

The Complete Philosophical Course of the Scotists

New Philosophical Course of the Scotists

Encompassing Universal Philosophy: *Rational, Natural, Moral, and Transnatural*

Industriously produced, ingeniously elaborated, and most aptly set forth by the
Subtle School.

Authored by

R. P. Bonaventura Columbo, of Nice

Of the Order of Conventual Minors, Doctor of Sacred Theology, and Professor
of the same in the most celebrated city of Aquensis.

Now Published for the First Time

Translated by; <https://x.com/vertiasluxmea>.

Lyon

At the expense of Laur. Arnaud and Petri Borde.

M. DC. LXIX.

With Approval and Permission.

To the Most Reverend and Most Wise Father, P. Andreas Binus of Hispellum

Doctor of Arts and Sacred Theology, Most Vigilant Minister General of the entire Order of Conventual Minors, and Most Worthy Apostolic Commissioner by the authority of Our Most Holy Lord Pope Clement IX.

**F. Bonaventura Columbus of Nice, alumnus of the same Order, sends
greetings.**

When I was about to bring before the public light and commit to the press a complete and finished Philosophical Course, Most Reverend Father, you presented yourself to me at once — the one chosen from thousands, sought not abroad but found close at hand — as the most distinguished Patron and most illustrious Maecenas. For going forth under your most firm protection and most powerful assistance, I have no doubt that this work will be rightly diffused throughout the whole world and safely distributed. For you are the supreme head of the Seraphic Order and its most diligent General — named, elected, and acclaimed at the most recent General Chapter held in Rome, and willingly and eagerly received and most deeply beloved by all of us — chosen from among so many most upright and most distinguished men, with whom that Order itself most happily abounds and most admirably shines, for governing, ruling, moderating, and illustrating the aforesaid Company; inasmuch as you, endowed with the best character, adorned with exalted goodness and wondrous learning, and renowned for the integrity of your life, are destined to bring to it the greatest increase and growth. Hence it is not without reason that our Philosophy bears your name as its watchword — a name in which the love of wisdom shines and by which sound knowledge is attested, consisting in speculation and action, in virtue and practice, all of which you most ardently study and most deeply love, as you gave immediate signs and foretokens at the very outset of your governance, and have long pursued with distinction, and have followed through with the highest praise and acclaim.

But if true Philosophy not only speaks but also acts — according to that saying of the Master of morals: "Prove your words by deeds, lest your life be at odds with your speech" — then plainly you, like another Most Holy and Most Learned General Bonaventure, acting before speaking and through example rather than precept, aptly and opportunely accomplish, correct, repair, and restore what needs to be built and corrected; you raise up what has collapsed and been scattered, restore it to its former religious state, and bring it back to better fruit — knowing that the voice of deed is stronger and more efficacious than the voice of word. You now cultivate and vigorously build up above all in the Kingdoms of France, willingly assenting to the pious and just desires of the Most Christian King, and likewise precisely executing the commands and mandates of the Supreme Pontiff — by whose authority we hope, desire, and pray that

greater and worthier things may be conferred upon you by the most powerful and most devoted men aforementioned, so that you may more and more illustrate our Seraphic Family and illuminate the whole world.

Receive therefore with a cheerful heart and joyful countenance this work and pledge of my vigils and labors — a certain testimony and true monument of my perpetual veneration and enduring affection for you. Farewell, and farewell again — you who were born for the public good.

To the Reader

I have taken care to fortify and confirm all the assertions with explicit passages and testimonies of Scotus — cited, touched upon, or at least deduced from or presupposed upon his principles — and to corroborate them with the foundations and reasoning of that same Doctor; things long most earnestly desired by all his students, since no one before, as far as I have seen, has achieved this in Philosophy. Vulpes indeed began this labor with industry and ingenuity in his theological volumes, but was overtaken by death and did not complete it. Then two of our recent writers accumulate many things learnedly and copiously from Scotus and others both ancient and modern, and refute objections — though they sometimes scorn the more eminent Scotists, especially the Formalists by name, and favor excessively the Moderns outside Scotus's school. More recently Poncius undertook and encompassed a complete Philosophical Course, but assembles and defends many things not consonant with Scotist doctrine, and sets little store by citations, references, and notable passages of Scotus — thinking himself the very first to complete it; whereas before him, Tataret, John of the Masters, the Parisians, and very many others everywhere — especially in the more celebrated Universities — had set it forth by word and in writing with immense acclaim and published it to the world.

Wherefore, to the best of my ability, I shall bring forward the necessary and profitable citations, quotations of the Doctor, and notable passages, and shall endeavor to lay open what is obscure, to explain what is difficult, to distinguish and illuminate what is confused, and moreover to reduce and arrange everything — in proportion to the slenderness of my modest talent — into correct order and fitting method. But if anything occurs that has not been well said, let it be attributed to me and forgiven. If, however, anything good is found, let it be ascribed to God, the Author and Bestower of all good things. Farewell.

Approbation of the Doctors

We the undersigned Doctors of Sacred Theology have attentively read through and carefully examined the New Philosophical Course of the Scotists, composed with skill and elaborated with elegance in its entirety and in all respects by the Reverend Father Master Bonaventura Columbus, formerly public Professor of Philosophy at Aix and Lecturer in Sacred Theology — a work complete and finished in all its parts: which not only is consonant with Orthodox Faith and good morals, but also expounds the doctrine of Aristotle and of the Subtle Doctor Scotus with great clarity and learning, and defends both most vigorously against their adversaries, both ancient and modern. We therefore judge it worthy of being printed and published as soon as possible for the common benefit of all. Salon, 12 September 1667.

Fr. Jacobus Julianus, Doctor of Theology. Fr. Elzearius Borely, Doctor of Sacred Theology.

Faculty of the Very Reverend Father Provincial of the Province of Saint Louis

I, Fr. Gabriel Taulany, Doctor of Sacred Theology, Conventual Minor, and Provincial of the Province of Saint Louis, grant the faculty that the New Philosophical Course of the Scotists, by Father Master Bonaventura Columbus of our same Order — approved by the judgment of serious Doctors and long desired by us — be committed to the press. Aix, 15 September 1667.

Fr. Gabriel Taulany, Provincial.

Approbation of the Doctors of the Sacred Faculty of Paris

We have found worthy the New Philosophical Course according to the mind of the Subtle Doctor, by Father Bonaventura Colombo of Nice, of the Order of Conventual Minors — inasmuch as there is nothing in it that does not breathe sound doctrine and indeed the acumen of the Subtle Doctor. So we testify, we the undersigned Doctors of Theology of the distinguished Parisian Faculty, on the second day of December in the year 1669.

Fr. Paulus Lombard, Prior of the Carmelites. Fr. Elias Vial, Carmelite.

Consent of the Royal Procurator

Having seen the Approbation of the Doctors of the Parisian Faculty, I on behalf of the King assent that the book entitled *New Philosophical Course according to the mind of the Subtle Doctor*, by the Reverend Father Bonaventura Columbus of Nice, of the Order of Conventual Minors, be committed to the press by Laurentius

Arnaud and Petrus Borde, associate booksellers of Lyon, with the customary prohibitions. Given at Lyon, the second day of December in the year 1669.

Galliat.

Permission

Granted in accordance with the conclusions of the Royal Procurator. Lyon, on
the day and in the year aforesaid.

Dulieu.

Epitome of Dialectic, Divided into Three Books, According to the Mind of the Subtle Doctor

Author: Fr. Bonaventura Columbo of Nice, of the Order of Conventual Minors, Doctor and Professor of Sacred Theology

Prooemium

Aristotle, the head and renowned prince of the Peripatetics, affirms at the beginning of the first book of the *Physics* that in every discipline and faculty, knowledge and science arise from an acquaintance with principles, saying that we consider ourselves to know any given thing when we have come to know its first causes and first principles down to its elements. The author of the *Speculative Grammar* was not unmindful of this precept, and invokes it in his prooemium, aptly applying it to the presentation and clarification of his own subject; and subsequent philosophers have likewise observed it. Moreover, from the same Stagirite (*Text 21 of the first book of the Posterior Analytics*) and from Scotus (*ibid.*, q. 2; in the *Prologue*, q. 1, §. *In ista quaestione, A*; in 4 *Sent.*, d. 47, q. 1, §. *Respondeo, A*; and in other places), we come to know principles insofar as we come to know their terms — and both these texts seem to favor our purpose and to fit our subject exceedingly well, since we are most eager to instruct in the principles and elements of Dialectic, and in the whole discipline of reasoning, taking our starting point from terms, so that once these are known and grasped, its inner recesses may the more easily and conveniently be opened up. For no one can be thoroughly acquainted with the intimate nature of Logic — which is in itself very obscure — unless the process of reasoning, or the syllogism, is made known to him. That Aristotle treated this by design and directed all the works of Dialectic toward it is testified by Scotus (q. 3 of the *Universals*), Zabarella (l. 1, *De natura Logicae*, c. 18), Fonseca (l. 1, *Institutionum dialecticarum*, c. 5; and l. 1, *Met.*, c. 3, q. 1, sect. 3), and is indicated by Aristotle himself at the close of the *Sophistical Refutations*.

For just as Grammar cannot be acquired without letters, Mathematics without points, and Physics without the prior conception of matter and form, so Logic cannot be learned if terms are unknown and neglected. It is in no way possible to proceed without error: no one can compose propositions, form their oppositions, construct their equivalences, produce their conversions, and perceive the nature of the syllogism, its properties, its fallacies, and other matters of this kind, without having first examined and understood terms. The Subtle Doctor teaches this plainly (q. 1 of the *Prologue*, §. *Contra istam rationem, G*), in these words: "The intellect cannot understand a mediated proposition unless

it understands the immediate one, nor that unless it understands its terms." And in (*1 Sent., d. 3, q. 2, §. Ad istud, sub C*): "That knowledge is most perfect which is obtained from terms perfectly known." And in (*q. 4, ante V*): "Pure and genuine truths cannot be grasped without grasping their proper terms." Likewise in (*4 Sent., d. 10, q. 8, §. Respondeo, sub B*): "It is impossible to conceive any complex expression whose extremes are not conceived." Chrysaorius had experienced this: encountering the *Categories* of Aristotle and not then grasping them, he could never have understood them had not his master Porphyry first prefaced and expounded the *Isagoge* of the universals, which contains the principal terms. The Scotist Bonet lends support to this, saying at the beginning of (*l. 1, Met., c. 1*): "Distinct knowledge of a conclusion depends upon knowledge of principles and upon distinct knowledge of terms." Francis Lychetus, the most faithful interpreter of Scotus, also concurs (*in 1 Sent., d. 3, q. 2, §. Contra istud obijcitur*): "In arguing, we first compose the syllogism from propositions, and the propositions from terms, and then we resolve the syllogism into propositions, and the propositions into terms. And so in all of this, knowledge of terms is required." And just as, according to the teaching of the Stagirite (*1 Sophistical Refutations, c. 1*), those who do not know the counters and their values go wrong in calculation, so too those who have not a clear knowledge of words and terms are not infrequently deceived and ensnared in the conduct of debate.

Therefore that custom of philosophical academies is greatly to be praised and celebrated which, before the treatment of Logic, hands on to younger students a brief introduction to its terms — commonly called the *Summulae* — so that they may be rendered readier and more prompt in tracking down the truth of reasoning and detecting its falsehood: especially in the Lyceum and the Scotist school, which, as it stands higher than the rest in subtlety, likewise exists as more difficult in its depth. Not unwillingly concurring with these scholars, I undertake an epitome on terms and on what is terminated — that is, on the syllogism — provided only that I first employ the words of our Doctor and follow his path. For, as is witnessed by William Vorri long, the prince of theologians in his time, near the end of his address on the first book of the *Sentences*, and by James of Bagnacavallo, a most learned and devout man, on page 19 of his *Pastoral Epistle*, the Subtle Doctor, pouring out prayers to God and beginning his Dialectic, says: "O God, who art the term without end, grant me that I may speak of what is determined aright."

Division of This Entire Epitome

This little work is completed in three books. In the first, incomplex terms are treated; in the second, complex terms; and in the third, what is terminated — that is, the syllogism, which is composed from the preceding terms. A not incongruous reason is given for this partition, since the syllogism, which is established as the primary subject of Aristotelian Logic, encompasses two kinds of parts, namely integral and subjective, of which Scotus makes mention (*q. 3 of*

the Universals, §. *Dicendo ergo*, and §. *Ad aliud*; Cardinal Sarnanus on p. 79 of his commentary; and likewise at the beginning of Prologue 3, and 2nd lateral, §. *Ad 1 arg. prima q. R*, and §. *Aliter*, shortly before Q; and 2 Sent., d. 3, q. 4, §. *Contra, ista positio*, G). The integral parts of the syllogism are the incomplex and complex terms, enumerated by the same Doctor (2 Sent., d. 11, q. un., §. *De secundo*, shortly after C), which are called by Scotus himself (q. 2 of the first *Prior Analytics*, at the end; q. 6, §. *Respondetur*) and by other Dialecticians the remote and proximate matter of the same syllogism. The subjective parts are the analytic, topical, sophistical, and pseudo-graphical syllogisms, which the Doctor enumerates at the end of (q. 2 of the first *Prior Analytics*).

Investigating this entire subject matter, we first treat of incomplex terms, from which flow as properties: signification, predication, subjection, supposition, status, distraction, ampliation, restriction, alienation, diminution, and appellation. We then treat of complex terms, from which flow as properties: truth, falsity, opposition, equivalence, and conversion — discussed at length by Scotus in the books on the *Perihermeneias* and the *Prior Analytics*. Thereafter we treat of the syllogism, whose properties are: to consist of three terms, to exist in a mode and figure, and necessarily to infer a conclusion from the premises — as Sarnanus writes in his commentary (q. 3 of the *Universals*, p. 58), following Scotus in the books of the *Prior Analytics* just cited. This distribution is plainly indicated by the Doctor (1 *Perihermeneias*, q. 1; and 1 *Prior Analytics*, q. 2), and is marvelously confirmed by the order of the Philosopher's books in his *Organon*. For he examines incomplex terms in the book of the *Categories*, for the explanation of which the Porphyrian *Isagoge* is prefixed; he surveys complex terms in the books of the *Perihermeneias*; and finally he treats at length the syllogism, its species, and its properties in the books of the *Prior Analytics*, *Posterior Analytics*, *Topics*, and *Sophistical Refutations*.

Book I: On Incomplex Terms

Just as in thoroughly learning Grammar, letters are known before syllables, syllables before words, and words before nouns; so in acquiring Dialectic, incomplex terms are set out before complex ones, and these before the syllogism — as the Subtle Doctor (*q. 19 of the Sophistical Refutations*) and Lychetus (*in 1 Sent., d. 3, q. 2, §. Contra istud*) appear to indicate. The reason for this is that what is simpler and more general is to be placed before and preferred to what is less general and composite. Aristotle prescribes and effects this (*1 Physics, c. 1, Texts 4 and 7; and 3 of the same work, Text 2; and at the end of the Meteorologica*), saying that one must proceed from universals to singulars, and likewise from what is more general to what is less general. This book contains four questions: the first on the divisions and definitions of incomplex terms; the second on their properties; the third on universals; and the fourth on the categories.

Question I: On the Divisions and Definitions of Incomplex Terms

Article I: On the Names of This Discipline

Before we come to the matter we have proposed, the names of this discipline must be set out. For the Stagirite warns (*1 Sophistical Refutations, cited in our preface*) that in the conduct of debate those are easily deceived who do not know the names of things. So that we may not succumb to any error or deception, we have judged it worthwhile to investigate and learn the names of the discipline itself — which the same Philosopher explains more clearly (*1 Posterior Analytics, c. 1, Text 2*) through those prior cognitions: whether it is, and what it is, or what the name is and what the thing is. Nor does Plato dissent, judging in the *Cratylus* that the meaning of words is not to be despised; with whom the Seraphic Doctor agrees (*2 Sent., d. 38, art. 1*), saying that we are frequently led to knowledge of a thing through consideration of its words. And the Doctor (*2 Sent., d. 34, §. Ita qq., ante A*) is of the same mind.

This science is distinguished by many names, some metaphorical — in which sense it is called by Plato (*7 of the Republic*) the apex and end of all disciplines; by Cicero (*De claris Oratoribus*) the light of the sciences; by others it is called the sun of the mind, the eye of reason, the scale of truth, the gateway of the sciences — and by Aristotle it is called an instrument, as is clear from the title of his work; some names are proper — thus by the same Philosopher (*2 Met., c. 3*) it is called the method of knowing, and commonly it is termed Dialectic and Logic. Since these last two names are the more familiar and frequent among philosophers, we must accurately explain their meanings.

Dialectic is equivalent to the doctrine of discourse. For what in Greek is *διαλέγεσθαι* is in Latin *disserere* (to discourse). And therefore, etymologically,

Dialectic is the science of discoursing. Or, if you prefer, the science of disputing, as some more recent authors note from Augustine (*l. 1, Against Cresconius the Grammarian, c. 14*). Logic, however, is derived from the Greek word λόγος, which signifies speech, word, and reason, as Scotus notes (*in 1 Sent., d. 27, q. 3, §. Ad 3 q., circa R; and Quodl. 7, art. 3, sub Q*), following Augustine (*7 De Trinitate, c. 2*) and Jerome (*Ad Paulinum, c. 4*), whom Gadius cites in his commentary on that quodlibetal question just cited by us. Accordingly, by the derivation of the word, Logic is the science of discourse or of reason — or both terms just mentioned come to the same thing, as some more recent authors note from Cicero — and so Logic may be described as the discursive science that distinguishes the true from the false, as the holy Augustine intimates (*ibid., Against Cresconius the Grammarian*); or, as others prefer, Logic is the science of dividing, defining, and arguing well.

One objects, first, against the foregoing definition of Dialectic: Scotus (*q. 1 of the Categories, §. Ad quaestionem*) writes that Logic is neither a real nor a discursive science, because it considers neither speech nor the properties of speech. Therefore in the school of Scotus the preceding description of Logic is not suitable. One replies with Tataretus (*q. 1 of his Logic, on the fourth knowable*) that Logic is called discursive not because it uses speech — since in that case all sciences, which also use speech, would be discursive — but because it judges which speech is true and which is false. Or one may say with Scotus in the cited place that Logic is called discursive because the concept with which Logic is concerned is the immediate significate of a spoken word, and also because the properties of a concept belong to the significative spoken word. Or one may finally say that Logic is discursive — that is, rational and reasoning — which everyone concedes, especially since we are not speaking of external speech but of internal speech, which we showed in our *Treatise on Angels, disp. 7* to belong to Angels as well, and which coincides with discourse and reasoning, as Augustine touches upon (*l. 2, De consensu Evangelistarum, near the end of c. 66*).

One objects, secondly: every science, especially a speculative one, distinguishes the true from the false — for example, Metaphysics, which (*2 Met., c. 1*) is the chief investigator of truth, which cannot be done unless truth is separated from falsehood through it. Therefore distinguishing the true from the false is not to be attributed to Logic alone as its proper function, peculiar end, and mark of distinction from the other disciplines. One replies that Metaphysics and Logic do not contemplate truth in the same way, as the Subtle Doctor notes in his commentary (*4 Met., Text 1; and 6 of the same, q. 3, §. Ad propositum*). For Metaphysics meditates upon transcendental and incomplex truth, while Logic speculates upon complex truth and gathers it by means of the syllogism. That habit which regards truth and by which falsehood is judged — since Scotus affirms (*in 4 Sent., d. 15, q. 3, §. De tertio, X*) that "the straight is the judge of itself and of the crooked" — is therefore rightly described as the discursive science that distinguishes the true from the false.

Article II: What a Term Is

The many acceptations of "term" are to be sought from (*5 Met., c. 17, Text 22*), which Fonseca (*ibid.*), Pelbartus (*vol. 1 of the Theological Rosary, s.v. Elementum*), and Major (*l. 1 and 2 of the Terms*) adduce and explain. Of these, I note only the term — that is, the boundary of the earth, which is named from "terminating" — taken universally, described as the final point or end of any given thing; in this sense death is called the term of life. Hence the Church sings in the Hymn of Compline, *Te lucis ante terminum*, and in the proper Office of Saint Clare, *Post vitae Clarae terminum*, and Augustine (*2 De consensu Evangelistarum, 24*): "Light is the term of all night." Again (*1 Physics, c. 4, Text 36*), it is demonstrated and defended by our Doctor (*in 2 Sent., d. 2, q. 9, §. Ad argumenta, sub N*) that all living things are bounded by definite terms. Moreover, "term" is often used not only for the end but also for the beginning of any thing; in this sense the first and last point of a line are called the terms of that line. Likewise, the extreme parts of a staff, a field, and the sea are called their terms; thus Dan and Beersheba are the terms of Judea, and it is read in (*Exodus 23*): "I will set your terms from the Red Sea to the sea of the Philistines, from the desert to the river."

From this signification, which is the proper one — as Campanella notes (*following Scotus, q. 1 of the Categories*) — "term" is transferred to signify the first and last point of a proposition; and in this acceptation a term may be described as the extreme of a proposition. A proposition is bounded by two terms, namely the subject and the predicate: the subject on the near side, and the predicate on the far side, as is clear in this proposition, "man is an animal," where "man" and "animal" are its terms; "man" is called the subject, and "animal" the predicate. "Is" is called the copula or bond of both, just as the union of matter and form is called the nexus of each.

The foregoing description of a term does not conflict with Aristotle's definition (*1 Prior Analytics, c. 1*): "A term is that into which a proposition is resolved." For that into which something is resolved is also that out of which it is composed, as is clear in the case of a natural body, which, since it is composed of matter and form, is also resolved into matter and form. Since a proposition is composed of terms, it is likewise resolved into terms. And it is perhaps not without reason that in (*1 Topics, c. 4, and in the Metaphysics passage mentioned above*) a definition is called a term, because it does not exceed the bounds of the essence of the thing being defined but is contained, enclosed, and equated to them. Or perhaps the Philosopher supplies such a definition of term because, just as experience confirms that motion ceases once the term is reached, so likewise our mind comes to rest in a proposition once the perfect sense of its terms has been grasped. Or — what pleases us more — Aristotle was there proceeding by the resolute method, since he was writing the books of the *Prior Analytics*, which are called analytic or resolute. Weighing this carefully, the Author of the *Speculative Grammar* adds: "Term expresses the function of terminating the

resolutions of the syllogism, because the dialectician resolves syllogisms into propositions, and propositions into subject and predicate, which are called terms according to the logician."

One objects, first, against the given definition of term: a proposition is resolved not only into subject and predicate but also into the verb, since it is constructed from subject, predicate, and verb. Therefore either the foregoing definition of term is defective, or the verb is a term — but the latter is false; therefore so is the former. The objection is met by saying that a term is that into which a proposition is resolved as into an extreme component part that encloses it. For this reason I noted above that a term is the extreme of a proposition, and Aristotle in the cited place, with Firminus Duraeus as interpreter, says: "I call that the extreme into which the proposition is resolved." Scotus lends support to this (*in 1 Sent., d. 2, q. 4, §. Si tenendo*), calling terms "extremes" in these words: "The necessary connection of extremes argues a necessary connection of the middles." Now the verb is not an extreme but a middle: for it mediates between both extremes and is the bond of each, and therefore does not enter into the definition of term. This can also be shown in the case of a physical composite, which is indeed resolved into matter and form as into its parts, but not into their union, which is the nexus of each — especially in Scotus's position, which holds that union is formally an extrinsic relation supervening upon the parts, as is clear (*in 3 Sent., d. 2, q. 2, art. 3, sub E*). Add to this what I noted above, that "term" in this context is taken for the beginning and end of anything, in which sense only subject and predicate are entitled to the name of term.

One objects, secondly: a definition must not apply to anything other than what is defined, as will be plain in the subsequent book in the article on definition. But the definition of term applies to something other than the term itself — namely, to a hypothetical proposition, which is resolved into propositions, as in "If the sun is shining, it is day." Therefore the foregoing definition of term has not been correctly given. The major being conceded, the minor is to be denied; its proof is dissolved because the ultimate resolution of a hypothetical proposition terminates in terms. The same thing similarly occurs in the resolution of a composite natural living thing, whose ultimate resolution comes to rest in prime matter, as Scotus teaches (*in 4 Sent., d. 11, q. 3*).

One objects, thirdly: a proposition is sometimes resolved into adverbs and prepositions, of which it is composed, as is clear in this: "Aristotle argued well in the first Physics against the early philosophers." Therefore the definition of term has not been correctly assigned by Aristotle. One must distinguish the antecedent: a proposition is resolved into adverbs and prepositions as into its predicate and subject — this is denied; as into additions and modifications of each, which are commonly called syncategoremata — this is conceded.

Article III: On Mental, Spoken, and Written Terms

Among the many distributions of terms, the first we encounter for discussion is the division into mental, spoken, and written terms, which Scotus intimates (*q. 1 of the Categories*). A mental term is the extreme of a mental proposition — or, according to Aristotle, that into which a mental proposition is resolved — such as "man" conceived in the mind. A spoken term is the extreme of a spoken proposition — or according to Aristotle, that into which a spoken proposition is resolved — such as "lion" uttered in voice. A written term is the extreme of a written proposition — or according to the mind of the Philosopher, that into which a written proposition is resolved — such as "God," whether inscribed on papyrus, marble, or other materials.

These three — concept, spoken word, and writing — are marvelously ordered by nature, as the Subtle Doctor notes (*in 1 Sent., d. 27, q. 3, §. Ad argumentum, in Solutione Secundi, ante I*). For since man, according to Aristotle (*1 Politics, c. 2; 9 Ethics*) and the Doctor (*q. 4 of the first Perihermeneias; and q. 13, §. Alii aliter*), is a civil and social animal, and since one person cannot look into another's mind or thoughts, nature has therefore granted spoken words — which, per (*1 Perihermeneias, c. 1*), are signs of those things that lie hidden in the soul, that is, of the concepts that are drawn from the intellect. Hence Plato says in the *Timaeus* — as Vorrilonius witnesses (*in 1 Sent., q. 22, art. 1*) and as Augustine states (*In Ezechiel, c. 13*) — that speech was given to us so that we might be able to express our mutual concepts. Scotus says the same (*in 1 Sent., d. 27, q. 3, §. Ad qq. istas, sub F*): "The spoken word is formed to signify and declare what is understood." And again (*in 2 Sent., d. 42, q. 2; and q. 4, §. Ad q. Q, in solutione primi*), he adds: "According to that work of speech man conducts himself in the most civil and political manner." The same he openly shows (*ibid., §. Ad q. 4, S*): "Locution belongs most of all to man, both as rational and as man, because he is in this way communicative." Augustine says the same (*2 De doctrina Christiana; and 15 De Trinitate, c. 10*). Thereafter, so that things might be recalled to memory, communicated to us more quickly and easily, and so that those who are absent and our posterity — with whom we cannot use spoken words — might participate, letters and writing were invented; and how great a benefit they are to man, especially through the art of printing, daily experience demonstrates.

Dialectic treats of the spoken term rather than the mental term, as Scotus touches upon at the end of the first *Perihermeneias* — though the spoken term derives its force from the mental — both because spoken words are more apparent to us than concepts, and because no man is instructed by another in internal speech, while Dialectic teaches how it should be instructed, judging the true from the false, for which purpose spoken words are necessary; and also because Dialectic is derived from *δια* — that is, two — and *λεξις* — that is, speech: the speech of two persons, namely, one who argues and one who responds. For since, from what was said in Article I, Dialectic is the science of disputation, in order for disputation to take place between two persons it can only be accomplished through spoken words. Much the same reason is given when one

asks why Logic treats of spoken words rather than of written ones. The reply is that spoken words are more manifest than writings, that they receive their force and efficacy from the one who utters them, and that they are more tenaciously impressed upon the memory of the hearer. Hence those who learn sciences from others are called not their readers but their hearers.

When we hear spoken words or read writings, two concepts can be formed in us: one concerns the name or writing only, without knowledge of the thing signified under such a name or writing — and this is called a non-ultimate term, so called because the intellect does not terminate in it but tends further toward the signification of the thing; the other concerns the thing signified, when namely someone knows both the name and the thing signified by the name — and this is called an ultimate concept, so called because, once knowledge of the name and the thing has been obtained, the mind of the one conceiving comes to rest. This interpretation and division appears to be intimated by John Major (*l. 1 of the Terms, fol. 7, col. 4*), and not far from him is the Prince of the Subtiles (*in 1 Sent., d. 3, q. 3, §. Loquendo igitur, L*), saying: "Something is conceived confusedly when it is conceived as it is expressed through a name; and distinctly when it is conceived as it is expressed through a definition." Those who lack ultimate concepts are said to be unlearned; those who possess them are said to be learned.

One objects, first: the members of a good division participate equally in the common character of what is divided, as will be plain in the following book in the article on division. But the written, spoken, and mental terms do not participate equally in the common character of a term: for just as a proposition is formally and intrinsically predicated of a mental proposition, so the formal and intrinsic character of a term is predicated of the mental term. Of the spoken and written, however, only extrinsically — just as truth formally exists in the intellect, but in a spoken word or writing as in a sign. Thus the essential character of term is located in the mental term alone. Therefore the foregoing division is not apt. One replies that this division of term is indeed not wholly exact — that is, it is not the division of a univocal thing into its univocates, or of a genus into its species — yet it is not unlike that which the Philosopher offers (*4 Met., c. 2, Text 2*), dividing health into the health of an animal, of urine, and of medicine. For health formally is in the animal; in urine as in a sign; and in medicine as in an efficient cause. If someone, in speaking of terms, wishes to go beyond the bounds of philosophy, he may compare it with that division by which sin is divided into sin of the heart, of the mouth, and of deed. For sin is formally in the will; materially, however, in speech and deed, as the Doctor excellently expounds (*in 2 Sent., d. 42, q. 4, §. Ad q. 2, N*). Or one may say with Major (*l. 1 of the Terms, fol. 3, col. 4*), admitting the major and denying the minor: for a term, whose genus is "extreme" and whose remaining element holds the place of a difference, is univocally divided into mental, spoken, and written.

One objects, secondly: this is not a sound division whose dividing members exceed the divided, as will be shown plainly in the place cited above. But the foregoing division is of this kind, since there can be a voice even though it is not a term — as Mark I records that John the Baptist was indeed a voice, as he himself admits there, but was not the term, which is the Word. Therefore it is a bad division. One replies: the major being conceded, the minor is to be denied. For its proof, I distinguish: John was a voice absolutely, with no account taken of the preceding and subsequent sense of Scripture — this may be denied; relatively — this is conceded, inasmuch as John was the messenger or forerunner of the incarnate Word. Therefore John says: "I am the voice of one crying in the desert: prepare the way of the Lord."

Article IV: On Significant and Non-Significant Terms, and Other Related Matters

One kind of term is non-significative, described as the extreme of a proposition that represents nothing to the cognitive faculty by human convention; or according to the mind of the Philosopher, a non-significative term is that into which a proposition is resolved by human will while signifying nothing to the cognitive faculty — for example, "blictri." Another is the significative term, defined as the extreme of a proposition that represents something to the cognitive faculty by human institution; or according to Aristotle, a significative term is that into which a proposition is resolved by human convention while signifying something — for example, "lion." The significative term is subdivided into categorematic, syncategorematic, and mixed — which Scotus touches upon (*q. 8 of the first Prior Analytics*, §. *Quantum ad 2*; and *q. 32 of the Sophistical Refutations*, shortly before §. *Ad 1 argumentum*).

A categorematic term is one that signifies something on its own — for example, "lion" signifies "a roaring animal." A syncategorematic, or co-significative term, is one that signifies nothing on its own but, when joined to another, designates something — such as universal signs, prepositions, and adverbs. For example, "learnedly" signifies nothing on its own, but if added to another term it signifies something, as in "he discourses learnedly." This can be further explained by an arithmetical analogy: just as among arithmetical symbols, zero signifies nothing on its own, yet if a 1 is prefixed to it, it makes 10, and if a 2 is prefixed, it makes 20 — so too, as Major says (*loc. cit.*, *fol. 5*), a syncategorema functions like a zero: that is, it signifies nothing on its own, yet joined to another it signifies something, as I was just explaining. A mixed term is one composed of a categorema and a syncategorema — for example, "no-one," that is, "no man," as the Doctor notes (*in 1 Sent.*, *d. 21, q. un.*, ante §. *Ad q. potest fieri, circa A*).

Hurtado (*disp. 1 of the Summulae*, *sect. 10*) and to some extent Arriaga (*ibid.*, *sect. 4*), following Tataretus (*Tract. 1, fol. 3, in solutione primi argumenti*) — from whom Fuentes does not dissent (*parte 2 Summularum*, *art. 7, diff. 2*) — think that substantive nouns are categorematic terms and adjective nouns are

syncategorematic terms. On the contrary: even if the said authors concede that substantive nouns are categorematic terms, they do not seem to me to rightly deny that adjective nouns are categorematic terms, judging them to be syncategorematic. For a categorematic term, by its very nomenclature, is predicable — as Hurtado himself admits there; but adjective nouns are predicable, as in "man is wise." Therefore adjective nouns are categorematic terms. Likewise, a categorematic term is significative, as is clear from its foregoing description; but adjective nouns are significative — for example, "learned" signifies "one having learning" (since it is a concrete noun, which, as will be said in Article VI, signifies a form and one having the form). Therefore adjective nouns are categorematic terms. Furthermore, adjective nouns are properly the extremes of propositions — as in the same example just given, "man is learned," where "learned" is one extreme of the said proposition; but syncategoremata are not properly terms, since they signify nothing on their own unless joined to others, as I showed above. They rather co-terminate than terminate the proposition. Therefore adjective nouns are not to be classed among syncategoremata.

One says: adjectives signify "with another" — that is, something after the manner of something adjacent, as I will show in the place shortly cited — therefore they are syncategorematic terms. Against this: even substantive nouns signify "with another," for it is necessary that in every proposition two extremes be placed explicitly or implicitly, one of which is joined to the other through a verbal copula to express complex truth. Therefore the reply is no answer. Nor does it help to say that a substantive signifies in the manner of something standing on its own and determinate, while an adjective signifies in the manner of something adjacent and indeterminate. For that indicates the proper distinction between a substantive and an adjective, but does not exclude the adjective itself from the category of categorematic terms. This can be urged by analogy: just as, by their own proper and peculiar characters, substance is being through itself and accident is being in another, yet both fall under the common character and concept of being as univocating — as Scotus teaches (*in 1 Sent., d. 39, q. 1*), whom Arriaga follows (*disp. 13, sect. 4, n. 40*) — so, although substantive and adjective differ by their own proper differences already assigned and explained by us, they nonetheless participate in the common character of a categorematic term, which is to be predicative and significative, as I forewarned near the beginning of this article. And so adjective nouns are to be reckoned among categorematic terms.

A categorematic term is divided into incomplex and complex, according to Aristotle (*in the Antepredicaments*) and Scotus (*q. 52 of the Sophistical Refutations, §. Pro solutione*). An incomplex term, according to Tataretus (*Tract. 1 of the Summulae, fol. 1*), is one that is subordinated to an incomplex concept; but it is commonly described as a spoken word signifying on its own, whose parts, when separated, do not retain the same signification they have when joined together

— such as "man," "Lord," and similar terms, whose parts taken separately do not have the same signification they possess when taken conjointly — as is obvious to all — and is indicated by Aristotle (*1 Perihermeneias, c. 1*) and by Scotus (*in 4 Sent., d. 8, q. 2, §. Aliter ergo, sub G*). This term is therefore called incomplex and indivisible on account of the unity and indivisibility of its signification, which its separated parts do not possess. It can be divided into simple — as "lion" — and composite — as "plenipotentiary" — much in the same way as, in the second book, noun and verb will be divided into simple and composite: in both cases the reason and difficulty appear to be the same, and are better to be examined there than in the present place. A complex term, according to the same Tataretus (*ibid.*), is one that is subordinated to a complex concept; and it is commonly said to be one that consists of several words each signifying on its own and aptly arranged. A complex term is of two kinds, as the Doctor touches upon (*1 Posterior Analytics, near the end of q. 34*): one is non-distant and the other is distant. A non-distant complex term is one whose parts are not joined by a verb — as "a white horse"; a distant complex term is one whose parts are joined by a verb — as "the crow is black." Whether a complex term coincides with a speech and a proposition, or not, I defer for examination to the place just cited.

As to why this first book is entitled "On Incomplex Terms" rather than "On Categorematic Terms" — given that we divide a term into categorematic and syncategorematic before dividing it into incomplex and complex — this reason can be offered: incomplex terms are ordered to complex terms as parts to a whole, and as letters to syllables, and syllables to words, about which the second book is aptly composed. But categorematic terms bear no relationship to syncategorematic terms, since, from what has been said, the latter are not properly terms but may be called co-terminal or co-significative and co-predicative — as "alone" is in Scotus (*in 1 Sent., d. 1, q. 21, q. un.*).

One objects, first, against the division of a categorematic term into substantive and adjective: if an adjective is a categorematic term because it is significative and predicative, then everything that signifies a totality and something signifying a partial quantity will be a categorematic term — the consequence being repugnant to all dialecticians who number such terms among syncategoremata. Therefore so is the antecedent. One replies by denying the consequence. The reason for the disparity is that an adjective signifies a form and one having the form, since it is a concrete noun; but "every," and other syncategoremata of that kind, do not do this unless they are joined to a concrete term or to another term. For that reason they have no place among the categorematic terms.

One objects, secondly: a syncategorematic term is not properly a term, as I indicated above. Therefore the division of a term into categorematic and syncategorematic is inept — the consequence holding because what is divided does not belong to the dividing members, which is opposed to the rules of a

good division to be assigned (*l. 2, art. 1, q. 7*). One replies that this is not an exact and adequate division but an improper and inadequate one, as is well deduced in the argument. It may rather be called an enumeration of terms.

One objects, thirdly: a proposition is not resolved into a complex term, because in our opinion a complex term coincides with the proposition itself, and the same thing is resolved not into itself but into something other. Therefore the later division of a term into incomplex and complex is not legitimate. I distinguish the antecedent: concerning a distant complex term — I concede it; concerning a non-distant complex term — I deny it. For example, in "Peter is a good philosopher," "a good philosopher" is a non-distant complex term into which the foregoing proposition is resolved. Or one may say that the foregoing division is improper and inadequate, just as the division of a term into categorematic and syncategorematic is improper.

Article V: On Equivocal and Univocal Terms

An equivocal term is one that belongs to several things having the same name but a different essential character according to that name. Scotus offers an example (*in 1 Sent., d. 25, q. un., §. Respondeo, A*) — namely "dog," which is an equivocal term with respect to the celestial dog, the aquatic dog, and the terrestrial dog. Aristotle (*at the beginning of the book of the Categories; and 6 Topics, c. 2*), and after him Scotus (*q. 13 of the Sophistical Refutations, §. Ad 1, ergo; q. 15 of the same, §. Ad primam rationem*), describe equivocal things as those "whose name is common but whose essential character according to that name is different."

They are divided by the Doctor (*q. 1 of the Categories; and q. 5, §. Ad q.*) into equivocating equivocals — those which are equivocal, meaning things that belong to many under a common name only, which are equivocal names attributed to many things by reason of the very spoken words — and equivocated equivocals, which are called those that enjoy only a common name, and these are the different things that participate in the common name only.

Furthermore, some equivocals are by chance, and others by design. Equivocals by chance are those that arise apart from human intention — that is, with no consideration taken of the things signified — for example, "Gallus" is said both of a man of the French nation and of a rooster; and these are called purely equivocal. Equivocals by design are those that acquire some agreement or similarity in the name from the intention of the one imposing it — for example, when someone gives the name of Saint Francis to his son because he hopes he will be like Saint Francis. This is reported to have been done with the names Abraham, David, and others by Tossignani (*l. 1 of the Seraphic History, near the beginning*); and these are called analogical.

A univocal term is one that belongs to several things having the same name and the same essential character according to that name. And Aristotle (*cited above*) defines univocal things as those "whose name is common and whose essential

character of substance according to that name is the same" — for example, "animal" with respect to man and beast is univocal, since both share the name and the character or essence of animal.

They are divided by the Doctor (*q. 6 of the Categories*, §. *Dicendum*) into univocating univocals — which denote the common name shared by many that participate in the same character — and univocated univocals — which are the many things that agree in a common name and character.

Furthermore, from Siretus (*Tract. Formalizatum*, fol. 7) and Pelbartus (*vol. 1 of his Rosary*, s.v. *ens*, fol. 51), univocals are subdivided into transcendental univocals and predicamental univocals. Transcendental univocals are those that, under the same name, possess the same transcendental character — that is, one included in no predicament — as substance and accident share the character of being in the opinion of the Subtle Doctor. Predicamental univocals are those that enjoy the same name and the same character of some genus, as stone and plant are univocated in the genus of substance, because the name and character of predicamental substance belong to both.

Further, predicamental univocals are subdivided into logical, physical, and metaphysical univocals, as Scotus touches upon (*q. 7 of the Categories*, toward §. *Ad 1*; and *q. 15 of the Sophistical Refutations*, §. *Ad primam rationem*; and in *1 Sent.*, d. 3, q. 3, §. *Contra istam univocationem*, sub *Q*). Logical univocals are those that enjoy a common concept of some reality conceived under a second intention — as is the concept of animal considered as a genus. Physical univocals are those that, under the same name, participate in the same specific nature — as Peter and Paul are physically univocated in human nature. Metaphysical univocals are those that agree under the same name in a nature abstracted by the intellect from its inferiors and stripped of individual differences — although from the side of the thing it is contracted, or contractible, through them.

Finally, some univocals are complete and others diminished, from the same Doctor (*q. 4 of the Prologue*, near the end, *GG*). Complete univocals are those that enjoy the same form and the same mode of being of the form. Diminished univocals are those that have a similarity in form but not a similar mode of being of the form — for example, a house within and outside the mind are univocated in the character of house by a diminished univocation: for the house outside the mind is real, while the house within the mind is ideal and exemplary — a distinction of which the Philosopher makes mention (*7 Met.*, Text 30; and *12 Met.*, Text 13).

One objects, first: in the foregoing definitions of Aristotle, the essential character of substance is posited in equivocals and univocals. Therefore if those definitions are legitimate, equivocation and univocation belong only to substance and not to accident — which savors of falsehood, since in the school of Scotus accident is univocated just as well as substance in the common

character of being. One replies that by "the character of substance" is to be taken the character of essence, which aptly belongs to both substance and accident, as the interpreters of that passage of Aristotle explain it. Therefore the consequence is denied; for "substance" taken broadly is used for the essence of any thing, as will be clear when I dispute about substance itself in proper form. The Doctor clearly transmits this interpretation (*q. 5 of the Categories*), saying that "the character of substance" is the same as the essential intellection, or concept, of any object.

One objects, secondly: one nature has but one definition, because a definition is devised to express the nature of a thing bounded by these or those terms — just as a field is enclosed by definite boundaries beyond which it does not extend, and from which the transfer of meaning is taken (as will be more clearly seen in *l. 1, q. 7, art. ult.*). But in the definition of equivocals a different essential character — that is, nature or essence — is posited. Therefore they do not have a single definition. One replies that the major holds for an essential and quidditative definition of a thing, but not for a nominal and descriptive definition, such as the definition of equivocals is. For this reason the Subtle Doctor rightly adds (*q. 5 of the Categories, in solutione tertii*) that this is not a true definition.

One objects, thirdly: Scotus (*in 1 Sent., d. 3, q. 2, §. Secundo non asserendo, B*) says: "A univocal concept is one sufficient to ground a contradiction by affirming or denying it of the same thing." Therefore, according to Scotus's doctrine, the univocal was poorly defined above. One replies that in that place Scotus is describing the transcendental univocal, for he is there treating of the univocation of being, which is a transcendental. We, however, have collected nearly all the divisions and definitions of equivocals and univocals and have adduced their descriptions as clearly as we could.

Article VI: On Concrete, Abstract, and Other Terms

The celebrated distribution of a term into concrete and abstract is indicated by Augustine (*l. 83 Questions, q. 1, 22*), saying: "Everything true is true by truth" — for "true" is the concrete form and "truth" is the abstract. A concrete term is one that designates a form and that which has the form. From this description one may refute Fonseca (*l. 1, Institutionum Dialecticarum, c. 3*), who thinks that a concrete term is one that has a composite mode of signifying; and Quiedo (*Controv. 1, puncto 3, n. 7*), who says that a concrete term is one called composite in reality or in name. For "God" is a concrete noun from which the mode of signifying composition is entirely alien; and it is a concrete noun involving no composition in reality or name. The concrete term is subdivided into substantial concrete — which signifies what subsists in a form or nature, as "man" signifies what subsists in humanity — and accidental concrete — which designates a form and connotes its subject, as "white" signifies whiteness and connotes the subject in which the whiteness inheres. This entire doctrine is transmitted by the Doctor (*in 1 Sent., d. 26, q. un., at the end, §. Ad argumenta, in*

solutione 2; q. 16 of the Universals, §. Ad primum; and q. 8 of the Categories, §. Ad q.; and q. 17 of the first Prior Analytics, §. Quantum ad 3); by Sarnanus (q. 4 of the Universals, p. 93); and by Pelbartus (vol. 1 of the Theological Rosary, s.v. Abstractum, §. 1 and 2).

Not very different from this appears to be the other partition of a term into substantive and adjective, as Scotus intimates (*in 4 Sent., d. 12, q. 1, at the end*) — which, although it has become somewhat apparent from what was said above in Article IV, I judge it not useless to expound more fully in this place. First of all, dialecticians take and describe the substantive and adjective differently from grammarians: for among grammarians, a substantive is what is declined by one or two articles, and an adjective is what is declined by three articles. But dialecticians define a substantive as what signifies something in the manner of something standing on its own — or, to use the words of Scotus (*in 1 Sent., d. 26, cited above*), "a substantive is what signifies what subsists in a form or nature that is imported through its abstract" — as "lion." An adjective, on the other hand, is what signifies something in the manner of something adjacent — or, as the Doctor says (*in 1 Sent., d. 5, q. 1, §. Quantum autem, C*), "what signifies a form in the manner of something informed": thus "just" designates justice as adjacent to the just man, or justice as informing the man, by reason of which he is called just. An adjective is called *adjectivum* (as Calepino records) as if it were *adiunctivum* — because it is joined to a substantive, or because it depends on a substantive — as Scotus rightly notes (*in 1 Sent., d. 12, q. 2, §. Ad argumenta, CC*), saying: "An adjective is in essential adjacency to the suppositum that terminates its dependence. Therefore it cannot be plurified unless the substantive that ends its dependence is plurified." Thus one who has many arts is called not a manifold but a single craftsman. Perhaps for this reason some call a substantive "fixed" and an adjective "mobile" — although as the Doctor notes (*in 1 Sent., d. 12, q. 1, §. Iuxta q., toward: Sed ista ratio*), their significate is the same, and the difference lies only in their mode of signifying — much in the same way as abstract and concrete differ from one another.

