production of heat three things are found — the heating action, the heat-passion, and heat — so in intellectual cognition three things are likewise found: the intellect-action, the intellect-passion, and intellection. The first is an action of the genus of action; the second is a passion of the genus of passion; the third is a quality of the predicament of quality, produced through diction — which we call intellect-action — just as heat is produced through heating. This latter is called by the Scotists an action of the genus of action; the former, however, an action of the genus of quality — or more properly it is to be called the terminus of the action rather than the action itself. Likewise intellection is described as the terminus of diction or intellect-action, because through the latter the former is produced, and the intellect-action is terminated and completed in it, as Aristotle sets forth (9. *Met.*, T. 16) and Averroes there.

Note III that some actions are true and real, through which something real is produced — such as heating, through which heat is produced, and illumination, through which light is generated. Others are analogical and grammatical, through which nothing real is produced — such as vision, intellection, and the rest, which are described as immanent and intentional actions, as Averroes expresses (2. *anima*, com. 41).

First Assertion: The mental word of the created mind is neither the known object nor the intelligible species. This assertion has two parts, defended by Scotus in the passages cited above. The first part is proved: an object is denominated known and understood by a cognition and intellection existing in the intellect and extrinsic to the object — just as a wall is denominated seen by a vision existing in the eye and terminated at the wall itself. Therefore the mental word is not the known object. The antecedent is evident. The consequence holds: the word is produced by the intellect, but the object precedes the operation of the intellect itself. Therefore this word is not the known object. Furthermore, what is only denominated by something through extrinsic denomination is not produced by it, as is clear from a painted Caesar, who is indeed denominated painted by the painting but is not produced by the painting itself. But the object is denominated known by cognition and understood by intellection, as I was arguing just now. Therefore it is not established as the mental word.

Objection. There is a disparity: the known thing is present to the knowing intellect, about which it judges — not so with the painted thing, which is not presented to the painting, which is why nothing mediating is caused. But the intellect understanding a thing, even if it is not present in the being of real existence, is nevertheless present in objective and intentional being. Hence, even though nothing real is produced outside, nevertheless something is produced in intentional being after intellection, which terminates it. On the

contrary: if the intellect judges about the known thing and deliberates about it, such judgment does not pertain to the mental word but to the second operation of the intellect, and discourse to the third. Therefore there is no valid response. Moreover, what is produced after the intellection of a thing is either real being or rational being. Not the former, as Aureolus admits; not the latter, otherwise only rational being would be the mental word, which is false, and soul-science — which is a real science about it — would not treat of it, since that is the task of Metaphysics or Logic. Furthermore, a thing is said to be from eternity in known and objective being, but the word of the created intellect is not said to have been from eternity, since none existed but was created in time, as faith teaches. Therefore the mental word cannot in any way be the known object.

The second part is shown as follows: the cause of something cannot be the effect of the same thing; otherwise the same would be the cause of itself, which is absurd. But the intelligible species is a partial and less principal cause of the mental word, as Scotus proves in the passage cited. Therefore it is not the word of the created intellect. Moreover, the intelligible species is called the impressed species, which as the cause of the word of the finite intellect precedes that word itself, which is called the expressed species. Therefore the intelligible species is in no way the mental word — unless one were to say that the same thing is cause and effect with respect to the same, which is impossible.

Second Assertion: The created word is not a term produced by intellection, but is actual intellection. The conclusion has two parts, supported by Scotus in the passages above. The first part, which is opposed to the Thomists, is proved, first: "to sense is to suffer" (2. *anima*, T. 52); likewise "to understand is to suffer" (3. *of the same work*, T. 2). Therefore intellection is a passion — not of the genus of passion but of the genus of quality, as I observed above. But if through intellection a mental word were produced, intellection would be an action of the genus of action, like diction, through which the mental word is begotten — as Augustine rightly saw (9. *Trin.*, *cap. ult.*): "Knowledge is truly begotten and volition proceeds." Since, then, intellection is the terminus of diction, through it nothing further is produced.

Objection. Intellection is a true productive action of the created word, just as the intellection of God the Father is a true act through which the Word of God, who is his Son, is produced. On the contrary: besides the fact that this conflicts with Aristotle, just cited, who asserts that intellection is a passion — which the Scotists place in the predicament of quality — and the divine Word is generated by God the Father not through the act of understanding but through the act of speaking, as I taught from Scotus in the Tract on the Triune God (*disp.* 1, q. 5) — it also contradicts the same Philosopher (9. *Met.*, T. 16), who compares speculation and any immanent operation, in whose series intellection of life and vision of sight are placed, to life and vision. But it is evident that life and vision are not productive of any term, as the same Stagirite notes there. Therefore

intellection is not a productive action of the created word or of any other term. And in (6. *Eth.*, *cap.* 4) there is nothing to the contrary. Nor does it help to say with St. Thomas (1. *part.*, *quest.* 85, *art.* 2, *ad* 3) that this holds for external sensation, not for internal sensation — since the Philosopher there is speaking expressly of the vision of sight, which is external sensation. And it is gratuitously denied of internal sensation, since in both the same reasoning appears. All the more so since the same Doctor (*opusc.* 48, *cap.* 1) frankly admits that sensation and intellection are not actions of the genus of action. Therefore they are not productive of any term.

Second: Immanent actions have no term, from Aristotle in the passages mentioned. But intellection is counted among immanent actions, even by St. Thomas, cited just above. Therefore through intellection no term is produced that is the word of the created intellect.

Nor does it help to say that an immanent operation, while it has no term outside, does have a term inside — or, as Averroes says in the passage cited, that it tends not to a real but to an intentional term. Since Aristotle, in the passage reviewed, plainly teaches that such an operation is the work, term, and end of the one operating, and that the agent proceeds no further — because having acquired this term, its motion comes to rest, just as one who is whitening a wall, once the wall has been whitened, no longer whitens it. So one who understands a thing, having obtained its full intellection, rests in that very intellection, and the action is terminated there — otherwise there would be a term of a term, indeed intellection itself would not be the term but the way to the term, which accords neither with Aristotle nor with truth. And another term would be vain and empty: for what does one who understands intend and will, if not the intellection of the intelligible thing? Therefore having obtained its intellection, one does not move to another term, but truly stops and remains in it.

Furthermore, that intentional thing which the Adversaries devise and say is produced through intellection and is its term and the mental word — is it real being or rational being? Not the latter, because it is directly produced by the intellect, not reflexively, as rational being is made. Nor do they distinguish it from real being; which is why they call it intentional being, distinguished from real being. Again, if they wish the word caused by intellection to be intentional being because it remains in the intention and in the mind of one understanding — by the same token intellection is intentional being, because it resides in the intellect and is its quality and perfection, of which there is no other term, since through it it is truly denominated as qualified and is fully perfected, and its action has its ultimate end there. Moreover, the same seems to have to be said of intellection as of love, since intellect and will are faculties of intellectual nature tending to acquire its perfection. But the terminus of will is love, of which there is no other term. Therefore likewise the terminus of the intellect is intellection, through which no other term called the mental word is obtained.

The second part is proved, first, from St. Augustine (*serm. 20. de sanctis*): "The voice is a sound, a sign of thought; but the word is thought itself." And (*tract. 13. in Ioan.*): "When you conceive a word to utter, you wish to say something, and the very conception of the thing in your heart is already the word — it has not yet gone forth, but it is already born in the heart and remains there, that it may go forth." The same (*tract. 23*). And Damascene (*1. de fide orthodoxa, cap. 18*), Irenaeus (*2. haeresium, haeresi 47*), and Anselm (*in Monol. 31*) are in agreement.

Second: What is produced by the created intellect is the created word. For the word is called generated knowledge, as is evident in Augustine (*9. Trin., 12*): "From the knower and the known, knowledge is born." But intellection is produced by the created intellect — hence in (*9. Met., 16*) it is described as its work and terminus. Therefore it is the mental word.

Third: The created word is not the known object, nor the intelligible species, nor the terminus of intellection. Therefore by sufficient distribution, it follows that it is actual intellection.

Objection I in favor of Aegidius, from Augustine (*8. Trin., 7*): "The word of Carthage is in the memory." But by "the word of Carthage" nothing else can be understood than the intelligible species, as the same Doctor plainly signifies in the passage cited at the beginning of this article. Therefore the intelligible species is the created word. I respond that both passages of Augustine are to be explained causally, not formally — that is to say, the word is caused partially by the intelligible species, as Augustine himself declares (*9. Trin., 12, cited just now* and *11. of the same work*).

Objection II. The word is produced, and is the terminus of production. But intellection is not produced. Therefore intellection is not the mental word. The major premise is conspicuous. The minor is admitted, because intellection is an action, and an action is not acted upon but is that by which something else is acted upon and produced. I grant the major and to the minor I say that this concludes of an action of the genus of action, not of an action of the genus of quality, as intellection is, as I noted above.

Objection III, from (*1. Eth., 3*): Happiness and other operations are not qualities. But there it is added (*cap. 7*) that happiness consists in contemplation, which does not seem to be far from intellection and knowledge, especially intuitive. Therefore intellection is not a quality, and accordingly is not the mental word. I respond that the aforesaid testimony can be explained in two ways. In one way: Aristotle is speaking there of productive operation and action, which plainly is not a quality. In another way: he is disputing against Plato, who holds that every good is a quality, the opposite of which the Philosopher maintains by saying that elicited acts are good, even though they are not qualities.

Question III. On the Will.

After the intellect, the will proceeds immediately from the intellectual nature and rational soul. And in acting and operating, it presupposes and pre-requires the action and operation of the intellect, according to that saying chanted not once: "The will is not carried to the unknown." And just as the sensitive appetite follows the sensitive cognitive faculty, as I asserted in Book IV, question 11, so the will, which is described as the rational appetite, accompanies and follows the intellect, which is a power and intellectual faculty. Now I have already said and taught many things about the will in Moral Philosophy, Book III, questions 1 and 2. Therefore I shall here add and append a few things that remain.

Article I. Whether the Will Is Distinguished from the Intellect.

Aureolus and Durandus (*1. dist. 3, quest. 4*) affirm that intellect and will are entirely one and the same power and faculty of the human soul, adorned and marked out by distinct and different names and functions. But the other Scholastics, recognizing a distinction between the aforesaid powers and faculties, dispute and contest vigorously over the nature of this distinction. For St. Thomas (*de veritate, q. 22*) with his followers asserts that intellect and will are really distinct. But Scotus and his disciples (*2. dist. 16, quest. un.*) establish a formal distinction between the two faculties just named. And this assertion has been proved in Book I, question 2, article 2, where, treating of the faculties of the soul taken generally, I taught that they differ from the soul and from one another not really but formally.

Particularly, however, it can still be argued from St. Damascene (*2. fidei, cap. 22*), who defines the will in these words: "The will is itself the simple faculty by which we will." But the intellect is the faculty by which we understand. Now, distinct definitions argue formal distinction, as has been asserted elsewhere. Therefore, since intellect and will have distinct definitions, it follows that they are formally distinct. Moreover, a distinct manner of acting implies a formally distinct faculty, as seems to be admitted by all. But the will participates in a manner of acting distinct from the intellect — since the latter acts naturally and necessarily, while the former acts spontaneously and freely and is indifferent with respect to distinct acts and opposite objects. Therefore between the two named faculties there is a formal distinction. Furthermore, in the divine realm the Son is produced and generated through the intellect, and the Holy Spirit proceeds and is spirated through the will. But this argues a formal distinction between intellect and will. Therefore if in the divine realm these faculties differ formally from each other, likewise in creatures.

Objection I in favor of the first position. The volitional faculty is equally cognitive, since the will cannot will anything unless it knows it. Therefore there seems to be no distinction between the intellect, which is cognitive, and the will, which is volitional. I distinguish the antecedent: formally, I deny it; pre-requisitively, I grant it. That is to say, the intellect first shows the known object to the will before the will wills it — in roughly the same way as a servant carries

a light before his master so that the master, illuminated by that light, may see what is to be done and command what is to be carried out. So the will, illuminated by the light of the intellect, chooses what is to be performed and commands the lower faculties to exercise their operations concerning those things.

Objection II in favor of the second position. Psalm 118: "Give me understanding, and I shall learn your commandments." And Matthew 15: "Are you also still without understanding?" Therefore man is devoid of understanding, and if he has it, he receives it from God, and accordingly it is really distinct from his soul. I respond with the interpretation that the passage is to be expounded in the mind of Augustine there (*conc. 18*): "Give me understanding," supply: "make me understand," according to Daniel 8: "I sought the meaning." And afterward it adds: "Make me understand that vision." And Psalm 31: "I will give you understanding" — that is, I will make you understand what is to be done and carried out by you.

Objection III. Aristotle (*3. Eth.*, 3) writes that intellect and will are the same principle of the rational soul. Therefore in the Peripatetic school, the will is distinct from the intellect. I respond that the two aforesaid faculties are one principle as really identified, but two principles as formally distinct. This is how Aristotle is to be interpreted in the passage mentioned.

Objection IV. Subordinate acts do not argue distinct principles and diverse faculties, as is established from illuminating and heating, which proceed from one sun. But intellection and volition are subordinate acts — since volition is subordinated to intellection, which is why that saying is celebrated: "Nothing willed that is not first known." Therefore will does not differ from intellect. I respond that the major premise holds for subordinate acts proceeding from the same faculty, not for acts proceeding from distinct faculties — as intellection and volition are. And the example adduced is to the opposite purpose, since illuminating and heating arise from diverse faculties: heating from the heating faculty and illuminating from the illuminating faculty. Hence in the celestial spheres there is illuminating without heating, while on earth both actions are had — namely illuminating and heating.

Article II. Whether the Will Is Nobler than the Intellect.

Some, whose names are suppressed by Bassolis (*4. dist. 49, quest. 3*), assert that intellect and will are of equal perfection and dignity. But the Thomists and Scotists, recognizing some pre-eminence and superiority between the aforesaid powers and faculties, contend and dispute sharply concerning their dignity. The former, with St. Thomas (*1. p., quest. 82, art. 3*), hold that the intellect surpasses and precedes the will. The latter, with the Subtle Doctor (*4. dist. 49, quest. 4*), hold that the will is to be preferred and set before the intellect.

Note and recall from what was said elsewhere — as Scotus indicates (*1. dist. 3, quest. 3*; and *2. dist. 24, quest. 1, ad 2*) — that the adequate object of the intellect and of the will is entirely the same, with respect to the same formal aspect. For both faculties are of equal scope, and whatever is intelligible is likewise willable. Hence the greater excellence and eminence of the one over the other is not to be drawn from their common object, but is rather manifested and declared from the more excellent and worthy acts, which proceed from the one and not the other of the aforesaid faculties, as will be plain in the next assertion.

Assertion: The will surpasses and excels the intellect in nobility and dignity. So Scotus, cited just now (§. *Iuxta hoc quasi ex latere*). And before him Alexander of Hales (*3. part., quest. 80, m. 1*), St. Bonaventure, Richard, and others of the same class and order. It is proved, first, from St. Anselm (*lib. de conceptu virginali, cap. 4*), calling the will "queen in the realm of the soul" and reason "her handmaid." But the queen is worthier than the handmaid. Therefore the will is more excellent than reason or the intellect. And St. Bernard (*lib. de libero arbitrio*) affirming that the will is mistress and reason is her attendant. But the mistress is more excellent than her attendant. Therefore so too the will is more excellent than reason, which coincides with the intellect.

Aristotle also gives his support (*9. Met., T. 10*), where he says that the will determines the intellect to this or that understanding and commands it to contemplate this and not that. For since the intellect is a natural faculty, and accordingly has no mastery over its own act — given the appropriate object, it must necessarily be determined by the will to go forth into the act of this or that intelligible object — as Scotus excellently pursues in his exposition of that text.

The Thomists object, specifically the Complutensians (*disp. ult., quest. 5, §. 3*): the will moves the intellect by applying it; while the intellect moves the will by preceding, directing, and ruling it. On the contrary: the intellect indeed represents things to be speculated about and done, but does not command; it directs but does not prescribe; it shows but does not compel. Otherwise, since it is a purely natural and necessary faculty, it would destroy freedom, and there would be no merit or demerit — for in things that occur naturally and necessarily, we neither merit nor demerit, by common consent. Moreover, command is an act of the will, as I showed at length in Moral Philosophy (*lib. 3, quest. 2, art. 4*).

Furthermore, the intellect is said to direct and rule not in the manner of a lord and king, who truly wills and commands what is to be done in his kingdom, but in the manner of a counselor who offers and presents to his lord what is to be performed — and it then lies in the lord's hand and power to do what is offered and presented to him. Therefore only the will in the realm of the soul has mastery of its own acts and commands the intellect to speculate on this or that, and can convert or avert it from such speculation and intellection, as Scotus

excellently pursues (*2. d. 42, quest. 4*). The mastery and command of the soul is therefore wrongly attributed to the intellect.

Second: The faculty whose act is worthier and more excellent is considered nobler and more distinguished by all, because the nobility or ignobility of a faculty is detected from its acts. But the act of the will, namely love, surpasses the act of the intellect, namely intellection, in perfection and nobility. Hence in sacred scripture the love of God and neighbor is greatly commended, but not the knowledge of them. And ever on the lips of St. John was that saying: "Little children, love one another." And Canticles 8: "Love is as strong as death." And the Poet sings: "Love conquers all things."

Hence the first angels are called Seraphim from love, and the second Cherubim from knowledge. Therefore the intellect is to be placed after the will. Moreover there is that saying from Hugh of Saint Victor (*in Ang. Hierar., cap. 7*), from Dionysius: "Love excels knowledge. The one pertains to the will, the other to the intellect."

Objection from the Adversaries. They respond and say that all that is true in the way, not in the homeland. On the contrary: the love of God and neighbor is of the same nature and species both in the way and in the homeland, even though in the homeland it is in a higher and more excellent degree. Therefore if it excels in the way, so too in the homeland, since there is no reason why the opposite should occur in the homeland. Moreover, if the Seraphim were named from the love of the way, which was the cause of their merit by which they rejoice and exult in heaven and hold the first seat among the celestial spirits, without doubt the love of the homeland surpasses the knowledge of the homeland — since it was by this love that they merited those supreme seats, not by the knowledge of the way. Therefore the love which was the cause of such happiness and glory, not the knowledge, is to be preferred and to excel in the homeland.

Again, it is a greater sin to hate God, and those who hate God more have sinned more and are more punished in hell. Therefore, by the opposite reasoning, those who loved God more merited more. The Seraphim loved God more and therefore merited more and acquired greater glory — not by reason of knowledge but by reason of love. Therefore love is to be preferred to knowledge both in the way and in the homeland, just as the hatred of God is established as the greatest sin both in the way and in hell among all the other sins.

Third: A nobler habit argues a nobler faculty, as the Adversaries do not deny. But the habit of the will surpasses the habit of the intellect in nobility, as is evident from (*1 Cor. 10*): "Faith, hope, charity — and the greatest of these is charity." Hence Augustine adds (*in exp. Psalm. 107*): "You find nothing more eminent than charity in the divine books." And (*15. Trin., cap. 19*): "Among the gifts of God, there is no greater gift than charity, nor any equal to it." Therefore, since charity

resides in the will, it is plainly deduced that the will surpasses the intellect in eminence.

Nor does it help to say with the Thomists that the light of glory, which belongs to the intellect, is more excellent than charity, and that charity excels only in the way and not in the homeland. For besides the fact that this has already been rejected from what was said in the response to the preceding objection, the aforesaid testimonies speak absolutely, and the distinction of way and homeland is devised to escape the force of the argument, as is clear from what St. Paul (*ibid.*, *cap. 13*) appends: "If I speak with the tongues of men and of angels and have not charity, I am become as sounding brass or a tinkling cymbal. And if I have prophecy and know all mysteries and all knowledge, and have not charity, I am nothing." Hence Augustine rightly concludes from this passage of Paul (*in exp. Psalm. 141*): "Therefore charity shows itself to be the more excellent way." And a little later: "Nothing is more excellent than the way of charity, and only the humble walk on it." All the more so: if the will is perfected in the way by a nobler habit than the intellect, likewise in the homeland — since an equal proportion holds both here and there. And to assert that the light of glory surpasses charity is said gratuitously, and confirmed by no basis, testimony, or reason. I add that charity unites more closely to God than the light of glory, as Hugh of Saint Victor teaches before others (*lib. de angelica Hierarchia*): "Love excels knowledge, and where knowledge stands outside, the affection of the lover penetrates — not because something is loved that is not known, but because it is loved more perfectly than it is known." The reason is that charity tends per se and immediately to God and his essence, which is the beatific object. But the light of glory, which is given to the blessed to elicit the beatific vision, does not so dispose itself — for the beatific vision to come about, the divine essence must be united to it in the nature of an intelligible species and object, as Thomas teaches (*1. part., quest. 22, art. 2*). Therefore charity is more perfect in both the way and the homeland than any other gift bestowed by God.

Fourth: What is posterior in generation is prior in perfection, as is evident in natural things. For nature proceeds from the imperfect to the perfect, and the rational soul, which is posterior in generation, is prior in perfection to the other preceding forms. But the will is posterior in generation to the intellect — for from the rational soul the intellect emanates first and afterward the will. Therefore the will surpasses the intellect in nobility and dignity.

The Complutensians respond (*cited, near the end of §. 2*) that this holds for one and the same thing, where what is prior in generation is posterior in perfection — but not absolutely and simply. For act is prior to potency both in priority of origin and of perfection. Likewise substance is prior to accident and to its own properties, not only in generation but also in perfection. On the contrary: this assertion — that what is prior in generation is posterior in perfection, and conversely, what is posterior in generation is prior in perfection — is recorded

in Scotus (*4. dist. 11, quest. 3* and *dist. 16, quest. 2, §. Ad rationes ante Q.*) and is understood by way of generation and in the same genus. In the genus of substantial forms, the last form is more perfect than those preceding — as the soul surpasses the forms of blood, embryo, and the like. In the genus of absolute accidents, the last is more perfect — as quality surpasses quality that is generated prior to it. So in the genus of faculties, the sensitive surpasses the vegetative, and the volitional the intellective — because the latter is ordered toward the former, and the acts of the intellect are directed toward the acts of the will: for to understand is for the sake of willing, and vision is for the sake of fruition.

But what the aforesaid Authors add — namely, that the intellect is act and the will is potency because the former is moving and the latter is mobile — is plainly false, because both are faculties proceeding from the rational soul. And the intellect does not move the will either physically or morally, but only representatively and counselingly, in the way that has been explained above. Indeed the will moves the intellect by command and precept, converting or averting it toward whatever it wills and pleases it. Moreover the will is formally free and mistress of its own acts and of the other faculties subject to it; it is the cause of merit and beatitude. Hence Augustine (*13. Trin.*) offers that saying: "Blessed is he who has whatever he wills and wills nothing evil." Therefore the will excels the intellect in perfection and dignity. This also seems to have been sensed by the Angelic Doctor (*1. part., quest. 82, art. 3*), who says: "Although the knowledge of those things which are below us is more excellent than the love of them, yet the love of those things which are above us is nobler than their knowledge." Hence the same Doctor adds there that charity, which is in the will, is more excellent than the intellectual habits.

Objection I. The beatific action and operation surpasses all other actions and operations (*1. Ethic., 1*). But the knowledge and intuition of God is the beatific action and operation, as is evident from John 17: "This is eternal life, that they may know you." And this seems to be what the Stagirite asserts (*10. Ethic., 10*), placing happiness in the contemplation of abstract substances. Spiritual knowledge, vision, and contemplation are the action and operation of the intellect. Therefore, since from the nobler operation the nobler faculty is detected, it is plainly shown that the intellect precedes and surpasses the will.

First corollary: Wisdom, which is a habit of the intellect, is simply the noblest and most excellent (*4. and 6. Ethic. and 1. Metaphysica, 1*). **Second corollary, from (*1. pol., cap. 1, 3*):** The intellect rules and commands the appetite. Therefore it is the noblest of the faculties of the soul.

I grant the major premise. To the minor I say that the vision of God is indeed the worthiest and most excellent among the operations of the intellect — but not when it is compared to the fruition of God; for the latter surpasses the former, and in it the formal beatitude of the blessed principally consists. And

this is the operation of the will. The same must be said in reply to the first corollary. To the second: the discussion there is of the sensitive appetite, over which the intellect in a certain manner seems to rule and command, since it is seeing and knowing.

Objection pressed further. One who sees and knows excels the blind and ignorant. But the intellect sees and knows, while the will is blind and ignorant. Hence arose that saying: the will is not carried to the unknown — for it is necessary that the intellect illuminate the will and show it objects so that it can will or not will or decline to will them. Therefore the intellect is to be set before the will. If the major premise is admitted, to the minor I say that the will is not blind and ignorant, but non-seeing and non-knowing — because the will itself is not capable of vision and knowledge, but of volition and fruition, which surpasses cognition and vision.

Objection pressed yet further. St. Augustine (*lib. 22. contra Faustum, cap. 37*) writes: "In the reason of man, in part active, in part passive, contemplation is certainly to be preferred." I satisfy this by saying it holds within the range of the acts of the intellect, but not outside — as is evident from the fruition of the divine essence, which is an act of the will surpassing all acts of the intellect.

Objection II. The faculty that regulates the rest is nobler and more eminent than they, because the rule surpasses in nobility what is regulated. But the intellect regulates the will — for the will, when it follows the upright dictate of reason, operates well, while on the contrary it operates badly and is to be censured. Therefore the intellect is eminent over the will. If the major premise is granted, to the minor I say that the intellect indeed regulates the will by way of counsel, while the will rules the intellect by way of command. For the will is like a King and the intellect like a Jurist. And no one doubts that the King surpasses in nobility the Jurist who offers counsel to the King himself.

Objection pressed further. The will depends on the intellect — for nothing is willed that is not first known, but not vice versa. Therefore the will is ignobler than the intellect. If the antecedent is granted, the consequence is denied. For the composite depends on matter and form, yet each of these is more excellent than it. Likewise the intellect in understanding depends on the phantasm, yet the former surpasses the latter. Therefore the prior operation of the intellect, which is pre-required and presupposed for the operation of the will, neither diminishes nor harms the greater excellence and nobility of the will over the intellect.

Objection III. The faculty that has a more abstract and simple object is more excellent and pre-eminent. But the intellect has a more abstract and simple object than the will — since the object of the former is being as true, and of the latter being as good; but the true is more universal and common than the good. Therefore the intellect excels the will. I grant the major; I deny the minor. For I

observed above from Scotus that the object of the will extends as broadly as that of the intellect — namely, being taken in its full latitude and amplitude.

Question IV. On Memory.

Since memory, taken universally, is divided into sensitive and intellective, it pleases me to establish two articles in this question — in the former, discussion will be of sensitive memory; in the latter, of intellective memory.

Article I. Whether Sensitive Memory Exists and What It Is.

The Subtle Doctor in both his works (*4. dist. 45, quest. 3*) proceeds problematically in the decision of this article, proposing and resolving the arguments of both sides, both affirmative and negative, yet leaning toward the affirmative — to which Bassolis there, Vorilongus, and others adhere, preceded by Aristotle (*lib. de memoria et reminiscentia*) and Alexander of Hales (*2. p., quest. 69, art. 1, m. 3*), whom all recent authors follow.

Note I that memory admits of many acceptations, as may be observed in Bercharius (*partesecunda, verb. Memoria*), Aureolus (*1. dist. 3, art. 2*), and Scotus (*quest. 3, ante §. Ad argumenta in oppositum principalia, sub H. and in Report., quest. 4*), where he says that memory is most importantly taken in three ways. First, insofar as it is the conserver of species concerning past things as past, and Aristotle discusses memory so taken in (*lib. de memoria et reminiscentia*). Second, insofar as it is the conserver of species concerning absent things, whether those things exist in their own being or not but have been past. Third, insofar as it is a partial and less principal productive principle of some knowledge — in which sense an intellect having such a current species is called fruitful memory, because in this way it can go forth into the act of knowing and understanding. Scotus discusses this sense extensively in the cited passage (*quest. 7*).

Note II, from Scotus in the fourth book at the places cited above, that a double object of memory is established: the remote and the proximate. The remote is that concerning which the one remembering at some point had an act — as one recalls a deceased friend with whom he long lived in familiar and holy intimacy. The proximate is a past act — as when I recall a past lesson that I recited. Such an act is described as the near object of memory. But these belong to both kinds of memory, both sensitive and intellective, even though principally to intellective.

First Assertion: Sensitive memory exists in the brute and in man. The Doctor holds this with Aristotle in the passage cited above and (*1. Metaphysica, 1*): "Those endowed with taste and touch alone lack memory, such as shellfish." Therefore all other animals that possess all the senses participate in sensitive memory. It is proved, first: there is a distinct cavity and organ in the back of the head of an animal in which the memorative power and faculty resides, as I handed down in

Book IV, question 10, article I. And this is evident from anatomical dissection and indicated by Damascene (2. *de fide*, cap. 20).

Second: Brutes produce many effects, perform very many acts, and accomplish numerous works that evidently and plainly show that they possess sensitive memory. For they foresee and provide for themselves what is necessary to sustain and preserve their life — as the ant in summer gathers grains of wheat to eat in winter. A dog fawns upon and is attentive to the one who gives it bread, whom it recognizes when that person, having been absent, returns; but it hates and flees from the one who carries a stick and strikes it. A bird constructs its nest, lays eggs, feeds its chicks, and defends them from enemies. The elephant and some other animals are capable of being trained. These and similar things could not be accomplished by brutes without memory. Therefore sensitive memory is not to be denied to them.

Objection. All the things enumerated that brutes accomplish do not proceed from the fact that they possess memory, but from the apprehension of something pleasurable or distressing. The ant finds pleasure in collecting grains of wheat; the dog is distressed when struck with a stick. Likewise the bird takes pleasure in constructing its nest and feeding its chicks, but is distressed at their removal and destruction. Therefore all those things can be said to be done by brutes through industry and the guidance of nature, not because they are practiced in memory. This, however, while not impossible and not improbable, it is nevertheless better to attribute memory to them, as more effectively and evidently suggested and demonstrated by what has been adduced for its defense than by its opposite, as Scotus admits, cited just now, at the end of the first article, in defense of Aristotle.

Third: Those that use reason and the intellect participate in intellectual memory. Therefore those capable of sense and endowed with imagination do not lack sensitive memory. The consequence holds: memory is retentive and preserving of species; intellectual memory retains and conserves intelligible species; therefore it belongs to sensitive memory to retain and conserve sensible species. But we experience that brutes have such sensible species. Therefore they also have sensitive memory. Finally, nature does not fail in necessities (3. *animae*, 45). But memory is necessary for brutes, so that goods once known and past they may pursue again, and evils and harmful things once past they may avoid again — and so as not to fall again into the adverse encounters that have been experienced — and to preserve and maintain their life. But unless they had species of past things and recalled them, they could not foresee and avoid future harms and dangers threatening them.

Second Assertion: Sensitive memory is described as the retentive power of past sensible species. The same thing is arrived at by the definition of sensitive memory given by Aristotle (*lib. de memoria*) and by Scotus, cited above (§. *Contra istam quaestion. C.*). This assertion and definition is easy to prove, since it consists

of genus and difference expressed through the preceding particles, and contains nothing diminished or superfluous, as is evident to one who reflects.

Objection I against the first assertion. Memory regards time as past, as Aristotle testifies (*lib. de memoria*). But time is the number of motion according to before and after (*4. Phys., 101*), which cannot be brought about without a comparison of one to another. But comparison is not of the senses but of the intellect. It follows therefore that memory does not belong to the sensitive part. I respond with Aristotle (*cited*) that in the same sense in which magnitude is perceived, time is also perceived, even though it is successive. For continuous motion is successive and perceptible by sense (*2. animae, 64*). And although time is a number, it is nonetheless also perceived by sense, since number is referred to among per se sensibles, as is evident in the passage just cited (*T. 64*).

Objection II. If there were sensitive memory, it would be convertive and reflexive upon itself and its own act, because the sensitive faculty would recall a past act, which belongs to a recollective faculty. But this pertains to the intellect, which alone is established as the reflexive and comparative faculty — comparing one object to another object, one of its acts to another act, and reflecting upon itself. Therefore sensitive memory is not to be admitted. It may be said that sense knows its own act — as sight knows vision — and that the recollective faculty knows a past act, because the recollective power differs from the sensing power: partly because it has a distinct organ from the latter, as is evident in anatomy; and partly because all animals are indeed sensitive but not all are recollective, as I observed above from Aristotle (*1. Met., 1*). Moreover, the sequel of the major premise can be denied. For although sense knows the prior and posterior, the present act concerning a present object and the past act through the species retained of an absent object — as is clear from the imagination — nevertheless it does not rightly follow that sense itself is a reflexive and comparative faculty, because it does not reflect upon itself nor does it compare one to another, as the intellect does, which is the collative and comparative faculty, as the Doctor rightly saw (*in Rep., cited, ad 2*).

Objection III. An ant generated this year, which has not yet experienced winter scarcity, gathers and piles up grains of wheat just as one three years old. Likewise a one-year-old bird constructs its nest just as another four years old. Therefore the ant and bird lack memory, since they cannot recall what they have not experienced. And accordingly, if they do anything, it is to be attributed not to memory but to natural instinct. I respond that this can indeed not improbably be attributed to natural instinct, but it is more fittingly and truly adapted to memory, as is made plain by what is accomplished by perfect brutes, especially those capable of being trained.

Article II. Whether Intellectual Memory Exists and Whether It Is Distinguished from the Intellect.

Some, cited by Scotus in the article above (*art. 24*), seem to deny intellectual memory and acknowledge only sensitive memory. But the common opinion is that of Scotus there, Bassolis, Vorilongus, Cavellius (*disp. 3, sect. 2*), Poncius (*disp. 63, quest. ult.*), and others admitting intellectual memory distinct from sensitive. Whether intellectual memory is a third faculty distinct from the intellect and will, however, is disputed by the Scholastics. Some, cited by Ruverius (*Tract. de actu intellectus possibilis, quest. 5, dub. 3*), hold that they are distinct faculties. Others, such as Bassolis (*4. dist. 45, quest. 1, §. Ad propositum*), Ockham (*quest. 12*), Durandus (*1. dist. 3, quest. 3*), Argentina (*2. dist. 39, quest. un., art. 1*), and St. Thomas (*1. part., quest. 79, art. 7*), teach that intellectual memory does not differ from the possible intellect. And Scotus does not dissent from them, both in the passage cited and in (*Quol. 15*).

Note that for remembering there is required some past act, which together with its object is established as the object of memory. But three things in memory must be representative: first, the intelligible species, which represents the thing of which there is memory. Second, the intention, which represents the past act of knowing. Third, the time in which we knew that thing. There are likewise three things represented: the known thing, the time in which the thing was being known, and the act of knowing the thing itself.

Assertion: Intellectual memory properly exists. So Scotus, cited above, and (*1. dist. 3, quest. 6*). It is proved, first, from Aristotle (*lib. de memoria et reminiscencia, near the beginning*): "We remember certain intelligible things — as that a triangle has three angles equal to two right angles — and this because we learned and speculated about it." But the act of learning and speculating is past, which belongs to intellectual memory. Therefore in the Peripatetic school intellectual memory is to be admitted. And it is indicated in (*3. anima, 8*). Augustine gives his support (*10. Conf., cap. 8* and following), as does Gregory (*near the end of 4. moral.*); and it accords with sacred scripture (*Luc. 16*): "Son, remember that you in your lifetime received good things, and likewise Lazarus evil things."

Second: Intellectual memory belongs to that faculty to which the act of recalling belongs. But the act of recalling belongs to the intellectual faculty. Therefore so does intellectual memory. The major premise is evident, since by an act we come to know a faculty. The minor is evident from the act by which someone understands that he once demonstrated that a triangle has three angles equal to two right angles, as I was just saying from Aristotle, and from the act by which a sinner recalls that he has not kept the commandments of God. These and similar things do not belong to sensitive memory, since the sense is incapable of demonstration and knowledge. Therefore they are adapted to intellectual memory, and so intellectual memory is to be admitted.

Objection. Nothing is in the intellect that was not first in the sense. Therefore if there is any act of remembering, it is to be attributed not to intellectual but to sensitive memory. I say that the antecedent is to be explained representatively

and by way of occasion, not per se and effectively. For the intellect does not understand unless the sense presents and offers phantasms or sensible species to it; yet the efficient cause of the act of understanding is not the sense but the intellect. Likewise, although intellective memory pre-requires and presupposes sensitive memory, nevertheless the former is distinguished from the latter with respect to being and the act of remembering.

Third: It is the intellect that clearly and distinctly knows and distinguishes the past from the future, compares the past with the present, and turns itself to its own past act upon which it reflects. But these things cannot be accomplished without intellective memory, since the sense cannot compare one to another, nor reflect upon its own past act. Therefore intellective memory is to be admitted.

Objection. Sight perceives itself seeing and knows its own vision, as the Doctor says (4. dist. 45, quest. 3, §. *De secundo art.*) from (2. *de anima*), cited by him. Therefore sense is a convertive and reflexive faculty upon itself, and accordingly sensitive memory suffices for the act of remembering. I say that sight accomplishes this because vision is in some manner colored, not because sight is a reflexive faculty — except improperly and imperfectly, as Bassolis notes there.

Fourth: In the sensitive part there is sensitive memory, as established in the preceding article. Therefore in the intellective part there also remains intellective memory. The consequence holds: the intellect can perceive whatever the sense perceives, and much more, since it is a more excellent and eminent faculty. But the sense possesses memory; therefore the intellect does too. Again, the separated soul possesses memory, as is recorded in Luke 16, cited above. Therefore so does the soul when conjoined. Finally, intellective memory is attributed to God and the angel, who are intellective. Therefore it is not to be denied to man, who possesses an intellective soul.

Second Assertion: Intellective memory is not distinguished from the possible intellect either really or formally. Deduced from Scotus in the passages just named. It is proved, first: it belongs to the nature of intellective memory to be the preserving place of intelligible species, their treasury and storehouse. But the patient intellect performs this function, as Aristotle testifies (3. *anima*, T. 7), calling the patient intellect itself "the place of forms" — namely of species — and (T. 18) "the intellect that becomes all things," meaning that this intellect receives in itself all intelligible species and all acts of understanding, which it produces, some of which are past and which the intellect itself remembers. Therefore intellective memory does not differ from the patient intellect.

Second: Entities are not to be multiplied without necessity (1. *Phys.*, 52). But one and the same intellective faculty suffices for understanding and for remembering. Therefore memory is not separated from the intellect. The major premise is admitted by all. The minor is shown: the same intellect altogether

apprehends and understands, judges, affirms, denies, and reasons. Therefore the same intellect receives intelligible species and retains and conserves them; and the same intellect produces the act of understanding and conserves it, receives a habit, and uses it when the occasion arises. It exercises various and different functions: for insofar as it produces the act of understanding, it is called intelligence; insofar as it has the species together with the present object, it is called fruitful memory; likewise when it recalls its past acts of understanding, it is called the recollective and memorative faculty, and absolutely memory.

This can be illustrated by one and the same vessel, which receives water into itself, retains it, and conserves it. And by the same imagination, which perceives both present and absent things; and by the same common sense, which attains all the objects of the external senses. Moreover, the same intellect knows things in the being of real existence and in known and objective being, and knows time, its parts and differences; and it investigates, penetrates, and surveys all beings both past and present. It is therefore concluded that the same faculty altogether is both intellective and memorative, just as it is apprehensive, judicative, and discursive.

Objection I against the first assertion. Aristotle in (*lib. 6. de memoria et reminiscentia*) hands down only sensitive memory, and Damascene (*2. fidei, cap. 20*) agrees. Therefore intellective memory is not to be imported into the schools. I respond that Aristotle indeed admits sensitive memory but does not deny intellective memory — indeed he explicitly teaches it not far from the beginning of his text there cited, which we adduce in our favor in the first assertion. Though he handed down much more about sensitive memory than intellective. Damascene, cited, can be explained in the same way.

Objection II. Memory is of the past as past. But the intellect is not of the past as past, because the past is singular, which is not understood by the intellect. Therefore and so on. I grant the major; I deny the minor and its proof. For the intellect, although said absolutely to be of universals — because universals are perceived by the intellect and not by the sense — yet the intellect itself understands singulars, not only present but also past. And universals can also be past, namely those that existed in the minds of past men, such as Aristotle, Scotus, and others.

Objection III. If intellective memory existed, the Blessed who at some time sinned while living in this world would recall, or at least could recall, their sins committed. Either, then, they would take delight in recalling them and be evil, or they would detest and grieve over them and be miserable. But neither is to be admitted. I may say, with St. Gregory (*in Psalm. 87*), that in the Blessed the recollection of sins is not unto sorrow and punishment but unto joy and exultation, and to the magnification of divine mercy, because they were freed from those sins. Or say that a vehement pleasure and delight, as established in (*7. Eth., cap. ult.*), excludes all misery. Since, then, the Blessed are affected by the

greatest delight in infinite and eternal beatitude, they are immune from all misery that could follow from the memory of past evils and sins.

Objection IV against the second assertion. St. Augustine (*11. de genesi ad lit., cap. 35*) writes that in one body there is one soul and three powers: intellect, will, and memory. But intellect and will are two faculties distinct either really or formally. Therefore memory is a third faculty distinct from those two. I respond, following Scotus (*1. dist. 3, quest. 9, §. De tertio C.*), that Augustine is to be explained as referring not to three distinct faculties — as Augustine himself declares (*14. Trin., cap. 8*) — but as taking memory for the reception and conservation of species, intellect for actual intellection, and will for the act of willing. St. Thomas interprets him in the same way (*1. p., quest. 79, art. 7*).

Objection pressed further. The image of the most holy Trinity shines in the soul, and man is said to have been made in the image and likeness of God for no other reason than because, just as in the divine essence there are three really distinct persons, so in the soul there are three aforesaid really distinct faculties. Scotus responds (*1. dist. cited, §. De tertio*) and says that the aforesaid image consists in first and second acts simultaneously, which Augustine expresses (*15. Trin., near the end of cap. 6*) in these words: "In man there is found a Trinity: the mind, that is the soul, the knowledge by which it knows itself, and the love by which it loves itself." More in Scotus in the passage cited, and I treat this in the Tract on the knowability of God.

Question V. On the Motive Power of the Rational Soul.

Article I. Whether the Rational Soul Can Move Itself and the Body Which It Informs.

Man enjoys a twofold motive power: one organic and material, which belongs to the whole composite, and by which man moves himself with progressive motion, as do all other animals; the other inorganic and spiritual, which belongs to him by reason of the soul, and which — since it is peculiar and proper to the soul — is attributed to the soul itself even when separated from the body.

Assertion: The rational soul possesses a motive power by which it can move itself from place to place and the body which it informs. This is Scotus (*2. d. 42, quest. 4, §. Ad quaestionem secundam N. and d. 16, quest. un.*), preceded by Augustine (*1. 83, 99, q. 8*). It is argued, first, from the soul of Christ the Lord, which, as is held in the Apostles' Creed, descended to the lower regions. But the soul of Christ is a rational soul, since Christ himself was a true and perfect man. Therefore the rational soul can move itself locally. This can be corroborated from the angels, to whom the soul is likened, who — as is had in sacred scripture — executing the commands of God descend to earth and ascend to heaven.

Second: What belongs to the inferior and more imperfect belongs to the superior and more perfect, by the argument from the lesser to the greater. But

the motive power belongs to the sensitive soul — since living things are moved locally, and the soul is the principle of vegetating, sensing, and moving from place to place. Therefore the motive power is accommodated to the soul.

Third: To every passive potency there corresponds an active one, as Scotus excellently pursues (*in prol.*, *quest.* 1). But the soul is in passive potency to existing in this or that place, since it cannot exist everywhere. Therefore there belongs to it an active potency by which it can acquire this or that place. Moreover, the body informed by the soul is moved from place to place, while the body not informed by the soul is not moved with progressive motion. Therefore the soul possesses a motive faculty and power by which it can move itself and the body which it informs.

Objection. Act and potency at the same time in one and the same thing with respect to the same are opposed. Therefore the same soul cannot simultaneously be in act and in potency with respect to its own motion. But if the soul could move itself, it would simultaneously be in potency and in act — in act because nothing can move itself unless it is in act; in potency because it would tend toward the motion and place it strives to acquire. I distinguish the antecedent: of objective act and potency, I grant it; of subjective act and potency, I deny it. For the same Peter who has a receptive potency for whiteness receives whiteness itself, which is his accidental act. Therefore, the soul moving itself to some location can be said to be in virtual act and in formal potency.

Article II. Whether the Motive Power Is Distinguished from the Other Faculties and Powers of the Soul.

Some, among whom is Ferrariensis (2. *contra Gentes*, c. 82), confound the motive power with the imagination and the practical intellect. Others, cited by Ruverius (3. *de anima*, *Tract. de voluntate*, c. 13), hold that the motive power is the sensitive appetite together with the executive faculty, so that they are two partial principles integrating one total principle of moving. But the common opinion is that of Mayronis (1. d. 43, *quest.* 2), Durandus, and other Scholastics, teaching that the motive and executive power differs from the intellect, will, and the other powers and faculties of the soul.

Note that the motive power is sometimes without prior cognition, and is called the natural motive power, which is found in the heart when it is dilated or contracted, and likewise in animals fixed to rocks. But sometimes the motive power acts with appetite and with prior cognition for the purpose of pursuing what is beneficial or fleeing what is harmful, and this is called the progressive power, by which an animal moves from one place to another. This is what the present difficulty concerns. This power is divided into the organic and the inorganic. The organic belongs to corporeal animate beings, and the inorganic or spiritual is adapted to spiritual living beings, namely the angel and the rational soul.

First Assertion: The motive power is not the imaginative sense, nor the practical intellect. Inferred from the Doctor (*4. d. 10, quest. 7, §. Respondeo*). The first part is shown: all animals possess some sense, at least touch (*1. Met., 1*), since touch is the sense necessary for an animal, as I said in the question on touch. But some animals lack the motive power, as is evident from those fixed to rocks. Therefore the motive power is not a sense — whether imagination or another sense.

The second part is evident: God is most especially endowed with intellect, yet is devoid of motive power. Moreover, the intellect, if it is speculative, rests in the sole contemplation of the thing; if practical, it is directed toward the guidance of action. But both kinds of knowledge are generated without the motive power. Therefore in no way is the motive power the intellect, whether practical or speculative.

Second Assertion: The motive power is not the sensitive appetite. Scotus does not disagree (*cited* and *2. d. 42, quest. 4, §. Ad quaestionem 2. N.*). It is proved, first: all animals participate in the sensitive appetite, even though some lack the motive power, as I was saying in the first assertion. Therefore the motor force is not the aforesaid appetite. Second: the appetite seems to be nothing other than an inclination and propensity of a thing toward having and possessing something — which is not what the motive power is; otherwise all those enjoying such an appetite would possess the motive power, which is false. Therefore the aforesaid appetite is not the motive power.

Third Assertion: The motive power is an executive faculty formally distinct from the other faculties of the soul. Scotus does not disagree (*cited above*). It is proved, first: the motive power in angels is distinct from their intellect and will. Therefore also in men, since the same reasoning applies in both cases. The antecedent is proved by the Parisian article: "If anyone says that the angel moves the heavens through intellect or will — error." Brutes are devoid of intellect and will, yet they are not without motive power. Therefore this is distinguished from the other faculties of brutes. Furthermore, someone might wish to move but will not move, since his will is not impeded but his motive power is. Therefore this differs from the will and the other powers and faculties of the soul.

Objection I. Aristotle (*3. animae, from text 44 to 15*) seems entirely engaged in establishing that the imagination together with appetite is the motive and executive power. Therefore in the Peripatetic school no other principle of progressive motion in an animal is to be devised. I respond that Aristotle indeed writes that imagination assists the progressive faculty by way of directing, and that appetite aids it by way of weight and propension — but that it is not itself the motive and progressive power, which I taught in the third assertion.

Objection II. The same judgment is to be rendered concerning the motive power of the angel as of the rational soul. But the former does not differ from

the intellect and will of the angel. Therefore neither does the latter. The major premise presents no difficulty. The minor is evident: the angel moves locally through the command of its will. I grant the major and deny the minor and its proof, as I showed at length in the Tract on Angels. And in the third assertion I adduced the articles of the Sorbonne University to confirm and corroborate this.

Objection III. What can be done by fewer means is done in vain by more (*1. Phys., T. 52*). But the rational soul can move locally without a third faculty distinct from the intellect and will. Therefore no other faculty distinct from them is to be asserted. The major premise is denied by no one. The minor seems evident, since only three faculties of the soul are commonly enumerated: intellect, will, and memory — as may be seen in Augustine (*11. de Genesi, ad lit., c. 35*). I grant the major and deny the minor. For the reasons set forth above show sufficiently evidently and effectively that a motive power distinct from those enumerated must be admitted.

Question VI. On the Separated Soul.

The state of the separated soul is the state that the rational soul has when it is separated from the body. For when it is joined to the body, the body weighs it down — the body that is mortal and corruptible, according to Wisdom 9: "The body which is corrupted weigheth down the soul." The soul itself, however, is immortal and incorruptible. Therefore the state it enjoys when separated from the body is called the state of the separated soul, of which the Scholastics treat: Scotus (*4. d. 45, quest. 2*), Major (*ibid. quest. 4*), Mayronis (*d. 46, art. 2, quest. 1. 2. 3. 4*), Aureolus (*d. 45, quest. un.*), St. Bonaventure (*d. 50, art. 1*), Richard (*art. 1, 2*), Bassolis (*d. 43, quest. 3*), and the rest in that place.

Article I. Whether the State of the Separated Soul Is Natural.

St. Thomas (*1. p., quest. 89, art. 11*) and his disciples there, and Henry (*Quol. 7, quest. 13*), assert that the state of the separated soul is violent or contrary to nature, as Thomas testifies (*4. contra Gentes, cap. 79*). The Conimbricenses (*Tract. de anima separata, disp. 2, art. 2*) think that the aforesaid state is neither natural nor violent, but beside nature. But Scotus (*in the passage cited, §. De tertia propositione K. and Quol. 3, quest. Ad argumentum principale MM.*), Lychetus, Bassolis, and others hold that such a state is natural.

Note I, from Scotus (*1. d. 3, quest. 3, §. Sed restat G.*), that a state is described as a stable permanence confirmed by the laws of divine wisdom. It is divided into the state of the way and the state of the homeland. The former is the state in which God has established what is to be done by us as long as we live in this age. The latter is the state in which the same God has decreed what is to be accomplished after this life, in Heaven. In the present state, the internal senses do not perceive things unless the external senses have first attained them, and

the intellect does not understand unless with the prior cognition of the said senses. Hence there is the common saying of the Philosophers: nothing is in the intellect that was not first in the sense; and one who understands must contemplate phantasms. Therefore the higher faculties presuppose the operations of the lower faculties, and there is a union and harmony among them in operating, which does not seem absolutely necessary, since angels do not understand in this way, nor do the Blessed in Heaven endowed with a glorified body. Perhaps this befalls us in this life on account of original sin, as Augustine signifies (15. *Trin.*, *ult.*): "What is the cause that you cannot gaze with a fixed eye upon that light itself? Unless it be infirmity. And who made that infirmity for you? Unless it be iniquity."

Note II, from the same author in the fourth book cited above, that natural inclination is twofold: one toward the first act, which is the inclination of the imperfect toward the perfect, and which accompanies the essential potency. The other is toward the second act, which accompanies the accidental potency, since it is of the perfect toward communicating its perfection. The opposite of the former is violent and not perpetual, because it posits a perpetual imperfection, which Aristotle considered an inconvenience, as it removes all perfection from the universe. The latter, however, imports nothing violent, even if it is perpetually suspended, since it does not entail imperfection. This latter inclination belongs to the soul with respect to the body. Furthermore, it is to be recalled from Book III, Physics, question 1, article 2, what the natural, the violent, and the neutral or beside-nature are. With these presupposed and premised:

First Assertion: The state of the separated soul is neither violent nor beside nature. The assertion has two parts and is inferred from the Doctor cited. The first part is proved, first, from (3. *Eth.*, c. 1): the violent is defined as that whose principle is outside, with no concurrence of the patient — that is, where the patient does not resist. But the soul does not resist the state of separation, since that state is nobler and more perfect — as it belongs to the angel and to God. For in that state it understands and perceives things more clearly and distinctly. Hence there were Philosophers who said that the soul was attached to and mingled with the body as a punishment for sin.

Second: Nothing violent is perpetual (2. *caeli*, c. 3, T. 17). But in that state the soul exists perpetually, since it is immortal and incorruptible. Therefore that state is in no way to be reckoned violent.

Third: If the soul existed violently outside the body, the resurrection of the dead would be natural — for it would tend naturally toward union with the body and could thus unite itself to the body on its own, just as a stone when not impeded and existing above tends by its own nature toward its center. But the resurrection is supernatural, capable of being accomplished by God alone, as the Theologians cited above teach. Therefore the aforesaid state is not violent.

The second part is argued, first: that is beside nature or neutral for something which neither profits nor harms it. But the state of separation profits the soul, because it is perfected, exists freely, no longer bound to the senses and conjoined to matter, and perceives objects more openly and clearly. Second: what is neutral and beside nature is neither natural nor violent. But in the next assertion it will be shown that the aforesaid state is natural. Therefore it is not neutral and beside nature.

Second Assertion: The state of the separation of the soul can be called natural. The Doctor holds this in the passage cited. It is proved, first: that state is natural in which the soul is perfected and ennobled. For the natural is that toward which a thing tends by its own nature, as being its ultimate perfection and highest happiness, which it acquires in that state in which it is assimilated to the angel — since it understands without a phantasm and without dependence on the body. That state is therefore to be considered natural.

Second: What is not natural is not lasting (*2. caeli, 15*). But this state is lasting. Indeed, if God at the Resurrection were not to join the soul to the body, the soul itself would persist forever separated from the body. For no created agent can unite it to the body, as the aforesaid Scholastics teach. Not incongruously, therefore, that state is described as natural.

Objection I. A part outside the whole remains violently, since it is ordered toward constituting and completing the whole. But the separated soul is a part outside the whole — namely man. Therefore in the said state it is disposed violently. I distinguish the major: concerning a part that receives its perfection from the whole, I grant it; concerning a part that communicates its perfection to the whole, I deny it — such as is the rational soul.

Objection II. The soul naturally tends toward union with the body. Therefore the state of the soul outside the body is violent. The antecedent is proved from St. Augustine (*22. de Civ., c. 26*), citing Virgil (*6. Aeneid*) singing from Plato: "Again they begin to wish to return into bodies." And the same Augustine (*12. de gen. ad lit., c. 1*), adduced above from Orbellus (*d. 49, quest. un.*), writes that in the soul separated from the body there is a certain natural appetite for administering a body, by which it is in some way held back from tending with its whole intention toward God. Add Scotus (*4. d. 49, quest. 3, F.*): "Some appetite for the body exists in the soul as toward what is properly perfectible by it." I distinguish the antecedent: concerning the inclination toward the first act, I grant it; concerning the inclination toward the second act, I deny it. So are to be expounded the testimonies of Augustine and Scotus adduced for the confirmation of the antecedent. Or I say that the soul enjoys a twofold natural inclination: one when it is united to the body, so as to acquire its perfection through the use of the senses; the other when it exists separated — for in that state, free from matter, it is more perfected and already satiated, from the union with the body once accomplished, toward which it no longer inclines. Just as a

fetus that has emerged from the womb no longer tends back toward it — as, following Avicenna, the Doctor defends (*4. prememorato*). Or say that the soul indeed inclines toward a body rightly disposed and well organized, but not toward a body ill-disposed, corrupted, and reduced to ashes, as happens in the state of separation. Add what I said in Book II, Physics, question 2, article 4, doubt 3.

Objection III. Death is contrary to nature, since it destroys it. But death occurs through the separation of the soul from the body. Hence adverse qualities clash so that the soul may exit from the body, and so great is the pain and horror of man at that time. I respond that death and the other things just enumerated do not regard the soul, which is immortal and incorruptible, but the whole composite which is man, who perishes, is dissolved, and returns to the earth.

Article II. What Belongs to the Separated Soul.

First Assertion: Material and organic faculties do not belong to the separated soul. Defended by the Doctor (*4. d. 45, quest. 3, §. Ad quaestionem sub M.*). It is proved, first, from Aristotle (*1. animae, T. 64* and *lib. de sensu et sensili, c. 1*), asserting that organic and corporeal faculties belong to the whole composite such as man is, not to the soul which is its part. Second: the aforesaid faculties are constituted from the perfection of the mixed body and of the soul united to it. But when the soul is separated, the body is corrupted, together with those things that follow upon it — among which are the said faculties. Therefore the soul separated from the body is devoid of those aforesaid powers and faculties.

Second Assertion: Inorganic and immaterial faculties reside in the separated soul. So the Doctor, cited just now. It is proved, first: things that are really identified with each other cannot be separated from each other, even by divine power — since separability is a plain sign of real distinction, as I have frequently insisted in the foregoing. But spiritual faculties are really identified with the soul and with each other, as I showed (*1. 2. de anima, quest. 3, 4, 2*). Therefore they persist in the separated soul.

Second: The subject remaining, those things that are in the subject also remain, unless some corrupting cause is present. But in the state of separation the soul persists, which is the subject of the said faculties. Therefore the very faculties persist, since no cause can be adduced that corrupts and destroys them.

Third: A form is not found without its operation and principle of operating — as the form of fire without heating and its principle of heating and causing, and water without cooling and its principle and efficient cause, as is evident (*2. caeli, T. 17*). But the rational soul is a form — indeed the most perfect of forms — and its operation is intellection and volition, and the principle of each is intellect and will. Therefore in the state of separation, which is a state of perfection, the soul is not deprived of any of these.

Fourth, it is shown individually, concerning all the powers and faculties of the same soul: first, concerning the recollective and memorative power (*question 4 of this Book, article 2*); concerning the motive power (*ibid. question 5, article 1*); concerning the intellect and will, it is plainly evident, since the highest happiness is situated in the acts of these very faculties — namely in the vision of the intellect and the fruition of the will. Therefore these faculties remain in the separated soul.

Third Assertion: Intelligible species and intellectual habits not entailing imperfection remain in the state of separation, as do also the habits of the will. This assertion has two parts, to which Scotus gives his support (*4. d. 45, quest. 1, §. Alia opinio*). The first part is opposed to Poncius (*disp. 56, quest. 2, concl. 1*) and is proved, first, from (*3. animae, T. 6*): "The soul is the place of forms" — namely of intelligible species. But a place is preservative of what is in it. Therefore, since the intellect is the place of intelligible species and remains both in the state of conjunction and of separation, it is deduced that the said species persist in the separated soul.

Moreover, from Boethius (*5. de consolatione, prosa 5*): "Whatever is received is received in the manner of the receiver." But the soul is altogether immortal and incorruptible, from what has been asserted in the present Book, question 1, article 3. Therefore species received in it remain when it is separated from the body. And Avicenna (*naturalium, parte 1, cap. 6*) adds that the soul separated from the body understands more clearly and distinctly — which it could not do unless in its separated state it conserved species, since they concur partially in producing the acts of understanding. St. Jerome gives his support (*in prologo Bibliæ, c. 7, ad Paulinum*): "Let us learn on earth those things whose knowledge may persevere for us in Heaven." But knowledge, being of a conclusion, presupposes demonstrative premisses; the premisses pre-require terms, which are not perceived without the aforesaid species. Now if the knowledge acquired by us in this state with such great labor and sweat were not to remain in the other state, our study would be unworthy and vain, and our toil in seeking and exploring it fruitless, as the Doctor adds (*in the passage just cited C.*).

Second: Intelligible species are repugnant to neither state — whether of conjunction or of separation. Therefore they persevere in both. The antecedent for the state of conjunction is admitted by Poncius and others recalled by Aureolus and other Scholastics in the passage cited above. For the state of separation it is shown: the said species, even though in their coming-to-be they depend on phantasms, do not depend on them in their being. For they can exist — indeed they actually do exist without them — since they are in the intellect, which in its being does not depend on matter and material things (*3. animae, 6*). Therefore these species persist and endure in the soul.

Third: Such species are not instantaneous qualities but continuous and permanent, and nothing is contrary to them. Therefore if they here remain in

the intellect after the acts of understanding, they remain also there — since that state is not of worse condition, indeed of more perfect condition than this; otherwise the soul would be saddened at their admission, in the acquisition of which it spent so much time and study. The antecedent is admitted, since neither the intellect is opposed to them — as it is their seat and subject — nor the object, since from this the species take their origin. And nothing is both productive and simultaneously destructive of one and the same thing.

Fourth: If the inferior faculty accomplishes something, the superior likewise can accomplish it — as if sight perceives color, likewise the common sense and the intellect perceive and know it. But the imagination, which is an inferior faculty, conserves species of absent things, as is evident in dreams. Therefore the intellect also retains and conserves species of known things when it is separated from the body.

Moreover, the separated soul possesses memory and reminiscence, from what was said in question 4, article 2 of this book, which cannot exist without intelligible species retained and conserved in the intellect. Hence the rich man of the parable (*Luc. 16*) recalled his five brothers who were still living in this world.

The second part is evident: charity, which is a habit of the will, perseveres in both states, according to (*1 Cor. 13*): "Charity never fails." Moreover, a perfect state calls for a perfect habit. But charity is a perfect habit — indeed the most perfect and excellent among all habits, whether intellectual or moral. Therefore it remains in the separated soul. Hence from this an argument is drawn to prove the first part of this assertion: if moral habits persist in the will of the separated soul, likewise intellectual habits that do not carry with them imperfection repugnant to that state persist in the intellect of the same soul.

Fourth Assertion: The separated soul can understand something new that it did not understand in the body. So Scotus (*cited above, quest. 2, §. Ad quaestionem C. and in Report., §. Ad 2. quaestionem*). It is argued, first: from a natural agent duly approximated to the patient when not impeded, an effect is produced, as is evident from fire burning straw placed near it. But the separated soul is endowed with the agent and patient intellect, to which an angel or some other object previously unknown but now known and understood presents itself. For the sufficient and total principle for generating knowledge and intellection is the cognitive faculty and the object in itself or in a species representing it. Therefore, since the separated soul has all of this, it is plainly shown that it can acquire for itself knowledge of something previously unknown to it.

Second: The soul of a child that died after a short time of life has no knowledge of any object — for in the body it exercised only vegetative and sensitive operations. But that soul separated from the body is not like a stump incapable of intellection, because it possesses agent and patient intellect. Therefore it can

acquire for itself intellection of some object. And if the soul of a child can do this, it is not to be denied to the soul of an adult or any other, since they are of the same nature and essence.

Third: What participates in a nobler and more eminent mode of being has a greater and more favorable manner of acquiring its own perfection. But the separated soul has a more excellent and superior mode of being, since it is separated from matter and from the imperfect state — for in that state it understands without the senses and phantasms to which it was bound when joined to the body. Therefore it is fitting that it can acquire for itself cognition of a previously unknown object.

Poncius objects, following St. Thomas (*4. d. 50, quest. 1*), that species are infused by God or by an angel, through which the soul arrives at cognition of unknown objects. On the contrary: without necessity and compelling reason, recourse is not to be had to God or abstract substances. For it ill befits a philosopher, when natural reasons and effective arguments are at hand — as in the present case — to have such recourse. For the separated soul has a sufficient principle for going forth into the act of understanding, since it possesses the intellect and a present object. If, for example, an angel presents itself to it, will the soul not be able to know it? If in the state of the way, through the motion of the heavens, it attained knowledge of it, will it lose that knowledge in the homeland and, when the angel is presented to it, not know it? For from object and cognitive faculty, knowledge is produced, as Augustine testifies (*9. Trin., c. 12*), from whom no Scholastic dissents. Moreover, the soul when conjoined can acquire for itself the species of things and understand them; and in the separated state, enjoying the same intellect and the other faculties belonging to it, will it be ignorant of them and be unable to attain some of them anew? This is assuredly false and absurd — that something having a natural and unimpeded principle of acting, and all else necessary for acting, should not act unless God or an angel exerts a special influence. The soul would be worse than inanimate things, which by a common influx perform their own works — as fire heats, water cools, and air moistens.

Objection. This comes from the soul's mode of understanding, since the soul itself understands in dependence on phantasms, and in that state it lacks phantasms — and therefore it then cannot understand anything unless species of things are furnished to it by God or an angel. On the contrary: that mode of understanding is not natural to the soul but befell it from original sin, as was said above. Moreover, if it arises from the connection of the lower faculties with the higher, and of the senses with the intellect, yet the higher faculty can accomplish something without the concurrence of the lower — as the imagination acts in dreams with the other senses, both external and internal, at rest. Therefore, since the intellect is superior, abstracted from the senses, it will be able to understand present and proportionate objects without a new influx and concurrence of God or an angel.

Furthermore, a man traveling in a carriage can travel on foot outside the carriage. And a man walking on a ship can likewise walk outside the ship — because in both cases he possesses the power of walking. So the soul in the body can acquire certain species of things and understand them; it can also do this outside the body, because in both states it participates in the same power of understanding.

Second: Sensible species from present sensible objects are caused in the sensitive and material faculties, for they are their natural similarities and images, and are offered by the imagination to the agent intellect, which transfers them from material being to spiritual being, as I said and explained in the proper place. Just as, therefore, the material objects themselves cause and present the said species to the senses, so they also present them to the agent intellect of the separated soul, which having that power in the state of separation, it plainly follows can have the same effect of transferring them from material being to spiritual being. And accordingly by those means, since they are spiritual, the soul can without doubt know and understand the objects represented through them.

Third: An angel can know something new through species derived from objects, as Augustine implies (*lib. de cura pro mortuis, c. 13*) and Gregory affirms (*12. Mor., c. 13*), from whom St. Thomas does not dissent (*1. p., quest. 89, art. 8*), conceding that an angel sometimes descends from heaven to investigate and examine certain things. Therefore the separated soul can do the same. Moreover, sensibles move the sense — as color the eye and sound the ear. Therefore spiritual things likewise move the intellect. Furthermore, an accident when conjoined acts — as the whiteness of a wall disperses sight. Separated from its subject, it likewise affects the sense — as the whiteness of the consecrated host disperses the same sight as if it were in its subject. Therefore the same must be asserted of the intellect of the separated soul as of the conjoined soul.

Objection I against the third assertion. (*1 Cor. 13*): "Knowledge shall be destroyed." But knowledge is one of the five habits of the intellect (*6. Eth., 3*). Therefore intellectual habits do not remain in the state of separation. I respond that the testimony of St. Paul adduced for the major is to be understood with respect to the partial and imperfect mode — not with respect to the substance of knowledge itself — as the Apostle himself declares a little later: "Now I know in part; but then I shall know even as I am known." For we shall no longer see God and the rest of the objects represented in his essence in an enigma and in a mirror, but face to face. Lyranus agrees with this, both there and in the epistle of Jerome to Paulinus (*cap. cited in the third assertion*).

Objection II, from (*3. animae, 39*): "As sense is related to sensibles, so is the intellect to intelligibles." But sense cannot know sensibles unless they exist as present. Therefore the intellect cannot know intelligibles unless they are present through phantasms. But in the state of separation there will be no phantasm,

since the soul will then be devoid of all the senses, as has been proved in the first assertion. Therefore the separated soul neither retains nor conserves intelligible species. I respond that Aristotle is to be understood of the state of conjunction, which alone he knew — not of the state of separation, in which the soul does not need a phantasm, since it has intelligible species already acquired, which are preserved in the possible intellect as in their treasury.

Objection III. The soul is united to the body so that through the use and service of the senses it may acquire cognition of things. Therefore in the state of separation, since it lacks all senses, it cannot acquire any knowledge of things — otherwise the soul's union with the body would be in vain. I deny the consequence. For the soul can acquire knowledge of things by a twofold path — namely in the state of conjunction and also in the state of separation — just as a goal can be acquired by two means, for example health by bathing and by a drink. If it is acquired by bathing, it does not follow that it cannot be obtained by a drink, but in either way. Likewise the soul can acquire for itself cognition of things both in the state of conjunction and in the state of separation.

Objection pressed further. Between the knower and the known there intervenes some proportion, as between the receiver and the received. But between the separated soul and a material object there is no proportion — since the latter is sensible and the former is not at all. And the spiritual cannot receive the material, nor can the latter act upon the former. Therefore the soul in that state can acquire no knowledge of a thing. I say that the agreement and proportion is not intercepted in entity but in intelligibility — that is, just as a material thing is intelligible, so the soul is intellective and understanding. Just as between the infinite God and the finite intellect there is no proportion in entity, but there certainly is in intelligibility — that is, just as God is knowable, so the created intellect is cognitive.

**Moral Philosophy of Fr. Bonaventure Columbi
of Nice, Minor Conventual, Doctor and
Professor of Sacred Theology. According to the
Mind of the Subtle Doctor.**

Moral Philosophy of Brother Bonaventura Columbi, Conventual Minor, Professor of Sacred Theology

Occasion of Writing

I have resolved to commit this Moral Philosophy to the press, both on account of its very great usefulness, delight, and dignity, which I described in the preceding pages, and also on account of the scarcity of writers in the Scotist school who have consigned it to print. For the older Scotists scarcely touched it as a matter of settled practice, and the more recent ones taste it but sparingly and superficially. This is perhaps because moral philosophy is easy to grasp, not heavily laden with speculative questions, or because what is treated therein is handled and examined almost entirely in Theology, especially in Book III of the Sentences and in the second part of the Summa Theologica. For this reason I have judged it fitting to examine and sift it clearly and precisely, yet briefly, so that those devoted to Scotist teaching may have a complete and finished philosophical course covering the whole of Scotism, together with the express passages and testimonies of the Subtle Doctor, either stated by him directly or derived and collected from him.

Preface

The first author and sower of Moral Philosophy is reported by Augustine (*8 City of God, ch. 3*) to have been Socrates, who, having set aside the study of natural things, gave himself entirely to moral questions and applied all his care and diligence to correcting and composing human conduct. And indeed it is the constant sense and consensus of all that the human race is ruled and governed by natural and moral law. Aristotle, moreover, wrote in (*1 Politics, 2*) that the man who is instructed by perfect law and follows it is the best of all living creatures; but the man drawn away from right law and good morals is the worst of all animals. And Seneca in the Natural Questions says: Virtue is not acquired except by a preceding guide and teacher; but vice is born without any instructor. Therefore Ethics — which, as a heavenly discovery and gift, is the true norm and mistress of good morals — is to be embraced and cultivated with great zeal; it lays open the way to virtue and closes the door to vices, it teaches how to moderate and restrain the passions of the soul, it shows what is just and what is unjust, urging us toward the one and bidding us flee the other, and at last it leads us onward to everlasting happiness and heavenly beatitude, in which may he deign to make us partakers who possesses the highest glory and infinite blessedness.

Book I: On the Prolegomena of Moral Philosophy

Three questions are set out and examined in this prelude. The first concerns the existence and names of Moral Philosophy. The second concerns its division and nature. The third concerns its object and the matter with which this Philosophy is engaged.

Question I: On the Existence and Names of Moral Philosophy

The first thing we investigate and examine concerning any proposed subject is whether it exists, as Aristotle instructs (*2 Posterior Analytics, 1*). Gladly accepting and eagerly following this instruction and precept, we have resolved to treat and explain briefly the existence of Moral Philosophy before we approach its other attributes and predicates.

Article I: Whether Moral Philosophy Exists

The assertion is that Moral Philosophy exists. The Doctor holds this position (*verf. Ideo dicitur sub E, and § Ad argumenta BB, and 4, dist. 14, q. 3, § Hic dicitur F*). It is proved, first, from the common consensus of the Philosophers, who unanimously and harmoniously teach and publish such a Philosophy. In support are Augustine (*8 City of God, ch. 5*), Plutarch (*2 On the Opinions of Philosophers, ch. 1*), and Aristotle (*in the fifth volume of his works*). Second, from the celebrated division of Philosophy into rational, natural, and moral — received by the Stoics, Peripatetics, and other Philosophers — against the flood of which it would seem imprudent and rash to set oneself. And from the common partition of science into speculative and practical, the latter of which is subdivided into active and productive, which Aristotle mentions (*6 Metaphysics, ch. 1*) and notes beforehand (*2 Metaphysics, T. 3*): the end of speculative science is truth, while the end of practical science is a work — which is either manual, pertaining to productive science, or moral, pertaining to Ethics. Moreover, just as Grammar was devised for speaking correctly, Rhetoric for speaking well, and Logic for arguing aptly, so Moral Philosophy — whose end is that we become good (*10 Ethics, 9; 1 Metaphysics, 2*) — must be conceded for the purpose of living well and happily.

First objection. Aristotle (*2 Metaphysics, T. 3*) and Scotus, defining Philosophy in the same passage, say: Philosophy is the science that contemplates truth. But Ethics brings about works rather than contemplating truth, as is evident from (*10 Ethics, 9*). Therefore, since the definition of Philosophy does not apply to it, Moral Philosophy ought not to be admitted. I reply that the said authors are speaking in that passage of speculative philosophy, not of practical philosophy, which is what Ethics is, as the text shows plainly and clearly a little further on:

the end of speculative science is truth, the end of practical is a work. Augustine demonstrates this learnedly and solidly (*11 City of God, ch. 25*), speaking of the Platonists: They establish a tripartite discipline of wisdom, of which one part is called Logic, another Physics, and the third Ethics. The Latin names of these are already confirmed in many writings, so that they are called rational, natural, and moral.

Second objection. There is one object common to all disciplines, as may be seen (*3 Metaphysics, T. 10*); since then the division of Philosophy and science is taken on the basis of things (*3 On the Soul, 51*), it does not seem that a Moral Philosophy distinct from the other disciplines needs to be devised. I reply that there is one common and transcendent object — namely, being — which Metaphysics alone contemplates, as Aristotle affirms (*4 Metaphysics, 1*). But beyond being, there are particular objects which the other sciences consider, as the Philosopher illustrates in the passage just cited with the example of the mathematical sciences, which are distinguished from Metaphysics by their particular objects. This he had already taught beforehand (*1 Ethics, ch. 6*), saying: There are many sciences even of those things which fall under a single name.

Article II: By What Names This Science Is Called

Just as Logic has several names, some proper and some figurative, as I made clear (*in the Epistle to the Dialectic, Book I, q. 1, art. 1*), so Moral Philosophy is assigned a great many terms, as Aristotle's commentators observe in the proem to the Ethics.

The assertion is that some names of this science are improper, others proper. This assertion is twofold and is derived from Scotus (*in the passages cited in the preceding article*). The first part is evident from the fact that, given the various and diverse functions and offices which moral philosophy performs, many names are adapted to it. It is called the mistress of life, the rule of morals, the medicine of the soul, and the beacon of the will, as Raconius develops elegantly (*in his first Proem to Moral Philosophy*). The second part is manifest. It is called civil philosophy, the origin of which is derived from the word City, of which the individual households, poor and rich, are parts, as the Philosopher writes (*4 Politics, 21*). It is also called practical philosophy, because it properly directs praxis, which is the operation of the will that can be conformed to the right dictate of reason, as I said (*in Logic, Book I, q. 3, art. 5, dub. 1*). It is again named Ethics, or moral philosophy, since it treats of morals, custom, and acquired habit, as Scotus notes above all others (*4, dist. 14, q. 3, § Hic dicitur F*), and as Aristotle intimates (*1 Magna Moralia, ch. 7*).

Objection. One thing participates in only one name, as is the case with man and other things to which Adam assigned names (*Genesis 2*); but Moral Philosophy is one by reason of the unity of its formal object, concerning which see the third question. Therefore it is to be designated by one name and not by several. The

major premise is denied. For nothing prevents one art or science, by reason of the diverse functions, offices, attributes, and predicates with which it is occupied, from acquiring several names, as is evident in the case of Logic and Metaphysics, which are distinguished by many terms, as has been delivered in the proper places. Dionysius supports this, who composed an entire work on the divine names, even though God is one and utterly simple. Jerome agrees (*Epistle 136*), who from the sacred text collects and sets out ten Hebrew names attributed to God himself. And concerning the Demon, Bernard understands that saying from the sixth Aeneid: "One to whom a thousand names belong, a thousand arts of harm."

Question II: On the Division and Nature of Moral Philosophy

Article I: How Many Species Moral Philosophy Has

To begin with, Ethics is divided into Monastic, Domestic, and Political philosophy. Monastic philosophy is concerned with the moral actions of the private individual; the word "monk" means alone or solitary. Domestic philosophy is engaged in the well-ordered governance of the household. Political philosophy is occupied with the right administration of the city and the governance of the commonwealth. Political philosophy is further subdivided into Monarchy, Aristocracy, and Democracy. Monarchy is that form in which all things are subject to and governed by the command of one. Aristocracy is that in which all things are managed and governed by a few men distinguished by virtue and equity. Hence the Philosopher says in the first book of the Metaphysics that those endowed with intelligence ought to take precedence over others. Democracy is that in which the People has the power of governing and moderating all things.

First assertion: the common division of Moral Philosophy into Monastic, Domestic, and Political is correct. This is presupposed by the Doctor in the cited passage. It is proved, first, from Aristotle, who divided all his works on Moral Philosophy into ten books on Monastic philosophy, two on Domestic, and eight on Political. The stated division is therefore consistent with the doctrine of Aristotle. Second, moral operation is exercised around three goods: either about the private individual, and it is Monastic; or about the household, and it is Domestic; or about the city, province, or kingdom, and it is Political. Ethics is therefore rightly divided into the three named species.

Second assertion: Monastic philosophy precedes Domestic and Political in time, and Political philosophy is later than the two preceding in time, but excels them in dignity. The Doctor does not disagree in the same passage, and Aristotle accepts this (*1 Economics, ch. 1*). This assertion contains two parts. The first part is argued thus: a man must first know what is necessary for his own instruction

and governance, which belongs to Monastic philosophy, before he undertakes to regulate and order a household, which pertains to Domestic; and he must first become suited to governing a household before he is fit to administer a commonwealth. And in urging this, the Apostle Paul says (*1 Timothy 3*): If any man cannot govern his own household, how shall he have care of the Church of God? Moreover, besides God, love of oneself precedes love of others, as the Doctor teaches (*4, dist. 50, q. 2, § Respondeo*). And Aristotle indicates this (*2 Politics, 3*). Hence that common proverb: The first charity begins with oneself. David may have had this in view when he said (*Psalms 118*): My soul is continually in my hands. Gregory adds, concerning Job, chapter 8: Kings are those who know how to rule their own bodies, who temper in themselves the movements of desires, who regulate their thoughts under the law of virtue. They are kings because they preside over themselves; they know how to govern themselves. Solon the Athenian likewise says: Rule, where you have first learned to obey. For when you have learned to be ruled, you will know how to rule.

The second part is shown thus: the common good must be preferred to the particular good, since the former is more divine, as Scotus intimates (*1 Reportata, dist. 10, q. 1*) after Aristotle (*2 Magna Moralia, ch. 17*). Now Political philosophy labors about the common good, whereas Monastic and Domestic look to particular goods. Political philosophy therefore excels the others in dignity. Hence a man of noble birth scorns all things, even at the cost of himself and his entire household, in order to provide for, preserve, and defend the commonwealth from hostile assault.

Third assertion: Political philosophy is rightly divided into Democracy, Aristocracy, and Monarchy; and the last of these surpasses the other two. This assertion, which is divided into two parts, is not at odds with Scotus in the cited passage. The first part is argued thus: either all citizens are engaged in the governance of the commonwealth, and it is Democracy; or only those more outstanding in virtue and intelligence hold the care of the commonwealth, and it is Aristocracy; or one supreme figure stands above and presides over all, and it is Monarchy. There are therefore only three political species enumerated. Furthermore, just as in Logic every proposition is either universal, or indefinite, or particular, so governance is either entrusted to the people, or to those more excellent by virtue, or to one alone. If the first, it is Democracy; if the second, Aristocracy; if the third, Monarchy. No more and no fewer than these three political species need therefore be enumerated.