An adjective acquires a double significate, namely primary and secondary, or principal and less principal: its primary significate is the form, and its secondary is the subject in which the form inheres. Thus "just" denotes primarily justice and secondarily the man in whom justice inheres — this same point the Doctor affirms of accidental concrete terms (*q. 4 of the Universals; and in 4 Sent., d. 12, q. 1, §. Ad argumenta principalia, ad 4, T*). Nor is it to be passed over in silence that certain nouns counted as substantives by grammarians are adjectives by the verdict of dialecticians — such as the noun "Lord," which primarily signifies lordship and secondarily the man in whom lordship is adjacent.

Nor does the distribution of a term into connotative and absolute — which the Doctor adduces (*q. 2 and q. 8 of the first Prior Analytics, §. Quantum ad secundum*) — seem very different from this. To begin with, it appears to be established that a

connotative term does not differ from an adjective, both because each signifies something in the manner of something adjacent and enjoys that double significate already explained — as "white" according to everyone is a connotative term that designates whiteness as adjacent to paper or to a wall; and also because "white" is an adjective and a connotative term, as Scotus writes (*in the place just cited*, q. 8; and *intimates in 4 Sent., d. 12, q. 1, toward the end, T*). Nor does what Fonseca adds trouble us (*l. 1, Institutionum, c. 24*): that certain nouns are connotative — such as "father" and "teacher" — which are not adjectives. For since he does not prove this but merely asserts it, it is refuted with equal ease by which it is built up: for this holds in Grammar, not in Logic, as I observed above. For "father," even if he wishes it to be only a substantive noun, is nonetheless also an adjective and is taken adjectively, as may be seen (*in 1 Sent., d. 5, q. 1, A*).

Furthermore, certain nouns are not adjectives grammatically — such as "creation" and "conservation" — yet they are connotative, as is clear (*Quodl. 12, art. 2, F*); and they are concrete in the logical sense — as Gadius (*ibid., in the commentary*) admirably notes: if active creation is taken for its formal element, it signifies a relation of reason founded in the divine will and connotes the act of the divine will; but if passive creation is taken for its formal element, it signifies the real dependence of a creature upon God and connotes the relation to the non-being preceding it. Since these therefore signify something in the manner of something adjacent and possess that double significate already explained by us — namely primary and secondary — just as we affirmed above of adjectives and accidental concrete terms, they do not seem to be removed from the series of adjectives and concrete terms, as Mastrius and Bellutus perform (*parte 1, Institutionum, Tract. 1, c. 3*). As for what they add concerning vital operation — which they say from the Doctor (*Quodl. 13, §. Ad argumentum principale, LL*) is not a concrete noun but a connotative term — I say that Scotus there does not deny that it is a concrete noun in the logical sense, because he expressly holds that vital operation, such as vision, is a quality that is an absolute entity and connotes a relation tending toward the object seen. So its formal significate is an absolute form, and its less principal significate is the relation looking toward the object seen; and since it thereby retains the mode of signifying of concrete terms, it does not appear to be expunged from among concrete nouns — just as the Doctor gives the example of the intelligible species, which is evidently a concrete term, in the same place.

An absolute term is not far removed from a substantive: for the foregoing definition of a substantive can aptly be accommodated to it. It is called "absolute" as if loosened from another, or not depending on another — as "man" and any substantial concrete term. I am not unaware that certain terms are called absolute — such as "intellection" — which in truth are not precisely absolute, since they connote something besides their own entity, as I was explaining above concerning vision. For that reason they are better placed in the catalogue of concrete connotative terms than of absolute ones — as Gadius

(*cited, fol. 142, col. 2*) notes along with Scotus. An absolute term can also be said to be one that is opposed to a relative term. For this reason the division of terms into absolute and relative is celebrated: everything that exists either exists as itself, or as something in relation to another — that is, it is either absolute or relative. Thus "ox" is an absolute term, and "disciple" is a relative term.

An abstract term — concerning which Sarnanus (*q. 1 of the Universals, p. 8, §. Primum*), Siretus (*Tract. Formalitatem, fol. 18, p. 2*), Brulifer, Trombeta, and other Scotists there treat well and at length — is described as what signifies something taken separately; or according to Scotus (*in 1 Sent., d. 26*), an abstract term signifies precisely a form. Since, however, there is a double form — substantial and accidental — there is likewise a double abstract: of substance and of accident. The abstract of substance designates precisely the substantial form, as "humanity"; the abstract of accident denotes precisely the accidental form, as "whiteness."

Moreover, the division of abstract into abstract with ultimate abstraction and abstract with non-ultimate abstraction is not to be despised — whatever Fonseca may object against Scotus (*1 Met., c. 28, q. 13, Sect. 5*). Abstract with ultimate abstraction is that in which no further abstraction remains — which is described by the Doctor (*in 1 Sent., d. 5, q. 1, infra A*) as that by which the formal character of something is considered in itself apart from whatever is not per se included in it. By this single abstraction is substance abstracted from its suppositum, as was explained above by the example of humanity: for it is thus taken most absolutely and precisely from everything that is outside its quiddity — which Avicenna (*5 Met., cc. 1 and 2*), carefully weighing this, expresses: "Equineness is only equineness and nothing else." An abstract with non-ultimate abstraction is one in which room for further abstraction still remains — as is the abstract of accident, whether absolute or relative. For accident involves more than substance, and a relative accident more than an absolute one. In an absolute accident two abstractions can be made: one from subjects, as whiteness is abstracted from this and that white thing; another from inferiors, as whiteness-ness is abstracted from this and that whiteness. But in a relative accident three abstractions can be formed: from subjects, from the foundation, and from inferiors — on which Scotus (*ibid., B*) and John Vallo (*Tract. Formalizatum, fol. 183*) treat most acutely. Since therefore the concretion of accident is multiple, so likewise the abstraction in it is multiple. Hence Fonseca errs in thinking that there is but one abstraction of accident and of substance, since accident involves more than substance, as I showed plainly above — both of absolute accident and of relative.

One objects, first: concrete and abstract signify the same thing, as Scotus writes (*in 1 Sent., d. 27, q. 3, §. Ad 2 q., I*). Therefore there is no division of a term into concrete and abstract. One replies that concrete and abstract do indeed signify the same thing per se, but differ in the mode of signifying — from the same

Doctor (*ibid.*; and *q. ultima of the Universals, at the end, in the solution of the first*) — which suffices for these terms to be distinguished from one another. Therefore in formal response to the argument: the antecedent is conceded, the consequence is denied for the reason given. Augustine does not appear to depart from this (*l. 1 Soliloquia*): "Truth and the true seem to be two things, just as chasteness and chastity."

One objects, secondly: if a concrete term is described as "what signifies a form and one having the form," and an abstract as "what signifies precisely a form," then in spiritual things, which lack form and matter, there would be no concrete term and no abstract term — yet concrete terms, such as "God," and abstract terms, such as "Deity," are commonly conceded in such things. Therefore concrete and abstract were not well described. One replies that form is taken in three ways: first, for pure and simple act — thus God and Angels are called forms, as is clear in Aristotle (*11 Met., Text 51*), Scotus (*Quodl. 9*), and Boethius (*3 De Consolatione, metr. 1*); second, for the essence and quiddity of each thing, according to that of (*Philippians 2*): "Who, being in the form of God, thought it not robbery to be equal with God, but emptied Himself, taking the form of a servant" — of this Aristotle (*3 Physics, Text 17*) and Scotus (*in 1 Sent., d. 5, q. 1; and frequently elsewhere*) also make mention; third, for the other part of a composite — concerning which the Philosopher (*1 Physics, 7 and 8 Met.*) and the Subtle Doctor (*there; and 2 Sent., d. 2, q. 2*) treat. In the foregoing definitions of concrete and abstract, however, form is taken not in the first or third, but only in the second sense. Therefore the implication of the major is denied.

One objects, thirdly: things that are abstracted with ultimate abstraction have nothing predicated of them except in the first mode of per se predication, from Scotus (*in 1 Sent., d. 5, q. 1, §. Quantum autem, A*). But what is included among the ultimates of abstraction is still predicated of, even if not in the first mode of per se predication — as "humanity is an entity," and likewise "whiteness-ness is whiteness-ness." Therefore the foregoing rule about ultimate abstracts is contrary to truth and reason. One replies that of ultimate abstracts a predication can be made that is not formal but identical, as the objection proves. In response to the argument therefore: the major being conceded, one may say to the minor — with Trombeta (*Tract. Formalizatum, parte 3, fol. 48, p. 2*) — that from that canon are excepted transcendentals that are either actually infinite, as "God is goodness," or permissively so, as is shown in the foregoing proposition, "humanity is an entity." The reason is that the actual or permissive infinity of one or both extremes identifies those extremes with one another. For this reason such propositions are true.

Article VII: On Denominative and Denominating Terms

Denominative and denominating terms do not seem to differ from concrete and abstract, as Scotus indicates (*in 4 Sent., d. 12, q. 3, §. Ad principales rationes, AA*), citing (*1 Sent., d. 5, q. 1*) where he treats abundantly of concretes and abstracts.

Therefore what we showed concerning those in the preceding article need not be repeated here. I only touch upon what requires some explanation, so that the technical terms of the Philosopher may be fully illuminated for us.

Now these three — the denominating, the denominated, and the denominative — are in some way distinguished from one another. For the denominating is the form that denominates the subject in which it is: as whiteness inhering in a wall denominates that wall as white. The denominated is what has the denominating form in itself: as a wall having whiteness is denominated white. The denominative is what is predicated of its subject: as "sweet" is predicated of sugar, for "sugar is sweet" is well said. Bonet and Orbellus add (*3 Met., q. 1*) that the denominating, the denominated, and the denominative are denominated by the same name, yet differ in that the denominative has the name of the formal effect, while the denominating retains for itself the name of the form. A denominative term can be divided into substantial — what is denominated from a substantial form, as "man" from humanity — and accidental denominative — what is denominated from an accidental form, as "white" from whiteness. Scotus intimates this partition of denominatives (*q. 15 of the Categories, §. Per idem ad 2 argumentum; and in 4 Sent., d. 12, q. 1, §. Ad argument. I; and Quodl. 18, §. De primo, sub C*).

Furthermore, three kinds of denominatives are commonly distinguished, excellently explained by Major in the present context, namely: denominatives in name only, denominatives in signification only, and denominatives in name and signification together. Denominatives in name alone are those one of which is derived from the other only according to name, as "study" and "studious" — as the Doctor notes (*q. 36 of the Categories, §. Circa notificationem*). For "study" designates diligence and labor, while "studious" designates a lover of virtue. Denominatives in signification alone are those one of which is derived from the other according to signification alone, as "virtue" and "studious." Denominatives in name and signification together are described by Aristotle (*in the book of the Categories, c. 1*) and by Scotus (*in the place cited above; and q. 8 of the Categories*): "Whatever things have their appellation from something else, differing only in case according to name" — as "Logic" and "logician," "Philosophy" and "philosopher." The parts of this description are explained as follows. "Whatever things from something else" — that is, from an abstract name, as "just" from "justice." "Differing only in case" — that is, in final ending: for they begin with the same syllables and end differently, as "sweetness" and "sweet." Or as Scotus says (*ibid.*), the case of denominatives can be either as accident to subject, or as form to suppositum of the same nature: whence arises a double denominative predication — essential and accidental — to be explained in the following question, a. 1. "Have their appellation according to name" — that is, they are derived, as is abundantly clear in the examples given above.

One objects, first: what is not outside the essence of the thing denominated is not a denominating form, since denominatives are those denominated from some accidental form, as Arriaga thinks (*disp. 10, sect. 2*). But the substantial form is within the essence of the thing denominated — as humanity is within man. Therefore there is no substantial denominative. One replies by denying the major and the alleged description of denominatives: for just as there is a double form — substantial and accidental — and a double denomination — intrinsic and extrinsic — so also there is a double denominative — substantial and accidental, as is clear from the Doctor (*in 1 Sent., d. 32, q. 2, §. Contra, sicut*); and the description of denominatives adduced from Aristotle is adapted to both, since the common character of them prescribes from each.

One objects, secondly: denominatives are those that differ only in case, as is clear from the said definition of them. But, for example, "white" and "whiteness" are denominatives, and yet they differ not only in case but also really. Therefore denominatives are not well described as those that differ only in case. One replies: the major being conceded, the minor is to be denied. For "white" and "whiteness" indeed signify the same thing, but differ in the mode of signifying — as the Subtle Doctor writes of any concrete and abstract term (*in 1 Sent., d. 27, q. 3, §. Ad 2 q., L*).

Article VIII: On Common, Universal, and Singular Terms

A common term, taken universally, is one that is adapted to many — as human nature belongs to many individuals, and the divine nature to three Persons. That one common thing belongs to many is transmitted by the Philosopher (*7 Met., c. 13*) and, following him, Scotus (*in 1 Sent., d. 1, q. 3, §. De secundo principali, B*), with whom agree Saint Bonaventure (*in 1 Sent., d. 5, in dubiis litteralibus*) and Gabriel (*ibid., d. 25, q. un., art. 1*); and it is clear from the very force of the name. A universal term is one apt to be predicated of many — as genus and others, on which see below (*q. 3, art. 1 of this book*). A common term is broader than a universal: for every universal is common, but not conversely. For according to Scotus (*in 2 Sent., d. 3, q. 1, §. Sed contra istud, I; and 7 Met., q. 16*), there are real common natures on the side of the thing that are not formally universal except through the work of the intellect. Likewise the divine essence is indeed common to three Persons, yet is not universal but is of itself singular — as Scotus holds (*in 1 Sent., d. 1, q. 2, §. Per hoc ad argumenta, E*). Furthermore, among common terms some are more common and others less common — namely superiors and inferiors, one of which can be predicated of the other, the more common of the less common. Thus "substance," which is a more common term than "body," is predicated of body itself — as "body is a substance" — but not conversely: "every substance is a body" — for God and Angels are indeed substances but not bodies.

Not far removed from those just enumerated appear to be the exceeding and exceeded terms, one of which can neither be universally affirmed nor universally denied of the other — as "animal" and "white": for not every white

thing is an animal, nor is every animal white; only "some animal is white" and "some white thing is an animal" are true. Nor does the collective term — also called by some the copulative term — appear to be removed from the common term. For it designates many things aggregated together, as "Rome, Avignon, Aix." On the other hand, a non-copulative term is one that does not signify many things aggregated together, as "king," "duke," "soldier."

A singular term — called "individual" by philosophers and "proper" by grammarians, as the Author of the *Speculative Grammar* observes (c. 7) — is one that is predicated of one alone. Four kinds of singular term are enumerated: determinate, vague, demonstrative, and from supposition. A determinate singular is one that signifies some one thing certainly and determinately, as "Peter." A vague singular is one that denotes some one thing indeterminately, as "a certain man" — and the Doctor explains it (*q. 12 of the Categories; and in 3 Sent., d. 24, q. un., §. Alia est opinio, sub A*). A demonstrative singular is one to which a demonstrative pronoun is prefixed, as (*Matthew 21*): "This is Jesus the Prophet from Nazareth." A singular from supposition is one that signifies only one thing hypothetically, as "son of Abraham" is understood of Isaac, and "son of the Blessed Mary" is understood of Christ. Again, if a common noun is taken with a singular, it is rendered singular — whether in the direct case, as "the city of Nice," or in an oblique case, as "the horse of Alexander." More on these things is elegantly and learnedly set out by Titelmanus (*l. 1 of the Dialectical Consideration, through six complete chapters*).

One objects, first: Aristotle (*8 Ethics, c. 10; 3 Politics, c. 1*) writes that the republic is the genus of many species; and (*1 De Caelo*) that the world is the lowest species — yet it is obvious to all that genus and species are universal terms, while the republic and the world are collective terms that receive the character of a common term. Therefore the term is wrongly divided into common and universal. One replies that "universal" is used in two ways: first, broadly, in which sense universal and common do not differ — as the Stagirite intimates (*4 Met., c. 5*), saying that the species of the one are as many as the species of being, since neither being nor its properties are properly universals according to universal doctrine, to be explained more below (*q. 3, art. 1*); and second, narrowly — and in this sense their distinction is clear through their foregoing descriptions, to be examined more accurately in the place just cited.

One objects, secondly: the name "Francis" belongs to many who are distinguished by that name — yet "Francis" is a determinate singular term, as I said above, and the Doctor indicates (*q. 11 of the first Prior Analytics, §. Notandum*). Therefore a common term coincides with a singular one, or its foregoing description is inept. One replies by distinguishing the major: according to the name — I concede; according to the thing signified — I deny. For "Francis" designates determinately this man, to whom plurality is repugnant. Therefore

not without reason could a common term be distinguished into equivocal and univocal, as the foregoing distinction intimates, for dissolving the objection.

One objects, thirdly: if a common term is one that is participated in by many, then "God" would be common, since it is communicated to three Persons. But God is singular, according to (*Deuteronomy 32*): "See that I alone am, and there is no other God beside me" — and it is demonstrated in (*Met., l. 4; and in the Treatise on the One God, q. 1*). Therefore it seems that the common term was not well described above. One replies: the major being conceded, the minor is to be distinguished. "God is singular, insofar as it cannot be divided into subjective parts" — I concede. "God is singular insofar as it cannot be communicated to many supposita" — I deny. For He, though singular, is common to three Persons on account of His infinity, as the Eagle of the Scholastics teaches above all others (*in 1 Sent., d. 2, q. 4*), and from there adducing reasons derived from the principles of Metaphysics and Theology to establish this — which I have expounded abundantly in (*Tract. on the Triune God, disp. 1*).

Article IX: On Convertible and Other Terms

Scotus (*1 Prior Analytics, q. 14, §. Alio modo, toward the second case*) and Major (*l. 1 of the Terms, col. 3*) recount convertible terms — those that can be universally affirmed or denied of one another. For example, "man" and "risible": "every man is risible," and "every risible thing is a man." Likewise the Doctor (*in 4 Sent., d. 8, q. 1, §. Ex his, H*) and Sarnanus (*in his exposition of the Universals, p. 95*) mention synonymous terms, which under different names signify the same thing — as "Peter," "Cephas," "sword," and "blade" — and Augustine touches upon this (*l. 20, Against Faustus, c. 12*). These terms have a great affinity with the convertible ones, in that just as the latter can be mutually predicated of one another, so too can the former — though they differ in that synonyms have the same signification, while convertible terms do not. Nor do those that are called pertinent terms seem to differ much from these — terms of which one implies another, as "man" implies "animal" and "animal" implies "living"; or one is really identified with another, as "risible" and "capable of weeping."

Others are impertinent or disparate terms — those that neither imply each other nor have any affinity with one another — as "white" and "musical," from Aristotle (*4 Met., c. 14*) and Scotus (*q. 10; and in 1 Sent., d. 7, q. un., §. Ad argumenta, Q; and d. 11, q. 2, §. Contra istam opinionem, sub D; and in 4 Sent., d. 12, q. 2, §. Ad argumenta, L*). Some terms are repugnant — those that cannot be simultaneously predicated of the same thing at the same time, as "wise" and "unwise." These are of four kinds: contradictory, contrary, privative, and relative. Contradictory terms are those of which one negates the other, as "man" and "not-man." Contrary terms are those that mutually exclude one another from the same subject, as "heat" and "cold." Privative terms are those of which one designates the absence of the other in a suitable subject, as "seeing" and "blind." Relative terms are those said in conversion, as "teacher" and "disciple."

Since among repugnant terms some are positive, some negative, and others privative, such terms must be explained, as well as the distinction that lies between negation and privation. A positive term — which the Doctor touches upon (*in 1 Sent.*, d. 17, q. 5) — is one that signifies something real that is said to be on the side of the thing, as "stone." A negative term is one that designates a negation in a subject that is not suited to it, as "not-seeing" with respect to a stone — of which Scotus makes mention (q. 8 of the first *Prior Analytics*, §. 2 *conclusio*). A privative term — though it was set out above in general terms — is one that denotes the absence of a form in a suitable subject, as "blind" with respect to a man lacking sight — of which the Doctor also makes mention in the place just cited. From this the distinction emerges between negation and privation, or between a negative and a privative term. For a negative term signifies no capacity for the form in the subject of which it is predicated; a privative term signifies a capacity for the form in the subject of which it is predicated — as the Prince of the Subtiles transmits (*1 Sent.*, d. 23, q. un., §. *Item arguo*, H). This is rendered plain by the examples given above.

Nor are finite and infinite terms to be passed over in silence, of which Scotus makes mention (*1 Prior Analytics*, q. 37, §. *Quantum ad 1*); nor transcendent and non-transcendent terms, which he enumerates (*in 1 Sent.*, d. 3, q. 3). A finite term is one to which no negation is prefixed, or one that determinately affirms something, as "dog." An infinite term, to which a negation is prefixed, is one that determinately denies something but determinately affirms nothing — as "not-dog" can indifferently be said of everything that is not a dog, yet is determinately predicated of none of them — of which Sacred Scripture makes use (*1 Peter 2*): "not a people of God," and (*Romans 9*): "I will call my non-people my people" — and Augustine makes mention of it (*l. 1 Ad Simplicianum*, in the solution of 2 q., at the end). A transcendent term is one that is assigned to no predicament, or — as Trombeta says (*Tract. Formalitatem*, art. 1 *principali*, fol. 9, p. 2) — one that belongs to something outside a genus; and it is deduced from the Doctor (*in 1 Sent.*, d. 8, q. 3). Tataretus adds (q. *de substantia*, dub. 3) that for a term to be transcendent it suffices that it is not a genus and has no genus above it. Six transcendent terms are commonly enumerated: being, one, true, good, something, and thing — indicated by the initial letters of the word "Reuban," as Pelbartus notes (*vol. 1 of the Rosary*, s.v. *unitas*, §. 3). Add to these God and what is predicated of God; and also what belongs to being before it is divided into ten primary genera — as Trombeta (*cited above*) writes following Scotus (*in 1 Sent.*, d. 8, q. 3, §. *Teneo*; and *in 2 Sent.*, d. 1, q. 4, §. *Ad 1 alterius*, F; and §. *Ad argumenta principalia*, sub P). A non-transcendent term is one that is placed in some one of the ten categories, as "ox," "color" — the same authors just named affirming this.

One objects, first: the dividing members do not exhaust the entire range of the divided term in "negative" and "privative": for "absence" is neither a negative nor a privative term, since it is predicated of both — just as negation of negation in general and outside a genus, as Scotus (*in 1 Sent.*, d. 13, q. un.) and Orbellus (4

Met., c. 4, q. Whether there is a return from privation to habit) affirm. Therefore the division of a term into positive, privative, and negative is insufficient. One replies by denying the antecedent, since absence, or negation taken universally, is as a genus prescinding from negation and privation taken strictly, as from its inferiors. Now what is common and superior is not numbered among the enumeration of inferiors — as will be shown in Physics when the whole controversy about motion is raised.

One objects, secondly: a transcendent term is one that wanders through all genera of things, or, more explicitly, one that is imbued in every real concept. Therefore a transcendent term is ineptly described as one that is enclosed in no predicament. One replies by denying the antecedent. For in the school of the Subtle Doctor, being is not formally included in its properties — which are plainly transcendents — nor in the ultimate differences of things, as will be clear in its proper place.

Article X: On Terms of First and Second Intention

A first intention, according to Scotus (*in 1 Sent., d. 23, q. un.*), is a known object as known — as "known man," insofar as he is known, is a first intention. For to intend — as the same Doctor notes (*in 1 Sent., d. 38, q. un., §. Respondeo, A*) — is to tend toward another; for the object tends toward the soul by moving it to knowledge of itself. It is therefore called a first intention because the object moves the intellect before it is known by the intellect itself — as Vorriolus rightly notes (*in 1 Sent., d. 23*), saying: "It is called a first intention because it tends first toward the soul or intellect, by moving it to be understood." For it is necessary, for example, that whiteness be first offered to the intellect and move it to knowledge of itself, before the intellection of that very object is elicited from it — as Scotus indicates (*q. 3 of the Universals; and in 1 Sent., d. 3, q. 7, §. Contra istam opinionem, toward: Item quomodo*). Therefore every concept of which it is natural to be made immediately from the thing, without an act of the intellect in operation, is of first intention — that is, every positive objective concept and also a negative one — as Scotus (*in the place just cited of the first Sent., §. Item arguo sic, sub G*), Gadius (*Quodl. 5, fol. 63, col. 4*), and Aureolus (*in 1 Sent., d. 23, near the end of the second article*) write.

A second intention, from the same Doctor (*ibid.*), Orbellus (*7 Met., c. 7*), and Aureolus (*ibid.*), is a relation of reason caused by a comparative act of the intellect comparing one known object with another known object. For example, if the intellect compares animal with its species, there arises a second intention called "genus"; if it compares man with its individuals, there arises a second intention called "species." It is called a second intention because it is founded upon a known object — which, from what has been said, is called a first intention: for genus is founded upon the known animal, and species is founded upon the known man. For the intellect does not compare objects with one another unless it knows them. Or perhaps because a second intention is

posterior to the first: just as the comparative act by which a second intention is generated follows upon the direct act by which a first intention is generated — this reason can be deduced from Scotus (*in 1 Sent., d. 35, q. un., near the beginning; and §. Contra secundam propositionem, G; and in 1 Sent., d. 6, q. 1, §. Ad argumenta, sub F*) — and it is plainly transmitted by the Most Eminent Cardinal Sarnanus (*Tract. on first and second intentions, art. 1, §. 2*). Perhaps for the same reason, first and second intention acquire the names of first and second imposition, or also first and second consideration, from Scotus (*in 4 Sent., d. 1, q. 2, §. Hic primo, B*): because what we first perceive and perform, we also first name; and what we perceive later, we assign names to later — as Francis Titelmanus elegantly pursues (*l. 1 of the Dialectical Consideration, c. 27*), and John Major explains more plainly (*l. 2 of the Terms, fol. 14, §. Terminus primae intentionis*), in these words: "It seems to me that one must say that terms are called of first imposition because they were imposed first in time: Adam, the first imposer, began his imposition with what was most necessary. Afterward, when the necessities of life had been accumulated, learned men proceeded to terms of the sciences in a different direction. This is clear from the beginnings of Genesis, where the first inventors of the mechanical arts are enumerated, and it squares with Aristotle's view in the first book of the Metaphysics."

One objects, first: a known object is a first intention, as is clear from the beginning of this article. But to be known is a being of reason, because it is had only through an operation of the intellect. Therefore a first intention is a being of reason — which seems to smack of falsehood. One replies to the major: a known object is a first intention fundamentally; but formally it is "as known," as is clear from its description given at the very beginning of the article. Whether a first intention is a being of reason is deferred for discussion to another place. Meanwhile let Sarnanus, recently cited by us, be consulted.

One objects, secondly: Scotus (*1 Sent., d. 23*) writes that a concept, whether positive or negative, is a first intention. But an object is a first intention insofar as it moves the intellect to knowledge of itself; now negation, since it is nothing at all, cannot move the intellect to knowledge of itself. Therefore a negative concept cannot be a first intention. One replies: the major being conceded, the minor is to be distinguished. "Formally" — I concede; "connotatively or subjectively" — I deny. For thus a blind man is known, loved, and walks — not because blindness is the reason for such operations, but because that in which such a privation is located is a subject capable of those operations.

One objects, thirdly: the Subtle Doctor (*Quodl. 1, §. De altero termino, circa K, L*) says: "A second intention is a passive comparison by which two known objects are compared with one another by the intellect." The same thing he states more expressly (*in 4 Sent., d. 1, q. 2*). The Author of the *Formalitates*, Trombeta, and others affirm this same thing in their *Tract*. But the contrary view seems to be held by the same Doctor (*in 4 Sent., d. 12*), where he calls it the active comparison

by which the intellect compares two known objects with one another; and Anthony Andreas likewise affirms this (*7 Met.*, q. 16). One replies that from a different respect the comparison is called active and passive — just as the same motion is called action and passion (*3 Physics*, Text 21). For it is called an active comparison insofar as it proceeds from the intellect comparing one known object to another known object; and a passive comparison insofar as it bears upon the known and compared objects. In the former place cited, Scotus speaks of the passive comparison; in the latter he speaks of the active comparison. Therefore there is no contradiction in Scotus's assertions, since in them he looked to different respects, on account of which the apparent repugnance is removed.

Question II: On the Properties of Incomplex Terms

Article I: On Sign and Signification

Let no ambiguity of name delay us from learning Logic, and so that the properties of terms may not in some way remain hidden from us, it pleases us to adduce a general description of sign, from knowledge of which the divisions and definitions of any signs can be grasped with ease. A sign, taken universally, is whatever represents something to a cognitive faculty — as a spoken word is a sign of a mental concept, from Aristotle (*1 Perihermeneias*, c. 1) and Scotus (*in 1 Sent.*, d. 22, q. un., §. *Potest dici, ante A, toward: Ad propositum*). With an eye to this, the Author of the *Speculative Grammar* (c. 1) adds: "A sign is a reason for signifying or representing." To signify, according to Scotus (*q. 15 of the Sophistical Refutations*), is to represent something to the intellect; and signification is the representation of some thing to the cognitive faculty. Thus Cicero uses "signification" (*De Amicitia*): "If any manifestation of virtue shines forth, to which a kindred soul may apply itself and attach itself." And Caesar (*6 De Bello Gallico*): "Let fires be forbidden, lest any signification of his approach be made from afar." Thus God signified death (*2 Peter 1*): "The putting off of my tabernacle is swift, as our Lord Jesus Christ has signified." And what was to be done (*Apocalypse 1*): "He signified it, sending through His Angel to His servant John the things that must shortly come to pass." The thing signified, or significate, is what is signified through the sign; for a sign and its significate are correlatives — and correlatives mutually regard one another, as the Doctor indicates (*in 4 Sent.*, d. 1, q. 2, §. *Ad 1 argumentum, O*).

A sign can perhaps be divided into spiritual and sensible. A spiritual sign is one that represents something spiritual to the cognitive faculty — and this can happen in two ways. Either the sign is sensible and its significate is spiritual, as (*Matthew 3*) a dove, and (*Acts 2*) a tongue of fire, designated the Holy Spirit. Likewise a Sacrament — described by Augustine (*10 De Trinitate*, c. 5), cited by Scotus (*in 4 Sent.*, d. 1, q. 2, ante §. *Hic 1*); Alensis (*4 p.*, q. 1, m. 1); and other Scholastics — as "a sacred sign" — that is, of grace, which is spiritual. This is also

plainly expressed through the definition of the Master (*1 Sent., d. 1, 4*): "A Sacrament is the visible form of invisible grace" — that is, a sensible sign. Or both the sign and the signified are spiritual — and this can also occur in two ways: either it is a known sign through which another thing is known; or it is a reason for knowing another thing, even though it itself is not known. In the first way, premises can be called a sign of the conclusion, because once they are known as its principles, the conclusion itself is known. Similarly, the rational soul can be called a sign of God (because man is made in the image of God) — knowing which, we are elevated to knowledge of God. In the second way, the intelligible species is a representative sign of the spiritual thing understood or to be understood. Scotus adduces this distinction of sign (*Quodl. 14, §. Ad ista, AA*), which Lychetus and Gadius (*ibid.*) explain excellently.

A sensible sign — from Augustine (*2 De doctrina Christiana, c. 1*), cited by the Doctor (*in 4 Sent., d. 6, q. 10, §. Hic dicitur, sub D*) — is "what, apart from the impression it makes on the senses, causes something else to come into awareness." A sign described in this way is properly called a sign. For since our knowledge originates from sense, a sign taken strictly is adapted only to what is subjected to sense — as Augustine clearly shows (*l. De principiis Dialecticae, c. 5*), saying "a sign is what presents itself to the sense and, besides itself, presents something to the mind." It was later transferred to other things that are remote from the senses — just as the Doctor declares that the name "instrument" was applied and adapted from artificial things to natural and supernatural ones (*in 4 Sent., d. 1, q. 5, §. Ad primam ergo, F*); so "sign" was taken from sensible and material things to represent spiritual and immaterial things.

Again, a sign is subdivided into natural and voluntary. A natural sign is one that signifies something by its own nature and denotes the same thing for everyone — as tears denote grief and laughter denotes joy. A voluntary sign, or sign "by convention," is one that designates something by human will and institution — as the sound of a bell is a sign for hearing Mass, a name is a sign of a thing, and the trumpet call for retreat is a voluntary sign. Scotus makes mention of this distinction of sign (*1 Perihermeneias, q. 4, §. Ad q. dicendum; and in 1 Sent., d. 22, q. un., §. De ratione huius, sub C; and in 4 Sent., d. 11, q. 3, §. Hic duo, A, post*) — following Aristotle (*1 Perihermeneias, c. 1*) and Augustine (*l. 2, De doctrina Christiana, c. 2*).

Further, a sign is subdivided into commemorative — which recalls the past to memory: as a cross is a sign of Christ who suffered, the blossoms of a fruit tree are a sign of the fruit to be born, and a significative spoken word is a commemorative voluntary sign, from Scotus (*in 2 Sent., d. 42, q. 4, §. Ad argumentum, sub O*); demonstrative — which points out what is present and existing: as the needle of a clock is a demonstrative sign of the present hour that it is actually indicating; and the circle covered with ivy leaves posted on a cross before the door of a house is a demonstrative sign of wine for sale, as Scotus

notes (*in 4 Sent., d. 1, q. 2, §. Ad 1 argumentum, O*); and prognostic — which foretells what is future: as redness of the moon foretells wind, and the morning croaking of frogs foretells coming rain. Scotus adduces this partition of sign as well (*ibid., §. De secundo principali, D*); as do Richard (*ibid., q. 3, art. 1*) and Alensis (*cited a little before*).

Finally, a sign is divided into speculative and practical, from the same Doctor (*ibid., q. 3, §. Hic quatuor, A; and §. De secundo, C*). A speculative sign is one through which a concept of the significate can be had — as the spoken word "man" signifies humanity, and smoke signifies fire. A practical sign is one that signifies that the significate is or is being done — as the touch of a hand is a practical sign of peace, and the Sacraments are practical signs of grace. A practical sign can further be distributed into certain and uncertain, or equivocal — as the Doctor just named touches upon (*q. 2*). Finally, there is a division into doctrinal and non-doctrinal sign: the latter is not used by science — such as smoke and an image; the former is very much used by science, and it is threefold: namely concept, spoken word, and writing — about which something was noted in the above.

One objects, first: the definition of sign applies to things other than what is defined. Therefore it is not a good one. The antecedent is proved: a cause known first leads to knowledge of its effect; but a cause is not a sign of its effect. Therefore, etc. One replies by denying the antecedent. For its proof, the major being conceded, the minor is to be distinguished: properly — I concede; improperly — I deny. For water is not properly called a sign of moisture, nor fire of heat, nor fever of death; nor are demonstrations from cause called demonstrations from sign, as demonstrations from effect are. Nor is God called a sign of creatures. The reason for this can be that a sign represents the significate, as is clear from what has been said; but a cause does not represent its effect in the way that an effect represents its cause, of which it is a likeness. Therefore a cause is not properly a sign of its effect — whatever some more recent authors may say. You will insist: Sacraments are signs and causes of grace, as Scholastics transmit (*in 4 Sent., d. 1, with the Master there*); and winds are signs and causes of sea storms. Therefore a cause may be called a sign of its effect. One satisfies the objection by saying with Scotus that Sacraments are moral causes of grace, not physical ones — as the objection proves. To the other point about winds, I say that properly speaking winds are not signs of sea storms, but other things are, to be explained in the *Meteorologica*.

One objects, secondly: all signs are by convention. Therefore sign is badly divided into natural and voluntary. The antecedent is proved: all things were created by the will of God, according to (*Psalm 134*): "Whatever He willed, He made." But every sign is created; therefore it is also voluntary. One replies by denying the antecedent. For its proof, I say that this is true in the order of existence but not in the order of essence and in the objective order. For it

pleased God to produce this or that, at this or that time; yet the essences of things are not changed at His pleasure, since their ideas are in His very divine mind — as the Subtle Doctor writes (*in 1 Sent., d. 35, q. 1*). Even more so, because if the foregoing objection were of any force, no created being would be natural and necessary — which is false and absurd.

One objects, thirdly: the definition of sign given by Augustine applies to every sign, according to Scotus (*in 4 Sent., d. 6, q. 10*). For Scotus there holds that the sense posited in the definition of sign is to be taken not only for corporeal sense but also for incorporeal sense — that is, for any cognitive faculty. Therefore the definition of sign is not to be narrowed to sensible sign alone. One replies that the antecedent is true if sign is taken in a broad and extended signification; but false if it is used in its proper and original institution, as I noted above.

Article II: On Predication

Since universals and the predicaments cannot be grasped without some knowledge of predication — and since in their treatment reference is most often made to predication and subjection, especially in the universals, which dialecticians consider as predicable in what and in what kind — I shall here not improperly treat of predication before I come to universals and the predicaments. This John Major, the disciple of Scotus, does carefully and subtly (*fol. 101*), as do some more recent authors of notable intelligence and learning.

Predication is the assertion of one thing of another. Predication can be divided, from the Doctor (*1 Posterior Analytics, q. 16, §. Ad q. dr.*), into ordered or direct, and disordered or indirect. Ordered predication is when what ought to be predicated is predicated, and what ought to be subjected is subjected — and this occurs when what is superior is predicated of what is inferior, as "man is an animal"; or when what is equal is predicated of what is equal, as "man is risible." Disordered predication is when what ought to be subjected is predicated, and what ought to be predicated is subjected — which occurs when what is superior is subjected and what is inferior is predicated, as "animal is man." There may be added a predication that is beyond all order, which occurs when one extreme is not naturally apt to be predicated of or subjected to the other, as "white is sweet" and "sweet is white."

Next, predication is divided into formal and identical, according to Scotus (*in 1 Sent., d. 5, q. 1, §. Ad argumentum principale, Z; and in 4 Sent., d. 12, q. 2, §. Ad argumenta principalia, O*). Identical predication is of two kinds: one in which the same thing is predicated of itself, as "man is man" and "God is God" — concerning which Scotus treats at length (*q. 8 of the first Perihermeneias; and in 1 Sent., d. 26, q. un., §. Ad 1 tertia via, ante AA, toward: Respondeo*); and Bonet and Orbellus (*3 Met., q. 1*). The other is when one extreme is really identified with the other extreme — either both are finite, as "rational is risible"; or one is infinite while the other is not formally infinite, as "the divine essence is paternity"; or

both are infinite, as "the divine essence is goodness." The Doctor notes that Logic has not been transmitted for creatures with respect to this kind of predication in abstract terms (*1 Sent., d. 8, q. cited*). Formal predication is that in which the predicate designates the form of the subject; and since the form of the subject can be of two kinds — namely essential and accidental — formal predication is likewise of two kinds: essential and accidental, as John Vallo observes among other Formalists (*in his Lectura, fol. 194*). Essential predication — which is also called quidditative — is had when the predicate belongs to the essence of the subject, as "man is rational" — of which Scotus makes mention in the first place just cited. Accidental predication is when the predicate is an accident with respect to the subject, as "man is white" — and this is properly called denominative, as is clear from (*1 Sent., d. 3, q. 3, §. Contra istam univocationem, P*). For in it the predicate is said to be in the subject in a certain adjacency and formal inherence, by reason of which it obtains the name of denominative predication taken strictly — as Bonet notes (*3 Met.*) together with his teacher (*in 2 Sent., d. 1, q. 1, §. Ad argumentum circa I; and Quodl. 3, §. Respondeo, O; and Quodl. 8, §. De 1*).

Denominative predication, however, can be extended and broadened to much more: for denomination can be effected from something like a form in a subject — thus the soul is called human (*Quodl. 18, §. De 1, D*); or from a part of some whole, as from the genus of the species, as "man is an animal"; or from the genus of the difference, as "body is animated" — from the same cited above (*and in 2 Sent., d. 3, q. 6, §. Ad q. E*); or from an action — thus ultimate denomination belongs to the suppositum (*in 1 Sent., d. 12, q. 1, §. Ad argumenta respondetur, AA; and 4 Sent., d. 12, q. 3, §. Ad principales rationes, AA*) — where the Doctor transmits the mode of effecting other denominations besides those given. Nor do I judge to be omitted the partition of denomination into intrinsic and extrinsic, from (*1 Sent., d. 22, q. 2, §. Aliter dicitur; and d. 32, q. 2, §. Contra; and Quodl. 18, §. De tertio principali, R*). Intrinsic denomination is that through which the subject is designated as really affected by the form signified through the predicate, as "man is prudent." Extrinsic denomination is that through which the subject is denoted as not possessing the form signified through the predicate except by reason of its termination of it — as a stone is called "known" not by a knowledge existing in it but by a knowledge inhering in the intellect, terminated to the stone itself — as Sarnanus explains (*q. 9 of the Universals, p. 162*).

Again, from the same (*Quodl. 3, §. Respondeo, O; and 4 Sent., d. 11, q. 3, §. Ad rationes, FF*), there is per se predication — when the subject includes the predicate, or when the subject is per se one as to concept (*Quodl. 3, §. Respondeo, O; and in 2 Sent., d. 3, q. 6, §. Ad q. ergo, E; and in 3 Sent., d. 22, q. un., §. Sed quid Logice, sub M*); and per accidens predication — which occurs when the predicate does not belong to the essence of the subject or does not follow its essence — on which I shall treat at length (*l. 5, art. 6, q. 3*). Nor do I judge anything needs to be added to them, since this division coincides with the division by which

predication is distributed into essential and accidental, which I explained carefully above. Concerning the modes of per se predication, however, I do not here treat, deferring what must be said about them to the place just cited.

One objects, first: every form can denominate the subject in which it is, from (*Quodl. 3, §. Respondeo, sub P; and 1 Sent., d. 11, q. 1, §. Ad argumenta, AA*). But an essential form is in what it essentially constitutes in being. Therefore it can essentially denominate it — and so there seems to be no difference between essential predication and denominative predication. One replies with Scotus (*Quodl. cited*) that denominative predication taken broadly comprehends both essential predication and denominative predication properly so called — although "denominative" is properly said when the predicate is outside the formal and essential character of the subject, as "man is risible," or "wood is white," or "man understands." As to why a relation is in the divine essence but does not denominate it, see Scotus (*cited above*) and Gadius there.

One objects, secondly: an essential form is essentially predicated of that of which it is the form, whether in the direct case — as "man is animated" — or in the oblique case — as "man has a soul." But the soul is the form of the body, described as (*2 De anima, Text 70*): "the first act of an organic body having life in potency." Therefore the soul is essentially predicated of the body. But Scotus in the places cited above in the first objection says this is an accidental and denominative predication — "body is animated" — while he says the following is formal essential and in the first mode of per se predication: "man is animated" — as is also clear (*in 1 Sent., d. 8, q. 4, §. Contra istam solutionem, X*). Therefore either the Doctor is inconsistent with himself, or one of the premises is false. One replies: the major being conceded, the minor is to be denied. "Body" taken in potency is from (*4 Sent., d. 11, q. 3*). The soul, however, constitutes the body in the being of what is animated. Since body taken universally is divided into animated and inanimate as into its proximate differences — and that predication is therefore denominative and accidental, because it is the predication of a difference of the genus not actually and formally including its differences, as Scotus excellently proves (*1 Posterior Analytics, q. 20*) — for this reason, "body is animated" is not essential; but "man is animated" is maximally essential and in the first mode of per se predication, because the soul is an essential constitutive part of man himself.

One objects, thirdly: the common doctrine of the Scotists is that there are only four kinds of predication — namely formal, identical, denominative, and essential — as may be seen in Siretus, Vallo, Brulifer, Mauritius, and other Formalists (*Tract. Formalitatem*). Therefore the division into per se and per accidens predication is not fitting and not in conformity with the Scotist school. One replies: the antecedent being conceded, the consequence is to be denied. For formal predication comprehends per se predication; and denominative predication contains per accidens predication — although, as Brulifer not

negligently observes, each is sometimes used interchangeably by the Philosophers.

One says: essential predication does not differ from predication of the first mode of per se. Therefore there are not four kinds of predication. The antecedent is proved: essential predication is that through which the essential identity of predicate with subject is expressed; but through predication of the first mode of per se such identity is expressed. Therefore, etc. I say that essential predication placed in fourth position belongs to the divine order only, as the Master of the Formalitates rightly notes (*art. 3 partial of the Tract. just named*), in which there is signified consubstantiality and the origin of one Person from another, as "the Son is of the essence of the Father" — that is, the Son originates from the Father and is consubstantial with Him. Essential predication in the strict sense — which is also called quidditative and formal in the first mode of per se — is adapted to both created and uncreated things.

It remains now to treat of subjection, which is the placing of one thing under another extreme. But since subjection and predication are correlatives — and since correlatives are mutually known, so that when one is known the other is also known, according to Aristotle (*1 Categories, c. De ad Aliquid*) — having already obtained knowledge of predication, the knowledge of subjection is obtained with ease. Nor do I judge that anything worthy of note about subjection itself is to be added that cannot conveniently be gathered from what has been said.

Article III: On Supposition

Supposition, as seems to be deduced from Aristotle (*1 Sophistical Refutations*), is the position, or acceptation, of a term — and it is divided into material, which is the acceptation of a term for itself, as "man is a noun"; and formal, which is the use of a term for the thing signified. Hence it is called "supposition" because a term is substituted or subrogated for what has humanity. For just as we use brass counters in place of gold coins to reckon with — in place of the thing signified through a term, as "man" is supposed — so we use terms to signify things, as Aristotle indicates (*ibid.*) and Scotus adds (*q. 52 of the Sophistical Refutations, §. Pro solutione*), saying that a term is placed in place of another. From material supposition to formal there is no valid argument, as: "man is a disyllabic word; but Ludovicus is a man; therefore Ludovicus is a disyllabic word."

Formal supposition is subdivided into improper and proper. Improper supposition is the use of a term for the thing taken improperly — thus Christ the Lord (*Apocalypse 5*) is called "the lion of the tribe of Judah." Proper supposition is the use of a term for its proper significate; in this way "lion" is taken (*Proverbs 30*), when it is said: "the lion is the mightiest of beasts." Further, proper supposition is divided into common — which is the use of a common term, as "being" — and discrete or singular — which is the use of a singular term, as "Francis." Again, common supposition is divided into simple and personal, of

which the Doctor makes mention (*in 1 Sent., d. 21, q. un., §. Ad 1; and q. 13 of the Categories*). Simple supposition is the use of a term for its immediate significate, as "man is a species," where "man" is taken precisely for what has humanity insofar as it prescribes from all its individuals. Personal supposition is the use of a term for its mediate significate, as "man walks," where "man" is taken for some individual of human nature. From simple supposition to personal there is no valid argument, as Scotus exemplifies (*q. 16 of the Universals*): "animal is a genus; but man is an animal; therefore man is a genus."

Finally, supposition is divided into distributive, collective, determinate, and confused. Distributive supposition — also called copulative — is described by the Doctor (*q. 14 of the Sophistical Refutations*) as the acceptance of a common term for any of its supposita, each of which is that term itself — or, as the same Doctor touches upon (*q. 1 of the Prologue, §. In ista q. videtur, ante A*), distributive supposition is the use of a common term for its mediate significates taken separately, as "man is risible" — distributed thus: "Peter is risible, Paul is risible," and so of the remaining individuals of human nature. This supposition can occur in three ways. First, if a generic term is supposed for all species and all individuals of those species — and it is called supposition for the singulars of genera — as "animal is sensitive," which is taken not only for all species of animal but also for each individual animal, as "man is sensitive" and "lion is sensitive"; and likewise "this man is sensitive" and "this lion is sensitive"; and similarly the remaining individuals and species of animal. Second, if a generic term is supposed only for the species — and it is called supposition for the genera of singulars — as "every animal was in Noah's ark," that is, every species of animal was in Noah's ark, but not each and every individual of it; otherwise the individuals that now exist would have been in Noah's ark, which is most plainly false and ridiculous. Third, if a universal term is supposed for many singulars but not for all — and this is called accommodated supposition: thus the statement of Saint Paul (*1 Timothy 1*) is distributed: "God wills all men to be saved" — that is, all who shall be saved, as Scotus intimates (*in 1 Sent., d. 46, §. Ad 1 argumentum, B*). Similarly (*Psalms 18*): "Into all the earth their sound went out" — that is, into the principal regions of the world. From what is non-distributed to what is distributed there is no valid argument — as it does not follow: "every man is an animal; therefore every animal is a man," because "animal" in the antecedent is not distributed as it is in the consequent. Collective supposition is the use of a common term for many taken in aggregate, as "all the Apostles of the Lord are twelve" — that is, Peter, Andrew, and all the rest taken together are twelve. The Doctor makes mention of this (*1 Prior Analytics, q. 4, §. Oppositum; and 2 Sent., d. 2, q. 9, §. Ad argumenta, I*).

Determinate supposition — also called disjunctive — is the use of a common term for its inferiors to be enumerated disjunctively, by conjoining entire propositions: as "every man is just" — descending disjunctively: "John is just, or Ludovicus is just." This appears to be touched upon by Scotus (*q. 10 of the*

Sophistical Refutations, §. *Ad primam q.*). Confused supposition — also called disjunct — is the use of a common term for its inferiors to be referred to confusedly, by conjoining only the terms: as "an eye is necessary for seeing," where "eye" is supposed for some eye, whether right or left — and in this the latter differs principally from the former, because the former supposes one or another determinately, while this latter supposes one or another indifferently. The Doctor cites both suppositions (*in 1 Sent., d. 3, q. 3, §. Contra istam univocationem, S*).

Against this common doctrine, new and recent authors have come forward — by name Hurtado (*disp. 2 of the Summulae, sect. 6*) and Arriaga (*ibid.*), imitating the Nominalists (as Mastrius and Bellutus observe (*1 p., Institutionum, Tract. 1, near the end of c. 10*)) — who affirm that supposition is the position of a spoken word in place of a concept in order to manifest that very concept. But their opinion is neither to be approved nor received. First, it is opposed to Aristotle (*cited at the beginning of this article*), who plainly transmits that we use names in place of things, and who plainly expounds that supposition is the subrogation of a thing. Next, names were invented to signify what the speaker intends to signify to the hearer, as is deduced from (*1 Sent., d. 21, q. un., §. Potest dici, ante A*); but the speaker strives to signify to the hearer the things themselves, and not the concepts, as I will show elsewhere. Therefore supposition is the substitution not of a concept but of a thing.

Hence Arriaga does not appear to speak consistently: for he says there, with Hurtado, that supposition is the subrogation of a concept; yet in (*disp. 13, sect. 2*) he adds that spoken words are chiefly significative of things, not of concepts, since the spoken word "man," for example, is not supposed for the concept of man but for one having humanity, and only the spoken word manifests the concept. But if the name "man" were subrogated in place of the concept of man, and the spoken word "white" in place of the concept of white, this proposition would be false: "man is white," because the concept of man is not the concept of white, and conversely. Add that it is for those things that we debate and reason about that terms are substituted — yet we do not debate about concepts but about things. Again, as Aristotle teaches (*1 Perihermeneias, c. 1*), spoken words are signs of concepts; therefore they are not their suppositions — since signification and supposition differ from one another, as Hurtado himself also notes (*cited above*). Wherefore what the same author heaps up falls apart — those things prove only that spoken words are indeed manifestative signs of concepts, not suppositional ones, as he contends. Further, the partition of supposition into proper and improper clearly makes evident our contention, since each is supposed for a thing, as was shown by examples given near the beginning of this article. Moreover, the same Hurtado (*sect. 3, at the end, §. 16*) says that personal supposition is taken from the person, according to what is in that person. Therefore according to Hurtado, supposition absolutely is not the subrogation of a mental concept. And Arriaga (*n. 46*) adds that "Peter" signifies an entity on

the side of the thing — therefore according to Arriaga himself, supposition is not the substitution of a mental concept.

One objects, first with Hurtado (*sect. 3, §. 14, 15*): in this proposition "Peter is a subjectible individual," the spoken word "Peter" supposes simply; and in the other "Peter runs," the name "Peter" supposes personally. But both have the same immediate significate. Therefore the distinction of simple supposition from personal is not derived from the immediate and mediate significate. The minor is proved: "being an individual subject" does not belong to Peter according to his person, or as others say, from the side of the thing, but through the work of the intellect. The major is denied — which he does not prove; for "Peter" always supposes personally and always obtains only the mediate significate, as Arriaga frankly concedes (*disp. 1 of the Summulae, sect. 6, n. 46*).

One objects, secondly: there is no common, immediate, and proximate significate, since all things are singular and universals exist only through the work of the intellect. Therefore the distinction of supposition into simple and personal must be derived from elsewhere than from the immediate and mediate significate. The antecedent is denied — for in our Logic questions (*l. 2, q. 1*), we clearly and abundantly show that real natures exist without any intellect conceiving them.

Article IV: On the Ascent and Descent of Terms

That supposition and its species may become more evident — especially the last four enumerated in the preceding article — it pleases us to investigate what the ascent and descent of terms is, and how many kinds there are. Ascent, taken universally, is described as a movement from lower to higher things — as when one mounts from the ground to the top of a building; descent, on the other hand, is a progression from higher to lower things — as when one descends from the summit of a house to its lowest foundation. Each is metaphorically applied to terms.

The ascent of terms can be defined as the progression from sufficiently enumerated particular terms to the universal term — or also from less universal to more universal — as "Peter and Andrew, and all the rest together, are the twelve Apostles of the Lord," from which it is rightly deduced: "all the Apostles of the Lord are twelve." This the Doctor touches upon (*in 2 Sent., d. 1, q. 9, §. Ad argumenta, I*). Descent, on the other hand — which the Doctor mentions (*q. 13 of the Categories, §. Sed tunc videtur, toward: Contra*) — is described as the procession from the common or universal term to the particulars, as "every man is risible; therefore Paul is risible, and John is risible," and so of the rest.

According to the four kinds of supposition, there are likewise four kinds of descent: copulative, copulated, disjunctive, and disjunct. Copulative descent is that by which we proceed from the common term to the particular propositions to be enumerated simultaneously through a copulative particle — as "every man

is sensitive," from which distributive descent is effected: "Peter is sensitive, and Andrew is sensitive," and so of the others. Copulated descent is that by which we proceed from a common term to the individual terms to be counted simultaneously through a copulative particle — as "all the predicaments are ten," from which one descends copulately: "substance, and quantity, and quality, and the rest taken together are ten." Disjunctive descent is that by which a transition is made from the common term to the particular propositions to be enumerated through a disjunctive particle by determining their subjects — as "every man is just," from which one descends disjunctively: "John is just, or Francis is just, or Anthony is just," and so of the rest. Disjunct descent is when from the common term one makes a step to the particulars to be referred to confusedly through a disjunctive particle — as "a horse is necessary for riding," from which one descends disjunctly: "this or that horse is necessary for riding," and so on. What I said about the fourfold number of descent is likewise to be affirmed of ascent, since they begin and end from mutually opposed terms — and of opposites there is the same reason and discipline, as Aristotle writes together with the common view of Philosophers (*4 Met., c. 2*).

One objects, first: we descend from a common term to particular terms, as is clear from the description of descent given above; and common terms are distributed for all their inferiors. Therefore, since God and whatever is predicated of God is contained under being, it follows that all proper predicates of God can be naturally known by us — which Scotus denies (*q. 1 of the Prologue*). One replies from the Doctor just cited (§. *Ad 1, ante V*) that this is true of terms common to the subject, but not of proper terms derived from proper principles — as Scotus acutely shows there, and as we have pursued at length (*in the Summa Theologica, tract. 1, disp. 1*).

One objects, secondly: of any given thing, either an affirmation or a negation is true, from (*4 Met., c. 4*). Therefore it is permissible to descend under the predicate and the subject of a universal affirmative proposition — which the Doctor cited above denies. One replies: the antecedent being conceded, the consequence is to be distinguished: under a predicate suppositing by determinate supposition — I concede; under a predicate suppositing by confused supposition — I deny. For it does not follow of any given contradictory that some part is true; it only follows that this or that part is true, as is clear from the confused supposition explained in the preceding article.

Article V: On Status and Distraction

Status is the use of a term for the time signified by the verb, as Scotus touches upon (*1 Perihermeneias, q. 9, toward: Ad oppositum*) — and this occurs when a verb is used for only one difference of time. Three kinds of status are enumerated according to the three differences of time — namely past, present, and future. The first status concerns present time, as is clear in this proposition: "man is learning," where "is learning" is taken only for men existing now. The second

status concerns past time, as "man has learned," where "has learned" is used only for those who in elapsed time were applying themselves to study. The third concerns future time, as "man will learn," where "will learn" is taken only for those who will hereafter apply themselves to study. Scotus enumerates these three states and differences of time (*1 Perihermeneias*, q. 11, §. *Ad quartum*, toward: *Ad 2 propositionem*). And at the beginning of the same paragraph he says: "a common term in any proposition, whether of present, past, or future, supposes for whatever supposita, whether existing or non-existing." To preserve status it is necessary that the verb hold the status of its supposition — otherwise, if something is added, either distraction or other properties of terms explained below arise. Furthermore, status also applies to what is adjacent, provided only that those things are understood which proceed from the action signified by the verb — as "wood is being burned," where "is being burned" is taken only of wood that is undergoing combustion. If it is otherwise, status does not hold — as when the Philosopher treats of natural things, where natural things are not to be taken only for those that now exist but absolutely for all, with no difference of time intervening, as the Doctor indicates (*ibid.*). Note further that every subject of an affirmative and present-tense proposition, whose predicate cannot belong to the subject unless its very existence is presupposed, has the status of present time — of which the Doctor makes mention (*q. ult. of the first Perihermeneias*): as "every man is healthy," where the verb of the said proposition is taken only for men now existing, who alone can enjoy health. But if the predicate does not presuppose the existence of the subject, then not status but distraction — which is opposed to status — is produced.

Distraction is the use of a term for a time other than that signified by the verb — as (*Matthew 11*): "the blind see, the deaf hear," etc. For in these propositions there is distraction, because the sense of these propositions is: "those who were blind see, and those who were deaf hear," and so of the rest — as is clear from (*Romans 4*): "who justifies the impious," where Augustine says: "who makes the impious pious." Some things about the distracting determination are written by the Doctor (*in 1 Sent.*, d. 36, q. un., §. *Contra istud*, E; and *in 3 Sent.*, d. 22, q. un., §. *Ad 1 principale*, R, at the end) and by Anthony Trombeta (*Tract. Formalizatum*, parte 3, fol. 47).

One objects: status is the acceptation of a term for the time signified by the verb; but distraction is also the acceptation of a term for the time signified by the verb. Therefore status and distraction are not distinguished from one another. The major is clear from the definition of status. The minor is urged by persisting in the examples given above to explain distraction — namely "the blind see, the deaf hear." For in these the difference of present time is signified, as the verbs "see" and "hear" denote. One replies: the major being conceded, the minor is to be denied. For its proof, I say that these terms "blind" and "deaf" are not taken for the time which is co-signified by their verbs, since those are taken for past time, while the said verbs designate present time.

Article VI: On Ampliation and Restriction

Ampliation — as Scotus intimates (*in 2 Sent., d. 2, q. 9, sub I*) — is the extension of a term to more differences of time. Four kinds of ampliation are enumerated. The first concerns present and past time — as "one who is disputing walks": the participle "disputing" is amplified, and the sense is "who is disputing or was disputing walks." The second concerns past and future time — as "a living being will die": thus "living" is amplified — namely, "who lives or will live will die." The third concerns past, present, and future — as "one who is born will die" — that is, who was born, or is being born, or will be born, will die. The fourth concerns past, present, future, and possible — as "man is an animal" — that is, man who was, is, will be, or is possible, is an animal. The Doctor treats more on these matters subtly (*1 Prior Analytics, q. 17, §. Quantum ad 3; and §. Quantum ad 4; and in the same work, q. 16*).

Hurtado (*sect. 8, disp. 2 of the Summulae*) writes that ampliation is to be used when the terms of a proposition signify things impossible for the time signified by the verb — as "a just man has sinned," in which proposition there is not this sense — namely, "the just man as just has sinned," because justice and sin cannot simultaneously remain in the same man — but the sense is: "he who is just has sinned." But this, besides being opposed to the current of the Summulists, does not seem to me to conform to truth. For true ampliation is grounded in more times than the truth of the copula requires — as is clear from (*2 Sent., d. 2, q. 9*) cited at the beginning of this article — whereas according to Hurtado the copula is loosened to one time and the predicate to another. Therefore Hurtado's reasoning lacks truth. Moreover, if this were admitted, it would not be ampliation but rather mutation and variation — for a transition is made from one sense to another, and a sophism could be committed from the divided to the composite sense, as Hurtado himself notes (§. 48 of the cited place). Again, restriction is opposed to ampliation, as the Summulists commonly teach — yet according to Hurtado himself, restriction is a narrowing from greater to lesser signification. Therefore, by the opposite, ampliation is a dilation from lesser to greater signification according to more differences of time — and so restriction restrains and ampliation dilates the signification of a term.

Restriction — which Scotus mentions (*at the end of q. 16 of the first Prior Analytics*) — is described as the constraint of a term, and can be effected in many ways: first, by the addition of an adjective, as "a learned man is honored by many"; second, by the apposition of an adverb, as "Scotus disputes subtly"; third, by a broader expression leading to a narrower and less common one, as "the Apostle Paul" and "the city of Rome"; fourth, by oblique cases, as "this is a young man of good character." Two canons of restriction are enumerated: the first is that a restricted term supposes according to the measure of what restricts it — as "a prudent man avoids many evils," where the word "prudent," which is the restricting term, is adapted only to those who shine with prudence and supposes

for them alone. The second is that if the verb designates a contingent connection, the supposition will be only for those to whom the signification can belong — as "a white man walks," where walking is accommodated only to those who are affected by whiteness. But if the verb presents a necessary connection of subject with predicate, the supposition and ampliation will be not only for the present but also for the past, future, and possible, as I was saying above. From a non-restricted term to a restricted one the argument holds affirmatively — as "man is mortal; therefore a just man is mortal." From a restricted term to a non-restricted one the argument holds negatively — as "a prudent man does not speak rashly; therefore not every man speaks rashly."

Alienation and diminution do not seem to differ very greatly from restriction. Alienation is described as the use of a term from its proper to an improper signification — as "a painted man is sold," where "man," by the addition of the word "painted," is transferred from the signification of a living man to the signification of a painted man, who by Aristotle (*1 Categories, c. 1*) and Scotus (*ibid.*) is equivocally a man. In alienated terms, a consequence from one to another does not hold — as "he is a painted man; therefore he is a man," because "man" uttered absolutely supposes for a true man. Diminution is the use of a term to which the expression "in a qualified sense" has been appended — that is, diminution is the acceptance of a term that of itself is indeed supposed absolutely, yet through the addition of another word is supposed in a qualified sense — as "an Ethiopian is white as to his teeth." Scotus makes mention of this (*q. 51 of the Sophistical Refutations; and in 1 Sent., d. 36, q. un., §. Contra istud obijcitur*). In diminished terms, a consequence from one to another does not hold — as "an Ethiopian is white as to his teeth; therefore an Ethiopian is white." Likewise Scotus (*cited, in 1 Sent., sub L*) adds that the consequence does not hold: "Homer is in opinion; therefore Homer is." And Boethius also taught this (*in the book of the Perihermeneias*), saying: "it does not follow: Homer is a poet; therefore Homer is" — as the Doctor also notes (*at the end of q. 23 of the Perihermeneias*).

One objects: a necessary proposition prescribes from all difference of time, as "every man is rational." Therefore in it there is no ampliation — and so the fourth ampliation enumerated at the beginning of this article is removed. The antecedent is clear because a necessary proposition is said to be of everlasting truth, because between its subject and predicate an indissoluble connection intervenes, as we shall say (*in our qq. l. 4, q. 4, art. 2*). One replies that a necessary proposition is indeed not presupposed for any determinate difference of time — yet it can be said to be amplified to every time, even possible time, insofar as it is true both of those who existed, exist, and will exist, and of those who are possible to exist — as Scotus transmits (*1 Prior Analytics, q. 16, §. Notandum igitur*).

Article VII: On Appellation

Appellation is that through which one spoken word denominates another; or, appellation is the application of one significate to the significate of another. The

Subtle Doctor provides an example (*1 Perihermeneias, q. 11, ante §. Ad quartum*): "Peter is a good lutenist," where the word "good" falls not upon Peter but upon "lutenist"; and it is signified that Peter is rightly skilled in the art of playing the lute — just as those are (*Apocalypse 14*): "playing on their harps." Adjective nouns and participles appellate — that is, they are appellative terms; while substantive nouns and their cognates are appellated — that is, they are appellated terms. An appellative term is selected according to its formal significate, and an appellated term is sometimes taken according to its material significate. For this reason a double appellation is established: one according to formal significate — which occurs when one term denominates the formal significate of another, as "man is wise"; and another according to material significate — when namely one term denominates the material significate of another, as "a musician is a builder": in this proposition it is designated that the material subject of music is also the subject of the building art.

In recognizing appellation, a sign and usage are of great assistance. If numeral nouns are joined to substantives, they appellate the material significate — hence in the divine order, the Father and Son are not called "two spirators" but "one spirator," because there is only one formal significate of theirs — namely the one power of spirating in both. But if the same numeral words are appended to adjectives, they appellate the material significate — for which reason the Father and Son are called "two spirating persons," and the three divine Persons are said to be "three creating." All this Scotus teaches more acutely and explicitly than the other Scholastics (*in 1 Sent., d. 12, q. 1, §. Iuxta q. istam, X; and in the Reportata of the first Sent., same dist., q. 2, §. Ad quaestionem dico*).

Whenever adjectives occur in any expression, since they are dependent, and one dependent thing cannot terminate the dependence of another dependent thing, they are terminated to something independent — namely a substantive — which is thereby denominates. For just as on the side of the thing, ultimately an accident requires some subject in which it inheres and which it denominates — as quantity denominates the quantum and quality denominates the quale — so too in speech an adjective, which is dependent, is terminated to the substantive, which is independent. If there are two adjectives, since they are both dependent, neither terminates the dependence of the other. Therefore when we say "two spirating persons," both "two" and "spirating" are adjectives requiring a substantive to terminate their dependence and their signification per se, or in the suppositum — and so they are named "two supposita spirating" and "two persons spirating." But they are not called "two spirators," because "two" is an adjective and "spirator" is a substantive — and duality is placed around the principal significate of "spirator," which is the principle of spirating — and it is signified that the power of spirating is multiplied in the Father and the Son, which is false and erroneous.

One objects: the Father and the Son are two spirating persons; therefore they are two spirators. The antecedent is clear from what was just conceded; the consequence is proved: the singular implies the singular — for it holds: "he is spirating; therefore he is a spirator"; and likewise the plural implies the plural — and so, since "two spirating persons" is conceded, "two spirators" should likewise be conceded. One replies: the antecedent being conceded, the consequence is to be denied. For this follows when the formal significate is plurified in each — as "there are two men; therefore there are two animals." But when it is not, it does not hold — as "there are three divine Persons; therefore there are three Gods" — as the Doctor admirably notes (*in the Reportata cited*, §. *Ad rationem dico*, at the end). Much more on these matters I wrote in (*Tract. on the Triune God*, disp. ultima, on the Holy Spirit).

Question III: On the Universals

To the treatment of simple terms belong the universals, or predicables, which Porphyry carefully examines in his *Isagoge*, enumerating the second predicamental intentions — because he prepared and directed it for the book of Aristotle's *Categories*, as Anthony Trombeta rightly notes (*in his golden Tract. Formalizatum*, art. 1 principali, fol. 9, p. 1). Since, however, the treatise of incomplex terms is expressed in two books — one on the five universals, the other on the ten predicaments — as Francis Titelmanus diligently observes (*in the preface of the first book of the Dialectical Consideration*) — it therefore pleases me to examine them individually in these two final questions.

Article I: What the Common and the Universal Are

What a common term is, what a universal term is, and the distinction between them is clearly established from what was said (art. 8, q. 2). I now adduce two definitions of the universal, of which the first is read (1 *Perihermeneias*, c. 5): "A universal is one apt to be predicated of many" — as "man" with respect to Peter, Paul, and the other individuals of human nature. The second is found (7 *Met.*, q. 15, 1, 45): "A universal is one apt to be in many." The first is called the logical universal; the second is called the metaphysical universal. Both together appear to be indicated by Aristotle (1 *Posterior Analytics*, c. 8, Text 63): "A universal is one in many and of many, not equivocal."

Three conditions a universal requires: the first is that a universal be one — that is, univocal — so that the equivocal is excluded from the character of the universal, as the Philosopher transmits (*in the place just cited*). The second is that it be apt to be predicated of many — for it is not necessary that the things of which the universal is predicated actually exist, but it suffices that they can exist, and that existence is not repugnant to them. The third is that the things of which the universal is predicated be many in the character signified by the name of the universal, and that the universal itself can be predicated of them taken together in the plural number — as "Peter and Paul are men." For this reason

God is not a universal: because although the same God is predicated of three Persons — for the Father is God, the Son is God, and the Holy Spirit is God — it cannot nonetheless be predicated of the same Persons in the plural; for it is false to say "three Persons are Gods," and true to say "three Persons are God" — as Peter Galatinus shows from Sacred Scripture, no less learnedly than elegantly (*l. 1, De arcanis fidei Catholicae, c. 2*), following Scotus (*in the Reportata cited, at the end of art. 7 of the preceding question*); and Augustine (*in Psalm 68, in the first part of the commentary; and Tract. 39 in Joan*).

One objects: a definition is among the universals, from Aristotle (*7 Met., c. 6*) and Scotus (*ibid.; and in 4 Sent., d. 1, q. 2, §. Hic primo, B*). But equivocal things have a definition, as is clear in the book of the *Categories*, c. 1. Therefore equivocal things are universals — and so the first condition of the universal is worthless. One replies: the major being conceded, the minor is to be distinguished: according to name — I concede; according to name and character — I deny. For properly speaking, only those things are defined that possess the same name and the same character — or that are per se one — as the Doctor (*cited, A*) says from Aristotle also cited (*c. 3, Text 16*) — and this will be clearer in (*l. 2, art. on definition*); and it was already made plain (*q. 2, art. 5, objection 2*). I do not here treat of the individual, which appears to be opposed to the universal, since what I wrote in the place just cited seems to be sufficient for our *Epitome* and our purpose.

Article II: How Many Kinds of Universal There Are

A universal, taken in the broadest sense, is commonly by dialecticians divided into complex — which is a proposition marked with a universal sign, on which Scotus treats (*1 Prior Analytics, q. 4*) — as "every animal is sensitive"; and incomplex — which is one something pertaining to many. This incomplex universal is constituted in five kinds by dialecticians, particularly by Mauritius Hibernicus (*in his exposition of the Universals of Scotus, q. 4*) and Sarnanus (*ibid., q. 2, p. 49*): namely universal in causing, in representing, in signifying, in being, and in predicating.

A universal in causing is described as what is the cause of many effects — as God and the sun. A universal in representing is what represents many things — as the idea of a house in the mind of a craftsman represents to the craftsman himself many houses to be built. A universal in signifying is what signifies many things — as a comet for the most part foretells many adversities for us. Universals in being and in predicating are those very things I described in the preceding article: the former pertains to Metaphysics, the latter to Logic. They are comprehended under five in number — namely genus, species, difference, property, and accident — derived from the five modes of predication, as the Doctor writes (*q. 12 of the Universals, §. Propter istas tres rationes*). For whatever is predicated is predicated either in what or in what kind: if in what, either after the manner of a part — and it is genus — or after the manner of a whole — and

it is species; if in what kind, either in what kind essentially — and it is difference — or in what kind accidentally, and this in two ways: either in what kind convertibly — and it is a property; or in what kind non-convertibly — and it is an accident.

One objects: God, who is called a universal in causing, is singular, as is clear from what was said (*ante objection of the preceding article*); and likewise the sun, which is also called a universal in causing, is numerically one. Therefore the division of the universal into the members enumerated is inept, since the definition of the universal does not fit them in the least. One replies that a universal distributed into a universal in causing and the other members previously enumerated is equivocal — and so it is not surprising if a universal in causing participates only in the name of the universal and is excluded from the proper character of the universal, as the argument rightly proves. And the same seems to have to be affirmed also of the universal in representing and in signifying.

Article III: On Genus

Among the universals, genus first presents itself — broader and more extensively ranging than the others, upon which the remaining universals appear to depend as the members of a body upon the head. Three acceptations of genus are enumerated by Porphyry (*in the Isagoge, c. on Genus*) and four by Aristotle (*5 Met., c. 28, Text 33*) — though in those three the four are comprehended on account of the affinity of one with another, which perhaps I will examine elsewhere. I now adduce the uses of genus as transmitted by Porphyry. The first is for a collection or multitude of certain things somehow related to one and to one another by a certain kind of kinship or common origin — as the race of the Hebrews, which looks back to Abraham, according to (*Acts 13*): "sons, of the race of Abraham," and (*ibid., c. 17*): "He made from one the entire race of men"; and the race of the Romans, which looks back to Romulus, is commonly given as an example. The second is for the principle of any kind of generation, whether that principle is productive or conserving — thus Adam is called the race of men, and Gaul the race of the Gauls. The third is for that under which species are subsumed — as substance is a genus whose species are body and spirit.

The first two uses of genus belong to poets — as Virgil sings: "and may God bring in the Latin race from which the Latin stock derives" — and to historians, as (*Leviticus 23*): "Whoever is of the race of Israel"; (*Numbers 13*): "We saw certain monstrous things of the sons of Enoch, of the race of giants." Pliny similarly says (*De viris illustribus*): "Pyrrhus king of the Epirotes, of maternal origin from Achilles, and paternal origin from Hercules." And orators, as Cicero (*l. 2, De natura Deorum*): "Even if one may contract the universality of the human race." The last use belongs to philosophers, by whom genus is divided into logical, physical, and metaphysical — as the Doctor intimates (*q. 7 of the Categories, §. Ad*

quaestionem dicendum) and Tataretus clearly teaches (*c. de substantia, scibile 2*), whom Sarnanus follows (*q. 1 of the Universals, p. 12*). Physical genus is transmutable matter, as Sarnanus notes there (*at the end of p. 11*). Therefore those things that are mutually transmutable are said to be of the same physical genus; while things devoid of matter are distinct in genus, according to that of the Philosopher (*10 Met., c. 13, Text 26*): "the corruptible and the incorruptible differ by more than genus" — that is, physical genus — as Scotus rightly interprets that passage (*in 4 Sent., d. 6, q. 10, M*). Metaphysical genus is one apt to be in many differing in species, as is clear from the Doctor (*7 Met., q. 18*) and Orbellus (*ibid., c. 7*); and we shall explain it when we treat of the universal in general in (*our questions l. 2, q. 1, art. 6*). Logical genus is what is predicated of many differing in species in what — as "body" is predicated in what of animate and inanimate body. Now, things that differ in physical genus can be under the same logical and metaphysical genus, as I was just noting from Scotus.

Again, from the same Doctor (*q. 24 of the first Posterior Analytics*), genus is divided into supreme, subalternate, and lowest. Supreme genus is one that has no other genus above it — or one that is so genus that it cannot be a species — such as substance, quantity, and the other highest genera. Subalternate genus is one that with respect to what is superior, or more superior, is a species; but with respect to inferiors is a genus — as "body," insofar as it has regard to substance, is a species; but insofar as it has regard to animate and inanimate, it is a genus. Lowest genus is one under which no other genus can be — as "animal." Again, from the same Scotus (*cited above; and in 4 Sent., d. 11, q. 3, §. Ad rationes ergo, CC*), genus is distributed into remote or mediate and proximate or immediate. Remote genus is one that is distant from those of which it is predicated — as "substance" with respect to man, between which many intermediates are interposed. Proximate genus is one that is immediately predicated of some things — as "substance" of body and spirit — all of which can be plainly seen in the Tree of Porphyry.

One objects: for distinct genera to be had, it is necessary that one multitude of men be distinguished from another multitude by order to one principle — as the race of the Gauls from the race of the Spaniards. But some things are called genera that do not possess such a distinction, as is clear (*Genesis 9*): "From these the race of men was spread abroad." And (*Acts 17*): "We are the race of God." And everywhere the entire species of man is called the human race. Therefore genus does not appear to have been aptly described above. One replies that there are other acceptations of genus, which I did not judge it necessary to recount above for our subject: for sometimes genus is taken for some quality — as (*Daniel 3*) it is read: "all kinds of musicians"; and (*1 Corinthians 12*): "other kinds of tongues"; sometimes for different species, as is clear from (*Ecclesiasticus 43*): "various kinds of beasts"; and (*Matthew 13*): "gathering from every kind of fish." Therefore even if the major is true in some cases, it is not in all, as is proved in the minor; and accordingly for distinguishing a common genus it suffices that some things

taken together agree in some one essential or accidental principle and differ from any other thing essentially or accidentally — as the authorities and examples just cited evidently demonstrate.

Article IV: On Species

That species is used in many ways, Vorrilonius (*in 1 Sent., d. 31*), Pelbartus (*vol. 1 of the Rosary, s.v. species*), and Mauritius (*q. 18 of the Universals*) recorded in writing following Scotus (*7 Met., c. 10 and Text 33*). First, species is taken grammatically — as a certain accidental mode of signifying a noun, in which sense species is divided into primitive and derivative, as the Author of the *Speculative Grammar* teaches (*c. 7*). Second, physically — as the likeness of a known thing in the one knowing, which is distributed into sensible and intelligible, of which Aristotle (*3 De anima, Text 18*) makes mention, saying: "not the stone but the species of the stone is in the soul"; and Scotus (*in 1 Sent., d. 3, q. 6, A; and in 4 Sent., d. 45, q. 1; and frequently elsewhere*). Or it is taken for beauty and comeliness, as the same Doctor notes (*q. 36 of the Categories, §. Quod forma habeat; and 2 Sent., d. 40, q. un., §. De 1, dico*); and it is intimated in Sacred Scripture (*Wisdom 5*): "From the greatness of the appearance of these things the Creator of them might be seen." Or for the form that is a part of a composite, as is clear (*5 Met.*) and I observed in the *Physics*, q. on form. Or for the appearance of a thing, according to (*2 Timothy 3*): "men having the appearance of piety." Third, theologically, for the divine essence — as I noted in the preceding question, art. 6, in the first reply to an objection — in which sense the Church speaks in the Prayer of the Epiphany of the Lord: "May we be led to behold the height of thy appearance." The Master (*in 1 Sent., d. 29*) and before him Saint Damascene (*1 Sentences*) plainly teach this, affirming that the divine essence is the species of the three Persons. Or for the sensible accident representing some Sacrament — thus the accidents of the Eucharist are called sacramental species, under which is designated the true and real presence of Christ's body, as is clear from Scotus (*in 4 Sent., d. 10, q. 1, 4*). Logically, species is taken for what is placed under a certain and determinate genus — and it is about species so taken that Porphyry and the other dialecticians speak in the present context.

Species is divided into subalternate — also called intercalary — and lowest — also called atomic. The first is what insofar as it looks to what is superior is called a species — as "body" with respect to "substance"; but insofar as it looks to inferiors it is called a genus — as "body" with respect to "animate" and "inanimate." The latter is so much a species that it cannot be a genus — and is defined as what is predicated of many differing in number in what — as "man" is predicated of Peter, Paul, and the remaining individuals of human nature, which differ from one another in number alone.

That the series of genera, species, and individuals may be plain — or the beginning, middle, and end of the whole edifice of the category of substance,

and by like reasoning of any other highest genus — it pleases me to adduce the Tree of Porphyry, which is as follows.

Article V: On Difference

Difference, taken universally, can be described as that by which one thing is distinguished from another — or, as the distinguished Scotist Mauritius says in his brief *Tract. Formalizatum*, difference is the otherness of extremes, or the reason for differing, by which namely one thing differs from another. In this way difference and distinction are taken indiscriminately — and what Scotus and the Scotists write abundantly and acutely about distinction seems to have to be affirmed also about difference, especially in created things. Porphyry, however, in the present context — whom the Subtle Doctor follows (*q. 23 of the Universals*) — divides difference into common, proper, and most proper. Common difference is that by which one thing differs from another by a separable accident — as Peter sitting differs from Paul standing by sitting, which is called a common accident and one separable from Peter. Proper difference is that by which one thing disagrees with another by an inseparable accident — as a raven differs from a swan by blackness, which is an accident inseparable from it. Most proper difference is that by which certain things differ from one another essentially — as man essentially disagrees with brute by rationality, which is his essential difference.

The first two are accidental differences — and they are said to make another in number (*aliud*) without constituting or distinguishing the essence and substance of the thing. The last is substantial and essential — and is said to make another in kind (*aliud*). For this reason, since the three divine Persons share the same essence in number, they are distinguished personally but not essentially. We rightly say in the divine order that the Father is "another" (*aliud*) from the Son in the masculine gender, but not "something other" (*aliud*) from the Son in the neuter gender — as Augustine notes (*Tract. 37 in Joan.*; and *ibid.*, *Tract. 45*) — for the reason just assigned: namely that the difference which makes something "other in kind" (*aliud*) is essential, and such does not exist between the divine supposita. An essential difference performs a double function — that is, it divides a genus and constitutes a species. From this arises the distribution of difference into divisive and constitutive: although they are entirely one and the same, they are nonetheless called double on account of the double respect they bear to genus and species. For insofar as it divides the genus it is called divisive; insofar as it constitutes the species, it is called constitutive. Thus "rational" is the divisive difference of animal and the constitutive difference of man.

A supreme genus has a divisive difference but not a constitutive one; a lowest species has a constitutive one but not a divisive difference; while an intermediate genus, or subalternate species, possesses both divisive and constitutive — as "animal" has the constitutive difference, which is "sensitive," and the divisive difference, which is "rational" or "irrational." From this is derived

the division of difference into generic — as "sensitive" — and specific — as "rational." And all such differences are essential, quidditative, and formal, as Scotus not obscurely signifies (*in 4 Sent., d. 11, q. 3, §. Alii concedentes, sub duplici CC*). The remaining individual differences, by which individuals are constituted in their individual being — called by the Scotists "haecceities" — are called material differences, because just as matter is more ignoble than form, so individual differences are surpassed in nobility by the aforesaid quidditative and formal forms.

Difference is described by Porphyry in three ways. First: "difference is that by which the species exceeds the genus" — which is to say, difference is that by which a species surpasses its genus — as man surpasses animal, which is his genus, by rationality, which is his difference. Man, indeed, consists of rationality, of which animal does not consist. Second: "difference is that which distinguishes the species subsumed under the same genus" — as was explained abundantly in the above. Third: "difference is that which is predicated of many differing in species in what kind essentially." This last definition is the logical one and is accommodated only to generic difference. We can transmit with Scotus (*q. 27 of the Universals*) a description of difference that befits both generic and specific difference — namely: "difference is that which is predicated of many in what kind essentially."

Why Porphyry assigned only the definition of generic difference, the reason can be given that from the definition of generic difference the definition of specific difference — and also what is common to both — could conveniently be derived, as the Subtle Doctor just cited has done. Just as from what Porphyry had already said about universals, the definitions of property and accident could be gathered — which are the fourth and fifth logical universal — although he did not adduce them. Or perhaps as Zabarella says (*in the Commentaries on 2 Posterior Analytics, Text 70*): the principal consideration of difference belongs not to the logician but to the metaphysician, as may be seen (*7 Metaphysics*).

One objects, first: a good division is binary, because it is through opposites, of which one must be opposed to another and not to two — as is clear in the case of elements and their qualities. But the foregoing division of difference into common, proper, and most proper is tripartite; therefore it is not fitting. One replies with Scotus (*q. 23 of the Universals*) that the major holds formally or reductively; and that division is reduced to binary thus: one difference is most proper, another is not — and this latter is then subdivided into proper and common.

One objects, secondly: a rule of a good division is that one member should not comprehend another, since they are opposed to one another. But in the foregoing division one difference comprehends another — for the most proper contains the proper and the common: for those that differ essentially also differ accidentally, since from the quiddity flow properties and accidents, according to

which there are proper and common differences. One replies from the same place: the major being conceded, the minor is to be distinguished. For if one of those differences is taken without precision, I concede it — since in that in which essential difference is found, the other differences are likewise present, as is well inferred by the argument. But if it is taken with precision, I deny it — since in this way one does not include another difference: for what is distinguished from another by the most proper difference is not distinguished from it, through that very most proper difference, by a proper or common difference; but it is distinguished by proper difference according to a proper accident, and by common difference according to a common accident. And so one and the same thing can disagree with another by these three differences according to distinct entities.

Article VI: On Property

Property is sometimes taken as opposed to what is improper — in which sense "man" properly signifies a living man, but improperly and equivocally a painted man, as is clear from Aristotle (*at the beginning of the book of the Categories, c. 1*) and Scotus (*ibid., q. 5*). Sometimes property is taken as opposed to what is common — as is clear from (*1 Topics, c. 4*): "No one calls something the property of a thing if it could belong to another." It is also used in this way (*2 Chronicles 6*): "From my own substance I will offer holocausts." (*Matthew 25*): "To each according to his own talent." And in Cicero (*Cato maior*): "That is the property peculiar to old age, but one common to illness." And it is enumerated by the Doctor (*q. 30 of the Universals, §. Ad quaestionem*). Sometimes it is taken for the dominion over something — in which sense it is taken by jurists who discuss property and usufruct as opposed to one another. And it is luminously indicated by the Doctor (*in 1 Sent., d. 12, q. 2, §. Per idem patet, B*): "He alone is called a proprietor who in possessing a thing depends in no way on another; while a user who in using a thing depends on another is not properly a proprietor." Moreover, Alvaro Pelayo (*l. 2, De planctu Ecclesiae, art. 56*) notes that on account of iniquity, imperial law was introduced, by which men say "this is mine" and "that is yours" and contend in court — as is found in (*C. Iure*). And Saint John Chrysostom had similarly noted before him (*vol. 1 of his works, oration on St. Philogonius*): "In heaven there shall not be that cold word 'mine' and 'yours'."

Philosophers, however, speak of property insofar as it is a passion, or natural aptitude, flowing from the essence of a thing — as Scotus (*in 2 Sent., d. 16, q. un.; and q. 30 of the Universals*) names it — and thus, following Aristotle (*4 Topics*) and Porphyry (*in the Isagoge, c. 4*), they say there are four modes of property. First, property is taken for what belongs to a species alone but not to every member of it — as being a grammarian belongs to man alone but not to every man, since not every man is a grammarian. Second, for what belongs to every member of a species but not to it alone — as being bipedal belongs indeed to every man but not to man alone, since birds also have two feet. Third, for what belongs to every

member, and to it alone, but not always — as going gray belongs to every man and to man alone, yet not always, since it happens to him only in old age. Though some animals appear to go gray, they do not properly go gray but grow grizzled, as Major (*c. de proprio, Notabile 1*) and Tataretus (*ibid., scibile 1*) affirm. Fourth, for what belongs to every man, always — as risibility, which belongs to every man, to man alone, and always to man. And this is called property in the proper sense in the fourth mode — which is reciprocated with that of which it is the property, as "every man is risible" and "every risible being is a man." Logically, property — as it is the fourth predicable — can be described as "one apt to be predicated of many in what kind convertibly" — as "risible" is predicated of this and that man and the remaining individuals of human nature, as the Doctor writes (*q. 30 of the Universals, §. Ad q.*).

One objects, first: Aristotle (*1 Topics, c. 1*) enumerates only three modes of property — namely property per se, property per accidens, and property sometimes. Therefore the fourth mode of property added by Porphyry is superfluous in the doctrine of the Philosopher. One replies that though Aristotle in the cited place mentioned only three modes of property, he did not therefore deny the fourth mode, which he expressed (*5 Topics*) — where he enumerates all four modes under different words transmitted by Porphyry: namely property per se, per accidens, in relation to another, and sometimes.

One objects, secondly: the second mode of property does not participate in the nature of property itself — for what is common to many is by no means proper, as I showed above. Therefore property is not correctly divided into the four modes named. One replies to the antecedent that the second mode participates in the nature of property not simply and per se, but insofar as it prescribes from property simply and property in a qualified sense, or from property per se and per accidens. Therefore the consequence is denied.

One objects, thirdly: not every man always laughs — for it is said that Christ the Lord never laughed; that Heraclitus wept over everything, Democritus laughed at everything, and Zoroaster was born laughing, as the Author of the *Theatrum mundi* narrates. Likewise not every man is capable of learning, as is clear of infants and imbeciles. Therefore the foregoing description of property is inept. One replies: the antecedent being conceded, the consequence is to be denied. The description of property is derived not from act but from aptitude, as Scotus excellently teaches (*q. 33 of the Universals, §. Ad q.; and Quodl. 11, §. De primo, ante C*), saying that the proposition "man is risible" is necessary and in the second mode of per se predication, while "man laughs" is contingent. The same must also be said about what is added regarding capacity for learning, whose act is impeded by the absence of the use of reason or by a disposition of the organs, as the adduced objection proves.

Article VII: On Accident

Accident, from the Doctor (*q. 34 of the Universals*), admits many acceptations. I select three that are more principal and more fitting for our subject. First, accident is taken for what rarely occurs or comes about by chance — in which sense it is called an accident for one who is digging a vineyard to find a treasure. This bears on what Quintilian says: "not to be easily moved by favorable things, nor to be broken by accidents." Second, for everything that does not belong to the essence of something — of which Aristotle (*in the Sophistical Refutations*) and Scotus (*ibid.*) make mention — and in this way clothing is said to be an accident of a clothed man, the individual of a species, and a species of a genus. According to this acceptation, accident can be divided into proper accident — such as risibility with respect to man — and common accident — such as whiteness with respect to a wall. Third, for what accidentally and contingently belongs to some subject — and it is about this that speech is being made at present. A triple definition of it is transmitted by Porphyry (*c. 6 of his introduction*). The first: "accident is what is present and absent without the corruption of the subject." Accident so described is divided by Porphyry in that place, and by Scotus (*q. 35 of the Universals; and 1 Posterior Analytics, q. 42*), into separable — such as walking for man — and inseparable — such as blackness of an Ethiopian. The second: "accident is what can belong and not belong to the same thing." The third: "accident is what is neither genus, nor species, nor difference, nor property, yet is always in a subject." A fourth may be added, proper to this place: "accident is one apt to be predicated of many in what kind non-convertibly" — as whiteness of milk, sugar, and a wall.

The first description is more celebrated and more difficult to explain — and so it must be carefully examined by us with Scotus (*q. 32 of the Universals*), principally with this distinction: the presence or absence of an accident from the subject without injury and corruption of the subject can be understood in two ways — either according to reality, or according to reason. For experience confirms that some accidents are separated from the subject without any injury to the subject itself — as is clear of whiteness with respect to a whitewashed wall. Other accidents, though they are so connected with the subject that they cannot be separated from it, can nonetheless through the intellect be separated and abstracted without the destruction of the subject itself. For since an accident does not enter into the essence of the subject, it can be understood without it — the essence of the subject remaining intact. For whether you consider blackness joined to the raven or blackness separated from the raven, you posit nothing or subtract nothing from its essence, nor do you admit anything repugnant to it. This cannot apply to property: for although property can be understood by abstractive precision without the subject from which it flows — nonetheless not by divisive abstraction, nor together with its opposite — because it flows necessarily and naturally from the essence of the subject itself. But accident can be understood without its subject by both kinds of abstraction just enumerated, and even together with its opposite, while the subject itself continues unharmed.

One objects, first: Porphyry (*cited above*) affirms that certain accidents are inseparable from the subjects in which they inhere — as is clear of the blackness of an Ethiopian, which cannot be separated from him without his corruption and destruction. Therefore the foregoing definition of accident is not accommodating. One replies by distinguishing the antecedent: some accidents are inseparable really — I concede; by reason — I deny. This distinction remains more than sufficiently explained from what was observed shortly before this objection.

One objects, secondly: a definition must be adequate to what is defined. But that definition of accident is not adequate to what is defined — that is, to accident itself. Therefore it has not been correctly given. The major is known. The minor is proved: the death of an animal and the burning of a house are accidents that cannot be without the destruction of their subjects. The major being conceded, the minor is to be denied. For its proof, I say that those are privative accidents — and the definition just cited is to be understood of positive accidents, of which a definition is properly given, as the Doctor admirably notes (*in 4 Sent., d. 1, q. 2, §. Hic primo, C*).