The second part is shown, first, from (*3 Politics*) and (*12 Metaphysics, 55*): Entities do not wish to be badly governed; therefore let there be one prince over all. Second, from the Fathers: Chrysostom (*Homily 34 on 1 Corinthians*): God gave us one head, namely Adam. For why are we all born from earth, since he did not make woman from earth? Because it would not have sufficed to impel us toward concord that we are similarly of the same essence, unless we also had the same

first parent. And Jerome, both (*in his first book against Julian*) and (*in his letter to the Monk Rusticus*): Cranes follow one in repeated order; there is one Emperor, one judge of a province; Rome as it was founded could not have two brothers as kings at the same time. Third, the Prince is the image and exemplar of God on earth and the moderator of things, as some report from Seneca; and Monarchy represents the dominion of God, which is one alone, according to that saying of (*Matthew 6*): No one can serve two masters. (*Jeremiah 12*): Many shepherds have destroyed. And (*John 10*): There shall be one fold, one shepherd. Moreover, (*2 Physics, 22*): Art imitates nature; but the governance of nature tends toward one, as the parts and members tend toward one body and the soul that vivifies and governs it, and the body and soul toward one animated composite; all the powers of the soul and of the whole animated compound are subjected to one — namely to the will or rational faculty. Among land beasts the Lion reigns, among aquatic creatures the Whale, among birds the Eagle, and over all living things man presides, as is evident from (*Genesis 1*): Have dominion over the fish of the sea, and over the birds of the air, and over all living things that move upon the earth. Finally, the Lord of all is one God, as we read (*Apocalypse 19*): King of Kings and Lord of Lords.

First objection against the first assertion: Aristotle (*1 Magna Moralia, ch. 1*) numbers Ethics under Political philosophy. Therefore Ethics does not differ from Political philosophy, or at least is not more general and universal than it. I reply that Aristotle is there speaking by the figure of synecdoche, taking the part for the whole — that is, taking Political for all of Ethics. For designation commonly proceeds from the nobler part. Thus books are titled "On the Soul" even though their subject is the animated body, as I there taught. Similarly, Augustine (*2 Questions on the Gospels, q. 7*) uses "soul" in place of "man." And (*3 On the Harmony of the Evangelists, ch. 24*) he adds that it is the custom of Sacred Scripture to use the part in place of the whole. Therefore Moral Philosophy is called Political, because Political is its apex and towers above its other parts.

Second objection against the third assertion: In (*1 Kings 8*) the Israelites are rebuked by God because they asked him for a king. Therefore Monarchy, whose head is a King, is not more excellent and worthy than the others. I reply that the Israelites were not reproved by God for having asked for a king absolutely, but because they wished to exchange God himself, who was their King and who governed them through judges, for a king who would possess the kingdom as his own and transmit it to his sons by hereditary right. Therefore Augustine adds (*on Psalm 17*): It is well known that the people asked for a king not according to God's will but according to their own. And (*Book 5, Questions, q. 26*) citing Deuteronomy 17: To those desiring a king, God did not command it but permitted it.

Third objection: By nature we are not slaves but free. For God made man and left him in the hand of his own counsel (*Ecclesiasticus 8*). Therefore Democracy,

in which public liberty exists, is to be preferred to the others. I reply that the fact that we are free in the acts of our will does not prevent us from being subjected to and obeying one person for the good governance of the city, kingdom, and empire — one who has the power to restrain the wicked and reward the good. This Chrysostom expounds no less luminously than eloquently (*Homily 23 on Romans*): Since equality of honor and condition frequently produces conflicts and dissensions, God established many princeships and many subjections — of husband and wife, parent and child, old and young, slave and free, ruler and subject, teacher and student. And why do you marvel that he did this in man, when he did the same in our body? But this indeed to a lesser degree, that to a greater — here the commanding members, there the subjected ones. The same is to be seen in beasts, as in bees, cranes, and flocks of wild sheep. And even the sea is not without this discipline; there too many species of fish are governed and march under one, and they undertake their long migrations in this way. For that liberty which is dissolute and lacking in moderation is everywhere the cause of evil and confusion. You ask: who was the first king of all? I say, with Augustine (*1 Questions on Genesis, q. 121*), that in Israel it was Saul, as is evident from (*1 Kings 10*): And all the people cried out and said: Long live the king. I said "in Israel," for before Saul, kings are related to have flourished in other regions (*Genesis 14*), where Abraham defeated the kings who had taken Lot captive. And it is admitted among the chroniclers that Ninus, son of Belus, subjugated the peoples of all Asia, and he lived before Saul. Therefore Saul was not simply the very first who claimed the name of king for himself, as is clearly evident from the text just cited in chapter 8: Appoint us a king to judge us, as all the nations have. See further in Genebrard (*1 Chronology, pp. 17–18*).

Article II: Whether Moral Philosophy Is a Science

That Moral Philosophy is a true single habit of the intellect is something no one fails to know. It is indeed a habit by which the intellect judges what is to be embraced and what is to be avoided. But since, as was stated (*in Logic, Book I, q. 2, art. 1, Note 2*), five habits of the intellect are established and distinguished, it is rightly put in question which of those five habits is to be assigned to Moral Philosophy.

The assertion is that Moral Philosophy is a science. So holds Scotus (*q. 4 of the Prologue, § Ad argumenta principalia circa BB*). It is proved, first, from Aristotle (*2 Metaphysics, ch. 1, T. 3*) and (*6 of the same, ch. 1, T. 1*), where speculative and practical sciences are enumerated, among which Moral Philosophy holds a not insignificant place. Hugh supports this (*Book on the Formation of Novices*): The way to God is that science which pertains to instruction in living rightly and honorably. And Ockham demonstrates this at length (*Quodlibet 2, q. 14*). And Aegidius concludes (*1 On the Rule of Princes, ch. 3*): Through the intervention of this science man governs himself and acquires himself. Second, Moral Philosophy is a habit acquired through demonstration; therefore it is a science.

The consequence holds from (*1 Posterior Analytics*, 2) and (*6 Ethics*, 3). The antecedent is proved: many demonstrations are made in Ethics — for example: every supreme good is the ultimate end; but God is the supreme good; therefore he is the ultimate end. Again: everything consonant with reason is to be pursued; but virtue is a good consonant with reason; therefore it is to be pursued. Third, Ethics is one of the five habits of the intellect, as all concede; but it is not art, since art is a productive habit exercised through a bodily organ; nor is it the habit called understanding, which is acquired by the mere explication of terms; nor is it wisdom, which contemplates the highest causes; nor is it prudence, since boys can be proficient in Mathematics and Ethics even while lacking prudence — a point whose reason Aristotle gives (*6 Ethics*, 8): prudence is concerned with particulars, which become known to us through experience, of which boys have none. And some persons are adorned with Ethics and other disciplines yet are stripped of prudence, managing their affairs badly, as Raynaud notes specifically concerning Solomon (§ 4 of the *Prologue*, n. 41), and before him Aeneas Sylvius (*Epistle* 104).

First objection: Moral Philosophy, according to Augustine (*19 City of God*, ch. 3), is called the art concerned with life, or the art of honorable life; but art is a habit distinct from science (*6 Ethics*, 3). Therefore Moral Philosophy is not a science. I reply by explaining Augustine as using "art" in the broad sense, as Aristotle takes it (*1 Metaphysics*, 1), where he calls the mathematical disciplines arts, which are established as sciences proper — not in the narrow and proper sense of "art," which rightly differs from science, as the argument proves.

Second objection. The same Philosopher writes (*6 Ethics*, 8) that the habit of acting with right reason with respect to what is good or bad for man is prudence; but Moral Philosophy is of this sort; therefore it is prudence. I reply that the major premise is to be taken only with respect to things that are good or bad according to particular circumstances, since prudence concerns singular actions to be carried out and administered at the proper time and place, as Aristotle clearly intimates in the passage just cited — not with respect to what is good or bad in general, which pertains to Ethics. I add that prudence is one of the moral virtues, about which in its proper place; whereas Ethics considers not only the moral virtues but also many other things, as will be apparent in their treatment.

Third objection: Science concerns eternal things (*1 Posterior Analytics*, 6); but Ethics concerns temporal and mutable things, for it is concerned with human acts, which are subject to change, as no one is unaware. Hence Job says concerning man (*Job* 14): He never remains in the same state. Therefore Moral Philosophy is not a science. I reply by exposition and distinction of the major: taking it as non-complex, I deny it; taking it as complex, I concede it. To the distinction of the major, the minor is to be distinguished piously with Scotus, as I accomplished (*in Logic*, Book I, q. 2, art. 2).

Article III: Whether Moral Philosophy Is Practical

Having passed through all that I carefully adduced and extensively explained in Logic at the passage now cited, art. 5, dub. 1 and 2, the present difficulty is resolved promptly and easily.

The assertion is that Moral Philosophy is practical. This is defended by Scotus (*q. 4 of the Prologue, § Contra istam positionem, sub E*) after Aristotle (*1 Ethics, 3*) and (*10 of the same work, ch. 10*), and by Clement (*2 Paedagogus, ch. 13*), who calls it the study of right reason — that is, practical reason — which directs morals. It is proved, first: every science that directs praxis is practical; every science that does not direct praxis is speculative; but Ethics directs praxis; therefore it is practical. The major is common. The minor is manifest: Ethics directs the operation of the will, which is true and proper praxis, as the Doctor, with universal agreement, teaches in the cited passage (*§ Dico igitur*). Second: every science is either speculative or practical (*6 Metaphysics, 1*); but Moral Philosophy is a science, as I proved in the preceding article; it is not speculative, however, since it tends toward a work and its end is that we become good, as stated in the passage just cited. Therefore Moral Philosophy is to be classed among the practical disciplines — not productive or manual disciplines, but active ones, whose principle in the agent is choice. For the same thing is both doable and choosable (*6 Metaphysics, a little before T. 2*).

First objection: the end of practical science is a work (*2 Metaphysics, ch. 1, T. 3*); but in Moral Philosophy there is no work present, since its subject is praxis, which denotes no work. Therefore Moral Philosophy is not practical. I concede the major and distinguish the minor: there is no manual work, I concede; there is no moral work, I deny, as I declared abundantly in the passage recently cited.

Second objection: every science exists for its own sake, as Aristotle not obscurely intimates (*1 Metaphysics, 2*); but Moral Philosophy does not exist for its own sake, since it is directed toward moral work. Therefore it is neither speculative nor practical. I reply that this is a feeble argument with no force. For if it proved anything, it would only show that Ethics is not speculative — which we willingly admit — not that it is not practical, as may be seen in the text just cited, where the Stagirite explicitly and openly writes that the science which exists for its own sake is nobler than one that exists for the sake of something else. Therefore I absolutely deny the major — that is, that every science exists for its own sake. This is piously and learnedly indicated by Chrysostom (*Homily 13 on Romans*): What profit will it be for one who knows what is to be done, if he does not bring it to action? Certainly none; indeed, from that knowledge greater condemnation arises. And Aristotle forewarns this (*10 Ethics, ch. 9*) and (*1 Eudemian Ethics, ch. 3*).

Question III: On the Object of Moral Philosophy

Article (Sole): What the Object of Moral Philosophy Is

Philosophers who investigate and treat moral questions dispute greatly and strenuously about determining the object of Moral Philosophy; Raconius attempts to reconcile them (§ 2 of the Prologue to his moral discipline). For some are of the opinion that its object is virtue. Some, like Pontius, hold that it is natural happiness. Others hold that it is the human moral action. Others still hold that it is man as one who is to be imbued with good morals. For the declaration and decision of this question:

Note first that some actions are natural and necessary, while others are free and contingent. The former proceed from man naturally and necessarily — such as nutrition, growth, and generation, which are common to all living creatures. The latter proceed from him freely and contingently — such as love and hatred. Note further, from the Doctor (*q. 4 of the Prologue, art. 1, § Dico igitur*), that there is a twofold act of the will: elicited and commanded. The elicited act proceeds immediately from the will itself and resides in it, as the act of loving. The commanded act is the act of another power, subject to the will by its command — such as the act of the sensitive appetite restrained by the will, concerning which God says to Cain (*Genesis 4*): Your appetite will be under you, and you will rule over it.

Note second that the act of the will can be examined in two ways. First, in the genus of being, insofar as it is a being or a real physical act proceeding from the will; its consideration belongs to Psychology, which treats of the will and consequently of its acts. Second, in the moral genus, insofar as the action is judged worthy of praise or blame, commendation or reproach; Moral Philosophy disputes concerning this. Furthermore, recall what I said (*in Logic, Book I, q. 4, art. 1*) about the divisions of an object and the conditions necessary for it and required for it.

First assertion: virtue is not the proximate and adequate object of Moral Philosophy. This is derived from the Doctor (*q. 3 of the Prologue, § Ad 1 argum. 1 quaest.*) and (*§ Ex his dictis in fine*). It is proved, first, because virtue does not contain everything that is comprehended in Ethics — such as the good, the end, happiness, and other such things, about which we shall treat individually in this work. Therefore it cannot be its total and adequate object. Second, the primary and adequate object of a science is not ordered toward something else that is treated in it; rather, all that is handled therein is in some way referred to it. But virtue is ordered toward happiness as toward its end and term; therefore it is not the total and adequate object of Ethics.

From this the opinion of those who hold that natural happiness is the total object of moral discipline is also refuted, since happiness is its end, not its total object. I add that a real science — and Ethics is such — is not concerned with an accident as its object; but formal happiness is an accident — namely, the perfect operation of an intellectual nature. Moreover, natural happiness does not contain virtually or potentially all the truths that are attributed to this science;

and many things are treated in it that do not accord with natural happiness, and therefore it is not determined to be its total and adequate object.

Second assertion: nor is the human action as morally directable the formal object of Moral Philosophy. This is gathered from the same Doctor in the cited passage. It is proved, first, because the formal and total object of any science is its object "that" — that is, what is examined and sifted by the science — but the human action as morally directable is not the object "that" but the object "by which," meaning that through the action and through practical knowledge the moral philosopher knows that one must live well and honorably, and he exercises himself in good morals in order to attain happiness. Such a human action is therefore not the primary and proximate object of moral doctrine. Second, the moral action does not contain all that is considered in Ethics — especially the good, the end, happiness, and similar things. For these are not actions, nor are they reducible to action. Moreover, as (*in Logic at the cited passage*) we rejected the act or operation of the intellect as directable from the object of Dialectic, so equally the moral action as informable by good morals is to be repelled from the object of Ethics. Besides, the object of a real and principal science, such as Ethics is, is not an accident, as the Doctor assents and as is evident from the object of physics and other sciences; but an action — whether it belongs to the genus of quality or to the genus of action — is an accident; therefore it does not stand as the formal object of Moral Philosophy.

Third assertion: man as one to be instructed and moralized in good morals is the formal and adequate object of Moral Philosophy. The Doctor hints at this (*q. 3 of the Prologue, § Ad 1 argum. 1 quaest., in the solution to the third*). Aureolus defends this explicitly (*in the last question of the Prologue*). And Aristotle touches upon it (*1 Ethics, 4*). It is proved, first, from the refutation of the others. Since it is accepted by all as certain that Moral Philosophy has some formal object to be established, and this is not virtue, nor natural happiness, nor anything else, as has been proved above, it is evidently established that it is man as one to be imbued with good morals. Second, it is argued from analogy: the object of physics is the natural body, and the object of medicine is the healable body; therefore the object of Ethics is the moralizable man. Third, the said object participates in all the conditions necessary and required beforehand for the proximate and formal object of Ethics. For in Ethics one presupposes and precognizes whether moralizable man exists and what he is; his knowable attributes are demonstrated; and all that is discussed in Ethics is directed toward him, as is apparent to anyone who reads and runs through it. Therefore such is the object of moral discipline.

First objection against the second assertion: the human action as morally directable has all the conditions required for the formal object of Moral Philosophy; therefore it is its formal object. The antecedent is proved: the principle, parts, and properties of the human action are free choice and the

habits that incline toward and influence honorable acts. For all these things are examined and sifted in moral science; and so forth. I deny the antecedent. To its proof I say that the action is the object "by which," not the object "that," as is shown clearly in the second assertion.

Second objection against the third assertion: in Ethics, it is not precognized of man whether he exists and what he is, nor are his knowable attributes demonstrated. For that is the task of Psychology, not of Ethics; therefore moralizable man is not the formal object of Ethics. I deny the antecedent, since man is considered differently by Ethics and by Psychology. For Psychology regards him as a natural body animated by a rational soul; Ethics regards him as one to be instructed in good morals. Therefore he can fall under the consideration of each science under a different formal aspect, as the Stagirite affirms in an analogous case (*1 Ethics*, 7).

You will ask: what is the end of Moral Philosophy? I say it is the honest life and true happiness to be conferred upon man, as Seneca intimates (*Epistle 88*), Aureolus demonstrates (*in the last question of the Prologue*), and Aristotle indicates (*1 Ethics*, 4 and 5).

Book II: On the Good, the End, and the Happiness of Man

Those who investigate and treat moral questions examine and agitate three topics proposed by us before they touch upon the remaining matters pertaining to Moral Philosophy — both because the Prince of the Peripatetics observes this order, and also because, when the good is presented, the end fixed, and happiness set before man, he himself is moved willingly and roused eagerly to seek out the means that are fitting, opportune, and efficacious for attaining them, as Aristotle indicates (*1 Ethics*, 2) and Eustratius notes (*in the Preface to the first book of the Ethics*). There are, moreover, four questions in the present book: the first on the good, the second on evil, the third on the end, and the fourth on the happiness and beatitude of man.

Question I: On the Good

Article I: Whether the Good Exists

From the twofold good mentioned by the Doctor (*2, dist. 7, q. unica*) the present difficulty can be raised — namely, concerning the good that is convertible with being, which is called transcendental good and is examined and sifted by Metaphysics; and concerning moral good, which Ethics examines and considers.

First assertion: transcendental good is conceded. This is the position of Aristotle (*4 Metaphysics, T. 18 and 28*), of Scotus, and of the other Philosophers in the same place. It is proved, first, from Sacred Scripture (*Genesis 1*): God saw all the things that he had made, and they were very good. And (*Exodus 33*): I will show you all good things. Second, an attribute is convertible with that of which it is an attribute, as is evident from Porphyry (*in the Isagoge, ch. on the property*); but transcendental good is an attribute of being (*4 Metaphysics, cited*). That being exists, no one denies; therefore transcendental good also exists. Third, the good is what all things desire (*1 Ethics, 1*), and in its pursuit almost all are engaged; whence arises that common saying cited by Scotus (*5 Metaphysics, ch. 2, in T. 3*): No agent acts with a view to evil per se. Transcendental good must therefore be admitted.

Second assertion: moral good exists. This assertion is also common, like the preceding. It is proved, first, from Sacred Scripture (*2 Chronicles 24*): He did what is good before the Lord. (*Matthew 5*): That they may see your good works. (*Titus 2*): Present an example of good works. And of Saint Lawrence the Church sings: Lawrence performed a good work. Second, an act elicited by the will in conformity with right reason is morally good, as will be apparent below; but the act of a prudent and wise man is conformed to the right dictate of reason; therefore moral good is not to be rejected. Furthermore, the celebrated division of good into natural and moral is received by all. And many, Socrates most notably, having set aside natural good, turned toward moral good and placed all their care in obtaining it, as I observed in the preface to this discipline. Moral good is therefore fittingly admitted.

First objection: (*1 John 2, 16*): All that is in the world is either the concupiscence of the flesh, or the concupiscence of the eyes, or the pride of life. But all these are evil, because they are sins and transgressions of divine law. Therefore no good is to be conceded. I reply that the said testimony must be explained according to the interpretation of Augustine (*6 Against Julian, ch. 1*), taking "the world" to mean the wicked man in whom the mentioned sins reign. And concerning this, the same John says at the beginning of his sacred discourse: The world did not know him. And in the same work (*ch. 14*): For the prince of this world comes. But since besides the wicked and reprobate man there is the good and just man, it is not rightly inferred that there is no good. Aristotle also saw this well (*3 Politics, 7*): The good and just must rule and have authority over all. And (*4 Ethics, 3*): Only the good man is to be honored.

Second objection: from the same John (*ch. 19 of the same*): The whole world is placed in wickedness. Hence Saint Anthony, as is evident from his life, once saw the entire world ensnared and entangled in the snares of the devil, from which few are freed. Add the outrages, crimes, and abuses committed in the world. Therefore there does not seem to be any good in the world. The answer must be given from Augustine (*on Psalm 34, sermon 1*) and (*Treatise 3 on John*), and from

Alphonsus (*Book 10 Against Heresies, on the word "World"*): in that passage the world is taken to mean the wicked and depraved inhabitants of the world, who are marked by countless evils and crimes. Therefore holy men, unless aided by God, would undoubtedly perish, entangled in the nets and snares of evildoers in the same world. Hence it is written of the just man (*Wisdom 4*): He was taken away, lest wickedness should change his understanding, or deceit deceive his soul. And (*Psalms 123*): The snare is broken, and we are delivered. Therefore, even if there are evils, there are also goods. For if one opposite exists, the other opposite also exists or can exist, as Aristotle excellently pursues (*4 Metaphysics, T. 20*).

Article II: How Many Species of Good There Are

Good is divided first into transcendental good, of which I made mention in the preceding article, and predicamental good, which is diffused by Aristotle (*1 Nicomachean Ethics, ch. 9*) and (*1 Eudemian Ethics, ch. 5*) into the ten genera or predicaments. The reason for this division can be given: whatever exists is either located in a genus and is predicamental, or is outside a genus and is transcendental, as I showed abundantly in Logic and Metaphysics, Books 1–2.

Second, it is distributed by Plato (*1 On Laws*) and indicated by Augustine (*2 On Genesis against the Manicheans, ch. 4*; *1 On the Nature of the Good, ch. 1*; and in the *second commentary on Psalm 26*) and by Scotus (*1, d. 1, q. 4, § Negationem*), following Aristotle (*1 Ethics, 6*), into divine good, which is called good through essence — such as God alone, concerning whom (*Matthew 19*): No one is good but God alone. And (*9 Ethics, 4*): God is the good, since he is himself whatever he is. And created good, which is called good through participation, which is everything created. The cause of this partition is that, as is evident from the Metaphysics in the treatment of being, being is adequately divided into uncreated and created being.

Third, by Scotus (*1, d. 1, q. 1, art. 3 and 4*; and in the *Reportata, ibid., q. 1*), into true good, apparent good, and preordained good. True good is that which is genuinely fitting and suitable to a thing. Apparent good is what indeed appears good but in reality is not good. Preordained good is what someone sets before himself as good, even if it is neither true nor apparent good. For the will can, by its own free choice, preordain something to itself as good, as will be shown in its proper place.

Fourth, by the same Doctor (*2 Reportata, d. 7, q. 3*), into natural good, which is fitting to some nature; gratuitous good, which renders man pleasing to God and flows into his meritorious act; and moral good, which is conformed to the right dictate of reason.

Fifth, by Augustine (*8 City of God, ch. 8*; *Book on Spirit and Letter, ch. 11*) and Scotus (*4, d. 46, q. 4, A*; and *d. 15, q. 4, B*), following Aristotle (*1 Rhetoric, ch. 5*), into intellectual or spiritual good — such as the virtues and gifts of God, concerning which (*Ecclesiasticus 31*): His goods are established in the Lord. Bodily good —

such as health and beauty, (*Psalms 44*): In your beauty and grace. Hence Augustine adds (*15 City of God*): The beauty of the body is a gift of God, it is good; but for that reason he grants it also to the wicked, lest good appear to be the property of the wicked alone. I do not omit the saying of Diogenes, who, seeing a young man of handsome face but shameful morals, said: O what a fine house, and what a bad guest. The good of fortune — such as wealth, concerning which (*Matthew 25*): The master of the household called his servants and handed over his goods to them. One may add eternal good — such as beatitude, concerning which (*Matthew 17*): Lord, it is good for us to be here. And (*Ecclesiasticus 39*): Good things have been created from the beginning for the good.

Sixth, by Aristotle (*1 Ethics, 3*) and Scotus (*3, d. 34, q. un., § His suppositis ante K*), into honorable good, which is sought for its own sake and instructs the rational nature — such as intellectual and moral virtue; useful good, which is sought for the sake of something else — such as wealth, for obtaining dignities; and pleasant good, whose presence brings delight to the one who possesses it — such as a fruit that is beautiful to the eye and delightful to behold, of which sort was what God produced in the paradise of pleasure (*Genesis 1*).

Objection: there is only one good, and that the supreme, as is evident from (*Luke 18*): No one is good but God alone. Therefore all the divisions of goods presented above are vain. I concede the antecedent and deny the consequent. For there is only one good through essence; but there are many goods through participation. This response is furnished by Damascene (*2 On the Faith, ch. 29*): God alone is good by nature — that is, through essence; other things, however, are good through participation.

Article III: What the Good Is

Some, among whom Suarez (*Disputation 10 of the Metaphysics, 24*) seems to agree, and Faber (*in the Supplement, 4, d. 14, ch. 5*), hold that good exhibits only a relation of reason of the suitability of one thing to another. Others, following Coimbra (*Disputation 1 on the Ethics, art. 1*), hold that the good designates formally a certain absolute aspect of the thing whose good it is. Scotus, however, (*1, d. 17, q. 2; and Quodlibet 18*), together with Gad and Lychet in the same passage, teach that the good formally exhibits nothing other than a real relation of integrity or suitability of the thing whose good it is.

Note first, from the Doctor in the cited passage (*§ De primo, C*), that good is twofold — primary and secondary. Primary good, which is also called essential good, is the integrity or perfection of a thing in itself, which designates the negation of imperfection and diminution. Thus human nature is called good because it has everything required for its essence; and this is transcendental good, which is convertible with being (*1 Ethics, 6; and 4 Metaphysics, 28*). And it is really identified with being, as an attribute with the thing of which it is the attribute. And good thus understood is divided into good through essence —

such as God — and good through participation, which is everything created. Secondary good, which is called supervenient and accidental upon being, is the integrity of its suitability to another to which it ought to be suited, or of another to itself; and these two suitabilities are interconnected, as one may see in Augustine (*8 Trinity, ch. 3*): Good health without pain and fatigue; and the good countenance of a man evenly proportioned, cheerfully composed, and brightly colored. One can see in this authority the prior suitability when it says: good health is without pain and fatigue. And the posterior suitability when it adds: and the good countenance of a man evenly proportioned, cheerfully composed, and brightly colored.

Note second that there are three kinds of agents: natural without cognition — such as fire, whose good is to heat and to ignite, and whose good it is for matter to underlie form and to concur partially in the generation of the whole. Natural with sensitive cognition — such as the horse, whose good is to eat oats, and for the ox to eat hay. Intellectual or free, which acts freely and rationally, and this alone can operate morally well or badly, since it is endowed with will and possessed of judgment, by which it judges something to be right and conformed to right reason; whereas the rest are drawn by the impulse of nature and necessarily determined by their objects. Moral goodness, moreover, is derived from the relation and disposition of the will to right reason. Therefore that act is good which is conformed to right reason, and conversely that act is evil which is deformed with respect to right reason.

Note third that there is a twofold rule: intrinsic and extrinsic. The intrinsic rule is right internal reason, which judges and dictates concerning human acts and works as they ought to be performed. The extrinsic rule is considered by some to be the divine intellect, which from eternity knows all things — when, where, and how they ought to occur. It is better established as the divine will, to which the created will must be conformed, as the Doctor teaches (*1, d. 48, q. un.*). But in order for a moral act to be good, not only is the capacity for judging the suitability of the act required, but it is also necessary that one actually judge rightly concerning the act; otherwise a sleeping person who possesses the capacity for judgment would act morally well, which is absurd. Furthermore, for the goodness of an act many circumstances are required; the chief ones are the circumstance of end, of manner of acting, of time, and of place, concerning which see learnedly and eruditely in Angelus, on the word "circumstance." For the rational agent acts for an end, chooses means suitable and opportune for its attainment, and therefore if his end is good, his act is correspondingly good. Hence the force of that admonition: Whatever you do, do it prudently, and look to the end. Then follows the manner of acting, so that the act is performed with due decency and honesty — if, for example, bread is given to the hungry for God's sake, the act is good; but if the giver were to throw it at the head of the needy person, the manner is improper. Hence the common saying: Add measure to all things. And Horace sings: There is a measure in things; there are,

in short, definite limits, beyond and short of which right cannot exist. Next is the circumstance of time, so that the act be done at the due time — for example, one must fast during Lent, but not at all on the Lord's Day. Next, the circumstance of place, so that the act be done in a fitting and proper place — for example, the Mass is to be celebrated in a church and a suitable location. From these and other circumstances an act becomes morally good; but if any of the said circumstances is lacking, the act is bad. Hence Dionysius adds (*4 On the Divine Names*): Good comes from an integral cause, and evil from any defect whatever. And Aristotle (*2 Ethics, ch. 5; and 3 of the same work, ch. 3*): All circumstances must simultaneously concur in any moral act in order for it to be morally good. And the Doctor adds in the passage just cited: The defect of even one circumstance, whichever it may be, suffices for the act to be morally evil. For this reason we read in Sacred Scripture (*James 2*): He who has offended in one point has become guilty of all.

First assertion: good, whether transcendental or moral, is not relational. This is derived from Scotus, who is cited below for each part. The first part is proved, first, because the terminus of creation and production is not a being of reason nor a relation of reason, since a real positive action obtains a real positive terminus; but transcendental good is the terminus of real positive creation and production, as is evident from (*Genesis 1*): God saw all the things that he had made, and they were very good; and (*Proverbs 3*): He made all things good in his time. Therefore transcendental good is not a relation of reason. Second, uncreated good is a real positive being: for God is the supreme good, than which nothing greater can be conceived, as is evident from Anselm (*in the Proslogion, ch. 2*) and Augustine (*1 On Christian Doctrine, ch. 7*). Therefore created good likewise; the consequence holds, for if the divided term is real and positive, the dividing members are real and positive, as I showed (*in the Epitome of Dialectic, Book 2, q. 7, art. 1*). But good, taken precisely and universally, is a real positive being, since it is an attribute of real being convertible with it. Third, appetite is directed toward a real positive being, since it is a real positive power; but the good is that toward which the appetitive power tends; hence it is defined (*1 Ethics, ch. 1*): the good is what all things desire. Augustine (*in the Book on the Nature of the Good*), Basil, and the other Fathers, who treat of good as a real positive being throughout, give their support. The second part is proved, first, from (*Psalms 118*): Teach me goodness and discipline and knowledge. And therefore: It is good for me that you have humbled me. Second, real science per se does not treat of beings of reason; otherwise it would not be real but rational; but Ethics is a real science and treats of the good per se, as is evident from its course. Third, a morally good act is praiseworthy, and if done in the grace of God it is worthy of reward and eternal life; but God does not save man through a being of reason, but through real positive good works which follow upon him. I add that even without anyone thinking about it, a man acting according to the right dictate of reason is

morally good, and one acting contrary to right reason is morally evil. Therefore moral good is not a relation of reason.

Second assertion: moral good is the suitability of an act of the will in conformity with right reason. So holds Scotus (*1, dist. 17, q. 2, § Quantum ad istum art. ante P*). It is proved, first, because that the positing of which brings about something is the essence and formal character of it, as has been inculcated and approved by all in many other places; but when the suitability and conformity of an act of the will to right reason is posited, the formally moral good act is established; and when that suitability is taken away, the act is evil. Hence Aristotle (*6 Ethics, ch. 3*) says: Right choice requires right reason to which it must be conformed. Second, praxis — which is the moral act — is defined as the operation of the will that is apt to be done in conformity with right reason so that the act may be right, as I showed abundantly (*in Logic, Book I, q. 2, art. 5, dub. 1*). Now what is placed per se in the definition of something is essential to it. Moreover, good comes from an integral cause, according to Dionysius cited above, and evil from any defect whatever; but the cause is not integral unless the said suitability is present, together with the other circumstances. Therefore moral goodness of an act consists in the said suitability.

Third assertion: moral good is not something absolute but a relation of suitability and conformity. So holds Scotus in the cited passage. It is proved, first: moral good is formally situated in the conformity of the act of the will to right reason, as I showed in the preceding assertion; but such conformity is a relation, as no one denies. Therefore moral good is also a relation. Second, from the act of the will conformed to right reason and the due circumstances there arises that suitability of the moral act, just as from the positing of any two extremes a relation arises, as I explained abundantly (*in the Epitome of Dialectic, Book I, q. 4, art. 8*).

One may say, with Raynaud following certain recent authors (*Discipline 4 of Moral Philosophy, art. 1, nn. 13–14*), that it is not a relation but a connotation. On the contrary: connotation follows upon morality, as Becanus rightly sees (*1–2, Tract. 1, ch. 4, q. 5, n. 4*); for a thing is first constituted in its formal — that is, essential — being before it connotes anything else. Hence I said (*in Logic, Book I, q. 3, q. 1, art. 5*) that the concrete in the direct case signifies the form, and in the oblique case the subject. Moreover, given the hypothesis that there were no connotation, morality would still exist, since the aforesaid conformity would be present. Furthermore, between absolute entity and relative entity no middle term is interposed, since whatever exists either exists in relation to itself and is absolute, or exists in relation to something else and is relative. But morality, as the authors just cited show, is not an absolute entity; therefore it is rightly inferred to be the said relation of suitability and conformity of the will to the right dictate of the mind.

First objection: measurability is a relation of reason (*5 Metaphysics, ch. 15*). Therefore that suitability is also a relation of reason, since it is an order of the regulated to the rule and of the measured to the measure. First confirmation: morality adds nothing real to the physical act, since the moral act depends on the will just as the signification of words depends on the pleasure of the one imposing them. Second confirmation: God is called creator not through anything real newly accruing to him from the creation of a thing; likewise he is called the Lord of a servant, and a husband and wife are called spouses through a relation of reason or through extrinsic denomination. Therefore the same should be affirmed of morality. I deny the antecedent: for measurability is a true and real property of quantity, just like divisibility and the other attributes of quantity mentioned and explained (*in the Epitome, Book I, q. 4, art. 6*). To the first confirmation I also deny the antecedent. For it is ridiculous that good or evil works should depend on the thought of the intellect, and that rewards be conferred through a good being of reason and punishment be avoided through an evil being of reason that man makes. To the second confirmation I say there is a disparity, because God, being infinite, can receive nothing new that is real; but the physical act of the will, being finite, is capable of a new reality, which is morality. I add that such denominations, even if they are extrinsic, are nevertheless not beings of reason, as I have shown elsewhere against Vasquez.

Second objection: Aristotle (*1 Ethics, ch. 1*), cited by the Doctor (*4, dist. 49, q. 9*), Bonaventure (*5 Metaphysics, ch. 3*), and Seneca (*Epistle 118*), accepts the definition of the good handed down by the ancient philosophers: the good is what all things desire. The same is found (*3 Topics, ch. 1*). Therefore no other definition of the good is to be introduced, as we did above. I reply that the said definition is approved as a good one, since it is given not a priori but a posteriori — that is, through the property, which is desirability — just as (*5 Metaphysics, ch. 15*) quantity is defined through divisibility, which is its property.

Third objection: good is a quality (*10 Ethics, ch. 3*) and following. Again, virtue and vice are qualities residing in the predicament of quality; therefore the good is not formally a relation. I reply by explaining Aristotle and the common opinion through a distinction: good and virtue are qualities fundamentally, whether taken for the physical act or the physical habit, I concede; formally and essentially, as a suitability and conformity of the act of the will with right reason, I deny. For, as the Doctor says (*in the cited Quodlibet*), beauty is not formally a quality in a beautiful body, but an aggregation of all things befitting such a body — such as magnitude, shape, and color, as well as all their proportions to the body and its members. So too the moral goodness of an act is a kind of comeliness of that act, including an aggregation of due proportion — namely with respect to the power, object, time, end, place, manner, and the like, concerning which Scotus (*in the first cited passage*) and somewhat more below (*in the question on moral virtues, art. 2*).

Article IV: Whether the Exterior Act Adds Any Goodness to the Interior Act

Although the treatment of this controversy pertains to the book on human acts, it is nonetheless my pleasure to examine and decide it here, so that knowledge of the good may be spread more broadly and widely. On this question two opposed Scholastic opinions prevail. The former is that of the Thomists, cited by Faber (*in the Addition to Book 4, dist. 14, disp. 2, n. 4*), and of the Nominalists with Ockham (*Quodlibet 1, q. 20*), who hold that the exterior act has no goodness distinct from the goodness of the interior act. The latter is Scotus's (*Quodlibet 18, § De tertio*), Gad's, and others cited there, who teach that the exterior act participates in its own moral goodness distinct from the goodness of the interior act. Aureolus holds the same opinion (*2, dist. 32, q. un., art. 1*), and Richard does not disagree (*dist. 40, art. 4*).

Note first that this question is raised concerning the interior and exterior act of the same subject, time, and object. For with respect to different subjects, the interior act of Plato can be good even though the exterior act of Socrates is not good; and Plato can now at this moment elicit a good internal act, and after some interval of time put forth an exterior act devoid of goodness; and live chastely with his wife now, though previously he lived unchastely with a concubine. Furthermore, note with Gad in the cited passage (*fol. 181*) that in this inquiry we are not investigating whether the interior act is intensified or extended through the exterior act, since they are distinct acts and one does not intensify or extend the other.

Note second, from the Doctor (*Prologue, q. 4*), that there is a twofold act: elicited and commanded. The former is called interior, the latter exterior. The interior act is the act of the will that proceeds immediately from the will itself; hence it is called elicited, because it is elicited spontaneously and freely by the will. The exterior act is that which is commanded by the will — as hearing a lesson is an act by which the will commands the hearing faculty to hear what the teacher explains. In the present question we ask whether the act commanded by the will acquires another goodness distinct from the goodness of the elicited act of that same will.

The assertion is that the exterior act has another moral goodness distinct from the goodness of the interior act. So holds Scotus in the cited passage. It is proved, first, because things that are prohibited by God through distinct negative precepts take on their own distinct character of being illicit and malicious — otherwise they would be forbidden not by two precepts but by one only. But the interior act is forbidden by a distinct negative precept different from the precept by which the exterior act is forbidden, as is evident from (*Exodus 20*): You shall not commit adultery — the exterior act. You shall not covet your neighbor's wife — the interior act. And (*Deuteronomy 5*): You shall not steal — the exterior act. You shall not covet your neighbor's property — the

interior act. This is also hinted at by the Apostle (*2 Corinthians 9*), who, speaking of the exterior act, says: He who sows sparingly will reap sparingly — which would not be true unless the exterior act participated in some goodness distinct from the goodness of the interior act, as Richard rightly infers in the passage cited above. Second, from Augustine (*12 Trinity, 12*): The sin of thought is far less than if the thought be carried out in deed. And (*13 Trinity, 5*): Through evil will alone someone is made wretched; but more wretched through the power by which the desire of evil will is fulfilled. And a little before: He would call that man blessed because he lives as he wishes — although he would already be wretched in doing so — yet he would be less wretched if he were unable to have any of the things he perversely desired. It is evident that the holy Doctor is speaking not of the wretchedness of punishment, but of the wretchedness of fault. For one whose desire is not fulfilled is more afflicted than one whose appetite is satisfied, according to that of (*Proverbs 13*): Hope that is deferred afflicts the soul. And this is clear from (*Psalms 9*), cited by the same Doctor: The sinner is praised in the desires of his soul, and the one who does iniquity is blessed — where the first verse clearly refers to the interior, and the second to the exterior act and sin completed in deed. If therefore the bad exterior act adds malice to the bad interior act, then by equal and contrary argument the good exterior act adds goodness to the good interior act. Boethius adds his support (*4 On Consolation, Prose 4*). And Aristotle agrees (*9 Metaphysics, T. 19*), saying that in good things the act is better than the power. Third, moral goodness is the integrity of those things which, according to right reason, ought to befit the moral act; but a different integrity belongs to what, according to the dictate of right reason, ought to befit the interior act and to what ought to befit the exterior act. Therefore the goodness of the exterior act is different and distinct from the goodness of the interior act. The major is evident from the preceding article. The minor is proved: some exterior act can be performed only successively, and also some exterior act can only be done by unwilling or benefiting one's neighbor — which is not true of the interior act. Since therefore certain circumstances apply to the external act which do not suit the internal act, it is rightly concluded that each has a distinct moral goodness. Fourth, that to which, if it is only mentally held, no reward is due, but if it is completed in action, praise and reward are due, participates in a distinct goodness. Now to one who has the teaching of the Catholic faith, if he does not teach, the aureola of Doctors is not given; if one desires to die for Christ, unless he actually dies for him, he does not receive the aureola of martyrdom; likewise if one is not a virgin in mind and body, uncorrupted, the aureola of Virginity is not due. Moreover, civil and canon law do not reward men except for good external works performed and exhibited by them, nor do they punish them except for evil external works; but of internal acts they leave judgment solely to God, who searches hearts. It must therefore be acknowledged that the external act enjoys a proper goodness distinct from the goodness of the internal act. This is openly

indicated by that Scripture text (*James 3*): He who does not offend in word, this is a perfect man — which everyone knows to pertain to the external act.

First objection: Augustine (*3 On Free Will, ch. 3*) writes that if someone has the will to lie with another's wife and the opportunity is not given him, before God he is as guilty as if he had completed it in deed. Chrysostom agrees (*Homily 26 on Matthew*): The will alone is rewarded for good or condemned for evil. Bernard agrees (*Epistle 77*): What is more complete than that the will is reckoned for the deed? And elsewhere: the will alone burns in hell. Nor does Gregory disagree (*Homily 4 on the Gospel*). I reply that these and similar testimonies of the Fathers only prove that in the bad interior act there is sin without any external act, according to that word of the Savior (*Matthew 5*): He who has looked upon a woman to lust after her has already committed adultery with her in his heart. And that the primary and originating malice comes from the interior act — hence Christ the Lord says (*Matthew 15*): Out of the heart come evil thoughts, thefts, adulteries, and so forth. But they do not deny that sin and malice are found in the exterior act joined to the interior act, since there are distinct precepts prohibiting each, as I noted above. And commonly sin is distributed into sin of the heart, of the mouth, and of the deed.

Second objection: what is not voluntary is not good or evil, since goodness or malice derives its origin from the will. Hence that celebrated saying of Augustine (*in the Book on True Religion, ch. 14*): Sin is in no way a sin unless it is voluntary. But the exterior act separated from the interior act is not voluntary, since it derives its goodness or malice from the interior act. Therefore the exterior act participates in no goodness distinct from the goodness of the interior act. I reply: granting the major, I distinguish the minor. It is not voluntary subjectively — as sadness is subjectively in the will — nor objectively — as the object willed is called voluntary, I concede; it is not voluntary imperatively, I deny. For it is commanded by the will, to which the other powers are obedient. Therefore each act is called voluntary, with this distinction however: the interior act is voluntary primarily and immediately, the exterior act secondarily and mediately.

Third objection: the truth of the act of understanding and the truth of the object understood is the same; therefore the goodness of the act of willing and the object willed is the same; but the exterior act with respect to the interior act stands like an object, since the will by an elicited act conformed to right reason wills the exterior act to come about; and so forth. The antecedent is proved in two ways: first, just as the truth of the principle is immediate, so the actual knowledge of it can be called immediate, and that of the conclusion mediate. Second, the knowledge of principles comes from the terms, and the knowledge of conclusions from the principles — so to these as objects truth belongs. Confirmation: where one thing exists on account of another, there is only one thing; but the exterior act borrows its goodness from the interior act; therefore

the exterior act enjoys no goodness distinct from the goodness of the interior act. The major is argued by the Nominalists: the act with respect to the end and with respect to the means to the end is the same. Again, the habit of principles and of conclusions is the same. I distinguish the antecedent: objectively and denominatively, I concede; formally and intrinsically, I deny. For truth is one thing in the mind, another in the thing, as I noted (*in Logic, Book IV, q. 4, art. 3*). Similarly, goodness is one thing in the interior act, another in the exterior act, because they have a different suitability and conformity to the right dictate of reason. Now the proof of the antecedent counts in our favor: for the truth of the conclusion differs from the truth of the principles — the former is mediate, the latter immediate. Hence Aristotle (*6 Ethics, ch. 4*) establishes distinct habits of principles and conclusions: of principles there is the habit of understanding, of conclusions the habit of science. To the confirmation: the major rather helps us than hinders us. For even though the exterior act is good on account of the interior act, it is still not deprived of its own goodness. For the conclusion is true on account of the premises, yet the conclusion itself enjoys its own truth distinct from the truth of the premises, as I was just saying.

Fourth objection: sin, according to Anselm (*1 On the Virginal Conception, ch. 27; On the Fall of the Devil, chs. 15–16*) and Scotus (*2, dist. 35*), is the privation of due justice; but in the exterior act there is no other privation of due justice distinct from the privation of due justice in the interior act. Therefore in the exterior act there is no other malice distinct from the malice of the interior act. The major is evident to Scotists. The minor is shown from the same saint: justice or injustice resides only in the will; therefore it cannot be in the exterior act, which does not have its seat in the will. First confirmation: where there is one aversion and one concupiscence, there is one formal character of sin; but in the interior and exterior act there is only one aversion, because there is only one will, which alone can be averted from the end or converted toward the end. For aversion, according to (*2, dist. 37*), is the disordering of the will with respect to something ordered to the end by divine precept, around which it ought to be ordered. Second confirmation: what Augustine (*Book 83 Questions, q. 38*) sometimes calls by name "cupidity" and in the same place "concupiscence," he calls the poison of charity. Since therefore charity is located only in the will, so too malice or sin. I reply by explaining Anselm as speaking of actual justice, which is the rectitude of the act conformed to right reason; and this is twofold — primary, which applies to the elicited act, and secondary, which belongs to the commanded act. By this distinction, to the argument in form: I concede the major; I distinguish the minor concerning primary and habitual justice, I concede; concerning secondary and actual justice, I deny. To the first confirmation I concede the major; I distinguish the minor with Scotus in the cited passage: concerning formal and virtual aversion, I concede; concerning aversion taken for whatever malice effectively separating one from the end by willing or obtaining, I deny. For this aversion can exist in the commanded act of the will. For just as

referability or orderability to the end can be called conversion, so irreferability and in-orderability can be called aversion. To the second confirmation: if concupiscence is taken for improper will, I admit that it can be formally or causally found in sin; but if it is taken for all immoderate appetite or command of the delectable, I acknowledge it as belonging not only to the elicited and interior act, but also to the commanded and exterior act. This is touched upon by the Gloss (*on ch. 20 of Exodus*): He who adds a deed to the will adds iniquity to iniquity. And the sacred text confirms this throughout, imposing punishment on evil works (*Apocalypse 18*): As much as she has glorified herself and lived in pleasures, and so forth. And establishing reward for good works (*Matthew 25*): Possess the kingdom prepared for you from the constitution of the world; for I was hungry, and you gave me to eat; I was thirsty, and you gave me to drink. And (*Matthew 16*): He will render to each according to his works. Add Athanasius (*in the Creed*): Those who have done good will go into eternal life; those who have done evil, into eternal fire.

Question II: On Evil

Article I: Whether Evil Exists

Chrysologus rightly sets the tone for the discussion of evil (*Sermon 131, toward the end*) when he says openly and explicitly: We cannot know how good things are good unless we know them through the knowledge of evils. This is intimated (*Genesis 3*): You shall be as gods, knowing good and evil. Augustine pursues this (*2 On Genesis against the Manicheans, ch. 9*) and (*in the Book on True Religion, ch. 20*). The reason is that one opposite cannot be fully and well known unless the other opposite is known — for opposites fall under the same discipline; that evil is opposed to good is noted above all by Aristotle (*in the Postpredicaments, ch. on Opposites*). Therefore, from the knowledge of the good already had in the preceding question, knowledge of evil will be conveniently gathered in this question.

Note, from Scotus (*2 Reportata, dist. 34, q. 1*), that just as privation is known through the habit — as darkness through light — so evil is discerned through good, and by passing through evils one arrives at goods. Hence someone sings: He has not merited sweet things who has not tasted bitter things. Now the Philosopher asserts (*5 Metaphysics, 21*) that good and perfect coincide; and perfect is taken in two ways. In one way, perfect is that to which nothing is wanting — called perfect simply and with essential and primary perfection. In another way, something is called perfect in a qualified sense and with secondary perfection. Similarly, good is twofold: good with primary goodness and good with secondary goodness. Good in the first mode has no contrary — whether positive or privative — since contraries naturally occur in the same subject (*2 Topics, ch. 20*). What therefore is not apt to be in another has no positive or privative contrary. But good with primary goodness, insofar as it is primary, is

not apt to be in another, since being primary it exists from itself and independently — which is supremely necessary, needing nothing else, being self-sufficient, and what is self-sufficient is supremely good. Thus that good only has a contradictory opposite — namely, non-good. But good with secondary goodness participates in a privative opposite. For evil is the privation of good, according to Damascene (*2 On the Faith, ch. 4; and Book 4, ch. 2*), just as darkness is the privation of light.

The assertion is that evil exists in the universe. So holds Scotus in the cited passage (*art. 1, § Viso igitur*). It is proved, first, from Sacred Scripture (*Genesis 2*): of the tree of the knowledge of good and evil. (*Proverbs 1*): They run to evil. (*Ecclesiasticus 4*): An evil eye toward evil things. And (*Matthew 6*): Deliver us from evil. Second, from Chrysostom (*Oration on Saint Philogonius*): Where there are perpetual and successive evils. And (*Homily 40 on Matthew*): Whatever is not good is evil. Salvian (*Book 6 On the Governance of God*): Since there are two greatest evils — if a man either destroys himself or offends God. Augustine (*on Psalm 34*) and Jerome (*on ch. 6 of Jeremiah*). And that this is the opinion of the Peripatetics and ancient Academics is attested by Augustine (*19 City of God, ch. 4*), which is clearly visible (*2 Magna Moralia, ch. 8*). Nor should we omit the admonition of Diogenes, related by Laertius (*Book 4*). Seeing a young man naturally evil throwing stones into the sky, he said: Bravo, you will not hit the mark — signifying that those who lead a wicked life will in no way be heirs of heavenly goods. Third, an inferior that is regulable and conformable to its superior rule can deviate from it, and sometimes does deviate, either on account of something opposing it or another cause, as is evident in natural agents, to which monsters sometimes happen — which are called evils or sins of nature — and in free agents acting contrary to God's precepts and laws prescribed to them by God as King and Judge, who are said to commit moral evils or sins, which are punished by the ministers of justice. Therefore, since every creature, whether natural or free, acknowledges a first and supreme rule and its own particular orders and laws fixed for it, those that decline from and fail to conform to them are established to be evils. Fourth, natural and rational appetite pursues the good and flees the harmful evil; one is adorned with perfection, the other deprived of it; one is beautiful, the other ugly; as the seeing man differs from the blind, the healthy from the sick, and countless other examples, on which Chrysostom treats abundantly and learnedly (*in the first passage cited*). Finally, there is almost no one who does not undergo some evil and experience it daily. Hence Tyrius most aptly adds: What age or time is there that is not assailed by some evil? Is it not the case that as soon as one is born, freshly drawn from the moist places of his mother, he drips with mud and filth, fills everything with crying and tears? Afterward, if he grows to the flower of age, he is driven by a certain fervor and intemperance. If he reaches puberty, on account of the ardor of spirit and vehemence, he cannot be contained in duty by any counsels, any admonitions.

If he gradually reaches old age, he dies and withers. In the end, nothing else remains but a useless, morose, and difficult hostelry of the soul.

First objection: an infinite good does not admit of any evil alongside it — just as if there were an infinite body, no other body could be alongside it in the same place, as I said (*in Physics, on the question of the infinite*). Therefore, since there is an infinite good — namely God — no evil is given. I reply with Scotus (1, *dist. 2, q. 2, § Ad 1 argum. DD*) that the antecedent is true of a natural and necessary agent, as certain Philosophers supposed, but not of a free and voluntary agent, such as God is, who, although he is the supreme and infinite good, nevertheless permits evil for the sake of the good, as Augustine teaches (*in the Enchiridion, ch. 6*). Hence the Royal Psalmist says (*Psalm 118*): It is good for me that you have humbled me.

Second objection: the works of God are perfect (*Deuteronomy 32*); all things were made through him (*John 1*). Therefore, since good and perfect are identified — as Scotus holds in the cited passage — it is plainly concluded that there is no evil. I reply that those scriptural passages are to be explained of works immediately and solely produced by God, who saw all the things that he had made, and they were very good (*Genesis 1*) — that is, perfect, as some translate it, and aptly, since as stated, good and perfect coincide — but not of works to whose production a secondary cause concurs, which sometimes fails in its operation. Hence through natural causes the evil of nature happens, and through free causes the evil of morals. This Augustine confirms (*in the Book on the New Song, found in his collected works, Vol. 9*): For the first man received free will rightly ordered, and God placed before him, as is read (*Ecclesiasticus 15*), fire and water — stretch out your hand to whichever you will. He chose fire, he left water. Look at the just judge. What man chose, he received freely; he willed evil, and that evil followed him.

Article II: How Many Species of Evil There Are

Although the partitions of evil seem to appear from the divisions of good adduced in the preceding question, article 2, those are nevertheless broader and more extensive than these. For though there is a supreme good, there is no supreme evil, as Scotus proves (2, *dist. 37, § Ad aliam quaest. H*; and 4, *dist. 50, q. 2, § Respondeo A*), Vorrelon (*ibid., dist. 34, concl. 1, part 2*), and Suarez (*Disputation 11 of the Metaphysics, sect. 2, n. 1*), and as I will show below when I treat the cause of evil, and as is found (7 *Ethics, ch. 12*). Moreover, the distribution of good into absolute good and relative good is indeed approved, as the Doctor intimates (*Quodlibet 16, art. 1, sub C*). But the division into evil that is evil in itself and evil that is evil to another, accepted by Vasquez (1–2, *disp. 95*) and Suarez (*in the cited passage, n. 5*), is not to be adopted; in the first place, Augustine (2 *On the Morals of the Manicheans, ch. 8*) openly rejects it, saying: Evil in relation is in itself good; and venom in itself is good, but to another it is evil, because it is harmful. Then, as will be said in the next article, evil formally is the privation of good; therefore

nothing is absolutely evil. Again, evil is the unsuitability of a thing, and unsuitability is a relation, just as suitability is likewise a relation. Therefore the said division is invalid. All the more since a relation — whether real or of reason — does not belong to the genus of active things; therefore evil is not evil because it is evil to another.

Now the celebrated division is from Augustine (*1 On Free Will, ch. 1*) and the Scholastics — notably Scotus (*2 Reportata, dist. 34, q. 1, § Secundo*): into the evil of nature, which is the privation of natural perfection — thus a monster (*2 Physics, 7 and 82*) is called evil, the sin of nature — and the evil of morals, which is the privation of conformity of the act of the will to the right dictate of reason.

Also common is the division from the same Augustine (*in the cited passage*) and (*Against Adimantus, ch. 24*), approved and found in Scotus (*2, dist. 37, § Ideo possit; and 4, dist. 50, q. 2, § Respondeo A*): into the evil of punishment and the evil of fault. The evil of fault is the privation of due rectitude that ought to be in the second act of the will and is not; which, according to Scotus (*in the second passage cited*), is sin formally. The evil of punishment is the privation of a due good arising from fault, as the damned are deprived of beatitude and punished in hell on account of sins committed by them.

First objection: when the divided term is removed, the dividing members into which the divided term is distributed are likewise removed, as is evident from what was said (*in the Epitome, Book 2, q. 7, art. 1*). But evil does not exist, as Dionysius says (*4 On the Divine Names*). Therefore no division of evil exists either. I concede the major and deny the minor, as is evident from the preceding article. Concerning Dionysius I say that he is to be interpreted as speaking of evil formally — which is not a positive thing, but a privative one, as will be shown in the next article.

Second objection: besides the evils enumerated there is demeritorious evil, which is opposed to the good of grace, of which the Doctor makes mention (*2, dist. 37*). Therefore the divisions of evils presented above are insufficient. I reply that demeritorious evil is reduced to the evil of fault, which is sin, on account of which the sinner demerits in the sense that God no longer preserves grace in him. Especially since grace and sin, in the school of Scotus, are not properly and formally opposed. Therefore there is no need to establish demeritorious evil as a member opposed to grace and distinct from the evil of fault.

Article III: What Evil Is

Cajetan (*1 part, q. 48, art. 1; and 1–2, q. 18, art. 5*), Medina (*ibid.*), and Vasquez (*Disputation 45, ch. 9*), following the Pythagoreans — as Aristotle indicates (*2 Metaphysics, ch. 1*) and Thomas witnesses (*1 part, q. 49, art. 1, ad 1*) and Major (*2, dist. 43, q. 3*) — assert that the evil of nature, which they also call evil simply, is something privative; while the evil of morals, which they also call evil in a qualified sense, is something positive, and consequently they determine that sin

formally is something positive. The opposite is defended by Scotus (2, *dist.* 37, § *Iste gg.*), Alexander of Hales (2, 2, q. 94, m. 2), Henry (*Quodlibet* 1, q. 25), Aureolus (*dist.* 35, art. 2), and others who commonly teach that evil formally consists in the privation of good.

Note that, although these three — evil, vice, and sin — are sometimes used interchangeably, as is evident in Alexander (2, 1, q. 18) and following, there is nonetheless some distinction among them. For evil is more broadly diffused than vice and sin, and they seem to stand in relation as more common and less common, as higher and lower. For evil is opposed to good, whether natural or moral; but vice is opposed to virtue — hence Basil says (*in the Monastic Constitutions*, ch. 3): Vice is nothing but the desertion of virtue. And Augustine adds (4 *On Free Will*, ch. 14): What you have found to be lacking to the perfection of nature, call that vice. But sin, as Aureolus notes in the cited passage, adds above evil a reference to the agent, since that which is the privation of what is due in the being of the agent as agent is called sin — though it is most commonly taken as opposed to grace through demerit, insofar as it is a falling away from the first rule and divine ordinance, as in (*Psalms* 36): Decline from evil and do good. Or as it is an aversion from God and a conversion to the creature. Thus Augustine writes (*toward the end of Book 1 On Free Will*): All sins are contained in this one genus — that someone is turned away from divine and truly permanent things and converted toward mutable and uncertain ones. And (*Book 2*, ch. 19): The will turned away from the immutable and common good, converted to its own proper good. And (*in the Book on True Religion*, ch. 3): Aversion from earthly things and conversion to the one true God. Aureolus adds in the cited passage that fault regards the free agent, so that fault properly is not found except in one who possesses free choice; and thus when a man acts badly he is to be blamed, and if he acts well he is to be praised, because he is endowed with free choice. Moreover, observe that in these things just described two things can be considered: the material, which is positive, and the formal, which is privative — which I noted and expressed specifically concerning sin (*in the book on causes*, q. 3, art. 3, note 3), as may be seen there and below in article 5.

The assertion is that evil, taken formally, is the privation of good. So holds Scotus in the cited passage. It is proved, first, from Scripture: (*Psalms* 12): Evil is called a declining — Decline from evil and do good. Transgression — (*Matthew* 15): Why do you transgress the commandments of God? Prohibition — (*Psalms* 33): Restrain your tongue from evil. Defect — (*Psalms* 118): My soul has fainted for your salvation; and in negative precepts a negation is added: You shall not steal, you shall not kill, and so forth. From all this it is concluded that evil formally exhibits nothing positive. Second, from the Fathers: Dionysius (4 *On the Divine Names*): Evil does not exist, nor is it a being among existing things; but it is the privation of perfection, of the proper and fitting good. Damascene (2 *On the Faith*, ch. 4): Nothing is evil except the privation of good, just as darkness is the privation of light. Augustine (*Book 83 Questions*, q. 7): The name of evil is derived

from the privation of species. And (*in the Enchiridion*, ch. 11): What else is what is called evil, except the privation of good? Ambrose (*Book On Isaac and the Soul*, ch. 7), Anselm (*Book on the Concept of Virginal Conception*, ch. 5), and others cited by recent authors hold the same. Third, that is the precise and formal character of evil by the positing of which, with everything else removed, evil is posited; and by the removal of which evil is removed; but when the privation of good is posited, evil is posited, and when anything else is removed, evil is not removed unless that privation is removed; therefore evil is the privation of good. The major is clear. The minor is proved: if the act of the will is conformed to right reason it is always good; but if the act itself deviates from such rectitude it is evil — hence Dionysius says in the cited passage: evil is from any defect whatever. For an act is never called evil except when it is deprived of the perfection and goodness it ought to have; and this is evident concerning natural evil — for example blindness, which is the evil of the eye and which cannot be found without privation. Moreover, if evil were something positive, it would be either something corporeal or incorporeal, as Augustine argues (*Book 83 Questions*, q. 7). But neither is established to be the case, since God created both, and not evil taken formally. For, as the same Augustine asserts (*12 City of God*, ch. 7): An evil will has no efficient cause but a deficient one. Aristotle agrees (*6 Ethics*, ch. 3): Right willing necessarily seeks right reason to which it is conformed; and conversely, willing is evil when it is not conformed to right reason; and therefore evil formally is the privation of that conformity, perfection, and goodness — whether it is the evil of nature or the evil of morals, as Suarez rightly concludes (*Disputation 11 of the Metaphysics*).

First objection: there are many distinct species of sins — such as theft, homicide, and so forth; but such species cannot be assigned through privations but through positive acts; therefore evil is not rightly defined as the privation of good. First confirmation: many vices are opposed to one act of justice — such as theft, homicide, and adultery — which differ in species; and so forth. Second confirmation: if theft were the privation of the due rectitude of justice and the defense of a neighbor's goods, but one is not always bound to defend a neighbor's goods unless one has care of them by duty — therefore and so forth. I reply with Scotus (*Quodlibet 18*, § *Ex isto Y*): having conceded the major, I deny the minor. For evils in their own way differ just as the goods that ought to be in them differ — so that if the goodnesses and rectitudes that ought to be in them differ in species, the evils opposed to them likewise differ in species; and if those are distinguished in number, so the evils are numerically distinct. For privations differ just as the habits of which they are privations: thus deafness and blindness differ in species in a privative way, just as hearing and sight are distinguished in species in a positive way. And this and that blindness are numerically distinguished in a privative way, just as this and that sight are numerically distinguished in a positive way. And from the greater or lesser goodness of which an act is deprived, a greater or lesser evil, a more or less grave sin and

transgression of the law, is inferred. To the first confirmation I deny the antecedent. For theft is opposed to the right dictate of reason that each person should have and possess what is his own; but whoever steals takes from another what is his own; therefore theft is the privation of such rectitude. Homicide, however, is opposed to the right dictate of reason that each person should enjoy his own proper life, and it is formally the privation of that rectitude, because it takes life from one's neighbor. From this the answer to the second confirmation is evident. For theft does not conflict with the defense of a neighbor's goods, but with the right dictate of reason that each person should hold and possess what is his own.

Second objection: moral good and moral evil are contrary opposites; therefore evil is not the privation of good. The antecedent is from Aristotle (*2, ch. on Opposites; and 2 Ethics, ch. 8*). The reason is that between good and evil a middle term is interposed — namely, the neutral or indifferent — but between privatively opposed things no middle is given. Confirmation from the same Philosopher (*ch. on Opposites*): from privation to habit no return is given; but from evil to good — as from vice to virtue — a return is had. Therefore and so forth. I reply by distinguishing the antecedent: taken materially, I concede — thus justice and injustice are contrary qualities, as are virtue and vice; taken formally and precisely, I deny — for thus, as Aureolus notes in the cited passage from Aristotle (*10 Metaphysics, ch. 3, T. 16*), one of the contraries includes the privation of the other. And evil is not called evil precisely on account of the positive, but on account of the included privation. Or say that this holds of evil taken as harmful, as Augustine mentions (*12 City of God, ch. 4*), but not of evil taken as the privation of a suitable good. Aristotle in the passages cited is to be thus interpreted. To the proof I say that no middle is interposed when the subject is capable of the form; but a middle is given when the subject is suited to receive the form but does not yet have it — as a puppy after the ninth day is either seeing or blind; but before the ninth day it is neither seeing nor blind, but simply not seeing. Or say that this is true in natural things, not in moral ones; and by this distinction the confirmation is answered — for although in natural things no return from privation to habit takes place, as from death to life, nonetheless in moral matters a return can be made, as from the unjust to the just and conversely; and likewise from evil to good and vice versa.

Third objection: every deed, word, or desire contrary to the law of God is something real and positive; but every sin, especially of commission, is a deed, word, or desire; therefore every sin is something real and positive. The major is evident. The minor is from Augustine (*in the Book against Faustus, ch. 25*). I reply that the argument concludes concerning sin taken materially, not formally, and that Augustine is to be thus explained. For the same Augustine, commenting on the words of John — "without him nothing was made" — says that sin is nothing, and when men sin they become nothing, which he derived from (*Psalm 72*): I was brought to nothing, and I knew it not.

One may say: if sin is nothing, God would punish the sinner for nothing — which seems false and absurd. I say that God does not inflict punishment on the sinner for nothing in a negative sense, but for nothing in a privative sense — that is, for the privation of due rectitude that ought to be in his act and is not. Just as a teacher beats the student who did not apply himself to his lesson, even though he was obliged to do so; and the master chastises the servant who did not preserve his goods, even though he was obliged to keep them safe; so God punishes the sinner, who, when he was bound to observe God's commandments, transgressed them.

You will insist: in hatred of God there could not and ought not to be any rectitude or conformity to right reason, because it is precisely and absolutely evil. Therefore God does not punish the sinner for the privation of due rectitude that ought to be in the act and is not. I say that the act of the sinner's will, by which he wills evil to God, informed with that malice, could and ought to have been informed with due goodness and rectitude — that is, with love for God — because a man is bound to love God himself as creator and supreme good; and by hating him he fails and merits punishment, departing from the first and superior rule fixed and established for him.

Article IV: From What Evil Arises

To begin with, the error of the Pythagoreans and the heresy of the Manicheans, who suppose two first principles — one the cause of goods and the other the cause of evils — is to be banished. Against these Augustine inveighs sharply and vehemently (*Against the Letter of the Foundation, from ch. 30 to the end; 2 On the Morals of the Manicheans; 2 On Genesis against the Manicheans, chs. 1 and 9; in the Enchiridion, chs. 10, 12, 24*) and elsewhere throughout, especially (*1 On Free Will, ch. 1*), where he says: We believe that all things that exist are from one God, and yet that God is not the author of sins. Alphonsus also refutes them excellently (*Book 10 Against Heresies, heresy 2*). Plato agrees (*in the Timaeus and in Book 11 of the Republic*), arguing against Hesiod and Homer, who assign ten causes of evils. And Augustine testifies (*8 City of God, ch. 14*) that according to Plato all the gods are good and exalted. Add (*1 Timothy 4*): Every creature of God is good. And (*Genesis 2 and 3*): Every tree that God planted in paradise is good. Hence Augustine adds (*1 On Genesis against the Manicheans, ch. 13*) that poisonous herbs were created for the punishment and testing of mortals. And (*in the Enchiridion, ch. 11*): God acts well even out of evil. And it is established as a matter of faith in the Council of Braga, ch. 7, whose words Alphonsus adduces (*in the cited passage, on the word "creature," heresy 2*). Moreover, whatever exists is good, because what exists is a being, and being and good are convertible, as Metaphysicians teach and Augustine affirms (*in the Enchiridion, ch. 24*), and the author of (*On Faith to Peter, ch. 4*) agrees. Furthermore, good and evil are opposed privatively, as was stated above; but the good is positive, having a good principle — which is God; therefore evil, which is privative, obtains no productive principle — just as

blindness, darkness, and other privative things properly have no principle and efficient cause, since they do not properly come to be. For this reason Augustine (*14 City of God, ch. 12*), speaking of the food by eating which Adam fell into sin, adds that the food was not evil or harmful except because it was forbidden. And (*in the Book on True Religion, ch. 13*): The devil, insofar as he is an angel, is not evil, but insofar as he is depraved by his own will. Moreover, if there were a true first principle of evils, it would be either from itself or from another — not from another, for then it would not be a first principle but would depend on a prior other; nor from itself, for to be from itself is to be independent and the supreme good, as Scotus infers (*2 Reportata, dist. 34, q. 1, § Ad aliam quaest. H*). Finally, a supreme evil is impossible, because nothing can be found that lacks all good, as the Doctor notes in the cited passage with Augustine (*1, 83 Questions, q. 6*). Therefore a twofold first principle — one of goods and another of evils — cannot exist.

First assertion: the evil of punishment is from God. So holds Scotus (*2, dist. 4, § Dico possit sub DD; and 4, dist. 50, q. 1*) and Vorrelon (*ibid., art. 2*). It is proved, first, from Scripture (*Jeremiah 11*): Behold, I will bring evils upon them from which they cannot escape. (*Amos 3*): There is no evil in the city that the Lord has not done. (*Micah 1*): Evil comes down from the Lord. And (*Baruch 2*): The Lord brings evils upon us. Hence God pronounced the sentence of punishment against Adam, Eve, and the serpent (*Genesis 3*). It is proved second from Augustine (*1 Retractions, ch. 26*): Therefore the punishment of evils, which is from the Lord God, is an evil. And (*1 On Genesis according to the Letter, ch. 13*). And he condemns the contrary opinion as heretical (*in the Book on Heresies, heresy 65*). Salvian writes (*in the Book on the Governance of God, in the beginning*): We are indeed punished by God, but we ourselves cause ourselves to be punished. And since we ourselves cause ourselves to be punished, who can doubt that we ourselves punish ourselves by our own crimes? Because whoever gives the cause by which he may be punished, punishes himself, according to that saying: each is bound by the cords of his own sins. Third, a just and upright judge, according to the laws prescribed, punishes the wicked and rewards the good — for he must judge according to works whether good or evil; but God is the just judge of the living and the dead, and we must all appear before the tribunal of God, so that each may receive according to what he has done in the body, whether good or evil. Therefore the evil of punishment is from God. Hence (*Ecclesiasticus 11*): Death and life are from the Lord God. And Alphonsus (*Book 10 Against Heresies, on the word "evil"*) reports that a certain Coluthus was condemned as a heretic for having asserted absolutely that God is not the maker of any evil — since from the sacred pages cited above it is clearly established that God is the cause of labors, afflictions, calamities, and the other things that are evils of punishment. For through these evils are corrected, and the good become better, as Augustine excellently pursues (*3 Against Julian, ch. 8*).

Second assertion: the evil of fault is not from God, but from the created will. So holds Scotus in the recently cited passage (*sub H; and § Ad solutionem istorum. T*) and following. This assertion has two parts. The first part is defended by Augustine (1, 83 Questions, q. 4), and the contrary opinion is refuted as heretical by Alphonsus (*Book 10 Against Heresies, heresy 1*). It is proved, first, from Scripture (*Matthew 7*): A good tree cannot produce evil fruit; but God is supremely good — indeed, No one is good but God alone. (*Romans 11*): If the root is holy, so are the branches; but God is holy (*Isaiah 6*). Therefore the evil of fault is not from God. Second, the evil of fault is punished by God, as I showed in the first assertion. Therefore it is not from God. Hence (*Hosea 13*): Your ruin is from yourself, O Israel; from me only is your salvation. Third, Scotus argues in the cited passage before X: God cannot be averted from himself — neither formally, because he cannot fail to love himself, since he is the supreme good knowing no higher rule; nor virtually, because nothing other than himself is necessary, but whatever is outside himself is willed freely and contingently by him; but sin — which is the same as the evil of fault — is an aversion from the immutable good and an inordinate conversion to a mutable good, according to Augustine (*in the work on Free Will*). Therefore the evil of fault is not to be attributed to God. The second part is proved, first, from Sacred Scripture (*Psalms 33*): But the countenance of the Lord is upon those that do evil. And (*Romans 7*): But what I do not will, that evil I do. Second, from Augustine (12 *City of God*, chs. 6, 7, 8, and 9; 1, 2 *On Marriage*, ch. 20; 3 *To Boniface*, ch. 9; 1 *On Grace against Pelagius*, ch. 20; 1, 83 Questions, q. 4; and 1 *On Genesis according to the Letter*, ch. 9), where speaking of the Demon he says: From itself it has an evil will; from God — that is, from him — it has a good nature. And (*On Correction and Grace*, ch. 6), speaking of man, he says: The first depravity, by which God is not obeyed, is from man, because by his evil will departing from the rectitude in which God first made him, he became depraved. Third, the cause of the evil of fault is that which falls away from the first rule fixed for it and from the commandment likewise established for it; but the created will is of this kind, as is evident from (*Genesis 1*) concerning our first parents and the other transgressors of divine law. Fourth, what is punished on account of the evil of fault is its cause; for the sinner and transgressor must be punished; but the created will is punished, as Augustine affirms (11 *On Genesis according to the Letter*, ch. 20): It must be believed that the evil of one's own will is to be punished by the fire of eternal punishment. Furthermore, the will alone is the source and origin of good and evil, of merit and demerit; for in its power alone it lies to operate well or badly. Hence Augustine adds (8 *On Genesis according to the Letter*, ch. 17): The will is the cause of sin, and no other cause is to be sought. And (13 *City of God*, ch. 14): From the evil use of free will the chain of calamity had its beginning. The same is written (1 *Magna Moralia*, ch. 10).

Third assertion: the evil of nature does not come from the first cause but from the secondary cause. This is derived from the Doctor in the cited passage. It is

proved, first, from (*Genesis 1*): God saw all the things that he had made, and they were very good, or perfect, as some translate it. And (*Ecclesiasticus 34*): The works of God are perfect. And elsewhere: God made man upright. Second, from Augustine (*1 On Genesis against the Manicheans, ch. 21*): God made all things not only good, but very good. He writes the same (*1 On Free Will, ch. 1; and Book 2, chs. 1 and 2; and 1 Questions on Exodus, q. 143*). Third, Aristotle (*2 Physics, T. 27*): The sun and man generate man; if a monster should occur, it is attributed not to the sun, which is the universal cause, but to the man, who is the particular cause, on account of excess or deficiency of matter, or other causes discussed (*in Physics, in the book on causes, q. 6, art. 3*). Fourth, a monster is a sin of nature, whose cause is a deficient cause, as above all Alexander of Hales observes (*3 part, q. 26, m. 7, art. 1*); but God is the perfecting and unfailing cause, since he is first among all things, regulable and conformable by no one. Therefore the evil of nature is to be ascribed not to God but to the creature.

First objection: (*Job 41, 4*) speaks of the Demon: This is the beginning of God's fashioning, which he made to be mocked by his angels. (*1 John 3*): From the beginning the devil sins. And (*John 8*): He was a murderer from the beginning. Therefore the Demon is the principle and cause of evils. I reply that, from the very moment the Demon was created by God, he turned away from God himself and converted to love of himself, since he coveted equality with God; therefore he is said to be the beginning of God's fashioning. For he who rose like the morning star fell and was made an object of mockery and derision for the angels, as is evident from the cited text of Job: So that he may be mocked by his angels. And (*Psalms 73*): That dragon, which you have formed to mock at it. Moreover he is called a murderer from the beginning, because from the time man was created, he cast man into death through envy, persuasion, and temptation, as Scripture attests (*Wisdom 2*): Through the envy of the devil death entered into the world. Thus Scotus replies (*2, dist. 5, q. 2, § Ad 1 principale ante R*) together with Augustine (*11 On Genesis according to the Letter, ch. 21*). Or say, also with the same Augustine in the same passage, that this is to be explained of God's foreknowledge: although God foreknew that Lucifer would voluntarily and freely fall into sin almost immediately after his creation, God nevertheless willed to create him for the exercise and progress of the good. So it is said (*Ecclesiasticus 24*): From the beginning and before the ages I was created. And (*Apocalypse 3*): The Lamb who was slain from the origin of the world.

Second objection: (*Exodus 4*): I will harden the heart of Pharaoh. And (*Ezekiel 14*): I will deceive that prophet. And (*Isaiah 64*): The Lord has mingled a spirit of error among them. And (*ch. 63*): Why have you led us astray, Lord, from your way? But to harden, to deceive, and to lead someone into error is the evil of fault; since God does this, it is plainly inferred that God is the cause of the evil of fault. Alphonsus replies (*Book 10 Against Heresies, heresy 1, on the word "evil"*): God is said to harden the heart of Pharaoh not because he imbues it with malice, but because he permits it to be hardened, deceived, to fall into error and

into a reprobate sense. This is consistent with the exposition of Augustine (*in the Book on Predestination, chs. 5, 6, 15*): I will harden — that is, I will not soften. He writes the same (*5 Against Julian, ch. 3*). Just as when a master conducts himself so indulgently and complaisantly toward his servant that he does not punish his vices and crimes, he is said to make the servant worse and more depraved.

Third objection: it is read (*3 Kings 12*) that by the will and instigation of God the wicked and depraved king Rehoboam reigned. And (*Job 34*): God causes the hypocrite to reign. And (*2 Kings 16*): God commanded Shimei to curse David. Therefore God is the author of the evil of fault. I reply that these and similar authorities, which can be adduced, are dissolved and explained by this distinction — namely, that they are to be understood not effectively but permissively; that is, God permits that a bad prince and king should govern and reign, because of the sins of the people, as is evident from the passage of Job cited. And (*2 Thessalonians 2*): Because they have not received the love of truth, that they might be saved, therefore God will send them a strong delusion to believe a lie, so that all who have not believed the truth may be judged.

Article V: How Evil Proceeds from the Created Will as from a Good

That evil arises from good is openly handed down by Augustine (*1 Against Julian, ch. 3; and Book 3 Against the same, ch. 24*), Ambrose (*Book on Isaac and the Soul, ch. 7*), and Scotus (*2, dist. 37, § Ad aliam quaest.*). But by what means this happens is a disputed point among the Scholastics. Three modes of speaking are set forth and discussed in this article by Scotus in the cited passage, which his annotators attribute to Saint Bonaventure (*2, dist. 34, 44*), from which the same Scotus, in the cited passage (*§ Propter igitur*), having examined and pondered them well and carefully, acknowledges that he collects the true solution to this difficulty.

The first mode of speaking is that found and defended by the Seraphic Doctor in the cited passage (*dist. 34, qq. 2, 3, 4, art. 2*), asserting that evil comes from good accidentally — with accidentality on the part of the cause — just as the Philosopher says (*5 Metaphysics, T. 2; and 2 Physics, T. 33*) that Polycletus is accidentally the cause of the statue. The second is that of the named Doctor (*ibid., d. 44, q. 3, a. 1*), asserting that the good is the accidental cause of evil — with accidentality taken on the part of the effect — that is, when the will per se intends something positive in the effect, to which it happens that something deformed or evil is conjoined, which the will does not per se intend. The third is that of the same Doctor (*ibid., q. 2, art. 1*), holding that evil proceeds from the good not as from an efficient cause, but as from a deficient one.