Question IV: On the Predicaments

Aristotle treats of the predicaments deeply and learnedly — both in the *Logic (1 of the Categories)* and in the *Metaphysics (l. 5, 6, 7, Text 14)* — as does Scotus (*ibid.*). We shall treat of the same matters, with the help of divine grace, first noting that the aforesaid book of the *Categories* is divided into ante-predicaments, predicaments, and post-predicaments — according to the partition of which this present debate of ours is arranged.

Article I: On the Ante-Predicaments

Three ante-predicaments are enumerated — namely equivocal, univocal, and denominative terms, of which I made mention (*l. 1, q. 1, art. 5 of this Epitome*), and denominatives (*ibid., art. 7*). There are furthermore two divisions and equally as many ante-predicamental rules.

The first division is into incomplex, or simple, things — which are possessed neither of truth nor of falsity, as "man," "lion" — and complex things — which admit truth or falsity: as "man is an animal" is called a true complex, and "man is a stone" is called a false complex. I mentioned this division in the place now cited (*art. 4*), and explained it abundantly there. The second division is into accident and substance. Substance is being through itself — or, as Aristotle says (*5 Met., c. 8*): "substance is a being not existing in another." Accident, on the other hand, is being in another, as will be explained below.

Substance is divided into universal and singular — and likewise accident into universal and singular. Universal substances are described by Aristotle in the present place as those "that are said of a subject" — understand, of the subject of

predication — "and are not in a subject" — supply, of the subject of inherence — as "man" is said of Peter, who is its subjective part and something inferior to it; and it is not in a subject, because, being a substance, it does not inhere in any subject. Singular substances neither are said of a subject nor are in a subject — as "Paul" is not said of a subject, since it has nothing inferior to it; for this reason it is also called an individual, because it cannot be divided into other inferiors beneath it; nor is it in a subject, since it is a substance, which, from what has been said, is a being subsisting through itself. Universal accidents are defined as those that are said of a subject and are in a subject — as "color" is predicated of this and that colored thing, and is in a subject — namely in a wall or in other colored subjects. Singular accidents, on the other hand, are described as those that are not said of a subject yet are in a subject — as "this color" is not predicated of a subject, for the same reason as we gave for singular substances; nonetheless it is in a subject, since it is being in another — namely in an apple or in paper. To be said of a subject is the same as to be predicated of a subject, whether essentially — as "man is rational" — or accidentally — as "man is fair-haired."

The first ante-predicamental rule is: whatever is essentially said of the predicate is also said of the subject — as Scotus rightly interprets (*q. 9 of the Categories*, §. *Ad q. dicendum*) — or as others say: whatever is essentially predicated of the superior is also predicated of the inferior. For example, if "sensitive," "living," "body," and "substance" are predicated of "animal," those same predicates are aptly predicated of "man," which is something inferior to "animal" itself. For higher essential predicates are included in the inferiors and are therefore rightly predicated of them. The second rule — which is recounted by the Doctor (*Quodl. 17*, §. *De tertio, sub F*; and *q. 10 of the Categories*) — is as follows: the differences, species, and individuals of genera that are not subalternately ordered are different — as may be seen in every series of any predicament, to be adduced in its proper place below.

One objects, first: certain things are neither substance nor accident. Therefore the division into accident and substance is insufficient and inept. The antecedent is most evident in the doctrine of Scotus, which admits substantial and accidental modes, as well as "thisnesses" (haecceities) and properties, as is clear (*Quodl. 1, art. 3; and elsewhere*). One replies by distinguishing the antecedent: really — I deny; formally — I concede. For in Metaphysics it will be shown that the thisnesses and properties of things are really identified with the natures of which they are properties and affections.

One objects, secondly: a definition is properly of what is positive, as Scotus teaches (*in 4 Sent., d. 1, q. 2, §. Hic primo, C*). But Aristotle here defines substance through negation, saying: "substance is what is not in a subject"; and (*5 Met., cited above*): "substance is a being not existing in another." Therefore the foregoing definition of substance is not fitting. The major being conceded, I say to the

minor that through that negation in the definition of substance is denoted the positive predicate of substance itself — which is being subsisting through itself. Or it may be said that when something is not at all manifest to us — as substance is — it is described through negation, as prime matter is described by the Philosophers (*7 Met.*) and God is described by the theologians (*1 Sentences*) — which I also not negligently noted in my *Physics*, q. on matter.

Article II: What a Predicament Is, and How Many There Are

What the Greeks call *κατηγορία*, the Latins call predicament — derived from predication, its original institution. Hence a predicament, by etymology, is the same as what is predicated of something. Although it has more than one acceptation — as Fonseca (*5 Met., c. 7, q. 1, sect. 2*) and the Conimbricenses (*q. 2 in the Categories, art. 1*) note — the more frequent use is found in Porphyry (*6 de specie*) and Scotus (*in 2 Sent., d. 3, q. 3, §. Contra istud, ante B; and q. 4, §. Contra istam conclusionem, post D, toward: ex tertia via*) — for a natural coordination of predicates and subjects of some highest genus. Thus a predicament can be described as the natural series of a highest genus, of subalternate and lowest species, and of the individuals that are under it. This is clearly seen in the predicament of substance and of the others, for which I constructed and distinguished their proper categories in their places below. Just as in the supreme court of the Gallo-Provençal province the Most Illustrious Lord de Seguiran, the most deserving First President, shines and stands out in the brilliance of the good arts, the light of outstanding sciences, and the splendor of conspicuous virtues — whom the other most distinguished Presidents and Senators, most renowned for integrity of character, learning, and wisdom, succeed in wonderful order — so in each predicament there is given a highest genus under which the remaining subalternate genera, species, and individuals pertaining to it are ordered and arranged.

Three orders are noted as being in a predicament above the others by Tataretus (*q. 1 of the Categories, dubitation 2*) — namely the direct, the lateral, and the reductive — of which Scotus enumerates the first and third (*3 Sent., d. 22, q. un., B*) and posits the second (*1 Posterior Analytics, q. 24, §. Item si rationale*). In the direct or straight predicamental line and per se reside genera, species, and individuals. In the indirect or lateral line, divisive differences have their seat. In the reductive order are placed the essential physical parts — namely matter and form — and integral parts, such as head and feet; the modes of things, such as existence; and the acquisition of a thing, and other such matters, which have no place in either the direct or indirect line.

Ten predicaments are enumerated by Aristotle, Scotus, and other philosophers — namely substance, quantity, quality, relation, action, passion, where, when, position, and habit — which are indicated by these words: "Aristotle the great, Prince of Philosophers, fatigued teaches today seated in the school crowned." The first word "Aristotle" designates substance; the second word "great"

designates quantity; and so of the rest in succession — on each of which separately there is to be discourse.

One objects: Aristotle sometimes enumerates ten categories, sometimes three, sometimes six, sometimes eight — as Peter Gassendi objects against him (*l. 1, Adversus Aristoteleos, exercitatio 8*); and what the Doctor touches upon (*1 Posterior Analytics, q. 24, §. Item si rationale; and §. Contra*). Therefore either there are not ten categories, or Aristotle involves contradictions. One replies: the antecedent being conceded, the consequence is denied — since the Philosopher in the proper places cited at the beginning of this question adduces neither more nor fewer than ten predicaments. If elsewhere he does not retain the said number, that perhaps occurs because the matter about which he was treating did not require it, and he only made mention of those that pertained to the matter under dispute — just as in the *Topics* he treats now three, now only two universals, although according to his opinion and the common opinion of the rest, five universals are conceded.

Article III: On Substance

Substance is taken in many ways from (*5 Met., c. 8, Text 14*). First, for the foundation of any thing — thus "surface" is called the substance of whiteness, because whiteness is founded and underlies in it; and faith (*Hebrews 11*), cited by the Doctor (*in 3 Sent., d. 31, q. un., §. Respondeo, A*), is called "the substance of things hoped for," because Christian religion is founded in it; and riches are called a man's substance, as (*Canticles 8*): "If a man were to give all the substance of his house," and (*Luke 15*): "dissipating his substance" — and Augustine makes mention of it (*in Psalm 68, in the first part of the commentary*) — because those things are subjected for the necessities of his body's sustenance. Second, for the essence of any thing, whether it be substance or accident — a use favored by Aristotle (*both in the place cited and also in the book of the Categories, c. 1*), where defining univocals he says: "univocal things are those whose name is common and whose character of substance according to name is the same"; and: "equivocal things are those whose name is common and whose character of substance according to name is different." And Augustine (*l. De immortalitate animae, c. 12*) intimates this. So since in that place the Philosopher speaks of univocals and equivocals insofar as they prescind from the univocation of substance and accident, it is perspicuous that the name "substance" is used there for the essence of any thing. Even more so, because in the *Metaphysics* passage cited he explicitly posits this usage of substance — which Scotus also intimates (*both there, and also in q. 5 and 6 of the Categories; and in 1 Sent., d. 8, q. 3, §. Alii probant, ante S*). Third, for what is from itself, of itself, and through itself — as God alone is, who is His own being, according to (*Exodus 3*): "Who is, has sent me to you." God alone has being through essence; all other things by participation. Thus Aristotle (*12 Met., Text 29*) and the Subtle Doctor (*Quodl. 1*) took "substance" in this way. Fourth, for what is indeed of itself and through

itself but not from itself — as is every created substance, from the highest genus of the category of substance down to its individuals inclusive. Aristotle (*1 Categories, c. 5*) and Scotus (*ibid., q. 12 G; and in 1 Sent., cited above*) treat of substance so taken. Fifth, for what is not an accident — or, as our Formalists speak, for what is not in another through information — such as the parts of a perfect and composite substance, both essential parts as matter and form, and integral parts as head and feet. Aristotle (*1 Physics, Text 12; and 8 Met., c. 1, Text 3*) and Scotus (*2 Sent., d. 12, q. 1*) treat of substance so accepted.

A double etymology of substance can be given, as Isidore (*l. 2 of the Etymologies*), Vorriolus (*in 1 Sent., d. 5*), and Pelbartus (*vol. 1, s.v. substantia, §. 1*) note. One from "sub-standing" — which Aristotle (*5 Met., c. 8*) and Scotus (*2 Sent., d. 8, q. 3, §. Teneo opinionem meam, F*) adduce — for the reason that it underlies accidents as their foundation, and accidents cannot exist without it. Hence since primary substance underlies all accidents, it is rightly called by the Philosopher "most of all substance." Since God, however, is entirely alien from the reception of any accident — as Scotus (*cited above*) writes following Augustine (*7 De Trinitate, c. 5*) — He is therefore not properly substance in this sense, since the meaning of substance so called belongs only to created substance, which is capable of accidents. The other etymology is from "sub-sisting" — because it subsists through itself — as Saint Bonaventure (*in 1 Sent., d. 23, q. 2*) and the Scotists (*Tract. Formalizatum*) hold; and it is intimated by the Doctor (*in the Reportata of 1 Sent., d. 26, q. 1*). And in terms of this nomenclature, "substance" is attributed both to created and uncreated substance, because each subsists through itself.

Substance is divided into primary and secondary — or into universal and singular — from Aristotle (*c. de substantia*) and Scotus (*ibid., q. 12; and Quodl. 3, §. Respondeo, ante Q*). Again, into celestial and sublunary — and such others — on which see below (*art. 5*).

One objects: if substance is distributed by Aristotle into primary and secondary, then by parity of reasoning quantity should be divided into primary and secondary — and likewise quality and the other predicaments. But the division of quantity into primary and secondary is ridiculous. Therefore the division of substance into primary and secondary is also inept. One replies by denying the subsumption — for a universal and singular quantity is given, and in this way quantity can be said to be divided into primary and secondary. As to why Aristotle did not distribute quantity in that way, he perhaps did so because the foregoing division of substance is derived from the modes of subsisting through itself and of underlining accidents — as the Doctor intimates (*at the end of q. 12 of the Categories*). For primary substance primarily underlies accidents, while secondary substance does so only secondarily — and so Aristotle adds: "when primary substances are destroyed, it is impossible for anything else to remain."

Article IV: On the Properties of Substance

Six properties of substance are enumerated by Aristotle (*c. de substantia*) and presupposed by our Doctor (*ibid.*). The first is not to be in a subject — and this appears to be a property of substance in the fourth mode, as Scotus indicates (*in 3 Sent., d. 1, art. 3, sub D*). For it belongs to every substance, both primary and secondary, both complete and incomplete, to substance alone, and always — whether it resides directly or indirectly in the category — as is clear from what was said above — whatever the Conimbricenses may say in their commentary on this chapter.

The second property is to be predicated univocally — that is, under the same name and the same character. This property, however, belongs not to primary but only to secondary substances — as "man" is univocally predicated of its individuals. The same property appears to be adapted to universal accidents, which, although they are denominated of the substance in which they inhere, are nonetheless univocally and essentially predicated of their inferiors — for example, "color" of whiteness and blackness — since the genus is the same for each.

The third is to signify "this something" (*hoc aliquid*) — and this belongs only to primary substance. For it is properly "this something" — that is, an individual, a singular, and a numerically single substance. But to signify "what kind of thing" (*quale quid*) belongs only to secondary substance — since secondary substances are the quiddities of primary substances. For just as an accidental form qualifies its subject accidentally, so the essential form or substantial quiddity qualifies primary substance essentially, in which it resides. In what sense a substantial difference has the mode of quality the Doctor explains (*in 3 Sent., cited above*), adducing the place of the Philosopher (*5 Met., Text 19, C*).

The fourth — as Augustine (*l. De immortalitate animae, c. 11*) likewise notes — is that nothing is contrary to substance — which is to say, one substance is not opposed to another; for those things that are opposed to one another by proper contrary opposition are in a subject and mutually expel one another from the same subject — as heat and cold mutually drive each other out from the same water in which they inhere, on account of their repugnance, as the Doctor explains (*4 Met., commentary on Texts 9, 27, 37; in 1 Sent., d. 1, q. 1, infra L*). Yet the property of substance, as I noted at the beginning of this article, is not to be in a subject.

The fifth is that substance does not admit of more and less — that is, substance is not intensified or remitted. For Paul is not more a man now than before; and likewise Paul is not more a man than Andrew. But one wall is whiter than another, because whiteness, which is a quality, admits of more and less. Whether substance admits individual degrees, see Scotus (*8 Met.; and 1 Sent., d. 17, q. 3*) and ourselves in the proper question on this matter.

The sixth is that substance admits contraries — which can be understood of one and the same substance in number, which is changed over the course of time by the reception of contraries. For the same man is sometimes healthy and sometimes ill; and one and the same wall is now white and now black, as is clear from the Doctor (*in 4 Sent., d. 49, q. 13, §. Respondeo, B*). Although quantity also receives contraries — as a surface that is whitened or darkened — nonetheless there is a distinction between surface and substance in terms of the reception of contraries: because surface is their subject *quo*, while substance is their ultimate subject *quod* — as Scotus excellently teaches (*in 4 Sent., d. 12, q. 2, §. Ad quaestionem, H*).

One objects, first: not to be in a subject is the essence of substance. Therefore it is not its property. The antecedent is clear from Aristotle (*c. 2 and 5 of the book of the Categories*); the consequence holds because a property follows from the thing of which it is the property — as the Doctor writes (*in 1 Sent., d. 8, q. 4, §. Ista tamen, M*) — and flows from it; and the same thing cannot be cause and effect of the same thing with respect to the same thing, whether through emanation or through transmutation. One replies by distinguishing the antecedent: not to be in a subject can be taken in two ways — one way as signifying the very substance itself, which has no capacity for inhering in a subject, and I concede that through "not being in a subject" the positive predicate of substance is denoted; the other way as signifying the aptitude for existing through itself, and in this way "not being in a subject" is a property of substance. This distinction is clear by analogy with "sensitive" — which, as I noted (*1 Sent. 2, De anima*), can be taken in two ways: either for the essential constitutive difference of an animal, or for the faculty of sensing of that same animal, which is its faculty and property.

One objects, secondly: Aristotle (*ibid., c. 5*) writes that primary substance is more of a substance than secondary substance; and shortly after he adds that substance does not admit of more and less. Therefore either one is false, or Aristotle contradicts himself. One replies by distinguishing the antecedent: primary substance is more of a substance than secondary substance as to mode — I concede; since primary substance, including more, underlies more than secondary substance; as to essence — I deny. Thus the apparent contradiction in the words of the Philosopher is resolved. Or, if you prefer, in the school of Scotus, say that substance does not admit of more and less according to specific being — yet it does according to individual being, as is clear from the Doctor (*8 Met., q. 3; and 1 Sent., d. 17, q. 3*).

One objects, thirdly: the same proposition is made false from a true one — as with Peter seated, this proposition "Peter is seated" is true; but with him standing or walking, it is false. But truth and falsity are contraries. Therefore admitting contraries is not a property of substance alone. The Stagirite replies that a proposition is true or false not through its own change but only through the change of its object; whereas substance admits contraries through a change

existing in the substance itself and not in something distinct from it. Or it may be said with Scotus that truth and falsity are not properly contraries but relations of conformity and disformity with respect to the object of which they are predicated — as will be clear (*l. 4, q. 4, art. 2*).

Article V: In Which the Series of Predicamental Substance Is Examined

Predicamental substance is divided into incorporeal and corporeal, as Augustine intimates (*l. 83 Questions, q. 6*). Incorporeal substance is subdivided into three Hierarchies and nine Orders, which are called Seraphim, Cherubim, Thrones, Dominations, Virtues, Powers, Principalities, Archangels, and Angels. Corporeal substance is divided into inanimate and animate. Inanimate into simple and mixed. Simple is either celestial — and it contains eleven heavens: the Empyrean heaven, the Primum Mobile, the aqueous or crystalline heaven, the heaven of stars, the heavens of Saturn, Jupiter, Mars, the Sun, Venus, Mercury, and the Moon — or it is sublunary, and comprises the four elements: fire, air, water, and earth. Mixed is divided into imperfectly mixed and perfectly mixed. Imperfectly mixed comprises all meteorological phenomena, which are of two kinds — some arise from moist matter, or from vapor: clouds, rains, snow, dew, frost, and ice; others are fashioned from dry matter, or from exhalation: thunder, lightning, thunderbolts, wind, comets, and the like. Perfectly mixed comprises three genera: one is the genus of stones, whose various species are marble, whetstone, flint, and rock; another is the genus of metals, whose species are gold, silver, tin, lead, bronze, and iron; the third is the genus of liquids, whose species include sulphur, bitumen, etc.

Animate substance is either sentient or non-sentient. Non-sentient obtains many genera: the genus of trees, shrubs, plants, herbs, and roots. Sentient is either devoid of reason or possessed of reason. Devoid of reason is either aerial — as a bird — or aquatic — as a fish — or terrestrial — as a quadruped. Possessed of reason is man — as Peter. If you desire a shorter line of the category of substance, see (*Article 4 of Question III*).

One objects: Porphyry, in the range of the predicament of substance (*c. de specie*), places "rational animal" as the genus of man. Therefore possessed-of-reason substance must again be divided. One replies: the antecedent being conceded, the consequence is to be denied. The reason is that Porphyry, with Plato whose student he was, thought that Angels are rational animals — and so in his view "rational animal" is posited as the genus; which orthodox faith does not admit, and which we have fully rejected in (*Tract. on Angels, disputation I*).

Article VI: On Quantity

Quantity is used in two senses. First, for quantity of power or perfection — in which sense, from Augustine (*6 De Trinitate, c. 7*), Scotus (*in 1 Sent., d. 17, q. 3, §*.

Supposito caritatem, sub FT; d. 19, q. 1, §. De 2, B; Quodl. 6, §. Ad primum principale, sub MM), Bonet (*little book on quantity, at the beginning*), and Orbellus (*4 Met., q. 2*) write: "In things that are not great in bulk, to be greater is to be better." Thus God is called "great" in Sacred Scripture, especially (*Psalms 16*); and (*Luke 1*) is read of Christ: "He shall be great before the Lord." Second, for quantity of bulk — which is adapted only to corporeal things, and it is of quantity so taken that the Philosophers speak in the present context. The common description of quantity pleases me — namely that quantity is being extended through itself, or the position of part outside part (*as the Doctor affirms in 4 Sent., d. 10, q. 1, art. 2*) — as the surface of a wall.

Quantity, from Aristotle (*c. 6 of the book of the Categories*) and Scotus (*ibid., q. 16*), is divided into continuous — whose parts are joined by a common boundary — and discrete — whose parts are not joined by a common boundary: as if there were two pairs, nothing common is found between them by which they could be joined to one another. Continuous is subdivided into permanent and successive. Permanent is what has its parts existing simultaneously — as a table. Successive is what has parts that continuously flow — as an hour. Three species of permanent quantity are: line, surface, and body. A line is a magnitude long only, whose parts are joined by a point. A surface is a magnitude long and wide without depth, whose parts are joined by lines. A body (as taken here) is a three-dimensional extension, or a magnitude long, wide, and deep, whose parts are joined by surfaces. Successive quantity has two species — motion and time. Motion is the act of being in potency insofar as it is in potency. Time, on the other hand, is the measure of motion according to before and after — on which see the *Physics* for an abundant treatment. Discrete quantity likewise contains two species — number and speech. Number is a multitude of units; and speech is a discrete quantity consisting in the long or short pronunciation of syllables — as "Francis is disputing."

Three properties of quantity are enumerated by Aristotle (*in the same chapter*) and Scotus (*ibid., q. 24*). The first: nothing is contrary to quantity (understand, in the sense of proper contrariety) — for one line is not properly opposed to another line. The second: quantity does not admit of more and less — for one bicubital thing is not more a bicubital thing than another, although one can be greater or more extensive than another. The third: in terms of quantity, things are said to be equal or unequal. Those are called equal whose quantity is one and the same; and those are unequal whose quantity is different. And this is said to be its property in the fourth mode. Other properties of quantity may be added — namely divisibility, finitude, infinity, and measurability — on which a more proper discussion will be held elsewhere.

One objects, first: great and small, much and little, above and below are contraries among themselves — and they are quantities. Therefore one quantity is contrary to another quantity — and so something is contrary to quantity.

Aristotle (*cited*) and Scotus (*q. 24 of the Categories*, §. *Ad quaestionem dicendum, in the solution of the fifth*) reply that those things of which we have been speaking above in relation to the first property are not properly contraries but are relatives: for "mountain" is called great by comparison with a small mountain, and so of the rest — as the aforesaid authors sufficiently explain, and Titelmanus elegantly (*l. 2, c. 30*).

One objects, secondly: quality admits of more and less, as Aristotle transmits (*c. de qualitate*). Therefore the same is to be affirmed of quantity. The consequence is proved: just as quality — for example heat — is said to be greater or less, so a fortiori quantity — for example a table — will be said to be greater or less; and so it should not be denied that quantity admits of more and less. One replies: the antecedent being conceded, the consequence is to be denied. For its proof, I say that one quantity is indeed greater or less than another quantity, yet it is not more or less a quantity. The reason is that, as Aristotle writes (*8 Met.; and 1 De Generatione*), more and less presuppose the intensification or remission of the same form in the same subject — which Scotus proves at length and effectively (*in 1 Sent., d. 17, q. 3*). Greater and less, on the other hand, designate the extension or restriction of the same form in the same subject — for it is valid to say "this man is greater than another man," but not "this man is more of a man than another man" — which will be clearly established in our questions on the universals. For now it only remains to adduce and clearly set out the catalogue of this predicament — which Major (*in the present*) and more clearly Gadius of Bologna (*Quodl. 7, fol. 70, col. 3*) set out.

Article VII: On Quality

Aristotle (*1 Categories, c. 8*) describes quality in this way: "quality is that according to which certain things are said to be of a certain kind." More clearly, according to the principal Scotists: quality is an absolute accident determining or qualifying the subject in which it is, according to which it is denominated as of a certain kind — as whiteness is a quality according to which a wall is denominated white. For if one asks what kind of thing the wall is, the correct reply is: "it is white." Hence (*Matthew 8*), when the sailors asked about Christ the Lord: "what kind of man is this, for the winds and the sea obey him?" — the reply is: "this is the Prophet from Nazareth."

Quality is divided into four modes or species, each of which is called by two names. The first is habit and disposition. Habit is an adventitious quality difficult to remove — as one who is skilled in Logic and has long been exercised in it has the habit of Logic. Disposition is an adventitious quality easy to remove — as if someone has a knowledge of some part of Logic quickly acquired, he is said to have a disposition toward acquiring Logic, since he can lose that knowledge easily. The Doctor makes mention of this (*4 Sent., d. 6, q. 10, O*). The second is natural potency and impotency. Natural potency, according to Scotus, is a natural facility for acting — as the Philosopher exemplifies with runners and

boxers. Natural impotency is a difficulty or weakness in acting — as a natural difficulty in seeing or hearing that someone has from birth. Scotus touches upon this (*2 Sent., d. 16, q. un., §. Ad primum, P*). The third is passion and passible quality. Passion in this context is a quality of short duration that moves the sense, or arising from the movement of sense — as the redness of a face arising from shame. Passible quality is a lasting quality that moves the sense or arises from the movement of sense — as a lasting pallor of face arising from an interior and long-lasting illness. This is remembered by Scotus (*q. 36 of the Categories, §. Ad quaestionem*). The fourth is form and figure. Form — as the Doctor notes (*q. 36 of the Categories, §. Ad dicendum*) — is a quality arising from the natural delineation of a body, following upon determinate quantity — in which sense small men are said to be well-formed but not beautiful. Figure is a quality following upon quantity taken precisely — as the figure of a triangle or quadrangle. From which some affirm that form is to be considered in natural things and figure in mathematics. But Scotus describes figure differently (*in 4 Sent., d. 10, q. 1*) — as we shall investigate in our questions, where we shall examine more exactly and subtly what figure is.

Three properties of quality are enumerated: the first is to have a contrary — for one quality is opposed to another — as heat to cold, dryness to humidity. The second is to admit of more and less — for quality is intensified and remitted, by reason of which one white thing is said to be more or less white than another white thing. The third is that in terms of quality things are said to be similar or dissimilar: those things are similar whose quality is the same, and dissimilar those whose quality is different — as two white walls are called similar on account of the whiteness they share, and dissimilar to a black wall on account of the blackness they do not both possess. And this last affection belongs to quality in the fourth mode.

One objects, first: Aristotle (*cited above*) makes habit and disposition the same species of quality — and shortly after he holds that disposition is the genus of habit. Therefore either what was said above is false, or Aristotle is not consistent with himself. One replies that disposition is taken in two ways: in one way generically — as a quality easy or difficult to remove from the subject in which it inheres, and in this way Aristotle takes it when he says that disposition is the genus; in the other way specifically — as a quality easy to remove, and in this way disposition and habit are one species of quality.

One objects, secondly: the same Philosopher adds that it is proper to quality for things to be said similar or dissimilar on account of it — yet (*2 and 4 Met.*) he establishes similarity and dissimilarity as the primary differences of being. Therefore the foregoing property does not belong to quality alone. One replies that I have diligently and fully read and re-read the books of the Philosopher cited by Peter Gassendi (*l. 1, exercitation eighth*) and have by no means found what Gassendi adduces — and so he falsely attributes that and much else to him,

so that the common master may be deserted and new or obsolete doctrine introduced: which he has not yet achieved, and indeed has been compelled for good reasons to desist from his undertaking. Or one may say that the Philosopher in those passages took similarity and dissimilarity in the broadest sense — just as he sometimes took quality for substantial and essential difference, as I noted elsewhere together with Scotus.

Article VIII: On Relation

Relation, from the Doctor (*q. 25 of the Categories*, §. *Dicendum*; and *ibid.*, §. *Ad 3*), is the bearing of one thing toward another — or the reason for relating and the respect by which a relative is referred to another. A relative is what is referred to another. Correlatives are those that mutually regard one another. Relatives are defined by Aristotle (*in the present chapter*) and Scotus (*in 2 Sent.*, *d. 1, q. 4*, §. *Contra, sub B*): "those whose entire being is to be referred to another."

For a relation, from the same Doctor (*in 1 Sent.*, *d. 31, q. 1*, §. *Ad quaestionem, A*; and *Quodl. 6*), three things are required: first, the foundation and the term must be real; between the foundation and the term there must be a real distinction; and third, from the nature of the extremes, without any intellect conceiving, a relation must necessarily arise.

Many divisions of relations and relatives are adduced throughout by Philosophers and Theologians. The principal ones are as follows. The first is into real relation — which has being on the side of the thing, as paternity — and relation of reason — which depends in its being and coming-to-be upon the work of the intellect, as the relation of genus. This division is intimated by the Doctor (*in 1 Sent.*, *d. 30, q. 2*; and *in the Reportata of 2 Sent.*, *d. 1, q. 7*). The second, from (*2 Sent.*, *d. 1, q. 5*, §. *Ad primum alterius opinionis, F*), is into transcendental relation — which has no seat in any predicament, as the relation of substance and accident belonging to them before they are divided into their modes — and predicamental relation — which is located in some category, as filiation. The third, from Aristotle (*c. de ad Aliquid*) and others, among whom is Orbellus (*5 Met.*), is into relatives according to being — which essentially include a respect toward another, as double and half — and relatives according to being said — which together with an adjoined relation import something absolute, as science and the knowable. This division does not appear to be received by Scotus (*q. 26 of the Categories*, §. *Dicitur ad q.*). He, however, adds another (*q. 36 of the Universals*; and also *q. 27, 28 of the Categories*) — into relatives per se and per accidens; and he appears to perceive the former (*Quodl. 13*), as elsewhere. The fourth, from the same (*q. 27 cited*, §. *Dicendum*), is into mutual relatives — which are referred to one another by a real relation, as Father and Son — and non-mutual relatives — of which one regards another by a real relation but not conversely, as God and creature, science and the knowable. The fifth, from (*1 Sent.*, *d. 30, q. 2*, §. *Contra 1, at the end, E*), is into relations of equiparation — which are of the same name and character, as all relations of similarity — and relations of disparation — which

are of a different name and character, as all relations of dissimilarity. The sixth, from (2 *Sent.*, d. 1, q. 5), is into relations of superposition — which are relations of greater dignity, as the relation of teacher — and relations of subposition — which are of lesser dignity, as the relation of disciple. The seventh, from (1 *Sent.*, d. 19, q. 2, §. *Ad argumenta*; and 4 *Sent.*, d. 13, q. 1, §. *Ad huius autem, D*), is into intrinsically supervening relations — which necessarily arise once the extremes are posited, as once the Father and Son are posited the relations of paternity and filiation necessarily arise — and extrinsically supervening relations — which do not arise from the positing of extremes alone unless some condition is added, as once Peter and the street are posited, the relation of Peter's presence to the street does not arise unless Peter is placed in the street.

Three properties of relatives are especially enumerated by Aristotle (*ibid.*) and Scotus (q. 17 of the *Categories*). The first is to be said in conversion — as the Father is the Father of the Son, and the Son is the Son of the Father. The second is to be simultaneous by nature — for once one of the relatives is posited, the other is simultaneously posited; and once one is removed, the other is also removed: as once the Father is posited, the Son is posited; and the Father being removed, the Son is removed — for they mutually destroy one another. The third is to be simultaneously known — for once one relative is determinately known, the other is also known: as if someone knows that Plato was the teacher of Aristotle, he also knows that Aristotle was the disciple of Plato.

One objects, first: Aristotle in this chapter makes relation a highest genus; and in the post-predicaments he places relation among the species of opposition. But nothing can be both a highest genus and a species of another genus. Therefore, etc. One replies that opposition is not properly a genus: for some opposition is real and some is of reason; and of real being and being of reason there is nothing univocal in common that could be a genus, from Scotus (1 *Sent.*, d. 29, q. un.). For this reason Aristotle rightly establishes opposition among the post-predicaments.

One objects, secondly: among relatives, the knowable and knowledge are improperly conjoined, since the former signifies potency and the latter act. It would be better to say "the known" and "knowledge" than "the knowable" and "knowledge." The antecedent is to be denied — because the knowable and knowledge are non-mutual relatives; therefore it is not necessary to posit knowledge and the known, but "knowledge" and "the knowable" are rightly said.

Article IX: On Action and Passion

I do not recount the multiple acceptations of action and passion, because they are difficult to grasp, and also because they will be more conveniently explained elsewhere. And so here I treat only of action and passion insofar as they constitute these two predicaments. Action is described by Gilbert of Poitiers (*l. Sex principiorum*, c. 2) as that according to which we are said to act upon what is

subjected. And in accordance with this definition of action, passion can be defined as that according to which we are said to be acted upon in what is subjected — as one cutting wood is said to act upon the wood, and the wood itself, insofar as it is being cut, is said to be acted upon. Hence the cutting, insofar as it is from the one cutting, is called action — according to which the agent is denominated as cutting; but insofar as it is in the cut wood, it is called passion — according to which the wood is denominated as cut. Thus under the one name of "cutting," the said action and passion are signified; yet for the sake of distinction we can use the expressions "active cutting" and "passive cutting" — just as we use the names of "active heating" and "passive heating."

Not unlike these are the definitions of action and passion given by Aristotle (*3 Physics, c. 3*): "action is the act of the agent as agent"; and "passion is the act of the patient as patient." And more clearly by Scotus (*in 4 Sent., d. 13, q. 1, §. Ad huius autem difficultatis intellectum, sub H*): "action is a respect extrinsically supervening upon the transmuting toward the transmuted"; and "passion is a respect extrinsically supervening upon the transmuted toward the transmuting." I confess that these matters require a long examination and diligent inquiry to be held elsewhere. For now I only recount two properties of each adduced by Aristotle. One is to have contraries — as heating is opposed to cooling. The other is to admit of more and less — which is to be understood not of the abstracts but of the concrete terms of action and passion: for one agent is said to act more than another, just as one patient is said to be acted upon more than another — as a greater fire heats more than a lesser fire; and wood placed closer to a more ardent fire is more burned and consumed than wood placed near a less ardent fire. Since, moreover, action and passion mutually imply one another and appear to be really the same (*3 Physics, Text 21*), I therefore set out the series of action, which with changed words can be adapted to passion.

Article X. On *Ubi* (Whereness)

Ubi is described by Gilbert in the booklet cited above as the circumscription of a located body arising from the circumscription of its place. The Doctor hints at this description at (*4.d.10.q.1. §. Dico ergo, sub O.*), where he says that *ubi* is the relation of a circumscribed whole to its circumscribing whole. It is divided into active *ubi* and passive *ubi*: for from the application of a place to the body located there arises an extrinsically accruing relation called active *ubi*, and from the application of the located body to the place there arises an extrinsically accruing relation called passive *ubi*. Gilbert, in the cited work at chapter 5, defines only the passive *ubi*, yet what is needed is an account of what is common to both, together with a description of it, as Scotus indicates (*4.d.10.q.1.K.; Quol. 11, sub C.*). *Ubi* may be described as the presence or containment of a thing in a place — as in "to be in the heavens" — and it can be divided into definitive *ubi*, by which something is here in such a way that it is not elsewhere (an angel, for example, is in the heavens in such a way that it cannot simultaneously be on earth), and

circumscriptive *ubi*, by which something — say, a body — is commensurate with and adequately fitted to its place. Furthermore, circumscriptive *ubi* is subdivided into active and passive *ubi*, which were described at the beginning of this article and are to be treated at length in Physics. Two properties of *ubi* are enumerated: the first is that it has no contraries, for nothing is opposed to *ubi* as such; the second is that it does not admit of more and less — that is, it cannot be intensified or diminished — for although one instance of *ubi* may be more extensive than another, it is not thereby more or less intense.

Objection. The description of *ubi* given above applies only to *ubi* taken as local presence; yet a body can have a true *ubi* without local presence; therefore, etc.

Reply. The major premiss is granted; the minor is denied, since it is not proved by Ruuio, who raises this objection. For nothing is anywhere unless it has local presence, as is clearly demonstrated by the description of *ubi* given above.

Article XI. On Situs (Position)

Gilbert at chapter 6 affirms that *situs* is the same as — and this brings us back to — the definition of *situs* given by Scotus at (4.d.10.q.1.§. *Dico ergo, sub M.*), namely, the co-extension of the parts of a body to the parts of its place. Aristotle likewise states (1.Met., c.19.): "Position is the disposition of parts in a place, as standing or sitting." This is explained in the same way as the description of the preceding category. For from the application of the place to the parts of the body existing within it there arises an extrinsically accruing relation called passive position. The properties of *situs* are the same in number as those of the category of *ubi*, namely, having no contraries and not admitting of more and less — with the addition that it directly attends substance.

Article XII. On Quando (Whenness)

Quando is the adjacency of time remaining in a temporal thing, or the containment of a thing in time — as in "to have been once," "to be now," or "to be in the future." Thus it is found in *Tobias 12*: "When you were praying with tears"; and in *Matthew 24*: "Tell us when these things shall be." The description given above is explained in much the same way as the descriptions of the two preceding categories were explained. For from the application of time to the temporal thing measured by it there arises an extrinsically accruing relation called active *quando*; and from the application of the temporal thing measured to the measuring time there arises an extrinsically accruing relation called passive *quando*. The properties of this category are three: first, it has no contrary; second, it does not admit of more and less; third, it belongs to those things that endure through time.

Objection. *Quando* does not appear to have several genera and subaltern species under it — which is also said of *ubi*. Therefore *quando* does not appear to be one of the supreme genera.

Reply. Scotus answers (1.d.8.q.3.§. *Teneo opinionem meam, O.*): it is not of the nature of a supreme genus to have several subaltern species beneath it, but rather to have no further genus above it. Moreover, certain subaltern genera can in fact be assigned to this category as well, as appears in the synopsis below.

Article XIII. On Habitus (Vestiture)

Habitus, according to the author cited at chapter 7, is the adjacency of garments and such things as are about the body. Scotus agrees (q.36, *predicamentali*, §. *Ad 2.q.*), or, as others prefer, *habitus* is the application of a garment or ornament to the body. Thus *James 3*: "A poor man in filthy clothing"; and *1 Timothy 2*: "Women in seemly attire." For from the application of a garment to the body there arises an extrinsically accruing relation called active *habitus*; and from the application of the body to the garment there proceeds an extrinsically accruing relation called passive *habitus*. Moreover, there can and ought to be assigned a common and supreme account of this category, which is possession abstracting from active and passive — and this must likewise be done for the three immediately preceding categories, as the Doctor notes (4.d.10.q.1.K.). Thus the union of a subject to any form whatsoever belongs to this category, as John of Bassolis teaches above others (4.d.12.q.1.art.1.), and Gilbert in the cited work is in agreement, placing in this category the being-quantified and the being-white — that is, the relation of the subject to quantity and whiteness — as our younger contemporaries note in the present context. The reason can be given that such a respect is in some manner left behind from the adjacency and adherence of a form to its subject. The properties of this category are three: first, it has no contrary; second, it admits of more and less; third, it always exists in more than one thing — that is, in both the possessor and the thing possessed.

Objection. Aristotle (5.*Met.*, c.20.) says that *habitus* is a medium between the possessor and the thing possessed, just as action mediates between agent and patient; but action is something absolute, residing in the category of quality; therefore *habitus* is as well.

Reply. The major premiss is granted; the minor is denied, as is clear from what was said above in Article IX.

Article XIV. On the Post-predicaments

The post-predicaments are five, as the Doctor writes after Aristotle (q.37 and 38, *predicamentali*), namely: opposites, modes of prior, modes of simultaneous, the six species of motion, and the modes of having.

Opposites are those things that involve mutual repugnance. They are found in a fourfold distinction: contradictories, contraries, privatives, and relatives. Contradictories are those of which one negates the other, one being positive and the other negative — as *being* and *non-being*, *man* and *non-man*. They are immediate, as the Doctor states (2.d.2.q.2.§. *Ostenso proposito, sub Y.*; and q.7.§. *Ad*

1.q.dico.CC.). For this same reason the Doctor (q.25, *predicamentali*), following Aristotle (1.Post., Tex.5.), defined contradiction as an opposition that has no medium in itself. Contradictories are further divided by the same authority (1.d.4.q.1.Ad 5, *sub D.*) into incomplex — of which we now speak — and complex — of which we shall speak in the following book.

Contraries are those that are maximally distant under the same genus and mutually expel one another from the same subject — as heat and cold. They are subdivided into immediate contraries, between which no medium falls — as even and odd — and mediate contraries, between which a medium intervenes — as between whiteness and blackness, where redness is the medium.

Privatives are those of which one is positive and the other signifies the absence of the first in a subject capable of receiving it; these are called a habit or form and its privation — as light and darkness, sight and blindness — and such opposites are immediate, according to Scotus (1.d.17.q.2.§. *Contra istam conclusionem, infra DD.*). Relatives are those that mutually regard one another, of which Scotus treats (q.39, *predicamentali*) and of which we spoke above in Article VIII.

Aristotle sets out five modes of prior, and Scotus adds a sixth (1.d.5.q.2; *Quol. 12, q.2; 2.d.1.q.1*; and elsewhere). First, something is said to be prior to another in time or duration — such as those things that are generated earlier: Adam, for instance, was prior to Noah in time. Second, prior in nature: that which does not convert the consequence of subsistence — that is, what is pre-required and presupposed for the being of another. Thus one is prior in nature to two: "there are two" follows from "there is one," but not conversely. For this reason Scotus (2.d.3.q.4.§. *Contra istam conclusionem, D.*), following Aristotle (5.Met., c. *de Priori, Tex.16.*), adds that what is prior in nature can, without contradiction, exist without what is posterior to it. For the several modes in which something is said to be prior in nature, see the Doctor (2.d.1.q.1.§. *Respondeo.A.*; q.3.§. *Tenentes autem ante H.*), and Mastrius and Bellutus (*disp.9.q.2.Art.1.*). Third, prior in dignity or perfection — as gold is prior to the other metals because it is nobler than they are. The Philosopher accordingly adds (10.Met., Tex.22.) that in every genus there is one thing that is the measure and standard of the rest. Fourth, prior in order — which belongs to those things that precede others according to the disposition of things: thus letters precede syllables, and syllables precede words. Fifth, prior in causality — in which sense that which is the cause of another is said to be prior to it in this way: as the sun is prior to illumination, and fire to heating. These five modes of prior are contained in this verse:

In time, in nature, prior in order, and in honor we say; we say a cause is prior to its effect.

The sixth mode of prior, which the Subtle Doctor introduced into his school — as appears from (1.d.5.q.2; *Quol.12.q.2; 2.d.1.q.1*; and elsewhere) — is priority of origin: that from which something originates or is produced. Thus in the

Trinity, the Father is prior in origin to the Son, and the Son is prior in origin to the Holy Spirit.

Although there are as many modes of simultaneous as there are modes of prior, as the philosophical commentators note here — Aristotle nevertheless adduces only three modes of simultaneous, perhaps because the others can be easily understood, as Scotus observes (*q.43, predicamentali*). These are simultaneous in time, in nature, and by division. Those things are simultaneous in time that are born at the same time, as Esau and Jacob. And Christ and John were contemporaries, as Augustine notes (*62 de consensu Evang., c.6.*). Simultaneous in nature are those things said to be convertible — as correlatives. Simultaneous by division are those things that immediately divide the same genus and participate in it equally — as man and brute, which immediately divide animal and receive its account in equal measure. The modes of simultaneous listed above are contained in the following four verses:

I say those are simultaneous in time whose generation is now. Those that convert with one another we say are simultaneous. And those species are simultaneous that distribute a single genus. But not by reason of the genus itself.

The species of motion, which are reckoned at six, are: generation, corruption, augmentation, diminution, alteration, and local change. Generation is a substantial change from substantial non-being to substantial being — as when a man is generated, there is a passage from not-being a man to being a man. Corruption is a substantial change from substantial being to substantial non-being — as when a man dies, he passes from being a man to not-being a man. Augmentation is the increase of pre-existing quantity — as when water is added to water, the water itself is said to be augmented. Diminution is the decrease of pre-existing quantity — as if water is taken from water, the water itself is said to diminish. Alteration is the change of one contrary quality into its contrary — as from cold into heat — or of a medium quality into an extreme, as from redness into blackness, or of one medium into another, as from green into red. Local change is the transition from one place to another — as when Peter, departing from Aix, makes for Rome, he is said to change locally.

Having is contained under eight modes, which Scotus mentions (*q.36, predicamentali, §. Ad 2.q.*). The first is to have a quantity — as to have a body two cubits long. The second is to have a quality — as to have learning. The third is to have something around the body — as to have a tunic. The fourth is to have something on a part of the body — as to have a crown on the head. The fifth is to have a part of the body — as to have a hand. The sixth is to have something contained in a container — as to have money in a purse. The seventh is to have something for the purpose of possessing it — as to have a field. The eighth is to have something for the purpose of cohabitation — as to have a wife.

First Objection. *Man* and *non-man* are contradictories; yet there is some medium between man and non-man. Therefore a medium is given between contradictories. The major is evident. The minor is proved: insofar as he is a man, a man is not white; nor, insofar as he is not-a-man, is not-a-man white.

Reply. The major is granted; the minor must be denied. In reply to its proof — apart from the fact that it involves a passage from incomplex to complex contradictories — I say that a medium is found between contradictories when the reduplicative particle *insofar as* is used, as Scotus notes (*1.d.5.q.1. §. Ad argumenta Logica, sub L.*).

Second Objection. There are as many modes of posterior as there are modes of prior, since they mutually regard one another; and one of a pair of opposites is spoken of in as many ways as the other. Yet Aristotle does not enumerate the modes of posterior. Likewise, there should be as many modes of simultaneous as there are modes of prior and posterior together, for the same reason — which Aristotle does not provide.

Reply. The modes of posterior are easily gathered from the modes of prior; hence Aristotle does not expressly enumerate them, though there are indeed as many modes of posterior as of prior, as is correctly inferred in the argument. Nor did Aristotle wish to set out all the modes of simultaneous — partly for the reason drawn from Scotus above, partly because he wished to enumerate only those that required some explanation, and partly because the others can be reduced to those three.

Book II. On Complex Terms

A well-ordered method requires that, having examined the incomplex terms in the first book of this work, we examine in the second book the complex terms, which are propositions. The reason for this is that, once knowledge of simple things has been acquired, we must seek — in the order of nature — knowledge of composites, such as the proposition, which is constructed from incomplex terms. This book comprises seven questions. The first concerns the parts of the complex term; the second, its essence and division; the third, the matter, form, quantity, and quality of the proposition; the fourth, the opposition, equipollence, and conversion of simple propositions; the fifth, the modal proposition; the sixth, the exponible proposition; and the seventh, division and definition.