Note first, from Scotus in the cited passage (*§ Propter igitur*), that since in evil two things are involved — namely, the physical act, which is positive and is called the material element of sin, and the privation of due justice, which is the formal element of sin — the first has an efficient cause, because everything positive besides God has another as its efficient cause; but the second obtains no cause

except a deficient one. For the created will, which is bound to conform itself to God and to observe his commandments, if it does not conform and does not observe them — as Scotus asserts (*in Reportata 2, dist. 37, § Ad 1 q. dico*) — is said to fail, which is formally to sin and to do evil, according to that of (*Psalms 50*): I have done evil before you. From this evil we are begged to be delivered (*Matthew 6*): Deliver us from evil. For from the fact that the free cause does something positive, to which some defect is annexed, it fails or sins — as Augustine affirms (*3 Against Julian, ch. 26*): Just as when someone plucks the fruit of another, he commits theft, departing from the law of God commanding "you shall not steal." In this sense Scotus adds in the cited passage that most authorities can be explained — especially Dionysius (*Book on the Divine Names, ch. 4*): No one acts looking to evil. And Aristotle (*3 Ethics, ch. 5*): The virtuous man chooses good things per se, and evil things per accidens — meaning that he does not intend evil per se, but only per accidens — that is, casually and fortuitously. So that this may be better grasped:

Note second that one thing can arise from another per accidens in three ways. First, on the part of the cause — namely, because it is conjoined per accidens to a cause that truly produces such an effect; as music builds per accidens, since music is irrelevant to building, because a man does not build as a musician, but as a builder, insofar as he possesses the art of building, not insofar as he possesses the art of singing. In this way sin proceeds from the will not insofar as the will is the will — otherwise it would suit the divine will, which is impeccable — but insofar as it is defectible and capable of going astray, which happens to it from the fact that it is from nothing, as Augustine thinks (*12 City of God, chs. 6, 7, 8, 9; 1 On Grace against Pelagius, ch. 20; and Book 14 of the same work, ch. 13*): Man, from the fact that he is from nothing, fails and sins. And (*in the Book on Marriage, ch. 20*). The same is found in the author of (*On Faith to Peter, ch. 3*): All creatures are good, and because they were made from nothing, they fail. Second, on the part of the effect — which happens when the effect is not per se intended by the cause — as the finding of a treasure by one who is digging a vineyard. So evil is said to be caused per accidens by the will, because the will does not per se intend it, as I was saying in the preceding note. Third, by reason of what is extrinsic — in the way that being capable of laughter is accidental to rational, and rational to animal, because they are outside the essence of animal, as I observed (*in the Epitome, Book 3, q. 4, art. 4, n. 17*). So evil comes from the will per accidens, not insofar as the will is the will, but insofar as it is the created will — that is, insofar as it is finite and limited and is defectible and peccable by being from nothing — as the Doctor acutely deduces in the cited passage (*Q and R*) and before him Augustine (*14 Trinity, ch. 4*).

Note further that the soul and every nature are good, as is evident from (*1 Timothy 4*): Every creature of God is good. But the created will, which arises from rational nature, is good if it operates well; it is evil if it operates badly, as Augustine excellently and illustriously pursues in the cited work against Julian.

First assertion: evil derives its origin from good. So hold Augustine and Scotus cited at the beginning of this article, from whom Suarez (*Disputation 11 of the Metaphysics, sect. 3, n. 15*) seems to dissent. It is proved, first: a defect comes from a deficient cause — as a limp from a limping person, blindness from one lacking light, privation of form from matter, and so forth; but the deficient cause, as a being and a cause, is something good — as a blind man, according to human nature, is a positive being and good; matter is a part of the composite and the subject of the form; and the other things created by God are good, as Augustine notes (*in the Book on True Religion, ch. 23; and 19 City of God, ch. 13*). Therefore evil is from good. Second, evil must necessarily originate from one of two sources — from evil or from good — but not from evil. For such evil would either be from another — and that other from another, and so on to infinity, which is absurd — or from itself, and so it would be first and supreme evil, which is impossible, as was shown above. Moreover, evil is the privation of good, as Augustine testifies (*in the Enchiridion, ch. 11*), which the holy Doctor illustrates with the example of illness, which is the privation of health. Now privation presupposes and requires beforehand a subject in which it exists and from which it proceeds, as is evident from privation, which has its subject in matter; but the subject is good, because it is a being. Therefore it follows that evil is from good.

Second assertion: evil is from good, insofar as it is a finite and limited good — which is the created will. The Doctor holds this (*in the cited passage, § Propter igitur*). It is proved, first, by the testimonies of Augustine cited in the second note: for the reason why the will sins, says Augustine, is that it was produced from nothing; and what is from nothing is finite and limited. Second, what is defectible is peccable, because sin is a failure from the immutable good, as Augustine testifies (*1 On Grace against Pelagius, ch. 10; Book on True Religion, ch. 3; 14 City of God, ch. 9*); but the will, as created and finite, is defectible and frequently falls away from the divine commandments by transgressing them, according to that of (*1 John 1*): If we say that we have no sin, we deceive ourselves, and the truth is not in us. Third, every subject and servant can deviate from the precept and law of his Lord, because he is bound to conform himself to him; but every created will is subject to God and is obligated below him by God's precept commanding (*Matthew 10*): If you wish to enter into life, keep the commandments. And it must be conformed to him, as the Doctor expounds (*in the cited passage, § Ista qq. ante A. post B; and § Ad argumenta 4 q. in solutione 2*).

First objection: from good nothing proceeds except good, just as from evil nothing but evil; but the will is good, since it is from God, from whom every good proceeds. Therefore from the created will no evil is caused. The major is supported by the celebrated testimony of the Savior (*Matthew 7*): A good tree cannot produce evil fruit, nor can a bad tree produce good fruit. Gazing upon which, Horace — cited by Augustine (*5 Against Julian*) — adds: Then nature obeys, when without a teacher it has perceived what nature desires; for what is good cannot desire badly. Augustine replies (*5 Against Julian, ch. 3; and 4 Against*

the same, ch. 4): By the good tree is to be understood the good will, which is conformed to divine law, operates well, and elicits good acts, and produces the good fruits of meritorious work; and by the bad tree is to be understood the bad will, which, deviating from divine commandments, operates badly and produces the evil fruits of sins. Therefore it is not human nature that is called a good or bad tree, but the will that proceeds from it is called good or bad — since it is free and indifferent, and thereafter determines itself to operating well or badly. Or say with Scotus in the cited passage (§ *Ad argumenta principalia 1 quaest.*) that Christ the Lord understands by the tree the interior act, and by the fruit the exterior act — for there he rebukes the hypocrites, who, though inwardly bad, wish to appear outwardly good; and the same Savior warns us to recognize them by their exterior works, saying: By their fruits you shall know them.

Second objection: the created will is peccable because it is defectible, and sins because it fails, as is established from the second assertion, defended by Augustine (*12 City of God, ch. 7*). If therefore this reasoning holds, God can sin, because God can fail; for to fail is the same as to not effect (*2 Physics, T. 30; and 5 Metaphysics, ch. 2*); but God can not act, because he acts freely with respect to what is outside himself; therefore he can fail and sin. I concede the antecedent and deny the consequent. For although "to fail" nominally and grammatically sounds the same as "not to effect," yet really and morally it means the same as deviating from a superior rule to which one owes obedience. But God, being the first rule, in no way can fail and sin.

Third objection: in precise causes, if the negation is the cause of the negation, the affirmation is the cause of the affirmation (*1 Posterior Analytics, T. 30*) — as if having lungs is the cause of breathing, not having lungs is the cause of not breathing. When God causes rectitude in an act, he is the cause of its rectitude — that is, so that the created will in its own order of causation should cause rectitude in that same act. Therefore conversely, if God does not cause rectitude in an act, he is the cause of its obliquity and defectibility, which is sin. I concede the major. To the minor I say with Scotus (*in the question before X*) that if God were not to cause the rectitude that ought to be in the act of the created will, and this on account of the freedom of his own will and not on account of a defect of the created will which spontaneously does not concur, then he would not be the cause of sin — because there would be no privation of due rectitude, and thus no sin of the created will. For without the concurrent causation of the first cause, it cannot do anything; and thus in that case it would not sin. For when two causes concur simultaneously, the defect is attributed to the cause that does not act when it is bound to act; but since God is not bound to act, if the secondary cause then does not operate, no defect or sin is imputed to him.

You will ask first: why does God permit evils? Augustine replies (*3 Against Julian, before ch. 8*): God does this in order to draw good out of evils. And (*4 Against the same, ch. 7*): Christ uses every kind of evil well for the utility of the good. And (*3*

On Marriage, ch. 20): God operates well from evils in all things. And (*in the Book on Correction and Grace, ch. 10*): because he created all things very good, and foreknew that evils arising from goods would occur, and knew that it pertained more to his omnipotent goodness to bring good even from evils, than to permit no evils to exist.

You will ask second: whether one sin is the punishment of another sin? I reply with Augustine (*3 Against Julian, ch. 3*) and Scotus (*in the cited passage, § Ideo possit dici DD*): affirmatively. The reason is that punishment is formally the privation of a good suitable to the will and to the one who wills; but when someone sins, he is deprived of a good suitable to him, either according to the affection for advantage or the affection for justice, as the Doctor shows (*ibid., § Ad q. 3, C*). Hence Augustine rightly adds (*1 Confessions, ch. 12*), addressing God: You have commanded, Lord, and so it is — that every disordered soul is a punishment to itself.

One may say: if sin is the privation of due rectitude, which is fault distinct from punishment, how is one sin the punishment of another sin? I say, with Scotus (*toward the end of the cited distinction*), that punishment is taken in two ways. In one way, punishment is the privation of a good suitable to the intellectual nature — such as the privation of the vision and enjoyment of God — and this is a pure privation, which comes from God neither effecting nor failing but deserting — that is, leaving in its defect the nature that fails, and in all the defects consequent upon that defect, within which very many privations of perfections suited to such a nature are included. This in the damned is called the punishment of loss. In the other way, punishment is something positive unsuitable to the nature — as vehement heat applied to flesh is unsuitable to it; and punishment thus understood comes from God inflicting it, which in the damned is called the punishment of sense, of which Augustine makes mention (*1 Retractions, chs. 25 and 26*).

Question III: On the End

The treatment of the end is given precedence over the other causes, says Aristotle (*1 On the Parts of Animals, ch. 1*), because the end is the reason, and reason is the principle in things constituted both by nature and by will. Now Moral Philosophy treats above all of the end, because — as Augustine testifies (*9 City of God, ch. 1*) — we will all other things for the sake of the end, but the end itself only for its own sake. For virtues and other moral works we employ as means toward attaining the end or happiness, as Aristotle not obscurely indicates (*1 Ethics, ch. 2*) and Scotus openly teaches (*4, d. 49, q. 8, toward the end*). Having presupposed and precognized what I said in Physics about the final cause, I have proposed in the present work to examine and sift the rest of the same matter with a little more precision and accuracy.

Article I: How Many Species of End There Are

The etymology of "end" is not to be dismissed, derived as it is from "cord" or "rope" — since the boundaries and termini of lands were constituted by cords; hence we read (*Psalms 16*): The cords have fallen to me in fine places. And elsewhere: He divided the earth by cords of distribution. The reason may be that just as we draw by a cord what we desire, so for the attainment of the end we desire, we apply ourselves to labor, virtue, and other good works. Nor should the fourfold acceptation of end be omitted, which Scotus preludes (4, d. 49, q. 9, *toward the end*), to be better examined by us below as a more fitting and opportune place. Many divisions of the end are adduced and expressed by Suarez (*Disputation 23 of the Metaphysics, sect. 2*), Raconius (*in the Prelude to Logic, sect. last, ch. 2; and Tract. 2 of Moral Philosophy, disp. un., q. 2*), and Fuentes (2 *Physics, q. 7, diff. 1, art. 1*). I select and explain the more important and outstanding ones.

The first is the very common division into the end of the agent and the end of the work, touched upon by Scotus (1 *Metaphysics, q. 7, toward the close*). The former is that which the operating or knowing agent proposes to attain for himself — as if someone studies Philosophy for the sake of vain glory, this is his end; this is also called the extrinsic end. The latter is that toward which the work or science is directed and for the sake of which it was devised, which is called the intrinsic end — as the end of Logic is the discernment of truth from falsity. It can be divided into mediate or remote — as the combination of letters in Grammar and the knowledge of terms in Logic — and immediate or proximate — as the knowledge of correct speech in Grammar and the knowledge of the syllogism in Logic. And further into total or adequate, and partial or inadequate, which can easily be perceived from what I said (*in Logic, Book 1, q. 2, art. 1*).

The second is the division of the end of the work into the end for whom (*finis cui*) and the end of which (*finis cuius*), which Aristotle presents (2 *On the Soul, ch. 4, T. 37; and 2 Physics, ch. 2, T. 23; and ch. 7, T. 71*) and Scotus (2, d. 6, q. 2, § *In ista quaest. A*). The end for whom is that for whom someone wills some good for the sake of which he acts — as the sick person is the end for whom the physician, through medicines, wills to induce health. The end of which is the good itself that someone wills for another — as health is the end of which, which the physician through medicines cures in order to provide it to the sick person. The former regards the love of concupiscence, because it is for the benefit of another; the latter regards the love of friendship, because it is for its own sake and tends toward nothing further, as the Doctor asserts (*ibid.*), and Suarez follows (*ibid., n. 3*).

The third is the division into objective end or end that (*finis qui*) and formal end or end by which (*finis quo*), which Scotus mentions (12 *Metaphysics, ch. 2; Tract. On the First Principle, ch. 2; and 4, d. 49, q. 6, sub C*). The former is the object to be obtained and enjoyed — as the objective end of beatitude is God. The latter is the operation by which such an object is attained and possessed — as the

fruition by which the Blessed enjoys God. From this originated the division of beatitude into objective and formal, of which more at its proper place.

The fourth is the division into end to be made — which is effected by the one operating and intending, and which sometimes remains in the agent after the action is completed, as health induced into the sick person, and sometimes does not persist in the agent, as harmony after singing and the sound of the cithara after playing the cithara — and end of production, which is that toward which the operation of the produced thing is ordered, and which is required beforehand before the operation; as form is required before it is sustained by matter, and the subject before accidents. This is touched upon by Aristotle (*1 Ethics*, ch. 6; and *1 Magna Moralia*, ch. 3) and explained by Bonet (*3 Physics*, ch. 3).

The fifth is the division into ultimate end and non-ultimate end. The latter is also called the subordinate end and intermediate — the one for whose sake something is done, yet which is still referred and ordered to something else; as the giving of money for succouring the poor and for obtaining the grace of God. The ultimate end is that for whose sake something is done without being referred to anything further. This partition of the end is derived from Scotus (*2 Metaphysics*, ch. 2; and 4, d. 49, q. 2; and *ibid. in the Reportata*, q. 7, toward the end). Now the ultimate end can be subdivided into the ultimate end in a qualified sense — that is, the last in some order and series, as health intended by the physician, for the sake of whose restoration to the sick person he devotes all his care and effort — and the ultimate end simply, to which in the end all things are reduced, such as God, according to that of (*Proverbs 16*): The Lord has made all things for himself. The objections that can be made in the present article will be proposed and dissolved more conveniently and aptly in the following article.

Article II: Which of the Said Ends Is the Final Cause

The Scholastics are not in agreement or accord on establishing which of the kinds of end enumerated above properly possesses the nature of the final cause. So that we may separate what is more certain and probable from what is less certain and doubtful: we observe that it is certain and undoubted, as held by all from (*2 Physics*, T. 29 and 31), that the end is defined as that for whose sake something is done. But the question is put in doubt as to which of the enumerated ends the said definition applies. And certainly it seems certain that it applies to both ends of the second division — since the agent acts for the sake of the end, and the agent's work is directed toward the end precognized and proposed by that same agent. For a man acts for the sake of beatitude, and his works are directed and directed toward attaining it, and they participate in the proper and formal character of the end.

With respect to formal and objective end, nearly the same causation is had. For the operation of the agent — especially the intellectual agent — which is called its end, exists for the sake of it, or so that the agent may be perfected through it,

as is evident from Aristotle (*9 Metaphysics, T. 16*) and Scotus in the same passage. But the objective end is for the sake of the operating agent, and the formal end is that in which the agent may rest, by attaining the object through its operation, possessing it, rejoicing in it, and enjoying it. For the agent is perfected by the possession and possession of such an objective end, and rests fully and completely in its vision and enjoyment — which the Royal Poet clearly expresses (*Psalm 16*): I shall be satisfied when your glory shall appear. But the greater and more difficult doubt concerns the end for whom and the end of which, and also concerning the intermediate and ultimate end.

Now with respect to the first proposed and examined theme: Ockham (*2, q. 3, art. 1*), Gabriel (*ibid., dist. 1, q. 5*), Henry (*Quodlibet 2, q. 2*), and others hold the opinion that the end for whom, and not the end of which, participates in the proper nature of the final cause. But the common opinion of the other Philosophers attributes to both ends the proper formal character of the final cause.

With respect to the second doctrine about the ultimate and non-ultimate end, Vasquez (*with 1 part, disp. 82, ch. 1; and 1–2, disp. 4*) rejects the said division as illegitimate and vain, and attributes causality of the final cause to the ultimate end alone. But the common sense and consensus of the others is that both ends possess the proper character of the final cause.

First assertion: the end for whom and the end of which have the proper character of the final cause. This is derived from Scotus (*2, dist. 6, q. 1, F*). It is proved, first, from Aristotle (*2 On the Soul, ch. 4, T. 37*), who admits the said division of the end, while in (*2 Physics, 29*) assigning the common definition of the end, he said that the end is that for whose sake something is done. If therefore the members of a good division equally participate in the nature of the common divided term, and the definition of the latter applies to them, undoubtedly each end is properly the final cause. Second, for the sake of the end man is moved to act, as no one denies; but he is moved not only for the sake of the end for whom but also for the sake of the end of which — for in each there is goodness — and man is aroused not only to have objective beatitude but also to have formal beatitude. Likewise, the physician is moved to procure health and strives through his work to confer it on the sick person. Now health is the end of which, and the sick person is the end for whom; each is therefore properly an end. Indeed, not a few recent authors hold, following Scotus in the cited passage and Aristotle (*5 Metaphysics, ch. 2*), that the two coalesce into one. The reason is that the agent intends both ends adequately; for the physician wills health to the sick person — the sick person is the end for whom, and health the end of which — which Aristotle plainly teaches in the recently cited passage, saying: Why does the man walk? In order to be well. Here both ends are grasped — namely the man and health; the former is the end for whom, the latter the end of which;

with this distinction however: the end for whom is the principal end, and the end of which the less principal one.

Second assertion: both the ultimate end and the non-ultimate end are truly ends. This is gathered from Scotus (*1, dist. 1, q. 4, § Ad argumenta; and 4, d. 14, q. 2, H and R*). It is proved, first, from (*2 Metaphysics, ch. 2*): In ends there is no proceeding to infinity. And (*2 Physics, T. 89*), cited by the Doctor (*Quodlibet 16, F; and 4, dist. 49, q. 9, M*): Just as the principle is in speculative matters, so the end is in practical matters. As in the speculative sciences, what is the principle of one science is the end or conclusion of another, and conversely what is the end or conclusion of one is the principle of another — as is evident in subordinate sciences, of which (*in Logic, Book 5, q. 4, a. 7*) — so likewise in practical and moral matters, one thing is ordered toward another and is an end in such a series of things; and because such things are not supremely good, they are therefore ordered toward another, which is the last and supreme good of all. Moreover (*2 Physics, 24*): Man is the end of artificial things, whose ultimate end is God, as the Apostle intimates (*1 Corinthians 13*): All things are yours; but you are Christ's, and Christ is God's. And Saint Augustine (*Book 83 Questions, q. 56; and Book on Spirit and Soul, ch. 42*): The body and soul together constitute man; whatever is seen with bodily eyes was made for the body; the body was made for the soul; but the soul for God. Again (*2 Physics, ch. 7, T. 71*): The end of generation is the form; but the form is further ordered toward the composite as the total and ultimate end of the same generation. Add that one thing can be done for the sake of another, and then further ordered toward another — as someone eats to sustain his body, then in order to serve God. Finally, many recent authors — Suarez in the cited passage, n. 5, Fuentes (*q. 7, diff. 1, art. 1, n. 3*), and the joint Scotists (*Disputation 7 of Physics, q. 8, art. 1*) — hold that from the end of which and the end for whom, and likewise from the formal and objective end as partial ends, one total end is composed. For in the attainment of each, the conjunction of one with the other toward the desired and beloved takes place — as health is conjoined with the healthy man, and the healthy man can be said to be the complete and total end of the agent. Similarly, man through vision and fruition is united to God, and becomes blessed — by which he is said to have his end or his ultimate perfection, since he is conjoined with the best possible for him, as the Doctor writes (*q. 1 of the Prologue; and in Reportata 4, dist. 49, q. 7, in the last solution*). And this is shown by the Savior (*John 17*): I pray, Father, that they may be one, as we also are one — meaning by the unity of charity and love, as the Doctor teaches (*1, d. 5, q. 2*) and I expressed at length (*in the Tract. on the Trinity, disp. 3, q. 5*). Aristotle intimates (*5 Metaphysics, ch. 2*), saying that man walks for the sake of health — where he comprehends both the man, who is the end for whom, and the health, which is the end of which. The same is established concerning the formal and objective end. For man operates in order to see God and enjoy him; where God clearly seen and possessed is called the ultimate end of man.

First objection against the first assertion: the end is that by the having of which the appetite of the one desiring rests — just as by the attainment of the terminus, motion ceases. But by having the end of which, the appetite of the desiring person does not rest, because it is desired not for itself but for the sake of something else — as health, which is called the end of which, is desired for the sake of man. For it is not loved per se but for the sake of another; but the end is that for whose sake all other things are sought (*2 Metaphysics*, 8). Therefore the end of which is not properly an end. Hence Scotus (*4, dist. 49, toward the close of q. 2; and d. 50, q. 2, sub F*) adds that the operation does not seem to be for its own sake but for the sake of the object. And Suarez (*Disputation 24 of the Metaphysics, n. 16*) adds that the formal end is ordered toward the objective end. Confirmation: just as instrument is to principal cause, so end of which is to end for whom — for just as an instrument cannot act without the principal cause upon which it depends, so the end of which is not desired except for the sake of the end for whom, as I explained above concerning health, which is not desired except for the sake of the end for whom — that is, the man. Therefore the end of which does not enjoy the proper nature of the end. I concede the major. To the minor I say that both ends are conjoined simultaneously, so that the intention of the one desiring may come to rest — because they stand as perfection and perfectible; for the end of which is the perfection of the end for whom, as health is the perfection of man. This does not, however, prevent the end of which from being properly an end. For the agent is moved by it to act, as is clear from what has been said. To Aristotle I say that he is speaking of the ultimate end, or also of whatever end toward which means are ordered — with respect to which means, it is rightly called an end. From this the testimony of Scotus cited above is also answered. To the confirmation: the parallel is to be denied, because an instrument — as stated in *Physics* — is not properly active except in the actual movement of the agent. But the end of which is active in its own genus, since the agent acts by its proper action for the sake of attaining it.

Second objection: the end for whom is the subject — as health subsists in man; therefore the end for whom is not properly an end. The consequence holds from (*2 Physics*, 24), where we read that we are in some way the ends of all things. Confirmation: if such is admitted as a true end, it would accordingly have to be conceded that man is the end of God, because we desire him for ourselves — especially since from what was said above, the formal and objective end together make up one total end. But this is false and absurd; therefore so is the other, and accordingly the end for whom is not properly an end. I reply that if the end of which is compared to the end for whom, the latter is indeed its subject or object, and in this respect is not called the end nor does it exercise the causality of the final cause; but insofar as means are brought to bear for its attainment and the agent operates for the sake of obtaining it, it does. To Aristotle I say that he offered this not diminishingly but diversifyingly; for he had just previously mentioned the end of generation, and because man is the

end of artificial things, Aristotle says: We are in some way the ends of those things that are made by art — as Fomse rightly notes in the cited passage, (*q. 10, sect. 1*). And that this is true is evident, because the Philosopher adds that he treated of two ends in his book of Philosophy — which, although it does not survive among us, is nonetheless expressly found in (*2 On the Soul, ch. 4*). To the confirmation I deny the implication, because God is not ordered toward us, but we are ordered toward him; and in order to attain him through vision and fruition we observe his commandments and direct our works toward him. Therefore we love God, because he wills to be loved by us as the supreme good to be possessed by us; and we refer all things to him as to our last and consummate perfection, as Richard notes above all others (*3, dist. 26, q. 2, art. 7*).

Third objection: what tends toward something else is not an end — nor the last and outermost point of a thing — as I stated (*in the Epitome, Book 1, q. 1, art. 2*). But the intermediate end tends toward something else, as is established from its description stated above. Therefore the intermediate end is not properly an end. The major is supported by the testimony of the Philosopher (*2 Physics, 29*): The end is that for whose sake everything is done by the agent intending it. First confirmation: it is contradictory to say that something is both a means and an end, since a means tends toward another while the end is for its own sake. Therefore an intermediate end is not given. Second confirmation: God does not will one creature for the sake of another; for the divine will is not moved by a created object to will one thing for the sake of another. Therefore only the ultimate end enjoys the proper nature of an end, and the rest participate only in the character of means. I distinguish the major: if it has no proper goodness for the sake of which it is desired and loved by the agent, I concede — as bitter medicine, bloodletting, and such like; if it is endowed with its own goodness, on account of which it is desired per se, I deny — as moderate bodily exercise. For in this way one good can be loved on account of another — as chastity on account of health, and health on account of God. In this sense (*Ecclesiastes 2*) writes: I abstained from wine, that I might turn myself to wisdom. Where abstinence from wine is for the sake of wisdom, and wisdom for the sake of God. And Aristotle in the cited passage says that artificial things are for the sake of man, and man for the sake of God, who is the last end of all things. This agrees with that of (*1 Corinthians 13*): All things are yours; but you are Christ's, and Christ is God's. To Aristotle I say either that he is speaking of the ultimate end simply, or also of the ultimate end in a qualified sense, toward which all the means necessary for its attainment in that series are ordered. To the first confirmation: the antecedent is true reduplicatively but not specifically; for what is a means with respect to the ultimate end can be an end with respect to others — as abstinence from wine is a means toward wisdom as its end, and then wisdom is a means toward attaining beatitude. To the second confirmation I say that this holds for God, because every creature is only a terminating object of his intellect and will; but not for us, who are moved by created objects, and the

goodness of one can move us toward another goodness, and terminate our appetite not simply but in a qualified sense, as I shall show more below.

You will ask whether the aforesaid ends are loved by one or by a double act. I reply with Scotus (4, d. 49, q. 5, § *Ad quaest.*), Rada (2 *Controversies*, contr. 11, 2, a. 4), and Faber (2, disp. 32) that those ends are loved by two acts; for the end of which is loved with the love of concupiscence, and the end for whom with the love of friendship; and they differ in their disposition and object, as Faber explains (*ibid.*, ch. 3). Again, the intermediate end is ordered toward the ultimate end, and they seem to stand as cause and effect, which are really distinct from each other. Therefore the agent is directed toward them not by one but by several acts.

Article III: What Is the Constitutive Character of the End

This difficulty is proposed under another title — namely, whether the will can will evil under the character of evil — and can be debated in two senses: first concerning the constitutive character of the end in first act; second concerning the constitutive character of the same in second act. The former sense is examined in this article; the latter will be discussed in the following one. Now in the present question two opinions prevail. One is that of Alexander of Hales (1 part, q. 17, m. 4; and q. 34, m. 1), Thomas (1–2, q. 1, art. 1; 3 *Against the Gentiles*, chs. 2 and 3), and Suarez (*Disputation 13 of the Metaphysics*, sect. 5), asserting that the constitutive character of the end in being an end is goodness alone. The other is that of Ockham (2, q. 13, dub. 3) and other Nominalists, affirming that not only the good or evil, but also the indifferent toward good or evil, can be the objective character of the end, which the will can fix for itself and preordain as an end.

Note that the Scotists are divided and split into three parties on this question: for some, like Mastrius and Bellutus (*Disputation 7 of Physics*, q. 8, art. 2), follow the former opinion. Others, like Faber (1, disp. 13, ch. 7; disp. 9 on *Penance*, ch. 8), embrace the latter view. Still others, like Vorrelon (2, d. 43, diff. 2), consider both opinions probable; and Bruliferus, Gad (*Quodlibet 16*, fol. 169), and the Doctor himself (*ibid.*) seem to hold the same. And this I already asserted (*in the Tract. on the Angels*, disp. 11, q. 4).

Note second: in the school of the Subtle Doctor, being generally accepted is indeed the object of the intellect, as is evident from Scotus (1, d. 3, q. 2, § *Ad rationes in oppositum*, C and E). But whether the same is the object of the intellect and of the will, he speaks obscurely and dubiously there, and does not seem to firmly assent to either side; he proceeds in nearly the same way in this as in that difficulty, as is clear to one reading the text attentively. For in the passage just cited he adds the conditional particle "if"; but (2, d. 6, q. 1, § *Quia tamen*, A) he explicitly and absolutely says that every being is the object of the will, though he does not speak as absolutely there, as is evident from that phrase "can otherwise be answered to the question." Hence in the Reportata (2, same dist. and q.),

responding to the arguments for the opposite opinion, in the fourth solution he still left in doubt the said difficulty — whether hatred of God is possible.

Note third, from (*4 Reportata*, d. 49, q. 9), that there is a twofold appetite of the will: natural and free. The natural appetite is the inclination by which the will by its very nature inclines toward the good fitting to itself, which is said to desire and will by the affection for advantage and the appetite of concupiscence. Thus each thing is said to desire its own perfection, and (*1 Physics*, 81): matter desires form. The free appetite is that by which the will freely determines itself to willing something, whatever that may be — whether possible or impossible — which is said to will by the affection for justice and the love of friendship. If it is possible, it can efficaciously will it and apply sufficient and appropriate means for its attainment; but if it is impossible, it can will it inefficaciously and with approbation — as the evil angel is said by the Doctor in the cited passage to have desired equality with God. Now through the said distinction this controversy is completely and fully resolved. For by the affection for advantage the will always tends toward the good; but by the affection for justice, although it tends toward the good in most cases, this is not always so, as the Doctor writes (*4, disp. 49, q. 9, Resp. § Ad aliud cum dicitur*).

First assertion: the constitutive character of the end prescribes from good and evil, and is indifferent to each. This is derived from the Doctor (*2, disp. 6, q. 1, § Quia tamen, A*), saying that the will has as its object the whole of being. And (*4, d. 49, q. 1, § Ad 1 q. ante T*): whatever the will regards as its volible object under the most common character, because it is an immaterial power and consequently regarding the whole of being, or something of equal extension with being. And (*ibid.*, q. 10, § *Respondeo sub E*) he adds that the will can pour forth an act of willing or not-willing concerning beatitude or misery, and that there are indifferent acts — this is the constant doctrine (*2, d. 41, q. un.*). It is proved, first, from Augustine (*1 Retractions*, ch. 9 and ch. 22): Nothing is so much in the power of the will as the will itself. Which Scotus (*1, d. 1, q. 1, § Contra 1 art.*) and elsewhere explains of the elicited act of the will. And (*in the Enchiridion*, ch. 14): Either the will does not exist, or it must be called free. If therefore the will freely regards any object — whether good or evil — it is consequently indifferent to willing or not-willing this or that; and therefore the constitutive character of its end prescribes from each, and is indifferent to each. Second, for whatever object is presented to the will, it can will it, not-will it, or refuse it. If the first, the intended conclusion is had — namely that the will indifferently regards any object, whether good or evil; if the second, the will is not free, which conflicts with Sacred Scripture (*Ecclesiasticus 15*): I have placed before you fire and water; stretch out your hand to whichever you will. Third, what has its object abstracted from good and evil does not precisely and adequately regard good alone, as is evident of the intellect, whose object is being in its whole breadth (*1, d. 3, q. 3*), and which therefore does not contemplate truth or good alone; but the object of the will is being, which is more common than good and the other

transcendentals. Therefore the will by its objective character does not regard goodness alone. The antecedent is argued by the Doctor (*in the passage recently cited, § Ad rationes in oppositum*): for the will can will whatever object is presented to it by the intellect. If therefore the intellect contemplates every being, surely this is not to be denied to the will — since the appetitive power equals the cognitive power in operation with respect to all objects. See Faber (*in 4, disp. 9 on sins, q. 1, n. 7*).

Second assertion: the will can will evil under the character of evil. This is indicated by Scotus (*in the cited passage*) and explicitly asserted by the same in collation 17 toward the end, where speaking of the evil angels he adds: Either they will hatred of God under the character of evil — and the intended conclusion is had, namely that evil under the character of evil can be willed; or it is willed under the character of good — and then they would be erring, because hatred of God is per se evil, and love of God is per se good; or they cannot will — the opposite of which we experience in sinners and the damned. The same is nearly found (*2, d. 43, q. 2, ante A*). Then it is proved from Scripture (*Psalms 73*): The pride of those who hate you ascends always. And (*John 15*): He who hates me also hates my Father — where Scotus (*2, d. 42, q. 1, § Ad 1*) comes to the aid that no one can hate one divine Person without virtually having hatred for another Person also. Since therefore hatred of God is per se evil, and the will can will it — as the damned do — it is plainly established that the will can tend toward evil under the character of evil. Moreover, some people desire death and kill themselves, driven by despair, even though they know that death is a certain evil averse from and adverse to beatitude; and depraved men often will evil with no consideration or proposed goodness, but spurred by malice alone, and because evil pleases them thus — hoping for no good nor benefit therefrom. Furthermore, from (*1, d. 1, q. 1*) a threefold end is assigned: true, apparent, and preordained or prefixed — and this last is what the will proposes to itself with no regard for goodness, usefulness, or honesty, but spontaneously and freely. Therefore the will can, by its own free choice, will evil as evil. Aristotle indicates this (*2 Magna Moralia, ch. 7*).

Third assertion: Scotus appears to be undecided as to whether hatred of God is possible and whether the will can will evil under the character of evil. So holds Cavellus (*1 Metaphysics, q. 2, Scholium 3*), adducing many passages from both sides, from which he concludes that Scotus remained undecided. This is evident to one reading the Doctor's writings. For (*1, d. 1, q. 4, § Ad argumenta*), meeting the testimony of Augustine (*in the Enchiridion, ch. 73*): The wretched not only do not wish to be wretched, but cannot at all wish to be so — he says this is to be interpreted not of the actual and elicited act of the will, but of the natural, habitual, and aptitudinal act, by which the will naturally inclines toward its own perfection — just as every other power and nature does. Hence in the Reportata (*4, d. 49, q. 9*) he gives the example of prime matter, which naturally desires form, just as every imperfect thing desires its own perfection. And there he adds

that all will beatitude not by an act of friendship but of concupiscence; for the disordered will of the damned and of the worst wayfarers does not will that act for its own sake, nor that act in itself — indeed, it does not will it to exist, nor God to exist, who is the beatifying object. The same he writes (*in Reportata 1, d. 1, q. 2, § Ad 1 principale; and 2, d. 6, q. 2, M and N; and in the Reportata of the same dist. and q., § Ad 1 rationem; and 2, d. 43, q. 1, § Respondeo. D*) — saying that God formally cannot be hated by any will. And he cites himself (*4, d. 49, q. 9*). And in the same (*2, cited q. 2*) he speaks conditionally and dubiously. But he seems to speak absolutely in (*Quodlibet 16, F*), saying that the end does not have the character of something to be not-willed, because it includes neither malice nor a defect of the good. Hence this — namely, not-willing the end — includes a contradiction, just as seeing a sound does. This also seems to be intimated by Augustine (*4 Questions on Numbers, q. 24*): Nor does anyone sin for the sake of sin itself, but for the sake of what follows from it. And (*in the Enchiridion, ch. 14*), cited by the Doctor in both the works on the fourth, it is stated that it is in the power of the will to elicit the act of willing or not-willing, both concerning good and concerning evil — because no willing is necessarily elicited by the will, whether concerning beatitude in general or in particular, as is evident from the same first cited passage and from the same place of the fourth (*F*). And although the same Scotus there concludes that we cannot will misery with respect to the inclination and natural appetite, he nevertheless does not absolutely affirm that the will is determined to either act; and responding to that argument — in what there is no defect of good or evil, it is necessarily willed — he determines that proposition to be false, because the will with respect to any act is free and necessitated by no object. Then he adds that the will can suspend its act when beatitude is shown to it. Again (*3, d. 33, q. unica, § Ad rationem igitur, C*) he writes that the object of the will is the good. Augustine had already premised this (*1–2 On the Sermon of the Lord on the Mountain, ch. 34*): The will is not except in good things. This must be met with the Doctor (*2, d. 23, q. un., A and D*): it is to be interpreted of the object of the will that is not adequate and motivating, but only with respect to inclination and natural appetite, and as in most cases. And he writes the same (*4, d. 49, q. 10, § Ad 1 arg. E and M; and ibid. in the Reportata, q. 9, § Ad aliud cum dicitur*). Finally, toward the end of collation 17 he seems to admit hatred of God, which is per se evil. This can be answered: if one says that hatred of God is possible not formally but interpretively — just as the Doctor says (*2 Reportata, d. 6, q. 1, toward the end*) that the evil angel desired equality with God not formally — since such equality is impossible — but interpretively and with an inefficacious will, which is called velleity. So Gad replies in the passage cited above. Therefore the joint Scotists cited above, even if in their first conclusion they explicitly wish to defend Scotus in saying that the good is the adequate object of the will, yet in the end of the second conclusion and in the first solution, pressed by the cited passages of the Doctor, they honestly confess that Scotus is undecided in this matter — although they think the matter

inclines more in their direction. Whether this is true, let the fair-minded judge decide from what has been adduced up to this point.

First objection: Dionysius (*On the Divine Names*, ch. 4), cited by the Doctor (2, d. 43, q. 2, at the beginning): No one acts looking to evil. Aristotle (1 *Ethics*, 1): The good is what all things desire — cited by the Doctor (4, d. 49, q. 9). And (2 *Physics*, 31; and 7 *Metaphysics*, ch. 10): End and good are mutually convertible. Augustine gives support (1–2 *On the Sermon of the Lord on the Mountain*, ch. 34): The will is not except in good things. And Anselm (1 *On Concord*, ch. 21): The will cannot not-will the supreme good. Therefore the objective character of the end is true or apparent goodness. I reply that all those passages are dissolved in two ways. First, they are true as in most cases, not always; for some are so wicked and depraved that, although they know they are acting badly and with evil for an end, they do not for that reason desist from acting badly and perversely, as the Doctor notes (*in the passage just cited*, § *Ex his*, sub *N*). Second, they are verified with respect to natural appetite, not with respect to free appetite — that is, in virtue of the affection for advantage, not of the affection for justice — as Scotus asserts (*in 4 cited*, § *Respondeo*; and § *Ad 1*).

Second objection: as the intellect stands toward true and false with respect to assent or dissent, so the will stands toward good and evil with respect to willing or not-willing. But the intellect cannot assent to the false; therefore neither can the will will the evil. Hence Bruliferus, cited by Gad from Scotus (2, d. 6, q. 2, *N*; and *in the Reportata ibid.*, § *Ad aliud cum dicitur*), says that hatred of God is not possible, because it is evil — unless on the part of his justice, not in itself but in its effect, as punishing the damned, inasmuch as they do not will his vindicating justice. The parallel is to be denied, because the intellect is a natural power while the will is free; and therefore although the will with free appetite and with an elicited act wills the good in most cases, it nevertheless is not necessitated to do so, but freely and absolutely can not-will — not only negatively but also contrarily — as the Doctor writes (*ibid.*, § *Ex his*, sub *N*; and § *Ad 1 argumentum in oppositum*, *M*); although he concedes that Aristotelian assertion (2 *Physics*, T. 89): As the principle is in speculative matters, so the end is in practical matters — with respect to objects, not with respect to the powers. The reason is given by Scotus (1, d. 1, q. 4, § *Ad argumenta*; and *Quodlibet* 16, a. 1, *F* and *G*): necessity exists in the intellect from the evidence of an object necessarily causing that assent in the intellect; but no goodness of an object necessarily causes an assent of the will. For the will freely assents to whatever good object, and thus freely assents to the greater good just as to the lesser. Those of our recent authors cited who do not perceive this attempt to defend the contrary against the Doctor.

Third objection: what is not comprised under the object of some power, toward it the power is not directed — as is evident of sound, which, being outside the object of sight, does not at all pertain to sight, as Scotus infers (*Quodlibet* 16, a. 1, *ante F*). But evil is not comprehended under the object of the will, because evil is

not desirable or volible; only good, because it is suitable, is desirable and volible. Therefore the objective character of the end is goodness. I concede the major and deny the minor. To its proof I say it holds of natural appetite, not of free appetite; and as in most cases, not always — as the Doctor affirms (*in the 4 cited*). To the testimony of Scotus drawn from the Quodlibet I say either that it is to be explained in the way I just said, or that he is speaking dubiously, as his words indicate. Cf. *Hic potest dici*, and there (G) he adds that the will moves and determines itself to an object not necessarily but freely.

One may say: the volible by free appetite and the love of friendship is desirable; but evil as evil is not desirable — not in itself nor for itself — because, as was stated above (*q. 2, art. 3*), evil formally is a privation, which designates nothing positive formally. Moreover, a power has no act or object that is unsuitable to it; but evil is unsuitable, since it harms that in which it is. Therefore in no way can evil as evil be willed by the will. I say this holds for natural inclination and the affection for advantage; not, however, for the free act and the affection for justice. For the damned desire not to exist (*Apocalypse 9*): They shall desire death, and it shall fly from them. Looking to this, Augustine (*1 On the Misery of this World*) says: O Death, how sweet you are to those to whom you were so bitter; they alone desire you who have most vehemently hated you. And the evil angels desired equality with God, which is impossible (*2, d. 6, q. 1*). For from (*2 Magna Moralia, ch. 10*): Men even will things they know to be impossible — such as to rule over all men and to be immortal. Likewise that sin from malice exists — and that thus the first angel and Adam sinned — the Doctor holds with probability (*2, dist. 43, q. 1, sub C*). Or this holds of efficacious will, not of inefficacious and conditional will, as the Doctor asserts there. To the other I say it is true of the power and natural inclination immersed in the depths of evils, as is evident of the obstinate in evil — as Vorrelon notes in the cited passage — but not of free power and elicited act, by which a man can will good or evil, as Augustine delivers from Sacred Scripture in the Enchiridion: God made man so that he could will well or badly.

Article IV: What Is the Causality of the End

The final cause is indeed difficult to know, as I forewarned (*in Physics, in the book on causes*); but its causality is even more difficult; hence on account of its great difficulty — not rightly perceived and scrutinized by the Scholastics — they dispute greatly and contend in establishing and fixing it, as may be seen in our recent Scotists (*Disputation 7 of Physics, q. 8, art. 3*), Fonse (*5 Metaphysics, ch. 2, q. 10, art. 3*), Suarez (*Disputation 23 of the Metaphysics, sect. 4*), and Fuentes (*2 Physics, q. 7, diff. 3, art. 1*). For some, like Hervaeus (*Quodlibet 1, q. 8*) and Pererius (*1, S, ch. 3 of Physics*), hold that the causality of the end consists in the fact that the end provides and communicates goodness and lovability to the means — for the sake of attaining that end — as the end of medicine is health, which provides to the means ordered toward obtaining it their desirability and lovability, even

though it may cause not a little nausea and discomfort to the sick person. From these Aversa (*9, 13 of Physics, sect. 1*) does not seem to be far removed, holding that the causality of the end lies in the ordering of the thing toward its proper end. The common run of Philosophers, however, locates the causality of the end in the motion of the agent to act for the attainment of the end; those who do not cohere among themselves — with some placing it in a real motion preceding the action of the agent, and others in a metaphorical motion concurrent and accompanying the agent's action. The other part thinks it consists in the action of the agent, not distinguishing the causality of the end from the action of the will elicited toward and for the sake of the end. Thus, with Suarez in the cited passage and the Coimbrans (*Disputation 14 of Physics, q. 5, § 2*), hold the joint Scotists cited above and Fuentes (*Book 1, q. 7, diff. 3, art. 2*).

Note first: just as in the efficient cause three things are involved — the principle, the effect, and the action through which the agent acts and the effect is produced (and the action is called the medium between the agent and its effect — as in the production of heat there is the heat producing, the heat produced, and the heating by which the heat is produced by the heat that produces it) — so likewise in the final cause three things are distinguished: the principle of finalizing, the finalization, and the effect produced through that finalization. What the principle of finalizing is and what its effect is are neither obscure nor subjects of any contention among the said authors; but the entire knot of difficulty consists in finalization — what is understood by it and what it is: whether it is an attraction, excitation, and allurement; whether it precedes, accompanies, or follows the action of the agent; whether it is real or intentional; and whether it is indeed the action of the agent itself directed toward the end.

Note second: there are two kinds of motion — one real and another intentional. Real motion is taken here as that which occurs outside the intellectual agent — as a stone is moved by the one projecting it through real motion. Intentional motion is that which exists in the intellectual agent — as a known stone is said to have intentional being in the mind of the one knowing it, insofar as it moves the intellect to the knowledge of itself; similarly sensible and intelligible species have intentional being, and likewise light, as I said (*in Book 4 On the Soul, q. 5, art. 2*). Hence the celebrated adage: the object moves the power to the knowledge of itself. This motion, by which the object moves the power to knowledge of itself, belongs to the efficient cause; for the object or its vicarious substitute is a partial productive cause of the knowledge of that object, according to that of Augustine (*9 Trinity, last ch.*): Knowledge is born from the object and the power — which I proved at length (*in the cited passage, q. 10, art. 1*). Beyond this intentional motion, however, by which the intellect is moved by objects to the knowledge of themselves, there is the motion of the same objects presented by the intellect to the will, by which the will itself is said to be allured, drawn, and moved by the goodness, desirability, and lovability of those objects toward loving, pursuing, and attaining them — choosing and employing the means by which it can

possess and enjoy them. And it is of this motion that we treat in the present passage, which is called by Aristotle (*1 On Generation, ch. 7, T. 55*) and the other Philosophers metaphorical; not because it is not absolutely real but fictitious and imaginary — since the good, whether true or apparent, truly allures and draws the will toward its love and possession — but comparatively, that is, with respect to the motion of the efficient cause, which is said to move physically. This Parisian and Coimbran authors note (*14 Physics, diff., q. 2, T. 5*). And I said elsewhere from Augustine that the efficient cause is called cause by a special propriety (*antonomastice*), and action and effect are attributed to it, as is evident (*1 On Causes, q. 1, art. 1*).

Note third: although by common consent all concede that the final cause precedes the other causes, they disagree, however, about what precedence and priority this is to be taken as. For many, whom our two recent Scotists follow, hold that the end precedes the other causes only in the priority of nobility and perfection; whereas others, to whom the Coimbrans (*2 Physics, ch. 17, q. 20, art. 2*) adhere, hold that it precedes the other causes not only in nobility but also in origin — as is evident from (*3 On the Soul, ch. 3, T. 54; and 1, dist. 2, q. 2, § Ostenso, S*), where Scotus cites Avicenna (*6 Metaphysics, last ch.*) saying that if there were a science of each cause, the one that concerned the final cause would be the noblest. For it precedes the efficient cause in causality, because it moves it to act. And he had already intimated this beforehand (*q. 4 of the Prologue, § Contra istam positionem, ante E; and d. 25, q. un., § Contra conclusionem, B*): The end is the moving principle and moves prior to every other cause. This is not to be understood merely of the priority of perfection, as the Doctor seems to mean (*2, d. 37, q. un., § Ad solutionem istorum, V*), saying: matter does not materialize prior to the efficient cause effecting — for there Scotus is speaking of the simultaneous concurrence of cause 1 and cause 2 in producing a common effect, just as matter, form, and the efficient cause simultaneously cause the composite, which is the common effect of the said causes, and each cause concurs simultaneously in its own genus for the production of the same composite. Nevertheless he does not there deny that cause 1 precedes cause 2 by its preceding grace, according to that of (*Psalm 1*): Lord, you have anticipated him with the blessings of sweetness. (*Apocalypse 20*): I stand at the door and knock. Therefore although the causes act and concur simultaneously with their causalities in producing the common effect, nevertheless the final cause and its causality precede the other causes, because it moves the agent to act. Hence the Doctor there perhaps deliberately makes no mention of the end, but only of matter and the efficient cause — since (*1, d. 2, q. 2, S*) he explicitly and clearly asserts with these words: It — that is, the final cause — as regards causality, precedes the efficient cause. And the reason he gives is that it moves it to act. And (*2, d. 25, q. un., ante C*): The end moves prior to every other cause. The reason is from (*1, d. 1, q. 5, § Ad argumenta*): the causality of the final cause is to move the efficient cause to act. And this is premised (*q. 4 of the Prologue, ante E*):

The end is not a cause except insofar as, loved and desired, it moves the efficient cause to effecting. The same is repeated (*ibid.*, d. 8, q. 5, *ante C*): The end is not a cause except insofar as it moves the efficient cause to giving being — it moves, I say, as loved and desired. The same is found (*1 Reportata*, dist. 1, q. 3, *toward the close*; and 2, dist. 25, § *Ad 1 principale*).

First assertion: the causality of the end does not consist in the communication of the goodness and lovability of the means; nor in the ordering of the thing toward its end. This assertion contains two parts and is grounded in Scotus who is now to be cited. The first part is derived from the Doctor in the cited passage and (2, d. 6, q. 1), where he asserts that the angel desired equality with God, whose attainment is impossible, and there are no means available for its attainment. Again, the will — as stated in the preceding article — can tend toward evil under the character of evil, for the obtaining of which no good means are chosen; and if the end will be bad, its means can participate in no goodness from it. Moreover, means even before the causality of the end are endowed with their own goodness and lovability, because they have their own entity; but every being is good, since being and good are convertible.

Furthermore, sometimes means exist while the end does not; and what does not exist cannot provide any goodness to what does exist. For a thing must exist in order to act and communicate its goodness to another. Moreover, someone can choose means contrary to the end he intends — as one who wills beatitude chooses fornication, which is opposed to beatitude, as the Doctor pursues (4, dist. 49, q. 10, § *Ex his ante N*). Finally, when someone fixes for himself an end having no goodness; and when the end is only apparently good; and when someone intends the end but does not choose the means, but neglects them: therefore the causality of the end can exist without the communication of goodness to the means for obtaining such an end. And accordingly the causality of the end does not consist in such participation of the goodness of the means.

The second part is touched upon and confirmed by the Doctor (1, d. 8, q. 5, § *Contra istam opinionem*), saying from (5 *Metaphysics*, ch. 2): the agent for the sake of the loved end provides being to another by ordering it toward it; therefore the causality of the end is not posited in the ordering of the thing toward the end — since such ordering is had from the agent, whose causality is posterior to the causality of the end, as is evident from the third note. Then the causality of the end is in the intellectual agent proposing such an end to itself, by which it is moved toward its attainment; but the ordering or order of means toward the end is on the part of the thing — for medicines are ordered toward health, good works toward God, powers toward acts, and acts toward objects, and meritorious acts toward eternal happiness. Moreover, such an ordering of the thing toward the end can exist without the causality of the end, as the Apostle shows (1 *Corinthians 13*): All things are yours; but you are Christ's, and Christ is God's. Therefore in such an ordering the causality of the end is not situated.

Second assertion: the causality of the end is not the action of the agent as it comes from the end. This Scotus undoubtedly defends (2, *dist. 25, q. un., § Contra conclusionem, B*), where he explicitly says that the causality of the end is one thing, and the causality of the efficient cause another. But the causality of the efficient cause is the action of the agent; therefore in the school of Scotus the causality of the end is not the action of the agent. The same is gathered from the passages cited above. The fundamental reason is that the causality of the end is to move the agent to act, insofar as the end is loved and desired; whereas the causality of the efficient cause is that by which the agent actually and effectively acts and produces the effect intended by that same agent. Therefore the causality of the end is not the action of the agent. Moreover, the same thing with respect to the same cannot be both the causality of the end and its effect — just as the same thing with respect to the same cannot simultaneously be prior and posterior, provide being to something and receive being from the same thing. But the action of the agent is reckoned among the effects of the final cause, as will be shown below; and the reason is that the end moves and allures the agent to act, as I was explaining above. Then, if the action of the agent is confused with the causality of the end, just as the agent effectively concurs to act, so too the end would effectively act, and thus it would not differ from the efficient cause — which is refuted above — and Scotus excellently refutes (2, *dist. 25, q. un.*): the causality of the end is prior to the causality of the efficient cause, since the end first moves the efficient cause to act before the efficient cause acts; but to move the agent to act is the causality of the end from (1, *dist. 1, q. 1, § Ad argumenta*). Therefore the causality of the end is not the action of the agent — since that follows upon the causality of the end itself. Nor does it help to say that the causality of the end and of the efficient cause are distinguished virtually with the Coimbrans, or with others that they are really identified and formally differ. For since the causality of the end can exist without the causality of the efficient cause, it is plainly inferred that they really differ, according to the laws of real distinction assigned by us elsewhere. Finally, if objective truth can move the intellect to knowledge of itself — as no one denies — there is no reason why objective goodness cannot also excite and move the will to love and affection for it. This the said authors are also compelled to concede in their second reply.

Third assertion: the causality of the end is a metaphorical motion by which the agent is moved to act for the sake of attaining something. So holds Scotus in the passages cited above. It is proved, first, from Aristotle (1 *On Generation, ch. 7, T. 55*), affirming that health — which is the end of a cure — moves the physician metaphorically and figuratively to treat the sick person. For the motion of the end is the motion of one alluring and drawing by the mode of love. And this can be corroborated by that of the Poet: Each is drawn by his own pleasure. And (*James 1*): Each is tempted by his own concupiscence, drawn away and enticed. Second, the causality of a cause is that by which the cause actually causes — as the agent actually acts by its action, which is its causality; but with the said

motion posited, the end actually causes, and with it removed the end does not cause — just as with the action removed, the agent does not act. Therefore the causality of the end is the said causality. Third, the causality of the end is not the lovability of the means, nor their orderability toward the end, nor the action of the agent. Therefore by sufficient enumeration it is concluded that it is the said metaphorical motion.

One may say, with Cajetan (2–2, q. 17, art. 5), Fonse (*ibid.*, sect. 4), and the Coimbrans (2 *Physics*, ch. 7, q. 21, art. 2, aff. 2), that the causality of the end is that for whose sake something is done. On the contrary: that is not the causality of the end but its essence and definition; and it is one thing for the end to be a cause, and another to be its causality — as is established from (2 *Physics*, ch. 3, T. 31; 2 *Metaphysics*, ch. 2, T. 8; and 1 *Ethics*, ch. 7). All the more so because through it what is explained is not the causality of the end, but the final cause itself, which is thus defined: that for whose sake something is done. And this is most evident in the efficient cause — the efficient cause is the principle of acting, but its causality is not what acts but that by which it acts. Otherwise the Philosophers would have had no need to strive greatly in the investigation of the causality of the end, since it would be immediately at hand — namely, the definition of the end itself. Hence Scotus (*in the cited Prologue*, F) adds: The effect has nothing from anything causing it, because it is apt to cause, unless it actually causes. And a little later he concludes: The end does not actually cause as final cause except as, when actually loved and desired, it moves the efficient cause to act.

Therefore, in order for the end actually to cause, it must move the agent to act through actual motion; but this is not had through its definition, because the definition prescribes from actual causality and the actual existence of the thing. Therefore it is concluded that metaphorical motion is the causality of the end.

First objection: if metaphorically moving the agent to act were the causality of the end, then whatever metaphorically moves and allures the agent to act would be the final cause; and conversely, what does not allure the agent to act would not be the final cause. But there is some end that does not allure the agent to act — such as the end preordained by the agent, if it were evil, especially according to us, who from the assertions above have determined that evil under the character of evil can be desired and intended by us; and something can allure without being an end — as God is allured by his own goodness, even though it is not his end, because he is distinguished from it. All the more, as Scotus notes (1, *dist.* 1, q. 5, § *Ad argumenta*; and *dist.* 8, q. 5, § *Contra istam opinionem*): nothing has a final cause except with respect to that which has an efficient cause. But the divine goodness is uncaused and uncausable (*from 1, dist.* 2, q. 2, S). Therefore it cannot be the final cause of God himself. Pressed by this argument, Fonse and the Coimbrans cited above limit and narrow the metaphorical motion of the end to the created agent only, not to the uncreated agent — such as God is. And therefore they conclude that such causality of the end is peculiar to the created agent; and they add that the universal and adequate causality of the end is: that

for whose sake something is done — which in the last assertion we reject. We, however, are not constrained by these straits, nor do we narrow ourselves by these limitations, asserting the said motion to be adequate. Therefore to the argument in form: I concede the major. To the first part of the minor I say that it holds of natural appetite, not of free and elicited appetite — which, as I showed in the preceding article, can have an act not only concerning evil but also concerning the impossible. To the second part I say, according to Scotus (*1, dist. 1, q. 5*), that God is not the final cause with respect to himself, because with respect to him there is no efficient cause — since he is uneffectable and uncausable; and accordingly with respect to him there is no final cause either. But it is commonly said that God acts for the sake of an end — not of himself, but of the effect he produces. Into this those who are unwilling seem to fall, including the Coimbrans (*ibid., q. 22, art. 2, ad 1*).

Second objection: the final cause is the first of all causes — not only in the priority of perfection but also in the priority of time, or at least of nature, as Scotus holds (*ibid., in the Prologue; and dist. 2, q. 2, S*) with Avicenna (*6 Metaphysics, last ch.*). But if metaphorical motion is its causality, it in no way precedes the other causes. For before the end moves the will to act, the object must be known by the intellect, and it must partially concur to the knowledge of itself; and since the will is a blind power and is not directed toward the unknown, the intellect represents to the will the object thus known, so that I noted in the second note. Hence the Doctor adds (*2, dist. 25, q. un., sub B*): In agents acting with purpose, the end does not move unless it is known by the agent acting with purpose, which is the free intellectual agent. Therefore the efficient cause precedes the final cause, if metaphorical motion is its causality — which conflicts with the common philosophical pronouncement adduced in the major and explained in the third note. I reply: the major having been conceded, to the minor — although the known object is required for the will to be directed toward it, the end is nevertheless said to be prior in intention and posterior in execution, with respect to free actions and effects, not with respect to necessary and natural ones, which precede — just as the natural power precedes the free power in being, so too in operating, as the argument proves. Therefore the end is the first cause in orderly and voluntary matters, which proceed from a free and voluntary agent from choice and liberty. Hence Scotus (*1, dist. 41*) adds: One who wills in an orderly way wills the end before the means to the end. And in the entire ordering of things, God — who is the end and principle of all — first willed to confer glory on the predestined before founding the world and bestowing grace on them. It is therefore evident that the end is the first cause in operable, ordered, and rational matters, which must sometimes be precognized and provided for — as things to be done and operated on — so that the one acting may act rightly and operate well.

Third objection: some things tend toward the end without any prior knowledge of the end — as stones seek the center and all heavy things fall downward, and

light things rise. Therefore the said motion is not the causality of the end. The Coimbrans (*ibid.*, *art. 3, ad 4*) meet this by conceding the consequence concerning agents lacking cognition and appetite — holding that such motion, though it be adapted to the created agent, is not adapted to all, namely those devoid of cognition. But if such a created agent acts for the sake of an end — as the Coimbrans maintain — its causality of the end is to be assigned, which through them is not metaphorical motion, nor does it seem to be anything else — since in reality such an agent does not act for the sake of an end, as I have said elsewhere. Therefore I deny that the said agents act for the sake of an end, since they tend toward their proper places by their natural impulse.

Fourth objection: the end allures and draws the agent in the same way as one who exhorts and advises someone to do something — proposing and inviting him to do it — just as a moral cause does; but the motion of one exhorting and advising pertains to the efficient cause (*2 Physics*, 6, 3, T. 29). Therefore the aforesaid motion is not the causality of the end. I reply by denying the parallel of the major. For one who exhorts and advises actively acts, even if morally by persuading, the pursuit or avoidance of the thing to be done; but the end only as desired and loved moves the agent to act, as Scotus writes in the passages cited.

Fifth objection, for the joint Scotists cited: the Doctor (*1, dist. 2, q. 2, S*) says that there is not in actual motion the causality of the final cause unless the agent is moved by desiring and wanting the end; and that the end moves the agent means nothing other than the agent moves the end. Hence those authors conclude that the motion of the end does not precede the causality of the agent. They confirm this from (*2, d. 37, q. un., V*), where it is found that all causes simultaneously cause the effect — and that it is contradictory for an effect to be caused in one genus of cause and not in another, as being material without being an effect. Therefore it is contradictory for the end to finalize prior to the efficient cause's effecting. Therefore according to Scotus the final motion does not precede the action of the agent. I reply that that passage of Scotus rather militates against them than for them; for there the Doctor explicitly says that the causality of the end precedes the causality of the efficient cause, because it moves it to act; but the mover precedes the moved. If therefore according to Scotus the end moves the efficient cause to act, the causality of the former precedes the causality of the latter without question; for precisely because the agent acts, the end moves it to act; therefore the motion of the end, which is its causality, undoubtedly precedes the causality of the efficient cause. Hence he concludes there: Because in God nothing is causable and effectable, consequently with respect to God himself there is neither an end nor its causality; for what is finalizable is effectable; therefore since God, nor anything in God, is effectable, likewise it is not finalizable. To the point then added — that this is not taken effectively, otherwise the end would be the efficient cause, as the Doctor argues (*2, dist. 25, q. un., B*) — but alluringly (*allicitive*) — that is, because it allures and attracts the will to love of itself — as Scotus clearly expounds

(*Tract. On the First Principle*): The final cause is said to be prior, inasmuch as it begins by alluring the will; and by this reasoning it excels the other causes in causing. To the confirmation I answered abundantly in the third note.

Sixth objection: the cause in act has the effect in act (*2 Physics*, 27), since cause and effect are correlatives, which are simultaneous by nature. But before the agent acts, there is no effect caused — since every effect depends on the agent, without whose action nothing can be done. Therefore the causality of the end is not prior to the causality of the efficient cause, since through it something would be caused, and there would be some effect preceding the efficient cause — which is certainly repugnant. Therefore, since nothing can be done before the action of the agent, it is undoubtedly inferred that before the agent the end causes nothing, and the causality of the latter is the same as that of the former.

Confirmation: before the efficiency of the agent, there is only the objective goodness of the end and the end known by the intellect. But the known end causes nothing in the will of the agent except by representing the end to it, and its objective goodness pertains to first act. Therefore the causality of the end is no other than the causality of the efficient cause. Hence the end is called a cause only because the agent acts for its sake. Hence (*3 Metaphysics*, ch. 2, T. 3; and *1 On Generation*, ch. 7), it says that when the action ceases, the end also ceases.

Therefore unless the agent acts, there is no end. If moreover the end were to cause before the agent acts, it would not be true that the end is the cause of the agent's acting — since before the agent acted, something would already be caused by the end; and nothing can be caused without an efficient cause.

Therefore there is no prior causality of the end, but it is altogether the same as the causality of the efficient cause. Fonse replies (*ibid.*, sect. 5, in the solution to the first objection) that the Aristotelian pronouncement adduced for the major indeed holds for the other causes, but not for the final cause. The reason for the disparity he gives is that the final cause alone causes as a desired thing, and thus causes even when not existing; whereas the other causes do not influence the effect unless they actually exist. But the said axiom is not to be excepted for the final cause; since — as Fonse holds (*q. 21*, sect. 1) — it is a true cause, and the same author holds that it causes in virtue of real being; it plainly contradicts for a cause to cause and not exist. For whatever effect comes to be depends on the cause, since the cause is its influencing principle — as is evident from the general definition of cause. Especially because causality and the caused proceed from what exists, and nothing is caused except from what exists; otherwise the effect would depend on nothing, which is impossible. I add that the same author there holds it probable that the final cause causes in virtue of intentional being.

I, however, having conceded that proposition, say to the assumed that before the agent effectively concurs toward the effect, the final cause is actually in intentional being — in respect of which being it causes, as I said in *Physics* — and its effect is actual, which consists in alluring and attracting the will to act and to pursue the intended and proposed end shown by the intellect. Therefore I

concede indeed that every effect depends on the efficient cause effectively, but not alluringly and invitingly — for in this way the effect depends on the end that allures and lovingly draws the will to act. This Scotus not obscurely intimates (2, *dist. 25, q. un., R*) and more openly (*Tract. On the First Principle*): The final cause is said to be prior inasmuch as it begins by alluring the will; and by this reasoning it excels the other causes in causing. Therefore before the act elicited by the will, the end has its causality — which is the allurement and attraction of the will to operate — and what is allured and attracted is its effect. Hence when it is inferred: before the agent there is no effect — I distinguish: there is no effect effectively, I concede; there is no effect alluringly — which is being metaphorically moved — I deny. But the supporters of the opposite opinion confuse the effect proceeding from the cause effectively and alluringly, and therefore do not distinguish the causality of the end from the causality of the efficient cause — which Scotus in the cited passage proves to be distinct (*ante C*). To the confirmation I deny the antecedent. For besides the known end and the objective goodness, there is the metaphorical motion, which precedes the elicited act of the will; hence through the prior motion the agent acts and strives to posit the end in real being and to possess it; once possessed, it enjoys it and ceases to operate concerning it, from (3 *Metaphysics, cited*). It is not surprising, however, if sometimes the will fails to attain it. For either the action is impeded and interrupted, or it does not apply suitable and efficacious means for its attainment; or on account of its freedom it can fail to pursue it — indeed to flee it — even though in most cases, moved and allured by it, it is directed toward obtaining it.

Sixth objection: the same substantial union — as it comes from matter — is the causality of matter, and as it comes from form — it is the causality of form. Therefore similarly the same action — as it comes from the end — is its causality; and as it comes from the efficient cause — it is its causality. First confirmation: the same action is the causality of the first cause and of the second cause. Therefore the same must be asserted in our matter. Second confirmation: through the same act of understanding, the intellect is moved by the thing understood and moves that same thing; similarly the will through the same action is moved by the end and the end moves the will to love of itself. Therefore the same action, as it comes from the end, is its causality, and as it comes from the agent, it is its causality. I reply by denying the antecedent — as I said in *Physics*: just as there are diverse causes, so there are diverse causalities and unions. Through this the answer to the first confirmation is also clear. For the action of the first cause is one, and the action of the second cause is another, even though the effect of each is the same and common. To the second confirmation the parallel is to be denied. For the intellect together with the object necessarily produces understanding; but the will freely elicits its act — so that it can not elicit it and suspend that very act.

Article V. Whether all actions of an agent are effects of the end.

Since some actions of an intellectual agent look toward obtaining the end — an end called "the end in intention," such as desire, intention, and love — while others look toward the means to the end, such as choice, use, deliberation, and the investigation of means; and still others look toward the end once obtained, which is called "the end in execution," such as joy, complacency, and enjoyment — the Scholastics therefore not unreasonably inquire whether the end exercises its causality with respect to all the aforementioned acts, or only with respect to the first, the second, or the third group.

For most of those whom the Scotists cite and follow (*indivis. disp. VII. Phys. quaest. VIII. art. III*) judge that all acts of an agent fall under the causality of the end. Others, however — whom Fuentes adduces and defends (*2. Phys. quaest. VII. dist. IV. art. I. & II.*) — hold that the causality of the end is exercised only with respect to the means, insofar as these are to be ordered toward obtaining the end itself.

Note I (*ex Scot. 4. dist. 49. quaest. 8. § Ad argumenta. T.*): the end is taken in four ways. In one way, as the final cause, which is defined (*2. Phys. 29.*) as that for the sake of which something comes to be — in which sense God is the end of all things, because he has wrought all things for his own sake (*Prov. 16*). In a second way, as the ultimate perfection toward which a thing is ordered, such as beatitude, which consists in the vision and enjoyment of God, who is our end, since he is our ultimate perfection and fulfillment. In a third way, as the highest good to which an agent is united through its operation — as the blessed, through vision and enjoyment, attain God, the beatific object, who is highest and most perfect. In a fourth way, as the ultimate resting point in which the agent finally reposes, remaining in its contemplation and completion as in the perfect possession of the supreme good. These four senses of the end the Doctor (*in Rep. eadem dist. quaest. VII.*) reduces to three, and Vorrlong (*ibid. dist. 50.*) does the same. For the latter two appear to constitute but one sense, since the highest good and the ultimate are simply identical. Hence the Church sings on the sixth Sunday after Pentecost: "O God of virtues, of whom all that is best belongs entirely." Unless perhaps they differ by a distinction of reason, as the Doctor indicates (*1. dist. 1. quaest. 1. § De tertio D.*).

Note II (*ex Scot. 4. quaest. prol. § contra istam positionem. sub E. & Orbel. ibid. 9. 5.*): the end is considered in three ways — as known, as loved, and as possessed. The end as known does not move the agent efficiently to act, although it is necessary that the end be known by the intellectual agent in order that it may act on its behalf; yet the end does not act upon it efficiently, since it is a cause distinct from the efficient cause. Add to this that, as the Doctor argues (*2. dist. 25. quaest. un. B.*), if the end were to move the agent efficiently, then since every efficient mover is an efficient cause, the end would be an efficient cause; and since an efficient cause acts of itself for the sake of an end, the end would move for the sake of an end, which is absurd. The end as loved, or intended, or desired, is

properly called the final cause. For (*ex 1. dist. 3. quaest. 5. § contra istam opinionem*) the end is not a cause except insofar as it moves the agent to give being; and it moves as loved and desired, because the agent acts out of love for it. The same is found (*1. d. 2. q. 2. §*) and in the prologue cited before E. The end as possessed and held is the terminus of the agent, and is called the ultimate in execution; on the side of the agent it is called the formal end, and on the side of the object the objective end; and in the conjunction of both there is the consummate and perfect happiness which is followed by joy and delight, as will be made plain in the next article.

Note III (*ex 1. dist. 1. quaest. 3. § quantum ad 1. A.*): intellect and will agree in certain respects and differ in others as regards their complex acts. They agree in that, just as the intellect has a twofold complex assent with respect to complex truth — one pertaining to principles, another pertaining to conclusions — where the former is assent for its own sake, because we know principles through themselves, that is, simply by having their terms made explicit, while the latter is assent for the sake of something else, since we give assent to a conclusion on account of the premises which are its causes (as I showed at length in *Log. lib. 5. quaest. 1. art. 8.*) — so likewise the will has a twofold act by which it assents to the good: one by which it adheres to a good for its own sake, that is, not referring it further to any other good, as when an ordered will loves God for his own sake and rests in him alone; another by which it loves one good for the sake of another good, as health for the purpose of aiding the sick and serving God better. This agreement or comparison between the intellect and will is drawn from (*6. Eth. 3.*) where the Philosopher says: "What affirmation and negation are in the mind, pursuit and avoidance are in appetite." And he then adds: "Just as in the mind there is a twofold affirmation — one for its own sake, one for the sake of another — so in appetite or will there is a twofold pursuit or adherence, for its own sake and for the sake of another."

They differ, first, because the acts of the intellect are necessary and natural, partially caused by the objects with which they are concerned, from which they are distinguished and specified, and from which they derive their evidence, so that each is evident through the evidence of another. The acts of the will, however, are spontaneous and free, not dependent on the objects willed; and the will refers one thing to another, or not, or on account of another, since it is within its power to will or not to will this or that.

They differ secondly, because the two aforementioned assents of the intellect are adequate and immediate, so that no intermediate act is interposed between them — one that would be neither of principles nor of conclusions, neither evident of itself nor through another. But the assents of the will admit of an intermediate. For an object apprehended in an absolute way can be proposed and shown to the will, and the will itself can will it precisely, neither for its own sake nor for the sake of another good, and without intending to enjoy and

possess it. Indeed, the will can command the intellect to examine what kind of good that is, and how it is to be obtained, and how to adhere to it as it pleases. The fundamental reason for this difference is the natural necessity of the intellect, and the freedom and indifference of the will. Furthermore, Scotus (*ibid.*) and Vorrlong (*dist. 1. diff. 2.*) conclude that three acts of the will are to be enumerated: use, which is an imperfect act of the will tending toward one thing for the sake of another; enjoyment, which is the perfect act of the same faculty directed at something for its own sake; and a neutral act, which is an act of the same power directed at something neither for its own sake nor for the sake of another. Following upon enjoyment come delight, joy, and the like, which are not actions but passions of the will, as will be demonstrated in its proper place. Finally, it is gathered that there is a twofold genus of acts of the will, which the Doctor adduces and sets forth (*quaest. 4. Prol.*): some are proper and are called elicited acts, such as the intention of the end and the pursuit of means; others are commanded acts, so called because they are performed and exercised by the command of the will, by other powers distinct from the will.

Note IV: there are things that are properly made for the sake of an end, such as a house for dwelling and a ship for sailing, and the rest, which a voluntary agent regards as the termini and effects of its operations; but there are other things that are not properly made but rather simply are, and by which the agent produces its effects — as heating is that by which fire heats, and cooling is that by which water cools (as I explained in *Epitome lib. 1. quaest. quarta, artic. 9.*). In this sense, intention, elicitation, and the other actions of the will are said to be effects of the end in an improper sense, insofar as they are the means by which the agent operates. Hence Aristotle (*Met. cap. 2.*) adds that, among the means which serve for the attainment of the end, some are works — namely, actions — while others are instruments by which the craftsman carries out and completes the works he has intended and proposed. Now, as to effects in the proper sense, no one I have seen doubts that they are to be counted among the effects of the final cause. But the whole controversy centers on effects taken in an improper sense; and since, from what has been said, these are of three kinds — some preceding the intention of the end, some preceding the pursuit of means, and others following the attainment of the end — the first and the third are the subject of almost the entire dispute among philosophers. For regarding the second kind, there is scarcely anyone who removes them from the series of effects of the final cause, although Arriaga (*disp. 8. Phys. Sect. 7. num. 76.*) suppresses the names of certain supporters of the contrary position.

First Assertion: simple love of the end, and the other acts that precede the election of means for attaining the end, do not fall under the causality of the end. This is derived from the Doctor (*præcit. § Ad argumenta F.*), where he expressly states that the end does not move the agent to act except as loved and desired. Therefore, love and desire of the end precede its causality and are accordingly not contained within its scope. The same is found (*4. distinctione 49.*

quaestione 8.), where he says that God is the final cause of all things in no other way than because things are loved for his sake. Likewise (*1. distinctione prima, quaestione tertia*), he admits the neutral act and holds there that the highest good can be the beatific object without the character of an end. And (*2. distinctione 41. quaestione un.*) he affirms and proves that there are acts that are indifferent, not only in act but also in habit and in virtue. And I showed above, from the same Doctor, that it is an open question whether the will can tend toward evil under the aspect of evil.

Nor does it help to respond, with our more recent authors (*cit.*), that Scotus is speaking there of a particular, not a universal, causality of the end. For anyone reading those passages will recognize that he is speaking of it taken universally — which he establishes as a metaphorical motion, and no other kind does he ever set forth. And in (*quaest. IV. prol.*) he speaks plainly and universally of the end as known, intended, loved, desired, and so on. Hence the cited authors themselves candidly admit at the very beginning of article VII that they gathered this from (*1. distinctione prima, quaestione tertia*). Nor does it help them any more to add that Scotus speaks of the end as taking the principal role, because the end causes insofar as it attracts and excites the agent to act. For these authors (*artic. III. disp. VII.*) hold that the causality of the end is an action of the agent. Therefore, according to Scotus, such acts preceding the election of means are not comprehended under the causality of the end. This can also be argued from (*2. Phys. T. 29. & 5. Met. cap. 3.*), where the end is defined as that for the sake of which other things exist. Therefore, in the teaching of the Philosopher, what is done for the sake of something is an effect of the end, and conversely, what is not done for the sake of the end is not an effect of the end. But love, intention, and the other preceding acts are not done for the sake of the end, because to be effected for the sake of the end is the same as to be done out of love of the end; consequently, to be done out of love of the end would itself be to be done out of love of the end, which is empty and absurd.

But if you say that "for the sake of the end" coincides with the goodness of the end, which excites the agent to pursue it — I judge this to be false, since the agent is not always moved by the goodness of the end, but acts according to its own will and judgment, especially when the end is evil, which the will wills under the aspect of evil. Moreover, the end causes with respect to intentional being, as was said in the Physics. For this reason it is called prior in intention. Therefore, the intention of the end itself is not captured under its causality; otherwise, since a cause is prior to its effect, there would be something prior to the end itself — namely, that which is the cause of the intention, proposal, and love of the end — and consequently the end would not be the first cause, nor would it be prior in intention. Furthermore, if to act for the sake of the end is to act for the sake of the goodness of the end, then since brute animals are drawn by the goodness of the end, they would be acting for the sake of an end — which was rejected in the cited passage. Again, objective goodness causes not in the

genus of final cause but of efficient cause; for the causality of the end belongs only to the free intellectual agent. Therefore, since the object that for the most part moves the intellectual agent is devoid of mind and will, the effecting of that object ought not to be counted among the effects of the end. Finally, the effect of any cause is the terminus of its causality; but love cannot be the terminus of the end, since the end causes as loved and desired. And the metaphorical motion, which is the causality of the end, is a motion of love and desire; but the causality of any cause is not the effect, but that by which the effect is produced — as I made plain in the last note. Wherefore Suarez (*allegatus*) does not aptly write that love, intention, use, and choice are enclosed within the effects of the final cause, since they are not its termini, nor what is effected, but rather that for which the effect of the end — that is, the end in execution — is brought about.

Second Assertion: use, choice, and the remaining elicited or commanded acts of the will, whether internal or external, are numbered among the effects of the final cause. The assertion is twofold and is derived from the Doctor (*ubi supra*). The first part, concerning use, is plain from (1. *dist. 1. quaest. 3. ante § De 2.*), where Scotus says that use is an imperfect act of willing a good for the sake of another. For that which is done for the sake of an end is contained under its causality, as is plain from the definition of the end; and use is for the sake of the end — for a person acts by seeking suitable and fitting means, commands the external powers, applies his own or others' limbs to the attainment of the end, and orders and disposes them toward its possession. Moreover, use depends essentially on the end; for no one would labor and make use of necessary means unless he intended, pursued, and aimed at the end. Therefore, use is comprehended within the series of effects of the final cause.

The second part is virtually conceded by almost all philosophers and is easy to prove. For the elicited act and the other aforementioned acts are done for the sake of the end and are ordered and referred to it, and means are loved for the sake of the end — as bloodletting and bitter medicine are prescribed for the sake of health. Furthermore, the end moves the agent to elicit the act of willing the end, to employ the necessary means for obtaining and possessing it, and to direct all toward it. And, moreover, choice, command, and the other operations depend essentially on the end by which the agent is excited and moved. Therefore, the aforementioned acts are aptly counted among its effects.

Third Assertion: acts consequent upon the attainment of the end do not fall under its causality. This is drawn from the same Doctor (*ubi supra*), especially from (1. *dist. 1. quaest. tertia*), where he assimilates the acts of the intellect to the acts of the will in that some are for the sake of another, such as use, while others are for their own sake, such as enjoyment, which is had of the end once attained and possessed. Since therefore enjoyment and complacency are not ordered or referred to anything else — unlike those which are included under the causality of the end — it plainly follows that enjoyment and the remaining acts

consequent upon the attainment of the end are not to be counted among the effects of the end. Moreover, when the action of the agent ceases, the causality of the end also ceases (*ex primo de generatione, cap. 7. T. 55.*). When the end has been obtained, the action of the agent ceases: in the crafts, once a house is built, the builder no longer works at its construction, and the physician, once health has been restored to the patient, no longer tends to him; and in natural things, a heavy body, falling downward and arriving at its center, moves no longer but comes to rest (*ut scribit Doct. 4. dist. 49. quaest. 8. § Secundò videndum. sub E. & 1. dist. 1. quaest. 1. § De 4. E.*). With an eye to this, Augustine (*in Psal. 56.*) says: "But when you have arrived at him, you seek no further — he is your end." All the more so in the view of the adversaries, who hold that the causality of the end is the same as the causality of an agent, being the same action viewed merely under a different aspect. Furthermore, if such acts are effects of the end, then the end has not yet been attained, because the causality of the end is directed toward acquiring the end, for the sake of which the agent acts. But it is contradictory for the end to be both attained and not yet attained at the same time — which would be the case if such acts were being done for the sake of the end. For every causality is directed toward producing an effect and acquiring a terminus anew; and a new relation requires a new terminus. Since, therefore, once the end is attained — especially if it is the ultimate end — no further end remains to be acquired, it is rightly inferred that such acts are not to be ascribed among the effects of the end. Likewise, the end is prior in intention and posterior in execution. If therefore the end is obtained, the operations had with respect to the end as possessed are not enclosed under the causality of the end — because the end has already exercised its causality, and otherwise it would not be the last in execution but there would be something else still to be attained, toward which its causality would be ordered. Furthermore, from what was said in the first article of this question, the formal end is one thing — such as enjoyment — and the objective end is another — such as God. But if enjoyment were taken under the causality of the end, it would not itself be an end but would still be directed toward an end, because the end causes for the sake of another. Yet enjoyment, being the ultimate formal end of man, is not referred to anything else but stands with the objective union and conjunction of the end, by reason of which man is perfectly beatified and ultimately reposes, as Augustine signifies (*lib. 2. 99. Evangeliorum quaest. 39. Tomo 4. Suorum operum*): "The great repose is the reward of the labors of the just, which are performed in the service of the Church." Moreover, the said division of the end is received by Suarez (*cit. sect. 2. n. 5. & num. 12.*), who writes that both ends together complete one final cause. If therefore each is a final cause, neither is an effect of it — for the same thing cannot simultaneously be both cause and effect. Finally, enjoyment is the ultimate formal perfection of man, by which he is united to the highest good, or God, his beatific object; it is therefore not ordered to anything else, for otherwise it would not be the ultimate perfection. And thus Suarez and our

more recent authors do not rightly claim that there is one end made up of both, and that one is ordered to the other — a view I also reported above in article II.

You will object first, from (1. *dist. 1. q. 5. § Ad argumenta. Et d. 2. q. 2. § Iuxta tres conclusiones N. Et d. 8. q. 5. § contra istam opinionem.*): what is unendable is uncausable — that is, what has no end has no efficient cause, because every agent acting of itself acts for the sake of an end; and what has an efficient cause also has a final cause. But love, desire, and whatever other acts precede the election of the end have an efficient cause. For apart from God, all things are caused or causable by an efficient cause; these acts, therefore, are to be referred among the effects of the final cause. The confirmation comes from (2. *d. 40. q. un.*), where Scotus says that all human acts have regard to the end. The reason is that the agent acts for the sake of the end, is attracted and moved by the end toward attaining it. Therefore such acts are under the causality of the end.

I respond: Scotus speaks there of those things which are caused as the "what" (*ut quod*), not of those which are caused as the "whereby" (*ut quo*), as I noted above in the last note. And he speaks of those things which do not precede the action and choice of the agent — otherwise the action would be acted upon and the making made, which is not conceded. To the confirmation, I say that the Doctor is to be explained as referring to the second acts — choice, use, and the rest mentioned above — and not to the first acts, which are the subject of the present controversy. Especially because this is not found in Scotus; indeed the opposite is the case, since he establishes that there are indifferent acts that cannot be referred to an end, as Vorrlong (*dist. 1. primi diff. 2.*) also asserts.

You will object second: a man exercising the first act of love operates for the sake of the end, since he is moved by its goodness, for the sake of which he acts; therefore such love is contained among the effects of the end. First confirmation: that act of love proceeds from some cause — for whatever exists, God excepted, comes from another. Yet it seems to proceed from no cause other than the will, which directs all its acts to the end, since it is an agent of deliberate choice. Therefore, the first love is numbered among the effects of the end. Second confirmation: whatever is captured under the object of some power is regarded by it as one of its effects, as is evident of the object of the intellect, which is the true, and of the object of sight, which is color, and so on. Therefore the good, which is the object of the will, moves it to act for the sake of the end; and consequently that love of the end, by which the will is excited by the end to act, falls under its causality. Third confirmation: the act of love toward God is elicited by the will for the sake of the end, as is plain from (*Psal. 118*): "I have inclined my heart to perform your justifications forever, because of the recompense." Therefore every act of love, whether first or later, is counted as an effect of the end.

I deny the antecedent. For since man is a free agent, he can by his own deliberate judgment direct that action to no end at all, since, from what has

been said, there are indifferent and neutral acts — especially because that motion is the causality of the end, which precedes the action of the will; and hence the end is said to move as loved and desired, and that love precedes the efficient activity of the agent. To the first confirmation, I say that the act proceeds from the end, not from the will, which is at that point moved by the love of the end; and the motion of the end is not the motion of the will, since the will is drawn to act by its appetite and desire of the end, for the sake of attaining that same end. To the second confirmation: granted but not conceded is the antecedent; I deny the consequence. For I indicated above that the object of the will is every being, and its scope extends as widely as the object of the intellect. To the third confirmation, I say it holds for efficacious love, which is elicited by the will, but not for love of complacency, which is inefficacious and precedes elicited and efficacious love, as is plain from (1. *dist.* 8. *quaest.* 5. 2. *dist.* 6. *quaest.* 1.).

You will object third: the act consequent upon the attainment of the end is for the sake of the end, since it is a perfect act (*ex 1. d. 1. q. 3.*) by reason of which man is united to his end, and, enjoying, rejoicing, and delighting in it in the most perfect manner, abides with the end itself as now present, which he previously desired and burned with love for — and he can say those words of Canticles 3: "I held him, and I will not let him go." Just as the blessed hold, see, enjoy, and delight in God. Therefore, the said consequent acts are for the sake of the end and are contained within its causality. I deny the antecedent. For since "to be for the sake of the end" means the same as "to be for the sake of love of the end," love directed at the end as acquired and possessed would itself be for the sake of love, which is ridiculous and absurd. For the end has already exercised its causality; once the end is attained, since the causality of the end is the motion by which the agent is moved to attain the end, once it is attained such causality ceases — just as when an efficient cause has produced its effect, its action ceases, and once the terminus is acquired, motion ceases. Otherwise, if the agent were still being moved to act for the sake of the end, it would neither have it nor possess it, which is false given the hypothesis. I add that enjoyment, which is the perfect act, is the ultimate formal end; it is therefore not for the sake of the end, otherwise it would not be the ultimate end, but an end under an end. Nor does it help to say that it is for the sake of the objective end, because the objective end is likewise ultimate; and in its own genus one end is not ordered to another, since the end is divided equally into formal and objective end, as was established in the first article of this question.

If you say that there is a twofold action — one imperfect, tending toward the attainment of the end, and this ceases once the end is attained; another perfect, by which the agent reposes in the end, and this does not cease once the end is possessed — thus Suarez (*disp.* 23. *Met. num.* 16. *Sect. cit.*), Ruuius, and others explain Aristotle from (*Div. Thomas 4. dist.* 48. *quaest.* 2. *artic.* 2.), bringing in as corroboration and illustration the example of the motion of the Heavens, which,

once its end is attained — namely, the imitation of divine goodness — ceases; whereas love does not end with the attainment of the end but becomes more perfect in the union and enjoyment of the end as held and possessed.

On the contrary: this is begging the question, not dissolving the argument. For the very thing at issue and under debate is whether the act by which the agent acts with respect to the end as possessed is caused by the end or not. To this it is answered affirmatively, and when the reason is asked, the reply is forthcoming: because it is an act that endures with the end. But this is precisely what is being sought and investigated — namely, whether the act by which the agent operates with respect to the end as possessed depends on the end. We, however, say that it does not depend on the causality of the end at all, since the causality of the end has its own terminus ad quem and does not extend beyond it; otherwise the end would not be the ultimate end. Nor is the distinction adduced suited to the testimony of the Philosopher, because from (3. *Phys. cap. 2. T. 6.*): "Motion is the act of a being in potency, as in potency" — that is, an imperfect act directed toward acquiring perfection — and when the agent enjoys its ultimate perfection, there is no further motion; and when motion ceases, the action of the agent directed toward acquiring a terminus likewise ceases. Moreover, Aristotle speaks of the motion of generable and corruptible things, not of the circular motion of the Heavens, which is neutral and from without, and not for the imitation of divine goodness, but for the sake of the perpetual generations and corruptions of sublunary things, which have no limit until the day of judgment — at which point the motion of the Heavens ceasing, the generations and corruptions of sublunary things will also cease, as I said in *lib. de Caelo, quaestione secunda, articulo quinto*. Add to this that the agent is moved toward obtaining a thing which it lacks; once it has that thing, it reposes in enjoying it. Hence (*Apoc. 14*): "That they may rest from their labors." And the Church sings, "May they rest in peace," which David had wished (*Psal. 4*): "In peace, in the selfsame, I will sleep and rest."

Article VI. Whether means to the end are formally good.

Most of those whom Suarez follows (*disp. 23. Met. Sect. 6. num. 11.*) deny that means are good of themselves, except by reason of the end to which they are ordered. Others, however — among whom are Faber (*de peccatis disp. 9. quaest. 1. cap. 8.*), Fuentes (2. *Phys. quaest. 7. diff. 4. art. 3.*), and Hurtado (*dist. 13. de anima sect. 4. § 26.*) — hold that means directed to the end participate in a proper goodness and are contained under the object of the will.

Note I: means can be considered in two ways. In one way materially, as they are such entities without any consideration of or reference to the end — and in this sense no one denies that means possess some goodness. In another way formally, insofar as they are directed toward the end, for the sake of which they are taken up and loved by the agent; and it is of means considered in this way

that the whole proposed difficulty concerns, as both Fuentes and Suarez aforementioned note.

Note II, from what was said in the question on the good (*art. 2.*): there is a threefold good — the honorable, the delightful, and the useful. Means, however, are not referred among honorable and delightful goods, since these are desired for their own sake while means are desired for the sake of another. But although useful things are for the sake of others, they are not on that account deprived of their own proper goodness, just as relative things, although they respect another, are not stripped of their own proper entity and goodness. Thus means are said to have goodness — not absolute, but relative. Indeed, even if they were to possess no goodness and perfection at all — as the divine relations still fall within the object of the will, as Scotus teaches (*in Report. 1. dist. 1. quaest. 3.*), saying: "The will can have a predetermined end which has no character of good."

Assertion: means ordered to the end enjoy a proper goodness distinct from the goodness of the end, and they are comprehended under the object of the will. This is derived from the Doctor (*1. dist. 1. quaest. 3. § Quantum ad 1. A. & ibid. quaest. 4. § Ad argumenta.*): "The will assents just as freely to a greater good as to a lesser." (*Quol. 16. q. Dei F. 4 dist. 49. quaest. 10. § Ex his. Et ibid. Reportat. quaest. 9 collat. 17.*): "The will by its freedom and deliberate choice tends both toward means and toward the end." Aristotle gives support (*3. Top. cap. 1.*): "The end is more eligible than the things that are for the end." And shortly after: "What is for its own sake is better, more honorable, and more praiseworthy — friendship than riches." And (*1. Magn. mor. 3.*): "The end is better than the things that are for the end."

Now the assertion is proved by arguments. First: the object of the will extends just as widely as that of the intellect (*ex 2. dist. 6. quaest. 1.*); and the object of the intellect is every being — whether means, end, or anything else. The reason is that everything intelligible is also volible. Therefore, since means are beings, they are certainly goods and are contained under the object of the will. Second: every power and faculty which acts with respect to one object not absolutely but relatively — that is, in relation to another — acts with respect to both; but the will acts with respect to means not precisely, but in relation to the end. Therefore the will regards the means, and consequently means are comprehended under its object. The major is from the Philosopher (*2. de anima, T. 146.*), who affirms that the common sense is distinguished from the other senses precisely because it recognizes the difference among the objects of the various senses; and every power that establishes a difference between various things must necessarily know them. Therefore, since the will chooses the better and more fitting means, it plainly follows that it wills them and that means fall within its object. This argument is drawn from (*Quol. 16. art. 2. sub K.*). Third: as the principle is in speculative matters, so the end is in practical matters (*2. Phys.*); but the intellect attains not only the premises but also the conclusion by a

distinct cognition — the former through the habit of principles, the latter through the habit of science. Likewise therefore the will tends toward the end and toward those things which are ordered to it, of which kind are the means. Fourth: if any reason were to exclude means from the object of the will, it would chiefly be because they are not good, lovable, or desirable, as the proponents of the opposite view contend. But this reason is groundless, because, from what was said above, the will by its own will and deliberate choice can tend toward the good and the evil, the neutral, the referable and the unreferrable, the possible and the impossible, as is established from what has been said. All the more so because means are good by their own proper goodness, without any respect to the end. For the works which one performs toward attaining glory are good, and one of them is better than another; and accordingly God assigns a greater or lesser reward in accordance with the better or less good works performed. Likewise, the virtues of natural or artificial things are good — such as the virtue of wine, of which Timothy made use (at the Apostle's suggestion) to assist his health. Also, natural heat is good not only in itself, since it is a good quality, but also for the nourishment of the animal, which uses it as a means and instrument for sustaining and nourishing itself. Again, since goodness is the fittingness of a thing, and one means is more fitting than another, and one is preferred to another after deliberation, it follows that means are good and are captured under the object of the will. Pertinent here is the statement of Scotus (*1. dist. 41. quaest. un. § Potest aliter dici A.*): "One who wills in an ordered way wills the end before the things that are for the end, of which kind are the means, which are also willed, though the end is willed before the means that look to the attainment of the end itself."

You will object first, from (*2. Phys. c. 3. T. 31. & 6. Met. c. 1. necnon 1. Eth. 1.*) cited by the Doctor (*4. dist. 49. quaest. 4. § Iuxta hoc verf. Aliter dicitur.*): "The end and the good coincide." Therefore, according to Aristotle, means, which are not the end but are for the end, are not good of themselves, but only insofar as they regard the end. Hence the same author adds (*2. Eth. 7.*): "The good of a thing is that for the sake of which it acts." Since therefore the agent acts for the sake of the end and not for the sake of the means, it follows that means are not good except by participation in the goodness of the end, and accordingly are not comprehended under the object of the will. I respond that the assertion of the Stagirite is to be interpreted of the honorable and delightful good, which is desired for its own sake, and not of the useful good, which is desired for the sake of another — of which kind are means which serve for attaining the end. And this is confirmed by the other testimony of the same Philosopher, saying that the good is that for the sake of which the agent acts. For means, although they look to the end for the attainment of which they are taken up by the agent, are not on that account deprived of intrinsic goodness — just as a creature respects God, yet possesses its own proper entity and goodness distinct from that respect. Wherefore the goodness of means is indeed directed to the end, but it is not the

goodness of the end itself, differing from it as a relation from its terminus and an act from the object toward which it tends.

You will object second: means are chosen and taken up by the intellectual agent for the sake of the end. For this reason the agent chooses these rather than those means, and uses these before those, for the sake of attaining the end, by whose goodness it is excited and moved to act; it deliberates about them, investigates them, and selects the more efficacious and fitting ones for its attainment.

Therefore means derive and borrow their goodness from the end. First confirmation: when the end ceases, the means to the end also cease; therefore means participate in no goodness different from the goodness of the end.

Second confirmation: once the end is acquired, its means are of no use at all — for instance, bitter medicine, bloodletting, and the rest prescribed for obtaining health: once health is given up, these are not only useless but even harmful and evil. Therefore if there is any goodness in means, it is derived from the goodness of the end. I concede the antecedent but deny the consequence.

Rather, the opposite of what is proposed is inferred — for means are chosen as more fitting, convenient, and apt precisely because the means themselves enjoy a proper goodness distinct from the goodness of the end; otherwise any means would suffice for attaining the end, and one would not be more apt and expedient than another for it, which contradicts daily experience. Although therefore the goodness that is first and absolute in itself is the goodness of the end, nonetheless there exists a second goodness of means as such, distinct from the goodness of the end — as the Doctor (*Quol. 16. sub F.*) clearly explains, saying: "Just as there is an order in truth between a principle and a conclusion, which has a participated truth from the principle, so there is an order between the end and the being that is for the end in goodness or desirability, because a being ordered to the end has a participated goodness with respect to the end." To the first confirmation: if the end ceases to exist, the order or relation of the means to the end ceases as well; but the intrinsic goodness of the means does not cease — just as if a son dies, his father's paternity with respect to the son perishes, yet the person in whom the paternity inhered does not perish. To the second confirmation: I say that some means participate no intrinsic and formal goodness, but only an extrinsic one derived from the end, and these are good by the goodness of the end alone — such as bloodletting and similar things; while other means, besides their order and relation to the end, enjoy intrinsic and formal goodness, and these are good even with the goodness of the end removed — as sunlight, even if it is not good for one who is dim-sighted or an owl, is in itself good and benefits one who walks and works. Likewise, although the heat of fire is not good for one suffering from a burning fever, it is nonetheless good for the fire itself, since it is the power by which it heats. Thus what does not benefit one person because of an interposed obstacle is of benefit or ornament to another.

You will object third: when one loves a neighbor for the sake of God, there is no goodness in the neighbor to be loved except that which is derived from God, the ultimate end of man. Therefore a means, as a means, whatever it may be, borrows all its goodness from the end. First confirmation: what is a being by participation is also good by participation, and derives its entity and goodness from being and goodness by essence. Since therefore every created being is good by participation, it consequently receives its goodness from God, who is good by essence — the goodness that David prayed for (*Psal. 118*): "Teach me goodness, discipline, and knowledge." Second confirmation, from that adage: "Whatever men do, intention judges them all." If therefore actions are good because the end is good, and conversely actions are evil because the end is evil, it is plainly gathered that means borrow their goodness from the end, of which they are the means. I deny the antecedent, for every created thing is good by its own proper and intrinsic goodness, as is plain from (*Gen. 1*): "God saw all that he had made, and it was very good." And (*Matt. 7*): "A good tree makes good fruits." Even if God is good by a goodness that is independent and ultimate, the creature is nonetheless good by a goodness that is dependent and finite, and ordered to God as the ultimate end of all things. To the first confirmation: I distinguish — what is good by extrinsic goodness, I concede; what is good by its own proper and intrinsic goodness not respecting the end, I deny. Thus, with Scotus, Gadius responds (*Quol. 16. art. 1.*). To the second confirmation: I say this holds for what is ordered to a good end according to the judgment of right reason; otherwise it fails, since it does not follow that: "The end is good, therefore the means are good," because they can be evil — as when one wishes to fornicate for the sake of God, which God's law prohibits; or when someone wishes to counterfeit coin in order to aid the poor, which a statute of the prince forbids.

You will ask first: whether negations and privations are captured under the object of the will? The answer is affirmative. For Scotus (*4. dist. 50. quaest. 2. § Ad 2. quaest. F.*) and Vorrlong (*ibid. art. 3. diff. 1.*) assert that the damned desire non-existence, in accordance with (*Apoc. 9*): "They will desire death, and it will flee from them." But death is the absence of life. Likewise the will can will the impossible (*ex 2. dist. 6. quaest. 1.*), and the impossible is the negation of being. Moreover, certain philosophers blinded themselves so as not to see evils and fall into them, as I showed in the sermon on the man born blind. Again, the wicked love darkness and hate the light, as is clear from those words of Christ the Lord (*Ioan. 3*): "They loved darkness more than light." The reason is ready at hand: the will is free of itself and can tend by its own will toward good or evil; and evil is a privation of good, as was shown above. I add that we do not supremely love negations, as the Doctor argues (*1. Reportat. distinctione tertia*); and negation is known through affirmation (*ex 2. Perih. in fine, & 4. Met. T. 2.*). For the most part, however, a man desires negations and privations not precisely for their own sake, but to avoid greater evils. Hence the Doctor (*4. allegato, § Respondeo*) says:

"When there are two evils, in choosing the lesser evil one flees the greater evil, because there one evil has the character of good with respect to the other, as is plain from (5. *Eth.* 6. *in fine.*)."

To avoid punishment, therefore, the damned desire non-existence. Moreover, someone desires to exist without infirmity and pain so as to enjoy health; and someone desires death in order to obtain eternal life — as the Apostle says (*Philip. 1*): "I desire to be dissolved and to be with Christ." Although by the affection of self-interest and natural inclination he recoils from death: "We do not wish to be unclothed, but further clothed" (2. *Cor.* 5).

You will ask second: whether relations, both real and of reason, can be contained within the object of the will? Some, whom Suarez mentions (*cit. num.* 20.), answer negatively. Others, making a distinction, grant it of transcendental relations but deny it of predicamental ones — to which Suarez (*ubi supra*) subscribes. I, however, adhere to the affirmative position. For all those relations are beings which, just as they fall under the object of the intellect, so likewise fall under the object of the will, since both have an equal scope. The reason is that one can will to be a father or a Pope; but precisely considered, fatherhood, the papacy, and things of that kind are relations. All the more so, since just as relations possess entity, they likewise possess goodness — for every being is good, as is plain from the Metaphysics. Nor does Suarez's distinction between transcendental and predicamental relations avail, since the former, besides being-toward-another, participate in absolute entity; it is not with respect to being that they are relations, but with respect to the order and reference they bear to another. And if transcendental relations are good, predicamental relations are so with even greater reason, since beyond transcendental being they participate in something else, by reason of which they are placed in a genus. The same is also to be affirmed of relations of reason, as the Conimbricenses hold (2. *Phys. cap.* 7. *quaest.* 23. *art.* 2 & *log.* 5. *cap.* 2. *quaest.* 11. *sect.* 4.), which in their own way enjoy being that they receive from the intellect, and by reason of that being can be desired by the will. For just as they are intelligible, so also are they volible — especially since the will has the power to form a being of reason taken broadly, as I said in *Met.* 6. *de ente rationis.* q. 2 *art.* 2. *Assertionem* 2.

ARTICLE VII. Whether there is an ultimate end in a qualified sense.

This question can be understood and examined in two ways. In one way, it concerns the ultimate end in a qualified sense, that is, the ultimate end within some series and genus of things, which is the subject of the present article. In the other way, it concerns the ultimate end absolutely, that is, the ultimate end of all things, which we shall discuss in the following article.

Assertion. There is an ultimate end in a qualified sense. So holds Scotus (4. *dist.* 49, q. 3, before §. *Hic dicitur*; and q. 4, §. *In ista quaest., sub A*; and *ibid. in Rep., quaest.* 3, §. *ratio ad oppositum*; and plainly elsewhere). This is proved, first, from Aristotle, who posits both in the book of the Categories and in (5. *Met., tit.* 14) ten supreme

genera, and in (10. *Met.*, *cap.* 2) adds: "In each genus there is one thing that is the measure and standard of the others." And earlier, (2. *Phys.* 24; and 1. *Pol.* 5; 1. *Eth.* 1): "Man is the end of things." Second, where there is a first efficient cause in some order, there is also a first final cause; for as the Doctor writes (1. *dist.* 1, *quaest.* 4), the efficient cause and the final cause are joined together, so that unless there is an efficient cause, there will be no final cause, and conversely. Hence in the book of Genesis, the individual creations and generations of things are narrated according to their genus and species, especially of man, who was created by God and for the sake of God. Third, things possess not one but many powers; according to the variety and multiplicity of species, there are diverse virtues, potencies, and operations, which tend toward diverse effects and ends. Since these do not occur by chance—as the common run of philosophers together with Aristotle argues against Empedocles, Anaxagoras, and Epicurus—therefore each thing obtains its own particular end, toward whose attainment it is intended and directed by God. Furthermore, artisans according to their diverse arts propose and intend diverse ends for themselves: thus the physician has as the end of his treatment the health to be conferred on the sick person, and once that health is introduced, his treatment ceases. The same is clear regarding instruments, some of which are invented for cutting and others for writing; and concerning natural things, Ecclesiastes says (*cap.* 3): "All things have their season, and all things pass through their appointed times under heaven." To this point belongs what the Philosopher teaches (2. *Met.*, *cap.* 2): in essentially subordinated causes especially, one does not proceed to infinity. Since, therefore, all things are mutually ordered and disposed by God in number, weight, and measure, it follows that each thing obtains its own proper and particular end, toward which it is directed and ordered by the creator of those very things.

You object, first, from (7. *Phys.*, *cap.* 1 and 8 of the same work): the world is eternal; therefore the order and series of things is eternal, and so there is no ultimate end in a qualified sense in any series of things. I reply by granting the antecedent and denying the consequent. For by that argument one only concludes to an infinite number in accidentally ordered things, but this does not remove the ultimate end in a qualified sense, or the particular end of each thing, as Scotus teaches (1. *dist.* 2, *quaest.* 2, §. *Quantum ad 1, before I*).

You object, second: the parts of a line are infinite, on the authority of Aristotle (2. *Met.*, *loc. cit.*); therefore there is no certain and determinate end of each thing. This is confirmed from the same author in the same place, who concedes that matter is infinite. If, then, God, who is infinite, has no end, the same must be asserted of matter, and so not every thing has its own particular end. I reply that Aristotle is speaking not of aliquot parts but of proportional parts, which are said to exist in potency and in being divided, not actually divided and separated from one another—and these present no difficulty in the present context. To the confirmation, I say that matter is called infinite not in entity and perfection, as

God is, but in capacity and receptivity, or indifference, for receiving any form whatsoever; just as the rational soul, although limited in entity, is nevertheless called unlimited and infinite in capacity, because it can see the infinite God and enjoy him perpetually, as will be shown in its proper place.

ARTICLE VIII. Whether there is an ultimate end absolutely.

One can inquire whether there is one or several ultimate ends absolutely, whether there can be several, and whether it can be demonstrated that there is only one ultimate end absolutely.

Note, from the Doctor (*q. 1, Prol., D*): the ultimate end can be considered in two ways. First, precisely as the most perfect final cause in the genus of being, which is the measure and standard of all things by approach to it or withdrawal from it—and of the end so understood we speak in the present context. Second, as the ultimate end attainable by operation, that is, by vision and enjoyment—and concerning the end so understood, theologians disagree. For in this sense, God alone is the ultimate end of human beings and angels. For only these can behold God and enjoy him; the remaining creatures, since they lack mind and will, cannot exercise the aforesaid acts toward God, as Scotus confirms (*1. d. 1, q. 5, in solut. 4, s. dubij*).

First assertion: there is only one ultimate end absolutely. So holds Scotus (*1. dist. 2, quaest. 2, §. Iuxta tres conclusiones, N*). This is proved, first, from Scripture: Proverbs 16, "The Lord has made all things for himself"; and Apocalypse 1, "I am the Alpha and the Omega, the beginning and the end." Augustine subscribes to this (*1. De doctrina Christiana, cap. 23; 19. Civit.*); likewise Aristotle (*12. Met. 10*); Trismegistus (*in Pimander*); Plato (*4. De legibus*); and others widely embracing this truth. Second, an infinite regress is not admitted (*2. Met. 2*); therefore there is one ultimate end of all things. The consequent is supported by Scotus (*1. Rep., d. 2, quaest. 2, §. Ex hoc sequitur*): the first agent acts for an end that is not other than itself, because it is the end; and when an agent acts for an end other than itself, the end is a being nobler than the efficient cause. Third, creatures are so ordered and disposed among themselves that one exists for the sake of another: as (*1. Pol., cap. 5*) all corporeal things are in a certain way ordered to man, and man to God, as the Apostle acknowledges (*1. Cor. 13*). And this is seen in the entire universe of things, in which earth is ordered to water, water to air, air to fire, and so on up to the outermost heaven, where a marvelous connection and ordering of things appears. And just as the first in the catalogue of material things is heaven, so the last is earth; and if an admirable order shines forth in corporeal things, it does so with even greater right in spiritual things, in which there exists greater perfection and dignity. Hence Scotus adds (*in Rep., passage cited*): "The good of the universe consists in a twofold order: in the order of the parts among themselves, and in the order of the parts to some first; if primacy of this kind were removed, the nature of the good in the universe would be destroyed." I add that particular and singular things are reduced to common and universal ones;

and if being is the ultimate in ascending, in descending it is the individual; and in physics the ultimate resolution of things is to prime matter. It stands, therefore, that there is an ultimate end absolutely.

Second assertion: it is demonstrated that there is one ultimate end absolutely. Scotus holds this (*loc. cit.*; and *1. Rep., d. 2, q. 2*). It is also gathered from Scripture: Matthew 6, "No one can serve two masters"; and Isaiah 28, "The bed is too short for one to stretch out on, and the covering too narrow for both." Augustine favors this (*18. Civit. 18*). This is proved, first: it is demonstrated that there is one first efficient cause and one first cause (*8. Phys., cap. 1 and 2; Met., cap. 2; and 12. Met., cap. ult.*)—thus: everything that exists is either producing or produced; for what exists is either from itself or from another. If from itself, then it is unproduced and is the first efficient cause. If from another, then either that other is from yet another, and so on, until one arrives at a first that is unproduced and uncaused. In parallel fashion, then, it is demonstrated that there is one ultimate end absolutely: for either one thing is ordered to another, and again onward to an ultimate that cannot be further ordered or referred to anything else—and the intended conclusion is reached—or one proceeds to infinity, which in essentially subordinated causes is impossible (*2. Met., loc. cit.*). Therefore, one ultimate end absolutely is demonstrated. Second, every agent that acts per se and intellectually acts for an end. It either operates for an end other than itself—and so is imperfect, because it is ordered to something else and perfected by it (for it is ordered to the end so that it may be perfected by that end, its appetite satisfied, and its intention brought to rest; but this cannot be applied to God, who is far removed from all imperfection and perfectibility, especially since God does not act for an end in which he is beatified, but so that the creature may attain its end)—or it operates for an end that is identified with itself, and one has the ultimate end absolutely, which is God, as the Scriptures cited in the preceding assertion attest. Third, the end exists for the sake of no other and is said to have the character of what is best; it is the first and noblest of all causes, from what was said above. But God is the most perfect and most eminent, existing not for the sake of another but for his own sake, since outside of God there is nothing more perfect and more eminent, and he contains every good and perfection. Therefore it is demonstrated that there is an ultimate end absolutely. Moreover, every perfection is to be attributed to God; but being the first efficient cause denotes the greatest perfection; therefore so does being the ultimate end absolutely, which is God himself.

You object, first, against the first assertion: there are particular ends in the individual orders of things; therefore a common end of all things is not necessary. The antecedent is obvious, since each thing has its own end distinct from that of any other thing. For according to the distinction of things, there are distinct ends, as is clear of heavy things, which tend downward, of light things, which are carried upward; herbs sprout, plants flower, trees bear fruit, and so on, as discussed in the preceding article. I grant the antecedent and deny the

consequent. For even though in the categories there are individuals and their individual differences, this does not thereby remove the common and universal things and their generic and specific differences. Similarly, once the particular ends of any things whatsoever are admitted, so far from removing a common and universal ultimate end, it must rather necessarily be conceded. The reason can be given that things are so connected and ordered among themselves that one is referred to another, and all are finally recalled to one ultimate end absolutely, as Scotus plainly shows (*4. d. 49, q. 3, arguing ad oppositum*).

You will say: from these considerations it is inferred that there is one end of created things, which is the good of the universe, its composition, order, and conservation; but this reasoning carries no weight. For if God were to create other worlds, one of them would not be ordered to another, and so there would not be one universal and common end of them. I say indeed that the union and order of things belonging to one world is not the ultimate end; for just as the first cause does not enter into the totality of created things, so likewise the ultimate end is not something created, but is the uncreated and unproduced God, who is from himself and through himself, as Scotus notes (*1. d. 2, q. 2, sub 1, K*).

You object, second, against the second assertion: a demonstration consists of necessary premises (*1. Post., cap. 1, tit. 8*); but the argument adduced in the first assertion proceeds from contingent premises. For a caused middle term is assumed, which is contingent, since every caused thing is contingent, inasmuch as it is freely caused by God, according to the Psalm (*134*): "Whatever the Lord willed, he did in heaven and on earth." Therefore it is not shown that there is one ultimate end absolutely. I grant the major; to the minor I say that it is a demonstration a posteriori. For this inference is valid: there is an effect, therefore there is a cause, because relatives are simultaneous by nature and are said to be convertible. Or say that it is a demonstration a priori, thus: everything that can be effected is from an effective agent, and since one does not go to infinity, one must arrive at a first efficient cause and first of all causes in ascending, and in descending at the ultimate end, as the Doctor indicates (*1. Rep., d. 2, q. 2, §. Ad 2. rationem*).

You object, third: in accidentally ordered causes, an infinite regress is admitted by Scotus (*loc. cit.*); therefore it must be granted in essentially ordered causes as well, since the reason is the same in both. I grant the antecedent and deny the consequent. The reason for the disparity is given by the Doctor (*ibid.*): essentially ordered causes are actually causing, and one in causing depends on another; this is not so in accidentally ordered causes—Paul would generate Francis even if Peter did not exist, and so on for the rest, about which Scotus speaks well and acutely (*loc. cit.*), whom Fonseca follows (*2. Met., cap. 2, quaest. 7, sect. 5, ad 1*).

You object, fourth, from (*8. Met., cap., tit. 10*): things are related as numbers are; but there is no ultimate number, therefore neither is there an ultimate end. This

is confirmed: in mathematics one proceeds to infinity toward further and further conclusions; therefore in ends too one goes to infinity. I reply that in one respect there is parity and in another disparity. The parity is this: just as one thing depends on another, and a secondary cause on the first, so one number depends on another—as twelve on six, and eight on four. The disparity is that in numbers there is no stopping point, but in things there is, as is clear from what has been said, and as the Doctor explains (*in Rep. cit.*, §. *Ad argum. principale*). To the confirmation, this holds for accidentally ordered things, but not for essentially subordinated ones. Hence there is that saying of Solon, cited by Aristotle (*1. Pol., cap. 5*): "No end of the best has been set for mortals." And Ecclesiastes 1: "The eye is not satisfied with seeing, nor the ear filled with hearing."

ARTICLE IX. Whether the ultimate end concurs with particular ends in causing finally.

The status of this difficulty is to be understood in the following sense: namely, whether just as the first cause concurs efficiently in the production of all effects of any secondary cause, so too the ultimate end influences finally and concurs in bringing forth the effects of all particular ends. On this matter there appear to be two opinions among the Scholastics. One belongs to those who assert that the ultimate end concurs with particular ends in causing finally only remotely and mediately, among whom may be counted Durandus and others who, in the genus of efficient causality, hold that God gave creatures the power of acting and does nothing further concerning them, not concurring in their effects except through the power and potency of operating bestowed on them, as I reported (*lib. de causis, quaest. 3, art. 1*). The other belongs to those who hold that God cooperates immediately and proximally in all effects of secondary causes, and who likewise think that the ultimate end influences proximally and immediately together with the other particular ends.

Assertion: the ultimate end concurs with all particular ends proximally in causing finally. This is deduced from the Doctor (*1. dist. 1, quaest. 4; and d. 2, quaest. 2, §. Iuxta tres, N; and 4. dist. 49, quaest. 8, §. Ad argumenta, E*). This is proved, first: the same reasoning applies to the first efficient cause and the ultimate end. For the first cause and the ultimate end coincide, as was shown above; but the first cause concurs immediately and proximally in all effects of secondary causes; therefore the ultimate end likewise concurs proximally with particular ends in causing finally. Second, every possible perfection is to be attributed to God, since God is that than which nothing greater and more perfect can be conceived; but to act proximally and immediately with secondary causes is a perfection, and it is attributed to God by nearly all Scholastics; therefore to finalize proximally together with their particular ends belongs to the ultimate end. For the final cause is not like the material and formal causes, whose causalities are far from God, since they are imperfect, as

the Doctor observes (*in 1. dist. 2, quaest. 2, §. Quantum ad 1, before M*).

Furthermore, secondary causes are subordinated to the first cause; but in essentially subordinated causes, the inferior ones do not cause without the superior ones, because they depend essentially on them in causing. Therefore the ultimate end concurs proximately with particular ends in causing finally.

You will say, with Suárez (*disp. 24, Met., sect. 2*): this is true of the actions of a creature insofar as they are from God himself, but not of actions insofar as they are from the creature. For in this latter way, the first cause concurs only virtually, implicitly, and mediately—not always immediately with an immediacy of suppositum. So Suárez thinks he can reconcile the two opinions presented at the beginning of this article. But his distinction is empty and his reconciliation null; for by the admission and teaching of Suárez himself, the action of God and of the creature is the same. Therefore God always relates to it in the same way, especially since, insofar as the action is from the creature, it is always dependent and essentially subordinated; therefore it always needs the same immediate concurrence and assistance of God. And since the suppositum and power of God are not separated from him, if he acts immediately with an immediacy of power, he certainly operates immediately with an immediacy of suppositum, since God is everywhere in his suppositum and power, as I showed (*loc. cit.*). I add that the reasoning is the same for the efficient cause and the final cause, since the same God is the efficient cause and the end of all things. For God does not act for his own end—otherwise he would be imperfect—but for the creature's end, since he orders the creature to its end, as the Doctor observes (*p. d. 1, q. 5, §. Ad argumenta*).

You object, first: the causality of the end is a metaphorical motion, by reason of which the agent is moved to act on account of the goodness of the end proposed to it; but inanimate and irrational things cannot be aroused to act by such motion, since they lack intellect and will. Therefore God does not concur immediately with all particular ends in causing finally. I grant the major; to the minor I say that such things do not properly act for an end, for the reason given, but rather are acted upon and led toward the end, or toward what is advantageous for them. Therefore they are not moved metaphorically by the end in the way that intellectual agents are.

You object, second: in order for an agent to operate for an end, it must foreknow the end, since the will does not tend toward the unknown, as from the Doctor (*1. dist. 1, quaest. 4, before §. Ista quaest. and §. contra*). But often an intellectual agent neither knows the end nor intends it; indeed, it chooses and performs the contrary. I reply that it suffices if one knows the end confusedly and in general, and even habitually, though not actually, as the Doctor teaches (*1. distinct. 1, quaest. 4, §. posset; and in Rep. ibid., §. Ad 1. principale*).

You object, third: God concurs neither efficiently nor finally in the perpetration of vices and sins; but many intend and tend toward evils, according to Proverbs

1, "Their feet run to evil." Therefore, and so on. One must respond from what was said (*in Phys., loc. cit.*): sins are not formally effects but defects and withdrawals from God; consequently, God in no way—that is, neither efficiently nor finally—concurs in them. Especially because God has made all things for his own sake, but not from the intention of the sinner, who establishes for himself another ultimate end of his action, or a predetermined end, as Fonseca observes (5. *Met., cap. 2, quaest. 12, sect. 6, in the solution of the arguments*). Hence it is that some place their happiness in goods of the soul, some in goods of the body, and others in other created things—all of which must be brought forward and weighed in the next question.

QUESTION IV. On Beatitude.

ARTICLE I. What beatitude is and how many kinds there are.

That beatitude exists—which is also called the supreme good and happiness—no one doubts. For this is clear from the natural appetite that all have for acquiring happiness. For all, says Augustine (13. *Trin., cap. 5; in Ps. 32, conc. 2; and Ps. 118, conc. 1*), want to be happy and do not want to be wretched. And in the first place cited, he adds that a certain mime said in the theater that he knew what everyone wanted—namely, beatitude—as the Doctor cites (1. *dist. 1, quaest. 4, §. Quantum ad istos*). Aristotle agrees (7. *Polit. 13*): "All desire to live well and to be happy." Furthermore, the good is what all things desire; and beatitude is not only good, but is the accumulation of all goods, as Cicero writes (3. *Tusc. qq.*): "With all evils removed, it is the complete assemblage of goods." Again, each person desires his own perfection. For there is a common inclination toward the good and a flight from evil; and beatitude is the ultimate perfection of the rational creature, as the Doctor attests (4. *dist. 49, q. 2*).

But what beatitude is does not appear so clear, nor can it be clearly and evidently established unless we set forth and explain the meanings and divisions of beatitude. For the term "beatitude" is equivocal, as Scotus notes (4. *cit., quaest. 2, §. Ad quaest., CC*) and Alphonsus (3. *adversus haereses, haer. 4*). Therefore its principal meanings must be adduced, along with Vorillong (2. *d. 4, term. 1, art. 4*). In one way, beatitude is taken for the way and disposition toward true happiness, and this disposition can be twofold: remote, about which the Philosopher says (1. *Eth.*): "Children of good character are called happy insofar as they are remotely disposed toward beatitude"; and proximate, which David mentions (*Ps. 1*): "Blessed is the man who has not walked in the counsel of the ungodly, nor stood in the way of sinners"; and the Savior (*Matt. 5*), assigning eight beatitudes; and John 7: "This is eternal life, that they may know thee, the true God." In another way, beatitude is taken for liberation and rescue from present or threatening evils. Hence Virgil sings (1. *Aeneid*): "O thrice and four times blessed!" Third, for a certain participation in the supreme beatitude through knowledge and love, which is either active, about which (1. *Eth. 5*), or contemplative, about

which (*10. Eth. 3*). And in this sense, the author of *De fide ad Petrum* says that the angels were created good and blessed. Fourth, for the supreme state in which God is clearly seen and possessed by the blessed. Looking to this, David says (*Ps. 83*): "Blessed are those who dwell in your house, O Lord; they will praise you forever and ever." Beatitude is defined by Boethius (*2. De consol., Prosa 2*) as "the state made perfect by the aggregation of all goods." By Augustine (*13. Trin.*) and Isidore: "He is blessed who has whatever he wills and wills nothing evil"—that is, he is blessed who has every good that he can rightly will. Therefore he is blessed who perfectly possesses God. Vorillong notes three things in the above-quoted definition of Boethius. First, the state—since beatitude is invariable and immutable; hence the same Boethius says elsewhere: "Why did you so often call me happy, O friends? He who has fallen was not standing on a firm step." Second, the aggregation of all goods—for he who has God possesses every good, according to Exodus 33: "I will show you all good." Third, the perfection and completeness of the state—for the blessed lack nothing, because they have whatever they desire. Akin to this is the definition of beatitude given by Aristotle (*1. Eth. 7*): "Happiness is an activity of the soul in accordance with reason, or not without reason, according to virtue, in a perfect life." By "activity of the soul according to reason" is understood the operation of the intellect and the will, which are the powers of a rational and intellectual creature. "Not without reason" is added—meaning "according to virtue," namely, an action consonant with reason, which is made savory through wisdom and vision, and inflamed through the ardor of love and charity, which is had through the enjoyment of God. "In a perfect life" is added—that is, in a perennial and eternal life. For as (*1. Eth., loc. cit.*): "One swallow does not make a spring," so one day and an interrupted operation does not make a person happy and blessed.

The first division of beatitude, which Augustine touches upon (*lib. De catechizandis rudib., cap. 22*), is into natural and supernatural. Natural beatitude is a state free from all evil of punishment and guilt. In this sense, Augustine (*4. De Gen. ad lit., cap. 3*) says that the angels at the beginning of their creation were blessed with natural beatitude, because they possessed complete natural endowments and were in grace, as I showed at length (*Tract. de Angelis, disp. 2, quaest. 3*). Supernatural beatitude is the clear vision of God and its perfect enjoyment.

The second division is into contemplative and active, which Aristotle treats (*1. Eth. 5; and 10. Eth. 8*). Contemplative beatitude consists in the knowledge of God, and active beatitude in the love of the same God.

The third, from Augustine (*Tract. 6 in Joan.; and in Ps. 118, conc. 1*), is into beatitude in hope—which coincides with beatitude taken as a disposition, of which I made mention above, about which Ecclesiasticus 31 says: "Blessed is the man who is found without blemish, and who has not gone after gold"—and beatitude in reality, which is true happiness, which the saints enjoy in heaven.

The fourth is into objective and formal beatitude. Objective beatitude is God, whom the blessed clearly see and perfectly enjoy, as is clear from (*Ps. 3*): "But you, O Lord, are my protector, my glory." Formal beatitude is the clear vision and perfect enjoyment of the same God, by which the blessed are united and joined to the beatific object, which is their best and supreme good.

You object, first: Job 14, "Man born of woman, living a short time, is filled with many miseries"—which Heraclitus, beholding, always wept. Hence Saint Paul (*Rom. 7*): "Unhappy man that I am, who will deliver me from this body of death?" Therefore no natural beatitude exists. I reply that not all enjoy natural beatitude, but only those who devote themselves to the contemplation and love of God, and who possess intact natural endowments are called happy—not with happiness absolutely, but in a qualified sense, that is, with that happiness and beatitude that can be had in the present life, even though it is for the most part joined and intertwined with labors and sorrows, which the authors cited and others, reflecting on this, rightly regarded as unhappiness and misery. Hence Ecclesiastes 1: "I have seen all things that are done under the sun, and behold, all is vanity and vexation of spirit."

You object, second: Wisdom 9, "The body that is corrupted weighs down the soul"; and 2 Kings 14, "We all die, and like water, we flow away." But since beatitude is a perfect life, and in the present life there is continual and perpetual dying—as the poet sings (*Aen. 2*): "Everywhere grief, everywhere wailing, and many an image of death"—there appears no shadow of beatitude, whether absolutely or in a qualified sense. I reply that although for the most part, with respect to the body, human beings undergo nearly innumerable labors and afflictions, nevertheless with respect to the soul—to which beatitude properly, essentially, and principally belongs—if a person has been devoted to the knowledge and love of God, he is called blessed with natural beatitude, about which we are presently speaking.

ARTICLE II. On objective beatitude.

Since the more celebrated and copious division of beatitude is into objective and formal, it must be examined broadly and precisely by us in this and the next article. So many were the opinions of the philosophers about objective beatitude that concerning this topic, more truly than concerning any other matter, amid the various controversies and diverse human opinions advanced and debated, one could apply the common saying: "So many heads, so many opinions." See Aristotle (*1. and 7. Eth.*); Ambrose (*2. De officiis*); and especially Augustine (*19. Civit., cap. 1*), who reports that Marcus Varro counted 288 opposed opinions about objective happiness and beatitude, which can be reduced to three headings: namely, goods of fortune, goods of the body, and goods of the soul—of which Aristotle makes mention (*7. Polit. 1*). For all acknowledge that beatitude consists in some good; they dispute, however, whether it consists in

goods of fortune, or of the body, or of the soul—about each of which we must treat briefly in the subsequent discussions.

DOUBT I. Whether beatitude consists in goods of fortune.

Goods of fortune, which are also called external goods, are principally four: riches, power, honor, and glory. Two kinds of riches are distinguished by Aristotle (*1. Pol. 6*): one is called riches of natural things, which are granted to us by nature for our use and advantage, such as fields, estates, and livestock. The other is riches of artificial things, which human industry has invented for the exchange of goods, such as gold, silver, and things of this sort, which Aristotle mentions (*1. Rhet. 5*). Power, or sovereignty and dominion, is that by which some command, govern, and rule over others. Honor is the reverence shown to someone in testimony of his virtue or excellence. Glory is a clear reputation with praise, or a widespread fame about someone accompanied by praise, according to Augustine (*tract. 105 in Joan.*).

First assertion: happiness does not consist in wealth and riches. This is deduced from Scotus (*4. dist. 49, quaest. 1, §. Ad 1. quaest.*) and is defended by Bassolis (*ibid., art. 2*), following Aristotle (*1. Eth., cap. 5*). This is proved, first, from Scripture: Psalm 62, "If riches abound, set not your heart upon them"; Matthew 6, "Do not store up treasures for yourselves on earth"; and Luke 12, "Make for yourselves purses that do not grow old, an unfailing treasure in heaven, where no thief approaches, nor moth corrupts." Second, from the Fathers: Augustine (*1–2. De serm. Domini in monte, cap. 21–22; and lib. De disciplina Christiana, cap. 1*): "Money does not make you happy"; and (*in 2. enarr. Ps. 29*): "The more they have, the more they lack; they are ravaged by desires, dissipated by cravings, tortured by fears, and wasted by sadness." Chrysologus in a certain sermon: "The guardian of gold and keeper of silver has no security and knows no rest." And Gregory on the Gospel: "Those alone are true riches that make us rich in virtues. If, therefore, brothers, you desire to be rich, love true riches; if you seek the summit of true honor, strive toward the heavenly kingdom; if you love the glory of high positions, hasten to be enrolled in that celestial court of angels." Third, from the philosophers—notably Crates: "Begone, you most wretched riches! I will drown you before you drown me." Bias: "I carry all my possessions with me." Seneca (*epist. 111*): "It is base to place the happy life in gold and silver." And Aristotle (*2. Rhet. 16*): "Riches are scarcely anything other than fortunate madness." Fourth, beatitude is the end of man, for in it man finds rest—thus David desired (*Ps. 4*): "In peace, in the selfsame, I will sleep and rest." Hence the Church sings of the blessed: "He fell asleep in the Lord." But in riches man does not find rest: Ecclesiastes 5, "The miser will not be satisfied with money, and he who loves riches will reap no fruit from them." And there is the well-known verse: "The love of money grows as much as money itself grows." And another (*Aen. 3*): "To what do you not drive mortal hearts, accursed hunger for gold?" Fifth, happiness does not exist for the sake of another, since it is the ultimate end; but money

serves man for use and assistance. Hence Xenophon (*De inst. Cyri*, 8) says: "I do not consider those happy who possess and guard the most money, for in that case, those who guard the walls would be the most fortunate, since they guard everything that is in the cities." And Boethius (3. *De consol.*, *prosa* 3): "Always be rich, at least in precaution, lest riches be seized." Furthermore, riches are corruptible and capable of being lost, and the wealthy are often reduced to great poverty. Moreover, riches are less noble than man, since they are inanimate earthly mixtures, over which any living and animated thing excels in nobility. Therefore happiness is not to be sought in riches and money. Nor should we pass over what Jerome adds (*in Ps.* 83): "Every rich man is either unjust or the heir of the unjust."

Second assertion: beatitude does not consist in power, sovereignty, and dominion. This is gathered from the Doctor (*loc. cit.*). It is proved, first, from the sacred page: Wisdom 6, "The powerful will suffer powerful torments"; and Psalm 75, "He has broken the powers of bows, the shield, the sword, and war." Second, from Curtius (*lib.* 4): "An excessively heavy sovereignty is dangerous, and it is difficult to maintain what you cannot hold." Agrippa adds, speaking to Augustus in Dio (*lib.* 53): "It is necessary that whoever holds great power be consumed by many cares and agitations, perceive the least pleasures, and constantly see, hear, and feel the most troublesome things." Lembus subscribes, in a funeral oration for Guidobaldo, Duke of Urbino: "Over empires and riches, fortune and often chance hold dominion; sometimes by a small offense, as by a hailstorm, all the fruits of an entire year—and indeed, all the advantages of an entire life—are taken away." Third, what is subject to continual struggle, perpetual fear, unceasing anxiety, and hatred is not happiness, which is free from all afflictions and evils, as is clear from its definition; but power, sovereignty, and dominion succumb to these and to nearly innumerable calamities, sorrows, and labors. Hence so many sentries are posted, so many guards and fortifications are employed, and trust is given neither to parents nor to relatives. For the prince fears all and guards himself from all who seek his life. Hence, as Brusio reports (*lib.* 3, *cap.* 13), Saturninus, when urged by his soldiers to assume imperial power, said: "You do not know, soldiers, how great an evil it is to rule: swords hang over your necks by force, spears surround you on all sides; even the guards are feared, even the companions are dreaded; meals are not taken according to one's pleasure, nor journeys according to one's authority, nor wars according to one's judgment, nor arms according to one's inclination." And a certain prince, indicating to a flatterer the unhappiness and imminent danger of a king, suspended a sword by a single thread, with its point directly above the head of the man praising the king—by which he signified that the king's very life depended on the single thread holding the sword. And experience teaches us that those who rule over others fall into many dangers: Philip of Macedon, presiding over a war, lost an eye and afterward his life; his son Alexander perished by poison; Caesar was pierced by daggers; and the same is clear from

the histories of others who, while ruling in the world, exchanged life for death by an ill-fated end. Hence Seneca aptly adds: "The creator of the world, God, has placed these things together: hatred and sovereignty." And Chrysostom concurs (*in Matt.*): "For great power is always subject to greater fear, just as the branches of tall trees, even if a light breeze has blown, are shaken; so also those standing on the summit of high positions are disturbed even by the rumor of a slight message; but the humble, as if in a valley, are for the most part in tranquility."

Third assertion: neither is the highest happiness placed in honor. So Aristotle (*1. Eth. 5*), and the Doctor does not contradict (*passage cited*). This is proved, first, from Psalm 48: "Man, when he was in honor, did not understand; he has been compared to senseless beasts and has become like them." Second, from Chrysostom (*in Matt.*): "The greatness of honor begins to be a goad of punishments for those who do not live worthily of the honor." Anselm (*in Simil., cap. 71*): "Those who seek the honors of this world act like children who chase butterflies." And Seneca (*to Lucilius, epist. 82*): "Riches, honors, power, and the rest—things that are dear in our estimation—draw us away from what is right." Second, formal beatitude is in the blessed person, and objective beatitude is conjoined with the formal, so that the blessed person is united and joined by vision and enjoyment to the beatific object, as Scotus says (*4. d. 49, q. 2*). But honor is not in the one honored, but in the one honoring, as Aristotle attests (*1. Eth. 5*). Third, beatitude does not exist for the sake of another, since it is the ultimate end, as Augustine asserts (*lib. 2, De serm. Domini in monte*); but honor exists for the sake of another, that is, as a testimony to virtue, excellence, and dignity. Third, honor depends on the judgment and will of human beings, which is weak and inconstant, as is clear from Christ the Lord, who before he suffered, entering Jerusalem, was honored and acclaimed by the people, and shortly afterward was demanded by the same crowd to be crucified. Hence Chrysostom well says in a certain sermon: "Honors are inseparably accompanied by anxiety; the pomp and favor of the world is smoke and a breeze that suddenly vanishes." Nor should that often-quoted saying be omitted: "Honors change character."

Fourth assertion: neither can beatitude consist in worldly fame and glory. This is drawn from Scotus (*loc. cit.*). The first part, concerning fame, is proved from Seneca (*in Tragoedia, lib. 4*): "Despise fame; fame scarcely favors truth." Someone else adds: "The fame we pursue is wind, smoke, shadow, nothing." And Virgil (*4. Aen.*): "Rumor, than which no other evil is swifter; it thrives by its mobility and acquires strength as it goes." Tertullian writes the same (*Apol. 7*). Since, therefore, fame is inconstant and changeable, while beatitude is perpetual and unshaken, it is rightly concluded that happiness is not to be placed in fame. The second part, concerning glory, is supported from 2 Corinthians 10: "Let him who glories, glory in the Lord." Our glory, therefore, is nothing unless it is referred to God, as Augustine teaches (*lib. 1, De serm. Domini in monte, cap. 13; and lib. 1, cap. 1*). And the same Paul urges this (*loc. cit.*): "Whether you eat or drink, or whatever you

do, do all things for the glory of God." Bernard agrees (*in a sermon*): "It is certainly not the mark of an upright mind, but of a perverse one, to seek glory without exercising virtue, and to wish to be crowned without having competed lawfully." Nor should Ovid be despised (*4. Trist. 3*): "Glory travels a difficult road through steep places." I add that very often glory is counterfeit and vain, renders people proud and insolent, and depends for the most part on the judgment and whim of others. Therefore the highest happiness is not to be established in worldly glory. Boethius agrees (*3. Consol., prosa 6*): "How often deceitful, how often base is glory!"

You object, first, from (*5. Eth. 5*): "All things are obtained with money"; and Ecclesiastes 10: "All things obey money." Therefore happiness consists in wealth and resources. I reply that those quoted testimonies are to be understood of things that are marketable and that human beings esteem highly—not of virtue and wisdom and true good, which cannot be possessed by riches and money. For "all gold in comparison with it is a small grain of sand." Add that by the said passages it is indicated that money is merely a means for acquiring happiness, if one makes good use of it, as Abraham and other wealthy persons did, who were crowned with glory and honor. Hence Chrysologus adds (*serm. 121*): "Abraham was rich not for himself but for the poor, and he desired not to possess wealth but to distribute it." And the same is indicated (*4. Eth. 1*).

You object, second: through power and sovereignty, man approaches God more closely than through the rest of the things he can possess. Hence the powerful, kings, and rulers are called gods, as is read (*Exod. 13*): "You shall not speak against the gods." Indeed, dominion seems to have been commanded by God (*Gen. 1*): "Have dominion over the birds of the sky, the fish of the sea, and the beasts of the earth." Therefore beatitude lies in dominion and sovereignty. I reply that although by dominion man is made like God, nonetheless beatitude is not found in it; just as man is said to be made in the image and likeness of God through the rational soul, even though beatitude does not consist in the soul. The same is asserted of sovereignty, by reason of which man draws close to God; nevertheless, happiness is not found in it, as the second assertion shows.

You object, third: human beings especially desire honor and glory, as Cicero says (*pro Arch.*): "All are drawn by the desire for praise, and all the best are especially led by glory, and nothing among human beings is esteemed more than honor and glory." Hence Proverbs 15: "Good fame fattens the bones." And Augustine (*lib. De doctrina Christiana*) adds: "So let the teacher choose a good life that he also does not neglect a good reputation." Therefore beatitude consists in fame and glory. I distinguish the antecedent: concerning fame and glory that is fleeting and futile, which is called worldly, I deny it; concerning fame, honor, and glory that is true and divine, I concede. For thus it is written (*Ps. 115*): "Your friends are exceedingly honored, O God; their sovereignty has been greatly

strengthened." I add what is said (6. *Pol.* 4): "Most people desire gain more than honor."

DOUBT II. Whether beatitude consists in goods of the body.

Among goods of the body, the principal ones counted are health, beauty, and strength, which the Doctor mentions (4. *distinct.* 11, *quaest.* 4). Good health, or soundness, consists in an equality or balance of humors, as Scotus writes (*in both works*, 2. *distinct.* 12, *quaest.* 2, §. *Ad 1. rationem, sub G*). Beauty, according to Augustine (22. *Civit.*, *cap.* 19), cited by the Doctor (4. *distinct.* 49, *quaest.* 15), is "a congruence of parts together with a certain pleasantness of color." Strength is a virtue placed in the confrontation of dangers and the endurance of labors, as the Stagirite indicates (3. *Eth.* 6), and the Doctor agrees (3. *distinct.* 36, *quaest.* *un.*, §. *Quantum ad primum*).

Assertion: true happiness is not placed in the aforementioned goods of the body. The Doctor touches on this (*loc. cit.*, §. *De secundo*). And Lactantius defends it (*lib.* 1, *cap.* 18). This is proved, first: those things that do not satisfy the appetite and do not fulfill desire are not the object of beatitude, for that object satisfies and fully satiates the appetite. But the aforesaid goods of the body do not fulfill the appetite, since they do not exist for their own sake but are ordered toward activity. For being is for the sake of operating (2. *Caeli* 17). And even if a person possessed only those goods, he would still hunger, thirst, and need other necessities for sustaining life. Second, true happiness is a firm and fixed good, as is clear from its description; but the aforesaid goods are inconstant and unstable, as is evident from Psalm 37: "There is no health in my flesh"; Proverbs 31: "Beauty is vain"; and Judges 16: "His strength departed from him." This is further confirmed: for when sickness befalls a person, it dissipates his strength, destroys his beauty, and overturns his health. Third, good health is an equality of humors, which is an attribute of quantity, and therefore belongs to the category of sterile things; or if it is a proportion of humors, it is formally a relation, which has minimal entity. Strength, moreover, shines forth in enduring labors and confronting terrible things, which produce sadness rather than joy, pain rather than pleasure, and evil rather than good. Furthermore, in these things man is surpassed by beasts: the lion is the strongest, the peacock the most beautiful, the fish the healthiest; the eagle surpasses man in sight, the wolf in hearing, the dog in smell, the horse in speed, and the stag in length of life, as Augustine excellently discusses (*serm.* 34, *De verbis Domini*). Moreover, the body is ordered to the soul, as matter to form, and it is corruptible along with the things that accompany it; hence Paul cries out (*Rom.* 7): "Unhappy man that I am, who will deliver me from this body of death?" And Wisdom 9: "The body that is corrupted weighs down the soul." Therefore Augustine rightly adds (*serm.* 46, *De Sanctis*): "Let no one believe himself to possess any happiness or any true joy in this world."

You object, first: beatitude consists in what is sought for its own sake, because it is the ultimate perfection; but health is sought for its own sake. For through it we take pleasure and rejoice; hence Augustine (*lib. De bono coniugali, cap. 22*) says: "It is better to have the short and hunched stature of Zacchaeus with health, than Goliath's with fever." And Plato (*in Gorgias*): "The best thing is to be well, then to be handsome, and afterward to possess wealth gained without fraud." Plutarch adds (*in healthful precepts*): "Health is the most divine thing and by far the sweetest seasoning." If the major is conceded, the minor must be denied. For in truth, health is for the sake of activity. Hence man does not rest in it, especially since a person can be healthy yet poor and lacking in nearly everything, as happens not infrequently. Nor do I omit what is said (*1. Magn. Mor. 4; and 1. Eth. 9*): "The blessed person must be of perfect age. For a child, as a child, is not blessed." And this is touched upon (*Eph. 4*): "Until we all attain to the perfect man."

You object, second: beauty is loved by all and judged worthy of sovereignty. Hence that celebrated line: "The beauty of Priam is worthy of sovereignty." And Psalm 44: "In your splendor and beauty, go forward, advance, and reign." And of Christ the Lord it is read in the same place: "Beautiful in form beyond the sons of men." And Proverbs 31: "Strength and beauty are her clothing." I reply indeed that beauty is the principal ornament of the body, as is clear from that verse: "Therefore the Lord has clothed you with beauty." Nevertheless, beatitude is not found in it, since it is in the body, which is ordered to the soul, as I noted above; just as the excellence and preeminence of a person is not situated in his stature but in the nobility of his soul, its virtues, and its glorious works.

DOUBT III. Whether happiness consists in pleasure.

Many place true happiness in bodily and spiritual pleasure, among whom Epicurus and his followers are counted, as the Coimbra commentators report (*disp. 3, Eth., quaest. 2, art. 3*), from Torquatus in Cicero (*2. De finibus*) and Seneca (*lib. De vita beata*); also Augustine (*lib. De utilitate credendi ad Honoratum, cap. 4; serm. 13, De verbis Apostoli; and tract. De Epicureis et Stoicis, cap. 4, Tom. 6*). Certain Jews, as Alphonsus attests (*lib. 3, adversus Haer., haer. 2*), suppose that happiness consists in the delights of the flesh, of whom perhaps Solomon made mention (*Wisdom 2*): "Let us crown ourselves with roses before they wither; let no meadow escape our revelry." And Paul (*Gal. 6*): "He who sows in his flesh will from the flesh reap corruption." Also Augustine (*in Epist. ad Rom., cap. 13*). These are followed by Cerinthus, as the same Alphonsus affirms (*loc. cit.*), who, given over to lust and steeped in wicked morals, imagined that after the resurrection the kingdom of Christ would consist in desires and enticements of the flesh. The Saracens agree, as Scotus touches upon (*quaest. 2, Prol., §. De sexto*), expecting and maintaining as beatitude what befits swine—namely gluttony and sexual intercourse. This is also criticized by Avicenna (*9. Met., cap. 7*), although he perhaps does not dissent from their sect.

Assertion: the Catholic religion does not establish true happiness in bodily pleasure and fleshly delights. This is presupposed by the Doctor (*loc. cit.*) and defended by Pelusiotus (4. *Epist.* 55). This is proved, first, from the sacred page: Job 21, "They spend their days in prosperity, and in a moment they go down to hell"; Wisdom 2, "Believing they had found happiness in pleasure, they confess they have found misery"—"Therefore we have erred, and the light of truth has not shone on us"; 1 Corinthians 15, "Flesh and blood cannot possess the kingdom of God"; and Luke 16, "He feasted splendidly every day; the rich man died and was buried in hell." Second, from the Fathers: Augustine (5. *Civit.*, cap. 20, and the places previously named); Chrysologus (*serm.* 66); Jerome (*epist. ad Damasum Papam*): "Pleasure always carries a hunger for itself, and once past, does not satisfy." The same is written by Ambrose (*in Luc.* 6); Isidore (*De summo bono*); and Chrysostom (*orat.* 6, *De facto*). Third, from Seneca (*epist.* 39): "Some plunge themselves into pleasures, from which, once they have become accustomed to them, they cannot abstain, and for this reason they are the most wretched." Cato the Elder agrees: "Pleasure is the bait of evils, by which human beings are caught like fish on a hook." Cicero favors this (2. *De finibus*): "No one is worthy of the name of human being who would wish to spend an entire day in pleasure." Furthermore, bodily pleasure overwhelms the mind, depresses the intellect, and removes reason, so that a person immersed in it cannot accomplish anything excellent or distinguished, as Aristotle says (7. *Eth.*, cap. 11). Hence Salvian rightly adds (2. *De Ecclesia Cath.*): "Pleasures are impediments, not aids; not supports, but burdens." Moreover, true happiness includes the highest peace and rest, as I intimated above; but "the life of man upon earth is a warfare" (*Job* 7). Likewise, "the flesh lusts against the spirit, and the spirit against the flesh" (*Gal.* 5). Hence Augustine (*lib.* 2, *De serm. Domini in monte*, cap. 18) says: "Let us pray that the will of God be done on earth as it is in heaven; for when the body, like the earth, and the spirit, like the heaven, shall have consented in supreme and total peace, we shall not mourn. For there is no other mourning of this time than when these two fight against each other and compel us to say: 'I see another law warring against the law of my mind,' and to attest our grief with a tearful voice: 'Wretched man that I am! Who will deliver me from this body of death?' (*Rom.* 7)." Therefore happiness does not consist in pleasure, as the Stagirite also recognized (1. *Eth.* 5; and 8. *Pol.* 3), adding: "Happiness is an end which all think comes not with pain but with pleasure."

You object, first: Aristotle (10. *Eth.*, cap. 2) writes that it is ridiculous to ask someone why he wants to take delight; the reason is that everyone by his very nature desires delight; and (7. *Eth.*, cap. 11): children and beasts pursue pleasures. Therefore, in delight and bodily pleasure, which is greater than the rest, happiness consists. This is confirmed: just as the greatest unhappiness is found in bodily pains, so the highest happiness is in delight and bodily pleasure. Hence it is compared to honeycomb in sacred Scripture, and whoever has once experienced it abandons everything else, making light of it, and rests in it. I

reply that although nearly all take delight in the pleasures of the flesh, and the appetite for it is most intense, nevertheless beatitude is not located in that pleasure, since it lasts only a moment and afterward sadness follows, and the more libidinous animals are of shorter life. Indicating this, Paul says (*2 Cor. 16*): "He who commits fornication sins against his own body." Moreover, delight is a passion, while beatitude consists in action, as will be said below. I add that Aristotle (*2. Magn. Mor., cap. 7*) teaches that bodily pleasures are to be condemned.

You object, second: Isaiah 45, "My servants shall eat, but you shall go hungry; my servants shall drink, but you shall thirst"; Luke 17, "I dispose for you, as my Father disposed for me, that you may eat and drink"; Psalm 35, "They shall be inebriated with the abundance of your house." And certain people from Matthew 19, as Jerome attests (*lib. 4, in Matt.*), and Apocalypse 20, after a thousand years, think the kingdom of Christ will be in the pleasures of the world and the delights of the flesh. I reply that these and similar testimonies are to be expounded of spiritual food and drink, just as in Tobias 12, the angel Raphael says: "I eat an invisible food, of another kind." And so those passages are to be taken not carnally but spiritually, as Alphonsus (*cited above*) shows at length. Especially because man does not exist for the sake of food and drink, but the reverse; hence Cicero says: "I do not live to eat, but eat to live." And Saint Augustine (*lib. 2, De serm. Domini in monte, cap. 14*): "Nor should we evangelize in order to eat, but eat in order to evangelize." And (*cap. 25*): "Whatever thing is sought for the sake of another is without doubt inferior to that for the sake of which it is sought." And shortly after he concludes: "If we seek the Gospel and the kingdom of God for the sake of food, we make food the higher thing."

DOUBT IV. Whether happiness consists in goods of the soul, or in some other created thing.

Since from the foregoing it is perfectly clear that objective happiness does not consist in goods of fortune or of the body, it remains to inquire and consider whether it lies in goods of the whole composite, or in goods of the soul, or in some other object. For it is held as certain that man was created by God so that he might understand the supreme good, and by understanding might love it, and by loving might enjoy it, and by enjoying might possess it, as Panigorola affirms (*2. Quadr., serm. Dominica 2*). For all—not only Catholics but also pagans—plainly acknowledge that there is in man an inclination toward the good, just as toward knowing the true, and that this inclination is not had in vain.

Note that in man there are certain powers and faculties that are material, called potencies of the whole composite, such as the external and internal senses; and certain others that belong to the rational soul alone, namely the intellect and the will. Again, I observe that created things are either simple and spiritual, such as the angels, or composite and material, such as the elements and the rest of the

things contained in the universe, about which I treated extensively in general and in particular in the Physics.

First assertion: true happiness does not reside in the sensitive and material potencies, nor in the spiritual and immaterial ones. This is deduced from Scotus (4. *distinct.* 49, *quaest.* 8; and *ibid.* *quaest.* 1 and 2), and divides into two parts. The first part is proved, first, from Augustine (1. *De serm. Domini in monte*, cap. 8): "In man, the principal and excellent part commands the rest, not those things which we have in common with beasts"—such as the bodily potencies and powers. And (*ibid.*, cap. 9): "Your reward, which is unshaken and eternal, is not to be placed in things that are changeable and temporal." But the sensitive potencies are changeable and corruptible; therefore, beatitude is not to be sought in them. Second, such potencies are defectible and perfectible, as I said (3. *De anima*); but beatitude is "a state made perfect by the aggregation of all goods." Moreover, they do not fill our appetite: "The eye is not satisfied with seeing, nor the ear filled with hearing" (*Ecclesiastes* 1). And "the leech has two daughters"—namely the irascible and the concupiscible—"which say: 'Bring, bring!'" (*Proverbs* 30). Therefore true happiness cannot be found in these, as Aristotle also concludes (1. *Eth.* 9).

The second part is proved, first, from Augustine (*lib. De natura boni contra Manich.*, cap. 7): "Among the things made by God, so great a good is the rational nature that there is no good by which it is made happy except God." Second, such potencies are subject to many defects and errors: the intellect often errs and does not rest in knowing created things; hence *Ecclesiastes* 1: "He who increases knowledge increases sorrow." The will, in turn, succumbs to malice and is not satisfied in desiring and willing created things; hence David, affected by this annoyance, speaking to God, says (*Ps.* 16): "I shall be satisfied when your glory appears." Furthermore, as Augustine notes (*in cap. 21 of Job*): just as temporal goods are common to the devout and the impious, so intellect and will are shared by both; therefore happiness is not to be sought in these.

Second assertion: in no created thing, whatever it may be, is the supreme good found. This is taught by Scotus (4. *dist.* 49, *quaest.* 1, §. *Ad 1. q.*; and §. *De secundo*). This is proved, first: *Ecclesiastes* 1, "Vanity of vanities, and all is vanity and vexation of spirit"; Psalm 143, "Man is become like vanity; his days pass away like a shadow"; 1 John 2, "Love not the world, nor the things that are in the world"; and in the same place: "Whatever is in the world is either the concupiscence of the flesh, or the concupiscence of the eyes, or the pride of life." Second, from Augustine (*lib. 1, De serm. Domini in monte*, cap. 2; and 1–2 of the same work, cap. 21; and in the epistle cited from John): "The world passes away, and its concupiscence. What do you wish? To love temporal things and pass away with time, or to love Christ and live forever?" And Bernard (*serm. De Dedicatione*): "The greedy mind of man can be occupied by created things, but cannot be satisfied by them." And Aristotle (2. *Pol.* 5): "The nature of desire is infinite; therefore, nothing less than

God will fill the soul that is capable of God." Third, happiness is a perfect good; but no creature is perfectly good, because "no one is good except God alone" (*Luke 14*). Moreover, the soul is capable of the infinite, for it can understand the infinite and love it; therefore, no matter what finite thing is given, its desire is not fulfilled—just as prime matter, with any form received in it, always retains the appetite for having other forms, as I said (*in Phys., quaest. de materia*). Finally, even if the appetite for having things pleases, experience disappoints, as Paul Aretius discusses at length from Gregory (*36. Mor.*) (*lib. 3 of his works*).

Third assertion: true happiness and perfect beatitude is found in God alone. This is defended by the same Doctor (*loc. cit.*). This is proved, first: Exodus 33, "I will show you all good"; Psalm 32, "Blessed is the nation whose God is the Lord"; Psalm 82, "Blessed are those who dwell in your house, O Lord." Second, from Dionysius (*De caelesti Hier., cap. 10*) and Augustine (*lib. De natura boni contra Manich., cap. 7; and lib. contra Adimantum, before cap. 19*): "All beatitude is fixed in God alone, unshaken." The same Augustine (*in Soliloquia, cap. 1, Tom. 9*) attests to this. Third, God is that than which nothing greater can be conceived, from Anselm (*in Monol.*)—infinite, independent, containing all goods, especially riches and glory: Psalm 111, "Glory and riches are in his house"; honor and glory: Psalm 8, "You have crowned him with glory and honor"; principalities and dominions: Psalm 44, "You shall make them princes over all the earth"; wisdom and knowledge: Colossians 2, "In whom are all the treasures of the wisdom and knowledge of God." The same appears to be taught by Thomas (*1. part., quaest. 36, art. 3*). And Augustine excellently says (*Tract. 10, in Epist. Joan., ad medium*), and Cicero (*5. Tusc.*).

You object, first: in the knowledge, or vision, and enjoyment of the beatific object consists true and complete beatitude, as the Scholastics unanimously and concordantly hold (*4. distinct. 49*). But God is not seen, nor can he be seen or possessed by us: 1 John 4, "No one has ever seen God, nor can he be seen." This is confirmed: he is blessed who has God perfectly; but no one has God perfectly unless he loves him perfectly; and God cannot be perfectly loved, because he cannot be perfectly known: 1 John 4, "How can he love God, whom he does not see?" I reply by granting the major and distinguishing the minor: in this life, I concede; but in the other life, which we hope for after the universal resurrection, I deny. The same applies to the confirmation, for no one in this world can be blessed, as the arguments I adduced in the preceding doubts show—against the Beghards and Beguines cited by Alphonsus (*loc. cit., haer. 4 and 5*). This is explicitly stated by Saint Paul (*1 Cor. 13*): "Now we see through a mirror in an enigma, but then face to face."

You object, second: between the blessed person and the beatific object there must be some proportion, as between the knower and the known, the lover and the loved. But between God and man no proportion intervenes, since God is infinite and unlimited, while man is finite and limited. Therefore God is not the

objective beatitude of man. I grant the major and distinguish the minor: concerning geometric proportion, I concede; concerning the proportion of the one understanding to the understood, of the one seeing to the seen, I deny, as the Doctor asserts (4. *cit.*, *quaest.* 11, §. *Respondeo*, C).

You object, third: Aristotle (1. *Eth.* 8; and 7. *Pol.*, *cap.* 1) asserts that external goods are necessary for happiness, among which are money. But if God were the beatific object, riches would not be required, since God is "rich toward all who call upon him." Therefore happiness is not placed in God. I reply that Aristotle is speaking about happiness in a qualified sense, namely of the political man, who is greatly honored by the republic and presides over it; for the preservation of its glory and magnificence and for repelling its enemies, external goods, and especially riches, are of the greatest help, as is explained (2. *Magn. Mor.*, *cap.* 9; and 7. *Eth.*, *cap.* 13). But otherwise, if one speaks of happiness absolutely, it is not placed in these things, since it does not depend on chance and fortune, but on virtue and wisdom, which shine more brightly in adversity than in prosperity, as the Stoics argue against the Peripatetics mentioned by the Coimbra commentators (*disp.* 3, *quaest.* 4, *art.* 1). Nor does this response conflict with Aristotle, who holds (10. *Eth.* 8) that beatitude consists in the contemplation of abstract substances, the first and highest of which is God. Hence Augustine rightly adds (3. *contra Maximum*, *cap.* 23): "Nothing makes you good and blessed except the unchangeable good, which is God alone. For a good angel, a good man, and other good created things are not so good that whoever has obtained them is blessed; nor is any life blessed unless it is eternal."

ARTICLE III. On formal beatitude.

Many things are investigated and treated concerning formal beatitude by the Doctor and other Scholastics (4. *distinct.* 49). For the sake of distinction, I distribute these into the following doubts, as I did in the preceding article.

DOUBT I. Whether formal beatitude consists in operation.

This difficulty is treated concerning beatitude not only created but also uncreated, and not only natural but also supernatural. The common opinion of the philosophers (1. *Eth.* 7; and 10 *Eth.*, *cap.* 6)—although, as Scotus observes (*passage just cited*, *quaest.* 1, *before* §. *Ad quaest.*, *sub H*), the philosophers did not determine in what object or under what formality beatitude resides—holds that it consists in operation. I find only in Raconius (*Tract.* 3, *Mor.*, *disp.* un., *quaest.* 2, *art.* 3), citing Capreolus (3. *disp.* 13, *quaest.* 2), who reports that John de Ripa held that formal beatitude consists in the uncreated vision by which God sees and contemplates himself. The opposite, however, is defended by all the Doctors cited above, who judge that formal beatitude inheres in the one who is formally blessed.

Note, first: beatitude is of two kinds—one of the way and another of the homeland. Beatitude of the way is that which is had or can be had in this world,

and it is twofold: true and false. True beatitude consists in the knowledge and love of God, keeping his precepts, and bearing willingly and patiently the labors and sufferings of the present life. Thus Christ says (*Matt. 5*): "Blessed are those who mourn, for they shall be consoled." And (*John 7*): "This is eternal life, that they may know you"—that is, as Alphonsus interprets (*3. adversus Haer., verb. beatitudo, haer. 4*): the way to eternal life. The same is taught by Cyril (*lib. De fide ad Rheginas*) and others cited by Alphonsus. False beatitude is that which is placed in some created object from those named in the preceding article. Beatitude of the homeland is the supreme and ultimate perfection that can be had by an intellectual creature; and this is divided by the Doctor (*in the §. De secundo, recently mentioned, AA*) into beatitude absolutely and in a qualified sense. The former is a secondary perfection immediately conjoining the blessed person to the noblest extrinsic perfective object. The latter conjoins one to a less noble perfective object. Again, beatitude absolutely can be taken either for the conjunction to the extrinsic perfective object, or for the proximate foundation of that conjunction: the former is a relation, while the latter is an operation in the category of quality, as the Doctor writes (*loc. cit., §. Ad argumenta, in the solution of the 4th, EE*).

Note, second, from the same Scotus (*ibid., §. De secundo, Y*): it is held as certain among the philosophers that beatitude is a good that is sufficient, excluding all deficiency and want; likewise a perfect and complete good, free from all imperfection and diminution; likewise an ultimate good without any respect or ordering to another better and more perfect good; and finally a good such that, once possessed, things are completely well for the one possessing it. Conversely, misery is a complete want and absence of secondary perfection, a diminution of secondary good, and an exclusion of what is loved for its own sake when it is possessed. In short, misery is that by which things are completely bad for the one possessing it.

First assertion: happiness does not reside in the uncreated vision of God. This is deduced from the Doctor (*loc. cit.*). It is proved, first: happiness must inhere in the one who is formally happy (*from 1. Eth. 13*), just as whiteness must be in that which is formally white; but the uncreated vision is not in the blessed person but in God. Therefore, through the said vision, man is not formally blessed. Second, what is really and formally moved must receive something, because change is the reception of something new in a subject that was not there before, as I said (*in Phys., lib. De motu*). But a person goes from being not blessed to being blessed through beatitude received in himself, and this cannot be the uncreated vision, which is not receivable in a subject, since it is not an accident. Third, all would be equally blessed, because that uncreated vision is infinite and always behaves in the same way. Therefore the opinion of John de Ripa is singular and diverges from the common position, just as his view about the constitutive properties of the divine persons, which he thinks are absolute, as the Marginists of Scotus cite (*1. dist. 26, quaest. un., §. Tertia opinio*). The Doctor, however,

excuses him from error and heresy in that place, and shows his opinion to be probable and plausible.

Second assertion: formal beatitude consists in the operation of the blessed person. The Doctor holds this (*loc. cit.*) and proves it, first, in both works, by many passages from Aristotle, especially (1. *Eth.*, *cap.* 8 and 9): "Happiness is the best operation." And (10 *Eth.*, *cap.* 8): "The gods, who are the happiest, do not sleep, but operate." Also (2. *Pol.* 3; 2. *Magn. Mor.*, *cap.* 10; and 12. *Met.*, *cap.* 6, T. 61): "If he does not understand, what will be notable about him, what venerable? He would be like one sleeping." Second, Augustine (1. *De doctrina Christiana*, *cap.* 6) says that happiness consists in enjoyment, which is an operation of the will. And (*in his exposition of the Epistle to the Galatians, near the end; and lib.* 2, *De serm. Domini in monte*, *cap.* 33): "Since the blessed life is completed by action and contemplation, action desires the functioning of faculties and powers, and contemplation desires the manifestation of things." Third, Aristotle (2. *Caeli* 17): "Being is for the sake of operating." Therefore the intellectual creature, since it exists for the sake of the most perfect operation, which is beatitude, was created for this purpose—both because living things surpass non-living things by the grade of life, and intellectual beings surpass those lacking reason by the grade of intellectual life, which consists in operation, namely intellection and volition; and because the beatitude of the way is placed in operation, as is evident from the eight beatitudes related and explained by Christ the Lord (*Matt.* 5). The same must be asserted of the beatitude of the homeland—both because beatitude is the conjunction of the intellectual nature with its best, which is attained by operation, and because eternal life is expected by you in the same manner in which the angels participate in it: (*Matt.* 22) "They are as the angels of God in heaven." But the angels are beatified through operation: (1 *Peter* 1) "Into which things the angels desire to look"; and (*Matt.* 18) "Their angels see the face of the Father"; and (1 *Cor.* 13) "Then face to face."