Question I. On the Parts of the Complex Term

It is the unanimous view — which Scotus indicates (*q.1 of the first Perihermeneias, Ad 3.*) — that every complex term or proposition is composed of a noun and a verb. Therefore, in my treatment of the proposition, I begin with the noun and

verb, mindful of the precept stated at the beginning of the preceding book regarding the order of nature — namely, that parts are to be treated before the whole constructed from them.

Article I. On the Noun

The grammarian and the dialectician define the noun differently. The grammarian says that a noun is a part of speech in the mode of a being and of a determinate apprehension, as may be seen in the *Grammatica Speculativa*, chapter 7. The dialectician says that a noun is a conventionally significative utterance, without tense, no separate part of which signifies anything, finite and in the nominative case — as Aristotle shows (*1.Periherm., c.2.*) and Scotus confirms (*ibid., q.4, in fine.*). The parts of this description are now explained. It is called an utterance — that is, an articulate sound — for although every utterance is a sound, not every sound is an utterance, as the crash of two bodies or the sound of footsteps. Significative excludes utterances that signify nothing, such as *bus*. Conventionally excludes natural utterances, such as weeping. For nouns are imposed by convention, as the Doctor notes (*3.d.26.q.un.§. Ad proprium principale.M.*), and as Augustine observes concerning human languages (*1.qq.in Matt., q.17.*). Without tense distinguishes the noun from the verb, which co-signifies time — that is, it designates some difference of past, present, or future time — as Scotus indicates (*q.d.12.q.1.§. Iuxta quaestionem istam; and q. Priorum, q.19.§. Tertio.*). No separate part of which signifies anything distinguishes it from the sentence, whose separate parts do signify — as in "the tree is green." Finite means that it is not preceded by negation, as in "lion." In the nominative case excludes oblique cases, such as "of a man" — because oblique cases do not by themselves generate a complete enunciation: "of a man is" and "to a man is" are not complete, whereas "a man is" is. Some recent authors, notably Hurtado (*in Summis, disp.3.sect.1.*) and Arriaga (*ibid., Disp.2.sect.1.*), wish to depart from the description of the noun given above and consequently from Aristotle.

First Objection. It is not correctly said that no separate part of it signifies, for while this may apply to simple nouns, it does not apply to compound nouns, whose separate parts are significative — as is evident in the nouns *senatus consultum*, *res publica*, and *pro legatus*.

Reply. The parts of a compound noun, even if they retain some signification, do not retain the signification they have within the compound. The recent authors named press the point, saying that the parts of a compound noun have their own quasi-heterogeneous significations from which the whole signification of the noun is composed, a signification that does not differ from that of each part taken separately. This objection must be answered: the instance is demonstrably false in some compound nouns. The word *dominus* is composed of *do* and *minus*; but *do* separately is a verb and *minus* an adverb or comparative adjective, and no one fails to see that, separated thus, they have significations quite different from the signification they have when joined together. Moreover, the parts of a

compound word appear to function like letters and syllables, which, detached from the word, signify nothing — as if one were to separate the parts of *homo* into *ho* and *mo*: these syllables so separated either signify nothing at all, or if they signify something, it is alien to the signification they retain when joined. Furthermore, the formal character of a noun, as a significative utterance, is its signification, as stated in the *Grammatica Speculativa*, chapter 5; but the signification of a compound noun is one, because the thing signified by it is one. Therefore the parts, detached from it, do not preserve their own proper significations. For just as, when the union of a whole is removed, the whole and the mutual relation of the parts to it are also removed — as is universally conceded — so likewise when the union of the parts of a compound noun from the noun itself is removed, their significations in relation to the whole cease. For it is impossible that a relation should persist once its foundation and term are removed. Therefore, once the parts are separated from one another, the relation of union and the ordering of the parts to the whole must necessarily perish, and with it the signification those parts possessed when they were joined to the said noun. Again, if a compound noun is divided, either two simple nouns will result, as *res* and *publica*, or one noun and one preposition, as *pro* and *consul*; and to each noun thus divided there correspond in us two concepts, as is clear from what has been said. But it has now been established that through a compound noun only one concept is produced in us, corresponding to one signification.

Second Objection. Against another clause of the definition of the noun, namely *finite*: an infinite noun signifies something and is declined through cases; therefore it ought not to be excluded from the account of a noun. The antecedent is proved: *non homo* is an infinite noun signifying determinately everything that is not a man. This is confirmed first: *being* is predicated of more things than *non-man*, yet *being* is not excluded from the class of nouns. It is confirmed second: just as a finite utterance signifies something finite, so an infinite utterance denotes something infinite; therefore the account of a noun abstracts from finite and infinite, and should not be restricted to being finite alone.

Reply. *Non homo* and similar terms, which Aristotle does not call nouns absolutely but nouns with an addition — that is, infinite nouns — do not supply us with a determinate signification of any thing: they are applied both to things that exist and to things that do not exist. But dialectic uses the noun so that, together with the verb, it forms a definite and absolute proposition. Therefore, since an infinite noun presents us with no determinate signification of any real or fictitious being, it follows that it is to be banished from the account of the logical noun, even though it is declined through cases and designates something indeterminately. This is wonderfully confirmed by the grammatical definition of the noun adduced at the beginning of this article, in which the noun is said to signify something in the mode of a being and of a determinate apprehension: an infinite utterance, however, signifies in the mode of a non-being and of an

indeterminate apprehension, and is accordingly rightly removed from the class of the logical noun. To the first confirmation I say that *being* is of a determinate apprehension and is therefore rightly placed among nouns. To the second confirmation I say that in logic an infinite noun is taken negatively, whereas in the argument it is taken positively, insofar as it denotes an infinitely perfect being; and so the instance cited carries no force.

Third Objection. Oblique cases are properly nouns, since they signify together with one verb in the nominative and with another in the genitive or another case — as when one says "it repents me of my sin," which is the same as "I perform penance for my sin." Therefore, since only the phrasing differs and not the signification, oblique cases should not be removed from the number of nouns.

Reply. The Philosopher does not include oblique cases among nouns, because they cannot together with a verb produce a complete enunciation, as I stated just before the first objection. Moreover, the nominative is the mode of signifying as a what — as a subject — as is clear in the *Grammatica Speculativa* at the place cited; whereas oblique cases are modes of signifying a thing as *of which* — as in the genitive — or as *to which* — as in the dative. Logic investigates what is a *what* — that is, the truth of an enunciation, which is seen most clearly in the nominative: "a man is rational," "an animal is sensitive." Although, by changing the words while retaining the same signification of the thing, an oblique case can be made into a nominative — as is shown in the argument — this nevertheless belongs to grammar, not to dialectic. For the end of grammar is the integrity of speech, whereas the end of dialectic is the truth of the syllogism, which is perfectly expressed in the nominative.

Fourth Objection. From Nebrija and other grammarians: a noun is an utterance declined through cases, because nearly every noun is inflected through cases. Therefore this definition of the noun, and not that of Aristotle, is to be approved.

Reply. Even if the said definition of the noun is accepted by grammarians, it does not follow that it should be accepted by dialecticians. For grammar and dialectic make use of utterances in different ways, as Zabarella correctly notes (1. *de natura Logica*, c.10.): grammar employs utterances insofar as they are parts of discourse, whereas dialectic employs them insofar as they are signs of what lies within the soul — that is, for manifesting our concepts — from which enunciations and syllogisms are constructed, through which truth is made known and falsity is driven out, as Scotus indicates (1. *Priorum*, q.19.). Again, the grammatical concept is different — as *homo*, *hominis* — from the logical concept — as *homo*, *humanitas* — from Scotus (1. *d.2.q.7.¶. Sed hic restat, sub FF.*), Brulifer (in *Epitome Formalitatum*, fol.57, pag.2.), and Sirrectus (fol.26, pag.1.). Furthermore, pronouns and participles are utterances declined through cases, yet in the view of grammarians they are not nouns — for grammarians enumerate eight parts

of speech, among which these are placed as distinct from nouns. Add that a non-significative utterance can be declined through cases, and everyone, including the authors cited, admits that it is not properly a noun. Nor does it seem improbable that some nouns are indeclinable — as *cachoëtes* — and it seems that one must add: signifying some thing, as is found in the *Rudiments of Grammar*. Finally, declension is not the quiddity of the noun but seems to be accidental to it, as the grammarians themselves concede when they say that seven things are accidental to the noun, among which declension and case are enumerated.

Article II. On the Verb

A verb is a conventionally significative utterance, with tense, no separate part of which signifies anything, finite and in the indicative mood; and it is the mark of those things predicated of another. This definition of the verb coincides with the definition of the noun explained in the preceding article except in two respects. The first is that it co-signifies time; the second is that it is the mark of those things predicated of another. Regarding the first: the mode of signifying of the verb is to co-signify time, as the Doctor states (*1.d.12.q.1. §. Iuxta quaestionem*; and *3.d.25.q.1. §. Ultimo sub H.*; or an instant of time, as the same Doctor notes (*4.d.8.q.2. §. Aliter ergo, sub M. and S.*). To co-signify time means nothing other than to signify some difference of time — either past, present, or future. For although some noun signifies time — as *day* — and some noun signifies a thing as coming to be in a certain temporal difference — as *lunch* around midday — nevertheless the word *lunch* signifies the act of dining, or the refreshment of the body, as occurring around midday, yet it designates no difference of past, present, or future time, as does the verb *I lunch*, which denotes the present time of dining. For this reason it is rightly said that a noun signifies without time and a verb with time. Regarding the second — that the verb is the mark of those things predicated of another — this is aptly explained as follows: the verb is the copula or union of subject with predicate; it joins one extreme of a proposition to the other, whether the verb stands for itself — as in "dispute is a verb" — or for its significate — as in "a man is rational." Or, with John of Magistris (*q.3, scibili 3.*), say that the verb is the mark — that is, the sign — of the union of predicate with subject. Scotus indicates this (*6.Met., q.3. §. Sed quid.*). Dialectic makes use chiefly of only one verb — *sum*, which is called the substantive verb, perhaps so named because it underlies every predicate, so that it is understood in adjectival verbs as well — as "Peter disputes" is the same as "Peter is disputing." At times it is used adjectivally, as "he who walks is" — meaning, exists. Those who resist Aristotle's definition of the noun above equally resist the description of the verb here.

First Objection. The parts of a compound verb, taken separately, signify something — as is evident in the verb *circumeo*, which is composed of the adverb *circum* and the verb *eo*. Therefore the given description of the verb is not legitimate.

Reply. This instance is easily dissolved from what was said in the parallel case of the compound noun. For if the parts of a compound verb are disjoined from one another, they do not retain the same signification they had when joined together — as is conspicuous in some compound verbs, such as *circumdo*, whose parts are *circum* and *do*, and which manifestly do not retain the signification they had when previously joined once they are separated. This was pursued at length in the treatment of the noun, and it is equally applicable to the verb.

Second Objection. From infinite verbs, and likewise from verbs of past and future tense, propositions are constructed — for this is true: "Alexander heard Aristotle," and this: "Antichrist will be born." Moreover, some nouns lack the present tense, as *memini* (I remember). Therefore it is not necessary for the verb to be in the present tense of the indicative mood.

Reply. Infinite, oblique, and tense-deficient verbs belong to grammar; only the verb in the present tense of the indicative mood is proper to dialectic, as Peter of Spain teaches (*Tractatus de Enunciatione*, c.4.), along with other summulists. The authors cited adduce the grammatical description of the verb — namely, that a verb is an utterance conjugated through tenses — and attempt to import it into dialectic; but improperly, since these are essentially distinct faculties with distinct ends. For dialectic treats the verb and noun in order that from them the truth or falsity of an enunciation may be made manifest, and these properties of an enunciation depend on the present tense of the verb and the nominative case of the noun. Thus "Christ was born" is true, because at some time it was true to say "Christ is being born"; and "Antichrist will not be born" is false, because at some time it will be false to say "Antichrist is not being born." Add that even grammatically the said definition does not appear to be the genuine definition of the verb, because conjugation is accidental to the verb just as declension is to the noun, and nothing is properly defined through its accidental act but rather through its essence, as is universally conceded among philosophers. Hence the grammatical definition of the verb given by the author of the *Grammatica Speculativa*, chapter 10, is more apt: a verb is a part of speech signifying in the mode of being as distant from substance.

Question II. On the Essence of the Complex Term

Having explained the parts of the complex term, its entire essence is now to be examined, following the order we proposed above and which the Subtle Doctor indicates (*q.2 primi Post.*, §. *Ad primum.*).

Article I. Whether the Complex Term is Distinguished from the Sentence, the Proposition, and the Enunciation

A complex term, according to the force of the word, is the connection of one simple term with another, or that which embraces several simple terms — or, as others prefer, a complex term consists of several expressions standing in proper

relation to one another, as "a white man" or "a man is risible." Three questions arise. First, whether a sentence and a complex term coincide. Second, whether a sentence and a proposition are really the same. Third, whether a proposition and an enunciation differ from one another.

As to the first, to make the resolution clear, several senses of the word *sentence* must be introduced, followed by its definition. For *oratio* — sentence — as Vorrillongus notes (*q.4.d.22; 3.d.17.*), is said to be, as it were, the reason of the mouth; for a theologian it is the same as a devout disposition of the mind directed toward God, or, as Damascene teaches, an ascent of the mind to God. Thus it is found in *Psalm 87*: "Let my prayer enter before you"; and in *Psalm 34*: "My prayer in my bosom." For the rhetorician, a sentence is a persuasive proposition; hence the rhetorician is called an orator. For the dialectician, however, a sentence is described as a conventionally significative utterance some separate part of which signifies something, as found in *1.Periherm., c.4.* The earlier clauses of this coincide with those we adapted and explained above for the noun and verb. The later clauses are placed there to distinguish it from them. That the said definition of the sentence applies to the complex term is not denied by Arriaga (*disp.1.sect.5.*), though at (*disp.2.sect.1.n.7.*) he appears to think differently with Hurtado. Nor does it conflict with Aristotle (*1.Priorum, c.1.*), who in defining the syllogism says "a syllogism is a sentence, etc.," and at (*8.Met., Tex.9., cited by Scotus, 1.d.8.q.3, ante S.*) adds that a definition is a term or complex and is called a long sentence. The Doctor also accepts this (*Quol.13, in fine, sub NN.*; and *3.d.22.q.un. §. Rationes, sub C.*), and not in disagreement are the Conimbricenses (*1. de interpretatione, c.4.q.3.art.1.*) and several others. This can be seen from the fact that in a complex term either there are two simple terms without any bond — as "a white man" — and it is an imperfect sentence, as Fontanus notes (*c.1.prodig.*) and I indicated (*l.1.q.1.art.4.*); or there are two simple terms joined by a copula — as "a man is an animal" — and it is a perfect sentence, as no one denies. Hurtado at the place cited (*in 1.art. huius q., Sect.3.*) and Arriaga near the end of the first section do not agree with this; they define a sentence as a significative utterance composed of a noun and verb standing in proper relation to one another. This description is good grammatically but not logically; for propriety or impropriety of a sentence belongs to the grammarian, while it is the logician who attends to agreement or repugnance — that is, truth or falsity — as the author of the *Grammatica Speculativa*, chapter 18, teaches. For even if dialectic presupposes grammar and borrows proper speech from it, it should not be thought that both enjoy the same definitions of noun, verb, and sentence. And if the other real sciences presuppose dialectic, they do not for that reason employ, in setting out their own subject matter, the very same definitions — as is clear of the universal, which is defined differently by logic and by metaphysics, as may be seen at the place just cited (*q.3.art.1.*); and likewise of body, which is considered differently by physics and by medicine. Therefore the

definition of a sentence is not one and the same for the logician and the grammarian.

As to the second: Zabarella (*1.Post., circa textum 13.*) writes that a proposition regards the syllogism and is one of the premisses, but never the conclusion. Some, with Cicero, think that a proposition is that which holds the principal place in the syllogism. Philosophers commonly, however, use *proposition* for any enunciation, whether within or outside the syllogism — more frequently for the major, minor, or conclusion, as the Doctor indicates (*4.d.3.q.2.¶. Ad 1.arg., in fine;* and *d.8.q.2.¶. Aliter.H.I.K.*). For this reason we assert that a syllogism consists of three propositions. A sentence, however, seems to extend more broadly than a proposition: a syllogism, as the Philosopher testifies (*1.Priorum, c.1.*), is a sentence, yet it cannot be called a proposition, since it is constituted from propositions — for the same thing cannot be both constituting and constituted, both part and whole. A sentence also applies to more things than a proposition: every proposition is a sentence, but not conversely — every sentence is a proposition — as is clear from what was said above. And thus a proposition seems to differ from a sentence as the less common from the more common, or as a species differs from a genus, as Aristotle indicates (*1.Periherm., c.4.*; and *1.Praedicamentorum, c. de Substantia.*).

As to the third: some expositors of the Stagirite (as reported by Zabarella in the place cited above) establish a distinction between proposition and enunciation, saying that an enunciation is broader than a proposition — being simply an expression taken absolutely without regard to the syllogism — whereas a proposition is so called insofar as it is placed within the syllogism. Yet although this distinction was once acknowledged by some dialecticians, usage has prevailed such that one is used interchangeably for the other, as can be deduced from Scotus (*1.d.2.q.2.F.*; *d.40.q.un.B.*; and *4.d.8.q.2.N.*), and from Major (*in Logica, Tract. de propositione, fol.37, pag.2.*). Hence perhaps Aristotle's two books *On Interpretation* are entitled both *On Proposition* and *On Enunciation*, since proposition and enunciation coincide — which can be gathered from Aristotle himself, both in the books mentioned and in (*1.1.Priorum, c.1.*) and his commentators there.

First Objection. If the definition of the sentence given by Aristotle is admitted, a compound noun will plainly be a sentence, because its parts taken separately are significative — as if from the noun *circumsessio* one separates its parts *circum* and *sessio*, these utterances, separated from one another, still retain their signification, which they had when joined together. Therefore the definition of the sentence given by Aristotle is not properly assigned.

Reply. A similar instance was already dissolved above (*q.1.Art.1 and Art.2 of this book*) regarding the compound noun and verb. To avoid repeating what has been done, I pass over it here.

Second Objection. A complex term is one that consists of two expressions standing in proper relation to one another without a verb; but a sentence includes a verb; therefore a complex term and a sentence are not the same.

Reply. I distinguish the major: of a complex term taken absolutely, I deny it; of an indistant complex term, I grant it, as is clear from (*l.1.q.1.Art.4.*). To the minor I say it is to be granted of the perfect sentence, but not of the imperfect.

Third Objection. From the book cited above, a term is that into which a proposition is resolved; therefore a complex term and a proposition are not the same, since a proposition is composed of and resolved into terms as its parts, and — from Scotus (*3.d.2.q.2.art.1.C.*) — the whole is distinguished from its parts taken together.

Reply. The antecedent is true of the incomplex term, to which that definition belongs, not of the complex term of which we are speaking in the present context.

Article II. What the Complex Term Is

Two definitions of the complex term — or rather of the proposition — are given by Aristotle. The first is found at (*1.Periherm., c.4.*): a proposition is a sentence signifying something true or false. The second is had at (*1.Priorum, c.1., near the beginning*), and is derived from (*1.Post., c.1., Tex.13.*): a proposition is a sentence affirming something of something or denying something of something. The first definition is considered descriptive, because it is given through a property — namely, truth or falsity — which is a property of the proposition, just as even or odd is a property of number, as Scotus teaches (*q.1, predicamentali, ad finem*; and *1.Post., q.6, in calce.*). The second is called essential, because the essence of the proposition seems to consist in affirmation or negation. Yet since even this definition is not considered exact by many — as will be apparent from the objections raised and to be raised below — in order to remove all difficulty and explain the whole matter, a proposition taken universally can be described as a sentence of something about something. In this way it abstracts from affirmation and negation as a genus abstracts from its species, and from truth and falsity as an essence abstracts from its properties; and it is rightly divided into affirmative and negative as a genus into its species. This doctrine is touched upon by Aristotle (*1.Post., c.2., Tex.13.*; and *3. de anima, Tex.26.*), where he says a proposition is a sentence of something about something. Scotus (*q.52.Elench., §. pro solutione*; and *4.d.3.q.1.§. Aliter ergo, sub V.*) adds that a proposition abstracts from truth and falsity, and proves this on the grounds that every foundation is naturally prior to its accidental relation; but a proposition is the foundation of truth, which is an accidental relation, since it can be present or absent — just as the proposition can be conformable or disconformable to the thing. The Conimbricenses (*c.4.primi de Interpretatione, q.1.art.3.*) appear to favor the opposite view. The same is implied by Mastrius and Bellutus (*1. parte Inst.,*

Tract.2.c.3.), who defend the Conimbricenses' position, following Tataretus (*1.Perih., q.3.Scibili 3.*).

First Objection. From Hurtado (*disp.4.Sect.1.*): a definition explains not the property but the essence of a thing, as is clear; but the first definition of the proposition explains its property, as I said at the beginning of this article; therefore, etc.

Reply. I distinguish the antecedent: of an essential definition, I grant it; of a descriptive definition, I deny it. This was explained at the place just cited. And this is perhaps what Aristotle did, because truth and falsity are better known than affirmation and negation, especially to novice dialecticians, for whom easier things to know are to be proposed.

Second Objection. One of the laws of a good definition is that the definition converts with the defined, as we shall say at the end of this book; but truth or falsity does not reciprocate with the defined — for truth belongs to simple apprehension, which is not a proposition; therefore, etc.

Reply. The major is granted; the minor must be distinguished: of complex truth, I deny it; of incomplex truth, I grant it. For complex truth reciprocates with the proposition, just as risibility reciprocates with man.

Third Objection. A definition is not given through disjunction, nor is a genus defined through its species, according to the canons of good definition; but the said definitions are assigned through disjunction, as is evident on inspection, and the last definition is given through species, which we stated to be affirmation and negation; therefore, etc.

Reply. The major holds when the proper difference of the defined is known and named; but not when it is unnamed and almost unknown, as in the present case.

Fourth Objection. The mental proposition is a judgment by which we affirm or deny something of something; and to judge is to affirm or deny something of something. Therefore the vocal proposition corresponding to it is a sentence affirming or denying something of something, and not something abstracting from both — which Hurtado himself does not dare to deny at the end of the section cited.

Reply. I distinguish the antecedent: taken precisely and generically, I deny it; taken specifically, I grant it — as I noted above and explained not far before the first objection.

Article III. How Many Kinds of Complex Term There Are

The complex term — which, from what has been said, may rightly be called a sentence, proposition, and enunciation — admits of many divisions, which the Doctor recounts (*q.8.primi Priorum, §. Quantum ad 2.*). In the first place, a complex term can be divided according to the partition of the sentence. A sentence is

divided into perfect and imperfect. A perfect sentence is one that produces a complete sense in the hearer's mind — as "a man is an animal"; an imperfect one is that which produces an incomplete sense in the hearer's mind — as "a learned man." All of this regarding perfect and imperfect construction is taught by the author of the *Grammatica Speculativa*, chapter 19. Again, one sentence is interrogative — as *Matthew* 22: "Is it lawful to give tribute to Caesar?" — another imperative, as *Matthew* 11: "Learn from me, for I am meek and humble of heart." Another is optative — as *Isaiah* 64: "O that you would rend the heavens and come down." Another deprecativum — as *Isaiah* 45: "Drop down dew, ye heavens, from above." Another vocative — as *John* 7: "If any man thirst, let him come to me and drink." These kinds of sentences are used more by rhetoricians and poets than by dialecticians, who make principal use of sentences containing a verb in the indicative mood.

The first division of the proposition by species is into affirmative and negative, which the Doctor records (*1.d.4.q.2.§.1.Ad 1.arg.*). An affirmative is one in which the predicate is affirmed of the subject — as "a stone is a body." A negative is one in which the predicate is denied of the subject — as "a stone is not animate."

The second division, by parts, is into categorical or simple, and hypothetical or composite — which Scotus recounts (*q.3.primi Priorum*; and *1.d.39.§. Sed contra, infra I.*). A simple proposition is one that consists solely of one subject, one predicate, and a verbal copula — as "body is substance." A composite is one that is constructed from two simple enunciations — as "a man is risible, is teachable." More will be said about this in the following chapter.

The third division, by quality, is into true and false, of which the Doctor makes mention (*q.9.Secundi Perih.*; and *1.d.4.q.2.§. Respondeo*; and *Ad 1.arg.A.and D.*). A true proposition is one that conforms to the thing signified by it — as "a tree is animate." A false proposition is one that is disconformable to the thing signified by it — as "a stone is animate."

The fourth division, by essence and its mode, is into absolute and modal, which Scotus presents (*q.3.primi Priorum, vers. unde.*). This is rather a subdivision of the simple proposition, as is gathered from Aristotle (*1.Periherm., c.4.*), whom Fontanus follows (*l.3.Inst.Dialecticarum, c.3.*). An absolute proposition — also called by some a proposition *de inesse* (of inherence) — is described as one that designates something as belonging or not belonging to something — as "an animal is sensitive." A modal proposition is one that enunciates in what mode something belongs or does not belong to something; and this can be done adverbially — as "necessarily a man is an animal" — or nominally — as "it is necessary that a man be an animal."

The fifth division, by quantity, is into universal, particular, indefinite, and singular — which Aristotle recounts (*1.Periherm., c.5.*; and *1.Priorum, c.1.*) and Scotus at (*in fine, q.4.primi Priorum.*). A universal proposition is one whose subject

is qualified by a universal sign — such as *all* or *none* — as "every animal is sensitive," "no animal is a stone." A particular proposition is one whose subject is qualified by a particular sign — as "some animal is irrational." An indefinite proposition is one whose subject, though a common term, is not prefixed by any sign — as "a man is rational." A singular proposition is one whose subject is singular — as "Peter is a philosopher."

The sixth division, by matter, is into necessary, contingent, and impossible, as derived from Scotus (*1.d.39.*), following Aristotle (*1.Periherm., c.1.*). A necessary proposition is one in which there is an indissoluble bond between subject and predicate — as "an animal is sensitive." A contingent proposition is one in which the bond between subject and predicate is dissoluble — as "a man is white." An impossible proposition is one in which the subject and predicate are impossible with one another — as "a man is a stone."

The seventh division, into infinite and finite, is described by the Stagirite (*2.Periherm., c.1.*) and touched upon by the Doctor (*1.d.28.q.2.¶. Ad arg.G.*). A finite proposition is one whose subject or predicate receives no negation — as "a lion is capable of roaring." An infinite proposition is one some extreme of which is qualified by negation — as "a man is not-just."

The eighth division — from the Doctor (*1.d.2.q.2.¶. Ex his, sub D.; d.30.q.2.¶. Ad argumenta 1.q.; and 3.d.7.q.2.¶. Sed tantum.A.and C.*) — is into a proposition of two terms (*de secundo adiacente*), in which only a subject and verb are present — as "a man is" — and a proposition of three terms (*de tertio adiacente*), in which subject, predicate, and verb are all explicitly present — as "a man is prudent." This division is made by reason of the implicit or explicit predicate: for in the proposition of two terms, the predicate is suppressed — "a man is" being equivalent to "a man is existing" — whereas the proposition of three terms explicitly has a predicate, as is clear from the example.

First Objection. The species of a positive genus ought to be positive, since a species is constituted from genus and difference; but a proposition is a positive genus of affirmation and negation, being in the category of quality. Therefore its species — affirmation and negation — ought to be positive beings; but negation, as the very word indicates, is not a positive being; therefore, etc.

Reply. The major is granted; the minor may be distinguished: formally, I deny it — for in that sense it is a being of reason; materially, I grant it. This distinction is to be explained elsewhere. To the subsumption it may be said that under the name of negation a positive entity is understood, if it is taken materially — just as under the name of *irrational* a real positive entity is understood, which is held to be the essential constitutive difference of the brute.

Second Objection. Many more divisions of the proposition are enumerated than those we have recounted. Therefore the number of divisions given above is insufficient. The antecedent is proved: Scotus (*1.d.26.q.un.¶. Ad 1.tertia vie.Z., vers.*

Ad illud de supposito) offers a distribution into a proposition *per se* and *per accidens*; and (2.d.1.q.3., *circa D.*) into apprehensive and judicative; and all dialecticians commonly divide the proposition into natural, innatural, exceptive, exclusive, and reduplicative, and similar kinds, which will be explained more conveniently below.

Reply. The divisions we have adduced are the principal divisions of the proposition. Nor do we deny that others can be offered, as is inferred in the argument.

Article IV. On the Hypothetical Proposition

The hypothetical proposition, as I said in the preceding article, and as Peter of Spain teaches (l.1.c.15.), consists of two categorical propositions as its principal parts. The word *hypothetical* is derived from *ὑπό* — that is, *under* — and *θέσις* — that is, *position* — meaning, as it were, supposition, as Scotus notes (q.1.secundi Priorum, §. De 2.): because one of its parts is supposed under the other — or, what amounts to the same thing, one categorical proposition is supposed under another categorical proposition, as Fontanus touches upon (l.3.c.14.) and Peter of Spain expressly states at the place cited, with which the Doctor agrees (1.Priorum, q.3.§. Quantum ad 2.). According to this etymology, the hypothetical proposition is rightly distributed into conditional, copulative, and disjunctive; for in each of these three, one is presupposed to the other, as will be more clearly apparent through the examples given in the explanation of each hypothetical type. Hurtado (*disp.4.Sect.3.*) and Oviedo (*Controversia 3, puncto 3.*) — not having attended to this — hold that a hypothetical is a conditional that judges its object dependently on some hypothesis or supposition. For though every conditional is hypothetical, not every hypothetical is conditional; for *hypothesis* indeed denotes a condition, yet as Hurtado himself does not deny, it also denotes a supposition — and thus, according to this interpretation of the name *hypothesis*, all dialecticians rightly affirm that the hypothetical, taken generally, is a proposition composed of two simple ones. Moreover, a categorical and a simple proposition are the same, against Hurtado at the place cited. For from Aristotle and other dialecticians, a proposition is aptly divided into categorical and hypothetical; and according to the laws of good division, the dividing members are distinguished from one another. Therefore a hypothetical proposition cannot be categorical, just as a rational animal cannot be irrational, on account of their opposite differences dividing animal equally. It follows moreover that in Hurtado's view no other hypothetical would exist besides the conditional, which is false. Furthermore, *categorical* and *simple* mean the same among dialecticians: *κατηγορεῖν* is the same as demonstrating plainly or signifying openly. Therefore no distinction is to be established between a categorical and a simple proposition. And more so because dialecticians in using the words *categorical* and *categorematic* do not appear to be so scrupulous as not to apply them to any other sense than the predicative and enunciative, from itself and absolutely —

even if the literal meaning of those words indicates this, as Fontanus rightly observes (*l. de terminis Philosophicis*). Now, the threefold number of species of the hypothetical proposition is to be explained; their sufficiency arises from the threefold comparison of a conjunction with simple enunciations. If the hypothetical consists of two simple propositions, and the first is marked by the conditional particle *if*, with one derived from the other in an illative order, it is called a conditional hypothetical proposition — which Scotus mentions (*1.Periherm., q.8.*): as "if the sun shines, it is day"; and *Matthew 4*: "If you are the Son of God, command these stones to become bread." But if there are two categories united by the copulative particle *and*, a copulative hypothetical is obtained — as *Genesis 17*: "Walk before me and be perfect"; and *Exodus 3*: "I will be with you, and you shall have this sign." But if one simple enunciation is disjoined from another by the disjunctive particle *or*, a disjunctive hypothetical arises — as *Matthew 18*: "Where there are two or three gathered in my name, I am in their midst." The Doctor observes (*4.d.3.q.2. §. De secunda, sub M.; d.8.q.2., ante §. Aliter B.; q.10.Elench.; and 1.Priorum, q.10, in fine*) that the disjunctive does not posit determinately and indifferently one or the other — as "an animal is either rational or irrational." To the conditional are reduced the causal — as "because a mixture is composed of four elements, it is corruptible" — the temporal — as "when the soul informs the body, the body itself is animated" — and the local — as "where there is sensation, there is sense." A conditional can be formed in two ways: in one way from necessary matter, in which the consequent necessarily follows from the antecedent — as "if a man runs, he necessarily moves"; in this sense, dialecticians say that all true conditionals are necessary, and all false ones are impossible. In another way from contingent matter, in which the consequent follows contingently from the antecedent, such that it can fail to follow — or even the contrary of the predicate with the subject can occur — as "if you come to me tomorrow, I shall read," where tomorrow's lecture is not necessarily going to happen, but is only according to the decree of my will, which has freely so determined, if you come to me tomorrow, though I can choose not to read tomorrow if I wish. Whether the consequent is inferred from the antecedent on account of conditions to be laid down, and such an order of things to be provided — and whether God has conditional knowledge of conditionals, distinct from natural and free knowledge — is not a matter for the present inquiry. I have argued about it at length in my *Treatise on the Knowledge of God*, where I defend neither the Thomistic nor the Jesuit positions, but follow the way of the Subtle Doctor, which is partly favorable and partly opposed to both sides, as seems to me to be the view more conformable to the harmony of free will with the efficacy of divine grace.

First Objection. *Categorical* is the same as predication, and a categorical term is absolutely and through itself significative; therefore a categorical proposition does not convert with a simple proposition. The consequence is proved: a

composite proposition can be categorical — as "Peter reads and John writes," which is an absolute and perfectly significative enunciation.

Reply. The consequence is denied; in reply to its proof, I say that proposition is a copulative hypothetical, as I showed above.

Second Objection. A copulative proposition is not conditional, nor can any conditional be formed from it. Therefore a copulative cannot be hypothetical, for *hypothesis* means the same as *condition*, and *hypothetical* coincides with *conditional*.

Reply. The antecedent is granted; the consequence is denied; the reason for this denial was given at the beginning of the present article.

Question III. On the Matter, Form, Quality, and Quantity of the Proposition

We must deal first with the matter and form, as well as the quality and quantity, of the categorical proposition; and afterwards with the same as they pertain to the hypothetical.

Article I. On the Matter, Form, Quantity, and Quality of the Categorical Proposition

Most dialecticians have made no mention of the form of the categorical proposition — perhaps because, since a proposition is not a physical whole, it is not composed from a form as one of its parts. Hence, supposing that it has neither form nor matter, they consequently did not treat them. Although above we made mention of its matter, which cannot appear to exist without a form, nevertheless the matter we referred to there is not material cause — *materia ex qua* — but the matter with respect to which — *materia circa quam* — which belongs to anything that is presented to, or made subject to, the judgment of the intellect. For this reason it is called by some the subject matter. Those who admit matter and form taken metaphorically — among them Mastrius and Bellutus (*1.p.Inst., Tract.2.c.4.*) — hold that the matter of the proposition is the objects about which the proposition is formed, and the form is the copula — affirmation or negation. But these do not satisfy: first, because they do not assign the material cause — *materia ex qua* — which they are obliged to give, but rather the material with respect to which, of which I made mention in the preceding question, article 3, and about which there is no doubt at this point, as I indicated just before. Then, because the verb, being the copula or union of subject with predicate, does not appear to be the form but rather the bond between the two. Likewise, the philosophers' commentators on (*2.Phys.*) affirm — and Scotus agrees (*3.d.2.q.2.art.3, sub E.*) — that the union of matter and form properly speaking is not itself the form. It may however be said that the predicate is the form of the simple proposition, and the subject its matter, and the verb the link

of both. For the account of being a subject is called material, since it is proper to matter to be subject or to underlie form — hence in (*1.Phys., Tex.82.*) matter is defined as the primary subject of each thing, from which it comes to be. And the account of being a predicate is called formal, since what inheres in another and informs or constitutes it is predicated of the very thing it constitutes. From this arises the logical distinction between material being and formal being: an entity called material is one capable of being a subject, and an entity called formal is one capable of being a predicate. This doctrine is taught by Scotus (*2.d.3.q.6.§. Ad q. respondeo, sub H.*), indicated in (*q.11.Universalium, §. Ad 1.q.*) and explained there by Sarnanus (*q.9, pag.163.*), whom Trombetta (*in Met., q.19, fol.39.*) and Raconius (*q.3. de Enunciatione, parte 2.*) follow.

Quantity — which the Philosopher defines in the Categories as that according to which something is said to be *how much*, and which we described in (*q.4.libri primi, art.6.*) as a being extended through itself — is, in our consequent treatment of the quantity of the proposition, the extension of the subject, not of the predicate. For even if the predicate is singular, so long as the subject is universal, the proposition will be universal — as in "every creator is God," where *God*, which is the predicate, is singular, and *every creator*, which is the subject, is universal. Thus the proposition draws its universality, or particularity, or singularity from the subject that is found in it. Since the subject can be extended in four ways, a fourfold quantity is accordingly enumerated. For either the subject is extended to all those things to which it can pertain with respect to the predicate by which it is characterized — and if it is marked by a universal sign, the proposition is universal, as "every man is rational" — or it is extended to only one particular, and if it is prefixed by a particular sign, the proposition becomes particular, as "some man is learned" — or the subject, though common to many, is nevertheless qualified by no sign, and it is an indefinite proposition, as "a man is an animal" — or the subject is a determinate singular, and it becomes a singular proposition, as "Paul is a Tarsian."

The quality of a proposition can be assigned as twofold: one essential — in which case affirmation or negation can be called its essential quality, according to its definition given and explained in (*art.2.q.2 of this book*). For the essential difference of a thing is called its quality by Aristotle (*5.Met., Tex.19.*); and Porphyry in the *Isagoge* (*c. de differentia*) and the other dialecticians affirm that an essential difference is predicated of its inferiors *in quale quid* — in essential quality. The other quality is accidental — such as truth or falsity — as Aristotle (*c. de substantia*) and Scotus indicate (*4.d.8.q.2., sub*; and expressing this distinction at *3.q.1.d.1.art.3, sub D.*), where he says that *quale* taken generally is divided into substantial *quale* and accidental *quale*. The first does not belong to any species of quality insofar as quality is a supreme genus, for it is not called quality absolutely but with an addition — that is, essential quality. The second, however, especially does belong to it, since there is one category in which all accidental qualities are placed, as may be seen in (*l.1.q.4.art.7*). Therefore the division of

quality given above should not be criticized, as Hurtado does (*disp.4.Sect.2.*), for it is quite familiar to philosophers and plainly appropriate, as I showed in (*lib.1.q.3.art.5*; and *q.4.art.4.*). And Hurtado himself appears to sense this (*sect.6.7. of the cited disp.*); and at (*sect.5*) he had shown that conversion is sometimes in quantity and sometimes in quality — but that quality is what makes one true or false, affirmative or negative, as Hurtado himself objects. Therefore, unwillingly, he falls into the very distinction he attempts to reject.

First Objection. A proposition is of necessary matter when between its subject and predicate there is a necessary relationship, and it is of contingent matter when between subject and predicate there is a contingent relationship; likewise a proposition is said to be of impossible matter when between its subject and predicate there is a repugnant and impossible bond. Therefore the relationship of subject to predicate should be called the matter of the proposition, not the subject itself.

Reply. The antecedent is granted; the consequence is denied. For since a relationship is formally a relation, it cannot in any way be matter. Therefore the subject is held to be the matter of the proposition — and if the predicate flows necessarily from it, the subject is called necessary matter; if contingently, contingent matter; and if it is repugnant for the predicate to flow from it, impossible matter.

Second Objection. It is proper to matter to be determined, and it is proper to form to determine, as all concede; but the subject is not determined by the predicate, nor does the predicate determine the subject, because the subject is the cause of the predicate, and a cause is not determined by its effect, since it is prior to it. Therefore the subject cannot be the matter of the proposition, nor the predicate its form.

Reply. The major is granted; the minor is denied. For although a cause is prior to its effect, it can nevertheless be in some manner determined by its effect — just as matter is prior to form, which nevertheless determines it, because form is matter's formal act.

Article II. On the Matter, Form, Quantity, and Quality of the Hypothetical Proposition

Just as the matter of the categorical proposition is one subject and one predicate, so the matter of the hypothetical proposition is the twofold subject of its two simple propositions, and its form is the twofold predicate of those same two categorical propositions. For the hypothetical is composed of two categoricals, as I said in (*q. preceding, art.3.4.*). Therefore it must necessarily consist of their subjects and predicates as form and matter. Among hypothetical propositions, some are necessary, some contingent, some impossible, and some possible — just as was said above of categoricals. A hypothetical proposition

does not possess a different quantity from that of the categorical: a hypothetical is universal if both categoricals are universal — as "every lion is sensitive, and every lion is capable of roaring." A hypothetical is particular if the categoricals are particular — as "some man is learned, and some man is prudent." If one categorical is particular and the other universal, the proposition may be called mixed — as "some man is modest, every man is teachable." The case of affirmation and negation is not the same for a categorical and a hypothetical: a categorical is affirmative when the predicate is affirmed of the subject, and negative when the predicate is removed from the subject. But since the hypothetical involves a conjunction or condition, it is affirmative when its conjunction or principal copula is affirmative — as "Peter is risible, Bucephalus is capable of neighing" — and negative when its conjunction is negative — as "Peter is not a stone and a lion is not a tree." The quality of a hypothetical is not unlike that of a categorical: the quality of both is the same — that is, truth or falsity. For a copulative is true when both categoricals are true; false when both categoricals are false, or when either one is false. The reason why truth in a hypothetical requires both categoricals to be true, while for its falsity one false categorical suffices, can be given from Dionysius (*l. de Divinis nominibus, parte 4.*): because good is from one and complete cause — that is, from an integral cause possessed of all its circumstances — as the Doctor expounds (*Quol.18. §. De 1. sub H.*); but evil is from particular defects or from any defect whatsoever. This is perhaps better illuminated by the common saying: to construct requires many things; to destroy it suffices to have one. For a disjunctive to be true, only one of its parts need be true — as "an astrologer either is or is not an astrologer"; the reason is that — as Boethius, cited by the author of the *Grammatica Speculativa*, chapter 13, states — a disjunctive conjunction does not permit both to exist simultaneously; and it is further said there that a disjunctive conjunction joins two extremes, distinguishing them from a third. If sometimes the disjunction does not appear to separate one part from the other, this perhaps occurs because we use that mode of speaking to declare that at least one need not be the case, or that the other suffices. Our Lord Christ uses this formula in *Matthew 18*, saying: "Where there are two or three gathered in my name, I am in their midst." And in *Luke 2* it is read: "They offered for him to the Lord a pair of turtledoves, or two young pigeons." Nor do the arguments that Arriaga (*disp.secunda, sect.tertia, n.15.*) marshals against this teaching prove anything more.

Objection. A conjunction contributes nothing to affirmation or negation. Therefore the affirmation or negation of a hypothetical proposition is not to be sought from the affirmative or negative conjunction.

Reply. The antecedent is proved: affirmation or negation is taken from the agreement or disagreement of subject with predicate. I deny the antecedent; to its proof I say this holds for the categorical, but not for the hypothetical proposition.

Question IV. On the Opposition, Equipollence, and Conversion of Simple Propositions

Three things are proposed for examination in the present question, which will be briefly and clearly handled and resolved through the four following articles.

Article I. What Opposition of Simple Propositions Is, and How Many Kinds There Are

Opposition is described by Aristotle (*1.Periherm., c.4.*) as the affirmation or negation of the same thing about the same thing, not equivocally. Which is to say: opposition is the repugnance of two propositions having the same subject and the same predicate, taken in a univocal signification, by reason of affirmation and negation. Most add — and rightly — also by reason of quantity and quality, because subalterns, as will be said below, agree in quality and differ only in quantity; for one is universal and the other particular, though both are affirmative or both negative. From the description of opposition given above, several conditions required for it can be gathered. First, both opposed propositions must consist of the same subject and predicate — for lack of which these do not stand opposed: "every lion is capable of roaring, no man is capable of neighing," since they have different subjects and predicates. Second, the same verb must be retained in both — for which reason these do not mutually conflict: "Peter reads, Peter does not walk," since each has its own verb. Third, univocal signification is required — and so these are not opposed: "a lion is capable of roaring, a lion is not capable of roaring," if the first is understood of a living lion and the second of a painted lion. Fourth, the same time and place are required — and so these are not opposed: "Peter loves God, Peter loved God," or "the air is healthful in the fields, the air is not healthful in the squares." This last condition, however, holds only in contingent matters, not in necessary matters, which abstract from all time, place, and existence — and concerning these, there are propositions of everlasting truth, of which I shall treat at length in our fuller questions in this work, (*l.4.*).

A fourfold opposition is enumerated by Aristotle at this point (*c.11.*), Scotus (*q.38, predicamentali, Ad 2.q. dicendum*), and the summulists commonly: contrary, subcontrary, contradictory, and subaltern. Its sufficiency can be gathered as follows. Either we enunciate of a universal universally, affirmatively and negatively — and contrary propositions arise, as "every man is just, no man is just." Or we enunciate of a universal not universally, affirmatively and negatively — and subcontraries arise, as "some man is just, some man is not just." Or we enunciate of one universal universally, and of the other not universally — and contradictories result, as "every man is just, some man is not just." Or we affirm or deny something universally of something, and affirm or deny it particularly of the same thing — and subalterns emerge, as "every man is just, some man is just."

The quantity of a proposition, broadly speaking — since it is its extension, as I said in (*q.3.art.1 of this book*) — can be a ground of opposition: for just as great and small are said to be opposites, as Aristotle seems to concede (*c. de quantitate*), so a proposition, since by reason of its quantity it can be called large or small, or more or less extended, as more or less universal — those that differ only in quantity, as subalterns, are not wholly to be excluded from the category of opposites. Especially since subcontraries differ from one another only in quality: for both are particular — one affirmative, the other negative. And this is consistent with Aristotle, who in defining the propositions enumerated above makes clear mention of their quantity: he says of contraries that we enunciate universally; of contradictories, universally with respect to one and particularly with respect to the other; but the quantity of a proposition consists in universality or particularity, even in the view of those who strive to eliminate the opposition of subcontraries and subalterns. Accordingly, propositions are either opposed in quantity and quality, or in quality alone, or in quantity alone, as may be seen in the present table, indicated by Scotus (*1.2.Perih., q.6., vers. Item hac est una.*).

First Objection. From Fontanus (*l.1.Inst., c.6.*) and Arriaga (*disp.2.Sect.2.subsect.1.*): Aristotle does not enumerate subcontraries; therefore they should not be classed among the opposites. It is confirmed: they are not opposed in respect of truth; therefore they have no place among the opposites. It is confirmed again: they do not share the same subject; therefore they lack one of the conditions required for opposition. It is confirmed a third time: subcontraries can both be true simultaneously, and truth is not opposed to truth; therefore, etc.

Reply. Aristotle made mention of subcontraries in two places: namely, (*1.Periherm., c.5.*), where, according to Toletus, he understands subcontraries by *non-contraries*; and (*2.Priorum, c.13.*), where he expressly treats subcontraries. Even if Aristotle had not taught this, it would not follow that they are not to be admitted — an argument drawn from negative authority does not conclude. Add that subcontraries are opposed in quality; and if in them there is no truth, at least falsity is found in them, as all acknowledge: therefore such propositions are not exempt from opposition. To the first confirmation: it suffices if they are opposed according to some species of quality, as falsity is. To the second confirmation: the antecedent is denied — for man, for example, under the particular sign is the same subject of both subcontraries, just as in contraries man under the universal sign is the same subject of both. To the third: though both can be simultaneously true, they cannot both be simultaneously false — just as contraries are excluded from being simultaneously true — and for this reason they are not exempt from the opposites, as Tataretus (*1.Perih., q.4.Scibili.*) and Mastrius and Bellutus (*Tract.2.Inst., c.8.*) imply.

Second Objection. In subcontraries, the running of one subject — say Peter — is affirmed thus: "Peter runs"; and of another — say Anthony — the running is

denied thus: "Anthony does not run." Therefore, since there is no repugnance with respect to the same thing in the same regard, no opposition is involved in subcontraries.

Reply. Opposed propositions require the same subject; and if the subject is changed, there will be no opposition, as the argument proves — and this was noted near the beginning of the present article.

Third Objection. Hurtado (*disp.4.sect.7.*) attempts to defend only one opposition — namely, contradictory — arguing that formal opposition with respect to quality is obtained on account of two singular propositions mutually contradicting one another. Therefore only contradictory opposition is to be admitted.

Reply. The antecedent is denied. For as Hurtado himself frankly admits there, oppositions are required in proportion to their opposed objects, and thus there will be as many distinct oppositions as there are distinct opposed objects. Now besides determinate singular contradicting objects, there are given universal contradicting and contrary objects, as well as particular ones. Therefore more than one opposition must be posited. The major is at hand. The minor is urged from the descriptions of contraries, contradictories, and subcontraries given above, and from the division of things into universals and singulars, which the Philosopher presents at the beginning of the cited chapter, and also from the definition of opposition given there, which belongs formally to others besides contradictories, as I brought out and deduced above. For it consists in affirmation and negation, or in truth and falsity, as Hurtado himself maintains. But affirmation and negation, truth and falsity, apply not only to contradictories but also to contraries and subcontraries. Hurtado's foundation therefore collapses — especially because opposed universal propositions enjoy their own proper opposition distinct from singulars, just as they have their own distinct entity from them. I would note here that in the view of many, the truth of a universal proposition depends almost entirely on the truth of a particular; for given any particular false instance, the whole proposition is false. If this singular is false — "Peter is a stone" — then the universal is false — "every man is a stone."

Article II. On the Canons of Opposed Propositions

Among contrary opposites, this canon is observed: if one contrary is true, the other is false — but not conversely. Both moreover cannot be simultaneously true. The reason is that if two contraries were simultaneously true, then contradictories would be simultaneously true, which is impossible: for if two contraries are both true — both being universal — say "every dog is capable of barking, no dog is capable of barking" — it correctly follows that two particular propositions are true, the negative of which contradicts the universal affirmative — as "some dog is not capable of barking: every dog is capable of barking" — and the affirmative of which contradicts the universal negative — as "no dog is

capable of barking: some dog is capable of barking." But from the falsity of contraries, the falsity of particulars does not follow — just as from the falsity of a subalternating proposition the falsity of the subalternated does not follow: even if this is false — "every man is learned" — it does not therefore follow that this is also false: "some man is learned." Therefore concerning necessary contraries this rule is always to be observed: of the two, one is always true and the other false. Concerning contingent contraries, however, both can be simultaneously false — as "every man is just, no man is just."

The canon of subcontraries is this: in necessary matters, if one is true the other is false — as "some man is an animal, some man is not an animal." In contingent matters, both can be simultaneously true — as "some man is learned, some man is not learned."

Concerning contradictories, this canon is transmitted: two contradictories can be neither simultaneously true nor simultaneously false. The reason is that for the same thing to be and not to be simultaneously is repugnant; for everything either is or is not, and of everything it is true to affirm or deny — which is the most known and most universal principle of metaphysics.

The canon of subalterns is that if the subalternating proposition is true, the subalternated is likewise true — as "every man is an animal, some man is an animal." But if the subalternating is false, it does not correctly follow that the subalternated is false in contingent matters — as if this is false, "every man is just," it does not therefore follow that this is false, "some man is just." The reason is that the subalternating extends more broadly than the subalternated: hence for its truth more is required. But from the falsity of the subalternated, the falsity of the subalternating follows — as if this is false, "some man is just," the following will certainly be false: "every man is just." The reason is that for falsity less is required than for truth — as is clear from a parallel with the copulative proposition in (*q.3.art.2 of this book*).

Objection. These are contradictories: "only a man runs, not only a man runs," and yet both can be simultaneously false. Therefore the canon of contradictories is not always true. The antecedent is proved: the particle *not* falling over the whole proposition renders it contradictory to the affirmative. The consequence is drawn: if no one runs, this is false — "only a man runs." And likewise this is false — "not only a man runs" — given that neither a man nor anything other than a man runs.

Reply. Whatever others say, the antecedent must be denied. In reply to its proof I say that of mutually contradictory propositions, one is universal and the other particular — which the propositions cited are not; for they are explicable and are expounded thus: "only a man runs" — "a man runs and nothing other than a man runs." "Not only a man runs" — "a man runs and something other than a

man runs." This I explained at length in a parallel case in (*Tract. de Deo uno, disp.6.q.3.*) with Scotus (*1.d.21.l.1.S.Bon.*) and other scholastics there.

Article III. On the Equipollence of Simple Propositions

Equipollence — of which the Subtle Doctor makes mention (*q.5.primi Priorum*; and *q.13, ad finem*; and *q.14.§. Notandum*) — is the equal force and value of two simple propositions consisting of the same subject and predicate, with negation prefixed or postfixed to their universal or particular signs. Thus "every man is a liar": its contradictory is "some man is not a liar," and its equipollent is "not-some man is not a liar." For two negations affirm, and one alone negates — being of a destructive nature, it destroys what follows it; for if placed with a universal, it makes it particular, and if prefixed to an affirmative, it renders it negative — according to which rule these are equipollent: "some man is not a liar, not-every man is a liar." To correctly form equipollents, the following canons are to be observed. The first: in contradictories, for equipollents to be formed, negation is to be prefixed to the sign, as is clearly evident from the examples just given. The second: in contraries, for equipollence, negation is to be postfixed to the signs and subjects — as "every man is a liar: no man is not a liar"; and likewise "no man is a liar: every man is not a liar" are equipollent. The third: in subalterns, for equipollence, negation is both prefixed and postfixed — as "every man is a liar: not-some man is not a liar." Similarly, "some man is a liar" and "not-every man is not a liar." And finally, "no man is a liar" and "not-some man is a liar" are equipollent. The canons named above are indicated by this verse:

Prefix for contradictories, postfix for contraries, both prefix and postfix for subalterns.

The explanation of these words, so that every equipollence of opposed propositions may be achieved, is as follows. *Prefix for contradictories* — that is, so that two contradictories become equipollent, negation is to be prefixed. *Postfix for contraries* — that is, in contraries, negation is to be postfixed, so that they become equipollent. *Both prefix and postfix for subalterns* — that is, for opposed subalterns, negation is to be both prefixed and postfixed, so that they become equivalent. So that this may be better understood and more easily performed, the signs by which — with negation prefixed or postfixed — universals are rendered particulars and particulars are rendered universal must be distinguished. For this reason dialecticians composed the following verses:

Not-every, some; not-every-not, as-it-were-none. Not-none, some; but none-not amounts to every. Not-some, none; not-some-not amounts to every. Not-the-other, neither; neither-not yields both.

First Objection. If several propositions were equipollent, several propositions would contradict one and the same proposition; but this seems to be false, because only one thing is contrary to one thing, according to the scriptural saying: "God made all things in pairs, one against one, and two against two." Therefore the equipollence of propositions does not appear to be admissible.

Reply. It may be said that several non-equipollent propositions do not contradict one proposition; yet several equipollent ones can contradict one. Nor does the scriptural saying conflict with this, because there it speaks of simple and incomplex physical opposites, not of complex ones such as propositions.

Second Objection. No law, norm, or mention has been made of the equipollence of subcontraries. Therefore the rules given above for the equipollence of propositions are deficient and insufficient. The antecedent is clear from the verse given above. The consequence holds: equipollence is a property of propositions, therefore a canon of equipollence should be assigned to opposed subcontraries as well.

Some reply that the canon in subcontraries is exactly the same as in contraries, and hence no special mention was made of them above. Against this: the law of equipollence in contraries is that negation be postfixed, as I observed above; but a postfixed negation does not make subcontraries equipollent, as is evident in these: "some man writes, some man does not write" — if you add a negation to the first, you get "some man does not write," which is not distinct from the second; and if you join a negation to the second — "some man not, does not write" — the negation is uselessly repeated; and if you prefix a negation to either — "not-some man does not write" — this will not be a subcontrary, for *not-some* is equivalent to *every*, as is clear from what was said. Therefore that mode of making subcontraries equipollent is void. Others, to whom Mastrius and Bellutus (*c.8.Tract.2.*) give their assent, say that the negation is to be postfixed not adverbially but nominally — as in *nullum* (no) — as may be seen in these: "some man is white, some man is not white"; the equipollent of the latter is "some man is white-of-nothing." Against this: *nullum* is not properly a negation but a universal negative sign. And likewise it is neither a noun nor an adverb, as is clear from what was said; therefore it can be taken neither nominally nor adverbially; nor is this a proper but an unusual locution. Therefore the said mode of rendering subcontrary propositions equipollent is invalid, and accordingly the common view of the summulists is to be followed: that no equipollence is to be admitted in subcontraries. This is no surprise, for just as not all modes of the figures can be reduced by the ostensive path to the four modes of the first figure, as will be said in the following book, so among opposed propositions, subcontraries cannot become equipollent. This can also be shown and illustrated in the case of nouns, some of which are indeclinable, and in the case of verbs, some of which lack past tenses and supines. Thus there is no inconvenience in subcontraries being unable to participate in equipollence.

Article IV. On the Conversion of Simple Propositions

Conversion is the transposition of extremes, which occurs when what was the subject in one proposition becomes the predicate in another, and the predicate becomes the subject, with quantity and quality either remaining or being

changed — as "a place is not a body; therefore a body is not a place." The first proposition is called the *conversa* (converted), because its terms are transposed; the second is called the *convertens* (converting), because it is formed from the transposed terms. And from one the other is inferred — that is, from the converted the converting is deduced, as is clear from the example given. Scotus indicates this (*1.Priorum*, q.5; q.9; q.10; q.12; q.13; q.14.).

Three kinds of conversion are enumerated: simple, per accidens, and by contraposition. Simple conversion — also called conversion in terms — is effected by transposing only the terms, namely, the subject into the predicate and the predicate into the subject, retaining the same quantity and quality. This conversion is accomplished in two ways: in one way through universal negative enunciations — as "no fish is a tree; therefore no tree is a fish"; in the other way through particular affirmatives — as "some fish is living; therefore some living thing is a fish." Conversion per accidens occurs when the terms are transposed and the quantity changes while the same quality persists. It happens in two ways: either when both propositions are negative — one universal and the other particular — as "no stone is animate; therefore some animate thing is not a stone"; or because one is universal and the other particular, both affirmative — as "every body is substance; therefore some substance is a body."

Conversion by contraposition occurs when, with the same quantity and quality persisting, the finite terms become infinite. It can be done in two ways. First, when a universal affirmative of finite terms is changed into a universal affirmative of infinite terms — as "every man is an animal; therefore every non-animal is a non-man." Second, when a particular negative of finite extremes is converted into a particular negative of infinite extremes — as "some substance is not a body; therefore some non-body is not a non-substance." Scotus makes mention of this (*1.Priorum*, q.15. §. *Quantum ad 2.*).

Some moderns, including Arriaga, ask whether only the subject is to be made infinite, or both the subject and predicate simultaneously. This difficulty is resolved from the description of conversion given above. For it was said that this third conversion occurs when its terms go from finite to infinite through the addition of negations; and if only the subject were to be made infinite, only the subject should be mentioned in the said definition as going from finite to infinite. Moreover, unless both terms were to be made infinite in this conversion, the same quality would not be preserved in the converted and converting propositions — for one would be affirmative and the other negative, as is seen in these: "every man is an animal; therefore every non-animal is not a man." But if the predicate is made infinite along with the subject, both are affirmative — because every infinite is affirmative, as Arriaga concedes (*d.2.subsect.5.*). Furthermore, since a negation falling on a noun makes it infinite — and does not negate, as the same Arriaga does not deny (*disp.1.*) and repeats (*disp.2.subsect.4.*) — but if negation is added to the verb, as "Peter does not run," it

is opposed to "Peter runs" — therefore, unless the predicate is made infinite, the proposition is in no way affirmative. This is further clarified in the propositions of the second mode pertaining to this last conversion: both are particular negatives, and the converting cannot be formed unless both the predicate and the subject are made infinite, as is clear from the example cited. Nor should any condition or existence of a thing be appended here, as Hurtado thinks (*disp.1.sect.5.n.17*): since all necessary propositions, of which we gave examples above, abstract from all existence of a thing. Therefore no condition or existence of the thing is necessary.

So that the method of constructing these three conversions may be committed to memory, dialecticians composed these verses:

FE is simply converted, EU per accidens. AS by contraposition — so the whole conversion is effected. A affirms, E negates — both universally. I affirms, O negates — both particularly.

In these verses four letters are noted — A, E, I, O. A denotes the universal affirmative; E, the universal negative; I, the particular affirmative; and O, the particular negative. And in the first two verses there are three expressions — *Feci*, *Eua*, and *Asto* — which represent the three conversions enumerated above. *Feci* refers to the first conversion, in which are found E — denoting the universal negative — and I — the particular affirmative — both to be converted by it in the manner explained above. *Eua* refers to the second conversion, which applies to E and A, denoting the universal negative and universal affirmative to be converted by it, as I showed through examples. *Asto* is composed of A and O, which signify the universal affirmative and particular negative to be transposed by this conversion, as I made clear above.

First Objection. "No animal is falsely a body; therefore no body is falsely an animal." This conversion is not valid, since the antecedent is true and the consequent false; and thus the universal negative is not converted by simple conversion.

Reply. Conversion is not to be performed in the manner found in the objection, but rather thus: "nothing that is falsely a body is an animal."

Second Objection. If the universal negative is converted per accidens, this — "no man is a woman" — would have to be converted into this — "some woman is not a man" — which is false. Therefore the canon of the second conversion is not correctly assigned.

Reply. The said universal negative is to be converted as follows: "some woman is not some man" — which is true and legitimate.

Question V. On the Modal Proposition

Nearly the same things are investigated in the modal proposition as in the absolute, as the Subtle Doctor indicates (*1.Priorum*, q.3.§. *Quantum ad 2.*; q.48, *ad finem.*). Therefore from what has been said about the absolute, what we are about to say about the modal can easily be understood.

Article I. What the Modal Proposition Is, and How Many Kinds There Are

The modal proposition — which Scotus mentions (q.25.m.§. *Quantum ad 1.*; and 2.d.3.q.9.) — is described as one that is qualified by some mode — as "it is necessary that a man be an animal," where *necessary* is the mode, by reason of which the proposition is called modal. A mode can be defined as that which modifies a proposition, or restricts its signification to a certain and determinate thing — as Scotus notes (*cit.* q.26.§. *Quantum ad 1.*); or, as Peter of Spain teaches: a mode is the determination of an adjacent thing. Thus *necessary* determines only those things that are bound together by an indissoluble bond, as is evident from the example given above. *Contingent* is the mode that limits those things that are joined by a dissoluble bond, such that they can be either conjoined or disjoined — as "it is contingent that a man be white." *Possible* is the mode that determines those things that exhibit no mutual repugnance — as "it is possible that a man be blessed." Now *possible* extends more broadly than *contingent*: for what is necessary is indeed possible, but it is not contingent; hence *possible* appears to abstract from necessary and contingent. *Impossible* is said of those things that are mutually repugnant — as "it is impossible that a man be a stone," since man and stone are mutually impossible terms. The description of mode given by the Scotists (*Tract. Formalitatum*, art.1.partiali), from Scotus (1.d.8.q.3.) — a mode is that which, added to a thing, does not change the thing — does not appear to be at odds with the description of mode given above: for when any of the said modes is added to a categorical proposition, the proposition itself is not changed but only modified.

In proportion to the four modes named above, a fourfold modal proposition is enumerated by Aristotle (2.*Periherm.*, c.2.) and Scotus (q.26.*primi Priorum*, §. *Quantum ad 2.*). The first is called the modal of necessity, which enunciates something as necessarily belonging to something. The second is the modal of contingency, which enunciates something as contingently belonging to something. The third is the modal of possibility, which enunciates something as able to belong to something. The fourth is the modal of impossibility, which enunciates something as repugnant to something. All these have been illustrated and confirmed by examples above; and they can be formed either nominally — when the mode is a noun, as "it is necessary that a tree be a body" — or adverbially — when the mode is an adverb, which among logicians is called a syncategoreme, as "a man is necessarily rational." Furthermore, as the same Doctor notes (*ibid.*, q.27.§. *Quantum ad 1.*; and §. *Quantum ad 2.*): in a modal proposition two things are found — the mode and the dictum. The mode has

already been explained by us; the dictum is everything placed in the modal besides the mode — perhaps so named because the mode is said of it.

First Objection. The definition of mode given by Peter of Spain belongs to an accident, which is adjacent and inheres in a subject; but an accident is not a mode, as is evident in itself. Therefore the definition of mode is not adequate and correct.

Reply. The major is to be taken of adjacency taken in a first-intentional, not a second-intentional, sense: for the mode of which we speak is adjacent to a proposition insofar as the latter is taken in a second-intentional sense.

Second Objection. No subject and no predicate is the determination of the copula; but the mode regards the subject or the predicate; therefore the mode is not the determination of an adjacent thing.

Reply. This instance is to be dissolved by the same distinction by which the preceding was dissolved. Thus the major is true taken in a first-intentional sense, but not in a second-intentional sense.

Article II. On the Matter, Form, Quantity, and Quality of the Modal Proposition

Just as in the hypothetical proposition the twofold subject of two simple propositions is its matter, and the twofold predicate of the same is its form — as is clear from (*q.3.art.3 of this book*) — so, since in the modal we discern a twofold subject — one of the mode and one of the dictum — and likewise a twofold predicate — of the mode and of the dictum — first, both subjects of the mode and dictum receive the name of matter; and second, both predicates of the dictum and mode receive the name of form — as I made clear at the cited place in a parallel case.

The quality of the modal is twofold: one arising from the mode, the other from the dictum. It can happen that on the part of both it is affirmative and true — as "that a man be an animal is necessary." Or that on the part of both it is negative and false — as "that a man not be a stone is not possible." Or that on the part of the mode it is negative, and on the part of the dictum affirmative — as "that a man be rational is not contingent." A modal proposition is said to be absolutely affirmative when it has an affirmative mode, even if the dictum is negative; and it is called absolutely negative when it has a negative mode, even if the dictum is affirmative. Furthermore, in a modal proposition there is a twofold quantity — in the dictum and in the mode. In the dictum, the quantity of the absolute proposition is found; in the mode, the quantity of the modal proposition itself. Now *necessary*, since it is a universal mode, always posits the thing in being; but *impossible* always removes it; *contingent* sometimes posits it, sometimes removes it; *possible* denotes that the thing can be. But absolutely the quantity of a modal enunciation is taken from the mode. If the mode is universal, the modal will be

universal; if the mode is particular, the modal will likewise be particular. There are two universal modes — namely *necessary* and *impossible* — and two particular modes — namely *possible* and *contingent*. If negation is prefixed to universal modes, they become particular — as *not-necessary*, *not-impossible*. But if negation is prefixed to particular modes, they become universal — as *not-possible*, *not-contingent*.

Objection. In the proposition "it is possible that every man sit," a common term is made the subject with a universal sign. Therefore the said proposition is universal — which conflicts with what we asserted above.

Reply. Such a universal sign does not determine the whole subject but only a part of the subject; therefore it is not to be considered a universal proposition — and the mode of the proposition named does not function in that way.

Article III. On the Opposition and Equipollence of Modals

The opposition and equipollence of modals can be perceived from the opposition of absolutes — just as the latter is achieved by adding or removing negations, so too is the former constituted by the addition or removal of negations. Yet since there are certain peculiarities in the opposition of modals that do not apply to the opposition of absolutes, these must be briefly and clearly set out and elucidated by us, lest the minds of beginners be dulled by a multitude of laws and obscurity of subject matter.

It must first be known that *possible* and *impossible*, and likewise *contingent* and *necessary*, are opposed modes. Moreover, propositions can be opposed and equipollent in two ways: either with respect to a mode of the same name — as "it is possible for Peter to run, it is possible for Peter not to run" — or with respect to a mode of a different name — as "it is possible for Peter to run, it is contingent for Peter to run." Next: propositions consisting of the same universal affirmative mode — if a negation is added to the dictum of one — are contraries, as "it is necessary that a man die, it is necessary that a man not die." But if negation is added to the mode alone, they are contradictories — as "it is necessary for Peter to run, it is not necessary for Peter to run." But if both propositions have a particular mode, and a negation is joined to the dictum of one, they become subcontraries — as "it is necessary for Peter to move when he runs, it is not necessary for Peter not to move when he runs." In any mode whatsoever, four modal propositions can be formed. The first is formed when the dictum and mode lack negation — as "it is possible for Peter to sit." The second, when negation is joined to the verb — as "it is possible for Peter not to eat." The third, when negation is added to the mode — as "it is not possible for Peter to sit." The fourth, when negation is joined to both — as "it is not possible for Peter not to sit."

Now, so that every opposition and equipollence of modals may be made clear, four letters are noted — A, E, I, V — which designate four different modal

propositions. A: affirmative with respect to mode and dictum — as "that a man be an animal is necessary." E: affirmative with respect to mode and negative with respect to dictum — as "that a man not be a stone is necessary." I: negative with respect to mode and affirmative with respect to dictum — as "it is not possible that a man be a stone." V: negative with respect to both — as "it is not necessary that a man not sit." All of this dialecticians indicate and comprehend in this verse:

E negates the dictum, I the mode; A nothing, but V the whole.

Furthermore, four orders were devised in which all opposed and equipollent modals are visible, signified by these four expressions: *Amabimus*, *Edentuli*, *Illiace*, *Purpurea* — which are read in these verses:

The first is Amabimus, the second Edentuli. The third Illiace, the remaining Purpurea.

For the sake of distinction and clarity, these expressions — together with all the opposed and equipollent propositions — are arranged as follows. The four syllables of each expression represent four equipollents, and the four letters represent affirmative or negative, universal or particular propositions, as I noted just above; and they are visible in the table below.

Explanation of the four orders given above: propositions residing in the third and fourth orders are contraries; those in the first and second are subcontraries; those in the first and third, and likewise in the second and fourth, are contradictories; those in the first and fourth, and likewise in the second and third, are subalterns. All of this is contained in these verses:

The third is always contrary to the fourth in order. Let the first and second line be subcontrary to you. The third is contradictory to the first. The second conflicts with the fourth by contradicting. The first is subaltern to the fourth, taking the role of particular. The second has itself following this same rule in the series.

Furthermore, observe that all enunciations of any of the four orders named are indeed equipollent to one another, as is evident upon inspection; and they are opposed insofar as those in one order regard those placed in the remaining lines — as is clearly shown in the table above. Finally, there remains the conversion of modals to be explained: this is derived with respect to the dictum, not the mode — as Scotus teaches (*1.Priorum*, q.25.) — as "that Paul sit is possible." The conversion of this is thus effected: "that some sitting person is Paul is possible." Therefore in the conversion of a modal, the principles of the absolute enunciation are observed; and thus nothing more seems to need to be added here that was not already noted at the place cited. I found only one among the moderns — Arriaga (*disp.2.sect.5.*) — who despises the letters and expressions enumerated above; indeed, in the section just cited he rejects the letters that along with expressions pertain to the conversion of simple enunciations. But unjustly: for they greatly assist the memory, and from inspection of them one

more easily calls to mind what is to be done in these matters — as, besides Arriaga, all dialecticians confess with one voice. Otherwise he would necessarily despise those that designate the useful modes of syllogisms in any figure — which he did not dare to deny; on the contrary, he adduces, explains, and uses them. Therefore, since the reason and use of the former are the same as those of the latter, he doubtless despises the former without cause while accepting the latter. Hence, if they are supported by some foundation and reason — either he must reject all or accept all.

First Objection. These two propositions are in the same order: "it is not possible for a man to run" and "it is impossible for every man to run," and yet they are not equipollent. Therefore propositions of the same order need not be equipollent.

Reply. The reason why they are not equipollent is that their subjects are not arranged uniformly.

Second Objection. "Every man possibly runs, some man impossibly runs" — these are propositions of the same line, yet they are not equipollent. Therefore, etc.

Reply. They are equipollent on the part of the subject, but not on the part of the mode, by reference to which the equipollence of a modal is derived.

Question VI. On the Exponible Proposition

An exponible proposition — from Scotus (*1.Priorum*, q.5.) — is one that needs exposition or clarification on account of some particle that renders it obscure. A proposition that is obscure is called exponible; those that expound or clarify it are called exponentes. Three principal species of exponible propositions are enumerated: exclusive, exceptive, and reduplicative — of which we must now treat in the two following articles.

Article I. On Exclusives

An exclusive proposition is one qualified by some exclusive syncategoreme — as Scotus states (*1.Priorum*, q.4.§. *oppositum*; and q.14, *in fine*) — as "only a man is rational." The exclusive syncategoremes are *tantum*, *solum*, *solummodo*, *duntaxat*, and similar expressions. An exclusive proposition can be spoken of in two ways: either as having an excluded predicate, or as having an excluded subject. In the first way it is formed when the exclusion excludes other predicates from the same subject — as "only a man is rational." In the second way it occurs when the exclusion excludes other subjects from the same predicate — that is, other subjects do not share the same predicate — as "only an animal is sensitive." In exclusive propositions this canon is noted: the excluding particle does not exclude those things that necessarily or contingently belong to the subject. For when one says "only a man is rational," *animal* and the rest that are necessarily or

contingently predicated of man are not excluded — such as whiteness, which contingently belongs to man and by reason of which he is called white — but only what is repugnant to man, as being a lion or a stone.

Four exclusive enunciations are presented by reason of the affirmation or negation of the exclusive syncategoreme and the verb. If no negation is prefixed to the exclusive particle and the verb, the first exclusive arises — as "only a man is risible." But if negation is placed above the exclusive sign, the second is formed — as "not only a man is white." If negation is added to the verb, the third is formed — as "only the rational soul is not immortal." But if one negation is joined to the exclusive expression and another to the verb, the fourth results — as "not only a man is not immortal." The aforesaid exponibles are explained through their exponentes by removing the exclusive syncategoreme while retaining the same subject. The first exclusive is expounded through a copulative hypothetical containing — from what was said above — two categoricals, of which the first must be a particular affirmative and the second a universal negative, as "only a man runs" is thus expounded: "some man runs, and nothing that is not a man runs." The second is explained through a disjunctive hypothetical containing two simple disjunct propositions, of which the first must be a universal negative and the second a particular affirmative — as "not only a man runs" is thus expounded: "no man runs, or some non-man runs." The third is expounded through a copulative hypothetical having a first particular negative categorical and a second universal affirmative categorical — as "only a man does not run" is thus expounded: "some man does not run, and everything other than man runs." The fourth: through a disjunctive hypothetical comprising two simples — the first universal affirmative and the second particular negative — as "not only a man does not run" is thus expounded: "every man runs, or some man does not run." So that the method of resolving these exclusives may be more firmly retained in memory, four expressions are to be taken — namely *Dives*, *Orat*, *Amo*, *Hely* — in which the four letters A, E, I, O are noted according to the signification we assigned above in the treatment of the conversion of absolute propositions; and the exclusives are to be resolved in the order we showed through these expressions with their letters, as may be seen in the present synopsis.

Some recent authors resist this common teaching of the summulists — especially Hurtado (*disp.4.sect.14.*), who says that a proposition of the first mode — such as "only a man runs" — cannot at all be resolved through a first universal affirmative and a second universal negative, as "every man runs and nothing other than a man runs." Likewise, in necessary matter one would badly resolve an indefinite proposition — such as "only a man is rational" — into these two: "some man is rational, and nothing other than man is rational," because besides some man, something else is rational — namely, two, and all men are rational.

Against this: first, the subject of an exclusive is not marked by a universal sign but must be indefinite — and if an indefinite proposition is equivalent to a universal, not however in contingent matter, of which Hurtado himself gives the example. Furthermore, the intention of the summulists is not to convert or transpose exponible propositions. For it is not in doubt that an exclusive — with verb and sign affirmed — is convertible into a universal affirmative: as "only a man is rational; therefore every rational thing is a man." But rather to explain them and render obscure things clear — not to resolve the obscure through the obscure; but to convert said propositions, as Hurtado does, is rather to obscure than to clarify them. For it is at least as difficult, or equally difficult, to grasp "nothing other than a man runs" as "only a man runs," since one is an exclusive and the other an exceptive — both exponibles. But an exponible is not expounded through an exponible, but through two exponentes that are not in turn exponible — as Hurtado himself does not deny, and Scotus indicates (*1.d.21.q.un.sub A.*). Therefore the summulists rightly expound this — "only a man is rational" — as follows: "a man is rational, and nothing that is not a man is rational."

The recent authors press further: these are contradictories — according to the summulists — "only a man runs: not only a man runs," because the negative particle making the whole proposition negative renders it contradictory to the affirmative, and they cannot be simultaneously false — which conflicts with the law of contradictories. For if no one runs, this is false: "only a man runs," since neither man alone nor any companion of man runs. Likewise this is false: "not only a man runs," since neither man alone nor anything other than man runs — so that two contradictories would be simultaneously false. But these and similar arguments that the authors cited adduce against us are of no moment. For if in absolute contradictories this gives rise to no difficulty, neither does it in these exclusives. For these exclusives — "only a man runs, not only a man runs" — are pronounced absolutely and not from a hypothesis. For this rule is correctly established: a negation prefixed to an entire proposition renders it contradictory to the preceding proposition. Nor from this are propositions granted that offend pious ears, as Arriaga deduces (*subsect.3.*): as "not only God is blasphemous" — because its contradictory, "God is blasphemous," is false; therefore the former must be true. To dissolve this I note with Scotus (*1.d.11.q.un.¶. Ad g.A.*), after Aristotle (*1.Elench., c.4.*), that the word *solus* (only, alone) can be taken in two ways — categorematically and syncategorematically. *Solus* categorematically is the same as *solitary* — as is found in *Matthew 14*: "He went up into the mountain alone"; and *Mark 6*: "The ship was in the midst of the sea, and he alone on land." But *solus* syncategorematically is taken in relation to another, whose company is denied — as in *Psalms 71*: "Who alone does wonderful things"; and *Psalms 85*: "You are God alone." From these it is clear that if *solus* is taken syncategorematically, the said proposition is false — for the sense would be that God and others are blasphemous — unless the explanation is immediately added: either "God is not

blasphemous" or "another is blasphemous" — which does not seem to square with its proper sense. For its sense is that God is blasphemous, along with others associated with him — as when Christ said "I am not alone." Accordingly I judge the response to be: that the aforesaid rule does not hold when the subject of the proposition is incapable of its predicate, for in that case the extremes cannot be joined and hence cannot be associated or dissociated. This can be deduced from other parallel cases — such as "not only God is infinite, not only God is immense," and so on. The reason why, when negation is prefixed to an exclusive expression, the exposition is through a disjunction is that it is proper to signs of distribution, when they are prevented by others, not to distribute; and accordingly, just as the supposition is not distributive, so those propositions that are qualified by these signs are not to be explained copulatively.

Article II. On Exceptive and Reduplicative Propositions

An exceptive proposition — from Pelbartus (*Tomo 2. Rosarii, ante §.1.*) — is one that is qualified by some exceptive sign by reason of which it is rendered obscure and hence exponible — as "every animal except man is irrational." The exceptive signs are *praeter* (except), *praeterquam* (save that), *nisi* (unless), and similar expressions, which make propositions obscure and exponible through others equivalent to them — as "no animal except man is rational" is expounded thus: "among animals, man is rational, and nothing else." As many exceptive propositions can be formed as exclusive ones; their number, opposition, and other details, which the older dialecticians treat at length, I do not judge it opportune or necessary to adduce and examine.

A reduplicative proposition — from Scotus (*1.Priorum, q.35. §. Quantum ad 1.*) — is one that is qualified by some reduplicative sign, by reason of which it is obscure and therefore exponible. The reduplicative signs are *quatenus* (insofar as), *inquantum* (inasmuch as), *prout* (as), and other expressions of this form, which make propositions obscure and exponible through others equivalent to them — as "a man insofar as he is a man is capable of reason" is expounded thus: "a man, because he is rational, is capable of reason" — as is clear from (*Quol.3.H. d.11.q.2.*). For the reduplicating sign denotes that the cause of something is the formal reason upon which it reduplicates, as the Doctor indicates (*q.7.Universalium, §. Ad 1.*). As many reduplicatives are enumerated as there are exceptives and exclusives — about which and similar matters I shall not discourse further, but they can be seen at length in Major and Tatarctus, who discuss them abundantly.

Objection. This is not a reduplicative proposition: "Peter drinks as much as he can," even though it contains the reduplicative sign *inquantum*; therefore the reduplicative enunciation was not aptly described.

Reply. A reduplicative sign does not constitute a reduplicative proposition if it is taken adverbially — as it is taken in the argument; it does constitute one if it is

taken conjunctionally, as it is taken in the present context, whether the reduplication is with respect to the subject or the predicate.

Question VII. On Division and Definition

Three instruments — or modes of knowing — are enumerated in logic, as Tataretus notes near the beginning of his exposition of the *Summulae*, together with other dialecticians: division, definition, and argumentation. Of the first two we shall treat in the present question; of the third in the following book. It is not inappropriate to join a question on division and definition to this book, since they are either perfect or at least imperfect sentences and propositions.

Article I. On Division

Scotus notes (*1.d.3.q.1.¶. Loquendo igitur, N.*) that through definition we obtain distinct knowledge of the thing being sought; hence he says that division should precede definition — unless circumstances require otherwise — as Antonius Andreas indicates in his exposition of Boethius's little book on division. Division is described as a sentence by which a whole is distributed into its parts — as "a lion is divided into body and soul." The whole that is divided is called the *divisum* (the divided), and the parts into which the whole is separated are called the *dividing members*. There is a twofold division — from the Doctor (*q.23.Universalium*; and *1.d.3.q.1., ante F.; and infra N.*): one of the name and the other of the thing. For the whole that is divided is either a name having several significations, or a thing having several parts. In the first case the former division is had — as when *dog* is divided into terrestrial, marine, and celestial. In the second case the latter division is had — as when *living* is divided into vegetating, sensing, and understanding. Moreover, since one whole is real and another rational, it follows that one division is real — whereby a real whole is divided into its real parts — and another is of reason — whereby a whole of reason is distributed into its parts of reason, as a proposition into subject and predicate. Real division is fourfold, corresponding to the fourfold nature of the whole: integral, universal, essential, and accidental. Integral division is that by which an integral whole is divided into its parts — which is either homogeneous, that is, having parts of the same account, as flesh is divided into parts that share the same name and account of flesh; or heterogeneous, that is, having parts of different accounts, as of man one part is the head, another the heart, another the feet. Opposed to this is entitative division, by which an entitative whole is divided into its entitative parts — as the whole of matter into its material parts, of which in *Physics*. The division of the universal whole is into its subjective parts, which occurs when the more universal is divided into the less universal — as animal into man and brute. This is called logical division, which is either of a genus into its species — as color into whiteness and blackness — or of a species into its individuals, or of a genus into its differences, or of a difference into differences — as rational into this or that rational. The division of the essential

whole is into essential parts, and is twofold according to the twofold nature of the essential whole: either it is the division of the physical essential whole into physical parts — as body is divided into matter and form — or of the metaphysical essential whole into metaphysical parts, which are genus and difference. The former is called by Scotus (*1.d.3 and 8.*) the division into thing and thing; the latter, into reality and reality. One may add the division of a thing into its modes — whereby being is distributed into infinite and finite — and likewise the division of the potential whole into its powers and potencies — as one part of the soul is intellective, another appetitive — as is clear from the Doctor (*2.d.16.q.un.*), following Aristotle (*1.Praedicamentorum, c.5.*). The accidental division of the total accidental whole into its parts is threefold — which Scotus intimates (*1.Post., q.18., near the beginning*). The first is the division of an accident into its subjects, which occurs when the divided is an accident of the dividing members — as "of colored things, some are men, some are lions, some are stones." The second is the division of the subject into accidents, which occurs when the dividing members are accidents of the divided — as "of stones, some are white, some are black." The third is the division of accident into accidents, which occurs when both the divided and the dividing members are accidents of the same subject — as "of sweet things, some are white, some are yellow."

Four rules of good division are transmitted, of which the first is drawn from (*2.Post., c.5.*): the divided and the dividing members taken together must be adequate — as when animal is divided into rational and irrational, *animal* is the divided, *rational* and *irrational* are the dividing members, which are mutually adequate, for *animal* extends as broadly as *rational and irrational* together. The second: division must be made into members that are more proximate and immediate — as *substance* is correctly distributed into incorporeal and corporeal, not into inanimate and animate. The third: the dividing members must not coincide, but must be mutually opposed — as "of animals, some are men, some are brutes." Lacking this, this division is defective: "of animals, some are living, some are sensing," because *sensing* includes *living*, and the same thing can be both living and sensing simultaneously. The fourth: division should be made through as few members as possible — as "of sensing things, some are capable of reason, some lack reason." Hence, to avoid excessive multiplication of dividing members, a negation is sometimes added to one extreme — as "bodies are either living or non-living." The Philosopher hints at this (*6.Top., c.3.*; and *1.de partibus, c.3.*), using this example: "of magnitudes, some are lines, some are non-lines."

Objection. Only three conditions of division are commonly enumerated by Scotists, as may be seen in Tataretus (*in expositione Petri Hispani, fol.1.nota.3.*). Therefore four are incorrectly enumerated by us.

Reply. Those four are contained in the three; for the fourth was added so that the nature of division might be more clearly known to us — since division was devised to clarify an entire thing in its parts. A parallel holds for definition, of

which three conditions are recounted by Scotus (*1.Priorum, q.5.*) and five by the same author (*4.d.1.q.2.*) — which five are comprehended in those three. The same was done by him regarding the subject of a science, as we noted (*l.1.q.3.art.1 of Scotian Logic*).

Article II. On Definition

Much has been said about definition by John Major (*c. de genere*), Briansonius (*4.q.3.conclusionem 2.corollario 3.*), the twin Scotists (*disp.1.q.2.art.1, 2, 3.*), and not a few others; we shall briefly set out what is most necessary and pertinent. A definition is a sentence explaining the nature of a thing, as Scotus writes (*2.d.1.q.5.¶. Contra ista.1.*; and *3.d.22.q.un.¶. Rationes, sub C.*), following Aristotle (*1.Top., c.4.*; and *6. of the same work, c.1.*; and *7.Met., Tex.41 and 42.*). That whose nature is explained is called the *definitum* (defined), and that which explains the nature of the defined is called the *definitio* (definition). For what the defined designates implicitly and confusedly, the definition declares explicitly and perspicuously — as "a man is a rational animal." *Man* is the defined, and *rational animal* is the definition, though not infrequently the whole sentence is used in this way. A twofold definition is assigned by philosophers — especially Scotus (*2.Post., q.6.*; *1.Priorum, q.5.*; and *4.d.1.q.2.*). One is a definition of the name, the other of the thing. The definition of a name — from the same Doctor in the fourth cited and (*q.d.22.q.1.¶. Potest dici*) — is a sentence that explains the origin, interpretation, or etymology of the name — as "dialectic is the science of disputation," "logic is the science of discourse," "rock is that which wears down feet." The definition of a thing is a sentence declaring the nature of a thing — as "a man is a rational animal." This is in turn twofold: essential and descriptive. An essential definition is one that distinctly expresses the essence or quiddity of a thing — and is subdivided into physical and metaphysical or logical. The physical expresses the nature of a thing through matter and form — as "a man is a whole composed of body and rational soul." The metaphysical declares the nature of a thing through genus and difference — as "an animal is an animated sensitive being." A descriptive definition — also called a definition by addition — is a sentence explaining something extrinsic to the nature of the thing. This can be done in three ways: first, through genus and a proper property of the thing — as "a lion is a roaring animal"; second, through an extrinsic cause — as "a man is conditioned for attaining beatitude"; third, through common accidents — as "a man is a featherless two-footed animal." I note moreover that properly speaking there is no definition of non-being, the impossible, the negative, and the privative — because just as these do not possess a proper essence and quiddity, so neither do they have a definition. Hence Scotus adds (*4. already cited, ¶. Hic primo.A.*) that properly defined are positive being, a being that is one through itself, real, composite, and universal.

Four principal rules of good definition are observed. The first: a definition must distinctly explain what the defined designates confusedly; the reason is that a

definition ought to be clearer than the defined, since it was devised so that things might be clearly known to us — as the Stagirite notes (6.*Top.*, c.1.) and Scotus confirms (1.*Priorum*, q.5.). The second: a definition must convert with the defined. For this reason it is perhaps called by philosophers a *term*, because it is terminated at the essence it defines and does not go beyond it — as Briansonius especially observes at the place recently cited. The third: a definition must contain nothing superfluous and nothing deficient. Hence this is not a correct definition: "a man is a rational, mortal, and teachable animal," because the last two expressions are superfluous. Whether one name corresponds to one definition, see Scotus (*Quol.*13.), Lychetus, and Gadius there. The fourth: from Scotus (1.*Post.*, q.24.§. *Ad q. dicitur*; and 4.d.11.q.3., *infra CC.*) a definition is not to be given through a remote genus and remote difference — since a species, which is properly what is defined, is not constituted from remote genus and difference; and therefore this is not a good definition: "a man is a living substance" — because in it are found neither the proximate genus nor the proximate difference.

First Objection. If a definition is had only of a real positive being, then there will be no definition of a being of reason; but since a definition is the middle term of demonstration and the science of the same effect, it follows that logic — which considers second intentions, which are beings of reason — is not a science, which conflicts with Scotus (q. *Suae Dialecticae*).

Reply. I distinguish the consequence: of a being of reason there is no definition in the strict sense, I grant; there is no definition in the broad sense, I deny. For just as a being of reason has its own essence, so likewise it has a definition that explains that essence. And such a definition suffices for acquiring demonstration and causing science, as the Doctor notes (4.d.1.q.2.§. *De secundo principali*, I.) and Aristotle indicates (2.*Post.*, c.7.).

Second Objection. It is easier to define the singular than the universal. Therefore there is a definition of singulars, and accordingly it is not necessary that what is defined be universal. The antecedent is from Aristotle (2.*Post.*, c.15.).

Reply. Toletus, commenting there, explains that by *singular* in that place the less universal is meant, because the more universal are more abstract and more difficult to know. Whether there is definition and demonstration of singulars will be examined in our questions of Scotian Logic against Bonetus in the Metaphysics and Arriaga (*disp.*3.*Summularum*, n.7.sect.1.).

Book III. On the Terminated

The terminated — or composite from both incomplex and complex terms — is without doubt the syllogism, to be treated in this last book. For the terminated is always defined and explained through the terminating — as the Subtle Doctor

correctly notes (2.d.3.q.9.§. *Ad argumenta, sub L.*). Knowledge of this structure is what dialectic chiefly looks to, and Aristotle testifies that he labored long in its discovery — hence he rightly demands that thanks be rendered to him at the close of the *Elenchi*. For the syllogism is the object and end of the whole of Aristotelian dialectic, as I touched upon in the preface to this little work. Therefore thanks are rightly owed to the Stagirite himself, who both discovered it and treated it thoroughly. In this book four questions are raised: the first on the syllogism taken generally; the second on the same taken specifically; the third on dialectical topics; and the fourth on the sophistical syllogism.

Question I. On the Syllogism in General

Since in every discipline the more general precedes the less general — just as a genus precedes its species — which we observed Aristotle to have followed at the very beginning of the first book — it is not inappropriate that we premise a question on the syllogism in general, so that we may afterward treat of it in particular.

Article I. How Many Things Are Required to Constitute a Syllogism

A syllogism is constructed from three terms — as Scotus notes along with the other dialecticians (1.*Elench.*, q.4.§. *Ad 1.arg.*; and 1.*Priorum*, q.1.) — and from three propositions and an inferential particle, *ergo* (therefore) or *igitur* (hence). Of the terms, one is called the major extreme, another the minor extreme, and the third the middle term or medium — as Scotus indicates (q.11.*Praedicamentali*). Of the propositions, one is called the major, another the minor, and the third the conclusion. For the proposition in which the major extreme resides — or in which the greater force of the syllogism is found — is called the major; the one in which the minor extreme resides — or in which the lesser force of the syllogism is found — is called the minor; and the one that is gathered from those two is called the conclusion — though the one placed first is called the major, the one second the minor, and the one third the conclusion. All of this may be illustrated in this syllogism: "every animal is living; every lion is an animal; therefore every lion is living." The first two propositions are called the premisses, because they are put before the conclusion; and the last — which is derived from those two — receives the name of conclusion, as I was just saying. The major extreme in directly concluding syllogisms is called the predicate; the minor extreme, the subject; and the third term, the middle — because it mediates between those two said extremes and is never placed in the conclusion. The inferential word *therefore* or *hence* is the sign by which the conclusion is inferred from the premisses.