You object, first: beatitude is the accumulation of all goods and the aggregation of all perfections, as is clear from Augustine (13. *Trin.* 5): "He is blessed who has whatever he wills and wills nothing evil"; and Boethius (3. *Consol.*, *prosa* 2): "Beatitude is a state made perfect by the aggregation of all goods." But many other things are goods besides operation; therefore happiness is not placed in operation. This objection does not directly prove that happiness does not consist in operation; hence Scotus (*in Rep.*) omits it, as consulted. Or say that the blessed person enjoys all goods because he attains God through operation, in whom all things are contained formally or eminently.

You object, second: beatitude is a union or conjunction of the formally blessed person with the beatific object, as appeared above in the second assertion. But union or conjunction is a relation, while operation is an absolute entity in the category of quality; therefore, and so on. This is confirmed: an absolute thing can exist without a relation founded in it, because it is prior to it, and everything

prior, as prior, can exist without its posterior. Since operation is an absolute being, it can exist without that relation, and so there would be beatitude without the beatific object, and a blessed person without union with and attainment of the beatific object. I reply that the union is the medium by which the blessed person is conjoined with the beatific object—or as the Doctor says (*passage cited, in Rep., at the end of q. 1*)—causally; for it is a causal predication, and consists in the ultimate operation, which is the proximate foundation of the said union. To the confirmation, I concede the antecedent; to the consequent I say that intrinsic beatitude, which consists in operation, designates the terminus, or the beatific object, and concomitantly denotes that union, which, since it is an extrinsically supervening relation, does not arise unless the extremes are brought together.

You object, third: beatitude is permanent; hence it is called a perfect state. But operation is transient, or in process of becoming; therefore beatitude is not found in operation. First confirmation: an agent is not made more perfect through its operation in producing some effect; but beatitude is the best perfection of the blessed person; therefore, and so on. Second confirmation: the blessed person receiving beatitude is changed, since from being not-blessed he becomes blessed; but an agent as agent is not changed (*from 3. Phys., tit. 9*). Third confirmation: the blessed person is not the cause of his own beatitude, otherwise he would beatify himself; but he is the efficient cause of his own operation; therefore, and so on. I reply by granting the major and distinguishing the minor: concerning operation or action in the category of action, I concede; concerning operation or action in the category of quality, as is the operation under discussion here, I deny. To the first confirmation, I distinguish the major: concerning essential perfection, I concede; concerning accidental perfection, I deny. To the second confirmation, the same must be said. To the third, I say that two causes are required for beatification: one from the blessed person and another from the beatifying God. The blessed person is a partial cause of his formal and intrinsic beatitude, but is not the total or partial cause of extrinsic and objective beatitude.

You object, fourth: a habit is more perfect and nobler than an operation—both because it is more lasting and more permanent than an act, and a good that lasts longer is better than one that lasts only briefly (*from 3. Top. 1*); and because a habit is the cause of an act, and therefore one who has a habit operates more promptly, easily, and pleasurably, and a cause is nobler than its effect. Therefore, and so on. I reply from the Doctor (*cit., FF and SS*) by denying the antecedent. For an act, other things being equal, is more perfect than a habit, because through it the beatific object is attained. I said "other things being equal" because it could happen that a habit is so intense and an act so remiss that the habit surpasses the act. To Aristotle's testimony, I say it is to be understood as holding other things being equal, as is clear to one reading his text: for oaks and crows, though long-lived, are not superior to man. Especially in our matter, in which

the act is equally permanent as the habit. To the other point, I say this is true of a total cause, but not of a partial cause, which is what a habit is.

DOUBT II. Whether happiness resides in the essence or in the potencies of the soul.

Henry (*Quol. 13*), cited by Scotus (*4. distinct. 49, quaest. 2; and in Rep., ibid., quaest. 1*), thinks that formal beatitude is in the essence of the blessed person and in his potencies—indeed in the essence more principally and immediately, but in the potencies less principally and mediately, or by overflow: that is, from the essence beatitude overflows into the potencies, in much the same way as the beatitude of the soul overflows into the body. He adds, moreover, that the perception of happiness is more immediately in the potencies than in the essence of the soul, because love is a kind of transformation into the thing loved, as Hugh of Saint Victor teaches with Dionysius (*De caelesti Hierarchia 7*), in his commentary. For through love one despises himself and transforms himself into the other whom he loves. And so according to Henry, God by circumincession, or by indwelling, is in the creature, through which the creature itself is quasi-deified, just as a glowing coal becomes quasi-fire. But the opposite is taught by Scotus (*loc. cit.*) and with him the other Scholastics, both ancient and modern—notably Vázquez (*1–2, disp. 8, cap. 1*) and Raconius (*disp. un. De beatitudine, quaest. 2, art. 3, suppos. 2*)—who defend that formal beatitude is immediately and proximately in the potencies.

Note, first, from the Doctor (*loc. cit., §. Ad quaestionem ergo, 1; and §. Ad argumenta, O*): perfection is twofold—one of the essence and another of the potency. The perfection of the essence is prior to the perfection of the potency, just as the essence precedes the potency; the former is essential and pertains to first act; the latter is accidental, and is second act, or operation, in which I asserted in the preceding doubt that happiness consists. These perfections, however, are of different orders and regard different perfectibles. The essential perfection is nobler in its own order, that is, in the series of first acts; the latter excels among second acts. For happiness is not absolutely the noblest perfection, but only in a qualified sense—namely, in the genus of second acts, as the Doctor writes (*cit., §. proxime cited, O*).

Note, second, from (*2. dist. 16, quaest. un.*): the potencies of the soul are not formally the soul itself, nor are they accidents really distinct from the soul and from each other, but they differ formally from each other and from the soul, which is their foundation and root from which they sprout and flow, as I said (*1–2. De anima, quaest. 3*). Therefore the essence of the soul is not a suitable and immediate subject receptive of operations, just as the trunk of a tree does not immediately produce flowers or fruits, but its branches are their immediate efficient causes. Similarly, man does not see immediately through the body, or through the soul, or through a third entity, but through the visual potency, as the Doctor clearly expounds (*loc. cit., §. Ad istam 2, sub M; and in Rep., ibid., §.*

praeter hoc): "It is a greater good for the soul to see God through the intellect than through the essence, because seeing is not suited to be a good of the soul except through the intellect. Similarly, it is not suited to have the beatific object as beatific except through the potency that attains it through operation."

Assertion: formal beatitude is immediately located in the potencies, not in the essence of the rational soul. The Doctor holds this (*passage cited*). This is proved, first: formal happiness consists in operation, as I showed in the preceding doubt; but operation does not reside immediately in the essence but in the potency—as intellection in the intellect and volition in the will (*from 2. De anima 6; 9. Met. 10*). Therefore, and so on. Second, the essence of the soul, apart from its potencies, is not operative; for the soul is not formally intellectual and volitional except through the intellect and the will—just as an animated body does not operate except through its organs: it sees through the eye and hears through the ear. But the immediate recipient of vision is not the body but the eye; similarly, the suitable, immediate receptive subject of formal beatitude is not the essence of the soul but its potencies.

Third, a whole is not a suitable and immediate receptive subject of a quality except through quantity, by reason of which it is said to receive the remaining accidents. For quantity is called the subject-by-which, and the whole is called the subject-which, as I explained and proved elsewhere at length. Similarly, the soul is not a suitable and immediate subject capable of formal beatitude except through its powers and faculties, which are given to it for acting and receiving perfections suitable to it. I add that the indwelling imagined by Henry pertains to first act, as the Doctor proves (*loc. cit.*); but man is blessed through second act, by which he is conjoined with the beatific object—otherwise a sleeping person would be blessed, as Aristotle argues (*recently cited*). Indeed, Henry himself admits that man is beatified through love, which is a second act and an operation immediately inhering in the will. Finally, misery, which is opposed to beatitude, does not reside immediately in the soul, as the Doctor (*mentioned above, §. Ad istam q., H*) argues, and the philosophers he cites there confirm. Therefore the same must be asserted of formal beatitude.

You object, first: a nobler perfectible demands a nobler perfection, as is clear in the natural order of things, in which nobler natures enjoy nobler perfections; and in the moral order, in which distributive justice gives a greater and nobler reward to the one who performs greater and nobler works of virtue than to another who exercises lesser and lower works. But the essence of the soul is a nobler perfectible than its potencies, since the former is substance and the latter are accidents; and substance surpasses accident in nobility (*7. Met. 1*). Since, therefore, beatitude is the noblest perfection of an intellectual creature, it is aptly deduced that beatitude resides more principally and immediately in the essence than in the potencies of the soul. This is confirmed: an overflow goes from the prior into the posterior; but the beatific object first enters into the

essence before the potencies, because it is in the latter by overflow. I grant the major and distinguish the minor: in the order of essential perfections and in first act, I concede; in the order of accidental perfections and in second act, I deny. But formal beatitude is second act and excels among second acts (*from the Doctor cit.*, §. *Ad argumenta*, O). To the confirmation, I say the major holds of first act but not of second act. The indwelling—if any such universal or particular one belongs to the rational nature—pertains to first act, which can exist without second act but not conversely, as Scotus writes (*cited above*, §. *Ad istam 2, sub A*).

You object, second: whatever is the immediate recipient of an accident, if it could exist per se and separated from everything else, could immediately receive it—as is clear of quantity, which is the immediate recipient of whiteness, and when separated from material substance can immediately receive it, as happens daily in the most holy Eucharist. If, then, the potency immediately receives beatitude, and it were separated from the soul, it would certainly receive it; and so the potency would be blessed without the soul, which is false and absurd. This is confirmed: beatitude is immediately located in that in which its prior disposition immediately inheres, for glory is consummated grace. But the prior disposition of happiness, which is grace, has its seat in the essence, and from it overflows into the potency, just as the glory of the soul overflows into its body. Therefore, and so on. I grant the antecedent; to the consequent I say that the objection has force for those who hold that the potencies of the soul are accidents really distinct from the soul and from each other—but not for us, who maintain that the potencies of the soul are really identified with the soul and formally distinct, and are therefore inseparable from it. Moreover, even granting the consequent, no absurdity follows, for quantity has whiteness even when separated from corporeal substance. And the Doctor teaches this (*loc. cit.*, §. *Ad quaest.*, sub L). To the confirmation, I grant the major and deny the minor. For grace is immediately in the will, which alone can be called formally pleasing, and which alone can elicit a pleasing and meritorious act, as the Doctor notes (*cit.*, §. *Ad istam 2, G*).

You object, third: if happiness is more immediately and principally in the potency than in the essence, the intellectual nature would be blessed per accidens—just as wood is hot through the heat received in it. But this seems unfitting, because beatitude is the noblest perfection. Therefore beatitude is more immediately in the essence than in the potency. I concede the consequent of the major. For indeed nature is beatified through operation, which is an accident, as I showed in the previous doubt. But it is not per accidens if "per accidens" is taken to mean something accidentally and disorderly conjoined, as when a musician is white; for in that sense, an accident does not accidentally belong to an accident (4. *Met.*, cap. 4). And the Doctor explains this (*cited above*, §. *Ad quaest. ergo, N*).

DOUBT III. Whether beatitude consists simultaneously in several operations.

Richard (4. *dist.* 49, *quaest.* 6, *art.* 1), Saint Bonaventure (*ibid.*, q. 5), and Alexander of Hales (2. *p.*, q. 22, *m.* 1) place formal happiness simultaneously in the operations of both the intellect and the will. Scotus, however (*ibid.*, q. 3), and Thomas (*same dist.*, q. 1, *in solut.* 2 of the *quaestiuncula*), and the followers of each, hold that happiness is situated principally in only one operation.

Note, first, from the Doctor (*cited above*, §. *Ad quaest.*, A): beatitude is used in two senses. First, for the aggregation of all goods pertaining to it, and in this sense beatitude is not in one operation, since every potency of the soul can in its own way attain the beatific object—the intellect through vision and the will through enjoyment—and indeed the whole man is beatifiable, as will be evident below. Second, for the consummate perfection and ultimate operation by which things are absolutely and simply well for the blessed person; and in this sense beatitude is established in only one operation. For just as the beatific object is one in reality and in its formal character, and in it as an extrinsic perfective the nature is well and perfectly so, and only insofar as it is attained by this nature absolutely and immediately through operation, so the operation is only one concerning that object.

Note, second, from the same author (*ibid.*, A): a potency's attaining the beatific object immediately can be understood in two ways. Either the word "immediately" excludes a medium of the same order in attaining the object in its own order—as a potency is said to immediately attain the object present through its own operation, that is, not through any other medium than through the operation itself. Or "immediately" excludes a medium of a different character and order—that is, nothing exists that attains the beatific object more immediately, perfectly, and intimately. This distinction can be illustrated by the example of the first and secondary cause, both of which immediately attain the same patient, so that neither agent acting on the patient is a medium through which the other attains the common effect—though the first cause attains it more immediately, that is, more intimately and perfectly, since the entire attainment of the secondary cause is in virtue of the first cause acting independently. Similarly, the intellect and the will both immediately attain the beatific object, yet in different ways. For the intellect attains it by seeing, and the will by enjoying. Likewise, the intellect initiatively, and the will embracingly and quietly. For the intellectual nature does not rest in the vision of the beatific object alone, but tends further—namely, to enjoy it with the will.

Assertion: formal, intensive, and complete beatitude consists in a single operation. So holds Scotus (*cited above*). This can be supported, first, from Psalm 26: "One thing I have asked of the Lord, this I will seek." Second, from Damascene (2. *Fidei*, cap. 11): "Moreover, without worry or care, we would have one work, which is the work of angels—to praise God unceasingly and continually." Augustine indicates the same (*in Ps.* 86; 147). Aristotle agrees (1. *Eth.* 7 and 8; 13): "Happiness is the best operation, according to the best virtue, and in

a perfect life." Second, in every order there is one first and one last, which precedes and excels the rest, in which one stops and goes no further (2. *Met.* 2). Hence all Peripatetics admit one first cause, one first mover, one prime matter, one ultimate end—whether intrinsic and formal, or extrinsic and objective. Therefore in the genus and order of beatifying operations, there is one operation in which the blessed person intensively rests. Third, from (8. *Met.*, *cap.* 5): "Species are like numbers"—that is, one species is more perfect than another through the more perfect difference constituting it, as can be seen in all the divisive differences of genera and the constitutive differences of species, about which I treated in the Epitome under the article on difference. Therefore in the series of beatifying operations, one is more excellent than another, in which the blessed person ultimately rests. Fourth, what more perfectly and intimately attains the beatific object is more excellent and noble, as I touched upon above; but the operation of the will attains the beatific object more perfectly and intimately, for through it things are completely and perfectly well for the blessed person, and he tends no further, as will be shown in the next doubt. Hence Anselm (*lib. Cur Deus homo*, *cap.* 1) adds: "The order is perverse to wish to understand so that one may will; rather, one should understand so that one may will, love, and enjoy."

You object, first: beatitude consists in the union and conjunction of the blessed person with the beatific object, as I showed above. But the blessed person is united with the said object not only through an act of the will but also through an act of the intellect—that is, through both vision and enjoyment. Therefore beatitude is placed simultaneously in both acts. I reply that indeed the blessed person is beatified through both operations, yet with this order and distinction: more perfectly and intimately through the operation of the will than through the operation of the intellect.

You object, second: to whomever it belongs to be moved toward acquiring a terminus, it certainly belongs to rest in the terminus. But both the intellect and the will tend toward the beatific object as the terminus of both; therefore beatitude is found in both operations. I reply that although it properly belongs to the appetitive potency—whether sensitive or intellectual—to tend toward the terminus, as the Doctor notes (*loc. cit.*); nevertheless, granting the major, I distinguish the minor: equally perfectly and intimately, I deny; unequally and disparately, I concede. For the will tends toward the beatific object more perfectly and intimately than the intellect.

You object, third: one must philosophize in the same and equal way about the plurality of forms required for first act as for second act. But for the first act of a beatifiable nature, several things are required—namely, the intellect and the will. Therefore the same must be asserted of happiness in second act. This is confirmed: a nature cannot be perfectly and integrally beatified if anything remains in it that is still to be beatified; but if it were not beatified in all its

potencies and operations, something would still remain to be blessed. The intellect, however, is beatified through vision, and the will through enjoyment. Nor is beatitude perfect and complete unless man is beatified in both soul and body. Therefore happiness consists in many operations. I grant the major and distinguish the minor: equally, I deny; unequally and in a certain order, I concede. For just as there is an order among the beatifiable potencies, and one precedes another, so too the operations are ordered, so that the operation of the intellect is prior and the operation of the will is posterior—and in the latter, as the more perfect and nobler, happiness exists embracingly. This is similar to subordinated forms, of which the last gives essential completion to the composite, as I said (*lib. 2. De anima*). To the confirmation, I say this holds of extensive beatitude, but not of intensive beatitude, which we are now treating.

You object, fourth: Augustine (*13. Trin. 5*): "He is blessed who has whatever he wills"; but the blessed person wills not only enjoyment but also vision, and indeed all things that pertain to integral and perfect beatitude. Therefore the highest happiness is not placed in one operation. I reply that this is to be understood not divisively but unitively, and not in themselves but in him who formally and eminently contains all things. And this pertains to extensive beatitude, not intensive beatitude, which is under discussion at present.

DOUBT IV. Whether beatitude resides in an act of the intellect or of the will.

Thomas (*4. dist. 49, quaest. 1, art. 1, solut. 2; quaest. contra Gentes, cap. 23 and 26*); the Coimbra commentators (*disp. 3, Eth., art. 2*); Raconius (*disp. un. De beatitudine, quaest. 2, art. 3*); and not a few others hold that beatitude consists principally and essentially in an act of the intellect, and in an act of the will only as a kind of extrinsic perfection supervening on vision—in much the same way as beauty and comeliness comes upon a young person. Scotus, however, (*in both works, dist. cited, quaest. 4*), Bassolis, Vorillong, and the rest of his disciples in the same place, hold that the highest happiness consists essentially and principally in an act of the will, and originatively and less principally in an act of the intellect.

Note, first, from the Doctor (*cit., §. In ista quaest., before A*): all who hold that beatitude is situated in operation assert that such an operation proceeds from a spiritual and immaterial potency, such as the intellect and the will. For since beatitude is the best and noblest operation, it cannot come from sensitive and material potencies, as Aristotle also rightly saw (*1. Eth. 9*)—these being potencies of the whole composite; for just as they are inferior and more imperfect in being, so also in operating. Moreover, these potencies cannot through their operations attain the beatific object, which is God, who can be perceived neither by the bodily eye nor by any other senses, whether internal or external (*from what was said in the Tract. De cognoscibilitate Dei, disp. 3*). And if in any way these powers and faculties are beatifiable, this happens through the overflow or resultance of the beatitude of the soul into the body; for thus there will be total extensive beatitude, as the Doctor says (*q. 3 cit., §. Ad argumenta pro 1. opinione, F*,

in solut. 3). And so here the only question investigated is whether beatitude resides in a spiritual operation—of the intellect or of the will.

Note, second, from the same (*ibid.*, §. *Iuxta hoc, K and N; and in Rep., quaest. 2, §. Dico; from 9. Met., tit. 15*): something can be prior to another in two ways—by generation or by perfection. What is prior in generation is more imperfect than what is posterior in generation; and conversely, what is posterior in generation is prior in perfection, as we experience in natural things. For the body is first under the form of blood, then of an embryo, afterward under the form of a duly organized body, and finally is completed by the soul in the being of a living and animated thing, which is the last produced and the most perfect of all the preceding. The aforesaid principle, however, is to be understood within the same order, but not in a different order. For accidents are posterior to substance in generation, because they follow upon it; nevertheless they are more imperfect than substance, as is clear (*7. Met.*). Although things posterior in generation depend on the prior, they are nonetheless more perfect, as is evident (*9. Met., tit. 15*): thus the end depends on the means, which are nonetheless less perfect than it; form depends on matter; corporeal quality on quantity—yet in these cases the posterior and dependent things are more perfect. What is absolutely perfect, however, is entirely independent. For just as it is first in generation, so also in perfection, from the same Philosopher just cited. But where the two aforesaid kinds of primacy do not coincide, the stated dictum fails. Therefore, although the will depends on the intellect in acting, because it cannot will except a previously known object, one should not on that account think that its operation is more imperfect, or that the will is inferior to the intellect, as I showed (*lib. 3. De anima, q. De voluntate*).

Note, third: formal beatitude embraces many things extensively, as I touched upon above and gathered from various places and testimonies of sacred Scripture. First, knowledge or vision of God: (*John 10*): "This is eternal life, that they may know you"; (*1 Cor. 13*): "We shall see him as he is." Second, love of God: (*Proverbs 8*): "I love those who love me"; (*Canticles 3*): "I found him whom my soul loves." Third, delight, which (*from 1. dist. 1, quaest. 4*) follows upon enjoyment: (*Ps. 15*): "Delights at your right hand forever"; (*Ps. 26*): "That I may see the pleasure of the Lord." Fourth, joy: (*John 16*): "Your joy no one will take from you"; (*Matt. 25*): "Enter into the joy of your Lord." Fifth, retention and apprehension: (*Canticles 3*): "I held him, and I will not let him go"; (*1 Cor. 9*): "So run that you may comprehend." Sixth, security and perpetuity: (*Ps. 83*): "They will praise you forever and ever"; (*Matt. 25*): "The just will go into eternal life." Finally, the accumulation of all goods: (*Exod. 33*): "I will show you all good"; (*Luke 10*): "All things have been delivered to me by my Father." And this is clear from the definition of beatitude, which is "a state made perfect by the aggregation of all goods."

Assertion: beatitude consists principally and essentially in an act of the will. So holds Scotus (*loc. cit.*). This is proved, first: (1 *John* 4): "God is love, and he who abides in love abides in God, and God in him"; and (15): "This is my commandment, that you love one another." Hence Jerome, in his Commentary on Galatians, book 3, chapter 6, speaking of the Apostle John, adds: "He was accustomed to say nothing else at each assembly but this: 'Little children, love one another.' At last the disciples and brothers who were present, wearied by hearing the same thing always, said: 'Master, why do you always say this?' He answered with a sentence worthy of John: 'Because it is the Lord's commandment, and if it alone is fulfilled, it suffices.'" And the love of God is commended and commanded to us more than his knowledge; by reason of which it is indicated that happiness is located principally in an act of the will.

Second, Augustine (1. *Trin.* 13): "It will suffice to be illumined and to enjoy him alone." And (*ibid.*, cap. 5): "He is blessed who has whatever he wills." And (1. *De doctrina Christiana*, cap. 6): "The supreme reward is that we enjoy him." But volition and enjoyment are acts of the will; therefore happiness is principally placed in them. Anselm indicates the same (*lib. Cur Deus homo*, cap. 1). Nor does Aristotle dissent, who, as Maior notes after Scotus (*quaest.* 4, *Prol.*, §. *contra hanc conclusionem*), includes love in contemplation—that is, purity of life, which is understood in terms of love. And Bonet (4. *Theol.*, cap. 3) adds that the Stagirite comprehended love in contemplation as in its source. Hence the same Philosopher adds (12. *Met.*, tit. 36): the first intelligence moves the other intelligences in the manner of something loved.

Third, that potency is principally beatifiable which merits and exercises good works, because God will render to each according to his works, as is clear from the Athanasian Creed. But the will alone merits and performs good works; the remaining potencies do so at the command and under the direction of the will. Hence Augustine (11. *Civit.*, cap. 28): "A man is not called good because he knows what is good, but because he loves it." And Saint Bernard: "The will alone burns in hell, because it alone has demerited." Hence the Pharisees are rebuked (*Matt.* 12), who approaching Christ said: "Master, we wish to see a sign from you." Just as sin, then, is only voluntary, so merit and good work proceed only from the will; and therefore man is principally beatified in its act.

Fourth, what more perfectly and intimately attains the beatific object—in the act of that potency happiness is essentially established, as even the opponents concede, for the reason adduced by Aquinas (*loc. cit.*). But the will by its act more perfectly and intimately attains the beatific object. For it tends toward it immediately as toward the ultimate end, since the ultimate end as such is its proper object. For that is more to be willed which is more naturally desired by the appetite; and of this kind is what is nearest to the ultimate, which is absolutely more naturally desired.

Fifth, what is ordered to another is less perfect than what exists for its own sake, and attains less closely the object and end toward which it tends, as is clear of means directed and ordered to an end. But the act of the intellect is ordered to the act of the will; for we know in order that we may love, not the reverse. Hence Augustine (19. *Civit.* 14): "The rational soul has been given to man so that by his mind he may contemplate something, and according to this may do something"; and afterward: "so that he may know something useful, and according to that knowledge may order his life and morals." And earlier (11. *Civit.* 28) he had said: "In human beings who love rightly, love itself is more loved."

Sixth, the habit of the will is nobler than the habit of the intellect: (1 *Cor.* 13): "The greatest of these is charity." And its opposite is worse, namely hatred of God; hence the Seraphim, named from the ardor of charity and love of God, are the first among the celestial spirits. Therefore I wonder at the Coimbra commentators (*loc. cit.*), who, while placing heavenly beatitude in the contemplation of God alone, afterward assert that happiness in the present life consists in meritorious works and acts of charity. For if the latter is placed in works of the will, so also must the former be, since the latter is the way and disposition to the former. If, then, in good acts (*Matt.* 5) the happiness of this world is found, as the Coimbra commentators concede, consequently the beatitude of the other life must also be placed in the act of the same will.

You object, first: (*John* 7): "This is eternal life, that they may know you." But to know pertains to the intellect. Therefore happiness is principally in the act of the intellect. This is confirmed: Augustine (1. *Trin.*, *penult. cap.*): "Vision is the whole reward." But vision is an act of the intellect, just as love is an act of the will. For just as bodily vision is an act of the eye, so incorporeal vision is an act of the intellect. Aristotle seems to touch upon the same (12. *Met.*, T. 39): "The act of the intellect is life, and if the act is eternal, the life is eternal." I reply that this passage is to be expounded of the knowledge of faith, which is called eternal life and the happiness of the way, as is clear from the preceding and following words; Cyril and Augustine interpret the said passage in this way (*quaest.* 113, *Vet. et Nov. Test.*), whom Alphonsus follows (3. *adversus haereses*, *haer.* 4).

Or say with Scotus that in that Gospel passage it is not stated that eternal life consists in knowing. For if the Thomist were allowed to add "by knowing there is blessed life," the Scotist would likewise be allowed to add "by loving and enjoying there is blessed life." Or I say that there is indeed the blessed life of the intellect—but not of the will and of the whole man; and the principal one is that which is in the act of the will. By this, satisfaction is given to Augustine adduced in the confirmation: vision is indeed the whole reward of the intellect, but not of the whole man—only of his intellectual potency, which is beatifiable through vision. But the will is beatifiable through enjoyment, which is more excellent than vision. Therefore happiness consists essentially in enjoyment, not in vision.

You object, second: (*10. Eth. 10, or 8*): "The happiness of abstract substances consists in speculation," which is an act of the intellect. Therefore, since we shall be similar to them, according to Christ's word (*Matt. 12*): "They are as the angels of God in heaven," it is aptly concluded that our happiness too is placed in the act of the intellect. This is confirmed from (*1. Eth. 10*): "Beatitude is a sufficient good." But the vision of God is of this kind, as is clear from (*John 14*): "Lord, show us the Father, and it suffices us." One could reply that there is a twofold happiness—speculative and practical—as Aristotle seems to indicate (*10. Eth., at the beginning of cap. 7; and 7. Pol. 3*). Speculative happiness is situated in speculation, and practical in enjoyment. Therefore the intellect is beatified through speculation or vision, and the will through enjoyment. But happiness is placed more principally in the latter than in the former. Furthermore, one can say from the preliminary notes that the Philosopher comprehends both knowledge and love under contemplation. Or also, as the Doctor says (*at the end of the Prologue*), the Stagirite did not recognize that we can attain God by an act of love and enjoyment; hence he placed happiness in the act of the intellect. To the confirmation, I say that vision is a sufficient good for the intellect, through which the intellect itself is blessed; but it is not a sufficient good for the entire intellectual nature, nor is it the more perfect good. Indeed, love is a more sufficient and more perfect good, because once it is possessed, the one possessing it is less in need, and in it he rests entirely. To the scriptural testimony, I say it is to be expounded of sufficiency with respect to the instruction of faith, which is called the happiness of the way tending toward the happiness of the homeland—not of the sufficiency that is had in the terminus, through enjoyment, which is an act of the will, in which man is quasi-deified.

You object, third: beatitude is the first thing willed; for what we first desire is happiness. But an act of the will is not the first thing willed, because no potency concerns its own direct act as an object, although it can deal with a reflexive act. Therefore happiness does not principally reside in it. This is confirmed: an act of the will is ordered to the end; but happiness is not ordered to anything else, since it is the ultimate end of the blessed person. Therefore, and so on. I distinguish the major: beatitude is the first extrinsic thing willed, which is the beatific object—speaking of objective beatitude—I concede; formal beatitude is the first thing willed as something extrinsic, I deny. For formal beatitude is an intrinsic perfection of the blessed person, which he himself desires, just as each thing desires its own perfection, as Scotus notes (*cit., before §. In ista quaest.*). To the confirmation, the answer is clear from what was said (*quaest. 3, De fine, art. 2*).

You object, fourth: beatitude is the conjunction of the intellectual nature with the ultimate end through its own operation. But the will is not conjoined with the ultimate end through its own operation. For it is not conjoined through desire, which concerns an absent thing; nor through delight, which presupposes the attainment of the end in which one takes delight and rests. Hence Paul exhorts the faithful to acquire happiness (*1 Cor. 9*): "So run that you may

comprehend"; and (1 *Tim.* 6): "Lay hold on eternal life." Since, therefore, the intellect is an apprehensive and comprehensive power, it is proved that happiness is placed in it. I grant the major and deny the minor. For although the will is not conjoined with the beatific object through desire—because beatitude concerns a present thing, and desire concerns an absent thing—nor through delight, which is a passion following upon the beatific act, as the Doctor says (*quaest.* 4, *Prol.*, §. *contra hanc conclusionem*)—hence Augustine (9. *Trin.*, *cap. ult.*): "The appetite of the yearning one becomes the love of the one enjoying"—nevertheless, although by a primacy of origin the blessed person first rests in the act of the intellect, seeing the beatific object and perpetually attaining it, as the Apostle cited indicates, nonetheless by a primacy of perfection he rests in the act of the will, which is the ultimate and most perfect operation of the blessed person.

DOUBT V. In what act of the will does beatitude consist?

Since in the preceding doubt it was decided that beatitude consists principally and essentially in an act of the will, in the present doubt it remains to inquire and discuss what that act is in which happiness is located. All the Scotists, together with Scotus—a man deserving of every praise and armed with truth (*dist. cited*, *quaest.* 5)—assert that it is the enjoyment of the beatific object. In order to understand this correctly:

Note, first, from the Doctor (*loc. cit.*, §. *Ad quaest.*, *A*): the positive act of the will, taken generally, is divided into an act of willing and an act of not-willing. The act of willing is subdivided into an act of willing for its own sake, or for the good of the thing willed, and an act of willing for the sake of another, that is, for the good of the one willing. The former is called the love of friendship, or the affection of justice; the latter is called the love of concupiscence, or the affection of advantage. The latter is not enjoyment, but the former is. For to enjoy is to cling in love to something for its own sake—that is, for the sake of the beloved object. To perceive this better:

Note, second: enjoyment is taken in two ways, as the Doctor indicates (1. *dist.* 1, *quaest.* 5, §. *Ad auctoritatem*; and §. *Ex his patet*). In one way, improperly, in which sense it is said of the sensitive appetite and of other things that in any way attain objects. In another way, properly, and in this sense it belongs only to the will, whose proper act is love, as is clear from Augustine (*cited above*). Enjoyment is further divided into disordered and ordered. Disordered enjoyment is that by which someone enjoys an object that he ought to use for the purpose of enjoying something else—as when a sinner enjoys a creature, although he should use it for loving God and enjoying him. Hence Augustine adds (*lib.* 83. *qq.*, *quaest.* 30): "It is perversity to use what should be enjoyed, and to enjoy what should be used." In this way, the first angel sinned by immoderately desiring beatitude for himself, as the Doctor asserts (2. *dist.* 6) together with Anselm (*lib.* *De casu diaboli*, *cap.* 6). Ordered enjoyment is an act of the will tending toward an

object to be loved for its own sake. And it can be twofold: one of the way and another of the homeland; the former is imperfect, the latter perfect.

Note, third, from the Doctor (*4. dist. 49, quaest. 5, §. Ad quaest., E*): it is more probable that beatific enjoyment differs in species—formally by themselves, but causally from the relations of causes. For if they did not differ in species, they would differ only in degree. And if it were conceded that they differ only in degree, then the enjoyment of the way could be intensified to such a point that it would become the enjoyment of the homeland; and so someone in the state of a wayfarer could be blessed, which is false. Again, to cause the enjoyment of the homeland, the vision of God is presupposed, which is not required for the enjoyment of the way. Hence Scotus (*cit., sub E*) adds that the distinction between these enjoyments is derived from the distinction of unions, just as from different approximations of the agent to the patient, the effect varies. For an agent that is opposed and approximated to a patient along a direct line acts differently than an agent that acts along a reflected or refracted line. Knowledge, however, is like a kind of approximation of the object to the will. Hence, if the enjoyment of the wayfarer were increased to infinity or the highest degree of wayfarer enjoyment were reached, it would never equal the enjoyment of the homeland, and conversely. The reason is that since one species surpasses another in nobility, what is asserted of the individuals of one species must also be asserted with respect to the individuals of the other species; for the series of one differs in being and perfection from the series of the other.

First assertion: beatitude does not consist in an act of not-willing. So holds Scotus (*cit., sub B*). This is proved, first: not-willing for the most part tends toward evil, while willing tends toward good. But happiness not only is directed toward the good, but toward every good—indeed, toward the supreme good. Therefore happiness is not situated in the act of not-willing. Second, the beatific act is primary, per se intended, and immediate to the ultimate end, by which the blessed person is immediately and perfectly united to it. But not-willing is a secondary and occasioned act, and almost always presupposes willing, as Anselm indicates (*lib. De casu diaboli, cap. 3*): "No one abandons justice except by willing something that is incompatible with justice." Therefore happiness does not consist in the act of not-willing. Third, beatitude, from what has been said, consists in the best and most perfect operation. But willing is more perfect than not-willing, just as an affirmative proposition is more perfect than a negative one (*from 1. Perih., cap. 4*). Therefore happiness is not located in not-willing.

Second assertion: neither is happiness placed in the act of concupiscence. The Doctor teaches this (*cited above, before C*). This is proved, first: happiness consists in an act that is good of itself and perfect, as is clear (*1. Eth. 10*). But the act of concupiscence is not per se good, since it can be evil, as is evident from the first angel, who desired equality with God. Hence Augustine (*lib. 83. qq., q. 30*): "To use what should be enjoyed, and to enjoy what should be used, is sin." Second,

happiness is the first and immediate act of the ultimate end; but concupiscence is an act posterior to the act of friendship. For I desire good for Peter because I love Peter, to whom I desire such good. Third, the affection of advantage presupposes the affection of justice. For the latter governs and moderates the former; and concupiscence belongs to the will on account of the affection of justice. Moreover, the act of friendship is directed toward an object that is good in itself; but the act of concupiscence regards one's own advantage. And it is nobler to exist for its own sake than for the sake of another. Therefore happiness is not established in the act of concupiscence.

Third assertion: beatitude consists in the act of willing, which is the enjoyment of God present in himself. The Doctor holds this (*cited above, before D*). This is proved, first: Augustine (*1. De Doctr. Christiana, cap. 4, 5, and 6*): "The supreme reward is that we enjoy him." And this is clear from the definition of enjoyment given by the same Augustine (*ibid., cap. 1*), received by the Master and the other Scholastics: "To enjoy is to cling in love to something for its own sake." Second, happiness resides in the best act of the will; but enjoyment is the best act of the will; therefore happiness is found in it. The major is evident: for the love of friendship is the best operation of the will, by which the blessed person is most intimately and perfectly conjoined with the beatific object. Moreover, the best operation exists in the best and noblest potency. For according to the nobility of the potency one has the nobility of the act; and from what has been said, the will holds primacy among the potencies of the soul—both because it is free and the cause of merit, and because good is better than non-good, and also because charity, which resides in the will, is a nobler habit than faith, which remains in the intellect. Therefore happiness consists in the act of willing.

You object, first: enjoyment is common to both the blessed and the non-blessed; therefore happiness is not found in enjoyment. The antecedent is proved: both the wayfarer and the comprehensor enjoy, for both love God for his own sake; and if someone does not love God for his own sake, he can nevertheless love him—for nothing prevents him from loving God as good in himself with the love of friendship, just as the comprehensor does. Yet the comprehensor is blessed, while the wayfarer is not. Therefore, and so on. I distinguish the antecedent: perfect enjoyment, through which the intellectual nature is beatified and immediately approximated and intimately united to God, I deny; imperfect enjoyment, through which the beatific object is loved by the same creature that does not see it or attain it, I concede. The latter belongs to the wayfarer and the non-blessed; the former to the comprehensor and the blessed. That these differ in species from each other, I noted and showed above.

You object, second: it is not repugnant that someone not existing in grace and charity should clearly see the divine essence and enjoy it; but without charity no one can be blessed, since according to Augustine (*15. Trin., cap. 9*): "Charity alone divides between the children of the kingdom and the children of perdition."

Therefore happiness is not placed in enjoyment. The antecedent is clear from (*1. dist. 1, quaest. 4*), where Scotus says that a blessed person could see God without enjoying him, and could see one divine person without seeing another. I reply that in the given hypothesis, he would not be blessed, because one is not blessed from enjoyment unless the enjoyment is as great as befits a comprehensor—so that it is of that species according to some degree. But no enjoyment without charity can be as great as is required for beatification.

You object, third: all things inferior to the will are in their own way beatified in a qualified sense through the act of concupiscence. Therefore the will likewise can be beatified in the act of concupiscence and in the affection of advantage; but enjoyment pertains not to concupiscence but to the love of friendship, from what was noted above. Therefore, and so on. I concede the antecedent and deny the consequent. The reason is that those inferior things, because of their imperfection, can only attain their own advantage. Hence if there is any enjoyment in them, it is found in the act that they can have; and since they cannot have a more perfect one, they necessarily rest in it. But the will, since it possesses both acts, and the act of friendship is more perfect than the act of concupiscence, consequently happiness is found not in the former but in the latter. Just as the following inference is invalid: "The intellect understands whatever the internal and external senses perceive; therefore the optimal operation of the intellect consists in the sensitive cognition that the said senses possess." This consequent is invalid, as is clear from Aristotle, who places happiness in the contemplation of abstract substances, whose cognition does not fall under the senses.

You press the point from Augustine (*9. Trin., cap. ult.*): "The appetite of the yearning one becomes the love of the one enjoying." Therefore, and so on. I say this is rightly understood: for if it is understood of the appetite by which the wayfarer desires good for himself, such an appetite never becomes the love of the one enjoying, because in that case it is an act of concupiscence, which cannot become an act of friendship. But if it is taken of the appetite by which the wayfarer wills that God be good in himself, because he loves him for his own sake with the love of friendship, then that appetite, which is an imperfect love of friendship in the way, becomes perfect in the homeland and becomes the perfect enjoyment by which man is beatified.

You object, fourth: hope is succeeded by retention. For what we hope for in this life, we hold in the next; hence Canticles 3: "I held him and will not let him go." But retention is an act of the will, and yet it is not enjoyment. Therefore beatitude is found in retention, not in enjoyment. I reply that retention does not belong essentially to beatitude, but accompanies it, just as delight and security, about which we shall speak below. For although retention succeeds hope, it does not follow validly that happiness is formally placed in it. For the enigmatic

vision is succeeded by the clear vision of God, in which beatitude essentially does not reside, as was proved above.

DOUBT VI. Whether and how beatitude is perpetual.

Two things are proposed in the present doubt: one, whether beatitude is perpetual and will always endure—and on this all Scholastics are in agreement and unanimously embrace the affirmative. The other, by what reason beatitude is perpetual—and on this theologians disagree. For Giles (*in the present dist., cited by the Marginists of Scotus*) thinks that the perpetuity of happiness is to be derived from the very beatitude itself, which by its own nature is necessary and is such a form that it cannot fail to inhere in that in which it inheres—just as the most perfect corporeal form constitutes an incorruptible and intransmutable composite, such as the heavens. Others, such as Thomas (*1–2, quaest. 10, art. 1, 62*), hold that the perpetuity of beatitude is to be derived from a habit necessarily and always determining the beatific potency to the beatific act—namely, the intellect to seeing by the light of glory, and the will to enjoying by consummated charity. Scotus, however (*4. dist. 49, quaest. 6, §. Hic duo*), refuting both of the aforementioned opinions, holds (*ibid., §. Dico ergo, F*) that the perpetuity of beatitude comes from the divine will, which just as it willed to beatify the intellectual creature, so also wills to conserve it in that happiness always and perpetually.

Note, first, from the Doctor (*cit., §. Hic duo, B*): besides God, nothing is absolutely necessary, because God alone is through himself and from himself, dependent on nothing. All other things are simply contingent, because they are created and dependent on the divine will in being and conservation. Hence I said (*1. De causis, quaest. 3, art. 1*): if God were to withdraw his sustaining and conserving hand from creatures, they would immediately fall into nothingness. Certain created things, however, are called necessary in a qualified sense—not because they cannot be otherwise, but either because they do not have in themselves a principle of corruption (which is matter with privation annexed to it (*from 1. Phys., T. 80*))—as an angel, which is free from matter—or because they do not have a contrary that could destroy them—as the heavens, for which there is no agent in the nature of things stronger than it that could overcome its power and destroy it; it can be destroyed and annihilated only by God not conserving it. For in this sense, beatitude can be called incorruptible and perpetual: because it has no contrary that could destroy it, and so it always remains and will always continue to remain.

Note, second: "eternal" is taken in many senses, as Vorillong reports from Alexander (*in the matter of sacrifices, 1. dist. 31, art. 1*), which the Doctor seems to reduce to three (*loc. cit., §. De secundo dubio, before L*). First, "eternal" is taken properly for what lacks both beginning and end, being incapable of inception and cessation—in which sense eternity is defined by Boethius (*3. De consol.*): "The complete and perfect possession of interminable life all at once." Second, for a

long temporal duration that will nevertheless at some point come to an end, as Daniel 3: "O king, live forever." Horace also uses "eternal" in this sense, in the epistle cited by Augustine (*lib. 1. qq. in Gen. q. 31*): "He will serve eternally who does not know how to use a little." Third, for a perpetual permanent duration that will never have an end, as Matthew 25: "Depart, you cursed, into eternal fire"; and 2 Corinthians 4: "An eternal weight of glory works in us." Beatitude, however, does not endure in eternity properly so called, as Thomas holds (*4. d. 49, quaest. 2, solut. 3, quaestiuncula*). For as Scotus argues: if substance does not endure in eternity, neither does its act—because an accident is not more immutable than its subject in which it inheres. If, therefore, the act according to substance is measured by aeviternity, as Thomas concedes, consequently the act itself as beatific is not measured by eternity. I add that eternity properly so called belongs to God alone; therefore it is not to be applied to the beatific act. Rather, since it is permanent, it is measured by aeviternity; and if it were successive, it would be measured by perpetual time. Nor is Thomas's reasoning of any weight when he says that because beatitude cannot be attained by the powers of nature, on account of its outstanding and eminent perfection, it must have a peculiar measure, which is eternity, since beatitude is eternal life. For although it is not acquired by natural power, it is nevertheless less noble than substance, since it is an accident, and every accident is of a lower order than any substance. Moreover, the rational soul cannot be produced by natural power—indeed, no intellectual creature can—and yet no other measure is assigned to it than aeviternity, as I said (*in Phys., 1. De tempore, quaest. 1, art. 5*). And so if the aforesaid Doctor, on the basis of his reasoning, admits that the beatific act is measured by eternity, he would necessarily have to concede that the intellectual nature itself is measured by eternity, which he denies elsewhere.

Note, third, from the same (*ibid., §. De tertio, M*): beatitude can be taken in two ways. In one way, as a permanent intensive perfection, insofar as it is permanent—and in this sense perpetuity is not of its essence, because any permanent perfection of any degree of intensity is equally perfect whether it lasts a short time or even a single instant as if it lasted all time, as the Philosopher attests (*1. Eth. 6*): "Nothing is more perfect because it is more lasting; whiteness of one day is equally perfect as whiteness of one year." I am not unaware that the same Philosopher (*3. Top., locus 1*) asserts: "What is more lasting and more stable is better." And (*2. De generatione animalium*): "It is better to be than not to be, to live than not to live." There is no one who would not prefer to live a thousand years rather than, like the ephemeral fish (*from 5. Hist. animalium, cap. 19*), or like certain birds near the Hypanis, to live one day. But these statements, as Scotus writes (*1. dist. 8, quaest. 1; and 4. dist. 12, quaest. 2, §. Hic sunt*), are to be understood as holding other things being equal, as I have noted more than once above. In the other way, beatitude is taken as a permanent intensive and extensive perfection lasting perpetually—and in this sense perpetuity pertains to beatitude just as duration pertains to the thing whose duration it is.

In this sense, beatitude is not a per se unity, just as an operation and its entire aeviternity do not make a per se unity; for they are related as subject and its property, or as measure and measured, as I said (*in Phys., lib. De tempore et motu*).

First assertion: beatitude is perpetual. The Doctor teaches this (*cit., §. Hic duo sunt, A*). This is directed against Origen (*cited and refuted by Alphonsus, lib. 3, adversus haer., verb. beatitudo, haer. 3*), who imagined that the blessed would at some point suffer misery and the damned would have happiness in alternating cycles. This error was derived from Plato, who held that after a great year all things would return to their original state. This is proved, first: Wisdom 5, "The just shall live forever"; Psalm 83, "They shall praise you forever and ever"; and Matthew 5, "The just shall go into eternal life." Second, Athanasius in the Creed: "Those who have done good shall go into eternal life." Augustine (*serm. 17, De verbis Domini*): "The blessed life cannot exist unless it is eternal." And (*serm. 158, De tempore*): "For just as the just person will never leave glory, so the sinner will never be able to be freed from punishment." And the Church sings: "Perpetual light will shine upon your saints, O Lord, and an eternity of ages."

Third, Augustine argues (*13. Trin., cap. 8*): if the blessed person could lose beatitude, he would lose it either willingly, or unwillingly, or neither willingly nor unwillingly. If the first, he would not be blessed, because he would not love it. But the blessed person loves beatitude, which is his ultimate perfection and final end, and all wish to be blessed. If the second, he would be wretched, because he would not will the supreme good; and from what was said above, happiness does not consist in the act of not-willing. If the third, then he is not blessed, because he regards his happiness lightly, when it should be esteemed most highly, since it is the best of all things. Fourth, the same Doctor argues (*12. Civit., cap. 20*): the blessed person either knows that his beatitude will end, or does not know. If he knows, then he is not blessed, because fear is a passion by which the one fearing suffers and does not rest, on account of a future evil that he believes he will endure. Likewise, fear diminishes the love of that which must at some point be abandoned. Hence Christ (*Matt. 6*), to dissuade us from the love of the riches of this world, warns that they will end and be corrupted; and conversely, heavenly treasures will last forever and remain for eternity. If he does not know, then wayfarers are more knowledgeable and learned than the blessed, because the former know that happiness will perish, while the latter are ignorant of this—which is false, since the blessed are adorned with knowledge and crowned with glory. Furthermore, from (*2. De generatione, at the end*): nature desires what is better; but it is better for happiness to be perpetual than to cease, since in it every appetite and desire is to be fulfilled. Finally, no reason can be given why the highest happiness should be only temporary; and to say with Plato that all things will return to their original state is a mere fiction and idle imagination, as I showed with Scotus (*lib. De generatione, at the end*). Moreover, because the soul is immortal, and the body after the day of judgment will be marked with immortality, as Paul testifies (*1 Cor. 15*); and John (*Apoc. 7*): "God will

wipe away every tear from the eyes of his saints, and there shall be no more sorrow, nor mourning, nor crying," and so on.

Second assertion: the perpetuity of beatitude is not derived from the form of beatitude itself, which would necessarily and perpetually affect the subject in which it resides. So holds Scotus (*cit.*, §. *Dico ergo, F*). This is proved, first: a form is no more necessary in a subject than the subject itself in which the form inheres, because if there is any necessity, it is derived from the necessity of the subject sustaining it. But the subject of beatitude, and indeed any other subject, depends on the conservation of God, who freely and contingently conserves it, as I noted above (*Not. 1*). Therefore beatitude too is freely and contingently conserved by God, and consequently is not of itself and by its own nature perpetual. Second, every form really differs from the matter or subject in which it exists, because it is an absolute being and posterior to the subject, and at least by divine power separable from it, as I showed (*lib. 2. Phys., quaest. De forma*). But beatitude is an absolute accidental form, and an action in the category of quality, from what was said above; and every accident is posterior to substance in time, nature, and definition, as the Philosopher teaches (*7. Met., cap. 1*). Third, no form completely satisfies the appetite of matter, which has the appetite for receiving all forms as its perfections, as I said (*loc. cit., quaest. De materia*)—unless the form is infinite. But no created or creatable form can be infinite, since an actual infinite is repugnant. Therefore, since happiness is an accidental form, it is not necessarily and perpetually conjoined with the subject in which it inheres. Fourth, beatitude is no more connected with the blessed person than the blessed person is with God; or rather, beatitude does not depend more on the blessed person and his beatific potency than the blessed person depends on God. But the blessed person depends freely and contingently on God, because God's sustaining and conservation is free. Therefore beatitude is not perpetuated by the necessary union and connection that Giles imagines it has with the blessed person and his beatific potency. Moreover, beatitude is an operation of an intellectual nature; but God can absolutely prevent a cause from producing its effect, as is clear from the fire of Babylon (*Daniel 3*), and from the sky, which for three years by the prayers of Elijah did not provide its influences (*3 Kings 17*).

Third assertion: beatitude is not perennial because in the beatific subject there is no reason of evil or defect. Scotus maintains this (*loc. cit.*). This is proved, first: the blessed person, on account of the beatitude he enjoys, does not lose his will and freedom, since all his natural endowments remain intact—indeed, they are made more perfect. Therefore, when the object is shown to him, he does not relate to it necessarily, but freely and voluntarily possesses it. Consequently, the perennity of the blessed person's happiness is not derived from the goodness of the beatific object. Second, the object of the will, from what was said above, is not the good but being; therefore, with its full freedom and absolute dominion, the will can will, not-will, and suspend its act; it can command the intellect and other potencies, which are subject to its command and authority; it can not-will

the good, will evil, and suspend its act, as I sufficiently showed and proved above, and I composed an entire question (*Tract. De cognoscibilitate Dei, disp. 3*) on the point that the blessed person does not necessarily enjoy the beatific object shown to him.

Fourth assertion: neither is beatitude perennial because of a habit necessarily affecting the beatific potency—namely, through the light of glory necessarily determining the intellect to see God, and through consummated charity necessarily determining the will to enjoy him. The Doctor teaches this (*in the very same place mentioned above*). This is proved, first: a habit that comes to a potency is given to it for operating easily, promptly, readily, and pleurably, as is clear from the definition of habit—not for necessitating and impeding the potency from operating in its own mode. But before receiving the habit, the beatific potency did not operate necessarily, and the will was free and mistress of its own acts. Therefore, with the accession of the habit, its mode of operating is not removed but perfected and ennobled; and so happiness is not perpetuated by a habit superadded to the potency.

Second, when two partial causes concur in simultaneously producing the same effect, and one of them is the principal cause, that principal cause is not necessitated by the less principal cause to produce its operation—rather the opposite, as is clear of intellection, which is produced by the intellect and the known object: yet the intellect is the principal cause of intellection, from which it receives the denomination "understanding," and it is called a vital action. Likewise, an instrument does not necessitate the principal agent to act; rather, the principal agent forewarns the instrument to act and uses it at its discretion. Therefore, and so on.

Third, a prior cause is not compelled by a posterior cause, just as God, who is the first cause, is not determined by a secondary cause. But the beatific potency is prior to the light of glory and to consummated charity, just as a subject is prior to what is in the subject. Furthermore, the beatific potency is greater and stronger than the habit, since it is that by which we simply can act, and the habit is created by God for the sake of the potency. But what is greater and stronger is not necessitated by what is lesser and inferior; rather the reverse. Again, Christ in the way had as great grace and charity as the blessed—indeed greater, since his grace was supreme in the negative sense, as I said (*Tract. De Incarnatione*). Yet his will was free: "He was offered because he himself willed it" (*Isaiah 53*); and he merited by his will and freedom our redemption and salvation. The same must be asserted of the Blessed Virgin, who, more than all others, full of grace, operated spontaneously and freely. Therefore the cause of the perennity of beatitude is not to be placed in habits determining the beatific potencies.

Fifth assertion: beatitude is perpetual through the will of God willing it to endure perpetually. The Doctor holds this (*loc. cit.*), whom Raconius follows (*disp. un. De beatitudine, sect. 4, quaest. 2*). This is proved, first: beatitude is perpetuated

in the same way as an angel or the human nature; for as I was saying above with Scotus, an accident is no more perpetual than its subject in which it inheres. But the nature of an angel or a human being is perpetual by the will of God, as was decreed in the Sixth General Council of Constantinople (*act. 1*): that the angels are immortal and incorruptible by the will of God. Therefore by God's good pleasure, happiness is perpetual. Second, just as by the will of God beatitude is intensified, so also it is extended; but by God's good pleasure beatitude is intensified and the blessed person is perfected. For voluntarily and freely "the Lord will give grace and glory" (*Ps. 83*); and (*Matt. 20*): "Is it not lawful for me to do what I wish?" Moreover, all things that exist and occur *ad extra* are freely and contingently, as I observed above; but formal beatitude is a work *ad extra*, and the beatific object is voluntary. Hence Augustine (*lib. De videndo Deo*) says: "God is a voluntary mirror: if he wills, he is seen; if he does not will, he is not seen."

Sixth assertion: perpetuity is not of the essence of intensive beatitude, but only of extensive beatitude. Scotus defends this (*loc. cit.*). This is proved, first, from Aristotle (*1. Eth. 6*): "Whiteness of one day is equally perfect as whiteness of one year." The reason is that the extension of a thing does not pertain to the essence of its intensity; for the latter is of the category of quality, while the former is of the category of quantity; and the categories are unmixed, from what was said elsewhere. Therefore, and so on. Second, formal beatitude is essentially an operation of the intellect or the will, from the assertions made above; but perpetuity is not an operation, because, being of the category of quantity (which is not active), it cannot be an operation. Moreover, eternity is not of the essence of God's beatitude. For as I proved (*Tract. De Deo uno*), it is a mode of God, and his happiness is situated in operation; otherwise God would be as if sleeping, which Aristotle infers as unfitting (*12. Met.*). Therefore neither is perpetuity of the essence of created beatitude. I add that aeviternity and time are properties of enduring things, as I noted above; but properties are not of the essence of the things of which they are properties, as I showed particularly concerning time with respect to motion, of which it is a property (*in Phys., q. De natura temporis*). Therefore perpetuity does not pertain to the essence of intensive beatitude, but only of extensive beatitude.

You object, first: the same reasoning seems to apply to the certainty of beatitude as to its perpetuity; but certainty is of the essence of beatitude; therefore so is perpetuity. The major seems known and conceded by all. The minor is supported by the testimony of Augustine (*13. Trin., cap. 7*): "What is entirely most blessed will perhaps also be most certain." I grant the major and deny the minor. To Augustine I say, in addition to the fact that Augustine himself adds the particle of doubt "perhaps," his statement is to be expounded of extensive, not intensive, beatitude, as the Doctor says (*cit., §. Ad argumenta, T*). Or say with the same Doctor (*here in Rep.*): beatitude is most certain, not from the nature of beatitude, but from divine revelation, as is clear from the passages of Scripture cited above.

You object, second: it belongs to the intrinsic character of beatitude that it be the best and ultimate perfection, since it is the ultimate intrinsic end of the intellectual creature. Therefore it excludes every privation by which the subject could desire another perfection, and such a perfection could be corrupted and cease to exist; and so perpetuity is of the essence of beatitude. First confirmation: the reason the heavens are incorruptible is that their form fully satisfies the appetite of their matter—and not only that substantial form, but also the accidental form, such as transparency in the heavens and luminosity in the stars. Second confirmation: if a corporeal form can render a body eternal, as the form of the heavens, then surely a spiritual form renders the blessed person perpetual and incorruptible. Hence Saint Paul (*1 Cor. 15*) cries: "It is sown in corruption; it shall rise in incorruption." I reply that the antecedent holds with respect to intensity but not with respect to extension. Hence I said above with the Stagirite that whiteness of one day is equally perfect as whiteness of one year. To the consequent I say that it indeed excludes proximate privation, but not remote privation, and that it fulfills actual appetite but not potential appetite—just as prime matter, with any form received in it, retains the appetite for having other forms.

You press the point: beatitude is the ultimate intrinsic end, ultimately conjoining the intellectual nature with the extrinsic end that fulfills every desire and appetite. Therefore there is no longer any privation by which it could desire another form. I say that it is indeed the ultimate intrinsic end, yet a finite one. Hence it does not exclude remote privation, especially because the blessed do not formally possess every perfection possible for them, but only according to their merits.

You will urge: therefore they are not perfectly blessed, because they do not have whatever they will. For according to Augustine, cited elsewhere: "He is blessed who has whatever he wills." I say that the blessed have whatever they will—namely, justly and rightly, according to the divine law and ordinance. Hence their heart is fulfilled and at rest, especially since they have God, who unitively contains every good. Looking to this, Augustine (*1. Conf., near the beginning*) adds, addressing God: "Our heart is restless until it rests in you." To the first confirmation, I deny the assigned reason for rendering the heavens incorruptible, since absolutely and remotely they are corruptible, though proximately they are incorruptible, because there is no created agent stronger that could destroy them, as I said (*lib. De caelo*). To the second confirmation, the same answer applies: neither a substantial nor an accidental form, since each is finite, satisfies the entire appetite of matter, since matter also desires the other forms by which it is not actually informed.

You object, third: the blessed nature has not been divested of every privation; therefore it can be wretched, since of itself it is capable of both beatitude and misery. But it is impossible for the blessed to be capable of wretchedness;

otherwise they would not be fully blessed—indeed, they would fear lest misery befall them, and fear carries sadness with it, which is far removed from the blessed. Therefore perpetuity is of the essence of happiness. I reply that as far as concerns its own nature, the intellectual nature is capable of both contraries; for the same thing is the subject of contraries (*2. Top., cap. 2; and in the Postpredicamenta*). Nevertheless, it will never be wretched, because it knows from God's revelation that it will always remain in beatitude. Hence neither fear nor sadness falls upon it. Similarly, the damned know that they will be subject to perpetual punishments, and therefore they are afflicted and saddened to the highest degree.

You object, fourth: (*1. Eth. 8*): "Happiness is the best operation according to a perfect life," which for Aristotle includes perpetuity. Hence he considers it unfitting that the happy person could become wretched. Therefore, in the Peripatetic school, happiness is essentially perpetual. I reply that Aristotle speaks ambiguously and hesitantly on these and similar points, just as on the immortality of the soul. For (*12. Met.*) he writes that our beatitude is not perpetual; and (*3. Eth., cap. 9*) that after death nothing good or evil can happen. Nor is this surprising, since he did not know true happiness, which cannot be known by the powers of nature, being supernatural and therefore revealed to us by God. Speaking of this, Augustine (*12. Civit., cap. 20*) says: "That true happiness is truly promised to us, of which there will be a sure security, always to be maintained, and never to be broken by any unhappiness." And (*13. Trin., cap. 9*): "For those who attempted to discover these things by human arguments—however great their genius, however abundant their leisure, however subtle their learning—were scarcely able to arrive at the investigation of the immortality of the soul alone. Yet they did not find for that soul a stable blessed life—that is, a true one."

DOUBT VII. Whether beatitude renders the blessed person impeccable.

That the blessed person is impeccable, infallible, and unable to deviate is held by all orthodox Doctors; but by what reason and what cause he is impeccable, the Scholastics investigate and debate. For many, such as Raconius (*recently cited, quaest. 1, art. 2*), think that the impeccability of the blessed person necessarily comes from the force and nature of beatitude, so that in him there is absolutely no power of sinning—neither proximate nor remote. Scotus, however (*4. dist. 49, quaest. 6, §. Dico ergo, G*), Vorillong, and others in the same place teach that the blessed person is impeccable in the divided sense. For the explanation and resolution of this:

Note, first, and recall from what was said (*in the Epitome, 1.3. q. 4, a. 3, n. 9*): what the composite sense and the divided sense are. When it is said that the blessed person in the composite sense cannot sin, this means the same as saying that he cannot simultaneously be blessed and sin, because sin and happiness are opposed. For beatitude excludes every defect, and sin is a defect from the divine

law and the first rule. Hence the blessed person, as blessed, is impeccable—just as a white wall, as white, in the composite sense cannot be black, as was sufficiently explained in the passage just mentioned. In the divided sense, however, it is not repugnant that the blessed person could sin, or have the potency and possibility of sinning. To perceive this better:

Note, second, from the same Doctor: the potency of sinning is distinguished into remote and proximate. Remote potency is the created will, which by its very nature is defectible and liable to sin. For it is finite, free to do good or evil, and mistress of its own acts; and insofar as it is forewarned and determined from without—that is, by the divine will—to will the good, to continue and perpetuate the optimal act of enjoying the beatific object, it is called a remote potency, just as matter that is not prepared and disposed for receiving some form is said to have a remote potency for that form. Proximate potency for sinning, on the other hand, is the same will remaining in itself, free to either alternative, forewarned and determined by no extrinsic principle, with no obstacle interposed; it can choose the good or the evil presented and set before it—just as matter, when prepared and well disposed, can proximately and immediately receive the form produced or introduced or educed by the agent. Thus the blessed person does not have a proximate potency for sinning, because his will is forewarned by God to continually perpetuate his beatific act; while that act stands and endures, his remote potency for sinning can never be recalled to the act of sinning. For a secondary cause, forewarned by the first cause to act toward one opposite, cannot go out into the other opposite. Nevertheless, the blessed person has nothing intrinsic by which he is intrinsically rendered incapable, impotent, and repugnant to sinning; since his nature is defectible and liable to sin, because it is dependent, finite, and acknowledges a superior rule.

Note, third, (*ibid.*, *from that, extra, I*): an operative potency is not called a potency unless all the things necessary for acting are present and all impediments that could impede its operation are removed. For just as (*from 9. Met. 6*) nothing is in proximate passive potency unless the impediments preventing some form from being received in it are removed, so there is no proximate active potency unless all the requisites are present and the obstacles capable of impeding it from going forth into act or operation are removed. Similarly, in the blessed person there is the same volitional potency as there was before, while he was not yet blessed, and this is called the remote potency of sinning—simply defectible and liable to sin, lacking nothing necessary to it, since it is intrinsic to him, as are the remaining potencies. Yet in him there is no proximate potency of sinning, since he is forewarned by the first cause, which continuously produces the act opposite to sin—namely, the beatific act.

Note, fourth, from the same (*ibid.*): it is not contrary to the nature and freedom of the will to be forewarned and determined by the first cause, because the

secondary cause is inferior, is essentially subordinated to the first cause, and depends on it in being and operating—which the philosophers, notably Aristotle (*7. Phys. 1; and 8 of the same work*), recognized, professing that maxim: "Whatever is moved is moved by another," by reason of which they arrived at the knowledge of the first mover and first cause. It would, however, be contrary to its nature and freedom if it were determined by a habit, because since a habit is inferior and is given so that the potency may use it, consequently the potency cannot be forewarned and predetermined by it, since it is prior to and nobler than the habit, and is the principal cause. For the potency is that by which we simply can act; the habit inclines it, facilitates it, and partially—yet less principally—concurr in the operation. How created freedom, forewarned by the divine will, remains unimpaired, see Scotus (*loc. cit.*).

First assertion: the blessed are actually impeccable. Scotus holds this (*loc. cit.; and 3. dist. 22, quaest. un.*). This is proved, first, from Augustine (*lib. 3, contra Maximinum, cap. 13*); Nazianzen (*orat. 44, in principio*); and others passim. And it can be corroborated from that passage of Scripture (*Apoc. 2*): "Nothing defiled shall enter the kingdom of heaven." If, then, in order to enjoy glory, one must be immune from every stain of sin and blemish of fault, consequently in that kingdom no sin is committed, and the blessed are impeccable. Second, two opposites cannot be simultaneously in the same subject, according to Aristotle (*in the Postpredicamenta*); but beatitude is opposed to sin, and that state is opposed to this one. For in the former there is supreme rest and perfect peace; in the latter, continuous labor and perpetual warfare. Third, the blessed are in their terminus, just as the damned can no longer merit or demerit. For each remains perpetually in his city, by the decree of God, who immutably determined from all eternity that the children of peace and salvation should forever dwell in the heavenly city of Jerusalem, while the children of perdition and reprobation should be tormented with eternal punishments and torments in the city of Babylon and Tartarus.

Second assertion: the reason why the blessed are impeccable is the will of God forewarning and determining their wills to the perennial and perpetual enjoyment. Scotus teaches this (*loc. cit., sub G*). This is proved, first: the cause of the perpetuity of the beatitude of the saints is not the nature of beatitude itself, which is an accident really distinct from the subject in which it exists, separable by divine power, and contingent, as was proved in the preceding doubt. Therefore the cause of their impeccability is likewise not beatitude, which of itself is a separable accident, nor anything else extrinsic to them, but the divine will forewarning and continuing the beatific act. Second, when the first cause acts and forewarns the secondary cause, the secondary cause cannot resist; and when the first cause does not act, the secondary cause cannot act, as is clear from the fire of Babylon, which, when God suspended his concurrence, did not burn the three Hebrew youths cast into it. Moreover, by God's ordained power it has been decreed that the blessed will always remain in the good, as the

theologians commonly assert, and will not decline to evil—since in that state there will be no more pain or grief. Therefore the will of God, always concurring in the beatific act and not in its opposite, is the cause of their impeccability.

Third assertion: in terms of possibility and remote potency, the blessed are capable of sinning. The Doctor teaches this (*cited above, H*). And he asserts the same of Christ as man (*3. dist. 12, quaest. un.*). This is proved, first: created nature and free will are not destroyed in the beatific state but perfected; they are not removed but persist to the highest degree, and only accidents are bestowed on them, such as the light of glory and consummated charity, which together cause the beatific operation. But the said accidents do not take away the volitional power, which of itself can act well or badly and is capable of turning to either alternative, since it is essentially free, finite, and created. And the aforementioned accidents really differ from it, and so by the absolute power of God can be separated from it; they adorn it, perfect it, and conjoin it with the most perfect good and ultimate end. Second, the will of the blessed person, precisely and absolutely, is dependent, acknowledging a superior rule; but God alone is impeccable, because he is independent and the first rule of all things. Therefore the blessed person is absolutely and remotely capable of sinning. Third, God according to his pleasure and good will gives grace and glory to whom he wishes, as is clear from (*Matt. 20*): "Is it not lawful for me to do what I wish?" Therefore, absolutely, just as God freely bestows glory on the blessed, he could also take it away. And supposing that he were to take it away from the blessed person, the latter, left to himself as he was before beatitude, would undoubtedly then be capable of sinning. And so by remote potency and in the divided sense, the blessed person is capable of sinning.

You object, first, against the first assertion, from (*4. Top. 5*): God and the virtuous person can do wicked things; therefore the blessed person too is capable of sinning, just as God. Thomas responds, as cited by Vorillong (*3. dist. 12*): "If God wills"—but God cannot will to do wicked things, therefore neither can he sin. Against this: the power of God is his will; if therefore God can, then he wills. Moreover, Aristotle does not speak conditionally but absolutely, as is clear to one reading that book. The Seraphic Doctor responds that the cited statement was given by way of example, and examples do not require truth, as Ferchi notes in a similar matter (*vest. 3, leg. 2, cap. 6, before num. 58*). Or I say it is to be understood permissively, not effectively—as Exodus 4: "I will harden Pharaoh's heart," as Alphonsus explains (*1.10, adversus haereses, haer. 1, verb. malum*). Or it is understood of an angel or demon, for it is common for Aristotle to take "God" for "angel," as I noted (*in Log., lib. 3, q. 4, art. 3*).

You object, second: if God were to forewarn and determine the will of the blessed to the beatific act, then it would be coerced and would not be free in eliciting its acts. But to remove freedom and contingency from a secondary cause is absurd and incongruous, since it is against its nature. This is confirmed:

there would be nothing praiseworthy or commendable in the beatific operations, and the blessed person would be like a log or an inanimate and irrational thing, which cannot operate otherwise—although in heaven full freedom is promised to him; indeed, the will will be freer there, as Augustine attests (*in Ench.*, cap. 14). I deny the consequent, because as I noted above, since the secondary cause is subordinated to the first cause, if it is forewarned by it, nothing happens against its nature, which is so ordered and subordinated to the first cause—especially since it concurs in its optimal perfection, toward which it naturally inclines. Hence there is no coercion or violation of freedom. To the confirmation, I say this is praiseworthy, since the secondary cause determines itself to the good and cooperates in the good with the first cause. Therefore, since the secondary cause concurs with the first cause in bringing forth the beatific act, it does not follow that it is like a log or any other of the alleged inconveniences.

You object, third: Augustine (*in Ench.*, cap. 86) writes: "Just as our soul has the disposition of not willing unhappiness, so it will always have the disposition of not willing iniquity." And in the same place he adds: "Not only do we not wish to be wretched, but we can in no way wish it." Therefore in the blessed there is no potency of sinning, not even a remote one. This is confirmed: (*2. Perih.*): "When the possible is posited as actual, nothing impossible follows." If, then, the blessed person can sin, and supposing that he does sin—which does not involve a contradiction—it follows that he is not blessed but rather deserving of punishment and damnation, which is completely absurd. Therefore, and so on. I reply that Augustine is to be interpreted of proximate potency, not remote; or of fact, not of possibility; or of natural inclination, not of absolute possibility. To the confirmation, the same must be said: namely, in the divided sense and by remote potency the blessed person can sin, but not in the composite sense, by proximate potency, and by the ordained law of God, by which he has decreed that the blessed person will perpetually persevere in goodness and happiness, and will never fall into evil or sin. What is adduced from (*2. Perih.*) is explained by Scotus (*in dist.* 39, §. *Ad 1. arg.*, q.); see there.

DOUBT VIII. Whether beatitude renders the blessed person secure.

This difficulty has affinity with Doubt VI above, in which we investigated whether perpetuity belongs to the essence of beatitude. Hence from the resolution of that doubt, the resolution of this one is easy. For just as perpetuity presupposes beatitude, as measure presupposes the measured, so security presupposes happiness, just as an object is presupposed by what accompanies it. Security, however, does not regard the beatific object but beatitude itself, concerning which the blessed person is rendered certain and secure. To make what we have proposed clearer:

Note, first: certainty and uncertainty pertain to the intellect. For it is the intellect that is made certain or uncertain, or doubtful, about some object, as I touched

upon (*in Log., lib. 5, quaest. 4*), and will be examined in detail in its proper place. Fear and security, however, pertain to the appetite—whether sensitive or intellectual—and presuppose the apprehension of sense or intellect. Fear presupposes the apprehension of sense or intellect about an evil to be inflicted or about a continuing inflicted evil, as the Doctor notes (*cit., §. De secundo principali, P*); and concerning this the intellect is usually certain, though sometimes doubtful—although properly speaking, fear is not about what comes into doubt, as Scotus writes (*in Rep. here, §. De secundo principali*). Since fear and security are opposed, and opposites are placed in the same subject, and the same reasoning and discipline applies to opposites, consequently from the explanation of fear, the understanding of security is clear. Therefore the fear of an intellectual nature resides in the rational appetite, that is, in the will; and the same must be asserted of security, which also has its seat in the will, following upon the certainty about a good to be conferred or about a conferred good to be continued.

Note, second: "retention" is an equivocal name, of which the Doctor adduces four senses (*cit., §. De secundo principali, R*). First, retention is taken for the holding of an object in memory, when one retains the object itself through an impressed species, or through a habit, or through some other mode; in this sense, retention pertains to the intellect, which is not distinguished from the intellectual memory, from what was said (*lib. 3. De anima*). Second, for the actual intellection of an object, which occurs when the intellect actually contemplates the object, and in that contemplation the will holds the intellect itself, commanding the intellect not to turn to meditating on something else; and in this respect retention pertains to the will, and in the other respect to the intellect. Third, for the love of concupiscence, by which someone desires for himself a good that he hopes to possess. And retention so taken succeeds the virtue of hope, when we hold, possess, and enjoy what we desired through hope. Fourth, for the act of attainment, or the passion following upon the passion of hope, which is in the irascible. In none of these senses is retention of the essence of beatitude. In the first sense, retention precedes beatitude and pertains to first act of the intellect, while beatitude pertains to second act, as is clear from what was said. In the second sense, it is an act of the intellect, which also precedes beatitude, which is an act of the will subsequent to the act of the intellect, just as the will is naturally posterior to the intellect. In the third sense, it is the love of advantageous good, in which beatitude does not reside, since beatitude is the love of the honorable good, existing not for the sake of others but for its own sake. In the fourth sense, retention is a passion subsequent to beatitude, just as perpetuity accompanies intensive happiness.

First assertion: the blessed person is secure concerning his beatitude. So holds Scotus (*cit., §. De secundo principali, P*). This is proved, first: Psalm 111, "He will not fear evil tidings"; Psalm 22, "I will not fear evils, for you are with me"; and John 7, "No one will snatch them from my hand." Second, Augustine (*serm. 143, De*

tempore; and 12. *Civit.*, cap. 20; and in Ps. 99): "But there, when we shall have arrived, there will be perfect security." Third, fear is opposed to security, as I noted above; but fear cannot fall upon the blessed—otherwise they would not be blessed, for they would be afraid of losing their beatitude and would suffer in some way, because fear is a passion. Therefore, if the blessed were not secure about the perpetuation of their happiness, they would not intensely love God, because no one greatly loves what he fears he will at some point lose. But the blessed love God as much as they can love him, as well as their own formal happiness, in which they ultimately rest and take delight. Moreover, beatitude is eternal; therefore also secure, because the object of security is beatitude, which the blessed are certain and secure they will always possess.

Second assertion: the security of beatitude is not derived from the nature of beatitude itself, nor from any created object, but from the revealing divine will. The assertion is tripartite, and Scotus holds it (*ibid.*). The first part is clear from what was said about the perpetuity of happiness, which of itself is contingent, like any other created thing, and is perpetuated through the divine will. Similarly, security does not come from happiness itself, which is an accident and a property really distinct from the subject in which it inheres, and removable from it. Therefore, just as by God's good pleasure it is perpetual, so also it is secure.

The second part is also obvious: for the powers of nature do not attain it, since it is supernatural. Hence Augustine (*recently cited*) reports that men who were otherwise most learned and most subtle did not attain it, but fell into perpetual circles and empty windings, detours, and returns to impossible miseries—about which perhaps the Prophet says (*Ps. 11*): "The wicked walk in circles." Again, what depends on the divine will cannot be demonstrated, and beatitude, its perpetuity, and its security depend on the divine will, as will shortly be shown.

The third part is supported: John 10, "No one will snatch them from my hand." Hence the Church sings: "In eternity is their rest"; and "There shall be no more mourning, nor crying, nor any pain." Furthermore, the blessed know that God is truthful and unchangeable; since, therefore, God has declared that the blessed will forever remain in happiness, it plainly follows that through the divine will they are secure about it. Again, just as the damned are vehemently afflicted about the punishments to be continued for eternity (*Matt. 25*): "Depart into eternal fire"—so by contrast the blessed rejoice about the glory to be perpetually enjoyed and possessed, the divine will so revealing. The Church sings: "In the heavenly kingdoms is the dwelling of the saints, and in eternity is their rest."

Third assertion: security is not of the essence of beatitude. The Doctor teaches this (*cited above, Q*). This is proved by analogy with perpetuity, which from what was said is likewise not of the essence of beatitude but is a property of it, following and accompanying it. But security presupposes beatitude; and what presupposes and depends on something else does not enter into its essence—

this is well known. For the posterior is not of the essence of the prior. Moreover, intensive beatitude can exist without security—as if there were an hourly or momentary happiness. But what can exist without another is not essential to it—no one doubts this. Therefore I conclude that security is not of the essence of intensive beatitude.

You object, first: beatitude is the end of all desires; for through it the intellectual nature is satiated, and its appetite can progress no further, since outside of God, who is infinite and the ultimate end, there is nothing. Therefore, just as it is natural for each thing to remain in the good and persevere in its attainment, so permanence and perpetuity are essential to that state, and security as well. Moreover, Scotus, responding to this objection, says it is true of the extrinsic end that unitively contains every good, but not of the intrinsic end, which is finite and can lack some perfection. But if this response holds, it follows that the blessed person is not perfectly blessed, because his appetite is not fully and perfectly satisfied. I reply that the argument concludes about extensive beatitude and about the extrinsic or objective end, which is God—but not about the intrinsic end and intensive beatitude. To the added point, I say the blessed person is perfectly blessed, even though he does not have every degree of happiness, because he conforms to the will of God and his merits. Hence Augustine says (*13. Trin., cap. 5*): "He is blessed who has whatever he rightly wills"—where he aptly places the adverb "rightly," because if he wished for more, he would not rightly will, nor would he be blessed, because he would not conform to the will of God.

You object, second: the punishment of the damned is eternal; therefore the glory of the blessed is certainly eternal. The antecedent is clear: guilt is infinite, namely against God, who is infinite. But guilt cannot be infinite intensively—otherwise there would be a formally infinite evil, which is impossible. Therefore it will be infinite extensively, that is, in duration. If, then, perpetuity belongs to the intrinsic nature of duration, security likewise belongs to its nature. I distinguish the antecedent and the consequent: of itself, I deny; by the will of God, I concede. To the proof, I say that guilt is intrinsically and formally finite, because it is from a finite will; but extrinsically and objectively infinite, because it is against God, the infinite object. But God willed by his will and liberality to give an eternal reward to the just—which is not rigorously from justice but from his goodness and liberality. For even if the just person enjoyed the divine essence for an instant, it would exceedingly surpass his merit; yet God so willed and decreed that the blessed should perpetually enjoy the supreme good. Similarly, he was pleased to decree that the damned should be eternally tormented in punishment for their sins.

DOUBT IX. Whether joy is of the essence of beatitude.

The two princes of the Scholastics, who disagree in the preceding questions, also dispute in the present one. For the Angelic Doctor (*4. dist. 48, quaest. 3, art. 1*)

thinks that joy enters into the essence of beatitude. The Subtle Doctor, however (4. d. 49, *quaest.* 7), teaches that joy is not of the essence of beatitude.