Objection. "If every man were running, and Paul were a man, Paul would be running." In this discourse "Paul would be running" is the conclusion; "every man were running" is the major; "Paul were a man" is the minor — yet there is a kind of complex in which neither major nor minor nor inferential word is

evident. Therefore not every syllogism consists of three propositions and an inferential particle as explained.

Reply. Although in the said argument the three propositions with the inferential sign are not formally found, they are nevertheless virtually and equivalently present — which suffices for it to be counted as a syllogism.

Article II. From What the Syllogism Is Composed

Since the syllogism is a certain whole, it must necessarily be composed of parts, some of which among dialecticians are called material and some formal. The material parts are either remote — namely the incomplex terms — or proximate — namely the complex terms, or propositions. The formal parts are figure and mode, of which Scotus makes mention (*q.45.Elench.*; and *q.34.primi Priorum.*). Figure is the correct ordering of the middle term with the extremes by reason of due predication and subjecthood. Mode is the correct ordering of the three said propositions by reason of due quantity and quality. Due quantity is observed when at least one of the premisses is universal; and due quality, when at least one of the premisses is affirmative. Thus the matter of a syllogism is the incomplex and complex terms; and the form of the same is the correct ordering of the terms and premisses for inferring a good conclusion. I know that dialecticians distinguish another extrinsic matter of the syllogism — concerning necessary, possible, contingent, and impossible subject matter — of which I made mention (*l.2.q.2.art.3.divisione 6.*). Hence we sometimes say a syllogism concludes by reason of matter, sometimes by reason of form, and sometimes by reason of both.

Objection. In spiritual things matter and form are not found — for in this it differs from the material, that the material is capable of matter while the spiritual is devoid of it; but the syllogism is something spiritual, being an operation of the intellect stripped of all matter. Therefore material and formal parts of the syllogism are assigned incorrectly.

Reply. I distinguish the major: of proper matter and form, which is physical, I grant; of improper and analogical matter and form, which is logical or metaphysical, I deny. To the clarification of the major, the proof of the minor is to be correspondingly distinguished.

Article III. What the Syllogism Is, and How Many Kinds There Are

A syllogism — called by Aristotle a reasoning, discourse, and argumentation (*1.Priorum, c.3.*; *1.Top., c.1.*; and *1.Elench., c.1.*) — is defined as a sentence in which, when certain things are posited, something else necessarily follows from them, because they are what they are. It is explained as follows: *sentence* is said — that is, argumentation — as Scotus interprets it (*q.3.Universalium, §. Ad rationem positionis*). Or, as Tataretus says in his *Summulae (Tract.4)*, following Scotus (*q.5.primi Priorum, §. Quantum ad 2.*), *sentence* is placed in the role of genus, and is

understood of a composite sentence, not a simple one; for a proposition is indeed a sentence, but not a syllogism. And *sentence* is also placed so as to differ from incomplex terms. *When certain things are posited* — that is, when two premisses are arranged in due mode and figure. *Something else* — that is, the conclusion, which proceeds from both premisses and is different from them. *Necessarily follows* — because of the things posited — supplement: by the power of the syllogistic form the conclusion is necessarily deduced. For through the power of the medium duly united with the extremes in the premisses, one extreme is concluded to be enunciated of the other — as is clear in this syllogism: "every animal is sensitive; every man is an animal; therefore every man is sensitive."

First and principally, a syllogism is divided by John Major into syllogisms of the first, second, and third figure, as will be shown below and illustrated with examples in Article V. Second, into simple, hypothetical, and modal — whose explanation is roughly the same as that given for simple, hypothetical, and modal propositions in the preceding book. For a simple or categorical syllogism is one consisting of three categorical propositions — as "every body is substance; the sky is a body; therefore the sky is substance." A hypothetical syllogism is one that, besides three propositions, contains some conditional, copulative, or disjunctive particle — as is clear from what was said in (*l. cited, art.4.q.2.*). A modal syllogism is one that participates in some of the modes enumerated in (*q.5.art.2.*) — as "an animal is necessarily a body; a man is an animal; therefore a man is necessarily a body." Third, into demonstrative, dialectical, sophistical, and pseudographic — which the Doctor mentions (*1.Post., ad finem, q.1.; q.44, vers. Ad oppositum; and 1.Priorum, q.2.*). A demonstrative syllogism is one that proceeds from first, true, necessary premisses that are causes of the conclusion — as "every rational being is risible; every man is rational; therefore every man is risible." A dialectical syllogism is one formed from probables — and probables are those things that seem so to all, or to most, or to the wise, or to the most approved — as "every mother loves her child; Olympia is a mother; therefore Olympia loves her child." A sophistical syllogism is one that proceeds from apparent things — or from those that seem necessary, probable, and true, but are not — as "whatever you have not lost, you have; you have not lost a treasure; therefore you have a treasure." A pseudographic syllogism is one formed from the proper principles of a discipline taken with a misunderstanding — as "all semicircles are equal; but larger and smaller semicircles are semicircles; therefore larger and smaller circles are equal." The major is understood by mathematicians of semicircles of the same circle, not of different circles — as is deduced in the argument. The first syllogism generates science; the second, opinion; the third, deception; and the fourth, error. Whether these four are species of the syllogism, see Scotus (*1.Priorum, q.6.*), Major (*Tract. de syllogismo* in the exposition of the first chapter), and what I wrote in (*l.5.q.1.art.3.*). Fourth, into a syllogism consisting of a common middle — as nearly all the syllogisms

enumerated above — and one consisting of a singular middle, such as the expository syllogism, which clearly presents a thing and is formed in the third figure, where the middle term — which is singular — is always aptly subjected — as "this man is wise; this man is Socrates; therefore Socrates is wise." And also into a syllogism from obliques, mentioned by the Doctor (*1.Priorum*, q.34.), which consists of some oblique term or grammatical case — as "of opposites there is the same discipline; heat and cold are opposites; therefore of heat and cold there is the same discipline." Fifth, into formal and objective. The formal is the act of the intellect by which we reason about objects capable of being reasoned about. The objective is the reasoned-about object itself, about which the intellect reasons and syllogizes — as Scotus indicates (*1.Post.*, q.22.§. *Contra.*). Sixth, into affirmative — which by the force of affirming premisses affirms something of something in the conclusion — and negative — which from premisses, or from a negative premiss, denies something of something in the conclusion. Seventh, from (*1.Priorum*, c.2., cited by Scotus q.3.*Universalium*, §. *Ad 1.*), into perfect and imperfect. A perfect syllogism is one that needs nothing more for the necessity and evidence of its inference to be gathered, beyond what has been presented to it. It relies on the principles *of every* or *of none*, which are naturally known. An imperfect syllogism is one that needs one or more things for its necessity and evidence to become apparent. These and the preceding divisions will become better known from the following articles, in which all the modes of syllogizing, both perfect and imperfect, will be presented and discussed. Add the division of the syllogism into ostensive and leading to the impossible, which the Doctor presents (*2.Priorum*, q.1.); and also into converse, of which he makes mention (*ibid.*, q.5.); and circular — the same place, q.4.; and from appended terms, as he writes (*1.Priorum*, q.34.); and similar ones, which will be explained in their proper place.

The four modes of argumentation are not to be passed over; these the Doctor presents (*q.Priorum*, q.2.) and calls the syllogism, enthymeme, induction, and example. Since I have already explained the syllogism above, only the remaining three forms of argumentation remain to be explained. An enthymeme is a truncated or imperfect syllogism consisting of only two propositions, of which the first is called the antecedent and the second the consequent — as "a man is an animal; therefore a man is sensitive." Induction is an argumentation from singulars sufficiently enumerated to universals — as "fire, air, water, and earth are simple bodies; therefore every element is a simple body." Scotus makes mention of this (*2.Priorum*, q.ult.; and *2.d.29.q.K.*). An example is a reasoning from one singular to another singular — as "God spared Peter when he did penance; therefore he will also spare me if I do penance." These last three modes of syllogizing are reduced to the syllogism as imperfect to perfect — they derive their force and perfection from it. Moreover, induction is sometimes a conjoined syllogism, which is reduced to the simple categorical one; and sometimes an enthymeme, as is clear from the example of induction

given above. An example, however, is an imperfect induction, as was just declared by the argument of the example given.

First Objection. Scotus (*1.Post., q.f.*) denies that the syllogism can be defined. Therefore in his school the definition of the syllogism given above is vain and the explanation pointless.

Reply. Scotus is to be interpreted as speaking of definition in the strict sense, which is had only of a real positive and incomplex being — as the Doctor notes (*4.d.1.q.1.*) — not of definition in the broad sense, which belongs to a being of reason such as the syllogism. And he discusses and clearly declares this at the place now cited.

Second Objection. Some syllogisms exist in which the premisses are not conceded. Therefore the syllogism is not correctly defined as a sentence in which certain things are posited — that is, conceded.

The antecedent is proved: "every man is a dog; Brunellus is a man; therefore Brunellus is a dog." This syllogism is false, and in it the premisses are not conceded, because they are false and impossible.

Reply. It may be said that *posited* is not well expounded as *conceded*, but as *arranged and correctly ordered in mode and figure* — as our nonseparated contemporaries observe (*Tract.3.c.5.*), with Tataretus. Or, if the clause *conceded* is admitted, it is to be understood not absolutely but conditionally — namely, if the premisses are conceded, the conclusion must also be conceded.

Pressing further: given the premisses as conceded, it is not necessary that the conclusion be conceded; therefore the reply is null.

Reply. Given the premisses as conceded, the conclusion must certainly be conceded — with the necessity not of the consequent but of the consequence.

Third Objection. The conclusion is not a part of the syllogism. Therefore the syllogism is falsely described as a sentence in which certain things are posited, etc.

The antecedent is proved: the syllogism is said to produce science or opinion; but science and opinion are about the conclusion itself, or rather concern the conclusion itself.

Reply. The antecedent is denied. In reply to its proof, a distinction is drawn: if the syllogism is taken for the premisses alone — as the Philosopher took it in (*2.Priorum*) — it is granted; but if it is taken for the composite of three propositions duly ordered — as the same Aristotle took it in defining the syllogism itself — it is denied. But more on this elsewhere.

Article IV. On the Regulative Principles of the Syllogism

The two principles directing the syllogism are the *dictum de omni* (said of every) and the *dictum de nullo* (said of none), as Aristotle establishes (*1.Priorum*, at the end of the first chapter) and Scotus confirms (*ibid.*, *1.Priorum*, q.7.; *1.Elench.*, q.7.; q.36; and *q.ultima.*). The *dictum de omni* is described and explained thus: whatever is generally affirmed of some subject is also affirmed of all things contained under that very subject — as if *body* is universally affirmed of *animal*, it will likewise be affirmed of *lion*, which is comprehended under *animal* — as is clear in this syllogism: "every animal is a body; a lion is an animal; therefore a lion is a body." This principle rests on the very firm foundation that those things that are the same as some one third thing are the same as one another — which the Philosopher states at the cited place and in (*1.Phys.*; *7.Top.*), and which Gadius adduces (*Quol.11.fol.123.column*) and Scotus explains (*1.d.2.q.7.§.d.1.argumentum principale II.*; and *4.d.10.q.1.§. Ad in contrarium D.*): whatever things are the same to something by some identity, those things are the same to one another by that same identity, because no identity of extremes with one another can be concluded except according to that identity by which they are the same as the middle, and the middle is itself the same in this way; and through this proposition, so understood, every syllogistic form holds. The *dictum de nullo* is explained thus: whatever is universally denied of some subject is also denied of all things contained under that same subject — as if *spirit* is denied of *animal*, it will certainly be denied of *dog*, which is contained under *animal*. This is plainly evident in this syllogism: "no animal is a spirit; every dog is an animal; therefore no dog is a spirit." This principle rests on that most stable foundation: those things that are not the same as some one third thing are not the same as one another; for the opposite of the predicate destroys the subject, and if the premisses are not conjoined in the middle, neither will they be conjoined with one another in the conclusion — as Scotus indicates (*in 1. cit.*, q.4.; and *1.Priorum*, q.10.§. *secundo notandum.*). It must moreover be known that a consequence is the deduction or relation of the following of an antecedent to a consequent, and it is twofold: material and formal. A material consequence is the relation of the necessary conjunction of antecedent with consequent — as "it is a man; therefore it is risible." A formal consequence is the relation of premisses ordered in due mode and figure to inferring the conclusion — as "every good is to be embraced; every justice is good; therefore every justice is to be embraced." Furthermore, note that there is a difference between a consequence and a consequent. For a consequence is what was just described; the consequent, however, is the proposition placed after the inferential mark. Hence dialecticians deny the consequence of the proposed enthymeme, but not the consequent; and they distinguish the consequent, but never the consequence.

Objection. If the aforesaid proposition were always a true and firm foundation, this syllogism would be legitimate: "those things that are the same as some one third thing are the same as one another; but the divine persons are entirely the

same as the divine essence; therefore the divine persons are the same as one another" — which is false and heretical, as Scotus argues (*1.Priorum*, q.9.).

Reply. From Scotus in the first work cited, that holds in limited and finite things, but not in unlimited and infinite things. For this does not follow well: "Peter is simultaneously with God in Avignon, and the Supreme Pontiff is also simultaneously with that same God in Rome; therefore Peter and the Supreme Pontiff are simultaneous." By this, other sophisms are dissolved, Scotus says — especially this one: "this God is the Father; but the Son is this God; therefore the Son is the Father." Or, if it is granted absolutely — as Scotus at the cited first place does — it is to be expounded in the way expounded above; nor from this does any error or heresy follow. For it is correctly said that the three persons are the same as one another by essential identity, though not by personal identity — whatever some recent authors may say, who are to be refuted in (*l.4 of our questions*).

Second Objection. When the major is in the present tense and the minor is in the past or future, the conclusion does not follow — as "every man is an animal; Adam was a man; therefore Adam is an animal." And thus the *dictum de omni* does not always hold with truth.

Reply. The said discourse is not governed by that principle; hence it is no wonder that the argument does not hold. The major is indeed founded on the principle *de omni*; but not the minor — for it has a different sense, because it regards the past existence of Adam, while the *dictum de omni* placed in the major abstracts from all existence — as is clearly established from the explanation given above.

Article V. On the Figures and Modes of the Syllogism

Since the syllogistic figure is described as the correct positioning of the middle term with the extremes by reason of due predication and subjecthood — as I said in Article II of this question — as many different figures will be constituted as there are different correct dispositions of the middle with the extremes. And with Aristotle in the present work and Scotus in the same (*q.22, 23, 24*; and elsewhere), I find three correct and natural orderings of this kind, and therefore only three syllogistic figures. If the middle is subjected in the major and predicated in the minor, the first figure arises — as "every substance is a being; every stone is a substance; therefore every stone is a being." If in both premisses the middle is predicated, the second figure is born — as "no stone is rational; every man is rational; therefore no man is a stone." But if in both premisses the middle is subjected, the third figure is formed — as "every stone is a substance; every stone is a body; therefore some body is a substance." The syllogistic mode — which from what has been said is the correct ordering of premisses by reason of due quantity and quality — is twofold: direct and indirect. Direct is when in the conclusion the major extreme is predicated of the minor extreme — as

"every body is substance; every tree is a body; therefore every tree is substance." Indirect is when in the conclusion the minor extreme is predicated of the major extreme — as if from the said syllogism this conclusion were inferred: "therefore some substance is a tree."

All the useful modes of the said figures suitable for concluding are nineteen: nine of the first figure — four of them directly concluding and perfect, the remaining five indirectly concluding and imperfect, reducible to the four prior perfect ones. Four following belong to the second figure, and the last six to the third figure. All of these, so that they may be more easily recalled to memory, are clearly set out in the following verses:

Barbara, Celarent, Darii, Ferio, Baralipon. Celantes, Dabitis, Fapesmo, Frisesomorum. Cesare, Camestres, Festino, Baroco, Darapti. Felapton, Disamis, Datisi, Bocardo, Ferison.

In these verses there are as many modes of the figures as there are expressions aptly placed; and in each expression three syllables are noted, signifying the three propositions from which the syllogism is constructed: the first syllable designates the major, the second the minor, and the third the conclusion. The four letters A, E, I, O indicate what the propositions must be like in quality and quantity — they are explained in much the same way as they were explained in (*l.2.q.4.art.4.*). If in the said expressions anything more is present — as in *Baralipon* — it is placed for the sake of meter. The remaining consonant letters C, M, S, and P, which appear in some of the said names, stand for the reduction of imperfect syllogisms to perfect ones, as will be clear below.

Objection. Some syllogisms are held to be good even though they are not placed in any of the figures named above. Therefore more than three syllogistic figures are to be admitted. The antecedent is proved: this syllogism is good, though it does not reside in any of the three figures — "every man is an animal; no animal is a stone; therefore no stone is a man."

Reply. This argument asks whether a fourth syllogistic figure is given — which we refer to its proper place, namely (*l. quaestionum, q.1.art.6, Logicae Scoticae*).

Article VI. On the Modes of the First Figure

The modes of the first figure are presented with examples, supplied to us so that each person may more correctly and readily compose good reasonings — of which Scotus treats (*1.Priorum, q.22.*).

The first mode of the first figure is called Barbara, consisting of three universal affirmative propositions, an example of which I give immediately below.

Bar: Every body is substance. *ba:* Every tree is a body. *ra:* Therefore, every tree is substance.

The second mode is called Celarent, consisting of a universal negative major, a universal affirmative minor, and a universal negative conclusion. Example:

Cæ: No stone is animate. *rent*: Every diamond is a stone. Therefore, no diamond is animate.

The third mode is *Darii*, which is formed from a universal affirmative major, a particular affirmative minor, and a particular affirmative conclusion. Example:

Da: Every animal is living. *ri*: Some horse is an animal. *i*: Therefore, some horse is living.

The fourth mode is *Ferio*, having a universal negative major, a particular affirmative minor, and a particular negative conclusion. Example:

Fe: No animal is devoid of life. *ri*: Some dog is an animal. *o*: Therefore, some dog is not devoid of life.

The fifth mode *Baralippton* is formed from two universal affirmative premisses, with a third particular affirmative indirectly concluding. Example:

Bara: Every animated thing is a body. *li*: Every cherry is animated. *pton*: Therefore, some body is a cherry.

The sixth mode, *Celantes*, is composed of a universal negative major, a universal affirmative minor, and a universal negative indirect conclusion. Example:

Cæ: No animal is insensible. *lan*: Every man is an animal. *tes*: Therefore, no insensible thing is a man.

The seventh mode, *Dabitis*, is constructed from a universal affirmative major, a particular affirmative minor, and a particular affirmative indirect conclusion. Example:

Da: Every substance is a being. *bi*: Some man is a substance. *tis*: Therefore, some being is a man.

The eighth mode, *Fapesmo*, is formed from a universal affirmative major, a universal negative minor, and a particular negative indirect conclusion. Example:

Fa: Every body is substance. *pes*: No whiteness is a body. *mo*: Therefore, some substance is not whiteness.

The ninth mode, *Frisesomorum*, is formed from a particular affirmative major, a universal negative minor, and a particular negative indirect conclusion. Example:

Frise: Some animal is substance. *No color is an animal*. *somorum*: Therefore, some substance is not a color.

First Objection. "Every running thing is a horse; every man is running; therefore every man is a horse." This syllogism is in *Barbara*, yet its consequence is false. Therefore not every syllogism in *Barbara* is legitimate.

Reply. The parts of the said syllogism are impossible — for it cannot be that every running thing is a horse and every man is running. Therefore from their impossibility a true and formal consequence cannot be gathered.

Second Objection. "No frog is stronger than a dog; every man is stronger than a frog; therefore no man is stronger than a frog." This syllogism is in Celarent, yet its consequence is bad. Therefore not every consequence in Celarent is good and formal.

Reply. The antecedent is denied — that this argument is in Celarent — for besides the fact that the predicate of the major is posited three times in it, more is predicated in the minor than is the distributed subject in the major. For if *frog* ought to be the subject of distribution in the major, in the minor one should say "every man is a frog," which, being false, certainly yields a false conclusion. For more see Major, Tataretus, and other dialecticians.

Article VII. On the Modes of the Second Figure

The four modes of the second figure, concluding negatively and directly, are: Cesare, Camestres, Festino, Baroco — examples of each of which I give for the sake of greater clarity.

The first mode, Cesare, is woven from a universal negative major, a universal affirmative minor, from which is deduced a universal negative conclusion.

Example:

Cæ: No stone is living. *fa*: Every tree is living. *re*: Therefore, no tree is a stone.

The second mode, Camestres, is formed from a universal affirmative major, a universal negative minor, and a universal negative conclusion. Example:

Camestres: Every substance is subsistent. No accident is subsistent. Therefore, no accident is substance.

The third mode, Festino, takes a universal negative major and a particular affirmative minor, from which is inferred a particular negative conclusion.

Example:

Festi: No tree is sentient. *no*: Some animal is sentient. Therefore, some animal is not a tree.

The fourth mode, Baroco, is built from a universal affirmative major, a particular negative minor, and a particular negative conclusion. Example:

Ba: Every body is substance. *ro*: Some whiteness is not substance. *co*: Therefore, some whiteness is not a body.

Objection. In Cesare, this argument does not hold: "every man is not an animal; every risible is an animal; therefore every risible is not a man." It is confirmed: "no false thing is true; but of any contradictory pair, one part is true; therefore

no contradictory pair has one part false." This syllogism is in Cesare, yet the consequence is false.

Reply. The said syllogism is denied to be in Cesare. For the argument proceeds from the undistributed to the distributed — since in the premisses *animal* is held confusedly, for it is not explained whether every animal is a man, which it would be false to affirm, or whether every man is an animal, which it is true to assert. By the same token the confirmation is answered: for the argument proceeds from the undistributed to the distributed. For in the minor the other part is held confusedly, and in the conclusion it is distributed — as the Doctor indicates (*1.Priorum*, q.15. §. *Notandum.*).

Article VIII. On the Modes of the Third Figure

The last six modes pertaining to the third figure are: Darapti, Felapton, Disamis, Datisi, Bocardo, Ferison. I give examples of each individually.

The first mode, Darapti, uses a universal affirmative major and likewise a universal affirmative minor, from which follows a particular affirmative conclusion:

Da: Every lion is capable of roaring. *rap*: Every lion is an animal. *ti*: Therefore, some animal is capable of roaring.

The second mode, Felapton, is constructed from a universal negative major and a universal affirmative minor, from which is gathered a particular affirmative conclusion:

Felap: No man is immortal. *Ton*: Every man is rational. Therefore, some rational thing is not immortal.

The third mode, Disamis, has a particular affirmative major and a universal affirmative minor concluding a particular affirmative:

Disa: Some animal is a body. *Every animal is substance*. *mis*: Therefore, some substance is a body.

The fourth mode, Datisi, is composed of a universal affirmative major and a particular affirmative minor inferring a particular affirmative:

Da: Every stone is a body. *ti*: Some stone is a diamond. *fi*: Therefore, some body is a diamond.

The fifth mode, Bocardo, is composed of a particular negative major, a universal affirmative minor, and a particular negative conclusion:

Bo: Some man is not incorruptible. *car*: Every man is rational. *do*: Therefore, some rational thing is not incorruptible.

The sixth mode, Ferison, coalesces from a universal negative major and a particular affirmative minor, from which is deduced a particular negative conclusion:

Ferison: No substance is inherent. Some substance is a being. Therefore, some being is not inherent.

Objection. This syllogism in Darapti does not conclude: "every man is suspended; but every man is to be beheaded; therefore a man to be beheaded is suspended." It is confirmed: this argument in Darapti is not valid — "every man and two men are three men; but every man and two men are two men; therefore two men are three men."

Reply. The said syllogism is by no means in Darapti, since both premisses are particular. And more so because the premisses are not suitable for concluding — for they suppose for different things: the major for thieves in the past, the minor for thieves in the future. To the confirmation I say that the common and universal is not numbered in the enumeration of its singulars, because it is identified with them; otherwise the binary number would be the ternary, and two men would be three men — as is argued above, which is manifestly false — and is treated by Mauritius (*q.24.Universalium*, §. *de tertio*, fol.41.), following Scotus (*1.d.24.q.un. §. Circa illud, sub D.*).

Article IX. On the Common Rules of the Syllogistic Figures

Four common rules are observed for the three figures named above, as Scotus teaches along with the other dialecticians (*1.Priorum*, q.20., near the beginning).

The first: from pure particulars, by the power of the syllogistic form, nothing is correctly concluded — as "some body is living; some stone is a body; therefore some stone is living." The reason is that although two extremes may agree in a common term, they need not agree with one another by reason of their peculiar accounts.

The second rule — touched upon by Scotus (*1.Priorum*, q.21.): from pure negatives, by the power of the syllogistic form, nothing is correctly gathered — as "no tree is sentient; no man is a tree; therefore no man is sentient." The reason is that a syllogism composed entirely of negatives is opposed to the *dicta de omni* and *de nullo*, one of which is the principle of all affirming syllogisms and the other is the foundation of all negating syllogisms — in which it is noted that the middle must be conjoined with at least one of the extremes.

The third — hinted at by Scotus (*4.d.17.q.un. §. Ad argumenta, sub Y.*): if either premiss is particular, the conclusion is likewise inferred as particular. And likewise, if either premiss is negative, the conclusion will certainly be negative. The reason given is that the conclusion always follows the weaker part, and because the premisses are the cause of the conclusion — and an effect follows its weaker or inferior cause — as is clear in the case of natural agents concurring for

the production of the same numerical effect: the effect resembles the particular and inferior agent, not the more universal and perfect one — as a man generated resembles the generating man, not the sun or God co-operating in his generation — as the Doctor observes (*1.d.3.q.7., infra AA.*).

The fourth: the middle must not be placed in the conclusion. The reason is that the office of the middle is to conjoin the extremes in the premisses; hence it is placed twice in them, so that afterward in the conclusion the extremes themselves may be connected with one another. And moreover, if the middle were in the conclusion, that conclusion would not differ from one of the premisses, so that the cause would not be distinguished from the effect — which is absurd.

First Objection. Against the first rule, from Scotus (*1.Priorum, q.20.*): "an animal is Peter; a man is Peter; therefore a man is an animal." This consequence is good, though derived from pure particulars — and thus the first rule does not hold. It is confirmed: "an animal is the running thing; a man is the same animal; therefore a man is an animal." The consequence is valid, though gathered from pure particulars.

Reply. That rule is to be understood as follows: nothing follows from pure particulars by particularity of the middle — or, as the Philosopher says, when the middle is not distributed in the premisses — which does not occur in the syllogisms given above.

Second Objection. Against the second rule: from pure negatives a true conclusion is had — as is clear in this syllogism: "everything that is not an animal is not a man; a stone is not an animal; therefore a stone is not a man."

Reply. The major is truly not a negative proposition: in it the predicate is not removed from the subject — as is done in a negative proposition — especially since it appears to consist of a subject and infinite predicate; and in this case the aforesaid rule does not hold, as our recent contemporaries note and illustrate with the example of the Philosopher (*2.Caeli, c.4.*): "all stars that do not twinkle are near; planets do not twinkle; therefore they are near" — where the conclusion is affirmative, even though the minor is negative, and the conclusion is valid by reason of the infinite verb in the premisses — which the same authors (*1.p.Inst., Tract.2.c.1.*) defend as not conflicting with Scotus (*2.Periherm., q.1.*).

Third Objection. Some syllogisms are valid even though the middle has a place in the conclusion; therefore the third rule is not universally true. The antecedent is shown: "every lion is an animal; every lion is a lion; therefore every lion is an animal." Here the middle is seen in the conclusion, and the whole said syllogism is good.

Reply. In this syllogism the middle is placed in the conclusion — not indeed under the account of a middle, but under the account of one of the extremes; and this perhaps occurs because of the minor premiss, which is an identity.

Article X. On the Particular Rules of the Three Figures

Two peculiar rules are noted for the first figure, and the same number for the second; for the third figure, only one.

The prior rule of the first figure: from a particular major in directly concluding modes, no conclusion is inferred — as "some living thing is devoid of sense; every man is living; therefore every man is devoid of sense." The posterior rule: from a negative minor, no conclusion is reached in directly concluding modes; but in indirectly concluding modes — namely in *Fapesmo* and *Frisosomorum* — it follows well, as "every animal is sentient; no plant is an animal; therefore some sentient thing is not a plant." The reason for both rules is that the middle is not distributed in the premisses — that is, one proceeds from the undistributed to the distributed.

The first rule of the second figure — which Scotus touches upon (*4.d.1.q.1., ante §. Ratio 2., circa F.*): if the major is particular, nothing is concluded — as "some living thing is not sentient; every animal is sentient; therefore some animal is not living." The second rule: from pure affirmatives nothing is inferred — as "every sentient is an animal; every living is an animal; therefore every living is sentient." The reason for both is the same as that given in the rules of the first figure. Scotus makes mention of this (*1.Priorum, q.23. §. Tunc ponuntur.*).

The rule of the third figure: from a negative minor, an invalid conclusion results, for the same reason assigned in the other preceding rules — as "every animal is a body; no animal is insensible; therefore some insensible is not a body." Scotus makes mention of this (*1.Priorum, q.24. §. Quantum ad 1.*).

Objection. Against the first rule of the first figure: "some animal is rational; every man is rational; therefore some man is rational." This conclusion is correctly deduced from premisses of which the major is particular. Therefore the first rule of the first figure is not certain.

Reply. The aforesaid rule is to be understood as follows: nothing follows from a particular major — supplement: by the power of the form — not however by reason of matter, as is deduced in the argument.

Article XI. On the Reduction of Imperfect Syllogisms to Perfect Ones

Since a syllogism is distributed — from what has been said — into perfect and imperfect, and every imperfect can be reduced to a perfect — as Sarnanus the Cardinal especially observes (*q.3.Universalium, p.74, 81.*) — and since all the modes of the figures (except the first four of the first figure, which are plainly

exemplary of the most perfect kind of reasoning) are imperfect, it is therefore necessary to find a method of reducing imperfect syllogisms to perfect ones, so that those who are unwilling to assent to a consequence unless they clearly see its goodness may be convinced. So that this may be done more conveniently, we observe that the words of the verses enumerated in Article V of this question were ingeniously devised. For all the modes of the figures — both perfect and imperfect — have only four initial letters — B, C, D, F — which designate: all imperfect modes beginning with B are to be reduced to Barbara; with C, to Celarent; with D, to Darii; and with F, to Ferio. The reduction of a syllogism is the recalling of an imperfect syllogism to a perfect one, so that the imperfect syllogism may be seen to have been correct and may be clearly shown. There are two kinds of reduction of a syllogism, according to Aristotle and Scotus (*Quol.2.¶. De 2.H.*; and *q.12.Praedicamentali, §. Quia ista.*): one is called ostensive and the other leading to the impossible. Ostensive reduction is the recalling of some imperfect syllogism to one of the perfect ones of the first figure — on account of the denied conclusion of the said imperfect syllogism — and it is accomplished either through conversion of the said denied conclusion, or through transposition of the premisses. For example, if the indirect conclusion in Baralipson is denied — "every tree is animated; every cherry is a tree; therefore some animated thing is a cherry" — this syllogism is to be reduced to Barbara, because Baralipson begins with B, and through simple conversion of the denied conclusion a perfect syllogism is obtained, thus: "every tree is animated; every cherry is a tree; therefore every cherry is animated." And if every cherry is animated, it follows that some animated thing is a cherry — which was denied — just as if every man is rational, it correctly follows that some rational thing is a man, by the *dictum de omni* and by the ante-predicamental rule: whatever belongs essentially to the superior belongs also to the inferior. Reduction to the impossible is the recalling of an imperfect syllogism to a perfect one, on account of the denied conclusion of such an imperfect syllogism — when the respondent is brought to conceding something impossible, such as two contraries simultaneously, or two contradictories. And such a reduction is had through taking the contrary or contradictory of the denied conclusion. So that these two modes of reducing may be more easily perceived, it is useful to note the four consonants S, P, M, C, which appear in some of the said imperfect modes. S indicates that the reduction is to be made through simple conversion — meaning that the preceding proposition is to be converted by simple conversion. P: by conversion per accidens. M: the major is to be made the minor. C: such a mode — such as Baroco — is to be reduced only by the path to the impossible. Moreover, so that one may more conveniently commit to memory the method by which reduction is to be made in any imperfect mode, dialecticians set down this verse:

Phabifer circles the earth and the sphere through the years.

In this verse two expressions are noted, each consisting of five syllables, corresponding to the five imperfect modes of the first figure. The next two following expressions, each consisting of four syllables, correspond to the four modes of the second figure; and the last two expressions, each consisting of six syllables, correspond to the six imperfect modes of the third figure. And in all of these the four vowels A, E, I, O are placed, which show the four modes of the first figure: A designates Barbara, E Celarent, I Darii, and O Ferio. For through this kind of proof the said imperfect modes are confirmed, as is clear from the present example in Baralip-ton:

Every animal is sentient. Every man is an animal. Therefore, some sentient is a man.

If the respondent denies the conclusion posited, the arguer takes the contradictory of the denied conclusion — say, "no sentient is a man" — and because Baralip-ton is reduced to Celarent, according to the rule prescribed for the first figure, the said contradictory of the denied conclusion is put as the major, and the major becomes the minor, from which is inferred the contrary of the conceded minor of the reduced syllogism by converting it per accidens — thus in Celarent:

No sentient is a man. Every animal is sentient. Therefore, no animal is a man.

"No animal is a man; therefore no man is an animal." But every man is an animal — as the respondent conceded — therefore no man is an animal and every man is an animal; and thus the respondent admits two contrary propositions as simultaneously true.

Objection. From Aristotle (*1.Priorum*, c.6.): besides the two reductions assigned, there is another reduction through exposition — when, with a singular middle substituted in place of the common middle, the same conclusion is deduced as was inferred in the syllogism having a common middle. For example, if the respondent denies this conclusion in Darapti:

Every tree is animated. Every tree is a body. Therefore, some body is animated.

The arguer takes a singular middle placed under *tree* and puts it in place of the common middle — thus: "this cherry is animated; this cherry is a tree; therefore some tree is animated, and this tree is a body; therefore some body is animated" — because whatever follows from the consequent follows from the antecedent. Therefore there are three reductions of an imperfect syllogism to a perfect one.

Reply. There are only two common reductions to all figures. For the reduction through exposition is peculiar and proper to the third figure. Or it may be said that through this reduction, a change is made only by reason of the common middle exchanged for a singular one; whereas in the two said reductions the same middle remains, and conversion and transposition of propositions take place with the same middle persisting.

Article XII. On the Powers of the Syllogism

Nine powers of the syllogism are comprehended in a ninefold number, as examined by Aristotle in (*2.Priorum*). The first is the power of concluding several things. For from the subalternating, the subalternated can be concluded — as "if arithmetic is a science, then music, which is subalternated to it, is also a science." Likewise, "if man is rational, then Peter is rational." Moreover, from the converted, the converting can be concluded — as "no fish is a tree; therefore no tree is a fish." And this can occur through the taking of several minor extremes. The second is the power of gathering true things from false ones — as "every animal is white; a swan is an animal; therefore a swan is white." This occurs when, from both false premisses, or from one premiss false in whole or in part, we conclude something true. But a false thing can by no means be inferred from true things — otherwise the antecedent would be true and the consequent false, which cannot occur. The third is the power of syllogizing circularly, and it is effected when, through the conclusion and the converse of one of the premisses, we deduce the other premiss of the first syllogism — as "every rational is risible; every man is rational; therefore every man is risible." The minor is inferred from the same conclusion with the converse of the minor, and holds only in convertible terms — thus: "every man is rational; every rational is risible; therefore every man is risible." Likewise, from the same conclusion with the converse of the major, the major is inferred — thus: "every risible is rational; every man is risible; therefore every rational is risible." The fourth is the power of syllogizing conversively. This occurs when, from the contradictory of the conclusion together with one of the premisses, the contradictory or contrary of the other premiss is inferred — whereby we showed in the preceding article that all imperfect syllogisms are reduced to perfect ones. The fifth is the power of syllogizing to the impossible, which we declared sufficiently at the place now cited. The sixth is the power of syllogizing from opposites. This occurs when from contradictory or contrary premisses a conclusion is gathered in which the same thing is denied of itself. This is done to convict those who obstinately would concede or deny contradictories or contraries simultaneously — as "every tree is animated; no tree is animated; therefore no tree is a tree."

Objection. Aristotle (*1.Post., c.3.*), along with the other philosophers, admits regress in argumentation and rejects circularity. Therefore to syllogize circularly is not a power of the syllogism.

Reply. The antecedent is granted; the consequence is denied. For it is one thing to have the power to do something, another to do it usefully or uselessly. The first is indeed possible without the second. Therefore we admit the power of syllogizing circularly; but whether it is profitable to syllogize circularly will be examined elsewhere.

Question II. On the Syllogism Taken Specifically

We adduced and explained many divisions of syllogisms and gave their definitions in the preceding question, Article III. Therefore, since nothing else pertaining to them worthy of note for beginners occurs to us, we have taken care to add only a few things here.

Article I. On the Expository Syllogism

The expository syllogism — from Scotus (*1.d.2.q.7.Ad 1.principale II.*; *q.10.Praedicamentali*; and *1.Priorum, q.11.*) — is described as one whose middle term is a singular term held singularly and univocally. It is called expository either because it clearly sets the thing before one's eyes, or because it expounds a common middle through a singular middle — as "Paul is an Apostle; Paul is a Tarsian; therefore some Tarsian is an Apostle." This syllogism relies principally on that principle — those things that are the same as some one third thing are the same as one another — which was already explained by us in Article IV of the preceding question. For the said syllogism to appear correct, three conditions are required. The first is that the middle hold singularly — lacking which this syllogism is not valid: "Plato is a singular term; Plato is a being; therefore a being is a singular term." The second: the middle must be the total extreme in one of the premisses. Hence this does not follow: "Plato is in this temple; Socrates is in this temple; therefore Plato is Socrates." The third: in affirmatives, such an identity as is had in the premisses must be concluded; and conversely, such a diversity must be concluded in negatives as is present in the premisses. Hence this syllogism is not valid: "this divine essence is the Father; this divine essence is the Son; therefore the Son is the Father." For the Father and Son are the same in the divine essence, but not in person. For the person of the Father is different, the person of the Son different, and the person of the Holy Spirit different — as Athanasius states in the Creed.

First Objection. This expository syllogism is not valid: "this God is everywhere; this God is some man; therefore some man is everywhere."

Reply. It may be said that it is not valid concerning an infinite and singularly held term in a common way — as is clear from Scotus cited above; and we treated this at length in (*Tract. de Trin., disp.3.q.4.*). Or say that it concludes only with respect to divinity, not with respect to humanity.

Second Objection. Nor is this expository syllogism good: "this being preceded its mother; but this being is some man — according to *John 8*: 'Before Abraham was made, I am'; therefore some man preceded his mother."

Reply. The argument concludes by reason of divinity, not by reason of humanity. For God is man through the assumption of humanity; hence it is not correctly inferred that some man preceded his mother, because the Son of God did not assume humanity before his mother.

Article II. On the Syllogism from Obliques

A syllogism from obliques is one composed of some oblique term — as "every good is from God; salvation is some good; therefore salvation is from God." Aristotle treats this (*2.Priorum*, c.37.) and Scotus (*1.Priorum*, q.18., *ante* §. *Tunc sunt*; q.39. §. *Quantum ad* 1.; and *1.d.2.q.2. §. Ad argumenta principalia, sub E.O., and thence*). For its correctness and the goodness of its consequence, several things are to be observed: first, in an affirmative, if one of the premisses is oblique, the conclusion must be constructed with obliques or an oblique — as is clear from the example given above. Next, in a negative, if one of the premisses formed with obliques is affirmative, nothing is concluded. Furthermore, Aristotle at the cited place notes that these syllogisms from obliques, in order to be correctly formed, are to be reduced to direct ones — as "of opposites there is the same discipline; virtue and vice are opposites; therefore of virtue and vice there is the same discipline." This is reduced thus: "opposites are those of which the discipline is the same; virtue and vice are opposites; therefore virtue and vice are those of which the discipline is the same."

Objection. This syllogism from obliques is good, though formed from one affirmative premiss — namely: "no sin is in God; but every acceptance of persons is a sin; therefore no acceptance of persons is in God" — as is clear from the scriptural passage, *Acts 10*: "In truth I have found that God is not an acceptor of persons."

Reply. It may be said that the said syllogism is indeed composed of an affirmative minor and a negative major — since from pure negatives in any figure nothing is concluded, as we said above — yet it is not composed of an affirmative consisting of several obliques; and therefore it seems to be good. Some recent authors respond in this way — though the description of this syllogism given at the beginning of this article is opposed to them. Nor does there seem to be any better reason for a syllogism consisting of obliques than for one composed with a single oblique. It may perhaps be said with others that the aforesaid rule is not universally true — but holds in some cases and fails in others — just as in the ostensive reduction of syllogisms we excepted certain modes — Baroco and Bocardo — as we noted above. And the agreed view of dialecticians is that the reduction of the mode Celantes is not to be carried out in the same way as the other modes. As for what else can be said about the demonstrative and dialectical syllogisms — either it is clear from what has been said, or it is to be examined elsewhere.

Question III. On Dialectical Topics

No one denies that the whole of logic is situated in judgment and invention, as in its two principal parts. Since we treated of judgment above, there now remains a discussion of invention — which is held to consist principally in knowing the dialectical topics.

Article I. What the Dialectical Topic Is, and How Many Kinds There Are

A topic is the seat of an argument — or that from which a suitable argument is drawn. For just as a natural place is said to conserve a thing in its being, surrounding, containing, and fostering it, so a dialectical topic provides force and strength to the argument drawn from it. An argument — though it is not infrequently used for the syllogism, as Scotus says (*q.1.Universalium*, §. *Dicendum*) — is properly the proving middle of a conclusion, and is commonly described as follows: an argument is that which makes credible a doubtful thing, as is clear from (*1.Elench.*, *q.4.*). A topic, taken in its most common sense, is twofold: one is called the *maxima* — a self-evident proposition for which no other is prior or better known in the same genus, as "of whatever the definition is predicated, of that the defined is also predicated" — the other is called the *differentia maximae* (difference of the maxima), which consists of the terms from which the maxima are composed and by which they differ from one another, such as definition and defined. The *differentia maximae* is in turn subdivided into intrinsic, extrinsic, and middle. Intrinsic is when the argument is drawn from those things that enter into the substance or nature of the thing; extrinsic is when the argument is drawn from those things that are separated from the substance or essence of the thing; middle is when the argument is drawn from those things that partly agree with the terms in question and partly differ from them. In general, twenty-eight topics can be enumerated: eighteen intrinsic, seven extrinsic, and three middle — about each of which we must treat individually in the three following articles.

First Objection. If the definition of a topic were good, these two terms *man* and *animal* would be topics, because an argument is drawn from them — "it is a man; therefore it is also an animal"; but they cannot be topics, since they can be neither maxima nor difference of a maxima. Therefore the definition of a topic is not correctly given.

Reply. The inference from the major is denied: even if an argument is drawn from them, it is not drawn from them as a maxima or as a difference of a maxima.

Second Objection. The difference of a maxima is the relation of the terms from which a maxima is constructed; but a relation is not a term but a relation. Therefore the topic of the difference of a maxima is not correctly described.

Reply. The difference of a maxima is formally a relation; but fundamentally it is the said terms — as some Scotists aptly observe.

Article II. On Intrinsic Loci Drawn from the Substance of a Thing

An intrinsic locus is derived either from the substance and essence of a thing — in which case an argument is drawn from what belongs to the substance of the terms under examination — or from what accompanies the very substance and

nature of the thing, in which case an argument is deduced from what follows upon the terms under examination. The loci taken in the first manner number six: from definition, from the defined, from description, from the described, from interpretation, and from the interpreted. The loci taken in the second manner number twelve: from the universal whole, from the integral whole, from the whole in quantity, from the whole in mode, from the whole in place, from the whole in time, from cause, from effect, from generation, from corruption, from use, and from what commonly accompanies a subject. In accordance with the order of loci set out above, each individual locus is to be carefully explained and illustrated with examples — the former class in the present article, the latter in the following one.

The locus from definition is the relation of a definition to what it defines, from which four arguments are drawn: two affirmative and two negative. The first: whatever is affirmed of the definition is likewise affirmed of the defined — as, "a rational animal is capable of laughter; therefore, a human being is capable of laughter." The second: whatever the definition is affirmed of, the defined is equally affirmed of — as, "substance is a self-subsisting being; therefore, a body is a self-subsisting being." The third: whatever is denied of the definition is also denied of the defined — as, "no rational animal is inanimate; therefore, no human being is inanimate." The fourth: whatever the definition is denied of, the defined is likewise denied of — as, "a plant is not a rational animal; therefore, a plant is not a human being." We argue in essentially the same manner from the defined as from the definition, changing only the name of the definition to that of the defined, since the locus from the defined is the relation of the defined to its definition.

The locus from description is the relation of a description to the thing described — as, "Logic is the investigator of truth and falsehood; therefore, it is necessary for the pursuit of the sciences." Arguments are drawn from description to the described, and vice versa, in the same number as from definition to the defined. To this locus belongs the locus from a species to its proper attribute — as, "a human being is sentient; therefore, the capacity for laughter is a sentient capacity" — as well as the locus from individuals to their attribute — as, "Peter runs; therefore, something capable of laughter runs."

The locus from interpretation is the relation of an interpretation to the thing interpreted — as, "a lover of wisdom goes for a walk; therefore, a philosopher goes for a walk." Much the same kinds of arguments are produced in these cases as in the foregoing loci.

One may object that the following does not hold: "A just person is a lover of wisdom; therefore, a just person is a philosopher" — and thus that the locus from interpretation to the interpreted is not reliable. In reply: if the just person loves wisdom already possessed, or is at least in the act of possessing it, the inference must be denied; but if he lacks it and is not in the act of attaining it,

the inference must be granted — for love is directed toward what is already had, while desire is directed toward what is yet to be had, as will be clear in Ethics.

Article III. On Intrinsic Loci Drawn from What Accompanies the Substance

The loci drawn from what accompanies the substance — or the quiddity — of a thing, twelve in number as listed in the previous article, must now be briefly expounded and confirmed with examples.

The locus from the universal whole — that is, from genus to species — is the relation of the universal itself to its subjective part, and it holds negatively: as, "a stone is not an animal; therefore, it is not a human being" — for whatever the universal whole is removed from, its part is equally removed. Conversely, the locus from the subjective part is the relation of the subjective part itself to its universal whole, and it holds affirmatively: as, "a human being runs; therefore, an animal runs."