Note, first: joy, delight, exultation, pleasure, and the like are commonly confused, although they differ from each other in some way. They are attributed both to material potencies, such as the sensitive appetite, and to spiritual ones, such as the rational appetite. For man is said to rejoice in the vision and enjoyment of spiritual things, as well as in good and delicate food. Properly speaking, however, joy is a passion of the soul following upon an intense act of love concerning the beloved object. Gladness designates a movement and expansion of the interior powers. Hence it is called "laetitia," as if "latitia" (breadth), because it makes the soul broad, as it were, spreading its forces outward. Exultation denotes an exterior movement proceeding from the heart and appearing externally; hence it is named "exultation," as if "leaping out." These reside in the concupiscible, presuppose the operation of the lover concerning the beloved object, and subsequently follow and accompany it. Hence the Doctor (*cit.*; and 1. *distinct.* 1, *quaest.* 3, *Rep.*) plainly distinguishes delight from love, because the latter is an action and the former a passion.

Note, second, from Scotus (*in 4, loc. cit.*, §. *Dico ergo, A*): the will can be considered in two ways—as operative and as receptive. If considered in the first way, as operative, it is ultimately perfected through the operation by which it is perfectly and intimately conjoined with the absolute best, which is its beatific object; and in this operation beatitude is essentially located. If the will is considered in the second way, as receptive, it is perfected through supernatural passions, of which it is ultimately receptive—namely, joy, delight, and the like. Hence Scotus gathers (*ibid.*) that joy more closely approaches beatitude than security does. For formal beatitude and joy reside in the same potency, namely in the concupiscible. The will rests through delight insofar as it receives it, just as the same will is perfected through operation insofar as it is operative. But security is in the irascible, which follows hope—not the virtue but the passion—as I touched upon in the preceding doubt.

Assertion: joy is not of the essence of beatitude strictly taken, but is a passion following upon it. So holds Scotus (*cited above*). This is proved, first, from Aristotle, who (10. *Eth.* 4) says that delight (which from what was said above coincides with joy) supervenes upon operation. For after the operation, delight comes and is something supervening; it perfects the operation as beauty perfects a young person. But beatitude consists in operation, from what was shown and proved above. Therefore joy does not enter the essence of beatitude in the school of Aristotle. Second, love and delight differ in that love is an action of the will, about which as an object there can be delight—for someone can take delight in love—as Scotus writes (*in Rep.*, 1. *dist.* 1, *quaest.* 3). But delight and joy coincide; therefore, and so on. Third, beatitude consists in the intimate union of the blessed person with the beatific object; but this union is effected through

operation, which joy accompanies. Again, beatitude regards the beatific object not only as efficient cause but also as object; delight or joy, however, is directed toward the beatific object only as efficient cause, by which it is caused. But beatitude, since it is a vital operation, is effected partially by the blessed person, who relates to it not only passively but also actively. Finally, we desire many things (*from 10. Eth., cap. 3*) even though we have no delight—such as knowing, remembering, and things of that sort. Hence operation does not exist for the sake of delight, but rather the reverse, as the Philosopher says (*loc. cit.*): we do not work in order to rest, but rest in order to work.

You object, first: Saint Augustine (*10. Conf.*) writes: "Joy is the blessed life." Therefore joy is of the essence of beatitude. The antecedent is clear from a definition to what is defined. For if it is valid to say "man is a rational animal," it rightly follows "therefore a rational animal is man." Similarly, "the blessed life is beatitude," and conversely; and "joy," according to Augustine, "is the blessed life"—so it is plainly deduced that joy is essentially beatitude. This is confirmed from (*10. Eth., cap. 1 and 2*): "Delight is the ultimate good"; and in the same place: all things desire delight. Therefore joy is essential to happiness. I explain Augustine with Scotus: causally, insofar as the blessed life causes joy, just as a nature causes a property. And this is clear from Augustine's words: "Whose joy you yourself are, and this itself is the blessed life: to rejoice about you, on account of you, for your sake." Or say that it is not an essential definition but a descriptive one—just as when we say "man is a risible animal." Hence joy is not in the will as operative, but as receptive of its passions, among which joy is numbered. To the confirmation, the answer is clear by the same reasoning. Delight and joy are a good that follows upon beatitude as a passion perfecting the will not as operative but as receptive, as was explained above. This is how the Philosopher is to be interpreted in the places cited.

You object, second: beatitude is perfect rest and the satiety of all desires, as is clear (*Apoc. 14*): "Let them rest from their labors"; and (*Ps. 16*): "I shall be satisfied when your glory appears." Hence Augustine adds. First confirmation: "No good satisfies except God." But joy is perfect rest; therefore it is essentially beatitude. I reply that indeed in the blessed person there simultaneously exist beatitude, joy, and things of that sort, but not in the same way. For beatitude is that by which *per se primo* man is blessed; but joy follows upon happiness, as a property follows its subject from which it emanates.

You object, third: by his absolute power, God can remove whatever is not of the essence of something, especially if it is really distinct from it, posterior to it, and essentially independent of it, as I asserted and showed elsewhere from Scotus. If, then, joy were not of the essence and quiddity of beatitude, by divine power there could be beatitude without joy and delight; but it is repugnant that beatitude should exist without joy, as the Savior indicates (*John 16*): "Your joy no one will take from you." Therefore joy is of the quiddity of beatitude. I concede

the antecedent and deny the consequent, and its assumption. For there is no contradiction; and although it is repugnant, it will never happen. For God has so disposed that delight, joy, and things of this sort are annexed to beatitude. For I said above that intensive beatitude could last for an instant, although this will never happen, but will endure perpetually. Furthermore, *ad hominem*, there can be vision without enjoyment, and yet this will never occur—although Thomas does not wish enjoyment to enter the nature of beatitude.

You object, fourth: what is better and more perfect is to be attributed to beatitude, since it is the greatest of all perfections. But it is better and more perfect for beatitude to have joy as essential to it than not to have it. Therefore, and so on. I reply that the major holds provided it is not repugnant to it; but it is repugnant that joy, since it is a property of beatitude, should be of its essence—just as it is repugnant that the posterior should be of the essence of the prior, and that a property should be of the essence of the subject of which it is a property, as if risibility were of the essence of man, and wisdom, which is an accident, were of the quiddity of the same. So I responded (*lib. De mundo*) to those who assert that it is better for the world to be a composite than something one by unity of order, since the former contradicts the world, while the latter is congruent with it.

DOUBT X. Whether man is the lowest beatifiable being.

In this difficulty, three things can be inquired. First, whether man is beatifiable. Second, whether human nature among beatifiable creatures is the lowest and last. And third, whether the philosophers recognized that man is to be beatified with the true beatitude that we hope for and expect to possess after this life.

Note, first: creatures are of three kinds. Some are inanimate, such as stones, and these are unfit for happiness; for although they seek their proper center in which they rest, nevertheless, because they do not operate there, they are without and incapable of beatitude, since happiness consists in operation. Some are animated and operative in their proper places, yet they are entirely material and use corporeal potencies for operating, and they deal with corporeal and material objects; and since the properly beatific object is spiritual, consequently they cannot properly be beatified, as Aristotle notes (*1. Eth. 9*). Others are entirely spiritual creatures, such as angels, and that they are beatifiable no one doubts. There remains man, who consists of body and spirit; and indeed his soul is capable of happiness, for it possesses intellect and will, which are operative potencies capable of attaining the beatific object through their operations. As for his material potencies, which are called powers of the whole composite, although the same reasoning seems to apply to those in man as to those by which brutes are equipped, yet because the human body is informed by the rational soul, and the beatitude of the soul overflows into the body (as will be shown below), the inferior potencies of man are therefore called beatifiable—not absolutely, since the beatific object is beyond the scope of their objects, but

in a qualified sense, insofar as they operate in their own way as they can, and rest in their operations. Just as our sight cannot as clearly behold the sun as the eye of an eagle, nevertheless it rests in the vision of the sun, because it sees as much as it can see. For it suffices to fulfill the appetite of a nature if it has as much as by its own nature it can have, and is suited to having it.

Note, second: although man naturally desires beatitude, nevertheless he does not know by natural powers the sufficient and opportune means for attaining it; rather, these must be revealed to him by God, and he must be instructed in what is necessary for its attainment, as I asserted (*in the Prologue, quaest. 1, art. 2*).

Hence the Philosopher, led by nature, could not arrive at knowledge of true happiness, because he was not illuminated by the light of faith, and perhaps did not recognize any state of man other than this one. Although, however, as Scotus argues (*4. dist. 49, quaest. 8*), man can know and speculate about being and what is contained under it, and arrive at the knowledge of God the supremely good, in whom alone as the best and most perfect he can be satisfied, nevertheless by his own power he cannot know whether he can attain that best by operation—and therefore clearly see, enjoy, possess, and rejoice in it—as I pursued at length (*Tract. De cognoscibilitate Dei*).

First assertion: man is beatifiable. The Doctor maintains this (*cit., §. Respondeo, shortly before A*). This is proved, first, from Scripture: 1 Corinthians 13, "Then face to face, and I shall know as I am known"; and Matthew 22, "They will be as the angels of God in heaven." Second, from Augustine (*12. Civit., cap. 20; and Oratio contra Iudaeos, Paganos et Arrianos*); and passim elsewhere. Third, each thing inclines toward its own good and is perfected with its ultimate perfection in the best and most perfect good. But human nature is of this kind. For it tends toward its ultimate perfection, and through it is ultimately perfected. But its ultimate perfection is beatitude and the end of actions (*1. Eth. 7; and 10. Eth., cap. 8*). Therefore, and so on. Fourth, God is blessed through the vision and enjoyment of himself. For he is not as one sleeping (*from 12. Met. 51*), but lives an intellectual life, which is situated in the operations of the intellect and will. But human nature possesses intellect and will; therefore it is beatifiable. Furthermore, Christ promises eternal life to the good, which is beatitude: (*Matt. 25*) "The just shall go into eternal life"; and (*John 4*) "It will become a fountain of water springing up into eternal life."

Second assertion: human nature is the last among natures that are beatifiable absolutely. The Doctor holds this (*loc. cit., §. Secundo videndum, before E*). This is proved, first: Augustine (*lib. De natura boni contra Manich., cap. 7*): "The other things that are made from nothing, which are certainly inferior to the rational spirit, can neither be blessed nor wretched." And (*14. Trin., cap. 8*), speaking of human nature: "It is capable of that of which it is an image." But the image is not in any creature lower than humanity, as is clear from what was said (*Tract. cited*). Therefore humanity is the lowest beatifiable nature. Second, natures inferior to

humanity operate only with organic and material operations, by which the beatific object, which is immaterial and spiritual, cannot be attained.

Furthermore, in the above-mentioned treatise I asserted and proved that God cannot be seen with corporeal eyes, and therefore cannot fall under the object of any corporeal and material potency. Aristotle agrees (*1. Eudem. 4*): "For neither a horse nor a fish nor any other kind of animal is called happy." And (*10. Eth., cap. 8*) he asserts the same.

Third assertion: a certain nature inferior to humanity is beatifiable in a qualified sense. The Doctor teaches this (*loc. cit.*). This is proved, first: (*Luke 10*) "Blessed are the eyes that see what you see"; and (*ibid. 11*) "Blessed is the womb that bore you, and the breasts that nursed you." Where the Seraphic Doctor adds: "Mary was blessed not only because she bore Christ in the flesh, but even more blessed because she most perfectly bore him in her mind." Second, every nature that can be conjoined with its own best and ultimate end through its own operation is beatifiable in a qualified sense, because beatitude occurs through the union of the beatifiable nature with its own best—I say with its own best, not with the absolute best, because it is not beatifiable absolutely. But a certain nature inferior to humanity, such as the sensitive nature, can be united to its own best through sensitive potencies, as is clear (*Job 19*): "In my flesh I shall see God my Savior." Therefore human nature is not the lowest beatifiable. Third, the whole man is beatifiable, because the whole man merited, as will be shown in the following article. In man, however, besides the rational nature, there is a corporeal sensitive nature, which through its powers subject and obedient to the will, just as it merits, so also is beatified. Hence after the day of judgment, man's beatitude will be greater and more ample, because his body is to be blessed, as will be shown below—and this only through the sensitive faculties and potencies operating and attaining in their own way the beatific object. Hence the bodies of the saints and the relics of the just are honored on earth—both because they were instruments and causes of good works, and because after the end of the world they are to be blessed and glorified in heaven, as Christ indicates (*Matt. 17*): "His face shone like the sun." And it is a probable opinion of some that the inferior and natural potencies are blessed with respect to the most beautiful body of Christ.

You object, first: a part is inferior and less noble than the whole, as I said (*1–2. Phys., q. De composito, art. 2*). But the soul, which is a part of man, is beatifiable—indeed, now the soul alone is blessed, and the whole man will be blessed after the day of judgment. Therefore a certain nature inferior to humanity is capable of beatitude. I reply by granting the major; to the minor I say that the soul is the immediate receptive subject of beatitude, and functions as the subject-by-which; but man is its mediate subject, and functions as the subject-which. For man understands and wills through the intellect and the will; intellections and volitions are immediately located in these potencies, and mediately in man. But when the question is raised whether a nature inferior to human nature is

beatifiable, the doubt is raised not about the rational soul, but about corporeal and material natures.

You object, second: those things that are ordered to one end, which are nearer and more immediate to it, attain it more nearly and immediately; while the rest, which are more remote and distant from the end, reach it through the prior ones—as if someone were to ascend to heaven, he would pass through the air and fire before reaching it. But the angels are nearer and more immediate to the ultimate end than human beings, because they are more excellent and outstanding. Therefore man is not beatifiable immediately, but mediately—that is, through the mediation of angels. I reply by distinguishing the major: concerning means necessary for the attainment of the end, and concerning essentially subordinated agents—as is explained in the minor, and can also be illustrated by the example of subalternate sciences and arts—I concede; concerning means not necessary for the attainment of the end, and concerning agents not essentially subordinated, I deny. Of the latter, one does not depend on another in acting, and each in its own way immediately concerns one and the same object—even though one deals with it more perfectly and another less perfectly—just as the human eye and the eagle's eye both behold the sun immediately, although the latter sees the sun more perfectly than the former. Similarly, angel and man are both immediately beatified in God as the beatific object, even though the angel, being more perfect than man, attains him more perfectly.

You object, third: God is the supreme and most universal cause, the maker of all things, and also the ultimate end of all (*from what was said, quaest. De causa finali*). Therefore any nature, even one lower than humanity, is capable of happiness. I distinguish the antecedent: God is the efficient and final cause of both material and spiritual things, I concede; God is the cause and end of all those things attainable through operation, I deny. For this belongs only to the intellectual nature; hence human nature occupies the last place among beatifiable natures.

ARTICLE IV. On the beatitude of the body.

That the human body is to be blessed, reason persuades; for since it is an instrument and essential part of man, and the whole man is to be blessed because the whole man has merited, consequently his body must be marked with beatitude. And since the same man cannot be blessed in a mortal body, he will be blessed in an immortal body, as Scotus teaches (*4. dist. 49, quaest. 13, §. Respondeo, A*). The body, moreover, is beatified through four beatific endowments, about which in general and in particular we must speak in the following doubts and paragraphs.

DOUBT I. On the beatific endowments in general.

Sole Section. What are the beatific endowments, and how many kinds are there?

Maior (4. *dist.* 49, *quaest.* 7) and Richard (*ibid.*, *art.* 3) report that some think retention is a beatific endowment distinct from the others. But the common body of theologians—notably Argentinensis (*quaest.* 1, *art.* 1) and Nicholas of Neise (*tract. De beatitudine corporis, quaest.* 1)—as the Seraphic Doctor notes (*ibid.*, *art.* 2, *quaest.* 1), maintains that there are only four beatific endowments of the body: impassibility, clarity, agility, and subtlety.

Note, first: the endowment is commonly divided into the endowment of the soul and of the body. The natural endowments of the soul are the moral virtues—prudence, fortitude, temperance, and justice. The supernatural ones are the theological virtues—faith, hope, and charity. The beatific endowments are vision, enjoyment, and the perfection of perpetual security of both. The natural endowments of the body are beauty, strength, soundness, and similar things. The supernatural ones are comprised in four, and are named as stated near the beginning of this section.

Note, second, from Vorillong (*art.* 1 of *this dist.*): these three—endowment, gift, and paraphernalia—differ from each other. An endowment is what the bridegroom gives to the bride when she marries; hence, when Christ marries us, he bestows upon us grace and charity. A gift—that is, as it were, a "giving by gift"—as Angelo notes (*verb. donatio*), is taken by the jurists, especially Ulpian, properly for an irrevocable giving; but here it means what the husband gives to the wife after the marriage is consummated. Thus glory is called the endowment of the blessed soul. Hence the Church sings: "Come, bride of Christ, receive the crown"; and Paul (2 *Tim.* 4): "There is laid up for me the crown of justice." Other senses and types of gift are to be sought from Angelo (*at the passage cited*). Paraphernalia are what is given to the wife by friends after the wedding. Hence all paraphernal goods are said to be all the goods of the wife, as the Blessed Angelo observes (*verb. paraferna*). For it is derived from "para" (beside) and "pherna" (endowment), as if "beside the endowment."

Note, third, from the same Vorillong (*mentioned above*): endowment is taken in three senses. First, for what is bestowed on the bride by the father of the bride himself, and is her own property and patrimony, and the husband has the use of it for bearing the burden of matrimony, as the jurists observe (*Angelo, verb. Dos*). In this sense, God the Father endows the soul so that it may be the bride of Christ. Second, for what the bridegroom gives to the bride, as is clear (*Gen.* 34), where Jacob says to Shechem and his sons: "Increase the endowment, and ask for gifts"; and (*Exod.* 22): "If anyone seduces a virgin and sleeps with her, he shall endow her." The Doctor makes mention of both these senses of endowment (4. *d.* 49, *quaest.* 13, §. *Dico ergo*). Third, for the perpetual adornment of the soul and body given by reason of the nuptials to be consummated in the resurrection. In this sense, the Doctor (*just cited*) says, impassibility is an endowment—or rather a divine assistance preserving the body of the blessed person from all

corruption—even though such an endowment does not formally inhere in the blessed person himself.

Assertion: there are four endowments of the blessed body, as listed above. The Doctor presupposes this, disputing about each of them in particular (*from quaest. 13 to quaest. 16 of dist. 49*). This is proved, first: Wisdom 3, "The just will shine, and will run about like sparks among reeds." The Seraphic Doctor adds (*loc. cit.*): "In the shining is clarity, in the spark impassibility, in the reed subtlety, and in the running about agility." And the Savior indicates (*Matt. 13*): "The just will shine like the sun." For the sun is clear, subtle, impassible, and agile. The Apostle agrees (*1 Cor. 15*): "It is sown in corruption, it shall rise in incorruption"—here impassibility is noted. "It is sown in dishonor, it shall rise in glory"—here clarity is expressed. "It is sown in weakness, it shall rise in power"—here agility is indicated. "It is sown a natural body, it shall rise a spiritual body"—here subtlety is designated. Augustine agrees (*22. Civit.*): "All deformity will be absent from our bodies through clarity, all slowness through agility, all weakness through subtlety, and all corruption through impassibility." Reason also confirms this: the human body and every mixture is said to be constituted from four elements, from which it contracts four imperfections or defects. From water, which is moist, it contracts passibility or corruption—hence whatever is aqueously moist easily corrupts. From earth, obscurity, since it is an opaque or dense body, and therefore dark. From air, weakness, for it is thin and easily yields to what pushes it. From fire, animality, for fire is the most active and continually consumes, continually needing fuel. Therefore, since the body of the blessed person is perfect and adorned, and the aforesaid imperfections and defects are removed, it must be perfected and adorned with four adornments, which are the four aforementioned beatific endowments.

You object, first: the body does not enjoy more endowments than the soul, nor the servant more than the mistress; for what is less noble is not to be adorned with more ornaments than what is more noble. But the soul is endowed and adorned with only three endowments—namely, vision, enjoyment, and perpetual security. Therefore likewise only three endowments are to be assigned to the glorified body. I deny the major. For the sensitive soul has more potencies than the intellectual, yet it does not follow that it is more excellent. Likewise, God, though the most perfect and noblest of all, lacks accidental perfections and ornaments; especially because nobility consists not in a greater number but in the principal perfections. Or say that there is a disparity, since the endowments of the soul are derived from its potencies, while the endowments of the body are derived from the quaternary number of elements.

You object, second: the endowments are numbered according to the number of comparisons of the body to the soul. But the body is compared to the soul in two ways: the soul relates to the body either as mover or as perfection. Therefore there are only two endowments of the body. I reply that according to

those two comparisons, four dispositions and perfections are required in the body, corresponding to the four defects and imperfections contracted from the four elements; and therefore four endowments of the beatific body are established.

You object, third: just as clarity pertains to beauty, so does the congruence of parts. For Augustine says (22. *Civit.*, cap. 19): "Beauty is the congruence of parts together with a certain pleasantness of color." Therefore, just as clarity is counted among the endowments of the body, so should the congruence of parts be. This is confirmed from Anselm (*lib. De similitudinibus*, cap. 50): "The parts of beatitude are beauty, agility, strength, liberty, health, pleasure, and longevity." I reply that clarity is an endowment because it is given to the glorified body; but the congruence of parts is what was already present before the body was beatified. Hence it does not constitute a new endowment distinct from the rest. To the confirmation, Richard responds (*quaest.* 2, ad 2): beauty is reduced to clarity, liberty to agility, strength to subtlety, and health, pleasure, and longevity to impassibility.

DOUBT II. On impassibility.

Section I. Whether the glorified body is impassible.

For the explanation and resolution of this section, as presented in the said question (*quaest.* 6, art. 1) by Bassolis and other Scholastics there, two senses of "impassible" and two corresponding senses of "passion" are adduced, which I shall express in the first note.

Note, first: "impassible" and "immortal" are taken in two senses. First, "impassible" means "able not to suffer," and "immortal" means "able not to die." Thus Adam in the state of innocence was immortal, namely able not to die. For if he had obeyed God and had not fallen into sin, he could have not died and would not have died; but after a long life in the earthly paradise, he would finally have been transferred to the heavenly paradise, seeing God clearly and enjoying him perfectly, as the Doctor asserts (2. *dist.* 19). Second, "impassible" means "not able to suffer," and "immortal" means "not able to die." In this sense Adam in the said state was not immortal. For he could die, and in fact, through the sin committed by him, he did die. Moreover, observe that passion is properly corrupting or degrading, which is touched upon (*Wisdom* 9): "The body that is corrupted weighs down the soul." Improperly, however, it is preserving and perfecting, about which Aristotle speaks (2. *De anima*, T. 139; and 3 of the same work, T. 18) and Scotus (1. *distinct.* 3, *quaest.* 7, §. *Ad auctoritatem*).

Note, second, from the same Doctor (4. *dist.* 49, *quaest.* 13, §. *Responsio*): in the beatific state, those things are placed which are necessary for it and which contribute to its perfection. Hence nutrition, growth, generation, and things of this kind are not found there, because no nourishment is necessary, nor augmentation, since all things there are perfect—which Paul signifies (*Eph.* 4):

"Until we all attain to the perfect man." For in this state there is the accumulation of all goods and perfections; and actions and passions that carry imperfection with them are far removed from it, with God preserving the glorified body from all evil and affliction, on account of the merits that it performed together with the soul joined to it, according to (*Apoc. 21*): "God will wipe away every tear," and so on.

Assertion: after the resurrection, the body of the blessed person will be impassible and immortal. So holds Scotus (*just cited*). This is proved, first, from Scripture (*1 Cor. 15*): "This corruptible must put on incorruption, and this mortal must put on immortality"—and consequently impassibility. For passibility does not remain with immortality. Second, from Augustine (*13. Trin.*): "The blessed life is immortal." Someone adds: "The supreme good is immortality alone. And virtue advances one to immortality." Third, the body must be proportioned and conformed to the soul in the most perfect state, which is the beatific state, just as in the imperfect state, or in the way, the soul conforms to the body. For it sympathizes and grieves with the injured body; therefore in the homeland the body is immune from all passion and corruption, just as the soul likewise is then impassible and immortal. Fourth, in the same state the soul desires and wills the body to last as long as it itself will last, since both are essential parts of man; but the soul and man will endure perpetually; therefore so will the body, without which man cannot exist. And so the body is then impassible and immortal. Moreover, the body cooperates and concurs with the soul in meritorious acts, as an organ and instrument of it, and is conjoined with the soul, which is then rendered impassible. Therefore the body, by reason of merit and union with the soul, exists in the said state as impassible and immortal.

You object, first: what is palpable is corruptible, as Gregory says (*in cap. 20, John*): "What is palpated must necessarily be corrupted." But the body of the blessed person is palpable, as is clear (*Luke 24*): "Handle and see." And the body of Christ, which is spoken of there, was glorified. Therefore the body of the blessed person is not impassible. I distinguish the major: of what is palpable left to itself and not preserved by any cause capable of freeing it from corruption, I concede, and in this sense the testimony of Gregory cited above is taken; of what is palpable but preserved by the divine will, I deny—and of this kind is the glorified body, as I touched upon above at the end of the second note.

You object, second: the body of the blessed person is endowed with sensation; for sensation is a perfect animal operation (*2. De anima, T. 123*). In that state, moreover, the glorified body is perfect in every respect. But sensation does not occur without the passion and corruption of the sensible body, for every sensitive being suffers from an excessive sensible object—as the sight from the light of the sun, and touch from intense heat. Therefore in the homeland the body of the blessed person does not remain impassible. I distinguish the major: of sensation that does not carry with it imperfection and real passion, such as

intentional sensation—namely vision and hearing—I concede; of real sensation carrying imperfection with it, such as nutrition, I deny.

You object, third, from (*1. Caeli*, T. 15; and *2 of the same work*, T. 18): "Nothing violent lasts." But the glorified body is a mixture that contains in itself four elements, which—apart from fire—remain above by violence, since they are outside their proper places. Therefore the body of the blessed person is not free from passion. The major is glossed as applying to what is violent left to itself, but not to what is violent yet preserved by God and to be perpetually preserved—of which kind is the glorified body.

You object, fourth, from the same (*1. Caeli* 7, 124), where Aristotle, arguing against Plato, says: the heavens cannot be corruptible and be perpetuated by another, because something cannot be of itself possible and be perpetuated by another. But the body of the blessed person is of itself perishable and corruptible; therefore it cannot be preserved by God as incorrupt and perpetual. This is confirmed from Averroes (*12. Met.*): apart from the motion of the heavens, nothing is of itself possible and necessary through another. But the aforesaid body is of itself possible; therefore it cannot be necessary through God, and consequently it is not impassible. I reply with Scotus that Aristotle's reasoning holds, provided it is understood as follows: if the heavens are of themselves corruptible, as Plato admits, then of themselves they can be corrupted. But if God necessarily conserves the heavens, then they cannot be corrupted. That the same body can be corrupted and cannot be corrupted involves a contradiction. But we, holding that God acts freely *ad extra*, say that a celestial body, like any glorified body, is of itself corruptible, but by the divine will is perpetually conserved and perpetually preserved from all corruption and corrupting passion. To the confirmation, I say Averroes speaks from the principles of Aristotle, who held that God necessarily acts *ad extra*. Hence, apart from the motion of the heavens, other things that are by their own nature subject to corruption do not always last, but are corrupted. But we, illuminated by the light of faith, hold that the motion of the heavens will have an end after the day of judgment; yet the elements, the heavens, and the bodies of the blessed, with God preserving them, will be free from all passion and corruption and will endure forever.

Section II. By what cause the body of the blessed person is impassible and immortal.

Many opinions of the theologians are recited and refuted on this difficulty by Scotus (*loc. cit.*) and Vorillong (*ibid.*). Some think the body is made impassible and immortal from the material and subjective cause—that is, because in the glorified body the qualities that follow upon mixture and the contrary qualities disposing it to corruption do not remain; or if the said qualities do persist, as others suspect, they are in equilibrium, and one cannot act upon or be acted upon by another. Many introduce impassibility into such a body from the side

of the efficient cause, by removing everything that could induce corruption in that body, or by giving everything that contributes to preserving it from corruption, whether from within or from without. Some derive the said endowment from the formal cause, affirming that from the glorified and immortal and incorruptible soul there flows perpetual health and perennial vigor into the body that it informs. Nor are there lacking those who derive it from the absolute dominion by which the blessed soul perfectly dominates the body, which perfectly obeys it; hence, since there is no resistance, incorruptibility and impassibility are had. Others hold that the body is rendered impassible because of the absence of privation, which (*1. Phys., T. 81*) is said to be the cause of corruption. Since there is in it no contrary quality, no motion, nor anything else aiding corruption, it is inferred to be incorruptible and impassible. But Scotus (*cit., §. Dico ergo, D*) and his followers, having rejected all the aforementioned opinions, hold that the cause of the impassibility of the glorified body is not intrinsic but extrinsic, not created but uncreated—namely the divine will not co-acting with the secondary cause for its corruption.

Note: the cause through which the body is made impassible can be assigned as multiple. For it is either positive or privative. If privative, two can be posited: the cessation of heavenly motion and the non-cooperation of the first cause with the secondary cause. Positive cause is divided into intrinsic (which is material or formal) and extrinsic (which is efficient or final). The efficient cause is subdivided into uncreated (which is the divine will) and created (which is celestial or sublunar, substantial or accidental, or one that removes an impediment). Specifically, it can be said to be the blessed soul, or an endowment in the body.

First assertion: the body of the blessed person is not made impassible through the absence of natural qualities that follow upon mixture. So holds the Doctor (*cit., sub A*). This is proved, first: nothing is lacking to that body that pertains to its natural being and its adornment, since it is in a perfect state. But those qualities pertain to the natural being of the body—not constitutively, but consequentially, since they flow from it. Therefore, because of their absence, that body is not made impassible. Second, such a body would not be a mixture, since the qualities of the mixture would not emanate from it; nor would it be a suitable and proportioned subject informable and receivable by the rational soul. Third, those qualities are only dispositive toward corruption; therefore, even with them removed, the cause and root of corruption would still remain. Hence (*1. Phys., text cited*) the natural qualities are not said to be the cause of corruption, but matter together with privation. Finally, the heavens are free of those qualities, yet they are not absolutely impassible and incorruptible, as I said (*lib. De Caelo*).

Second assertion: neither is such a body rendered impassible because contrary qualities have been reduced to equality. Scotus holds this (*ibid., sub B*). This is

proved, first: the elements, even though they are equal in acting and resisting taken as wholes, are nevertheless passible and corruptible according to their parts. Hence there is perpetual conflict among them, and continuous generation and corruption of sublunar things. Therefore impassibility of the said body is not derived from the equality and tempering of qualities. Second, in a mixture some quality always predominates, as I taught (*lib. De elementis*). Even if there were a perfect balance in it, the body would still be passible. For the temperament of Christ the Lord was perfectly balanced, yet he was passible and mortal. Furthermore, even if it were impassible from within, it would not be so from without; hence something else must be assigned that renders it impassible both from within and from without.

Third assertion: the cause of impassibility of the body of the blessed person is not derived from the dominion of the soul over the body that it informs. This is against Thomas, and is for Scotus (*cit., before C*). This is proved, first: the corrupting qualities of the body do not oppose the soul; indeed, the soul presupposes them, since it informs a duly organized and properly tempered body, as is clear (*lib. 2. De anima*). Since the soul does not expel them, consequently it is not the cause of the body's impassibility. Second, if the soul impeded the natural corrupting causes of the body, this would be especially by the command of the will. But natural causes do not obey the will of a soul or an angel. For God has not subjected the terrestrial sphere to the will of an angel or soul, as is clear (*Hebrews 2*); hence (*in Phys., quaest. De vacuo*) I asserted that neither an angel nor any creature can produce a vacuum, because natural causes are not subject to it, but only to God their creator. Third, if the state of innocence had persisted, the lower powers would have perfectly obeyed right reason; but man would not for that reason have been impassible, since he would have nourished himself, grown, and done other things of this kind, which do not occur without corrupting passion, as I asserted elsewhere. Therefore, and so on.

Fourth assertion: the body of the blessed person is not impassible because of an endowment or quality prohibiting corrupting passion, which overflows from the soul into the body. This is defended by the Doctor (*loc. cit.*) against Henry (*Quol. 9, quaest. 16*). This is proved, first: that quality is either celestial, or elemental, or mixed; but it can be none of the enumerated. Therefore the body is not made impassible through the said quality. The major is clear from a sufficient enumeration of qualities. The minor is proved: it is not a celestial quality, because it is neither diaphaneity, nor light, nor luminosity, nor an occult quality, as is evident—especially because the human body, being a mixture, is not capable of a celestial quality. Nor is it an elemental quality, because this is corrupted according to parts or degrees. Nor is it a quality of the mixture, since this does not perpetually conserve the mixture, nor can it prevent or impede the body from other corrupting qualities. Hence, although hardness prevents iron

from being easily cut into parts, it does not free it from heating, cooling, and burning.

Second, qualities receivable in a proximate receptive subject are of the same physical genus (*from 5. Met., T. 33; 10 of the same work, T. 22*). But all the qualities of a mixture are either contrary or intermediate; therefore such qualities do not ward off corruption and corrupting passion from the body.

Third, either one quality fights another, or it does not. If the first, then such qualities do not remove all action, because one contrary acts upon another with corrupting action. For as is clear (*lib. De elementis*), one contrary strives to destroy another, and there is mutual struggle and continual conflict among them, from which the corruptions and generations of sublunar things follow. If the second, then one does not impede another from its action and passion.

Fifth assertion: the impassibility of the glorified body does not come from the cessation of heavenly motion. The Doctor teaches this (*loc. cit., sub C*). This is proved, first: the actions and passions of man do not depend on the motion of the heavens or on its absence; hence Augustine says (*11. Conf. 22*): "Even with the heavens standing still, the potter's wheel moves." Therefore neither is the impassibility of the body of the blessed person produced by the cessation of heavenly motion. Second, it is decreed by the Parisian article: "If anyone says that with the heavens standing still, and fire placed near straw, the fire would not burn the straw, this is an error." And (*Joshua 10*) it is narrated that with the sun not setting, a battle was fought against Gibeon. Third, from (*2. De generatione, cap. 11, T. 55*): motion is said to be the cause of generation not actively but adductively—that is, because it brings the generating agent to the place where it generates, where it has proximate matter and the other requisites for generating. If the generating agent were present and approximated to properly disposed matter, motion would not be needed—as if the sun were in the middle of the hemisphere and stood there, it would not need to move to illuminate and warm its parts. I add from what was said (*in Phys., lib. De motu*): formally, motion is a relation of the mover to the moved, and relation is of the category of sterile things. Therefore the positing of motion does not cause its passibility, nor does its cessation cause impassibility in the same body.

Sixth assertion: the cause through which the body of the blessed person is made impassible is extrinsic—namely, the divine will not cooperating with the corrupting secondary cause. This is defended by the Doctor (*passage cited, §. Dico ergo, D*). This is proved, first, by analogy: just as the will of the blessed person is impeccable because God does not concur with it in any sin or evil act, as I showed elsewhere, so the body of the blessed person is impassible because God does not co-act with the corrupting secondary cause. Second, (*Daniel 3*), in the furnace of Babylon, the three Hebrew youths were not burned by the fire, because God did not concur with that fire for their burning. Similarly, the body of the blessed person is not subject to any corruption and passion, because God

suspends his concurrence, without which the corrupting cause of his body cannot harm it; and so it remains immune from all passion and corruption. Furthermore, the heavens are incorruptible—not absolutely, since they consist of matter and form—but in a qualified sense: because in this universe of things no created agent is found that is stronger and more powerful than them. Therefore the body of the blessed person is incorruptible because no agent can act upon it and corrupt it, since God does not co-act and suspends his concurrence.

You object, first: the soul mediates between God and a corporeal creature. Therefore after the resurrection, just as it will be perfectly subject to God, so it will fully dominate its body, and consequently the body will be rendered impassible through this subjection. I deny the final inference: for such subjection would not constitute the body as impassible, as is clear in the state of innocence, in which the lower portion obeyed the higher, yet the body was not impassible. For it performed those things that cannot be done without passion, as I noted above. Moreover, the aforesaid subjection is produced not by the soul but by the divine will, as the Doctor observes (*cit.*, before *G*).

You object, second: Augustine writes to Dioscurus: "God made the soul so powerful that from its full happiness perpetual health and incorruptible vigor overflow into the body." Hence it was a miracle in Christ that, although in his soul he was blessed, that beatitude of the soul did not overflow into his body. First confirmation: hardness is a certain impassibility preventing a hard body from suffering—that is, from easily being cut into parts. Therefore a quality can be given in a body through which the body is preserved from corruption. Second confirmation: through grace man is made pleasing to God, through glory blessed, through whiteness white, and through learning learned. Therefore through the endowment of impassibility, which is a quality, his body is made impassible. Third confirmation: certain natural substances, such as balsam and things of that kind, make a body incorruptible, as experience shows. Therefore it is not unfitting to concede some quality by which the body of the blessed person is made impassible. I reply that this does not come from any quality that renders the body incorruptible, but from the divine will ordaining and decreeing that the soul and the body informed by it should be rewarded with beatitude on account of the merits performed during the person's life—the soul with vision and enjoyment of God, and the body with impassibility and the other endowments, which are from God himself. To the first confirmation, I say that although what is hard resists cutting, it does not resist heating and burning; therefore it is not completely impassible, as the body is. To the second confirmation, I concede the antecedent and deny the consequent, as is clear from the enumeration of qualities in the fourth assertion, which cannot constitute the body as impassible—just as no quality can render a person impeccable. To the third confirmation, those things can indeed preserve a body from corruption for a time, but not forever. For eventually the body anointed

and treated with them is corrupted and consumed, like any other sublunar thing—such as stones and things of that sort, which are called eternal because they last a long time.

You object, third: when the prior is removed, the posterior is removed, for when the cause is taken away, the effect is taken away. But the motion of the heavens is prior to the motion of sublunar things (8. *Phys.*, T. 73). Therefore, since after the day of judgment the motion of the heavens will have ceased (as faith teaches), all the motions of sublunar things will cease, among which is the corruption of the body, and so the body will be incorruptible through the cessation of motion. I grant the major and distinguish the minor with Scotus: the motion of the heavens is prior by the priority of uniformity and velocity, I concede; by the priority of causality, I deny. Or the major must be distinguished: if the posterior essentially depends on the prior, I concede; if it does not essentially depend, I deny—just as brutes are prior to man, as is clear from the book of Genesis, yet man can exist without brutes, as will happen after the day of judgment. But the motion of sublunar things, especially of man, does not depend essentially on the motion of the heavens. For man can move while the heavens are immobile, as was observed above.

You object, fourth: the glorified body is endowed with the endowment of impassibility, as no theologian denies. But an endowment is formally in the one endowed, just as whiteness is in the white thing and light in the luminous thing. If it is held with Scotus that the impassibility of the body of the blessed person arises from the preserving action of the divine will preventing the natural corrupting cause, no endowment of impassibility would be formally in such a body. Therefore the endowment of impassibility is not derived from the assistance and guardianship of the divine will. First confirmation: an element would also enjoy the endowment of impassibility, because after the judgment is concluded, it will be prevented by the divine will from all corruption; for there will no longer be conflict among the elements. Second confirmation: the damned would enjoy the aforementioned endowment, because his body will never be corrupted. Third confirmation: there would be a perpetual miracle—a body being preserved from all corruption—just as it was a miracle that the three Hebrew youths were not burned or harmed by the fire of Babylon. I grant the major and deny the minor. For an endowment given to a bridegroom by the bride's father is not really in the bridegroom or in the bride—as when it is money or a field. Likewise, if someone were to endow his daughter by providing her with soldiers to guard her from all harm, as Scotus teaches (*in Rep. here*). Nor in the definition of an endowment is there any expression denoting that the endowment is formally in the one endowed, as can be seen in Angelo (*verb. dos*) and other casuists and summists. Similarly, in the spiritual marriage, God endows the body of the blessed person with the endowment of impassibility, so that it is immune from all corruption. Likewise, the endowment consists in this: that the blessed person has a right, from his merits, for God to preserve and

conserve his body from every corrupting cause. By this, the answer to the first confirmation is clear: for the elements become incorruptible solely by God's good pleasure, but the body of the blessed person becomes so from preceding merits, by reason of which he has a right to receive such an endowment. To the second confirmation, there is a disparity: the blessed person has that endowment from his merits for his joy and exultation; the damned, however, has it for his punishment and affliction, on account of his demerits. To the third confirmation, I deny the consequence: for if this occurred now, it would indeed be a miracle, as was shown in the case of those three youths remaining unharmed in the fire. But then it will not be so, because a natural course will be established whereby things rest, remain unmoved, and are free from all passion and corruption—just as it will be natural and customary for the heavens to stand still and remain perpetually unmoved.

DOUBT III. On the agility of the body of the blessed person.

Section I. Whether the bodies of the blessed will be agile.

It is the consistent doctrine of the Scholastics, especially Scotus (*4. dist. 49, q. 14*), Vorillong, and others in the same place, affirming that the bodies of the blessed are adorned with the endowment of agility. For easier understanding and more convenient comprehension:

Note, first, from the Doctor (*just cited, §. Respondeo, B*): agility means nothing other than the capability of something to move itself promptly and swiftly by that motion whose principle is the soul—that is, progressive motion, not natural motion, whose principle in a mixture is the predominating element. Since, however, agility cannot be in any whole for moving itself easily unless there simultaneously concurs the motive power and the mobile, agility specifically requires a perfect motive power residing in the soul and a suitable disposition, not resistant to this motion, on the part of the movable body.

Note, second, from the same (*ibid., A*): in an animated sensitive composite, there is a twofold motion. One is natural, derived from the predominating element in it. Thus man naturally descends downward, because in him earth predominates, which, being heavy, tends downward. The other is progressive, which comes from the animal insofar as it is endowed with a soul, which is the principle by which the animal moves itself progressively. These two motions differ from each other in three ways. First, the principle of progressive motion is the soul, while the principle of natural motion is the predominating element. Hence, because in man earth predominates, after death his body is heavier than when he was alive, because then earth maximally predominates, with the spirit or soul separated from it. Second, natural motion occurs without any prior apprehension or cognition, but by the guidance of nature is determined to one direction—as a stone by its weight is carried downward to the center. But progressive motion occurs with prior apprehension and cognition of that

toward which it tends; hence it is not determined to one direction, but according to apprehension and appetite it is now determined to this one, now to that one. Third, in natural motion the mover from within cannot stop itself—as a stone falling downward cannot stop itself in such motion. But in progressive motion, the animal that is moved from within can plant its foot—as a horse, apprehending an offensive object, such as a wolf or a deep ditch, takes no further step, even when struck. And this is read of Balaam's donkey, which, struck by him, would not go further because it saw the angel (*Numbers 22*).

Note, third, from the same (*loc. cit.*, §. *Ad 1. rationem, M*): in the series and coordination of beings, some beings are so perfect that they cannot receive any further perfection, such as God. Some add Christ the Lord, the Blessed Virgin, and the most holy Eucharist. Some are so imperfect that they cannot be perfected by any further perfection—such as relative accidents. Others are indeed perfect in their genus, but can still be perfected—not with essential perfection but with accidental perfection—as a man perfect in his essence is perfected by science, grace, and glory, which are his accidental perfections.

Note, fourth, from the same (*ibid.*, *sub B*): the motive power is one, which can be called organic and inorganic under different respects. Insofar as man first moves one part of his body and then another, as happens in progressive motion, that potency is called organic—about which Aristotle speaks (*lib. De motu animalium*). Insofar as his soul is separated from the body and moves itself from one place to another—like an angel—such a potency is called inorganic. Scotus adds (*cit.*, *below C*): if all parts of the body that the soul informs were equally disposed to receive its motion, such a potency would be called inorganic, as will happen after the universal resurrection. Therefore the motive potency of man is not organic in itself, but per accidens, insofar as one part is more disposed than another. Hence man first moves the nearer part rather than the more remote one, and first the more disposed rather than the less disposed.

Assertion: the bodies of the blessed after the day of judgment will be agile. So holds Scotus (*loc. cit.*). This is proved, first: Wisdom 3, "Like sparks in a reed-bed, they will run about"; and Isaiah 40, "Those who hope in the Lord will renew their strength, they will take wings like eagles, they will fly and not grow weary, they will run and not tire"; and 1 Corinthians 15, "It is sown in weakness, it shall rise in power"—where the gloss says "living and mobile." Second, Augustine (22. *Civit.*, *cap. 30*): "Where the spirit wills, there the body will be immediately." Third, every fitting perfection is to be attributed to the blessed, since they enjoy a perfect state, as is the beatific state; and it is a perfection for glorified bodies to be agile, to be moved without labor and fatigue, and to move about at their pleasure. Moreover, the bodies of the blessed will be impassible, from what was asserted in the first doubt of this article, Section I. Therefore they will also be agile, since the reasoning is the same for this endowment as for that one.

You object, first: if agility is to be conceded to the glorified body, this would be especially on account of its local motion, as is clear from the description of agility in the first note. But in the beatific state there is no local motion, which is the act of an imperfect being (*3. Phys. 2*), since in it there is every possible perfection. Therefore the bodies of the blessed will not be agile. This is confirmed: when the prior is removed, the posterior is removed, because the latter depends on the former. But after the resurrection there will be no first motion—neither time, as the angel cries (*Apoc. 10*). Therefore neither will there be secondary motion, which is the motion of other things contained within the circuit of the heavens. I grant the major and deny the minor. For although the blessed person has every essential perfection simply possible for him, he does not have every accidental and qualified perfection, which is acquired through local motion. Similarly, the blessed person does not know all things actually, but what God wills to show him in the divine essence, which, from what was said elsewhere, is a voluntary mirror: "If he wills, he is seen; if he does not will, he is not seen." To the confirmation, I say the major is true of a prior on which the posterior essentially depends, as I responded above (*Doubt I, Section II, answering the third objection*).

You object, second: the glorified body does not need agility to be moved locally, but carriers and helpers, namely angels, as is clear (*Luke 16*): "It happened that the beggar died and was carried by angels to the bosom of Abraham"; and (*1 Thess. 4*): "We shall be caught up together with them to meet Christ in the air." Therefore the bodies of the blessed will not be agile. I deny the antecedent. For angels are given to the bodies of the blessed not because of need but out of reverence and honor—just as a lady is carried by her servants, not because she lacks motive power, but out of honor and dignity. They rather accompany her than carry her, just as courtiers with respect to a king, whom they follow and serve.

You object, third: the blessed reside in a certain place and a determinate seat, so that some are nearer to Christ and others more distant, according to their merits—as is said of the angels, of whom the first are the Seraphim, the second the Cherubim, and so on for the rest, whose orders and series I reported (*in the Tract. De Angelis*). But if they were agile, they would move locally, and indeed would leave a nearer place and acquire a more distant one. I reply that neither Christ nor the blessed are immobile, but can at will and pleasure move locally and change place, losing no perfection or beatitude—just as those who serve a king sometimes approach him and sometimes withdraw from him, while retaining his benevolence and favor. And this is clear of the angels in sacred Scripture, especially (*Gen. 28*), concerning Jacob's ladder, by which angels descended and ascended. The same must be asserted of blessed humans. Moreover, God is everywhere, and from any place, wherever one may be, he can be seen and possessed.

You object, fourth: the more perfect things are, the fewer operations they need to attain their perfection. But the blessed are perfect in both soul and body; therefore they do not move locally to acquire any perfection, and consequently they lack agility. This is confirmed: beatitude is called rest, as is clear (*Exod. 33*): "I will give you rest"; and "The blessed rest from their labors" (*Apoc. 14*). But if they moved locally, they would not rest, because rest and motion are privatively opposed. Therefore, and so on. I grant the major and distinguish the minor: with respect to essential perfection, I concede; with respect to accidental perfection, I deny—as with cognition, which is a perfection of the intellect and can be acquired anew by the blessed person, as was to be established above. To the confirmation, I say it is rest from labors and miseries; hence the Church sings for the deceased: "May they rest in peace." And also from meritorious works, as the Savior attests (*John 7*): "The night comes when no one can work." But not from local motion, for the angels too move in their blessed state, even though they enjoy eternal and perpetual rest.

Section II. What agility is.

Richard (4. *dist. 49, quaest. 7*) thinks agility is a certain supernatural quality by which the body is rendered capable, so that by the motive power of the soul it is moved quickly and promptly in local motion; by which impediments—especially gravity, which prevents the body from being easily and promptly moved locally—are removed. The opposite, however, is taught by Scotus (*ibid., quaest. 14, §. Respondeo, H*), Vorillong, and the rest of the Scotists, who deny the aforesaid quality and assert that no supernatural quality is added to the body of the blessed person for it to be moved easily and freely; the only thing that happens is that the motive potency of the soul becomes more intense and more perfect, and the accidental resistance (to be explained shortly) is removed from the body.

Note, first, from Scotus (*loc. cit.*): there is a twofold impediment in the body that prevents it from being moved agilely and swiftly. The first is derived from the organs of the motive power, which is in the joints and sinews; when this obstacle is removed, the body becomes agile and easy for motion, especially progressive motion. The second is taken from the whole body, which is replete with thick and material humors, and whose head is full of smoky vapors and exhalations and other things that make a person heavy and slow for motion, as is clear from a dead body full of thick humors, which is heavier than when alive—especially when deprived of vital spirits, which make the body lighter. But to the glorified body, with the aforementioned impediments removed, good and subtle spirits are bestowed, which make the body easy and agile for motion.

Note, second, from the same (*ibid., quaest. 13, §. Ad rationes, sub H*): that is simply violent which opposes the natural, and more violent which more opposes the natural, and less violent which less opposes the natural—as for water to be carried upward, lest there be a vacuum in the universe, is not simply violent; but

if water fell downward, given a vacuum, it would be simply violent and only qualifiedly natural. The reason is that the nature of the whole universe is more a principle of naturalness than particular nature, and what befits the whole is more natural than what befits the part. The Doctor adds (*quaest. 14, cit., §. Ad illud, sub K*): when there are certain ordered potencies, the naturalness of the superior potency is greater than that of the inferior potency, as is clear of touch, which naturally, according to its own inclination, would take delight in the tangible, and likewise taste in the tastable. Yet the blessed exercise neither touch nor taste in their acts, because the said senses follow the inclination of the superior appetite, namely the will. One must philosophize in the same way about what is heavy when it ascends, lest there be a vacuum. And as things are in the greater world, so too in the lesser world, which is man. Therefore it is more natural for the body to be informed and perfected by the soul and to be moved by it than to be moved by its own proper motion toward the center. Hence, according to the inclination of the superior nature, it would rest naturally absolutely, though in a qualified sense violently.

First assertion: the body of the blessed person does not become agile through a supernatural quality flowing from the soul into the body. So holds Scotus (*cit., §. Respondeo, H, G, I; and in Rep., ibid.*). This is proved, first: it is impossible for a mixed animated body not to be heavy, just as it is unfitting for a stone to exist and not be hard, especially if it is marble. For in the body, earth predominates, to which the highest degree of gravity belongs; indeed, the body is neither animated nor perfected by the soul unless it has gravity and the other natural qualities. For if the body were as dense and solid as gold, it would not be a suitable and proportioned subject informable and perfectible by the soul. Therefore the body does not become agile through the removal of gravity and the addition of a celestial quality.

Second, the body of the blessed person is not capable of lightness; otherwise it would not tend downward, because what is determined to one position through one quality is not determined to the opposite position—as is clear of fire, which is carried upward because it is light, and of earth, which tends downward because it is heavy. Since, therefore, the body of the blessed person naturally inclines downward through gravity, it is inferred that it is not agile through a quality joined to it.

Third, that quality is either celestial, or elemental, or mixed. Not celestial, because through it the body would be carried in a circle, just as the heavens are moved circularly. Not elemental, because it would be either a quality of fire seeking only the uppermost place, or of air seeking the middle place, or of water or earth tending to the lowest place; but the body of the blessed person is carried and moved to every place and every positional difference. Therefore, and so on. Fourth, every quality determines an agent to a certain and determinate operation, as is clear of charity, which inclines the will to good

operation, and of science, which inclines the intellect to knowledge of things. Therefore, if there were given a quality to make the body of the blessed person agile, it would only determine it to one motion and one position—upward or downward—whereas in fact it is indifferent and without any labor or fatigue for every motion and every place. And so no quality is given that renders the body agile for moving it. Finally, impassibility is not a quality added to the body; therefore neither is agility, since the reasoning is the same in both cases.

Second assertion: the body of the blessed person becomes agile through a more intense and more perfect motive power of the soul, through the removal of the twofold impediment previously described from the body, and through the conferral of good and subtle spirits on the same body. Scotus teaches this (*loc. cit.*). The assertion has two parts. The first part is proved, first: just as the visual power of the blessed person is intensified and perfected when the glorified body is resumed—for the blessed person can then, without any difficulty or labor, see any visible thing, because the visual power and the rest of his potencies are perfect and proportioned to their objects—so the motive power of the soul in the beatific state will be so intensified and perfected that it can move the body joined to it at its pleasure, without labor or fatigue. Second, the blessed will be like angels in heaven, as Christ testifies (*Matt. 22*). But the angels move themselves and the celestial bodies and anything else without fatigue; therefore the soul in the beatific state will move the body that it informs wherever it wills.

The second part is supported, first: the body is impeded from moving agilely and easily because of the impediment found in the joints and sinews, and because of the superfluous humors distributed throughout the whole body, especially the abdomen and head. When these are removed and subtle spirits are conferred in their place, the body becomes agile and ready for motion. Second, a corpse thrown into water sinks to the bottom because of the thickness and putrefaction in it; but once the putrefaction and thick humors are consumed, it rises and floats upon the water. Therefore, with impediments removed and subtler spirits added, the body will become ready and prompt for motion. William of Paris illustrates this (*1. part. of his Summa de universo*) with fools, who, remaining in their folly, move in marvelous ways, pass through dangers unharmed, and do other difficult and arduous things that they could in no way perform when free from their folly. The reason he gives is that during that time they eat little, their superfluous humors are evacuated, and their motive power is not so bound to the body as in the sane and wise. The same can be said of the body of the blessed person: with impediments removed and the motive power of the soul augmented, it becomes fit and agile for moving wherever the blessed person wills.

You object, first: Augustine (*11. Civit., cap. 10*) writes: "Then the heavy weight will be removed from the soul." Therefore in the beatific state, gravity will be removed from the glorified body, which impedes it from being moved

promptly and readily. Scotus responds (*cit.*, §. *Ad illud*, K), expounding Augustine of the weight that aggravates—namely, thick, noxious, and superfluous humors. Perhaps with this in view, Solomon (*Wisdom* 9) says: "The body that is corrupted weighs down the soul." But not of the weight that coincides with gravity, which is a property of the mixed and animated body, without which the soul cannot inform and perfect the body itself. Hence, as Aristotle says (2. *Caeli*, T. 71): if one star were added or removed, the heavens would not be moved by the angel applied to move them; so too, if the body were light, it would not be informable by the soul or movable by it. For we see that some things are impeded from motion on account of their lightness.

You object, second: if the glorified body were heavy, it would fall downward and tend toward the center to rest there, and it would remain violently above and in heaven. Therefore, for it to remain there, its gravity must be removed. I deny the antecedent. The reason was given in the second note: according to the inclination of the superior nature, it would rest naturally above in the absolute sense, though violently in a qualified sense, as was sufficiently explained in that passage.

You object, third: if the body of the blessed person were heavy, the soul by continuously moving it would grow weary and faint, and so would not be blessed, since beatitude removes all fatigue and labor. Therefore the body of the blessed person is devoid of gravity. I deny the antecedent. The reason is that the soul is not overcome by the gravity of the body, nor does any contrary action come from the body that would cause fatigue. Especially since fatigue comes from the consumption of spirits, which are repaired through rest. But such spirits do not exist in the soul but in the body—just as an angel moving the heavens is not fatigued, as I asserted (*lib. De Caelo*).

You object, fourth: the motive potency of the soul is substantial to the soul itself, really identified with it. Therefore it is not intensified in the beatific state, just as in the same state the soul is not intensified, since every substance, from the chapter on substance, does not admit of more and less. Consequently, the body is not rendered agile through the intensification of the soul's motive power. I reply by granting the antecedent and distinguishing the consequent: essentially, I concede; accidentally and extrinsically, I deny—for through the addition of pure spirits and the removal of impediments it is said to be intensified and perfected, as was abundantly explained above.

One may ask: after the day of judgment, will the saints in heaven be standing or sitting? It can be said that standing is to be attributed to them, rather than sitting or other positions. For in this way the body is more apt for operating and for moving more agilely, since the bending of its parts seems to conflict with agility. Hence (*Acts* 2) Stephen saw Jesus standing, not sitting or lying down. Augustine agrees (*lib. De symbolo*), explaining that article of faith, "He sits at the right hand of the Father," saying it is not to be understood of corporeal sitting but of

spiritual. In this way other passages can also be explained, especially Psalm 109, "Sit at my right hand"; and Matthew 19, "You too will sit judging the twelve tribes of Israel."

DOUBT IV. On the clarity of the glorified body.

Sole Section. Whether the bodies of the blessed will be clear.

That the endowment of clarity will be in the bodies of the blessed is the common doctrine of the Scholastics, especially Scotus (*4. d. 49, q. 15*), Saint Bonaventure, Richard, Bassolis, Vorillong, and Maior (*ibid.*). For easier understanding and more convenient comprehension:

Note, first, from the Doctor (*just cited, §. Respondeo, A*): clarity is a manifest splendor. For besides light and color, it conveys a manifestation of itself. Hence we call a light "clear," a truth "clear," and a color "clear" when it manifests itself or is ready to manifest itself. In this same sense, a Doctor is called "clear" whose doctrine is manifest to all, or can be manifested to all. The bodies of the saints will participate in manifest color, according to their complexions; hence according to diverse complexions they will have diverse colors, more and less beautiful, and also according to various regions, hot or cold, and as they were in the way. For it is probable that Ethiopians will retain their dark color and Tartars their whiteness, as Maior says (*cit., q. 10, at the end*). Also according to the merits of each, as Paul notes (*1 Cor. 15*): "One is the clarity of the sun, another the clarity of the moon." In seeing these, they will take more delight than in seeing the sun or any other luminous body—for a person takes more pleasure in looking at a well-colored face than at the blazing sun. Moreover, those bodies will not only be adorned with color but will also shine with light. Hence those bodies will be both colored and radiant. Therefore the Church sings to their praise and glory: "The just will shine like the sun."

Note, second, from the same (*loc. cit., sub B*), citing Avicenna (*6. Naturalium*), who affirms that luminosity, light, and color have different subjects in which they are received. For the subject of light is what is opaque and dense, while the subject of luminosity is what is translucent and terminately diaphanous. Hence Aristotle adds (*2. Caeli, T. 42*): the denser part of the heavens is luminous, like a star; and what is behind it cannot be seen, and so it eclipses it or another star, as is seen in an eclipse of the sun, when the moon prevents the sun from diffusing its rays to the earth. The remaining parts of the heavens, however, are diaphanous and luminous. From this it is inferred that if glorified bodies are luminous, they would not be translucent and transparent, so that other bodies could be seen through them. The subject of color is what is dense, since color is received in the terminated transparent medium, while luminosity is received in the unterminated transparent medium, as in air or water. Therefore it is probable that the bodies of the blessed will be luminous and colored, rather than luminous and bright with luminosity; for color and light are compatible in a

subject, although by a created agent they cannot be simultaneously induced into the same subject. But the parts of a diaphanous body do not receive light but luminosity; hence colored things are not transparent, and if they are diaphanous or luminous, they behave like a glow-worm. Although these things are commonly and regularly so, and according to the mind of Scotus, nevertheless there is no formal or virtual repugnance against diaphanous things being colored, as Bassolis and Maior (*cited above*) show more than others.

First assertion: the bodies of the blessed after the resurrection will be clear. The Doctor defends this (*cit.*, §. *Respondeo*, *A*). This is proved, first: (*Matt. 13*) "Then the just will shine like the sun in the kingdom of their Father"; (*Phil. 3*) "Conformed to the body of his glory"; and (*Apoc. 21*) "Having the glory of God." Second, Augustine (*22. Civit., cap. 19*): "After the resurrection, the Apostles saw the color of Christ's face, but they did not see his clarity." Third, every perfection is to be attributed to the body in the beatific state, since it is a perfect state; and its perfection is to have a fitting, luminous, and manifest color, which is the endowment of clarity, as is clear from the first note. Fourth, the glorified body is agile and impassible; therefore it is also clear, since clarity is a beatific endowment of the body, just like impassibility and agility. So that the body of the blessed person may be adorned and perfect in every way, it is not lacking in clarity.

Second assertion: the clarity of the glorified body is the manifest splendor of the color fitting to that body. So holds the Doctor (*loc. cit.*, *B*); and this is clear from the first note. For clarity adds nothing to color beyond the manifestation of itself; therefore the clarity of the said body means nothing other than the aforesaid splendor of the color fitting to its complexion, as is clear in the transfigured body of Christ (*Matt. 17*): "His face shone like the sun." That resplendence, that refulgence, is therefore the endowment of clarity.

You object, first: Gregory (*18. Mor., in cap. 18 of Job*) writes that the bodies of the blessed will be translucent and transparent, because the greater delight seems to be in seeing what is within rather than what is without. For in this, art seems to differ from nature: art produces harmony externally, but nature internally. Therefore the bodies of the blessed are not colored, and consequently not clear—since light is received in a dense body, not in a diaphanous one, as is clear from the second note. I reply that glorified bodies will be porous, and hence one blessed person can see what is within the body of another through its pores, as if it were diaphanous—just as a lynx can see what is within and beyond a wall. Thus the body of the blessed person will be more like crystal than air; for air is transparent, and therefore is receptive not of color or light, but of luminosity.

You object, second, from Augustine (*just mentioned*): the bodies of the blessed will be colored and beautiful. Therefore they will not be luminous or clear, because light and color do not seem to be compatible, as is clear from the sun, in which there is indeed light but not color. I grant the antecedent and deny the

consequent; for absolutely, light and color are not repugnant to each other, except on the part of the created agent, which cannot simultaneously introduce light and color into the same subject.

You object, third: clarity, or a clear color, presented to a viewer is necessarily seen by that viewer. But the body of Christ after the resurrection (*Luke 23*) was not recognized by the disciples going to Emmaus. Therefore the glorified body is not clear. Some respond from Augustine (*12. Civit., cap. 19*) that this happened because their eyes were weak, and therefore they could not discern the clarity of Christ's body—just as the Hebrews could not look upon the face of Moses (*Exod. 34*), and a bright cloud overshadowed the disciples at the Lord's transfiguration (*Matt. 17*). This is true of permanent vision, though not of transient; yet it is not absolutely true, as is clear from the sun, which is seen by us, but not as distinctly as by the eagle. Others, such as Thomas, respond that Christ concealed the clarity of his body by the command of his will, so that it would not be seen by those disciples, just as any blessed person can do. Against this: the will of anyone, whether blessed or not, cannot impede the action of a secondary cause—just as my will cannot prevent fire from burning or water from being heated, unless a contrary is present, such as fire against water and water against fire. Similarly, the will of the blessed person cannot prevent and impede natural causes from their acts and effects.

Scotus responds that this was done divinely—that is, by God not cooperating with the said disciples to see and recognize the Lord, as the sacred text indicates: "Their eyes were held, so that they did not recognize him." For without God's concurrence, no creature can do anything, since the action of the secondary cause depends essentially on the first cause. Hence it can happen that for seeing the clarity of a blessed person, God does not co-act in seeing it when the blessed person does not wish the clarity of his body to be seen by any non-blessed person; and so it can be said that the blessed person conceals the clarity of his body—not by his own will, but by God willing it, or rather not co-acting in beholding his clarity. Hence the objection of Argentinensis falls (*4. dist. 49, quaest. 1, art. 1*), who argues against Scotus: the blessed soul is not of lesser power, with respect to its own body, than an angel with respect to an alien body. But an angel, whether good or bad, can make it so that a body illuminated and at the proper distance in a medium is not seen by bystanders. Therefore the soul can do the same. The major is clear. The minor is supported: (*Gen. 19*) the angels struck them with blindness, from the least to the greatest, so that the enemies could not see. Likewise, magicians by the art of the demon make themselves invisible. This does not hold, I say; for this was done by good angels, with God not cooperating. By the demon, however, through the deception of the senses, as I showed abundantly (*Tract. De Angelis*).

One may ask: (*Luke 24*), Christ was seen by the aforementioned disciples in the guise of a pilgrim. Did he then change the color he had before? Did he show

them a sophisticated and phantasmal body? The Doctor responds (*at the end of the cited passage*) in the negative. For God could cause the action of a different quality in their eyes (or not concur with their visual potencies) so that they did not see the clarity of Christ's body, even though that body did not actually have such a color and quality—as is clear from vision through red glass, to which all things appear red, even though in them there is truly no red color. Nor was this an illusion or deception, because they were certain that he was such a person as he truly was, so that they would believe him to be Christ. And this was better than if they had seen him in his clarity, since Christ intended nothing other than to manifest his person to them.

DOUBT V. On the subtlety of the body of the blessed person.

Section I. Whether glorified bodies are subtle.

That the bodies of the blessed will be subtle is the common opinion of the theologians—Scotus (*4. dist. 49, q. 16, §. Dicunt quidam*), Richard (*ibid., q. 4*), Bassolis, Maior, and the rest—for whose understanding and explanation:

Note, from (*2. De generatione, T. 10*): the word "subtlety" is said from the power of penetrating and entering beneath. It is equivocal and hence must be distinguished. For it is taken in four senses. First, for what has an acute figure suitable for penetrating, like a needle. Second, for what has little matter, such as rare bodies—like air, because being rare, it is subtle and penetrative. Third, for the power by which something penetrates another: thus wine, oil, and things of that kind are called subtle, because they are penetrative. Fourth, for the possibility given to a glorified body to coexist with another body at the pleasure of the will of the soul informing it—and of this we speak in the present context, as is clear from Scotus (*cit., §. Ad argumenta*). The word is also transferred to cognitive potencies: for one is said to have a subtle sight who can penetrate to see small and distant things that others do not see, and a subtle intellect who scrutinizes and attains intimate and hidden things. Similarly, vital and animal spirits, as well as immaterial substances, are called subtle.

Assertion: the bodies of the blessed will be subtle. The Doctor holds this (*loc. cit.*). This is proved, first, from Scripture (*1 Cor. 15*): "It is sown a natural body, it shall rise a spiritual body." But what is spiritual is subtle, as is clear from the preceding note. Augustine (*just cited*) and Gregory, cited by Bonaventure, concur. Second, a body that penetrates another body is subtle, because the subtle is penetrative, as is clear from what was said above. But one glorified body penetrates another body, as the body of Christ penetrated the heavens (*Heb. 4*). Therefore, and so on. Third, one of the four beatific endowments is subtlety, as I asserted (*Doubt I of this article*). And the subtler a body is, the nobler it is, as is clear from the elements, among which the more excellent are the subtler and occupy a nobler place, such as fire and air. Again, the glorified body cannot be retarded or impeded from motion; otherwise it could be disturbed, afflicted, and put in

chains, in which case it would not be blessed but wretched. It must therefore be asserted that the glorified body is marked with subtlety.

You object, first: the glorified body possesses as much matter as it had when it was not glorified, because such a body is rightly proportioned and aptly organized. But a non-glorified body is not subtle, because it is opaque and material, which is opposed to the diaphanous and subtle. Therefore the body of the blessed person is not subtle. I reply that the argument concludes about grossness or subtlety in terms of quantity or quality, but not about subtlety in the fourth sense, about which we are now speaking.

You object, second: the subtle does not penetrate but is penetrated by the hard; for what is hard penetrates water, air, and similar things. If, therefore, the body of the blessed person were subtle, it would be passible—the opposite of which was established above. This is confirmed: the penetration of dimensions is considered impossible. But if the body of the blessed person were subtle, there would undoubtedly be a penetration of dimensions. Therefore, and so on. I distinguish the major: of subtlety joined with rarity in relation to a patient, I concede; of subtlety joined with the power of an agent and taken in the fourth sense, I deny. To the confirmation, I say the major holds of a body lacking the endowment of subtlety, but not of a body possessing it, as is the body of the blessed person.

You object, third: the glorified body is not of greater subtlety than a ray of light or air. But a ray of light or air does not by its subtlety penetrate opaque bodies, but only porous ones. Therefore, and so on. I reply that there is an equivocation in the name "subtlety," which from what was said in the note is equivocal. For a ray of light or air is subtle in the subtlety taken in the second sense; but the glorified body possesses subtlety in the fourth sense. Hence there is no valid argument.

Section II. What the subtlety of the glorified body is.

Many opinions are adduced and refuted by Bassolis (*quaest. 4, art. 1*), which can be reduced to two principal headings. One belongs to those asserting that the subtlety of the glorified body is something positive, who among themselves do not agree. For some assert that it is a kind of thinness by which the soul, by its command, can make the body of the blessed person pervade and permeate the cracks and pores of any body—in much the same way as a needle passes through porous bodies. Others affirm it is a quality caused by the overflow of the blessed soul into its body. The rest maintain it is a quality created by God, through which the body is penetrative of any other body. The other heading belongs to others who hold that subtlety represents nothing positive and absolute, and they are divided into two groups. Some say it is a subtraction of matter, so that the body that was material is converted into spirit and becomes entirely spiritual. The rest teach that subtlety is the due order of the glorified

body insofar as it is animated by a soul that has merited this; or more explicitly, the endowment of subtlety is a certain right by way of merit in the blessed person, according to divine ordination—with God himself doing this, either suspending his influence from bodies so that they do not resist each other, or so that they do not mutually expel each other.

First assertion: the subtlety of the glorified body is not the complete subjection by which the body is subjected to the soul so as to be able to reduce itself to any quantity and figure. So holds the Doctor (*cited above*, §. *Dicunt quidam*), and this seems to be against Durandus (*num. 9, dist. cited*). This is proved, first: the body of the blessed person is impassible, from what was said above. But if it were reduced to a small quantity, like a needle, it would be passible, because it would be condensed or rarefied; and condensation or rarefaction is a passion inconsistent with an impassible body. Therefore, and so on. Second, the glorified body is properly organic and aptly proportioned, as the soul requires in order to inform it, as is clear (*lib. 2. De anima*). But a body reduced to a small and tiny figure to pass through the thinnest pores and cracks of another body is not duly organized, as is clear from the cited passage and from (*lib. De quantitate, qq. De certa et determinata quantitate viventium animatorum*). Hence Scotus (*cited above*) rightly calls the opposite opinion a fiction. Third, the function of the soul is to inform and vivify an organic body suitable for exercising vital operations, as is clear from the twofold definition of the soul set forth and explained in the cited passage. Therefore the body is not reduced by the soul to the aforementioned subjection and obedience. Fourth, the divine mysteries of the Incarnation would easily be evaded if it were said that Christ's body passed through the cracks of the virgin's sealed womb; of the Resurrection, if it were asserted that the same body pervaded the pores of the stone of the sepulcher, or passed through the cracks of the door entering the cenacle to the disciples; of the Ascension, if it were held to have permeated the pores of the heavens. For those who assert these things would fall into the heresy of Calvin and others who deny that two bodies can simultaneously exist in the same place.

Second assertion: the subtlety of the body of the blessed person is not a quality caused by the glory of the blessed soul informing that body. This is deduced from Scotus (*cit., before §. Ad argumenta*). This is proved, first: the glory of the soul does not cause such a quality in the body informed by it, as is clear from the transfiguration of the Lord, in which the glory of Christ's soul did not overflow into his body, leaving it in the state it was in before. Therefore, and so on. Second, the happiness of the soul is situated in the vision and enjoyment of the divine essence, which, since they are qualities and termini of the potencies of the intellectual nature, cannot produce another quality by which the body of the blessed person would become subtle. Moreover, in the next assertion it will be shown that no quality can render the body of the blessed person subtle.

Third assertion: the subtlety of such a body is not a quality created by God and inhering in the glorified body itself. So holds the Doctor (*just cited*); Durandus (*num. 10*); and Argentinensis. This is proved, first: that quality would not be of greater power than the power of an angel, "upon the earth there is no power that can be compared to him" (*Job 41*). But the power of an angel cannot render a body subtle so that it permeates and penetrates any body, just as it cannot create a vacuum, from what was asserted elsewhere. Therefore neither can that quality make the body subtle. Second, that quality would be either active or passive. Not the second, because the glorified body would then undergo passion, which is false, since it is impassible. Not the first, because its action would not be the simultaneity of bodies; for its opposite more designates action—namely, the expulsion of another body. Nor is it a terminus, because the simultaneity of certain things is the non-mutual expulsion—and so it is rather a lack than a positing of action. If, therefore, that quality did not act, it would be more of an impediment to the body than an aid. Third, that quality would be either material or spiritual. If the first, it is not apparent why something material would render a body spiritual, since nothing can formally confer on another what it does not formally possess, according to the common dictum: "No one gives what he does not have." If the second, just as the spiritual soul does not make the body spiritual but only gives it life in first act and second act, so that quality, although spiritual, would not make the body subtle and spiritual. Fourth, such a quality would be necessary and natural, acting necessarily and naturally, always inclining to the same thing. But the obedience of the lower powers to the higher does not seem always to tend to the same thing, because sometimes they conform to right reason and sometimes they oppose it. Therefore the body would not be moved at the will of the soul, but according to the causality of the aforesaid quality; and so it would be more of a burden than an adornment for the blessed person.

Fourth assertion: the subtlety of the aforesaid body is not the conversion of matter into spirit. This is deduced from the Doctor (*loc. cit.*), who decrees that the same body in number remains—the opposite of which is censured as heretical by Bassolis and Durandus (*in the cited passages*). This is proved, first: if the body through subtlety were turned into a spirit, it would no longer be a body but a spirit; and so the resurrection of the dead would be removed, and our faith would be in vain—yet it is written: (*Mark 16*) "He is risen, he is not here"; (*John 11*) "Immediately he who had been dead came forth"; (*Luke 7*) "He gave him to his mother"; and (*1 Cor. 15*) "If Christ has risen, then we also shall rise." Augustine concurs (*De fide ad Petrum, cap. 17*): "The same man was in his mother's womb, hung on the cross, lay in the sepulcher, and rose again." Second, the body is now called "animal," and the sinful man is called an "animal man." But it is not called animal because it has been turned into a soul, as is clear. Therefore neither will his body then be called spiritual because it has been changed into a spirit. For it will be restored at that time, but will not be essentially changed—otherwise it

would not be a human being, who is essentially corporeal. Third, the human being would not be beatified or receive the rewards of his merits, because he would no longer be a human being but the spirit into which his body was changed. And innumerable other absurdities would follow from the aforesaid absurd, erroneous, and heretical opinion.

Fifth assertion: the endowment of subtlety means nothing other than the possibility of one body coexisting with another body, at the pleasure of the will of the soul informing it. So holds Scotus (*passage cited; and dist. 50, quaest. 6, §. Iuxta*). This is proved, first, from the refutation of the other opinions, in comparison with which this one is judged more probable and more subtle by Bassolis (*loc. cit.*). For since the endowment of subtlety was conceded above, and it is none of the things previously described, from a sufficient enumeration it is inferred to be exactly what was stated above. Second, one must philosophize in the same way about the endowment of subtlety as about the endowment of impassibility, as Scotus rightly deduces—from whom Durandus and Argentinensis (*cited above*) do not seem to be far distant. But impassibility denotes nothing positive and absolute, from what was previously shown. Therefore the same must be asserted of subtlety.

You object, first, against the first assertion: a body commonly called subtle is one that has fewer parts of matter under the same or greater quantity. Therefore, since from the preceding article the glorified body is subtle, it follows that it is subtle through a paucity of matter, like air or another thin body. The Doctor responds (*cit., §. Ad argumenta*): the glorified body is not subtle through the absence of some part of matter, but through the possibility of existing with another body, at the pleasure of the will of the soul—not effectually from itself, but from the divine will.

You object, second, against the second assertion: Augustine (*lib. ad Dioscorum*): "God made the soul of such powerful nature that from its full happiness perpetual health and incorruptible vigor overflow into the body"—as (*Matt. 17*): "His face shone like the sun." Where Scotus says this was then not a miracle, but the cessation of a miracle. Therefore, through the overflow of the glory of the soul, the subtlety of the body is caused. I reply that Augustine only means there that the body, from its union with the blessed soul, is concomitantly and regularly beatified—which we do not deny. However, he does not affirm that subtlety and the other beatific endowments are effected by the glory of the soul; for since the glory of the soul consists in the vision and enjoyment of the divinity, which are the ultimate termini of rational potencies (*from 9. Met. 16*), they cannot cause anything else.

You object, third, against the third assertion: clarity and agility are positive, real qualities; therefore the same must be asserted of subtlety and impassibility. For there does not seem to be a stronger reason for those than for these. This is confirmed: just as man is pleasing to God through grace, which is a positive, real

quality, and blessed through glory, so the body is subtle through a quality immediately caused by God and inhering in the glorified body. I concede the antecedent and deny the consequent—just as it is invalid to say: matter and form are positive, real principles; therefore privation, which is the third principle of natural generation, is also a positive, real thing. By this the confirmation is also answered: the antecedent is conceded and the consequent denied.

You object, fourth, against the fourth assertion: (*1 Cor. 15*): "It is sown a natural body, it shall rise a spiritual body." Therefore the body through subtlety is turned into a spirit. I reply by way of explanation: the body will rise spiritual not through the conversion of body into spirit, but through the endowment of subtlety. For just as it is called clear through clarity, and impassible through impassibility, so also it is called subtle through subtlety. Hence Bassolis and Nicholas of Neise, explaining that testimony, say: "It shall rise spiritual"—that is, subtle. And this can be corroborated from many passages of Scripture demonstrating that after the resurrection the same body remains: (*Job 19*) "In my flesh I shall see God my Savior"; (*Luke 24*) "Handle and see, for a spirit does not have flesh and bones." Gregory concurs: "The flesh of Christ rose again, but of a different glory, of the same nature—that is, corporeal."

§ III. Whether a glorified body can exist simultaneously, through its subtlety, with a non-glorified body.

That by the power of nature two bodies cannot simultaneously occupy the same place was shown in Physics, book VI, question 2, article 2. But now we must investigate whether this can be brought about by the power of God. On this matter, Durandus (*4, distinction 44, question 6*) holds that it is impossible and involves a contradiction, and Calvin and other sectarians follow him. The common opinion, however, is that of Scotus (*4, distinction 49, question 6, § Respondeo*), Richard (*question 5*), Argentré, and St. Bonaventure (*ibid., question 1, on the endowment of subtlety*), who affirm that no contradiction is enclosed herein, and that God can bring it about that two bodies simultaneously exist in the same place—whether one is glorified and the other not, or both are glorified, or neither is.

Note, from Scotus (*cited § Respondeo, OS*): Some say that between one quantity and another quantity, and likewise between one "where" and another "where," there is no formal repugnance, but only a virtual one. Formal repugnance exists between things that are opposed according to themselves and their effects, as white and black. Virtual repugnance, however, obtains between a natural cause and the opposite of its effect—for example, if the heavens were generating a worm from a given matter and a stronger agent supervened and induced in that same matter a form opposed to the form of the worm, this form is virtually opposed to the heavens. Now, quantity is not formally repugnant to quantity, since nothing is contrary to quantity or to substance, and formal repugnance

does not exist except in the same subject. But there are, by hypothesis, multiple subjects—namely, multiple bodies. The repugnance, therefore, is only with respect to place, because place is a space capable of containing a body, and one body fills one place to the extent that the place is apt to be filled. Accordingly, another body is opposed to it, because it cannot fill the same place already occupied by another body. The opposition is therefore virtual, insofar as the effect of one cause—namely, the filling of a place—is opposed to another natural cause, insofar as another body cannot occupy a place already occupied by another body. God, however, can prevent a natural cause from producing its effect, as when he prevents fire from igniting and heating. For this reason, if either body is abstracted from local repletion, there is undoubtedly no contradiction in two bodies existing simultaneously in the same place, one of which fills the place while the other abstracts from local circumscription. It can also be defended that two bodies can exist simultaneously in the same place even commensuratively and circumscriptively, because quantity, according to Physics IV, the chapter on the void, belongs to the genus of "sterile" things, and since nothing is contrary to it, consequently no contradiction is found to prevent two bodies from being simultaneously circumscribed by the same place, as Bassolis and other notable Scotists hold.

First assertion: two bodies, whether glorified or not, can exist simultaneously in the same place. So holds Scotus (*cited above*), following Damascene (4, *On the Faith, last chapter*) and Gregory (*cited by Bonaventure, question 1, on the endowment of subtlety*).

This is proved, first, because what has been done was at some time actual and was possible, since there is no potency toward the impossible. But it has in fact happened that two bodies existed simultaneously in the same place—namely, the body of the Blessed Virgin and of Christ the Lord at the Nativity; the body of Christ and the stone of the Sepulchre at the Resurrection; at the entry through closed doors to the Disciples in the Upper Room; at the Ascension into heaven; and in his coexistence with the empyrean heaven. Therefore two bodies can exist simultaneously in the same place.

Durandus (*recently cited*) objects that Christ's body exited from the Virgin's womb not by breaking but by dilation of the virginal enclosure, just as would have happened if the state of innocence had endured. To the point that Christ rose with the tomb sealed, he responds that this is not found in Sacred Scripture, and if some Saint asserts it, it is to be taken as an opinion.

Against this: this evasion is precluded by what was proved in § II of this doubt. For dilation and constriction, like condensation and rarefaction, are passions that are incompatible with a glorified body, since it is impassible. Furthermore, even if in the state of innocence there had been dilation, virginity would not have been preserved. But the Blessed Mary, according to the faith, remained a Virgin after giving birth; therefore the comparison fails. Moreover, the sacred

text is twisted: Hebrews 4 says that Christ penetrated the heavens, not that he dilated them—for as is evident from the terms themselves, penetrating is one thing and dilating is another. Furthermore, Matthew 28 records that after Christ's resurrection, an angel rolled back the stone from the entrance of the tomb; therefore before that it was closed, and accordingly Christ rose with the tomb sealed. And the Church sings: "He who, enclosed by the stone, is guarded under the soldier, triumphant in noble pomp, rises victorious from the tomb."

Second, if there were any repugnance, it would be on account of two quantities mutually repugnant, one expelling the other from the same place. But nothing is contrary to quantity, as is evident from the *Predicaments*, chapter on quantity (*1, Predicaments, chapter on quantity*). Therefore, etc.

Third, a cause can exist without its effect, as in Daniel 3, where fire did not burn the three Hebrew boys thrown into it. If, then, the effect of quantity is to fill a place, God can bring it about that one body fills a place while another does not fill the same place. It therefore does not imply a contradiction for two bodies to exist simultaneously in the same place.

Fourth, in the same foundation and subject there can be multiple accidents and relations, not only intrinsically but also extrinsically adventitious—for example, multiple paternities in the same father, and multiple locations of bodies in the same "where." Likewise, a prior thing can be multiplied without the posterior being multiplied, since multiple causes can exist without a multiplication of effects, because a prior, as prior, does not depend on a posterior. Now, bodies are prior to place, just as a subject and foundation are prior to the accident and relation founded and received in them. And a body can exist without a place, as is clear from the outermost sphere and from a body that God, if he willed, could place beyond the heavens.

Second assertion: it is also probable that two bodies can occupy the same place simultaneously even circumscriptively. This is proved, first, because the bodies of the blessed exist simultaneously with the empyrean heaven commensuratively, and it is not plausible that the body of Christ or of the heavens abstracts from local repletion and commensurative circumscription. This assertion is therefore likely. Second, it is easier for two bodies to exist simultaneously with their natural mode than with some other non-natural mode, as the Doctor argues (*4, distinction 10*) against St. Thomas, who holds that one body can exist in multiple places sacramentally but not circumscriptively. But if both bodies exist simultaneously in the same place circumscriptively, each is in its natural mode; whereas if either abstracts from local repletion, one of them is without its natural mode, because it is not commensurated by the place. Therefore this is possible. Third, nothing is contrary to quantity, as stated above; therefore two quantities of two bodies are simultaneously compossible in the same place. Moreover, there is no contradiction in two foundations or subjects equal to a third having two intrinsic respects of equality founded in

them toward that third; therefore neither is there any contradiction in two bodies equal to a given place having two extrinsic respects of passive circumscription founded in them, simultaneously terminated at one place. The former is possible; therefore so is the latter.

You object, first, against the first assertion: Boethius (*1, On the Trinity, chapter 1*) says that a variety of accidents produces numerical difference, yet place is always diverse, since we can in no way conceive one place as two. If, then, diversity of place constitutes numerical or individual difference, it plainly follows that two bodies cannot exist simultaneously in one place.

I respond that Boethius is to be interpreted not with respect to constitution, because place does not individuate or singularize a body, since a body can exist without a place, as is clear from the outermost sphere—but with respect to manifestation, because it is naturally known to us that one body is contained in one place, and if one body enters a place, another body withdraws from that place.

You object, second, from Physics I, 17: things that are the same as a third thing are the same as each other. But if two bodies are simultaneously in the same place, they are the same as each other; therefore they will not be two bodies but one, which contradicts the hypothesis. The major is well known. The minor is supported thus: the dimensions of a body cannot be different from the dimensions of a place, from Physics IV, chapter on the void—if there were a void, a cube (that is, a cubic body) could not be placed there. And where the cause remains, the effect remains.

I respond with Scotus (*cited, in the solution to the third*): place does not participate dimensions, as is established in Physics IV (*just cited*), where the ancient philosophers who supposed place to be an interval or space between the sides of the containing body are refuted. Aristotle infers that as an absurdity—that is, if place were that space, then the dimensions of the place and of the located body would be the same. The Doctor adds that the dimensions are the same not positively but negatively. Others say they are the same with respect to equality, but not with respect to identity of quantity.

You object, third, that things which agree more seem more capable of coexisting simultaneously—as water with water, and fire with fire coexist more readily than with things of a different genus and species. But two glorified bodies agree more than a glorified and a non-glorified body, and yet a glorified body is not simultaneously with another glorified body through the endowment of subtlety; therefore, etc.

I respond that the major is not true unless other things are equal, since not every similarity is a ground for simultaneity. For if that were true, two quantities, being of the same genus and species, would naturally be simultaneously in the same place, and two forms would be simultaneously in the same matter—which

I showed to be false in the Physics. To the minor I say that God has ordained that a glorified body can coexist with a non-glorified body at the will of the blessed, for the sake of acquiring some perfection; but God has not so ordained that one glorified body be in another glorified body, since no perfection is acquired from the simultaneity of both.

You object, fourth, that the entire reason why two bodies cannot coexist simultaneously is the twofold quantity of each, for one quantity does not tolerate another alongside it, because the entities of both are mutually repugnant; therefore, etc. Confirmation 1: just as two parts of quantity cannot simultaneously occupy the same position, so neither can a whole quantity, because it belongs to the intrinsic nature of quantity to have parts outside parts. Confirmation 2: if parts of quantity could exist simultaneously in the same place and position, they could be simultaneously replicated so that one would not be outside the other, and consequently it could happen that a great mountain would pass through the eye of a needle, and the entire heaven could be enclosed in a tiny purse—which seems not merely impossible but even incredible.

I respond in two ways. First, according to Scotus, there is repugnance in quantities with respect to simultaneous existence, but not formal repugnance—only virtual, as explained above. Second, following Bassolis: quantities are not repugnant to each other except from the order of things so established by God, such that the quantity of one does not simultaneously exist with the quantity of another body. To the first confirmation: two parts that are connected and conjoined cannot simultaneously occupy the same place, because they are so disposed that one excludes the other from the same place. But disjointed parts are not mutually repugnant to being united so as to coexist in the same place. Now, when it is argued that it belongs to the nature of quantity to have parts outside parts—with respect to internal extension, this is granted; but with respect to external position, it is denied, as I explained at length in Physics, book V, question 1. To the second confirmation, I say that this is possible through the removal of external extension, but not of internal extension, as is evident from the body of Christ in the Eucharist, which is whole in the smallest particle of the host, because its quantity abstracts from external position and local circumscription.

You object, fifth, that two indivisibles cannot be immediate; otherwise they would not be two, as is evident from Physics VI, chapter 1 and following. Therefore, by parity, if two bodies were simultaneously in the same place, they would not be two but only one—which contradicts the hypothesis.

I concede the antecedent but deny the consequent. The reason for the disparity is that indivisibles have no magnitude or smallness whatsoever, whereas bodies enjoy their own proper magnitude and divisibility. Therefore, even when placed simultaneously in the same place, they are distinguished and divided from each other. I add that two indivisibles or points would be distinguished from each

other even though nothing mediated between them; there would, however, be no continuum there.

You object, sixth, that from one point to another point only one straight line can be drawn. But if two bodies were simultaneously in the same place, two straight lines could be drawn from one point of the containing body to another point of the same contained body; therefore, etc.

I distinguish the major: with respect to the same body, I concede; with respect to different bodies, I deny. For in that case there would be two lines simultaneously and in the same place, just as there are two bodies existing simultaneously in the same place. Moreover, between two opposite points of a place, two straight lines can indeed be extended, but not if the places are not opposite.

§ IV. Through what a glorified body can exist simultaneously with a non-glorified body.

Since it was established in the preceding section that, absolutely speaking, two bodies can enjoy the simultaneous existence of one and the same place, it is fitting now to inquire through what a glorified body can penetrate a non-glorified body. On this matter, several modes of explanation are presented and rejected by Scotus (*4, distinction 49, question 16*), Vorrilong, Bassolis, and others at the same place.

The first is that of St. Bonaventure (*cited distinction, question 1, on the endowment of subtlety*), who affirms that the two aforementioned bodies can coexist in the same place not as mathematical quanta—for then they would become one—but as natural quanta, because although they would not differ in position, they would differ in subject.

The second is that of Richard (*question 5, opinion 2*), who holds that through a created power, which is the endowment of subtlety, a glorified body can coexist in the same place with a non-glorified body.

The third is that of Peter of Tarantasia (*this distinction, problem 4, § 3*), who defends that through the removal of grossness the aforementioned bodies are compatible with each other in the same place.

The fourth is that of St. Thomas (*distinction 44 of the same book 4, question 2, article 2, in the solution to the second sub-question*), who holds that this is accomplished through the removal of matter from the body. For he thinks that the diversity of matter requires diverse places, and since a composite depends not only on proximate causes but also and chiefly on the first cause, consequently God, abstracting matter from a body, can by his power place and conserve the said bodies simultaneously in the same place—in the manner in which, in the Eucharist, he places and conserves the sacramental accidents without a subject.

The fifth is that of Godfrey (*Quodlibet* 6, *question* 5), who teaches that a glorified body exists simultaneously with a non-glorified one through the removal of the quantitative mode by reason of which a body is in a place, which mode can be removed by God.

The sixth is that of Scotus (*cited, before § Respondeo*) and Henry (*Quodlibet* 9, *last question, ad 1*), who affirm that the two aforementioned bodies can exist simultaneously in the same place because God can conserve a prior thing without a posterior, and place is posterior to the body, naturally consequent upon quantity. God, then, can remove place from a body, and in this way it is possible for those bodies to coexist simultaneously in the same place.

First assertion: a glorified body is not able to exist simultaneously in the same place with a non-glorified body on the ground that they are natural quanta rather than mathematical quanta. So holds the Doctor (*cited above, § Dicunt quidam*).

This is proved, first: a natural body and a mathematical body differ only by abstraction—namely, a natural quantum is conjoined with sensible matter, while a mathematical quantum abstracts from sensible matter, as was explained elsewhere. Therefore, if natural bodies can simultaneously possess the same place, the same must be affirmed of mathematical bodies, because consideration and abstraction posit nothing in things. Since they are really identical, it is plainly deduced that the aforementioned distinction carries no weight.

Second, only the quantity of one body prevents the quantity of another body from existing simultaneously in the same place—no one denies this. But both mathematical and natural quantity are essentially quantity, differing only by the aforesaid distinction. Therefore the cited distinction is irrelevant to the matter.

Nor does it avail to say, with Bassolis (*cited, article 2, distinction 7*), that natural quantity differs by subject and mathematical quantity by position. For both require both a subject and a position: since quantity is an accident, it requires a subject; and since it is the ground of existing in a place, it demands a position. This distinction, therefore, does not resolve the proposed difficulty.

Second assertion: it is not possible, through a created power obtained through subtlety, for those bodies to possess the simultaneous existence of the same place. This is defended by the aforementioned Doctor (*§ Ad argumenta, in the solution to the second*).

This is proved, first, by the arguments adduced in doubt 2, § 2, assertion 3. Second, the power of any form, whether substantial or accidental, is limited and finite; therefore through no created power can two bodies possess simultaneous existence in the same place. For since a body is determined to one place, and the placement of one is the expulsion of another—as is confirmed by experience, since when water enters the place of air, the air recedes from that place, and so

on, just as the generation of one thing is the corruption of another. Third, a positive change cannot naturally occur unless there is a transition from the privation of a form to its possession in those things in which they are apt to concur. Therefore, absolutely speaking, no created power can bring it about that one body occupies one place and is not deprived of another place, as is clear in local motion.

Third assertion: through the removal of grossness, corpulence, or heaviness, a glorified body does not exist simultaneously in the same place with a non-glorified body. The aforementioned Doctor holds this.

This is proved, first: even if grossness or corpulence is removed from a body, there still remains the reason why one body cannot simultaneously exist in the same place—namely, the quantity of one filling the place and expelling another body from the same place, as I noted above. Two bodies cannot simultaneously occupy the same place on account of their quantities, which are naturally incompatible in the same place, and with corpulence removed, the quantities of the said bodies still remain. Therefore the alleged reason is irrelevant. Second, a glorified body is sensible and quantified, because glory does not remove sensibility and quantity from it. And with heaviness removed, it still remains quantified and sensible, as is evident from the heavens, which, according to *On the Heavens* II, 1, are neither heavy nor light, yet are natural and quantified. Third, corpulence is a quality that is posterior to quantity, for the first accident consequent upon corporeal substance is quantity. Therefore, with corpulence removed, quantity is not removed—for when a posterior is removed, it is not necessary that the prior be removed, since a cause can exist without its effect, and a principle without what is principiated. And so it is not correctly inferred that, through the removal of heaviness, those bodies hold the same place simultaneously.

Fourth assertion: the matter of one body is not an impediment to another body preventing both from simultaneously having the same place. Scotus defends this (*at the passage reviewed*).

This is proved, first: matter considered precisely does not require a place, for matter can exist without a place—as if it were placed beyond the heavens, since place is posterior to it, just as it is posterior to a body. Therefore, through the removal of matter, two bodies are not established simultaneously in the same place.

Second, if the matters of bodies were distinguished by places, then matters would not be distinguished unless places were distinguished. And since matter is an intrinsic and essential part of a body, it could not even by divine power come about that a body exist without a place, just as a body cannot exist without matter. But it is absurd that a body cannot exist without a place; therefore it is absurd that bodies could exist in the same place without matter.

Third, according to Thomas, form is individuated through matter. If, then, matter does not remain distinct, neither does the form, nor the body composed of them. But it is contradictory for a body to exist without its intrinsic and essential causes. Therefore the reason assigned is of no avail for placing those bodies simultaneously in the same place.

Fifth assertion: one body is not simultaneously with another in the same place through the removal of the quantitative mode. The Doctor teaches this (*before § Respondeo*).

This is proved, first: what is in a place equal to itself is in a place with its quantitative mode, because from quantity flows equality or inequality as its proper attribute. But a body existing simultaneously with another body is in a place equal to itself, for it retains its quantity, which is the ground of filling the place. Therefore this reason carries no weight.

Second, although God can bring about a body without quantity, the question is how, with quantity persisting in two bodies, one can exist simultaneously with the other. For Christ's body, when it ascended and penetrated the heavens, possessed the quantity appropriate to it and the other accidents that pertain to its integrity and adornment. It is not necessary, therefore, to remove quantity in order for two bodies to obtain simultaneous existence in a place.

Sixth assertion: by the power of God alone can two bodies share the same place simultaneously. Scotus teaches this (*cited, § Ad argumenta, in the solution to the second*), and Bassolis shows it at length (*cited, article 3, § Sed quantum ad*).

This is proved, first: the law of created power is that one body is contained and circumscribed by one place and does not bear or tolerate another body alongside it in the same place. Therefore only the divine power, which is bound by no law, can establish two bodies simultaneously in the same place. The antecedent is clear from what has been said and from experience; the consequent is immediate, since God, being infinite, possesses infinite power.

Second, to that power alone belongs it to bring about that two bodies enjoy simultaneous existence in one place, to which it belongs to bring about that one body simultaneously exists in multiple places, whether circumscriptively or sacramentally. But this can be accomplished only by the divine power, as I showed at length elsewhere. Therefore the former as well.

Third, he whom nothing resists can accomplish whatever is possible. For an angel, whom all of conjoined nature resists, cannot produce a void. But nothing resists the power of God, as is evident from Romans 9. Therefore by divine power this is possible. Moreover, that power alone can establish two bodies simultaneously in the same place which can bring it about that a body moves as swiftly as a spirit. Only the power of God can accomplish the latter; therefore also the former.

Seventh assertion: through the endowment of subtlety, a glorified body can exist simultaneously in the same place with a non-glorified body. Scotus holds this (*cited above, § Respondeo*).

This is proved, first, from the refutation of the other positions in the preceding assertions. Second, through the endowment of impassibility, the body of the blessed is rendered impassible; therefore, through the endowment of subtlety, a glorified body can penetrate a non-glorified body, and be intimately present to it at the will of one's own volition—not indeed from its own effective power, but from the divine will so decreeing, as the Doctor clearly explains (*cited, § Ad argumenta*).

You object, first: to every necessary cause there corresponds a necessary effect, for both are correlatives. But the endowment of subtlety is a necessary cause, namely a quality; therefore it has a proper effect, which can be none other than the penetration of a glorified body with a non-glorified one.

I concede the major but deny the minor. For impassibility is an endowment that, according to us who deny that impassibility and subtlety are qualities (following Scotus at the aforementioned passage before § Respondeo), has no effect. Subtlety is a certain extrinsic respect toward another body, and this respect is simultaneity.

You say: impassibility prevents a contrary agent from being able to cause action. I say that this is not an action but a resistance, as is evident from the heavens, which prevent the elements from acting upon them without any action elicited by the heavens themselves.

You object, second: unless subtlety is the cause of a body's coexisting with another body, the body after the resurrection would be a burden to the soul. For the soul could of itself coexist with any body, while its body could not coexist with any other body, and so the body would be a burden to it, since without it the soul could do what with it it could not—which conflicts with Augustine (22, *City of God, chapter 11*).

The inference is to be denied. The reason is that the body could, by divine power, exist simultaneously with another body just as quickly as if the soul, being without a body, could coexist with another body by its own power. For God assists it at its very nod, as though it had this in its own power—just as a wayfarer has grace, although grace is not produced by him but created by God.

You object, third: Scotus asserts that one body cannot exist simultaneously in another unless one of them is absolved from local repletion. Therefore from one of the bodies the quantitative mode is removed, and so he unfairly refutes Godfrey, into whose opinion he unwillingly falls.

I concede the antecedent and distinguish the consequent: with respect to external extension, I concede; with respect to internal extension and the internal position of parts, I deny, as was abundantly explained elsewhere.

§ V. Whether the beatitude of the body is accidental.

Since the Scholastic Doctors—notably Richard (4, *distinction 49, article 5, question 1*)—establish a twofold reward or beatitude, one essential and the other accidental, the essential beatitude concerns the primary or uncreated object and consists in the clear vision and perfect enjoyment of that same object. The accidental beatitude concerns the secondary or created object, without which the soul can be blessed. For this reason Augustine adds (5, *Confessions, chapter 4*): "Blessed is he who knows you, even if he knows not those things; but he who knows both you and them is not more blessed on account of them, but blessed on account of you alone." In the present inquiry, however, we are examining whether the glory of the body is essential or accidental.

Note that the beatitude of the body can be called essential in two ways. In one way, principally—and in this sense only the beatitude of the soul is essential, because the soul is the principal part of the human being. In another way, less principally—and in this sense, since the body is the less principal part of the human being, its beatitude can consequently be called essential, though less principally.

Assertion: the beatitude of the body is essential to it. This is taught by Richard (*cited*) and indicated by the Doctor (4, *distinction 49, question 8, § Ad argumenta; and distinction 50, question 5, § Ad 1. quest.*).

This is proved, first: both the soul and the body are essential parts of the human being, though one is formal and the other material. Therefore, just as the beatitude of the soul is essential, so the beatitude of the body is essential.

Second, that perfection is essential without which the subject would not be perfect, as was indicated above. But without beatitude, the human body would not be perfect, for it naturally tends toward it. Therefore the happiness of the body is essential.

Third, that perfection is accidental which is superadded to the essential and primary perfection—and the beatitude of the body is not of this kind, since the body tends toward it just as the soul inclines toward its own happiness.

Fourth, through the beatitude of the soul and of the body, the whole human being is totally beatified, and without it one is neither perfectly blessed nor indeed a perfect human being, and therefore not blessed. The beatitude of the body therefore contributes to the integrity and complete happiness of the human being, and is consequently essential to it.

You object, first: no beatitude is called essential that accrues to the essential beatitude, for that is accidental which comes to a thing already complete and perfect in its beatific being. But the happiness of the body accrues to the beatitude of the soul, as is evident from the Gloss on Exodus 25. Therefore the beatitude of the body is accidental.

I concede the major but deny the minor. For the beatitude of the body belongs not to the soul but to the body itself. Since it is proper to the body, it does not pertain to the soul.

You object, second: what is essential to one thing is not accidental to another, since, as Physics III, 27 teaches, substance is accidental to nothing. But the beatitude of the body is accidental to the substantial beatitude of the soul, for the happiness of the body follows upon the happiness of the soul. Therefore the beatitude of the body is accidental.

I deny the major. For although substance is accidental to nothing, nevertheless what is essential to one thing can be accidental to another—as heat is essential to whiteness, yet accidental to a wall, because a wall is only accidentally white.

Article V. On the beatitude of the whole human being.

That the elect will be blessed in soul and body is taught with the orthodox faith by the Doctor (*distinction 50, question 5, § Ad 1. quest.*), and the same Doctor writes that the entire human nature is the subject of happiness (*ibid., distinction 49, question 8, § Ad argumenta*). Therefore, after the investigation of the beatitude of the soul and of the body conducted above, it is now fitting to undertake a discussion of the happiness of the whole composite, that is, of the human being.

Doubt I. Whether all the senses of the blessed will have their acts.

St. Thomas (*4, distinction 44, article 2, question 1, in the solution to the third, sub-question 4*) and Richard (*ibid., distinction 49, article 4, question 3*) hold that all the senses of the elect in the fatherland will have their acts. St. Bonaventure, however (*at the same place, article 3, question 1*), Scotus (*question 13, § Ad rationes principales, in the solution to the second*), Major (*first conclusion*), Vorrilong (*article 2, first conclusion*), and many others assert that some senses will issue into their acts while others will not. For the resolution of this matter:

Note, from the Doctor just cited: some senses are necessary and pertain to perfection, such as sight and hearing; others exist on account of need rather than necessity, and their acts involve a concomitant imperfection, such as taste and those that serve nutrition. Furthermore, note from the same author that a certain kind of passion is corruptive and destructive of its contrary, while another kind is perfective, as is evident from what was said elsewhere. Finally, observe that change is twofold—intentional and real—and that there can be intentional change without real change, as was made clear in its proper place.

First assertion: not all the exterior senses of the blessed in the fatherland will issue into their acts. The Doctor holds this (*cited above*).

This is proved, first: where the objects of certain external senses are not present, neither are the acts of those senses, since external senses require their objects to be actually existing in order to act, as I said in the book on the sensitive soul, in the question on the external senses. But in heaven there are no odors or flavors, since these are corruptible qualities, as I showed there. Therefore not all external senses will issue into their acts in heaven.

Second, taste and smell serve nutrition and the restoration of what has been lost, but in heaven there is neither nutrition nor other acts accompanied by imperfection. Therefore not all external senses of the elect will produce their acts.

Second assertion: sight, hearing, and touch will elicit their acts in the fatherland.

Concerning sight, this is proved from Job 19: "In my flesh I shall see God my Savior," and Revelation 1: "Every eye shall see him." Augustine adds (*in the book On the Spirit and the Soul*): "Sight will be refreshed in the contemplation of Christ's humanity," and there is the object of sight—light and warmth—for glorified bodies will be luminous, duly proportioned, and translucent.

Concerning hearing, this is clear from Psalm 149: "The high praises of God shall be in their throats." Both the interlinear and the marginal gloss affirm this. And Revelation (*just cited*): "They sang a new song."

Concerning touch, this is shown from Luke 24: "Handle and see, for it is I." Moreover, the medium of touch—namely, conjoined flesh—is present there. And it is plausible that the blessed will mutually embrace one another. I add that the said senses exhibit no concomitant imperfection in their acts. They are therefore to be granted in the fatherland with their acts.

You object, first: a power conjoined with its act is nobler than one separated from it, because it is perfected by its act—as the intellect is perfected by understanding and the sense by sensation. For understanding and sensing include perfection. But the beatific state is perfect; therefore, since the blessed possess all the senses, it follows that all of them exercise their acts.

Confirmation: just as the soul desires union with the body, so it desires union with its object. Therefore, since the soul is glorified through the union of the acts of its powers, it follows that the sensitive body too is glorified through the exercise of its sentient powers with their acts.

I distinguish the antecedent: concerning a power whose act is not accompanied by imperfection and does not exist on account of need, I concede; concerning a power whose act is followed by imperfection and exists on account of want, I deny—as is clear from taste and smell, explained above. To the confirmation,

the parity is to be denied, and the reason for the disparity is given through the distinction just presented.

You object, second: the body is glorified because it served the soul; therefore the sense too should be joined to its object through its act, since it serves the soul. For there is nothing in the intellect that was not first in the sense (*from the book On Sense and the Sensible, chapter 6*).

I concede the antecedent but deny the consequent concerning taste and smell, for the reason already given. For they are beatified, if not through the presence of their objects and their own acts, at least through the redundancy of the soul's glory into the body and into all its senses.

You object, third: sound does not occur except by means of air, as is evident from its definition given in *On the Soul II*, T. 96. But in heaven there is no air; therefore there is no sound, and so hearing does not enjoy its act there.

I respond that the major holds in this present state, in which air is also required for living and breathing. But in another state air is not necessary, especially since God can supply its function there, just as he can bring it about that a human being live and speak in a void.

Doubt II. Whether the beatitude of all the blessed is equal.

It is certain that, with respect to duration from the part after, beatitude is equally participated by all the blessed, and also that objective beatitude is equally common to all, because God—who is their objective happiness, as the Psalmist says, "My glory" (*Psalms 3*)—is seen and possessed by all. The doubt, however, concerns formal beatitude: whether all the elect are formally equally blessed—that is, whether they equally in intensity and extension see and enjoy God. And the dispute concerns adults, for children departing this life endowed with baptism alone, without any personal merit but solely by the merit of Christ, are saved and equally glorified, as Bassolis writes above others (*4, distinction 50, question 2, article 1*).

Note, first, from Scotus (*at the place just cited, question 6, § Respondeo*): it is not necessary for the natural appetite to have every perfection of which it is capable. For as it suffices for a heavy object to rest on the earth, without it needing to rest in its deepest center, so the natural appetite of a human being rests in happiness according to merits and the will of God, just as each part of the universe rests in its proper place according to the appetite of universal nature. This occurs when heavier things rest in a lower place and lighter things in a higher place, so that by the law of nature each thing obtains its proper and determined place in the universe according to universal nature. And so, although the natural appetite naturally tends toward the highest perfection and happiness, God in his distributive justice ordains that beatitude be given to the blessed in proportion

to their merits, and since merits among human beings are unequal, beatitude is consequently communicated unequally.

Note, second, that equality is twofold: one of quantity and another of proportion. The first obtains between two quantities of bulk or power, of which neither exceeds the other nor is exceeded by it—as two boards each three cubits long. The second obtains between two quantities of bulk or power, of which one may surpass the other or be surpassed by it, yet they have a proportion to each other—as two is to four, so three is to six—and accordingly between two and three there is said to be an equality of proportion.

Note, third, from the same author (*ibid.*, § *Iuxta hoc*): the inequality of happiness can arise either from the active power, or from the passive power, or from the object, if the power is neutral. It cannot arise from the object, because the object of beatitude is infinite in perfection, and what is infinite as infinite in perfection cannot be unequal. The power, moreover, rests perfectly in the best thing in which the nature of its object is preserved, and the entire object is presented to the power of the blessed according to the whole of its reality and nature. Nor does inequality arise from the passive power, because this has equal capacity in every human being, as in an angel. But on the part of the active power, which is twofold—intrinsic and extrinsic—inequality can be investigated. The extrinsic power, if natural, acts equally on a subject aptly and equally disposed, but not on one that is impeded. A free power, however, either acts as it wills—as is evident from Matthew 20: "Is it not lawful for me to do what I will?"—or acts according to distributive justice, rendering to each according to their works, as God does. On the part of the intrinsic power, which is also twofold—natural (such as the intellect) or free (such as the will)—supernatural habits are added: the light of glory and grace, or charity. Now, the intellect or will in one person can be more perfect than in another and can thereby elicit a more perfect act. Likewise the light of glory and grace can be greater in one than in another; and consequently beatitude can be unequal, as I asserted in the treatise *On the Knowability of God*, disputation 3, question 6.

First assertion: the beatitude of all the predestined is not equal. This is defended by all the Scholastics, especially Scotus (*cited*) and Durandus (3, *distinction 14, question 1*).

This is proved, first, from John 14: "In my Father's house there are many mansions"—that is, of greater or lesser glory and perfection, as Bassolis interprets (*cited, at the end of article 2*). Augustine (*cited by Scotus, cited above, question 5*) testifies that this passage is to be understood of the blessed. Psalm 61: "Rendering to each according to his works." And 1 Corinthians 15: "As star differs from star in brightness." The Creeds, Councils, and Fathers adduced at the reviewed passage concur.

Second, just as in the nature of things there are degrees more perfect and less perfect, so also in glory there are greater and lesser degrees. In this universe of the world, it is evident that there are things more noble and less noble, greater and lesser—as is clear from whiteness and blackness and other things that admit of more and less. The same, therefore, is to be affirmed of the glory of the blessed.

Third, just as in the members of the body a greater or lesser excellence is evident—as is seen with the naked eye in the head and the remaining parts—so in the Church, which is the mystical body, the glory of the head is greater than the glory of the members, as Paul clearly teaches (*Ephesians 1*): "God the Father established Christ in the heavens, above every Principality, Power, Virtue, and Domination."

Fourth, greater charity argues for greater glory, for charity or grace is given as a co-principle of merit and glory. Again, God is just; therefore according to his distributive justice, a greater degree of glory is given to one who has labored more than to one who has labored less. Hence the Apostle (*2 Timothy 2*): "Labor like a good soldier." And Philippians 4: "Help those women who labored with me."

Second assertion: the glory of bodies is not equal for all the elect. The Doctors cited in the first assertion hold this.

This is proved, first, by the testimony of Scripture, 1 Corinthians 15: "Star differs from star in brightness." Therefore, just as some heavenly bodies are brighter and more radiant than others, so the bodies of the saints will enjoy unequal happiness.

Second, the body is a part of the human being, and the soul uses it for laboring. Therefore, as one soul is more blessed than another, so one body is happier and more sublime than another. And it is fitting that Christ's body be more resplendent than the rest, because Christ himself is the head over the whole Church (*Ephesians 1*). Then the body of the Blessed Virgin, and so on for the rest, according to their merits. The happiness of the bodies of the saints is therefore unequal.

You object, first: every blessed person has an equal capacity and natural appetite for receiving glory. Therefore, since in the fatherland the entire appetite is fulfilled and the entire capacity is completed through glory, it follows that glory is equal for all the elect. Hence Augustine adds (*12, On Genesis, Literally, chapter 35*): "In the soul there is a certain natural appetite for the body, by which it is somewhat held back from tending with full intensity toward the highest good, until that appetite comes to rest."

I concede the antecedent and distinguish the consequent: concerning the rational and deliberative appetite, I concede—for this is subject to the rule of the

divine will, and therefore it is content with as much glory as God wills to bestow upon it according the requirements of one's merits. But the natural appetite, since it is not an elicited act but only an inclination, does not need to have the highest glory and every glory, just as matter does not actually have every form. Augustine (*mentioned above*) is to be expounded in this sense.

You object, second: Matthew 20 says that all received individual denarii and were made equal, even though some came to labor in the vineyard around the sixth hour and others around the ninth. But the denarius there signifies the beatific reward, as the sacred interpreters explain; therefore happiness is equal for all.

Confirmation: from Augustine (*Tractate 66 on John*): "The joy of all will be equal." And (*83 Questions, question 32*): "One person cannot understand the same thing more than another; therefore one will not be more blessed than another."

I respond that the cited text is to be interpreted concerning beatitude not formal but objective—or concerning eternal life, which all the blessed possess, but not concerning the happiness by which one is happier than another. To the confirmation: Augustine is to be expounded extensively, not intensively. For although the joy is concerning the same objects—because each will rejoice concerning every individual thing and concerning all the things about which another rejoices—the joy is not equal in affection, equal in vision, and equal in enjoyment, but one will see more clearly and limpidly and will enjoy the beatific object more perfectly than another.

You object, third: privation does not admit of more and less. But certain beatific endowments are privations, namely impassibility and subtlety, as is clear from what was said above. Therefore the happiness of the body is not unequal.

I concede the major. To the minor I say that this is true of impassibility and subtlety, but false of agility and clarity, which are real qualities, as Scotus indicates (*cited above, § Ad 3. quaestionem*) and St. Bonaventure (*ibid., question 2, on the distinction of the endowments*). Nor should this surprise anyone. For physical principles are not all positive, and divine attributes include some that are positive and others that are negative, on which I wrote at length in the treatise *On the One God*, disputation 3.

Doubt III. Whether the punishment of the damned is equal.

Scotus (*4, distinction 50, § Ad it, quest.*) observes that just as the blessed person is blessed with the beatitude of soul and body, so the damned person is punished with a twofold punishment of soul and body. The reprobate is punished with a twofold penalty—the penalty of loss and the penalty of sense—as Chrysostom particularly notes (*Homily 23 on Matthew*).

The penalty of loss is the lack of a good suited to one's being—not a remote good, but a proximate one—that is involuntary and unwilled. More briefly, the

penalty of loss is the privation of the beatific vision and enjoyment. This can be called unequal in two ways. First, because it is a privation of unequal degrees—that is, of beatitude to which individuals were unequally ordained, whether to greater or lesser degrees. Second, because it is unwilling, since each person would wish for his own good more than for another's.

The penalty of sense is the positive sorrow or pain, whether bodily or spiritual, by which the damned are afflicted. The penalty of sense is divided into the mental, which is the sorrow caused by the apprehension of harm and is called the penalty of the worm, or the continual remorse of conscience; and the corporeal, which is the pain caused by the fire of hell through the alteration of the senses—for when the sense is altered, the appetite is altered, and through the appetite, the will.

First assertion: the penalty of loss is unequal for the damned. The Doctor (*cited*) holds this.

This is proved, first: privation is called greater or lesser in proportion to the greater or lesser habit of which it deprives. But some of the damned were ordained to a greater good and others to a lesser good. Therefore the penalty of loss is unequal. The antecedent is evident: not all are ordained to an equal good, as is clear from the preceding article. The consequent holds because those who could have attained a greater good and did not attain it grieve more than those who would have obtained a lesser good—just as someone who could have possessed a treasure and does not possess it is more anguished than someone who could have acquired ten gold coins and did not obtain them. Hence Bernard says (*Sermon 8 on Psalm 90*): "So that they may be more sharply pained when they see what they have lost."

Second, the penalty of loss is greater than the penalty of sense—as theologians confess with Chrysostom (*just cited*). But if the penalty of loss were equal, it would not be greater but rather lesser, because children bear this penalty alone, yet they are not equally tormented as adults who are damned.

Third, that which causes greater pain and sorrow is what is more involuntary and more unwilling. But some among the damned are more unwilling than others—as Lucifer suffers more than others drawn by him. Therefore the penalty of loss of the damned is unequal.

First assertion: the penalty of the worm is also unequal for the reprobate. The same Scotus defends this (*cited above*).

This is proved, first: the penalty of the worm, as explained above, is the sorrow caused by the apprehension of harm, and some of the damned grieve more than others. For he who has sinned more grieves more. Since, then, some have sinned more gravely than others, they are punished more than others, and accordingly the penalty of the worm is unequal for the reprobate.

Second, glory is unequal for the blessed on account of unequal merits, as was shown in the preceding doubt. Therefore equally, the penalty of the worm is unequal for the reprobate on account of unequal demerits.

Third assertion: the penalty of fire will certainly be unequal for the damned. The Doctor teaches this (*ibid.*).

This is proved, first, from Job 24: "They shall pass from the waters of snow to excessive heat." And Revelation 18: "As much as she has glorified herself and lived in luxury, so much give her torment and grief."

Second, Augustine (*On the City of God*): "Although the fire burns equally, it does not torment all with equal distress."

Third, the distributive justice of God requires that he who has fallen into greater fault be more tormented by the fire that God has placed in hell to punish the wicked. The penalty of fire is therefore unequal for the damned. Furthermore, he who has merited more by chastising his body and bringing it into servitude receives more reward and glory; similarly, he who has indulged in greater bodily pleasure has demerited more and is worthy of a greater penalty and punishment. The penalty of fire is therefore not equal for the wicked.

You object, first: privation does not admit of more and less, because it is the lack of a form in a subject apt to receive it, as I said in Physics, book 2, question on privation. But the penalty of loss is the privation of the vision and enjoyment of the divine essence. Therefore the penalty of loss is equal for the damned.

I distinguish the major: by reason of the lack of the habit of which it deprives, I concede; by reason of the greater wickedness or greater good of which it deprives, I deny, as was declared above.

You object, second: a natural agent acts equally on a subject that is aptly disposed, inasmuch as it acts according to the utmost of its power. But the fire of hell is a natural agent, acting according to the utmost of its power on the damned. Therefore the damned are tormented with an equal penalty of fire.

Bassolis responds that the inequality of the penalty of sense is not to be derived from the side of the fire, but from the inequality of demerits, and chiefly from the side of God the afflictor, who cooperates with the fire for a greater affliction in proportion to the demands of a greater fault. I add from the same author that if the fire cannot produce as intense an alteration as the sin deserves, the fire cooperates with God to the degree it can, and God immediately superadds the further degree.

You object, third: if penalty admitted of more and less, a greater penalty would be worse. But this is false, since penalty is a positive being and is just, and everything just is good; therefore, etc.

I respond that although a greater penalty is, absolutely speaking, a greater good, it is nonetheless, absolutely speaking, an evil for the one bearing such a penalty, since it is contrary to his inclination toward comfort. Therefore a greater discomfort, a greater affliction, and a greater pain follow. This can be illustrated by the wind, which is good absolutely speaking because it purges the air of clouds or brings rain that benefits the fruits of the earth, but is bad for another because it sinks his ship or soaks him with rain.

You object, fourth: every penalty of a sinner is infinite, because it is against God, an infinite object, and nothing is greater than the infinite. Therefore every penalty is equal for the damned.

I distinguish the major: objectively and extrinsically, I concede; formally and intrinsically, I deny. For the malice is formally as great as the goodness that would have been present in the act had it been elicited according to the due circumstances, as Scotus teaches with the author of the book *On Faith to Peter* (*at the end of the cited question*).

Doubt IV. Whether the elect will be more blessed after the day of judgment.

In this difficulty, one thing is presupposed and another is investigated. It is presupposed, as a matter of faith established by the Church—as can be seen in Alphonsus—that the souls of the saints, abstracted from the bodies that they informed, see God clearly and enjoy him fully before they reassume those bodies at the universal resurrection. What is investigated, however, is whether the glory of those same blessed will be increased after the judgment, or not. On this matter there are two positions among the Scholastics. One is that of Durandus (*44, distinction 49, question 7*) and Major (*ibid., question 12*), who hold that the beatitude of the just after the resurrection of the dead will be greater indeed extensively but not intensively. The other is that of the Master (*at the same place*), St. Bonaventure (*question 1, on the beatitude of the body*), Richard (*article 2, question 7*), and Argentré (*question 3, article 4*), who teach that the glory of the saints after the day of judgment will be greater both intensively and extensively.

Note, from the Seraphic Doctor (*cited*): beatitude can be called greater in four ways. First, because it concerns an infinite object—in this sense it is called greater because no greater beatitude concerning a greater object can be found. And since all the just participate in the same infinite object, beatitude is not properly called greater or lesser by reason of the object.

Second, with respect to habit: Peter possesses a greater habit of glory than Linus. Third, extensively, because Francis rejoices over more things than Anthony. Fourth, intensively, because one person enjoys a more intense vision and enjoyment and a greater effort than another.

Furthermore, observe from Scotus (*4, distinction 49, question 8, § Ad argumenta*): the rational soul is the part of the human being that is capable of beatification

and is the immediate subject of happiness. But the entire human nature is its mediate subject. For vision and enjoyment are immediately received in the soul—that is, in its powers, the intellect and the will—and this is called essential beatitude. The other, which pertains to the body and the humanity, is called accidental, as the Seraphic Doctor affirms (*cited above, before the response to the objections on the opposite side*).

First assertion: extensively, after the resurrection of the dead, the happiness of the elect will be increased. This is deduced from the Doctor (*at the cited passage*).

This is proved, first: not only the soul but also the blessed body will be beatified after the day of judgment, and the higher powers as well as the lower will be beatified. Therefore, extensively, after the universal resurrection, the beatitude of the saints will become greater.

Second, the just will then rejoice not only in their own glory but also in the glory of all others, for all the elect will then simultaneously participate in the same beatitude. A greater extensive happiness is therefore then conceded.

Second assertion: after the day of judgment, the glory of the saints will be more intense. This is in conformity with Scotus's teachings (*cited above*). For the Doctor holds that human nature is the total and adequate subject of beatitude, and that the humanity is a third thing really distinct from its parts taken conjointly. From this the following argument is drawn: the greater power of the whole is more intense than that of a part. Therefore, since after the day of judgment the entire nature is to be beatified, the glory of the blessed will be intensively greater.

Furthermore, this is supported by the Gloss on Revelation 6: "I saw under the altar the souls of those who had been slain." Now the souls of the saints are in lesser dignity than they will be, because they have received only one stole, but then they will be adorned with a double stole. Hence the Church sings in the proper office of St. Augustine: "What he tastes for himself for eternity, adorned eternally with one stole, secure concerning the other."

Jerome confirms this (*On Hosea*): "After the judgment is completed, God will show a more ample glory of his brightness to the elect." Nor does Bernard disagree (*in the book On Loving God*): "The soul, though stripped of the body, is still joined to it, if not by life or sensation, at least by affection, so that without it the soul neither can nor wishes to be consummated."

Moreover, the whole is nobler, more perfect, and stronger than its parts, as is evident from the author of the Book of Causes, proposition 17, received by all: "A united power is stronger than when dispersed." After the universal resurrection, the soul and body will be united together, and the whole human being will be constituted as blessed. Since operating presupposes being, a more perfect being will produce a more perfect operation. The human being will therefore then be more blessed.

Again, natural desire is directed toward the perfection of the one desiring, and the separated soul desires the body as its companion and instrument by which it exercised meritorious works, and the whole human being merited. Therefore James 1: "Blessed is the man who endures trial, for when he has been proved, he will receive the crown of life." But the soul alone is not a man but part of a man. Therefore, since the whole human being is then to be beatified, the happiness of the saints will be more intense.

Finally, the misery of the damned will be greater in the future, since now only the soul but then both the body and the whole human being will be tormented. Therefore, by the opposite reasoning, after the day of judgment the glory of the saints will be intensively increased.

You object, first: the more a power is conjoined to God, the more it is beatified and rejoices. But the soul separated from the body is more united to God than when conjoined to the body, for when conjoined, its power is diffused and dispersed in vivifying and governing the body. Therefore beatitude will be lesser when it reassumes the body than when separated from it.

Confirmation 1: the intellect and will do not use an organ in their operations (*On the Soul III, 16*). Therefore, through the union of the soul with the body, glory will not increase.

Confirmation 2: the soul of Christ in the triduum was less blessed than before, because it was separated from the body, which lay in the tomb. But this is false; therefore so is the premise.

I concede the major but deny the minor. For the human being will rise composed of soul and body, both more perfect and more robust, and all its lower and higher powers will be united and will become stronger, as experience confirms from the axiom adduced shortly before. To the first confirmation: I concede the antecedent but deny the consequent. The reason is that through the reassumption of the body, the nature is made perfect and whole, having a more perfect operation than if the soul alone existed. To the second: the parity is to be denied, since the soul of Christ was endowed from the instant of its conception with grace and negatively supreme glory, as I pursued at length in the treatise *On the Incarnation of the Word*.

You press the point: at that time Christ's soul lacked the body as its companion, and Christ as man was truly dead. Therefore perhaps it will not be unfitting to say that Christ did not then have all the glory he had while living.

The consequent can be conceded. For his body before death was not glorified—it was not endowed with the four beatific endowments. And even more so, because in the triduum he was not a man, and consequently, not having human nature, he did not have its glory. And he who does not have being does not have what follows upon being.

You object, second: the principles that are immediately beatifiable are independent of the body and its union—for they are the intellect and the will, which are immaterial powers. Therefore, through the union of the soul with the body, the glory of the human being does not increase.

I distinguish the antecedent: if those principles are taken as they are in a total and adequate subject having no inclination toward a body, such as the intellect and will of an angelic nature, I concede. But if they are in a partial subject, such as the rational soul, which naturally tends toward the body, I deny. For in that case those faculties become more perfect and more powerful, as is evident from what was said.

You object, third: if the glory of the just after the judgment is to be more intense than before, this will arise either from greater grace, or from the light of glory, or from a strengthening of power, or from the presence of the object, or from an obstacle found in the soul before the resurrection and removed after its union with the reassumed body. But it arises from none of these sources; therefore the glory of the blessed will not increase through the assumption of bodies.

The major is shown: not from grace or the light of glory, because these remain the same; nor from the beatifiable powers, because since they are really substance, they are not intensified or diminished; nor from the object, because the beatific object relates in the same way; nor is there any obstacle when the soul is separated, as is evident.

I respond that it proceeds from the strengthening of power that comes from an integral and perfect nature constituted and composed of soul and body, as was explained and proved above.

You say: this added degree, which was not there before, either is without merits, or is given on account of merits, or comes about without grace or with grace bestowed by God—but none of these appears to be the case; therefore no greater happiness will exist then.

I say that it is given by reason of the whole nature. For it is the human being who properly merited and performed good work; therefore a greater degree is owed to the whole than existed in the soul alone, which is only a part, though the principal one.

Doubt V. Whether the blessed see the punishments of the damned.

This difficulty can be understood either as a matter of fact or as a matter of possibility; likewise, whether by the eye of the mind or of the body; intuitively or abstractively; whether in their proper genus, or in the Word, or in some other similar way. And conversely, whether the damned see the glory of the blessed, and in what manner.

Note, first, from Scotus (4, *distinction 50, question 3, § Respondeo*), following Augustine (9, *On the Trinity, chapter 10*): beyond knowledge of a thing present and in its proper existence, something can be known in two ways. First, in a species—and thus a thing is known in itself and through itself, not through another or through the nature of another. Second, through privation—and thus a thing is known through another, not through its own nature, in the way that a privation is known through the habit opposed to it (4, *Metaphysics 4; 9 Metaphysics 3; 5, Ethics 1*). Again, something is known in its proper genus—that is, in its proper being, its essence, and its existence, as a stone is said to be known in a quarry—or in the Word, that is, in the divine essence, which is the most lucid exemplar representing and containing all things formally or eminently. That privations and other things of which there is no idea are known through the positive things opposed to them, I showed at length in the treatise *On the Knowledge of God*, disputation 2, question 6.

Note, second, from the same author (*ibid.*): the punishment of the damned is manifold. First, the reprobate are sorrowful because they have lost the substantial reward, which consists in the vision and enjoyment of the divine essence. Second, they are sorrowful about their guilt—not insofar as it is offensive to God, but insofar as it is the cause of their torments. Third, they are sorrowful about the perpetual fire detaining them, as in a most foul prison. Fourth, they are sorrowful about the fire altering their senses and holding their intellect in a continual and perpetual consideration of it. Fifth, they are sorrowful about their guilt insofar as it is the worm, or the continual remorse of conscience.

First assertion: the blessed do not in fact see the punishments of the damned with the bodily eye. So holds Scotus (*cited, § Respondeo*), against certain authors cited by Aureolus (4, *distinction 50, article 4*).

This is proved, first: between the visual power and its visible object a due distance is required, as is clear from what was said in *On the Soul*, book 3, question on sight. But between the empyrean heaven, where the blessed dwell, and hell, where the damned reside and are detained, there is an undue distance, as cosmographers and astronomers calculate. Therefore the blessed do not now behold with bodily sight the punishments of the wicked in hell.

Second, sight does not penetrate an opaque body. For it does not intuit what is beneath the earth. But hell is in the center of the earth, as theologians commonly assert. Therefore with the bodily eye, the blessed do not now observe the punishments of the damned.

Second assertion: nor with the eye of the mind by intuitive vision do the blessed see the torments of the lost. The Doctor holds this (*ibid.*).

This is established, first: between the intellect and its object a proportionate distance is required, as I said at the cited place, in the question on the intellect.

But the intellect of the blessed is in the empyrean heaven, while the sufferings of the reprobate are in hell. Therefore the blessed do not intuitively behold the punishments of the wicked.

Second, what is intuitively perceived by the intellect is present to it in its proper genus and in its proper existence—this is clear from the very terms. But the punishments of the damned are not present but far distant from the intellect of the blessed. Therefore the punishments of the reprobate are not viewed intuitively by the blessed.

Third assertion: by divine power, the blessed person can see the torments of the wicked in hell in both the aforementioned ways. Bassolis expressly defends this (*4, distinction 50, question 3, article 2*), and it accords with Scotus (*mentioned above*).

This is proved, first: God can supply every causality of a secondary cause in the genus of efficient cause, since this involves perfection and in God there is the fullness of every perfection. But vision, whether of the eye or of the intellect, concerning the torments of the wicked pertains to efficient causation. Therefore, if the eye or intellect can produce such vision when the object is present and concurring, God, who is of infinite power, can by himself alone cause it in the bodily or mental eye of the blessed.

Second, God by his power can produce every absolute being not essentially dependent on another, because his power is unlimited. But vision, whether corporeal or spiritual, is an absolute being not essentially dependent on another, since it is a quality belonging to the genus of absolute things. Therefore both types of vision can be brought about by divine power.

Fourth assertion: by abstractive mental vision, the blessed see the sufferings of the wretched in the underworld. This accords with Scotus and other Doctors.

This is proved, first, from Isaiah (last chapter): "They shall go out and see the corpses of the men who have transgressed."

Second, Jerome (*ibid.*): "Say—it is not a miracle if the saints, now immortal, see the reprobate by mental intelligence, since the prophets, still mortal, merited to see all these things. The elect shall therefore go out, not by place but by intelligence or manifest vision, to see the sufferings of the impious."

Third, the knowledge and science of opposites is the same, by the common dictum of the philosophers. But glory and misery are opposites. Since it is evident that the blessed contemplate their own glory and beatitude, knowledge of the misery and punishment of the reprobate should not be denied to them.

Fourth, the beatific state, insofar as it is possible, ought to be ennobled, since it is the supreme of all states. It is dignified and fitting that the blessed should know the punishments of the wicked, so that, having been snatched from them, they may return more abundant thanks to God and rejoice more in the happiness

attained, sustained by divine grace, liberated from the snares of the flesh, the world, and the devil, and from the punishments the impious suffer—as Durandus and Richard (*previously cited*) not obscurely indicate.

Fifth, wayfarers obtain some knowledge of the miseries of the reprobate from Sacred Scripture, as is evident from Luke 16: "The rich man also died and was buried in hell"; Matthew 22: "Cast him into the outer darkness"; and Job 24: "They shall pass from the waters of snow to excessive heat." All the more, therefore, do the comprehensors, from whom nothing is hidden that pertains to their knowledge, praise, and beatitude.

Finally, the reprobate know the state of the blessed, as is evident from the cited passage: "Father Abraham, send Lazarus," etc. Therefore the blessed know the misery of the damned.

Fifth assertion: by reason of the divine essence, the blessed see in the Word the positive punishments of the wicked. Scotus and St. Bonaventure (*cited*) support this.

This is proved, first: the divine essence is the most lucid mirror representing all things, as I have emphasized more than once. Therefore the blessed, beholding the divine essence, see the positive punishments of the impious.

Second, the divine essence represents all things whose ideas reside in it—no one denies this. But the aforementioned punishments have ideas in the divine mind, because they are positive beings for which proper ideas exist. Therefore, etc.

Sixth assertion: the blessed do not see the penalty of loss of the reprobate in the Word, but in the positive opposite of that penalty. The Doctor defends this (*cited above*).

This is proved, first, from what was said in the preceding assertion: only those things are seen in the Word whose ideas exist there. But the penalty of loss has no idea in God, since an idea is of something that can be made, whereas the penalty of loss is the lack of beatific glory.

Second, a privative opposite is known through its positive opposite—as darkness through light, night through day, and blindness through sight. But the penalty of loss is a privative opposite, as its description given above indicates. Therefore, since the penalty of loss is a privative opposite, it follows that it is known through its positive opposite, which is the glory of the elect, or the vision and enjoyment of the divine essence.

Seventh assertion: the blessed are affected by no passion from the vision or knowledge of the torments of the wicked. The Doctor teaches this (*cited*, § *De tertio princip.*, and at the end of the cited question, *Ad 3*).

This is proved, first: the blessed are impassible, as was shown above. Therefore they succumb to no passion from the vision of the sufferings of the impious.

Second, every passion is either of the sensitive appetite or of the rational appetite. In the blessed there is no passion of the sensitive appetite, since it is fully conformed to the will and the right dictate of reason. Nor is there passion of the rational appetite, since it is united and conformed to the divine will. Moreover, the blessed are in their final state, immune from all pain and sorrow, and free from passion. For they are absorbed into infinite glory and joy. Hence Gregory (*Homily 41 on Luke*) says: "The faithful in their rest attend to what is above them, the joys of which they cannot afterward contemplate." And concerning the reprobate the Seraphic Doctor adds (*cited*): "Then they will be absorbed by a greater pain, so that it will no longer be permitted them to think upon the dignity of glory; yet they will always hold in mind its loss and absence, so as to grieve."

Eighth assertion: the blessed rejoice over the punishments of the reprobate—not simply, but in a qualified sense, insofar as God has so ordained. This is received from the Doctor (*cited*) and is divided into three parts.

The first part is proved, first, from Psalm 57: "The just man will rejoice when he sees vengeance." And Psalm 51: "Behold the man who did not make God his helper."

Second, the blessed ought to conform to the divine will, which is just and holy. God has thus determined to afflict the unjust and punish the wicked; and Proverbs 1 says: "He will laugh at their destruction," and there too: "She will laugh on the last day." Furthermore, he who has what he sought is glad, and the blessed have what they asked for—namely, the punishment of the wicked. Revelation 16: "All the saints beneath the throne of God cry out: Avenge our blood, our God." Therefore the just exult that the wicked are tormented.

The second part is proved, first: God does not absolutely rejoice in the torments of the wicked, as is evident from Isaiah 1: "Alas, I will be comforted concerning my enemies." Therefore neither do the blessed simply rejoice in their miseries and punishments.

Second, the object of joy is not evil but good, absolutely speaking. But punishment is evil for the reprobate, especially the penalty of loss, which is the privation of beatitude. Add that the object of the penalty, around which it is ordered, is bare nature, which God does not direct toward punishment except on account of wickedness.

The third part is established thus: the blessed are pleased with whatever God wills, because they are joined to him in mind and will. But God justly wills to punish the impious. Therefore the blessed are delighted by the punishments of the wicked only insofar as God has justly decreed to punish them. Again, the just person ought to rejoice in justice, because it is good, and in punishing the wicked God maintains distributive justice. And so the blessed will what God

wills, and if it did not displease God for the wicked to be freed, they would will their liberation—as Scotus and Bassolis (*previously cited*) rightly pursue.

You object, first: the damned will not see the glory of the saints, as the Master asserts in the present distinction with Gregory. Therefore neither will the blessed see the sufferings of the wicked. The consequent holds by parity, for no stronger reason appears for the one case than for the other.

I concede the antecedent but deny the consequent. For the blessed, sustained by the divine light, can do many more things than the wicked, enveloped in the darkness of the underworld. Especially since the blessed are princes of the kingdom of heaven, and it is evident that princes can do more than servants and those consigned to prison, such as the reprobate—of whom it is read in Matthew 22: "With hands and feet bound, cast him into the outer darkness."

You object, second: the divine essence, although it represents the simple terms of things and necessary complexes, does not represent contingent propositions—such as "Judas will be damned" or "Peter will be saved"—otherwise every blessed person would know all contingent, future, and possible propositions, which is not granted.

I respond that the divine essence is representative of contingent propositions, not precisely in itself, but after the determination of the divine will, through which all future things are understood and fully known, as I showed at length in the treatise *On the Knowledge of God*, disputation 3.

You object, third: if the blessed were to see the evils of the impious, either they would have compassion for them, or they would rejoice over their punishments. If the first, they would be miserable, because compassion includes suffering, from which they are far removed. If the second, they would be cruel, for to rejoice over the evils of others conflicts with charity.

I respond that the blessed rejoice upon seeing the punishments of the wicked not simply but in a qualified sense, insofar as God has so decreed, and they delight in them insofar as divine justice shines forth therein, as I showed above.

Doubt IV. Whether the damned would prefer not to exist rather than to be tormented.

Certain authors—whose names the Doctor suppresses (*4, distinction 50, question 1, § Respondeo*) (cited by the marginalists as Scotus; Richard at the same distinction, article 4, question 2, who rather seems to hold the opposite there and in question 3; Durandus, however, expressly holds this view at the same place, question 2)—hold that the reprobate cannot desire non-existence. The common opinion, however, is that of Scotus (*cited*), Bonaventure (*ibid.*, *question 2*), Aureolus, Major, Bassolis, and others, who hold that the wicked can desire non-existence in order to flee from misery.

Note, first: something can be desired by the natural appetite, by which a person is carried toward a good suited to oneself and flees what is harmful and unsuitable—which occurs without prior cognition and an elicited act, as a stone by its weight naturally tends toward its center. Or something can be desired by the rational and deliberative appetite, by which a person desires at will whatever one wishes. It is concerning this latter appetite that the present difficulty arises. Aureolus observes (*cited, question un., article 1*), following Anselm and Aristotle (9, *Ethics, at the end*), that there is a twofold affection in the will—the affection for advantage and the affection for justice. The reason is that the will either tends toward what is advantageous and delightful to itself, and in this respect it is said to have the affection for advantage; or it tends toward what is just and honorable, which is sought for its own sake, and in this respect it is said to have the affection for justice.

Note, second, from Scotus (*mentioned above, § Ad 2. q.*): good and evil, if both are positive, are contrarily opposed to each other; if one is privative, like the evil of fault, they are privatively opposed; but if one is positive and the other negative, they are contradictorily opposed—as being and non-being, existence and non-existence. Misery is contrarily opposed to beatitude, since both are positive. Non-existence, or nothing, is not formally evil, and therefore is not formally hateful; otherwise, since before the creation of the world there was non-existence, or nothing, evil would have existed before the world was made—which is false. Evil, properly speaking, is divided into the evil of fault and the evil of punishment. Therefore arguments proving that, in order to avoid misery, no one can desire non-existence—because non-existence is greater than any other evil, since it takes away every good—are of no weight and are dissolved by the Doctor (*ibid., § Respondeo*).

Note, third, from the same (*cited above*): the evil of fault is not opposed to God as though through fault some detriment accrues to him, but is said to be against God because it is done against his law and precept. Nor does God, on account of fault, will the sinner simply not to exist, nor does the sinner himself desire non-existence on account of sin, nor is non-existence contrary to any precept. When it is said that sin dishonors God—as in John 8: "You have dishonored me"—it does not take anything from God. For honor is in the one honoring, not in the one honored. It therefore takes away some accidental good from the one honoring, which is a lesser good absolutely speaking than his substantial existence, which is excluded by non-existence, as Bassolis rightly argues (*article 2, ad 3*).

Furthermore, note from the same (*ibid., § Respondeo ergo*): fault and non-existence can be compared to the will either uniformly or non-uniformly. Uniformly, if it is understood that the will is the cause of non-existence either simply or as far as lies in itself, just as it is understood to be the cause of fault—so that the will itself would be the cause of non-existence. But this is impossible,

because the will cannot annihilate itself, just as it cannot create itself, for equal power is required for annihilation as for creation. Nor should one will non-existence in order to avoid misery, for otherwise one would sin mortally—since, just as hatred of God is a sin (because everyone is bound to love God above all things), so hatred of oneself is a sin, because after God, one is bound to love oneself. For this reason perhaps Aristotle says (9, *Ethics*, chapter 8): "A good man ought to be a lover of himself." And (chapter 7): "Existence is desirable and lovable for all."

Non-uniformly, however, if the will is the cause of fault but not of non-existence—so that the will does not cause non-existence itself but wills it to be effected by another, as if it wills to be annihilated by God or killed by a tyrant rather than fall into fault. And in this sense the present difficulty is raised: whether one should rather desire non-existence than fall into the evil of fault.

First assertion: by the natural appetite, no one can desire non-existence. The Doctor defends this (*cited*, § *Ad 2. q.*, § *Ad q. ergo*), with whom Bassolis (*article 2*) and Richard (*4, question 3*) agree.

This is proved, first, from On Generation II, T. 59, and On the Soul II, T. 35: nature desires existence, and the intention of all nature is to conserve existence. For this reason, lest any part of the universe perish, nature with its full effort avoids a void.

Second, the natural appetite means nothing other than an inclination and tendency toward one's own advantage and perfection, as is evident from the first note. Therefore so many remedies are sought for preserving one's own existence, and death, which deprives one of existence, everyone abhors and dreads. Therefore by the natural appetite no one desires non-existence.

Third, by the natural appetite every person wants to be happy, and nature knowingly desires (1, *Metaphysics 1*), because everyone wishes to be perfect. Therefore, since non-existence takes away every perfection and goodness, it is plainly deduced that no one naturally desires non-existence.

Second assertion: in order to avoid the evil of punishment, one ought not to desire non-existence. The Doctor holds this (*ibid.*, § *Respondeo ergo*).

This is proved, first: no one by right reason should wish for what conflicts with the good and the just. But to desire non-existence in order to flee punishments contradicts the good and the just, for punishment is from God and is aptly instituted for punishing the wicked. Second, no evil should go unpunished and no good unrewarded. If, then, it is just to reward the good, it is also equitable to punish the wicked with penalties. Therefore by right reason, no one should wish for non-existence in order to escape punishment.

Third assertion: one should rather choose non-existence than fall into fault. Scotus is the patron of this position (*cited above*).

This is proved, first: everyone is bound to keep the divine precept—Matthew 19: "If you wish to enter into life, keep the commandments." To sin is to transgress God's commandment—Matthew 15: "Why do you transgress the commandments of God?" Therefore one should rather choose non-existence than fall into the evil of fault.

Second, a person ought to conform to the divine will as to the first rule, for the inferior must obey the superior, and God is the first rule and the supreme of all. Furthermore, the love of God must be set above love of creatures and the affection for advantage, because God is to be loved above all things. For this reason Christ says: "You are my friends, if you do what I command you." And elsewhere: "He who loves father more than me is not worthy of me." Augustine confirms this (*On John, Tractate 7*): "He who hates his soul will lose it."

This is corroborated from Ethics IV, 3, where Aristotle, speaking of the courageous man, says: "According to right reason, a brave man ought to expose himself to the danger of death"—that is, of non-existence—"for the common good, lest he fall into the vice of cowardice."

You say: the brave man exposes himself to death for the hope of a better life that he expects, but he does not desire non-existence. Against this: Aristotle was uncertain about another life and the immortality of the soul, as I showed elsewhere. Yet he absolutely asserts that the brave man ought to fall for his country.

Fourth assertion: in order to flee fault, the wicked do not desire non-existence. The Doctor defends this (§ *Ad 2. q.*), with the support of Major (*at the end of the fourth book of the Sentences, doubt 1*).

This is proved, first, from Psalm 73: "The pride of those who hate you ascends always." Second, the damned are obstinate in evil, for they are in their final state, unable to do penance for their committed faults. Their fault displeases them not as offensive to God but as afflictive of punishment, and the worm of conscience is in them, which is a very grave penalty, as Bassolis particularly notes (*cited, article 3*). Therefore the wicked do not desire non-existence in order to avoid the evil of fault.

Fifth assertion: it is probable that the impious, in order to flee punishment, desire non-existence. This is the position of Scotus, Bonaventure, and others (*cited above*).

This is proved, first, from Matthew 26: "It would have been better for that man if he had not been born." Revelation 9: "They will desire death, and death will flee from them"—and death tends toward non-existence, for through death a person loses existence and ceases to be a human being. And Ecclesiastes 41: "O death, how good is your judgment for one who is in need, who is diminished in strength and advanced in age."

Second, Augustine (*On the Misery of This World*) writes: "O death, how sweet you would be to those for whom you were so bitter; you alone are desired by those who vehemently hated you." Jerome concurs, as remembered by the Seraphic Doctor: "It is better not to live than to live badly." The same Doctor (*On Mark 10*): "It is better not to exist than to exist for torments." And the Gloss on Jeremiah 20: "It is better not to exist than to exist badly."

Third, Aristotle (9, *Ethics* 9), after asserting that existence and living are desirable in themselves, adds that he does not mean this of those who lead a calamitous and wretched life. For some, out of weariness with life, kill themselves in order to flee misery, and it is commonly said of the wretched: "Death is better for him than life." Hence the same Philosopher (1, *Rhetoric* 2) writes: "The absence of evil is delightful."

Fourth, a momentary punishment is to be preferred to an eternal one, just as the infinite is set above the finite. But if the damned fell into non-existence, their punishment would be temporary, whereas it is in fact eternal. Moreover, non-existence is not evil nor hateful in itself, because it is nothing, as is clear from what was said; but the punishment and misery of the wicked is evil and hateful in itself, by which the reprobate are afflicted. Add that those condemned to death, lest they fall into despair from torments, are swiftly killed by the executioners on the judge's order. Therefore the Seraphic Doctor concludes: "I concede, then, that the damned would prefer not to exist, and every person ought to desire this, considering the gravity of both punishments."

You object, first: Augustine (3, *On Free Will, toward the middle*): "Consider how good it is to exist, which both the blessed and the miserable desire. For it is more to exist and to be miserable than not to exist at all, since you would be unwilling to be miserable." Confirmation 1, from the same (*ibid.*): non-existence is not eligible, because everything eligible seems to be good; therefore it is not desirable. Confirmation 2, from the same (*On the City of God*), cited by Durandus: "Those who appear and are most miserable to themselves: if someone were to offer them immortality in which that very misery would not end, they would exult with joy, and so they would rather choose to exist than not to exist." Add what is on everyone's lips: "It is better to exist than not to exist."

I respond by explaining Augustine: non-existence is not eligible simply, I concede; in a qualified sense—that is, for fleeing evil—I deny. This is what Aristotle indicates (9, *Ethics* 9): "Existence and living are desirable in themselves"; and (*chapter 4*): "Everyone wishes goods for themselves"—but not one who leads a miserable and shameful life. Or this is to be understood of an elicited appetite, not of the natural appetite and the affection for advantage. The same applies to both confirmations from Augustine.

You object, second: what is not contained under the object of appetite is neither desirable nor willable. But non-existence does not fall under the object of

appetite, which is true or apparent good. Therefore, since non-existence encloses in itself no true or apparent goodness but rather removes all entity and goodness, it is consequently not desirable.

I concede the major and distinguish the minor: per se and simply, I concede; per accidens and in a qualified sense, I deny. For metaphysics contemplates being and non-being, and logic considers affirmation and negation.

You object, third: he who necessarily desires beatitude necessarily desires existence, not non-existence. But every person, even the wicked, necessarily desires beatitude as his own perfection. Therefore non-existence is desired by no one. Confirmation, from Metaphysics IX, 16: privation is not desired except by reason of the opposed habit. Therefore non-existence is not desired unless existence is desired, but existence and non-existence cannot be simultaneously desired; therefore, etc.

I concede the major and distinguish the minor: by the natural and conditioned appetite, I concede; by the rational, absolute, and efficacious appetite, I deny. To the confirmation: I say that the habit is desired per se, and its privation per accidens. Privation is also called a principle not per se but per accidens (*Physics I*, 6).

You object, fourth: as a person is related to the supreme good, so to the supreme evil. But one cannot not will the supreme good; therefore one cannot will the supreme evil, which is non-existence, since it removes every good.

I concede the major but deny the minor. For the damned hate God, and so non-existence can be desired by them, especially because, as was said, non-existence is not evil. Moreover, just as the will can be directed toward the impossible, as was said elsewhere, so it can will non-existence by an inefficacious volition.

Doubt VII. What the aureole is, and how many kinds there are.

It is established that the reward is twofold: one essential, the other accidental. That the aureole is to be numbered among the accidental rewards seems clear to the Doctors, since some blessed persons have an accidental reward but not an aureole—which, as will be said below, is granted only to martyrs, doctors, and virgins. Others have the accidental reward that is the aureole, appropriate to those three groups just mentioned. This division is akin to the one we presented in the Epitome, book 1, question 3, article 5, distributing difference into the most proper and the not most proper, the latter being further subdivided into proper and common.

Note, first: the essential reward of the blessed, which consists chiefly in the vision and enjoyment of the divine essence, is metaphorically called a crown—Psalm 20: "You have placed on his head a crown of precious stone." And Revelation 3: "And on their heads golden crowns." For through beatific glory a person becomes a participant in royal power. Therefore it is added there (*chapter*

5): "You have made us a kingdom for our God." For a crown is the proper sign of royal power. The essential reward is called a golden crown, both because it is given to victors and because it is like a crown fashioned in a circular line, which is so perfect that nothing can be added to it except accidentally. Similarly, that reward is so perfect that whatever is superadded to it is accidental. Moreover, just as a circular crown terminates at the same point from which it begins, so through the essential reward the human being is joined to the first principle from which, by creation, he or she came into existence.

The aureole, which is the diminutive of the word for golden crown—just as Tulliola is the diminutive of Tullia—is the accidental reward, or the joy corresponding to works performed by a person that have the character of an excellent victory, through which there will appear outwardly in the body a certain beauty manifesting the aforesaid interior joy externally.

Note, second, from St. Bonaventure (*4, distinction 33, question 2, article 3*): three things are considered in the beatific reward—habit, state, and beauty. To habit corresponds the golden crown; to state, the fruit; and to the beauty of integrity, the aureole.

That the golden crown corresponds to habit is clear, because the golden crown is the essential habit of glory and is contained in the category of habit. That fruit corresponds to state is clear from Matthew 13, where greater or lesser fruit is required according to the superiority and goodness of the soil, more or less—like greater or lesser fruit according to one's state. The aureole corresponds to beauty, since the aureole is given for merits that look to something extrinsically more excellent. Hence there will be a certain beauty for doctors on account of those converted through them; beauty also for martyrs in the body, who exposed themselves to suffering and death for Christ; and beauty for virgins in the body, who kept themselves uncorrupt for Christ.

The same Saint adds that in these there is beauty with joy and joy with beauty. The aureole is owed both to the interior, by comparison to the exterior beauty, and to the exterior as related to the interior. Therefore, if a virgin wills to be corrupted and is not corrupted, and afterward repents—because her flesh remains uncorrupt, if she persists to the end, she will have the aureole. Likewise, if she does not will to be corrupted and is violently corrupted, she too will be adorned with the aureole, as is evident from the case of St. Lucy, who, addressing the tyrant, said: "If you order me violated against my will, my crown will be doubled." Furthermore, unless one actually exercises oneself in the acts of teaching, suffering, and conquering, one will not earn the aureole. Therefore, if someone wills to teach and does not actually teach, the aureole will not be given to him. Similarly, if someone wills to undergo martyrdom and does not undergo it, he will not be marked with the aureole of martyrdom.

First assertion: there exists an aureole, which is an accidental glory for victory over something excellent. The Doctor presupposes this (*at the cited passages*).

This is proved, first, from Exodus 25: mention is made of a golden crown and an aureole, and the Gloss interprets that passage as referring to essential and accidental glory.

Second, to one who fights outstandingly and conquers brilliantly, a special reward and crown should be given, as was done in antiquity. For there were different crowns—civic, military, and others, which Calepinus and other authors discuss at length. Now some in the spiritual battle achieve an outstanding and notable victory; therefore a special crown, which is called the aureole, should be given to them.

Second assertion: a threefold aureole is bestowed on three groups—martyrs, doctors, and virgins. This is the common view, presupposed by the same Doctor (*ibid.*).

This is proved, first: a special crown and singular reward should be given for a singular combat and excellent struggle, as I was saying above. But martyrs, virgins, and doctors fight in a singular way and combat excellently. Concerning virgins, this is evident from Revelation 14: "They are virgins." Concerning martyrs, the Church sings: "With the palm they came to the kingdoms, the saints merited crowns of beauty from the hand of God." And concerning doctors, the Savior says (*Matthew 5*): "He who does and teaches shall be called great in the kingdom of heaven." Therefore a triple aureole is to be assigned to those three groups.

Second, from a triple victory over the three chief enemies, a threefold glory and reward is earned by the victor. For distributive justice requires this. The three chief enemies to be overcome are the flesh, the world, and the devil. Over the flesh—that is, over carnal pleasure—the virgin above all wins a notable victory, and for this reason the aureole of virginity is bestowed upon her, to the reception of which the Church invites her: "Come, bride of Christ, receive the crown." Over the world, chiefly by enduring pain and bearing death, the martyr wins the palm and is adorned with the aureole of martyrdom, of which the same Church sings: "You have placed on his head a crown of precious stone." Over the devil, not only by conquering but also by snatching sinners from his jaws through patience and teaching, the doctor triumphs brilliantly and merits the crown called the aureole of doctors. Therefore Ecclesiasticus 39: "The nations will recount his wisdom, and the Church will proclaim his praise."

Third, three outstanding acts of three powers of the soul correspond to three principal crowns. One notable act of the rational power is defending the doctrine of faith against its assailants, and to this is given the aureole of the doctorate. Hence in the hymn of the Office of St. Francis, it is sung: "Crushing malignant enemies, the golden victor merited; he earned the aureole while he

taught." Another more excellent act of the concupiscible power is to restrain carnal pleasures, and to this is given the aureole of virginity, which David perhaps had in view when he said (*Psalms 44*): "Advance, prosper, and reign." The third distinctive act of the irascible power is to endure pains and labors and to undergo death for Christ, and to this is assigned the aureole of martyrdom.

The struggle of martyrs is stronger and more robust; that of virgins, more difficult and more perilous; that of doctors, greater and more laborious. The glory of martyrs stands highest; the crown of virgins follows; then comes the company of doctors.

You object, first: the freer one is and the more one is able to transgress God's precept yet does not, the more one merits, and a greater reward is owed to that person, as Gregory indicates: "Services are more pleasing the more freely they are rendered." But martyrs in bearing pain and enduring death are not freer, because punishment is inflicted on them by tyrants, and they necessarily undergo it. Therefore the aureole, which is the reward of an outstanding and singular victory, should not be given to them.

I concede the major but deny the minor. For they voluntarily endure harsher and more bitter punishments than others; therefore the aureole is rightly given to them.

You object, second: widows who abstain from the enticements of the flesh are more anguished than virgins, because the former have the habit of intercourse while the latter do not. Hence Augustine (8, *Confessions*, chapter 5): "From a perverse will, lust was made, and while lust is served, habit was made." Therefore the aureole should be given to them rather than to virgins.

Granting the antecedent, I deny the consequent. The reason is that the crown is not awarded for the difficulty of fighting but for the singular and excellent victory in the contest—and especially to one who has never yielded to the enemy but has triumphed singularly over it, as the virgin has.

You press the point: if a special reward is owed to the virgin, it is especially on account of difficulty or perfection. But it is not on the first ground, because it is more difficult to deny one's own will than to preserve virginity. Nor on the second, because it is more perfect to love one's enemies than to guard virginity.

The Seraphic Doctor (*cited above*) responds: the aureole belongs to the virgin not by reason of difficulty or perfection, but by reason of beauty and outstanding victory.

You object, third: he who exalts himself in the present will be humbled, and he who humbles himself will be exalted, as is evident from Luke 18. But the doctor in this life raises himself above others, so that some, puffed up with pride, fall into the depths of evil. Hence the Gloss on Matthew 4: "The devil deceives many

inflated by the honor of the magisterium." Therefore the aureole is not fitting for doctors.

I concede the major and distinguish the minor: one seeking his own glory, I concede; one seeking the glory of God, I deny. And if some doctors fall, this is to be attributed not to the doctorate but to their own wickedness. Therefore Christ says: "You are the salt of the earth; but if the salt loses its savor, with what shall it be salted?"

Query 1: Is the aureole in the soul or in the body? The Seraphic Doctor and Richard (*previously cited, question 4*) respond that it is in the soul, insofar as the joy and reward correspond to merit—for the soul properly merits by the will, and for this reason the aureole is in the soul. It is also in the body, insofar as it is a certain beauty that is a sensible sign of the same internal joy. For this reason Augustine writes (22, *City of God, chapter 20*): "The scars of martyrs will not be a deformity but a dignity." Perhaps for the same reason Christ willed to retain the wounds of his passion.

Query 2: Does Christ have an aureole? Richard responds (*cited, question 5*), and more fully in Quodlibet 1, question 6, in the affirmative. For Christ enjoys a threefold aureole—of martyrdom, of virginity, and of the doctorate—since he was a martyr, a virgin, and a doctor. Indeed, he is the King of Martyrs, the Crown of Virgins, and the one Master and Doctor of all.

Query 3: Are angels adorned with an aureole? The answer is negative. They are not laureated with the aureole of martyrdom, since they are immortal; nor marked with the beauty of virginal modesty, since they are incorporeal; nor endowed with the glory of the doctorate, because they were not taken up for the office of teaching and preaching.

BOOK III. On the Principle and Acts of Human Beings.

Having recognized and set forth the ultimate end, or beatitude, in the preceding book, there now follow in the present book the effective principle and its acts, in the knowledge and selection of which one must labor diligently and attentively. Aristotle follows this order in treating ethics, as can be seen in Ethics I, chapter 2, and Ethics III, chapter 1 and following; as well as in the Great Ethics I, chapter 10 and 11. Cicero (*On Ends V*) and Seneca (*Epistle 71*) do not depart from this order. The reason is that the final cause is the first and noblest of all causes; next comes the efficient cause, from which human acts proceed as from their productive principle. For this reason two questions are raised in this book: the first concerning the principle of human acts, and the second concerning human acts themselves.

Question I. On the Principle of Human Acts.

Article I. What is the principle of human acts.

The resolution of this article seems to be entirely located in the understanding and explanation of the term "human." Therefore, in order to remove all equivocation and to have the matter well understood:

Note, first: the intellect and the will are the principles, or powers, of intellectual and rational nature, of which Aristotle scarcely speaks as distinct things, as Raconius observes (*disputation 1, section 1, on the principles of human actions*), following Scotus (*2, distinction 25, question un., § Dico ergo, T.*). These powers are formally distinguished from each other and from the soul. For the intellect is a natural power, and the will is a free power, as I abundantly showed in *On the Soul*, book 3, question 2.

Note, second: acts can be called "human" in three ways. First, extrinsically and denominatively, because a work is done by a human being—as a bench is called "human," as I observed in the book *On the World*, question 2, on creation. Second, because it arises from some power of the human being—and so an intellection and any other operation proceeding from a human being is called "human" really and entitatively. Third, properly, because it proceeds from the will alone. An act of the will, which is free, is called human because it is proper to the human being as distinguished from beasts, for beasts act naturally and necessarily, or rather are acted upon, while the human being operates spontaneously and freely—as the Doctor discusses (*distinction 41, question un., § Aliter*), and Faber pursues (*disputation 4, on penance, chapter 1*). Aristotle also indicates this (*1, Ethics 9; 6, Ethics 2; 8, Ethics, chapter 1*).

Note, third, from Damascene (*2, On the Faith, chapter 27*): the will presupposes the intellect both in being and in operating. For it is prior in origin. Hence the well-known saying is celebrated: "The will is not carried toward the unknown." For these powers are mutually ordered to each other so that one in being and operating requires and presupposes the other, just as the internal senses presuppose the being and operation of the external senses. Therefore, although the will requires the intellect for being and operating, it does not depend on it in eliciting and producing its acts, nor does the intellect effectively concur in those acts. It only presents the objects toward which the will is carried at its own pleasure, so that the will itself is the mistress of its own acts and commands the intellect and the other powers that are subject to it, as will be shown more clearly below.

Assertion: human acts properly so called proceed from the will alone. The Doctor teaches this (*cited in the second note*), and it is deduced from *Ethics VI, 2*.

This is proved, first, from the common consent of all philosophers and theologians who, when treating of human acts, treat the acts of the will—especially those who in our time professionally compose a treatise on human acts.

Second, terms are to be used according to the common usage of authors, as Scotus notes (*1, distinction 14 and 15, question un., sub E, § Licet autem hac via*). But the general body of Scholastics takes "human acts" as acts of the will only. Furthermore, those acts are properly human that are considered worthy of praise or blame, as I touched on above. But only elicited or commanded acts of the will are capable of merit or demerit, glory or punishment. Therefore human acts are properly those that proceed from the will.

You object, first: the clear vision of God and its beatific enjoyment are human acts; yet they are not free but necessary, because the blessed person necessarily sees and enjoys the beatific object so that one cannot do otherwise—otherwise one could fail to be blessed, or even be damned, which seems contradictory. Therefore human acts are not only the free acts of the will.

The Coimbra commentators respond (*disputation 4, Moral, question 1, article 2, ad 1 and 2*), conceding that those are indeed acts of the human being but not human acts, because they are necessary, as the argument proves. But this response does not appeal to me. For if those acts in *via* are human, why not in the fatherland? They do not seem to lose their being in the fatherland but are more perfect and nobler there, just as charity in *via* and in the fatherland differs only as the perfect from the imperfect, the more from the less—which do not change the species or alter the essence of the thing.

Therefore I respond, following Scotus (*cited above*): these are free human acts proceeding from the will, even though in fact the will does not tend toward opposite acts, because God has decreed always to concur in those acts and not in the opposite ones. Nevertheless, absolutely and remotely, the will can tend toward opposite acts, yet it will never elicit an opposite act, because it is forestalled by the divine will continually sustaining those beatific acts, as was explained at the place just cited.

You object, second: acts of the intellect are human acts, yet they are not free, since they are natural and necessary, as proceeding from a natural and necessary power, namely the intellect. Again, the acts of those who are dreaming or insane are human acts, yet they are not free, since they lack merit or demerit. Furthermore, first movements are not in our power—that is, they are not subject to our will and freedom—and therefore they merit neither reward nor punishment; yet they are human. Therefore, etc.

I respond that the aforementioned acts are improperly called human, insofar as they are done by a human being, as I observed in the first note.

You object, third: acts of the will are immanent, just like acts of the intellect, which do not go outside the power itself. But there are other acts depending on the sensitive appetite, the bodily powers, and external members, which are esteemed good or bad, praiseworthy or shameful. Not all praiseworthy or imputable acts, therefore, are to be attributed to the will.

I respond that certain acts of the will are elicited and others are commanded. Therefore the listed acts of other powers are called good or bad from the will—not from themselves, but insofar as they are subject to the command of the will, whose task it is to rule and command the other powers so that their acts are made right and conformed to the law of God.

Article II. Whether there is free will.

The heretics cited by Alphonsus (*book 8, against heresies, under the word "freedom," heresy 1*) have fallen into such great madness and malice that they have taken free will from the human being. Against these, it seems one should proceed not with authorities and arguments but with sticks and ropes, until they confess that the one striking them could refrain from striking and beating them—just as Scotus says (*1, distinction 19, § Quantum ad 1*) with Avicenna (*1, Metaphysics, last chapter*) concerning those who deny that fire burns: they should be exposed and cast into the fire until they confess that fire burns.

Note, first, from Orbellis (*2, distinction 25, question 1*), following Scotus (*ibid., distinction 38, question un., § Respondeo, sub A*): free will displays two powers of the rational soul—namely, the intellect and the will—as its very name indicates. For it is called "free" and "judgment." It is called "free" because it designates the will, which alone is free among the powers of the soul. "Judgment" is added because it refers to the intellect, whose task is to judge, or arbitrate, what is to be chosen and pursued and what is to be avoided and rejected. The will, however, by the natural order requires and presupposes the intellect and its operation, because the intellect is the ostensive, consultative, and judicative cause, showing the will what is true or false, good or evil—and it then lies in the will's power to choose and pursue either option, or to reject and discard it.

Free will therefore denotes the ostensive cause, which others call the *sine qua non* cause—though Scotus (*2, distinction 25, question un.*) does not favor this terminology—for the role of the intellect is to display objects to the will. And the will is established as the effective, elective, and imperative cause, in whose power it is to choose what is shown to it by the intellect and to command the intellect and other powers, since it is the mistress and queen in the kingdom of the soul.

For this reason, one should not think that free will is a third power distinct from the intellect and will, or some habit of both powers, as some suspect. Rather, it is formally the will, which requires the intellect as a precondition. And this is on account of the natural order of powers, which are so disposed and ordered that a later power does not operate without the prior one—just as the internal senses do not operate without the prior operations of the external senses. Similarly, the will does not act unless the intellect acts first, according to the well-known saying: "Nothing is willed unless first known."

Note, second: although these three—the spontaneous, the voluntary, and the free—are sometimes used interchangeably by authors, as can be seen in Leviticus 22 and 1 Paralipomenon 19; Psalm 53: "I will voluntarily sacrifice to you"; Psalm 117: "May the voluntary offerings of my mouth please you, Lord"; Augustine (16, *Against Faustus*, at the end of chapter 29): "Not born of Jews, but of his own accord made a Jew"; and chapter 22, against the same (*chapter 73*): "If Moses had done this of his own accord, or if the Hebrews had done this of their own accord, they surely would have sinned"; and Ethics V, chapter 5 and 2—nonetheless a certain distinction is observed among them by Faber (*disputation 9, on penance, chapter 13, number 379*).

For the spontaneous is broader than the voluntary and the free; the voluntary is wider than the free. That the spontaneous extends more broadly than the voluntary is evident from Ethics III, chapter 2: for beasts are said to move spontaneously—that is, from an intrinsic principle—toward eating food, as an ox eats hay and a horse oats, yet they do not act voluntarily and freely, since they lack reason and will. Similarly, the voluntary is more universal than the free, since children and the insane, who lack the use of reason, are said to act in a certain way voluntarily, but not freely; for their operations are not capable of merit or demerit, as are properly free operations. The free, however, coincides with the voluntary taken strictly, and the will is a free power, since it is compelled by no extrinsic principle but determines itself to acting or not acting, or suspending its act, at its own good pleasure.

For this reason Damascene rightly writes (2, *On the Faith*, chapter 21): "Things are led by the natural appetite, but the will leads; it is not led." And (*chapters 25 and 26*): "A human being is the proper principle of his own works, and is free in power and judgment." And (*chapter 27*): "Rational beings lead, and irrational beings are led." The same (*book 3, chapter 18*).

Note, third, from Alphonsus (4, *against heresies, under the word "freedom," heresy 1*): the word "freedom" in Sacred Scripture is equivocal. For it is taken chiefly in three ways. First, for grace, through which a person is freed from sin—2 Corinthians 3: "Where the Spirit of the Lord is, there is freedom." And more clearly, Romans 6: "When you were servants of sin, you were made free from justice." Augustine concurs (12, *Against Faustus*, chapter 9): "And if the Son shall make you free, then you shall be truly free."

Second, for glory—Romans 8: "The creature itself shall be delivered from the servitude of corruption into the freedom of the glory of the children of God."

Third, as opposed to necessity and coercion—in which sense that is not free which is done necessarily and by compulsion, and conversely, that is free which can be done or not done, and whose principle is the will freely determining itself to action. Hence Augustine (*Against Fortunatus*) says: "God gave to the

rational soul, which is in the human being, free will for doing something or not doing it."

Note, fourth: the free and the contingent, although sometimes used interchangeably—especially by Scotus, who asserts that God acts ad extra freely and contingently—do not coincide precisely. For some things happen contingently and by chance that do not happen freely, and some things happen freely that do happen contingently, as I said in the Physics, in the question on per accidens causes. Again, some things are done necessarily and freely, as God necessarily and freely loves himself. The reason is that the will is essentially free and determines itself to action. But because the divine will is most upright and inflexible, and its object is infinite and infinitely good, it therefore determines itself to loving that object. The created will, however, which wills freely, for the most part wills contingently, because it is capable of deviation and defect.

Assertion: there is free will, or a free will in acting. The Doctor holds this (*cited below*), following Aristotle (*1, Great Ethics, chapter 10*).

This is proved, first, from Genesis 4: "Its appetite shall be under you, and you shall have dominion over it." Ecclesiasticus 15: "He has set before you fire and water; stretch out your hand to whichever you will." John 5: "Do you wish to be made well?" And Mark (actually Matthew) 12: "Either make the tree good and its fruit good, or make the tree bad and its fruit bad."

Second, Augustine, in his work On Free Will; against Felix the Manichean, book 2, chapters 3 and 4; and in the Acts with the same Felix, chapters 3 and 8; Ambrose (*1, On the Calling of the Gentiles, chapter 11*); Tertullian (*1, Against Marcion*); and others cited by Alphonsus.

Third, Aristotle (*9, Metaphysics 10*): irrational powers are determined to one thing, but rational powers are directed toward opposites—that is, they are indifferent to desiring and willing this or that, so that it lies within their power to choose and pursue this or that. If they were not undetermined and open to either alternative, it would not be necessary to deliberate or take counsel, which Aristotle infers as absurd and false (*1, On Interpretation, last chapter; 2, Eudemian Ethics, chapter 8*).

Fourth, if the human being did not possess free will, he would be worse than all other things, both living and non-living. For all these act by the guidance of nature and necessarily, and do not sin. Therefore, if a person were not free in his operations, he would not sin, as Augustine says (*against Fortunatus*): "He who is compelled by necessity to do something does not sin." He would be unjustly consigned to eternal punishments and thrust into the perpetual prisons of hell. And David would cry out in vain to God (*Psalms 118*): "You are just, O Lord, and your judgment is right." And God would prescribe precepts and laws to be observed to no purpose. For, as I may speak with Augustine (*On Faith Against the Manicheans, 4, 10*): "Who would not cry out that it is foolish to give precepts to

one for whom it is not free to do what is commanded, and unjust to condemn one for whom it was not in his power to fulfill the commands."

Furthermore, we experience that we operate spontaneously and freely in what we do, willing what we will and not willing what we do not will. For this reason laws are enacted, judges are appointed to punish their transgressors, and orators and preachers are deputized to admonish the people and exhort them to embrace the good and flee evil. For this reason Zeno, beating a slave caught stealing, wittily and sharply replied when the slave said "It was fated for me to steal": "And to be beaten," as Lactantius (*book 7*) well reports. Augustine (*2, On Free Will*) rightly adds: "He who says or holds that the will is not to be moved is to be expelled from the number of human beings." And Scotus (*1, distinction 30, question un., C*): "Those who deny freedom are to be beaten and tormented until they confess that those from whom they suffer could desist."

You object, first: John 15: "Without me you can do nothing." Therefore the human being has no free will. The consequent holds from what was said: free will is a free power of doing whatever one wills to do; but one can do nothing without Christ, as Christ himself plainly stated, and the Apostle openly proclaims (*2 Corinthians 3*): "Not that we are sufficient to think anything of ourselves as of ourselves, but our sufficiency is from God."

I concede the antecedent but deny the consequent. For this only infers that the concurrence of God is required for a person to act—just as the intellect cannot understand without an object or intelligible species, yet it cannot rightly be denied that the intellect has the power of understanding. From that passage of Scripture it is deduced that a person acts dependently upon God and cannot operate without God's cooperation, as I showed at length in the book *On Causes*, question 6, on the first and second cause. This is especially so because there the Savior was speaking about meritorious works, which cannot be accomplished without the prevenient grace of God, as the Council of Trent determines at the place there adduced.

You object, second: the same Redeemer says (*John 6*): "No one comes to me unless the Father who sent me draws him." But one who is drawn does not act freely but by compulsion. Since, then, a person is drawn by God, consequently he does not enjoy free will.

Confirmation: Augustine (*Sermon 2, on the words of the Apostle*): "It is true that the human being received great powers of free will when he was created, but lost them by sinning." And (*Epistle 107*): "We lost free will for loving God through the magnitude of the first sin."

I respond by explaining that passage as referring not to physical, necessary, and violent drawing—as Luther wrongly deduces—but to moral drawing, which occurs when a person is called by God, whom he can resist and sometimes does resist and acts contrarily, as is indicated (*1, Great Ethics, chapter 11*) and is evident

from Proverbs 1: "I called, and you refused; I stretched out my hand, and no one heeded; you despised all my counsel." And Matthew 23: "How often I wished to gather your children, as a hen gathers her chicks under her wings, and you were unwilling."

To the confirmation: Augustine there satisfies this by saying: "By death the human being fell; he was made weak, he was left half-dead on the road by robbers"—as is signified in Luke 10. Since grace is required for a meritorious work, without which a person cannot act well, by sin the human being is said to have lost free will—not absolutely, but for acting well, as the same Saint teaches (*Enchiridion, chapter 30*): "How can anyone glory in a good work of free will when he is not yet free for acting well, unless he puffs himself up with vain pride, which the Apostle restrains saying: 'By grace you have been saved through faith.'"

You object, third: God, by his eternal decree, decreed and established all future works to proceed from the human being, certainly and infallibly so and not otherwise, as Scotus and his disciples teach. Therefore there is no free will, since everything is determined from eternity, and a person cannot act otherwise than God decreed from eternity.

Confirmation: Romans 9: "It is not of him who wills, nor of him who runs, but of God who shows mercy; he has mercy on whom he wills, and he hardens whom he wills." Therefore no free will exists in the human being.

I respond that God's decree involves the free tendencies of the human will. For God has determined to act freely with free creatures and not to impede their freedom. Although things happen as God foreknew and decreed, free will is not thereby removed, since it lies in the human being's power to do the opposite and to determine himself to either alternative, as I said in Logic, book 4, last article. Hence Arriaga wrongly argues (*disputation 8, on the soul, section 1, number 3*) against the Scotists for admitting and defending such a decree of God, which is indicated in 3 Kings 8 and Colossians 2. For this reason the Church sings in the Office of St. Anthony of Lisbon: "Concerning whom the King of kings decreed otherwise." Add also John 14 (actually 44): "As the Father gave me commandment, so I do."

To the confirmation: I say that text is to be interpreted concerning predestination in intention, which depends on God alone. For God predestines and chooses for glory whomever he wills, since he is the Lord of glory; he bestows it on whom he wills and does no one an injustice, according to Matthew 20: "Is it not lawful for me to do what I will?"

Article III. In what freedom is situated.

Three opinions are recounted and celebrated on this matter. The first is that of Alexander (1, *On the Soul, chapter on phantasia*) and Averroes (2, *Physics, comment*

48), who hold that freedom is situated in the intellect alone. The second is that of St. Thomas (1-2, *question 17, article 1, ad 2*), Medina (*ibid.*), and Javelli (9, *Metaphysics, question 4*), who hold that freedom is radically in the intellect and formally in the will. The third is defended by Scotus (2, *distinction 25, question un., and distinction 38*), Faber (*disputation 9, on penance, chapter 10, number 226*), and others, who teach that freedom is in the will alone.

Note, first, and recall from what was said: the will presupposes the intellect in order to operate—not as an effective cause of the will's acts, whether total or partial (as will be shown below), but as an ostensive, illuminative, and consultative cause, in much the same way as the internal senses require the operation of the external senses. Likewise, in this present state, the intellect presupposes the operation of the senses, both internal and external, and for this reason the well-known saying is predicated by the philosophers: "Nothing is in the intellect that was not first in the senses." And the Doctor (1, *distinction 43, question un.*) adds that God's knowledge is the ostensive cause of things, while his will is the productive and effective cause of those same things, as I showed at length in the treatise *On the Knowledge of God*, *disputation 2, question 4*.

From these considerations it is clear that Faber (*cited*) does not speak to the mind of the Doctor when he writes that freedom can be said to reside radically in the intellect, on the ground that the will cannot issue into an act without a prior act of the intellect. For this does not mean that the root of freedom is located in the intellect, since the intellect is in no way free—neither formally nor causally—since its operations are natural and necessary, as Faber himself acknowledges. Although his explanation is not contrary to Scotus, his manner of speaking is unusual and unheard of among the Doctor and his followers.

Note, second: freedom is commonly divided into freedom of specification and freedom of exercise. Freedom of specification, as the term indicates, concerns objects distinct in species or in any other way, toward the willing or not willing of which the will is indifferently disposed, since it lies in its power to will or not will this or that. Freedom of exercise, as the name denotes, concerns the acts of the will by which the will wills or does not will, and exercises its spontaneous and free operations.

Freedom is further distributed into freedom of contrariety and freedom of contradiction. The former is had with respect to contrary acts, which are willing and not willing (nolition) good or evil. The latter is had with respect to contradictory acts, which are willing and not willing (non-volition) good or non-good.

I know that Raconius (*question 3, proposition 1, section 3, disputation 1, on the principles of human actions*) denies freedom of contrariety, on the ground that the will cannot will evil as evil but always tends toward the good, whether true or apparent. But he errs. For, as I said elsewhere, although the will naturally

inclines toward the good, it can absolutely will evil as evil, with Paul agreeing (*Romans 7*): "I do not do the good that I will, but the evil that I hate, I do." Nor does it help him to respond that the will wills evil under the appearance of good, for this response is precluded by the Apostle's words: "But the evil that I hate, I do." For hatred, which is of evil, cannot be under the appearance of good, as is clearly evident to anyone reading the text.

First assertion: freedom is not formally in the intellect. The Doctor holds this (*cited above*).

This is proved, first: where there is no first act, there is no second act, because the second act arises from the first. But the intellect is not the first act of freedom, because it is a natural and necessary power. Therefore to the divine intellect is attributed the generation of the divine Word, which is natural and necessary; to the divine will, however, belongs the procession of the Holy Spirit, which is spontaneous and free. Freedom is therefore not formally found in the intellect.

Second, the principles or powers of intellectual nature are divided equally into natural and free (*2, On Interpretation, last chapter; 9, Metaphysics 10*). The intellect is a natural power; the will is free. For this reason God is said to act ad extra by will, because he acts freely, and not by intellect, since the intellect is a natural and necessary principle.

Third, the intellect is determined to one thing. When an object is presented to it and duly approximated, it cannot not understand it—just as if a color is presented to the eye, provided it is not impeded and is duly approximated, the eye cannot fail to see that color. For this reason the intellect is compelled by evidently known, necessary truths, so that it cannot dissent from them or recoil, as Scotus asserts (*1, distinction 1, question 4*). And if any defect occurs, it is to be imputed not to the intellect but to the will, as Augustine rightly pursues (*2 and 3, On Free Will*).

Second assertion: freedom does not reside radically in the intellect. This opposes the Thomists; the Scotists (*cited*) defend it.

This is proved, first: either by "root of freedom" the Thomists mean the principle, origin, and source of freedom, or they mean the sine qua non cause, or the principle required as a prerequisite for freedom so that the will may exercise its freedom. Not the first, because from a natural, necessary power determined to one thing, freedom—which is voluntary, indifferent, and indeterminate to either alternative—cannot arise. For it is an implication in terms for freedom, indifference, and indetermination to proceed from what is natural, necessary, and determined to one thing, since these are plainly opposed to each other.

Not the second, either; for then there would be no root of freedom in the intellect, which the Thomists strive with all their might to introduce into the schools. For a sine qua non cause is not a root of operating but rather a necessary condition for operating, as is clear from the approximation of fire to combustible material, which is by no means the root or principle of burning. Similarly, although the intellect and its operation are required as a prerequisite for the will to operate—just as light is required for seeing—the intellect itself causes nothing in the will. Rather, the will is of itself free and the mistress of its own acts. Therefore freedom is not found in the intellect as in its source and root.

Second, every freedom is either of contrariety, or of contradiction, or of specification, or of exercise, as I observed in the second note. But none of these freedoms is rooted in the intellect. For freedom of contrariety consists in willing or not willing (nolition). Freedom of contradiction consists in willing or not willing (non-volition). But it is not in the power of the intellect to will or not will, to will or not will—for these acts do not belong to the intellect, whose acts are intellection, vision, etc., but to the will, as their very names plainly show.

Furthermore, given two premises that are evidently, necessarily known, disposed in due form and figure, the intellect necessarily assents to their conclusion, as I asserted in *Logic*. But if the root of freedom were in the intellect, it could plainly dissent from and recoil from the conclusion, which Aristotle and all other philosophers consider impossible.

Third assertion: freedom formally belongs to the will alone. So holds Scotus (*cited*).

This is proved, first, from Matthew 26: "Your will be done." John 5: "I seek not my own will, but the will of him who sent me." And 1 Corinthians 7: "Not having necessity, but having power over his own will."

Second, the Council of Trent (*session 6, canon 5*) decrees that the human being is free to cooperate with or resist grace by his own will.

Third, Augustine (*3, On Free Will, chapter 3*): "Will does not exist unless it is free." And (*1, Retractations, chapter 9*): "Nothing is so much in the power of the will as the will itself." The same is found in *Against Faustus*, chapter 36.

Moreover, the will commands the intellect and turns it toward or away from the consideration of any object whatsoever. Therefore freedom formally consists in the will alone. Furthermore, honor, dishonor, merit, and demerit are attributed to the will alone, as can be seen in Augustine and other Fathers passim, as well as in the Doctors and philosophers. Moreover, every good division, as was said in the *Epitome*, chapter 2, question 7, article 1, is made into opposed members—as animal into rational and irrational. Now, power taken universally is aptly and

adequately divided into natural and free; since the will alone is free, it is evidently concluded that freedom formally consists in the will alone.

You object, first: a formally free power must be cognitive. But the will is not cognitive; therefore it is not formally free, but the intellect is. The major is proved from Physics VIII, T. 8, and Metaphysics IX, T. 10: a free power is directed toward opposites, but it cannot be directed toward opposites unless it is cognitive, because it determines itself to one or the other, which cannot happen unless it knows the opposites. The minor is well known, for the will is commonly called a blind power, the reason being that it is an appetitive power, which is contradistinguished from the cognitive faculty, as I said in *On the Soul*, book 4.

I deny the major. To its proof, based on Aristotle's testimony, I say that the will is directed toward opposites not because it is cognitive but because it is formally free and of itself undetermined to either alternative. It requires cognition as a prerequisite, and cognition pertains formally to the intellect. Just as the eye requires light in order to see, so the will requires cognition in order to will, as is clear from the second note.

You object, second: freedom formally belongs to the faculty that has the power to command other powers. But commanding is attributed to the intellect and not to the will; therefore freedom too belongs to the intellect. The major is evident. The minor is supported: the role of the appetitive power, such as the will, is to execute what is commanded by reason as it judges and deliberates. For this reason Aristotle (3, *On the Soul*, T. 48) adds that the intellect and appetite are principles of motion, because the intellect commands and the appetite executes.

I concede the major but deny the minor. To the proof I say that this is valid concerning the sensitive appetite, but not concerning the rational appetite, which is the will. For the intellect only shows the will what should or should not be done, and it lies in the power of the will to choose either option and put it into execution, as will be clear in the next question, where it will be shown that command belongs to the will alone.

You object, third: that power is formally free which is indifferent and undetermined. But the will is not of this kind; therefore it is not formally free. The major is clear, for freedom consists in indifference to either alternative. The minor is shown: an indifferent power cannot determine itself; otherwise it would not be indifferent and undetermined but determined, and the same thing would move itself, which Aristotle rejects (8, *Physics*, T. 40).

I concede the major but deny the minor. To its proof I say that this is true of a universal natural agent, which is determined by the disposition of the subject matter—as the sun hardens mud and melts wax—but not of a free cause, which spontaneously determines itself to acting. As for what is added from the Philosopher, I say that this holds in necessary and subordinated motion, but not

in voluntary and free motion, as I abundantly explained in the *Physics*, in the book on motion.

You object, fourth: the will tends toward what is shown by the intellect, and follows the right dictate of reason, so that when a necessary and perfect syllogism exists, the will necessarily gives assent to its conclusion, from which it cannot deviate. Therefore the root of freedom is in the intellect.

Confirmation: the right judgment of the intellect regulates the will, which conforms to it as the regulated to its rule, as Scotus asserts with Aristotle (*question 4, Prologue*), where, describing praxis, he says that it is an action of the will conformed to right reason, and that practical science consists in the twofold respect of priority and conformity. Therefore radical freedom is situated in the intellect.

I deny the antecedent. For the will can, in its freedom, dissent even from a perfect discourse, as is evident from stubborn people who deny true and evident arguments—since the will is not necessitated by the object and is not compelled by any extrinsic factor. To the confirmation: I distinguish the antecedent—by way of counseling and serving, I concede, just as a servant carries a lamp before a master, and a counselor gives advice to a king and shows him what ought to be done in the kingdom, while it lies in the king's power and freedom to do these things or not, or even to choose and carry out the opposite at his own pleasure, as not rarely happens. By way of commanding and directing, I deny, as is evident from the response to this objection.

Article IV. Whether the will is only passive, or also active.

Some hold that the will is only a passive power, but they proceed by different paths. Godfrey (*Quodlibet 6, question 7, cited by Scotus, 2, distinction 25, question un., § Dicitur*) and Bacconi (*ibid.*) think that volition is produced by the phantasm irradiated by the agent intellect as an extrinsic effective principle, and is merely received in the will as its subject. Henry, however (*Quodlibet 12, question 5, cited by the Doctor, cited above, § Alia est opinio*), asserts that volition is produced by the cognized and understood object. Cajetan (*1 p., question 80, article 2*) and Durandus (*2, distinction 24, question 2*) hold that volition is caused by the object and the will as two partial causes constituting one total cause—just as one integral and total cause productive of intellection is had from the intelligible species and the intellect. Others assert that the first volition is produced solely by an intrinsic principle, while for subsequent volitions they posit two partial causes integrating one total cause, as the Nominalists hold, cited by Faber, and as Thomas and his followers appear to hold, according to the same Faber (*disputation 9, on penance, chapter 11, number 272*). Scotus (*mentioned above*) and many others teach that the act of willing proceeds effectively from the will alone, while the intellect serves as an ostensive cause, proposing and showing

the object to the will, in whose power it is to will or not will or refrain from willing it.

Note, first: in the common opinion, the will is receptive of volition, just as the intellect is receptive of intellection. For both operations belong to the genus of quality and are the end and perfection of the said faculties. For this reason Aristotle (3, *On the Soul*, 2) says: "Understanding is a kind of being acted upon." The controversy in the present discussion, however, is whether volition is produced by an intrinsic principle—the will—or by an extrinsic principle, which is the object or something else mentioned at the beginning of this article.

Note, second: the will can be viewed in two ways. First, as an appetitive power naturally inclined to receive its own perfection—and in this way it is a passive power, productive of no act, for to be inclined to receive something is not to act but to be acted upon, and accordingly inclination is not an action but rather a relation, which does not belong to the genus of active things, as I noted in *Logic*, book 1, question 1, article 1. In this we disagree with the Thomists, who hold that the will taken in this way produces a natural and necessary act, and that all subsequent acts are free. Second, as elicitive of its own acts—in which way it is active and free, with freedom of specification and exercise.

Note, third: a natural cause is not per se the cause of contraries but per accidens, by reason of the subject matter—as the sun hardens mud and melts wax, as Scotus notes (2, *distinction 25, question un.*, § *Contra, A*). Similarly, the science of contraries may be spoken of insofar as it regards both contraries, although it does not determine itself but is determined by the object of which it treats (9, *Metaphysics*, T. 3). But the will, being a free power directed toward opposites, is by its very nature undetermined and freely and spontaneously determines itself to one or the other, since it is fully and perfectly free, as the Doctor pursues (*cited, at the end of the question*).

First assertion: the will is not only a passive power. The Doctor defends this (*cited*).

This is proved, first, from Luke 22: "Yet not my will." And Matthew 26: "Not as I will, but as you will." But the will of God the Father, of which Christ was there speaking, is productive and active, for it produces the Holy Spirit and creatures. Therefore the will of Christ as man is likewise active. Again, John 10: "I have power to lay it down, and I have power to take it up again." The will of God and of the human being agree univocally in the common nature of will. If, then, the former is active, so is the latter.

Second, Augustine (*Retractions 9 and 22*): "Nothing is so much in the power of the will as the will itself"—that is, as Scotus explains (1, *distinction 1, question 4, § Ad argumenta*), as its elicited or commanded act. The same is indicated (22, *Against Faustus, chapter 37*).

Third, if two young men equally disposed have the same beautiful and delightful but forbidden object present to them, and one sins while the other does not, this cannot arise from anything other than the will of one concupiscently desiring the forbidden object and the will of the other not desiring it. For if it arose from the phantasm or the object, since the object relates in the same way to both, either both would sin or neither would.

Fourth, a lower power, such as the sense, both internal and external, is an agent—for the eye produces vision, and the imagination produces the act of imagining, as I said in *On the Soul*, book 3. Therefore a higher power, such as the will, is also active. For it would be absurd for the noblest power, which is the will, to be passive while the other less noble powers are active, since acting is nobler than being acted upon.

Moreover, according to *On Interpretation* II, last chapter, and *Metaphysics* IX, 10, the rational and volitive power is directed toward opposites—that is, it can choose or reject either opposite at will. And Aristotle (*1, Great Ethics, 6 and 7*) confirms this, saying that choice is an act of the will.

Finally, being acted upon is not in the power and freedom of the patient but of the free agent. If, therefore, the will merely receives and is not free with respect to what it receives, it would certainly neither merit nor demerit—which is an inconvenience and an absurdity. It is therefore better to deny that the will is merely passive.

Second assertion: neither the phantasm nor the cognized object can be the total productive principle of the act of the will. This assertion contains two parts.

The first part is proved, first: a vital act proceeds only from a vital principle, as its notion indicates. But the act of the will is vital—for it is an operation of the living will. Therefore the phantasm, which is non-living, is not the producer of volition.

Second, the phantasm is corporeal and material, just as the phantastic power is corporeal and material. But the act of the will is immaterial and spiritual. No corporeal and material thing totally produces a spiritual thing, for, as was said elsewhere, a body does not act physically on a spirit.

Third, every active principle is either equivocal or univocal, for as I said in *Logic*, book 3, no middle term intervenes between them. The phantasm cannot be a univocal principle, since it must be nobler than or equally noble to its effect. But it is evident that the phantasm is less noble than the act of willing, which is spiritual. Nor can it be an equivocal principle, which is more excellent than its effect, for an equivocal cause virtually contains its effect and therefore surpasses it in nobility. Moreover, an angel and a soul abstracted from the body could not will, since they lack phantasms. But it is false and absurd that an angel and a soul in that state lack the act of willing, since they enjoy God, and

enjoyment is an act of the will. The phantasm is therefore not the adequate cause of volition.

The second part is proved, first: a natural and necessary cause produces a natural and necessary effect, just as a free and contingent cause causes a free and contingent effect. But the object is a natural and necessary cause. Therefore its effect is natural and necessary—which perhaps is what Augustine had in mind (3, *On Free Will*): "It is not in our power not to be affected by what we see." Volition, however, is a free and contingent act. Therefore the object is not the total cause of volition.

Second, the acts of willing, not willing, and indifference cannot proceed from the object. For the object always excites the power to act in the same way, and since it is a natural cause, it cannot move the will toward volition, nolition, or neutrality, as is clear from the objects of the external senses: the eye, when a properly disposed and approximated object is presented to it, cannot fail to see it. Therefore the same would have to be affirmed of the will. The arguments adduced above to prove the preceding assertion also apply here—especially this: a finite natural agent is not the cause of contraries, because it is per se determined to one thing; the object, however, is a natural and necessary agent, while the acts of willing and not willing are contraries. It is therefore concluded that the object is not the total cause of the acts of the will.

Third assertion: the precognized object displayed by the intellect to the will cannot be a partial cause of volition. The Doctor inclines toward this view (*cited, and in the Reportata, at the same distinction, and 9, Metaphysics, question 15, § Per dicta*).

This is proved, first: if the object partially concurred in causing volition, the will would not be fully free, because it would be determined by the causality of the object, and so it could will only what is caused by the object—since a partial cause cannot act unless the other partial cause acts with it, as is clear from the father and mother concurring as two partial causes to generate offspring. Since the will is absolutely and perfectly free, it follows that the object does not partially co-act in producing volition.

Second, the will could not will evil, since evil is not an object—for the object is supposed to be something positive, whereas evil is the privation of good, as I taught in book 1-2, question on evil, article 1. Again, the will can will a non-existing and impossible object, and since such an object does not have and cannot have being, it cannot cause an act of the will, which is a real positive entity. Therefore the object does not partially co-act in causing acts of the will.

Fourth assertion: the will is free not only with respect to subsequent acts but also with respect to the first act. The Doctor holds this (*cited above*).

This is proved, first: all acts of the will, whether earlier or later, are of the same nature, proceeding from the same free principle. Therefore, if the later ones are free, the first act is also free. For if it were natural, it would proceed from a natural principle, just as a free act proceeds from a free principle. But the first act flows from the same will, which is a free principle; therefore the first act of the will is free.

Second, if the first act of the will is not free, this is chiefly because the will is its natural productive origin, since it is a natural appetite with respect to it. But the will, insofar as it naturally inclines toward something, is not productive of acts, as I observed in the second note.

Moreover, the Doctor argues (*Quodlibet* 21): if the will in its first act were moved naturally by the object, it would not move freely but naturally, and so the human being would be like a brute, which is moved by its apprehended object through natural motion. Furthermore, the will would be determined by an extrinsic principle—which would be either God or something physically predetermining it—which, as something false opposed to truth and freedom, has been rejected by us elsewhere.

Fifth assertion: the will is the total productive cause of its own acts. Scotus supports this (*at the aforementioned passage*), and Raconius follows (*cited above, section 4, question 1*).

This is deduced from the preceding considerations. For since it was proved above that the will is not merely a passive power, and that no total or partial extrinsic principle is the efficient cause of its acts, it plainly follows that the will is the total cause of those same acts. This is evidently shown by the following argument: the will, when any object whatsoever is presented to it, can will or not will or refrain from willing it. Therefore it totally causes its own acts. The antecedent is clear from the description of the will, which is a free, indifferent, and undetermined power, and the mistress of its own acts, as Aristotle rightly observed (3, *Ethics* 5).

You object, first: Aristotle (3, *On the Soul*, T. 54) establishes an order of movers and moved, of which some move but are not moved—as the desirable object moves the appetite toward its attainment but is not itself moved, since it is the object and terminus of the desiring subject. Some move and are moved—as the appetite moves the animal toward the pursuit of the desirable object and is moved by the desirable object on account of its goodness. And some are moved and do not move—as the animal's body is moved by the act of appetite.

But the will is a rational appetite; therefore it is moved by the desirable object and is consequently a passive power. Nor does it help to say that Aristotle is speaking of metaphorical motion, such as the motion of a final cause, since, having previously discussed the motion of an efficient cause, he would labor under equivocation if he then spoke of the motion of a final cause.

Confirmation 1: the same philosophical reasoning applies to the rational appetite, which is the will, as to the sensitive appetite. But the sensitive appetite is passive; therefore so is the rational appetite.

Confirmation 2: between active and passive power there is no middle term. But the will is a power, not indeed active—which (5, *Metaphysics* 17) is "the power of changing another, insofar as it is other." Therefore it is a passive power.

I respond: first, the object moves the will ostensibly, not effectively. Second, metaphorically, not really. Nor is it inconsistent that something be moved in one sense really and effectively, and in another metaphorically and intentionally, since the efficient cause is ordered to the end.

That this can be understood in both ways is evident from Scripture: Ecclesiasticus 31: "He who was able to transgress" is explained of any saint and member of Christ; "And did not transgress" is understood of the head, that is, Christ.

Against this, Scotus (*in the Reportata, ibid., § Ad 1. principale*) expressly says: "The object effectively moves the will, though it is not the total cause." This must be addressed by saying that Scotus is there speaking in the alternative opinion affirming that the object partially co-acts with the will in producing volition—an opinion that does not displease him, although he inclines more toward the opposite view, asserting that the will alone is the total efficient cause of volition.

To the first confirmation: the parity is to be denied, because the sensitive appetite is a natural power, while the rational appetite is free. Hence Damascene adds (*book 4, chapter 23, 42*): "The sensitive appetite is led, not leading."

To the second confirmation: I concede the major but deny the minor. For the will is indeed an active power, not a productive power as described at the cited place.

You object, second: the mover and the moved must be distinguished by subject, since the same thing cannot move itself; otherwise the same thing would be simultaneously in act and in potency with respect to the same thing, which conflicts with On Generation I, T. 17. Therefore the will is not an active power.

I distinguish the major: concerning things that are moved by organic motion, I concede; concerning things that are moved by inorganic motion, I deny—as an angel moves itself, and the intellect understands itself. Nor does it imply a contradiction for one and the same thing to be in subjective and active potency, and to be in formal potency and in virtual act, as I abundantly showed in the *Physics*, in the book on motion.

You object, third: matter and the efficient cause do not coincide (2, *Physics* 70). But the will is related as matter with respect to motion, and the mover is the

efficient cause. Therefore the will cannot be both active and passive with respect to its own acts.

Confirmation: the mover and the moved are really distinct, but there is no real distinction or relation between a thing and itself. For real relatives are opposed, as is evident from the Post-predicaments.

I respond by distinguishing the antecedent: concerning transmutative matter, I concede; concerning receptive matter, or the subject of operations, I deny. To the confirmation: I say this is true of the relations of producer and product, but false of other relations, such as the relations of mover and moved, on which I wrote at length elsewhere.

You object, fourth: if the will were active, since it is duly disposed and aptly approximated to willable objects, it would always will, because a natural agent approximated to a patient acts necessarily (2, *On the Soul*, 52). If the sense were active, it would always act; and if fire had a combustible near it, it would always burn. Therefore, if the will is an active power, it would always will.

I deny the inference of the antecedent. For this holds of a natural agent, not of a free one, which is what the will is.

You object, fifth, from Averroes (12, *Metaphysics*, comment 36): a bath in external reality moves sensitive things—that is, those it moves effectively. But a bath in the mind moves the will; therefore a cognized object effectively moves the will.

I concede the major and distinguish the minor: per se, I deny; per accidens, I concede. For this is true only ostensibly, not effectively.

You object, sixth: from a contingent cause, no determinate effect occurs unless it is determined by something extrinsic, since of itself it is indifferent and undetermined. But the will is a contingent and indifferent cause for willing or not willing. Therefore it is determined by an extrinsic principle, and so it is merely passive.

Confirmation 1: first movements are not in our power, and therefore they are neither praiseworthy nor blameworthy, as the body of theologians teaches.

Confirmation 2: at the end of Ethics VI, sometimes while we are thinking of nothing, an efficacious thought comes to mind that draws the will with it. But this volition is not from us; therefore it is from something extrinsic, and consequently the first act of the will is natural.

I distinguish the major: concerning a natural contingent cause, I concede; concerning a free contingent cause, such as the will, which freely determines itself, I deny. To the first confirmation: I say with Scotus (*Quodlibet* 21, M): "first movements" refers to intellections that are partially caused by phantasms, just as Augustine says (3, *On Free Will*): "It is necessary that we be affected by what we see." To the second confirmation: I say that, given the hypothesis, the will relates

passively, not actively. Therefore it does not then elicit an act, as also occurs in subreption, especially of the flesh.

Article V. Whether the intellect moves the will.

Those who assert, like Cajetan (*cited by Faber in the aforementioned article*), that intellection is the principle by which volition is produced, undoubtedly think that the intellect moves the will to exercise its acts. Those, however, who hold that the will is the total principle of its own acts, as the Scotists cited in the said article plainly affirm, maintain that the intellect does not move the will to produce its acts. That the will moves the intellect to speculate on and contemplate these or those objects, and turns it toward or away from meditating on those objects, is a well-known and clear position among the Scholastics.

Note: to move a power to act means nothing other than to reduce a power from first act to second act—that is, to excite and induce the power itself to act, which happens when the power actually acts and operates. A power can be moved to act in two ways: either with respect to the exercise of acts, when a power is excited to produce this or that act; or with respect to specification, when it is moved to operate with respect to this or that specifically distinct object. Furthermore, observe that in sudden, unexpected, or surreptitious acts, the will is not stimulated by the intellect but by the object—as in vehement pain or great delight, as Augustine confirms (*recently cited*).

First assertion: the will can be said to be moved by the intellect ostensibly and consultatively. This is consonant with Scotus (*cited*).

This is proved, first, from the well-known dictum of Augustine (8, *On the Trinity, chapter 4*): "Nothing is willed unless first known." Since the will is called a blind power, it is necessary that the intellect show it willable objects. It is therefore not unfitting to assert that the intellect moves the will ostensibly.

Second, the intellect is like a counselor and legal advisor showing the will what things are good or evil, just or unjust, and it then lies in the will's power to choose this or that, and to determine and apply itself to this or that course of action. The proposed assertion is therefore legitimate.

Second assertion: the will moves the intellect to understand, and commands it to turn toward or away from the speculation of this or that subject. This accords with the Doctor's writings (*cited*).

This is proved, first: the will is like a king in the kingdom of the soul and the noblest of its powers, as I showed in *On the Soul*, book 5. But the intellect is like its counselor. A king, however, moves and commands his counselor and all who live under his rule. Therefore the will dominates over the intellect.

Second, experience teaches us that the will at pleasure induces or withdraws the intellect from the consideration and speculation of this or that object, as is

evident from those who freely and voluntarily apply themselves to one science or art rather than another. The intellect therefore obeys the command of the will and is subject to its yoke.

You object, first: the intellect, in being and in operating, is prior to the will (*10, Ethics 7*). Therefore the will does not move the intellect. The consequent holds because to move is to act and to be moved is to be acted upon, and it is prior and nobler to act than to be acted upon, as Augustine says (*12, On Genesis, Literally*). Therefore the will does not move the intellect.

I distinguish the antecedent: by priority of origin and generation, I concede; by priority of perfection and nobility, I deny.

You object, second: a prior, as prior, does not depend on a posterior, as I have often emphasized. Since, then, the intellect is prior in being and operating, it is aptly inferred that the will does not move the intellect to meditate and contemplate. The antecedent is evident, because a prior, as prior, can exist without the posterior—as a cause without its effect, and God without a creature.

I respond that the major is true provided that the prior is not subject to the command of another. But if it is subject to another's command, the major does not hold. For a subject and servant, even if they precede the king in age and origin, still obey a king born later in time. Again, although means in being precede the end, they are nevertheless ordered to the end. Similarly, the intellect indeed precedes the will in origin, yet it is ordered to the will and carries out and obeys its command. Hence there is Anselm's saying, cited by us elsewhere: "We understand in order that we may will, but we do not will in order that we may understand." And (*9, Metaphysics 15*): "Things posterior in generation are prior in perfection." Accordingly, the will, though last in origin, is first in perfection.

Article VI. Whether the will moves the other powers to act.

Since there is a triple genus of souls and degrees—vegetative, sensitive, and intellective—the powers and faculties are also tripled. For some pertain to the vegetative soul, such as the generative, nutritive, and augmentative. Others are suited to the sensitive, such as the internal and external sensitive powers, as well as the appetitive and locomotive. Others are adapted to the intellective soul alone, such as the intellect and the will—on all of which I wrote at length in the book *On the Soul*.

Note, from Aristotle (*1, Ethics, last chapter, and 1, Politics, chapter 3*), and Scotus (*3, distinction 33, question un., § Ad arg. principalia, sub N*): command is twofold—despotic and political. Despotic command, also called servile, is that in which the one commanded offers no resistance, or at least resists only with great difficulty—as a master commands his servants. Political command, also called free, is that in which the one commanded can resist and oppose the

commander—as citizens obey magistrates, though sometimes they resist and oppose them.

First assertion: the vegetative powers are not subject to any dominion of the will, whether despotic or political. This conforms to Scotus (*just cited*).

This is proved, first: these powers administer their operations by the guidance of nature, which is necessary, whether one is awake or asleep or doing something else. For one is nourished, grows, and performs other operations of this kind. These powers therefore are subject to no command of the will.

Second, if they obeyed the will, they would operate at its pleasure and motion. But the contrary is evident, since it is not in a person's hand to be nourished and to grow; indeed, one often wants to be nourished and is prevented not only from nutrition but also from the other acts of the aforementioned faculties. Therefore such powers are not comprehended under the dominion of the will.

Second assertion: the motive power, by which the external members are moved—provided they are rightly disposed and not impeded—obeys the command of the will despotically. This is not inconsistent with Scotus.

This is proved, first, from Politics I, 3: "The mind commands, and the hand is moved." Second, from Augustine (8, *Confessions*, 9): "And the ease is so great that service can scarcely be distinguished from command." And (12, *City of God*, chapter 6); Damascene (2, *On the Faith*, chapter 16) and Anselm (*On the Virginal Conception*, chapter 4) concur.

Third, experience shows that we move our hands, feet, and other members at our pleasure without any intervening resistance or opposition. We walk when we wish, or cease from walking, or do anything else through our external members without any interposed obstacle. Therefore the will commands them with despotic and servile command.

Third assertion: the will does not always move the external members with the appetite going before. This conflicts with certain authors cited by the Coimbra commentators (*disputation 4, question 3, article 4*), whom the Coimbra commentators themselves favor. It is not inconsistent with the Doctor.

This is nonetheless established: we move external members against the sensitive appetite, as is evident from the martyrs, who, against the natural appetite, exposed and presented their members to tyrants and executioners for the most grievous torments and scourgings. Again, with no end proposed or offered to itself, the will can at its pleasure and nod excite and move such members. It is therefore not necessary for an act of the sensitive appetite to precede the moving of those members.

Whether the sensitive appetite can move the external members without the command and motion of the will is debated among the Scholastics. Cajetan and

Thomas (*1 p., question 81, article 3*) adhere to the affirmative, while others favor the negative. I assent to the former view, because the sensitive appetite of the human being is not of a worse condition than the sensitive appetite of a brute, and the latter moves the external members without the motion of the will, since the brute lacks a will. Therefore so does the former. Indeed, frequently, against our will, the external members are excited by the sensitive appetite and rebel against reason and the higher portion—as is evident from Christ, who (*Luke 12*) "was in agony," and according to the natural and sensitive appetite, or the lower portion, did not wish to die, and so addressing the Father said (*Matthew 26*): "Father, if it be possible, let this cup pass from me." And (*2 Corinthians 5*): "We do not wish to be unclothed but to be further clothed." And (*Ephesians 5*): "For no one ever hated his own flesh, but nourishes and cherishes it." Therefore the sensitive appetite can move the external members without the consent of the will.

Fourth assertion: the internal and external senses, as well as the sensitive appetite, are governed by the will—not with despotic but with political rule. This does not contradict Scotus. Thomas (*1 p., question 82, article 3, ad 2*) exempts the cogitative power, but the assertion is proved of all.

First, from Romans 7: "I see another law in my members, warring against the law of my mind." And James 1: "Each one is tempted, being drawn and enticed by his own concupiscence."

Second, Augustine (*Tractate 26 on John*): "The mind is drawn by love"—where he adduces that line of Virgil from the Second Eclogue: "Each is drawn by his own pleasure"—"not by obligation but by delight, not by necessity but by pleasure; how much more strongly should we say that one is drawn to Christ who delights in truth, justice, and beatitude." And after a few words: "You show a green branch to a sheep, and you draw it; nuts are shown to a boy, and he is drawn; and what he runs toward, he is drawn to; he is drawn by loving, he is drawn without bodily injury, he is drawn by the chain of the heart."

Third, those are governed by political command that sometimes do not obey, or at least obey with difficulty—and such are all the senses, because of the firm and fixed apprehension of objects in them. For we cannot fail to see visible objects that are present and duly illuminated, or fail to hear audible things, or fail to touch tangible things, and so on. Those powers therefore obey the will not despotically but politically. The major is evident from the description of political command given in the preceding note. The minor is confirmed by daily experience. I add that sometimes we will what the senses nevertheless perceive, as is clear in dreams, of acts of imagining, and of the sensitive appetite—which the previously cited passages of Scripture express.

You object, first: the sensitive appetite draws the will to itself, as Paul indicates (*Romans 7*): "I do not do the good that I will, but the evil that I do not will, I do."

But it seems the same should be said of the sensitive appetite of the human being as of the brute, and the latter draws the brute necessarily. Therefore the former necessarily draws the human being.

I distinguish the antecedent: indirectly and remotely, I concede; directly and proximately, I deny—as the sacred text indicates (*Genesis 4*): "Its appetite shall be under you, and you shall have dominion over it." This is also evident from what was said in *On the Heavens*, question 3, article 3, and indicated by Aristotle (*1, Great Ethics, chapter 11*).

You object, second: Scripture commands us to guard our senses from objects that can lead us into sin, as in the Song of Songs 6: "Turn away your eyes." Hence Gregory, discussing nocturnal illusions, says: "That malignant spirits do this, divine dispensation benignly permits, in the hearts of the elect, so that not even sleep itself may be without reward." If, then, one merits in sleep, the imagination is subject to the despotic dominion of the will.

Confirmation: in sleep the internal powers are more collected, since the external senses are at rest. For this reason divine revelations occur in dreams, as is evident from Matthew 2: "The angel of the Lord appeared in a dream to Joseph." Therefore the aforementioned powers obey the despotic command of the will.

I respond that this only shows that the senses are governed by the will with political dominion. For sometimes the will, enticed by a delightful object, falls into evil, as is evident from the subsequent words of the cited text: "Because they made me fly away." To Gregory's point: I say that the saints merit in sleep not per se but occasionally, because after sleep, while awake, they are displeased by obscene things and rejoice in the good things offered by the imagination—just as a sinner is gladdened by good things and saddened by evil things. To the confirmation: I say that the natural powers are collected, not the animal powers. For sleep is the rest of the animal powers accompanied by the intensification of the natural ones, as Orbellis attests (*2, distinction 25, question 2*). As for the further point about divine revelations, I say that then a person is acted upon rather than acting, and has more of a passive than an active role.

Question II. On Human Acts.

Article I. Whether the first act of the will is free.

The Thomists, with their master (*1-2, question 9*), as reported by Faber (*disputation 9, on Penance, chapter 12, 1, 310*), hold that the first act of the will is natural and necessary, and therefore in no way free. Scotus, however, and his disciples (*2, distinction 25, question un.*) hold that both the first and the subsequent acts are free. For the elucidation and resolution of this difficulty, what I extensively observed and established in the treatise *On the Angels*, disputation 2, question 6, and what I presented in article 4 of the preceding question, assertion 4, are relevant. With these premises noted and presupposed:

Assertion: the first act of the will is free. The Doctor defends this (*cited above*).

This is proved, first: from a free principle proceed all free actions, just as from a natural principle proceed natural and necessary acts. For principle is adequately divided into natural and free, as animal into rational and irrational. Now, the first act, like the subsequent ones, arises from the will. Therefore the first act is free, just as the others are free.

Second, every voluntary act is free, since it remains in the power of the will, which is by its very nature free. Hence Augustine (2, *On Free Will*) says: "Unless those things that are voluntary were in our power, the will would be neither to be praised nor blamed, and indeed not even to be admonished. But he who asserts that the will is not to be admonished is to be expelled from the number of human beings." The first act of the will is voluntary: if someone rises from sleep and an object is presented to him and he wills it, this act is free and first. For if the same object is offered to another in the same way and he does not will it, this act too is free, as Augustine rightly pursues (12, *City of God*, chapter 6): "If two are equally affected in mind and body, if the same forbidden object is desired by each, and one falls: this does not arise from anywhere other than from the will, which is free regarding whatever is proposed to it for desiring, because one sins and the other does not." Therefore the first act of the will possesses freedom, just as the others that follow it. More can be found in the treatise *On the Angels* (*previously cited*).

You object, first: that act is not free which is natural and necessary and determined by another. For in this a natural act differs from a free one. But the first act of the will is of this kind, for it proceeds from the will as nature and is determined by the object, or by an extrinsic principle. Therefore the first act of the will is not free.

I concede the major but deny the minor. For the will is of itself free and is determined by nothing. Therefore both its earlier and later acts are free.

You object, second: in every order there is a first mover that moves all others of the same order, as Aristotle says (7, *Physics* 1): "Whatever is moved, is moved by another." Therefore the will, producing the first act, is naturally moved by another, and accordingly its first act is not free.

I distinguish the antecedent: concerning necessary, natural, and subordinated motion, I concede; concerning voluntary, free, and non-subordinated motion, I deny. Aristotle (*cited*) is thus to be explained, since he is speaking there of the necessary and subordinated motion of the heavens, as I explained at length (1, *On Motion*, question 3, article 3). The remaining points desired here can be found at the previously named place.

Article II. Whether the act of the will is formally free.

Many recent authors, among them Vazquez (*disputation 34, 1-2, number 15*), Suárez, and others cited by Arriaga (*disputation 8, on the soul, section 4, subsection 4*), affirm that the act of the will is free extrinsically and denominatively, so that freedom is an extrinsic denomination of the act of the will. Other Scholastics, however—especially Thomas (*1-2, question 19, article 1*) and those adduced by Hurtado (*disputation 15, on the soul, section 6, subsection 2*)—assert that the act of the will is essentially and formally free. To these, Scotus and his disciples undoubtedly subscribe, for they everywhere teach that an act is divided into natural and free, just as power taken universally is divided into natural and free—especially because the same authors assert that every act of the will is free, both in God and in creatures, both in the blessed comprehensor and in the wayfarer.

Note and recall from what was said in the Epitome, book 1, question 4, article 9, number 30, and in the book On Generation and Corruption: action is taken in two ways—in one way as action belonging to the genus of action, and in another way as action belonging to the genus of quality, which is the thing produced, or the terminus of the action. In the present matter, the question is not whether the act of the will belonging to the genus of quality is intrinsically free—for since it is a quality and a terminus of the will, it is said to be free only extrinsically and denominatively. Rather, the question concerns the act or action belonging to the genus of action, which is called elicitation, and which is in the power of the will to elicit or not elicit—through which a person merits or demerits—namely, whether freedom is intrinsic and essential to it.

Assertion: the act of the will is formally and essentially free. This is deduced from Scotus (*cited above in the preceding passages*).

This is proved, first: an act is adequately divided into natural and free. A natural act is intrinsically and formally natural because it is determined to one thing. Therefore equally, a free act is formally and essentially free because it is undetermined to either alternative.

Second, things whose intrinsic principles differ formally and intrinsically are shown to have intrinsically distinct acts—as is evident from nutrition and augmentation. But the act of the will proceeds from a free principle, which formally differs from the intellect, which is a natural principle. Therefore the act of the will is intrinsically and formally free.

Moreover, an act is formally true or false, as I said in Logic, book 4, treating of truth and falsity. Therefore the act of the will is formally free—both because it is meritorious or demeritorious, and because the Holy Spirit is produced through an act of the will of the Father and the Son, which is intrinsically free, as I said in the treatise On the Triune God, in the question whether the Holy Spirit proceeds freely from the Father and the Son. Therefore, if an act of the will exists, it is formally free, just as if the will exists, it is formally to be called free.

You object, first: the act of the will is called free because it arises from the will, which is a free power—just as a bench is called human because it is fabricated by a human being. Therefore the act of the will is free extrinsically and denominatively.

I distinguish the antecedent: the act is principiatively free because it is elicited by the will, which is free, I concede; but the act is formally free because it originates from the will, I deny. For in itself and intrinsically it is free—just as I said in the previously cited treatise *On the Triune God*, disputation 1: the divine processions are principiatively distinguished through the intellect and will, but formally through themselves. Nor does the example of the bench apply, since the bench is called human only terminatively—that is, because it is the terminus of a human power. But the act of the will is a vital act, intrinsically and formally free.

You object, second: the same philosophical reasoning applies to a free act as to a true or false act. But an act is called true extrinsically—namely, from the object of which it treats, for truth, as was said in *Logic*, is the conformity of a thing with its principles. Therefore the act of the will is extrinsically free.

I concede the major and distinguish the minor: in itself and formally, I deny; objectively and terminatively, I concede. For truth is twofold: one is formal, which belongs to a true act; the other is objective, about which the formally true act is concerned.

You object, third: a free act can be converted into a necessary one. Therefore it is not essentially free. The antecedent is evident from the act of the wayfarer, which is free, and which then in the comprehensor is necessary. For the blessed person necessarily sees and enjoys God. Therefore the act of the will is not formally free.

I deny the antecedent. To its proof I say that such an act is not changed but remains the same free act, although the will of the blessed person is forestalled from issuing into the opposite act. Therefore it always persists as essentially free.

Article III. Whether there are indifferent acts.

This difficulty can be raised in multiple ways—namely, concerning natural, moral, and meritorious human acts, and about all of these in general, or in species, or in the individual, or in the singular. For some, such as St. Bonaventure (*2, distinction 41*), grant indifferent acts in common and in general, but not in the singular, holding that no singular act is indifferent and neutral. Others, such as Scotus—both here and in the *Reportata (2, distinction 41)*—admit indifferent acts in both ways: both in species and in the singular, in the order of morals and merit, but not in the order of nature.

Note, first: we are not here discussing non-human acts that seem to proceed from imagination alone—like picking up a straw from the ground, moving one's

arm, or touching one's beard—but human acts that proceed spontaneously and freely from the will, as the Doctor notes (*cited, before § Ad argumenta*). These can be viewed in the order of nature, or in the order of morals, or in the order of merit, as will become clear below.

Note, second, from Vorrilong (*at the present place*): these three differ from each other—subreption, deliberation, and intellection. For subreption negates every foresight of the intellect; hence it is called subreption, as if "stealing."

Deliberation designates an act of counsel in matters of action; hence deliberation is an act of the intellect, for it pertains to the intellect to deliberate and to the will to pronounce judgment. Deliberation differs from intellection because intellection receives every intelligible and knowable thing, speculative or practical, while deliberation is occupied only with practical and actionable matters.

Note, third: something can be indifferent in three ways. First, as unitable, determinable, potential, and contractible—and so a genus is said to be indifferent to its differences, by which it is contracted and determined; and similarly matter is indifferent to the forms it receives. Second, as equally participating in certain things—as if there were a shield equally participating in as much whiteness as blackness, it would be neither white nor black but indifferent. Third, as mediating between extremes—as liberality mediates between prodigality and avarice. It is in this third way that "indifferent" is taken in the present discussion: namely, whether between the good and evil of nature, morals, or merit there is an indifferent and neutral act that is neither good nor evil. Furthermore, the threefold goodness and malice—natural, moral, and meritorious—presented and explained above (*1-2, question 1, article 2*) should be recalled.

Note, fourth, from the Doctor (*2, distinction 41, Reportata, question un., § De 3. bonitate*): a person can refer an act to the due end in three ways. First, actually—when one actually thinks of the end, loves it, and operates for the sake of that end. Second, virtually—when one proposes to do something for the sake of God and, while operating, does not always actually refer that work to God. Third, habitually—when one who has the habit of charity can refer every act to God.

Conversely, an act can fail to be referred and ordered to God in three ways. First, negatively—when it is not referred to the end actually, virtually, or habitually. Second, privatively—when the act is not suitable for being referred, as a venial sin, which although compatible with charity, is not apt to tend toward God together with charity. Third, contrarily—when it is opposed to charity, as a mortal sin.

The question is which of these acts can be indifferent and neutral.

First assertion: between natural good and evil, there is no intermediate and indifferent act. So holds Scotus (*in the Reportata cited, § Ad q. dico*).

This is proved, first, from Dionysius (4, *On the Divine Names*): "Good arises from an integral cause, and evil from any defect whatsoever." Either a natural act has everything required for its being, and is good, or it lacks something, and is evil. Therefore no middle term intervenes between them.

Second, between a positive thing and a privation there is no middle term—as between a form and its privation (1, *Physics*, T. 67 and 68). But a good act is a positive being, and a bad act is a privative being, from what was established (1-2, *question 2, article 3*). Therefore between natural good and evil there is no middle, just as nothing mediates between being and non-being.

Second assertion: in the order of morals, there can be a neutral act—that is, one neither morally good nor morally evil. So holds the Doctor (*cited*).

This is proved, first, from Aristotle (10, *Ethics 5 and 9*): "A person is neither good nor evil, but can become good or evil"; and (2, *Ethics, chapter 1*): "The habit of justice is generated from just works, not however from works done justly"—that is, from works proceeding from the virtue of justice. Such an act is neither morally good nor morally evil, since it does not arise from virtue. Therefore it is neutral.

Second, between the just and the unjust there mediates the non-just. Likewise, acts preceding the virtues are neither good nor evil, and acts following the virtues introduce no moral goodness or malice. Indifferent moral acts are therefore conceded.

Third assertion: in the genus of merit, there are indifferent acts—namely, neither meritorious nor demeritorious. The same Doctor holds this (*cited above*), followed by Aureolus (*ibid.*, *question un.*) and Major (*question 2*).

This is proved, first, from Augustine (*Epistle 2*) and Jerome (*cited by Augustine there*): "Continence is good; luxury is evil. Between the two, walking, digesting the waste of the stomach, clearing the nose, and spitting are indifferent: this is neither good nor evil; whether you do it or do not, you will have neither justice nor injustice."

Second, one who has a virtue is not bound to use that virtue in all acts and to produce all acts from virtue. This would be harsh and exceedingly difficult, and would be like the ancient yoke that neither we nor our fathers could bear—namely, that one affected by mortal sin would in all acts sin mortally or venially, or that one in grace would always merit. This obligation exists only when the occasion arises and presents itself. For this reason there are affirmative precepts that bind always but not for always.

The Seraphic Doctor illustrates this with an example: if someone eats to satisfy the natural appetite, this act is not meritorious, because it is not referred to God; nor is it demeritorious, since it is conformed to nature—for sin is dissonant, not

consonant, with nature. Therefore it is neutral, and accordingly an act is admitted that is neither meritorious nor demeritorious.

Fourth assertion: there are indifferent acts not only in common—that is, in genus and species—but also in the singular. This assertion has two parts.

The first part is found in Scotus (*cited*, § *Aliter posset dici*), and is proved, first, from Ethics II, 1, as adduced by us in the second assertion, and, second, from the other points presented there.

The second part is held by the same Doctor (*in the Reportata cited*), who proves it by the authority of Boethius (*in the chapter on quality*), who affirms that the contrary of injustice is justice, as illiberality is contrary to liberality, but there can be a middle in one who previously did not have justice—such a person is not properly called just nor unjust, but non-just.

Furthermore, it is possible for a person to act without all the circumstances necessary for a morally good act, yet without acting against good morals—as if someone gives alms to a poor person neither for the sake of God nor for any other end proposed and intended by oneself. Since such an act is neither morally good nor evil, it is inferred to be a neutral act in the singular.

This is especially so because there can be an indifferent end with respect to goodness and malice. For, as Aureolus (*mentioned*) argues, to will to do what pleases and to experience one's freedom seems to be indifferent in those things that are not forbidden. For it pleases God that a person use the free will received from him and in which one has been left, especially in those things that are neither commanded nor forbidden. Therefore neutral acts are to be admitted both in the singular and in species.

You object, first: between a habit and a privation there is no middle term, because (10, *Metaphysics* 15) privative opposites are contradictory opposites, between which nothing mediates (4, *Metaphysics* 27). But good and evil are opposed privatively, for evil is formally nothing other than the privation of good, from what was established (1, *book 3, question 2, article 3*). Since every act is good or evil, no act is indifferent.

I distinguish the major: absolutely, I deny; with respect to the apt place and suitable time at which something is capable of receiving a certain perfection, I concede—as a puppy before its ninth day is neither seeing nor blind, but non-seeing. Therefore that act is good or evil which ought to have goodness or malice—but not every act, as Scotus rightly deduces (2, *cited*, D).

You object, second: from repeated acts a habit is generated. If, then, there were dissimilar acts, an indifferent habit would be generated from them, which does not seem probable. For since all acts are either conformed to the practical judgment or disconformed from it—if the first, just as the act is good, so is the

habit; if the second is granted, just as the act is evil, so is the habit. Therefore indifferent acts should not be admitted.

I concede the inference. For just as neutral acts are elicited, so from them a neutral habit is acquired, and it suffices for this habit to be consonant with an indifferent practical judgment.

You object, third: moral goodness is derived not only from the object but also from the due circumstances, especially of the end. But every intellectual agent ought to act for a good end. Therefore, if every act is intended for an end, consequently every singular act is good or evil. The major is conceded by all as true. The minor is supported: a rational agent ought to direct its operation toward a right end; otherwise it would act irrationally, and consequently its act would be evil.

I concede the major but deny the minor, because a person is not always bound to elicit a good act but can sometimes produce a neutral act—such as touching one's nose, scratching one's beard, and similar things that do not fall under merit or demerit.

You object, fourth: if a person were not always bound to act well, there would be no idle word, which conflicts with Matthew 12: "For every idle word you shall render an account." And the holy Fathers—especially Basil (*in the shorter rules, question 23*) and Bernard (*in the sermon on the threefold causality*)—affirm this. An idle word, however, is one that lacks an honest end, even if otherwise it is indifferent. Therefore there is no neutral act.

I deny the inference of the major. To the minor I say that, according to Chrysostom, by "idle word" is meant a mocking and calumnious word. For Christ was rebuking the Pharisees who were assailing him with insults and slanders. Moreover, an idle word is especially one that could bring some utility and do some good but does not—such as a frivolous, jocular, or vain word spoken in conversations and gatherings. But neither Scripture nor the Fathers intend that if someone picks up a straw from the ground and dips it in a liquid to taste it, or warns someone to brush a fly from his face, these are idle words for which one must render an account on the day of judgment.

You object, fifth: if the privation of a due end in a human act does not make the act contrarily evil, then equally the privation of any other circumstance would not make the act contrarily evil, and so a conjugal act in church and similar acts would not be evil—which contradicts truth and orthodox teaching. The Fathers concur: Chrysostom (*Homily 16 on Ephesians*): "You have not done the good; this is to have done evil." Jerome (*1, Against the Pelagians, at the beginning*): "Everything that is said either is or is not, and must be numbered among goods or evils." And (*Epistle 89*): "There is no indifference between good and evil, as the philosophers dispute." And Augustine (*1, On the Usefulness of Believing, chapter 12*): "Every deed, if it is not done rightly, is a sin. Nor can any deed be rightly done that does not

proceed from right reason." And (2, *On the Merits and Remission of Sins, chapter 18*): "The will is either good or evil." Therefore no indifferent act is to be established.

I respond by means of a distinction: if there is a privative circumstance, I deny that the act is contrarily evil. But if there is a repugnant circumstance, I concede that such an act is contrarily evil. If sometimes an act lacking a certain circumstance is called contrarily evil, this happens not because of the absence of that circumstance but because a repugnant circumstance is present. For often habits or acts that are contrarily evil are designated by privative names, such as imprudence and illiberality, as Simplicius notes (*in the Predicaments*), cited by the Doctor (*Quodlibet 18, article 1*). The Fathers are to be interpreted not absolutely—as if no act of the will can be indifferent—but relatively, that is, with respect to acts of justice and precept. For in this way, one either embraces justice, and the act is just and good, or injustice, and the act is unjust and evil—namely, when the place and time present themselves at which one is bound to observe the divine precept and to perform a good work, as clearly follows from what has been said above.

Article IV. Whether command is an act of the will.

Cajetan (1-2, *question 17, article 1*), Medina, and Vazquez maintain that command is an act of the intellect. Scotus, however (9, *Metaphysics, question 15, § Sed quomodo; question 4, Prologue; 4, distinction 49, question 4, vers. Tertium medium; and distinction 14, question 2, conclusion 4; also 2, distinction 6, question 1, § Ad 1*), Faber (*disputation 9, on Penance, chapter 9*), Castro (*book 1, on penal law, chapter 1, 2*), and others maintain that command is an act of the will. For its understanding and comprehension:

Note: command can be viewed in two ways. First, formally and precisely—and in this way command is an act of the will, which in question 4 of the Prologue is divided into an elicited act and a commanded act. Second, concomitantly—and in this way it is an act of the intellect. For unless the law, decree, or volition called command is explained and intimated, it cannot oblige anyone to its observance. No one is bound to anything unless he knows what is commanded to him. Hence the promulgation and intimation of the law is necessary; and although this is necessary for command, it is nevertheless intrinsic to it and concomitant by reason of the subject in which it is to be exercised.

Assertion: command is formally an act of the will. The Doctor defends this (*at the above-cited passages*).

This is proved, first, from Anselm (1, *On the Virginal Conception, chapter 4*): "The will moves itself against the judgment of other powers, and moves all other powers according to its own command." And Augustine (17, *City of God, chapter 4*): "The will uses all other powers."

Second, an act belongs to that power whose exercise it is, as is clear from vision, which is an act of the visual power, produced and exercised by it, and not of hearing or of another power, whose task it is neither to produce nor exercise vision. But command is exercised by the will. For the will commands the intellect and all other powers, just as a king in his kingdom and an emperor in his empire. Therefore command is an act of the will.

Medina and others respond by conceding the major and denying the minor. They say that the will is indeed the queen in the kingdom of the soul, but the intellect is the king and emperor. Against this: command formally obliges the subordinate to observe it, and if it does not oblige, it is not properly command but speech, advice, and consultation—which are acts of the intellect. But to oblige someone to observe something is an act of the will, as is signified in Matthew 8: "I say to this one, 'Do this,' and he does it." And (*ibid.* 6): "Your will be done."

Furthermore, command is not a natural and necessary act, as is the act of the intellect, but a free one. For he who commands can refrain from commanding. Hence it is not what the prince knows and understands but what pleases him that has the force of law, as is found (*1, law 1, § on the constitution of the Prince*). Again, the power of commanding belongs to one who is nobler. Hence Aristotle (*1, Metaphysics 2*): the wise and ingenious ought to preside over and command others. But the will is more excellent than the other powers, as I proved elsewhere. Therefore command is an act of the will.

You object, first: Ethics VI, chapter 5 and following: command is an act of prudence, which pertains to the intellect. Therefore command is an act of the intellect. This is also deduced from Proverbs 8, where wisdom speaking of itself says: "Through me kings rule, and the powerful decree justice."

Confirmation 1: Politics I, 3: "Reason commands the body with a servile command, as a master commands a servant, and the sensitive appetite with a political command, as a magistrate commands citizens." And Eudemian Ethics II, 2: "Reason commands the affections."

Confirmation 2: Ethics X, 7 and 8: happiness is placed in the act of the intellect. Therefore command pertains to the intellect.

I expound these passages by means of a distinction. Directively and dictatively, I concede—for the intellect dictates and prescribes what should be done and commanded by the will, and it is to be put into execution. But formally, I deny—for what the intellect proposes and what right reason dictates, the will then chooses and commands to be carried out, as Aristotle indicates (*1, Ethics 3, near the end*).

The passage from Proverbs is likewise understood: for the task of wisdom is to direct, order, and advise what is to be done and what is not to be done—as a

counselor advises the king and shows him what must be attended to in the kingdom, after which the king at his own pleasure commands and operates through his ministers. Augustine is similarly understood (*Homily 16*): "It cannot be that one who has good thoughts has bad deeds. For deeds proceed from thought. Nor can anyone do anything unless the command of thought first goes forth."

To the first confirmation: by "reason" the Philosopher means the entire rational power—namely, the intellect and the will. For we say that the intellect shows and proposes to the will what must be done, and the will itself chooses and orders what is to be carried out by the other faculties. Hence perhaps (*1, Great Ethics, at the end*) he says: "She manages all things, foreknowing; she is the Mistress."

To the second confirmation: I say that the intellect indeed excels the other cognitive powers, but the will surpasses both the cognitive and the appetitive. Aristotle placed happiness in the act of the intellect because he could not attain the truth that we shall enjoy God—and since this is known to us only through divine revelation.

You object, second: if command were an act of the will, it would be either a volition or a nolition. Not the second, because not willing is not commanding. Nor the first, because even if I know that my superior wills something, I am not bound to carry it out unless he commands me and prescribes it to be done. The role of the will, therefore, is not to command.

Confirmation 1: a judge can command something yet not will it to be carried out. Confirmation 2: when the will of a superior is shown to a subordinate, the subordinate is not bound to obey unless the superior commands what he wills.

I respond that it is an efficacious volition of the superior, which I am bound to obey if I know of it. To the first and second confirmations the same answer applies, for these are conceded with respect to an inefficacious will, but denied with respect to an efficacious will.

You object, third: to command means nothing other than to convey and intimate the law of a superior that is to be observed by a subordinate. For if it is not intimated and promulgated, the subordinate is not bound to observe it. But to convey and intimate belongs to the intellect; therefore so does commanding.

I distinguish the major: formally, I deny; concomitantly, I concede, as was explained in the note above.

You object, fourth: the same philosophical reasoning seems to apply to command as to prayer, with this difference: prayer belongs to the subordinate who is in need, directed toward a superior who is abundant and able to grant what the petitioner asks. But prayer is an act of the intellect, for it is described as "the raising of the mind to God." Therefore command too pertains to the intellect.

I concede the major and distinguish the minor by means of the distinction given in the response to the preceding objection. This is especially so because sometimes we pray by the mere affection of the will, as is clear from ejaculatory prayer. Hence Bagnacaval adds (*Treatise on Prayer*): "Prayer consists not so much in an act of the intellect as in an affection of the will."

Book IV. On the Passions.

Question I. On the Passions in General.

Article I. What a Passion Is.

Passion is an equivocal term, and must therefore be distinguished — as other equivocal terms must be distinguished — and its various senses must be adduced and explained, as (*Vorrlong, 3.d.19.art.1. and d.20.art.1. Raconius, disp.3. de passionibus animi sect.1.q.1. and the Conimbricenses, disp.6.q.3.art.1.*) make clear.

Passion is used, first, for a concept of the mind, as Aristotle attests (*1.Perih.c.1*): spoken words are signs of those passions which are in the soul, that is, of concepts. For this reason the intellect, in receiving a concept or an act of understanding, is said to undergo passion, as noted (*3.de anima T.2.*). And the word passion, in its very etymology, derives from the verb patior — to suffer — as (*Alexander of Hales, 3.p.q.17.m.2.art.2.*) observes.

Second, passion is used for the property of any given thing, as the Doctor mentions (*In Rep.1.d.26.q.2. and d.5.q.5. and 3.d.29.q.vn.*).

Third, for a quality of brief duration affecting the external sense, of which Aristotle treats (*in the Predicamenta, c. de qualitate*).

Fourth, for the relation coming to the patient from without through which it stands in relation to the agent, by which relation the predicament of passion is constituted; of this Scotus makes mention (*4.d.13.q.5.*), below, after Gilbert (*1.de sex principiis*).

Fifth, for the corruption and injury of the subject in which it is received: thus fire undergoes passion when water is thrown upon it, and a man undergoes passion when he is wounded, as Aristotle (*6.Top.c.2.*) and the Scholastics (*3.d.19.*) note.

Sixth, for the agitation, disturbance, or affection of the soul or of the appetitive power, of which Augustine (*Tract.46.in Ioan.*) and Aristotle (*1.Magn.mor.c.8.*) and others speak frequently. It is in this sixth sense that the present discussion proceeds.

It is to be noted, first, that appetite, taken generally, is divided into rational and irrational appetite. The former is the will; the latter is called the sensitive

appetite. Each has two powers: the concupiscible and the irascible. The former is concerned with the honest and pleasurable good; the latter is occupied with the arduous and the difficult to obtain, as will be treated at greater length in the following book.

It is to be noted, second, that as long as an animal lives, the heart is moved — in accordance with its natural temperament and proportion — by a perpetual motion of expansion and contraction, in keeping with the demands of animal life and its accustomed course. For such is the nature to which this aforementioned motion is owed, so that the animal may carry out the operations of life and its members may live. From the heart, as from the origin and source of life, the remaining parts of the animal are governed, as the Doctor touches upon (*in Rep.3.d.15.q.vn.ad 4.*). If this motion is exceeded — that is, if the heart is contracted more than usual — pain and sorrow result; but if it is expanded more than usual, joy and delight arise, as Augustine (*just cited*) treats splendidly.

Passion, taken universally, is rightly defined as a movement or agitation of the appetitive power arising from the apprehension of a good or evil. This is presupposed by the Doctor (*as cited above*). The definition of Remigius, cited and approved by (*Vorrlong, 3.d.20.art.1.*), amounts to the same thing: a movement of the soul through the apprehension of a good or evil. We substitute the phrase "of the appetitive power" for the word "soul," so as to establish a generic and universal definition that encompasses all passions — both those of the rational appetite and those of the sensitive appetite. This is explained before it is proved.

It is called a movement — an overflowing or a deficient one — because, as I noted in the second observation, passion arises through an unusual and extraordinary movement of the heart. The phrase "of the appetitive power" is added to designate the origin and subject of passion, which is each of the two appetites mentioned above. For this reason both man and the Angel are capable of passions, according to Scotus (*3.d.33.q.vn. and in the Reportatio ibid.*), following Augustine (*14.Trin.cap.5. and 6.*). The remaining terms are added to distinguish passion from judgments and opinions, against Chrysippus — reported by Cicero (*4.Tusculanarum qq.*) — who held that passions are judgments and opinions; and likewise against Raconius, who (*loc.cit.*) holds that passions belong to the sensitive appetite alone, though he elsewhere maintained that the irascible and concupiscible powers — which are their immediate subject — are congruent with the will.

The definition of passion, as thus explained, is easy to prove. For an apt and genuine definition of a thing consists of genus and differentia, as has often been said; and that definition is composed of both: its genus is movement, and the remaining terms constitute the differentia. The definition given is therefore fitting, and it contains nothing deficient or superfluous, as right definition

requires — as anyone who runs through its individual terms will readily see. It is therefore well framed.

Against this, one may object, first, that John of Damascus (*2.fidei cap.22.*), in defining passion, says: "Passion is a movement of the sensible appetitive power arising from the imagination of a good or evil." Passion, therefore, is properly the act of the sensitive, material appetite, and not of the rational, spiritual appetite. I reply that Damascus speaks only of passion in the specific sense, pertaining to the sensitive appetite. We, however, are speaking of passion in the generic sense, which encompasses the passions of both appetites. Should the text of Damascus not admit this interpretation, he is to be set aside in this regard and Remigius embraced instead, whose authority is not inferior. I am aware that some cite Augustine (*9.Civit.5.*) for the contrary position, but there Augustine treats only of passion belonging to the sensitive appetite, whereas elsewhere — especially in the passages adduced above — he expressly teaches that passions belong also to the rational appetite.

Against this, one may object, second, that passions derive their origin from the heart, as I noted above; but the heart is material and sensible; therefore passions belong only to the sensitive appetite. I grant the major and distinguish the minor: the bodily and carnal heart, I grant; the spiritual and immaterial heart, I deny — of which the Savior speaks (*Matt.15.*): "From the heart proceed evil thoughts," and (*Ps.59.*): "Create a clean heart in me, O God."

Article II. How Many Kinds of Passion There Are.

Many divisions of the passions are current among philosophers and theologians. I select and explain the principal ones, those that in some way pertain to our subject.