The locus from the integral whole — mentioned by Scotus (9.43. *Praedicamentali*. §. *Ad q.*) — is the relation of the integral whole to its integral part, and it holds affirmatively: as, "the house exists; therefore, the wall exists." The locus from the integral part, conversely, is the relation of the part to its whole, and it holds negatively: as, "the wall does not exist; therefore, the house does not exist."

The locus from the whole in quantity — indicated by Scotus (1. *Priorum* q.2. and *Quol.* 7. §. *Ad primum argumentum, sub BB.*) — is the relation of the whole to its part, and it holds affirmatively: as, "every horse runs; therefore, Bucephalus runs," and negatively: "no horse runs; therefore, Bucephalus does not run." The locus from the parts in quantity is the relation of all the parts taken together to their whole, and it holds affirmatively: as, "Peter runs, Paul runs, and so do the rest; therefore, every human being runs," and negatively: "Peter does not run, Paul does not run, nor do the rest; therefore, no human being runs."

The locus from the whole in mode — reported by Scotus (1. *Priorum* q.6. and *Sirectus* art. 3. *partiali Form.*) — is the relation of a common term taken without any qualification to that same whole taken with a qualification: as, "Peter is not a geometer; therefore, he is not a distinguished geometer." The locus from the part in mode is the relation of the part to its whole: as, "Euclid is an exceptional mathematician; therefore, Euclid is a mathematician."

The locus from the whole in place is the relation of the whole itself to its part, and it holds affirmatively: as, "God is everywhere; therefore, God is here," and negatively: "the Antichrist is nowhere; therefore, the Antichrist is not here." The locus from the part in place is the relation of the part itself to its whole, and it holds negatively: as, "Adam is not here, nor anywhere else; therefore, he is nowhere."

The locus from the whole in time is the relation of the whole itself to its part, and reasoning proceeds in essentially the same way as for the whole in place. It

holds affirmatively: as, "God exists at every time; therefore, God exists at the present time," and negatively: "the Antichrist has existed at no time; therefore, the Antichrist does not exist at the present time." The locus from a part of time to its whole is the relation of the part itself to its whole: as, "God exists in the present, the past, and the future; therefore, he exists at all times."

The locus from cause — suggested by Scotus (*Quol. 17. §. Contra conclusionem, ante L.*) — is the relation of a cause to its effect, and is fourfold, corresponding to the four kinds of causes, from each of which we draw both affirmative and negative arguments, as will be clear in the examples that follow when each kind of cause is explained.

The locus from the efficient cause — mentioned by Scotus (*Quol. 13. §. Ad ista*) — is the relation of the efficient cause itself to its effect, and it holds affirmatively: as, "the tree is good; therefore, it bears good fruit," and negatively: "the tree is bad; therefore, it bears bad fruit" — as Christ the Lord teaches, *Matt. 7*.

The locus from the material cause is the relation of matter itself to its effect, and it holds affirmatively: as, "iron exists; therefore, iron weapons can be made from it," and negatively: "iron does not exist; therefore, iron weapons cannot be made from it."

The locus from the formal cause is the relation of the formal cause to its effect, and it holds affirmatively: as, "whiteness exists; therefore, something white exists," and negatively: "whiteness does not exist; therefore, nothing white exists."

The locus from the final cause is the relation of the final cause to its effect, and it holds affirmatively: as, "happiness is good; therefore, virtue is good," and negatively: "punishment is not good; therefore, sin is not good." We argue in exactly the same manner from effect to cause, merely substituting the name of the effect for that of the cause; for if the effect is good, the cause is likewise good, and vice versa. This is what Christ the Lord argued and taught when he said: "By their fruits you will know them," *Matt. 7*.

The locus from generation is the relation of generation to the thing generated. The following axiom governs the arguments drawn from it: that whose generation is good is itself good — as, "the generation of something is good; therefore, that something is good" — and that whose generation is bad is itself bad — as, "the generation of a disease is bad; therefore, the disease is bad." The reason is that generation, being the production of anything whether substantial or accidental, tends toward the existence of the thing; therefore, if the thing produced is good, its production is called good, and if the thing produced is bad, its production is likewise bad.

The locus from corruption is the relation of corruption to the thing corrupted. The following axiom applies: that whose corruption is good is itself bad — as, "the corruption or destruction of a thief is good; therefore, the thief is bad" —

and that whose corruption is bad is itself good — as, "the destruction of a house is bad; therefore, the house is good."

The locus from use is the relation of use to that of which it is the use: as, "riding is good; therefore, the horse is good." Likewise, "killing one's neighbor is evil; therefore, the killer of one's neighbor is evil."

The locus from what commonly accompanies a subject is the relation of one common accompaniment to another, and it holds affirmatively: as, "the woman has milk; therefore, she has given birth," and negatively: "the woman does not have milk; therefore, she has not given birth."

One may object, first, that the following does not hold well: "An image is a painted man; therefore, an image is a man" — and yet it argues from the whole in mode. Thus the locus from the whole in mode does not always yield a valid argument. In reply: the inference does not hold because the argument proceeds from a restricting qualification — just as the inference from the qualified to the unqualified does not hold, as in: "the Ethiopian is white with respect to his teeth; therefore, the Ethiopian is white."

One may object, second, that the following does not follow correctly: "Whiteness exists; therefore, the wall exists" — even though it argues from formal cause to its formal effect. Thus the locus from formal cause to effect is not certain and infallible. In reply: the inference is invalid because a wall is not the concrete instantiation of whiteness; the concrete instantiation of whiteness is rather "something white." Thus the valid argument is: "Whiteness exists; therefore, something white exists."

One may object, third, that the following is not a valid inference: "The death of Christ was good, since through it we were saved; therefore, Christ was evil" — even though the argument proceeds through the locus from corruption to the thing corrupted. Thus this locus departs from correctness. In reply: the death of Christ was indeed good for us, for the reason given, but not for Christ himself with respect to his natural composite — for since he truly died, his humanity was destroyed through his death, as can be seen in Scotus (8.d.22., Orbellus, and other Scholastics there).

One may object, fourth, that the following does not hold: "God repented, according to Genesis 5, 'I repent having made them,' that is, human beings; therefore, God sinned" — even though it argues through the locus from what commonly accompanies a subject. In reply: such repentance, in relation to God, is understood metaphorically, like anger, mercy, and similar expressions, as will be discussed in the appropriate place; therefore, the inference has no force.

Article IV. On Extrinsic Loci

The extrinsic loci, which, as was stated in Article I of this question, are seven in number, and which the Doctor mentions (1.d.1.q.5. §. *Ad primum argumentum* 3.q.

and d.11.q.2. §. Contra istam positionem. A. and d.10.q.un. §. Ad argumenta principalia. F.), are as follows: from opposites, from greater to lesser, from lesser to greater, from similarity, from proportion, from transference, and from authority. I shall now run through all of these briefly, lest this little work grow into something unwieldy.

The locus from opposites is fourfold, corresponding to the four kinds of opposition already enumerated elsewhere: there are relative, contrary, privative, and contradictory opposites.

The locus from relatives is the relation of one relative to another, and it holds affirmatively: as, "there is a father; therefore, there is a son," and negatively: "there is no father; therefore, there is no son." For positing one relative posits the other, and removing it removes the other.

The locus from contraries is the relation of one contrary to another. It holds affirmatively in the case of immediate contraries: as, "it is even; therefore, it is not odd," and negatively: "it is not even; therefore, it is odd." I say in immediate contraries, because in mediate contraries the inference does not hold — as, "it is not white; therefore, it is black" does not follow, since it could be red or some other intermediate color.

The locus from privatively opposed terms is the relation of a privation to a habit, or of a habit to a privation, and it holds affirmatively: as, "this man is sighted; therefore, he is not blind," and negatively with the constancy of the subject and at a time determined by nature alone — for a puppy before the ninth day is said to be neither sighted nor blind, nor is a boy said to be toothless before the time fixed by nature.

The locus from contradictories is the relation of one contradictory to another: if one contradictory is true, the other is false — as, "it is true that Peter is sitting; therefore, it is false that Peter is not sitting."

The locus from greater to lesser is the relation of the greater itself to the lesser, and it holds negatively: as, "a general cannot take the fortress; therefore, neither can a soldier." Consonant with this is the axiom: if that which seems more likely to be present is not present, neither will that which seems less likely to be present be present — as Scotus writes (*q.25. Praedicam. §. Dicendum*).

The locus from lesser is the relation of the lesser itself to the greater, and it holds affirmatively: as, "a soldier can take the fortress; therefore, so can a general." Consonant with this is the axiom: if that which seems less likely to be present is present, that which seems more likely to be present will also be present — as the Doctor indicates (*ibid. and 1. Post. q.23.*) and *Aug. expositio 2. in Psal. 21. Isa. 32. in fine*.

The locus from similarity is the relation of one similar thing to another similar thing, and it holds affirmatively: as, "the capacity for laughter is proper to a

human being; therefore, the capacity to neigh is proper to a horse," and negatively: "the capacity for laughter is not the genus of a human being; therefore, the capacity to neigh is not the genus of a horse."

The locus from proportion is the relation of one proportionate thing to another proportionate thing: as, "as a sailor is to a ship, so a driver is to a carriage; but a sailor steers the ship; therefore, a driver steers the carriage." Both this and the preceding locus are mentioned by Scotus (*2.d.3.q.1. and 4.d.49.q.11.B.*)

The locus from transference is the relation of a transferred expression to the thing to which it is transferred: as, "when a human being is cheerful he smiles; therefore, when the meadows are in bloom, they smile."

The locus from authority is the relation of an authority to what is proved by it. Authority is the judgment of a person experienced in some science, concerning matters belonging to that science; for one must trust each expert in his own art — as, "Aristotle affirms that the earth is at rest; therefore, the earth is at rest." It holds only affirmatively, not negatively. For this reason it is commonly received that an argument drawn from negative authority is inconclusive — as, "Aristotle does not say this; therefore, it is not to be admitted." This is noted by Scotus (*1.d.3.q.7. §. Ad auctoritatem Philosophi, sub Y.*)

One may object, first, that the following does not hold: "The rational soul is moved; therefore, the rational soul is not at rest" — because Peter's hand can be moving and his foot at rest at the same moment. Thus the locus from privatively opposed terms does not hold. In reply: this is true with respect to different things, but not with respect to the same thing, as is inferred in the objection just cited.

One may object, second, that the following is not a valid inference: "The king cannot bear a weight of one hundred pounds; therefore, neither can the soldier" — even though it argues from greater to lesser; and thus the locus from greater to lesser is not always certain. In reply: the argument is not from greater to lesser with respect to the proper strength of either the king or the soldier, as it is framed in the objection — for understood that way it would rather be an argument from lesser to greater. The example adduced must be understood not of the king alone, but of those who attend and accompany the king.

One may object, third, that the following does not hold by way of similarity: "As a negative relates to a negative, so an affirmative relates to an affirmative; but a universal negative entails a universal negative in simple conversion; therefore, a universal affirmative likewise entails a universal affirmative in simple conversion." In reply: the argument is poorly formed and the inference does not follow — precisely because the things in question are not similar in the relevant respect. This objection therefore has no force.

Article V. On Middle Loci

The middle loci are three in number, as was stated, and they are called the locus from conjugates, from cases, and from division. These remain to be described and illustrated with examples, as was done for the foregoing ones.

The locus from conjugates is the relation of one conjugate to another. Among dialecticians, conjugates are concrete and abstract terms — such as "white" and "whiteness." It holds affirmatively: as, "the logician is knowing; therefore, logic is a science" — as the Subtle Doctor argues (*q.1. Universalium*) — and it also appears to be exemplified by Antonius Andreas (*q.9. in lib. sex principiorum*), who says: "the principles of action and passion belong to the same genus; therefore, so do action and passion." It also holds negatively: as, "avarice is not praiseworthy; therefore, a miser is not praiseworthy." This locus is, however, restricted in multiple ways. First, by the Doctor (*1.d.5.q.1.*) in the case of ultimate abstracts, where the following does not hold: "a horse is an animal; therefore, horseness is animality." Second, in the case of per se predicates, so that the following does not hold: "the white is sweet; therefore, whiteness is sweetness." Third, in the case of distinct predicates and terms, so that the following does not hold: "the white is colored; therefore, whiteness is colored."

The locus from cases is the relation of one case to another. Among dialecticians, cases are an adjective and its corresponding adverb — such as "just" and "justly." It holds affirmatively: as, "the just is good; therefore, what is done justly is done well," and negatively: "the unjust is not good; therefore, what is done unjustly is not done well."

The locus from division is the relation of one dividing member to another. We argue from division in two ways. First, by denying all the other dividing members except one, the remaining one is concluded: as, "a human being is an animal and is not irrational; therefore, it is rational." Second, if all the dividing members are removed from something, the divided whole is likewise removed from it: as, "a tree is not a brute animal, nor is it a human being; therefore, a tree is not an animal." One should review what was said at (*1.2.q.7.art.1.*) on the precepts of good division.

One may object that the following does not hold by way of the locus from division: "Plato is colored and is not black; therefore, he is white." I grant that the inference is flawed, because the rule given above is not observed — namely, that all the other dividing members except one must be denied.

Question IV. On the Sophistic Syllogism

Last of all, we must treat the sophistic syllogism, the purposes of the Sophists, and their loci. We offer this account not in order to deceive others, to defend falsehood, or to attack truth, but in order to draw truth itself out of the darkness and embrace it, and to repel falsehood proposed in the guise of apparent truth.

The sophistic syllogism is defined by Aristotle (8. *Top. c.4.*) as one that draws its conclusion from premises that appear probable but are not; and it is described by Scotus (*q.3. Universalium*) as the privation of a true syllogism, just as darkness is the privation of light. The same Doctor (*1.d.42.q.un. §. Ad auctoritatem, sub D.*) also calls it a defective, apparent, and deformed syllogism. This can be clearly illustrated from natural philosophy, which teaches that birds and beasts are painted with real colors, while the rainbow, the neck of a dove, and the rays of the sun are adorned with merely apparent colors.

Article I. On the Purposes of the Sophists

Two ends may be assigned to the Sophists. One is the principal end, which is vain or merely apparent wisdom displayed before an audience — something the Sophists endeavor to win, as Aristotle (4. *Met. 6.2. Tex.5.*) and Scotus (1. *Elench. in fine q.7.*) note. The other is a less principal end, namely the drawing of one's opponent into some inconvenience, which the Sophist strives to force upon the one who responds; and this is fivefold: refutation, falsehood, the paradoxical, solecism, and tautology.

Refutation — mentioned by the Doctor (*q.11. Elench. and 4.d.12.q.1. §. Ad q. sub E. versu. Ex ista ratione*) — is the denial of what was previously conceded and the concession of what was previously denied. That is, it occurs when the respondent is compelled to concede the opposite of what he had denied. For example, if someone denies the conclusion "some man flies," the Sophist will syllogize so as to compel the respondent to accept it: "Every rooster flies; some man is a rooster; therefore, some man flies." This sophism is dissolved by distinguishing the major premise, which is true of the barnyard rooster but not of a man of the French nation.

Falsehood is the concession of what is evidently false, or the denial of what is evidently true — that is, when the respondent is driven by the Sophist to concede something that is manifestly false: as, "whatever you have not lost, you have; you have not lost a treasure; therefore, you have a treasure." This sophism is dissolved by absolutely denying the major, or by distinguishing it. Regarding things you truly possessed and did not lose, it is conceded; regarding things you never possessed, it is denied. Chrysippus records something similar in *Teatro vitae humanae, p.197. col. 1.*

The paradoxical occurs when something is conceded that contradicts the common judgment of all — that is, when the respondent admits what is considered improbable by the audience: as, "not every cause loves its work; a mother is the cause of her son; therefore, a mother does not love her son."

Tautology is the pointless and useless repetition of one and the same thing: as, "every lion is an animal; this lion is a lion; therefore, this lion is an animal."

Solecism is an error of incongruous speech, contrary to the rules of grammar, which the Sophist endeavors to induce: as, "every human being is capable of knowing; every woman is a human being; therefore, every woman is capable-of-knowing" — where the grammatical form is incorrect.

One may object that Scotus (*2.d.42.q.4. §. sequitur sub L.*) writes that to recognize and define a solecism belongs to the art of speaking, while to commit one is a fault reproved in that art. Therefore, according to Scotus, solecism does not belong to the sophistical and deceptive art. In reply: it is true that discussion of solecism belongs to grammar; but it is the task of sophistry to impel someone toward committing a solecism. This is how the passage of Scotus just cited is to be interpreted.

Article II. What a Fallacy Is and How It Is Divided

A fallacy, according to Scotus (*q.5. Praedicamentali §. Ad quaestionem dicendum*), is a locus suited to deceiving the respondent through sophistic arguments. A sophistic locus is the seat of an argument from which the Sophist draws his sophistic arguments. Two causes are noted in a fallacy: one is apparent truth, which moves the respondent to assent to it — by reason of which it is called an apparent syllogism; the other is the deficiency of truth, which moves the respondent to reject it — by reason of which it is called a defective syllogism. All deceptive syllogisms either err in matter or in form, as the Doctor writes (*1.d.41.q.un. §. Ad auctoritatem, infra D.*)

To err in matter occurs when one or both of the premises appear to be true and sufficient for inferring a good conclusion, but are in fact false: as, "whatever you have not lost, you have; you have not lost a treasure; therefore, you have a treasure." The sophism is dissolved in the manner explained in the preceding article: the major is denied, since it appears true but is not.

To err in form occurs when the conclusion appears to follow from the premises but in fact does not: as, "an animal runs; therefore, a human being runs." For there may be some animal other than a human being that runs — a lion or a horse, for instance. The sophism is therefore dissolved by denying the consequence. Fallacies are, moreover, of two kinds — as the Doctor notes (*q.5. praedicamentali and 1. Elench. q.7.*) — some in speech, or in the word, and some outside speech, or in the thing. All together they are reckoned to number thirteen: six in speech and seven outside speech, as indicated by Scotus (*1. Elench. q.7.*), which will be treated in the two following articles.

One may object that every fallacy occurs through speech, as is evident; therefore, no fallacy exists outside speech, and thus the division into fallacies in speech and outside speech is incorrect. In reply: what is called a fallacy outside speech is so named not because it occurs without speech, but because its appearance of truth derives not from the word but from the thing, as the Doctor suggests (*q.5. Elench. §. Ad q.*)

Article III. On Fallacies in Speech

The fallacies in speech are equivocation, amphiboly, the fallacy of composition, of division, of accent, and of figure of speech — as Scotus indicates (*1. Elench. q.7. §. Verumtamen*). This sixfold number of fallacies is established by the Doctor (*q.19. Elench. §. Ad aliud*) by the following reasoning: every sophism arises either through the multiple sense of a single word — and this is equivocation; or through the ambiguous sense of a phrase — and this is amphiboly; or through a false composite sense — and this is the fallacy of composition; or through a false divided sense — and this is the fallacy of division; or through the resemblance of one word to another — and this is the fallacy of figure of speech; or through the quantity, aspiration, and manner of pronouncing a word — and this gives the fallacy of accent.

The fallacy of equivocation is deception arising from the unity of a name that has multiple meanings, as the Doctor writes (*1. Perihermenias q.f. and indicates 1.d.9.q.un. §. Ad quaestionem dico, and d.26.q.un. §. Ad rationes sub N.*). It occurs in three ways. First, when a name signifies several things equally and principally — and this is called equivocation by chance, or, as others prefer, pure equivocation: as, "every rooster has wings; but this man is a Gaul; therefore, this man has wings." This sophism is dissolved by distinguishing the major: it is conceded of the barnyard rooster but denied of the man of the French nation, as already stated in the preceding article. Second, when a name has one proper and one metaphorical meaning — and this is called equivocation by design, which others call analogy: as, "whatever has feet can run; a mountain has feet; therefore, a mountain can run." This is mentioned by Scotus (*q.14. Elench.*). The sophism is dissolved by distinguishing the major: what properly has feet is granted; what improperly has feet, as a mountain does, is denied. Third, from Scotus (*q.22. Elench.*): when a name taken conjointly signifies several things, but taken separately signifies only one: as, "everything incorruptible is permanent; everything capable of not being corrupted is incorruptible; therefore, whatever is capable of not being corrupted is permanent." To resolve this sophism one must distinguish the major: if "incorruptible" is taken to mean the same as "capable of not being corrupted," the major is denied — for Adam in the state of innocence was capable of not being corrupted and yet was not permanent. If "incorruptible" is taken to mean "incapable of being corrupted," the major is conceded.

The fallacy of amphiboly is a locus suited to deceiving, arising from a phrase having multiple senses. This is treated by the Doctor (*q.18. Elench. and 2.d.16.q.un. §. Rationes ista. C. Quol. 2. §. Ad 1. sub R.*). It differs from equivocation in that equivocation occurs in simple terms, while amphiboly occurs in complex terms. Just as there are three modes of equivocation suited to deception, so there are three modes of amphiboly suited to misleading. The first mode arises when a phrase equally and primarily has multiple senses, so that in one of the premises

it is taken in one sense and in the conclusion in another: as, "whatever belongs to Aristotle is possessed by Aristotle; this book belongs to Aristotle; therefore, this book is possessed by Aristotle." The sophism is exposed — following Scotus (*in Reportatis 4.d.13.q.1. §. Item formalius*) — because it is ambiguous whether "Aristotle's book" means a book composed by Aristotle or a book owned by Aristotle; if the major is understood in the first sense, the conclusion is false; if the major is understood in the second sense, the conclusion is true. The second mode arises when a phrase bears multiple senses, one principal and one less principal, and has one sense in one of the premises and another sense in the conclusion: as, "whoever ploughs the seashore turns the earth; but whoever wastes his effort ploughs the seashore; therefore, whoever wastes his effort turns the earth." For the phrase "ploughs the seashore," if taken in its proper sense, makes the major true and the minor false; if taken in its metaphorical sense, the major is false and the conclusion is true. The third mode occurs when a phrase taken by itself has only one meaning, but when joined to another it takes on a different meaning: as, "whatever someone sees, this sees; but someone sees a column; therefore, the column sees." The paralogism is dissolved by distinguishing the phrase "this sees" — for "this" may be taken in the nominative case, giving the sense that whatever someone sees, that thing itself sees, i.e., has the power and act of seeing; in which case the major is false and the conclusion absurd. Or "this" may be taken in the accusative case, giving the sense that whatever someone sees, he sees that thing; and in this way the major is also false.

The fallacy of composition is committed when one proceeds from a true divided sense to a false composite sense. Or: the fallacy of composition is a locus suited to deceiving, arising from the sameness of a false composite expression and a true divided one: as, "the white can be black; this wall is white; therefore, this wall can be black." The major in the composite sense is false: for what is white, insofar as it is white — that is, insofar as it is determined and contracted by the form of whiteness and remains under it — cannot be black, since otherwise two opposed forms would simultaneously exist in the same subject. But in the divided sense it is true: for what is affected by whiteness can in principle be affected by blackness.

The fallacy of division is a locus suited to deceiving, arising from the sameness of a false divided expression and a true composite one. This sophism is committed when one argues from a true composite sense to a false divided sense: as, "the white cannot be black; this wall is white; therefore, this wall cannot be black." The major in the composite sense is conceded, as just explained; but in the divided sense it is denied. For there is no contradiction in the fact that what is white can be made black: what is absolutely determined by whiteness can simply be determined by blackness, and vice versa, since there is no necessity except in a qualified sense and from a supposition. These two fallacies are mentioned and discussed by Scotus (*1.d.21.q.un. §. Ad 1.arg. sub A. and*

d.39. §. Quantum ad 1. sub G. and d.40. §. Ad istam quaestionem. A. and 2.d.2.q.1. §. Ad argumenta pro prima opinione, sub E. d.7.q.un. §. De 2. sub G. Quol. 18. §. De 2.M. and 4.d.49.q.6. §. Dico G. and ante q.25. 26. Elench.)

The fallacy of accent is a locus suited to deceiving, arising from the material sameness of a word that signifies differently according to its different manner of pronunciation. Three deceptive modes of this fallacy are described. The first occurs when a word can receive different accents, whether grave, acute, or circumflex: as, "every poplar is a tree; a people is a poplar; therefore, a people is a tree." The major is conceded if the first syllable of the word *populus* is long, but denied if it is short, and thus the conclusion does not follow. The second mode arises when a word can be either a term or a phrase: as, "you are rest; but rest is repose; therefore, you are repose." The quibble is dissolved by noting that *quies* can be either a noun or a phrase composed of the relative *qui* and the verb *est*. The third mode arises from the different pronunciation of serious and ironic speech, or of interrogative and assertive speech: as, "a good servant deserves to be rewarded by his master; but the master, when rebuking his servant, said, 'he is a good servant'; therefore, the servant when rebuked by his master deserves to be rewarded." This sophism is dissolved by noting that the phrase is pronounced sometimes seriously and sometimes ironically — as is evident in Virgil: *Arguetur Drance*.

The fallacy of figure of speech is deception arising from the resemblance of words — that is, as Gadius notes (*Quol. 2. fol. 32. col. 1.*) — from a similar ending of terms that do not in fact signify the same thing. This fallacy is committed in three ways. First, from the same ending of two words: as, "Muse is of feminine gender; therefore, the Pope too is of feminine gender." Second, when a transition is made from one category to another: as, "as many times as you were in Rome, you were a human being; but you were in Rome twice; therefore, you were a human being twice." This paralogism is dissolved because a transition is made from the category of When to the category of Quantity. Third, from a change of supposition: as, "man is a species; Peter is a man; therefore, Peter is a species." The quibble is dissolved because the argument proceeds from simple supposition to personal supposition. This form of deception is mentioned by Scotus (*1.d.2.q.7. §. Ad argumenta principalia sub AA. d.18.q.un. §. Respondeo, sub K. in solutione quinti 3.d.1.q.5. ante §. In ista and 4.d.12.q.2. §. Ad argumenta. O. and d.13.q.1. infra P. and ex instituto q.35. Elench.*)

One may object, first, that no word signifies more than one thing; therefore, there is no fallacy of equivocation. The antecedent is proved: a single sign has only one thing signified; therefore, a single word has only one meaning. The antecedent is denied. To its proof I distinguish: a single sign taken formally has only one thing signified — this I concede; taken materially, I deny it. For the same sound of a bell can signify both Mass and the call to a lecture.

One may object, second, that every phrase signifies only one thing — namely, the composition of predicate with subject. Therefore, there is no fallacy of amphiboly. In reply: a phrase does not signify the composition of predicate with subject; rather, that composition is designated by the copula *est*.

One may object, third, that if there were any fallacy of accent, it would above all be this one: "Every evil is an apple; but sin is an evil; therefore, sin is an apple." Yet this is a fallacy of equivocation. Therefore, there is no fallacy of accent. The minor premise is denied: since *malum* does not signify different things by virtue of its matter, form, and manner of pronunciation, it cannot be a sophism of equivocation.

Article IV. On Fallacies Outside Speech

The sophisms outside speech are more numerous and more dangerous than those in speech, as Aristotle indicates (*1. Elench. c.5.*). These are called the fallacies of accident, of the qualified to the unqualified, of the consequent, of ignorance of the elenchus, of *petitio principii*, of non-cause as cause, and of many questions as one.

The fallacy of accident is deception arising from the fact that, because two extremes are connected with a middle term in the premises, they are thought to be connected with one another in the conclusion, when in fact they are not. Note that "accident" here is taken to mean something extraneous — that is, something outside the essence or formal character of another thing — as the Philosopher uses it (*1. Top. and 1. Elench.*) and indicates (*1. Met. c.1.*), as Fomesca observes in his commentary there. The Doctor uses "accident" in this same sense (*q.43. 44. Elench. and 3.d.8.q.un. §. Ad argumenta. sub H. and elsewhere*). The source of the appearance in this fallacy is the partial identity of the two extremes with the middle; the source of its defect is their diversity with respect to a third, as Scotus exemplifies (*1. Post. q.34. ante §. Ad rationes*). Three modes of this fallacy are commonly assigned. The first occurs when something is predicated of some whole and is thought to be predicated of its subjective parts as well; an example is given by the Doctor (*q.16. Universalium, ante §. Dicitur hic*): "A human being is an animal; an animal is a genus; therefore, a human being is a genus." The second occurs when, from the identity of two extremes with a third, those two extremes are thought to be completely identical: as, "Peter is a man; Paul is a man; therefore, Paul is Peter." The third occurs when, from two things taken separately, something is inferred to belong to them conjointly as a matter of accident: as, "Andrew is white and is a monk; therefore, Andrew is a white monk."

The fallacy of the qualified to the unqualified is deception arising from the fact that something is asserted with a qualification, but is concluded absolutely and without any qualification: as, "an image is a painted man; therefore, an image is a man." Likewise: "Christians are not permitted to eat meat on Friday; therefore, Christians are not permitted to eat meat." Conversely, the same paralogism

occurs when one argues from the unqualified to the qualified: as, "this is a man; therefore, this is a dead man." Likewise: "this is a good person; therefore, this is a good gambler." The Doctor provides an example of this fallacy (*1.d.36.q.un. §. Contra istud, sub E.*) and makes mention of it (*d.39. §. Sed contra istam distinctionem. 1. and 2.d.1.q.2. §. Ad 1. argumentum, infra G.*); multiple modes of it are also adduced and discussed at length with examples by Mastrius and Bellutus (*parte 2. Tract. 3. c.3.*)

The fallacy of the consequent — noted by Scotus (*q.3. Universalium §. Dicitur. and ibid. q.8. §. Ad 1.q. and 1.d.35.q.un. §. Et quod arguitur. O. and 3.d.8.q.un. §. Ad argumenta, sub F.*) — is a locus suited to deceiving that arises from the apparent validity of the posterior consequence combined with the genuine validity of the prior consequence. That is, when a consequent proposition does indeed entail the antecedent proposition, but the antecedent does not entail the consequent: for the argument from lower to higher holds — as, "it is a human being; therefore, it is an animal" — but not the argument from higher to lower affirmatively — as, "it is an animal; therefore, it is a human being." I say affirmatively, because negatively the inference holds: "it is not an animal; therefore, it is not a human being."

The fallacy of ignorance of the elenchus — on which the Doctor expressly dissertates (*q.55. Elench.*) and touches (*2.d.2.q.7. §. Et ideo ad 4. infra C. and 4.d.11.q.3. §. Hic duo, sub D.*) — is deception arising from the apparent observance of the conditions required for a true contradiction, by reason of which appearance the inference seems sound and probative, when in fact it is neither. Or: the fallacy of ignorance of the elenchus is one in which what appears to be the contradictory of what has been conceded is concluded, even though it is not truly contradictory, owing to the absence of the conditions required in a contradiction — which are: with respect to the same thing, in the same respect, in the same manner, at the same time — to which one should add: in the same place. By reason of the first condition — same thing — the following paralogism arises: "Two is double of one, and is not double of three; therefore, it is both double and not double." By reason of the second condition — same respect — a sophism arises thus: "This is double of that with respect to breadth, and is not double with respect to length; therefore, it is both double and not double." By reason of the third condition — same manner — the following sophism is committed: "Man is a species; no man is a species; therefore, the same is both a species and not a species." This is dissolved because the argument moves from simple supposition to personal supposition. Owing to the absence of the fourth condition, a sophism arises: "Peter was healthy at that hour, and was sick at that hour; therefore, he is both healthy and sick." This is dissolved because Peter is not healthy and sick at the same hour. The condition of place seems reducible to this: "Paul lectures in Paris and sleeps in Rome; therefore, Paul both lectures and sleeps." This is dissolved because it is with respect to different places, and thus no contradiction follows. Nor should the definition of the elenchus be omitted,

so that this fallacy may be made clearer: the elenchus is a contradictory syllogism by which the contradictory of a proposition conceded by the respondent is concluded, as is clearly evident from the examples just given.

The fallacy of *petitio principii* — noted by the Doctor (*1. Elench. q.4.*) — is deception arising from the assumption of what is to be proved. It occurs when the same thing is proved by itself with only the words changed, or by something less known or equally unknown: as when someone proves that a human being has a large brain because a rational animal has a large brain; or that contrary subjects fall under the same science because opposed subjects fall under the same science.

The fallacy of non-cause as cause — adduced by Scotus and Lychetus (*1.d.3.q.7. Ad argumenta pro 2. opinione sub R.*) — is deception that occurs when the falsity of a derived conclusion is attributed to one of the premises that is in fact not the cause of that falsity: as when someone argues that philosophy is to be condemned because certain philosophers have invented and defended heresies — for philosophy is not the cause of heresies, but rather the wickedness of those men, their corrupt interpretation of Scripture, and their stubbornness in error. Similarly, if someone were to censure the Catholic faith on the grounds that certain Catholics are wicked — for it is not the orthodox faith but rather their depraved lives that is to be blamed.

The fallacy of many questions as one is deception arising from the resemblance of multiple questions to a single question. This quibble arises when a single answer is given to a question that in fact contains multiple questions: as, if a blind man and a sighted man are pointed out together and it is asked of them both "Are they blind or sighted?" — if the answer is "they are sighted," the Sophist infers "therefore, the blind man is sighted"; if the answer is "they are blind," the Sophist infers "therefore, the sighted man is blind"; and if the answer is negative, the Sophist infers "therefore, the sighted are not sighted." This sophism is dissolved by giving a double answer to the double question — namely, "one is blind, but the other is sighted." This fallacy is mentioned by Scotus (*q.9. Praedicamentali and ibid. q.38. §. Ad 2.q.*) and by Saranus (*in expositione q.3. p.76.*), as well as by the Doctor (*1.d.2.q.2. ante §. Ad 1.q. paulo post F.*)

One may object, first, that there is no fallacy of substance; therefore, there is no fallacy of accident. The antecedent is conceded by all. The consequence appears evident, since the same reasoning applies to both. The antecedent being conceded, the consequence is denied: because in the present context "accident" is not taken in the proper sense of the fifth predicable, but in the sense of something extraneous, as was noted above.

One may object, second, that one who does not know the elenchus is not deceived with respect to the elenchus. Therefore, there is no fallacy of ignorance of the elenchus. In reply: there are two kinds of ignorance — pure

negation, and corrupt disposition. With regard to the first, there is no fallacy; but there is with regard to the second, which consists in assenting to a false proposition with some prior knowledge of it presupposed. For this reason the fallacy is not taken up but rejected as worthless and empty; and the Sophist is not to be embraced but avoided. It is for this reason that the Sophists are rightly mocked in numerous passages by Cicero and Seneca. There is the well-known remark attributed to Diogenes, who, when a dialectician accosted him with insulting words in this manner — "What I am, you are not; but I am a man; therefore, you are not a man" — replied: "This last is false; if you would make it true, begin with me." So much concerning fallacies — to the praise of him who, as the Doctor testifies (*4.d.14.q.3. §. Hic dicitur, ante F.*) and Augustine (*Serm. 30. de verbis Apostoli*), neither deceives, nor wishes to deceive, nor can be deceived.

Rational Philosophy of Fr. Bonaventure Colombi of Nice, Minor Conventual, Doctor and Professor of Sacred Theology

*According to the Mind of the Subtle Doctor, Aptly
Distributed into Five Books and Brought to Full Completion*

Preface and Commendation of the Subtle Doctor

Having established in the three books of our *Dialectical Epitome* a knowledge of terms — which opens for us a clear and illuminated entrance to the whole of Logic — we now propose, God willing, to submit to examination the more celebrated questions, the more difficult articles, and the subtler points of dispute that are agitated both by the ancient and by the modern philosophers. We shall dispatch the easier matters quickly, cut away the useless entirely, and, with all the brevity and accessibility that is possible, scrutinize above all the weightier and more worthy topics and decide them as best we can. We undertake this labor willingly and diligently, both on account of our long exercise in these matters and on account of the benefit we hope to bring — and it is no small benefit — to students of Scotist and Thomist doctrine, and to all others devoted to letters outside either school, through the simplicity and clarity of our style. For we have taken up this province not out of vanity but led by truth, not for the sake of contention or provocation, but for the sake of knowledge and assistance.

Now, since the Stagirite affirms (*Metaphysics* I.1) that the human race lives by art and reason, we ought indeed to live gladly and pleasantly in pursuing Logic, which is the art of arts and the science of sciences, as Peter of Spain writes at the opening of his *Summulae*. Logic flows from reason, resides in reason, and treats of the operations of reason or intellect together with their consequences. It is therefore rightly called rational science. No one should be called away from the study of Logic or deterred by its obscurity and great difficulty. For the more obscure and difficult it is, the more excellent and eminent it is; it has placed its seat in high and arduous things, so that once this seat is attained, a more convenient and readier path may be prepared for us to take up the remaining sciences. I add the saying of Plato: difficult things are beautiful. And Aristotle (*Metaphysics* I, at the passage cited): we consider that man wise who is able to attain to difficult things and things not easily known by a man of slight capacity.

Nor likewise should the wit and the name of Scotus deter anyone from this inquiry and examination. The name Scotus means in Greek "darkness," as Tossignanum notes in *Book III of the Seraphic History*. Yet although that name clung to him more by reason of the subtlety and profundity of his excellent genius and intellect, and the obscurity of his manner of disputation, than by derivation

from his region of origin, there is nonetheless nothing so seized upon by difficulty or wrapped in dense shadow that the aforesaid Doctor cannot lucidly explain and clearly illuminate.

Who among us would reproach St. Paul? As is read in *2 Peter* I, and cited by Augustine (*On Faith and Works*, ch. 16), he has certain things difficult to understand, which the unlearned and unstable distort. And who would accuse Aristotle, who communicates his doctrine wrapped in many veils and circuitous expressions? For truth lifts itself up to the clouds (*Psalms* III). Or it lowers itself to the depth of Democritus's well (*4 Esdras*). The way of truth is hidden, and its parent is the hidden God. This seems to have been signified to the holy Apostles when at Christ the Lord's ascension a cloud received him from their sight. And before that, it had been shown to three of them, whom Christ himself had taken up, at his transfiguration, when a bright cloud overshadowed them.

Concerning our Doctor, St. Bernardino of Siena reports (*Sermons*, vol. IV): not rarely was Scotus himself carried into ecstasy and very frequently elevated above sensible and material things, so that with the senses at rest he might contemplate heavenly things, just as St. Francis our Father was sometimes seen to transcend himself in ecstasy, meditating with a pure mind on the divine mysteries. Therefore Scotus is not to be reproached or refuted, since, as a master of truth — as Maurice testifies (*On the Universals*, fol. 47), and as Scaliger confirms (*Exercises*, 324), and as Sarnanus judges (*Epistle before Anthony Andrew*) — he is like the sun among the stars among philosophers and theologians, and though subtle, obscure, and nebulous in his arduous pursuit of truth, he is rather to be admired and marveled at. For though he was most subtle and most gifted by nature with great boldness, he could never be convicted of any error, nor could any of his writings be overturned in the smallest part, as Tossignanum (cited above) and Vorrelog (*Peroration of his Theological Course*) note. Moreover, the Sacred Congregation of Cardinals decreed in the year 1610 that whatever is established to be Scotus's should be admitted and printed intact and inviolate by the censors of doctrines and books, as Cavellus (*Life of Scotus*, ch. 5) and Wadding (*Annals of the Minors*, vol. III) report.

What Averroes proclaims as something divine and miraculous concerning Aristotle (*Commentary on Physics* I, and *On the Soul* III, comment 14) is clearly a miraculous and prodigious thing to say of Scotus. He was taught fully and completely by his holy Mother the Church and her most holy Son; within a short time he had perfect mastery of all knowable things, and by the unanimous voice of all philosophers and theologians he is proclaimed their prince, celebrated as the phoenix of intellects and the prodigy of nearly the whole world, as Vernulaeus reports in his *Panegyric*. This is indeed Scotus, whose mind was opened by the prayers of the Mother of God, whose intellect God illuminated and adorned with the light of all the sciences, as Cavellus writes (*Life*, ch. 1). This is Scotus, who at *Sentences* III, d. 20, q. un., §*Tunc D.*, exhorts

men to contend without ceasing for justice and to die with alacrity for truth, just as Christ died for justice and truth, according to Bagnacaballensis (*On the Passion*, p. 21). This is Scotus whom God chose and pre-elected as the primary author and most vigorous defender of the Immaculate Conception of the Virgin, as Salazar affirms (*On the Immaculate Conception*, I, ch. 13). This is Scotus whose fame and memory are held in blessing, as Anthony Andrew states (*At the end of Metaphysics* XII). For as St. Bernard says, blessed is he upon whom the holy Mother looks with favor. Indeed, Scotus seems to be numbered among the blessed, upon whom the Blessed Virgin looked with a kindly countenance when, as he knelt in prayer before her marble image in Paris and recited the verse which the holy mother Church so frequently sings, especially after the Purification — *Dignare me laudare te, Virgo sacrata; da mihi virtutem contra hostes tuos* ("Deign to let me praise thee, O sacred Virgin; give me strength against thy enemies") — the Virgin herself nodded assent and inclined her head, pledging to him a glorious victory in the very cause for which the Doctor was praying. So Pineda reports in his *Observations*. Wherefore he carried off a splendid palm in the most celebrated disputation held in that city on behalf of the Immaculate Conception of the Virgin, where he brilliantly refuted two hundred arguments on the opposing side and answered them sharply and fully, as Pelbartus (*Stellarium*, IV, art. 3), Bernardino de Bustis (*In the Office Approved by Sixtus IV*, lect. 4), and Genebrard (*At the year of Christ 1484*) report. Moved and amazed by this, one of his opponents exclaimed and said to him: You are one of three — an angel from heaven, a devil from hell, or Scotus from Duns. So the Irish say, as cited by Cavellus in the passage noted above.

For this reason, Cardanus (*Subtleties*, 16) not unreasonably doubts which was the more subtle: Aristotle, Euclid, or Scotus. Nor do I pass over in silence that on the night of the Lord's Nativity, while he was devoutly meditating on the most sacred Incarnation of the divine Word, the Savior himself, with particular love and singular favor, showed affection to Scotus, in that he appeared to him in the likeness of a little child and offered himself to him to be touched with his eyes, his lips, and his embrace, as Paulino Berto affirms at the beginning of his works.

Scotus was endowed and loaded with all the virtues, and most especially with obedience, which God wills more than sacrifice. In testimony of his obedience, I record this outstanding monument. One day, as he was walking outside the city of Paris to refresh his spirit, a messenger met him bearing letters sent by our Minister General and entrusted to him with a mandate requesting that he proceed to Cologne. As soon as he saw and read this, he set out at once. He did not return to the Parisian friary where he resided, nor to the Sorbonne where he was teaching; he did not bid farewell to his dearest friends, nor take up his writings, nor seek and carry with him any of the things he needed, but departed immediately without any delay in order to obey the supreme superior of the Seraphic Order and to fulfill his commands. O man worthy of wonder, to be celebrated with all praise and proclamation — so much so that John Mair, a

most trustworthy witness, judged him worthy of the Supreme Pontificate. And entire kingdoms and not a few regions proclaim and declare him as though born from their own throne. For just as the seven cities of Greece contend over Homer's birthplace and each of them claims and asserts him as its own citizen, so England, Scotland, and Ireland claim Scotus as their own, and follow and embrace him as the chief and guide of all philosophers and theologians. And rightly so, for he is to be followed, read, and trusted in all things in whom nearly all excellences are supremely found — who flourished throughout the world like another Apollo, and happy was every man who honored him as master and who, with Mercury going before as guide, could penetrate the inmost recesses of philosophy and theology, as is read in the *Franciscan Martyrology* on the eighth of November.

For since he directed the keenness of his mind somewhat higher than others and elevated it in the pursuit of truth, he discovered new arguments, devised hidden difficulties, and most eloquently and keenly defended singular opinions beyond the common ones. By the great subtlety of his great intellect he refuted opposing views in a remarkable manner, so that lovers of truth and experts in disputation had in him material for the most fruitful exercise. If you were to remove from the schools the proper opinions of Scotus and his own peculiar controversies, the practice of disputing and debating would necessarily languish.

Nor let you be frightened by the opinion of those who prefer to err with others rather than to think aright with Scotus. For the entire university of Paris, the most celebrated in the city and in the world, firmly follows and steadfastly embraces his doctrine. The most distinguished academies of the world — especially those of Rome, Padua, Bologna, and Salamanca — along with the most learned men in every branch of learning, publicly teach and vigorously defend it. So many purple-robed Fathers, by whom the whole world of lands is adorned. So many supreme Pontiffs, who have held most rightly and most holily the helm and rudder of the Church, have adhered to it. Finally, the entire Minorite family, which perhaps abounds in as many and as great Doctors as shine forth in all the rest, gladly acknowledges him as common Master and defends him with alacrity. And of the weighty and sublime things that are read in all the other scholastics within living memory, scarcely as many are to be found as are stored up in this one Scotus alone.

I shall say this much briefly: perhaps no one has ever been so presumptuous as to dare to wish silently, from immortal God, so great a knowledge of things and so great an excellence of virtues as the all-powerful God bestowed upon Scotus. Therefore, by the light of divine grace, by the splendor of truth, and by the brilliance of the doctrine of the Subtle Doctor, we shall dispel the darkneses of philosophical difficulties, the obscurities of questions and articles, as we study his books and works without any suspicion of error, running without stumbling through the entire Scotist curriculum — as St. Jerome asserts concerning the

doctrine of St. Hilary, writing to Laeta, and as Bagnacaballensis confirms in the passage cited above, p. 19.

Book I: On the Prolegomena of Rational Philosophy, Which Is Called Logic

Nearly all philosophers, theologians, and the holy Fathers — most notably Augustine in many of his works — are accustomed to set down at the beginning of each treatise, faculty, or science they take up certain preliminary matters called by the Greeks *prolegomena* and by the Latins *praeludia* (prolegomena: preliminary discussions; praeludia: preludes), so that once students have come to know the utility, necessity, and excellence of the subject and science to be learned, they may be more easily, readily, and forcefully attracted and moved toward attaining it. The Subtle Doctor performs this with particular diligence in the first three questions of the universals, as the most eminent Cardinal Sarnanus rightly notes in the proem of his commentary on them.

Question I: On the Existence and Discovery of Logic

Article I: Whether Logic Exists

Some men, cited by Cicero (*Academic Questions*, I.1) and by Zwinger (*Theater of Human Life*, vol. II, near the end of bk. 4), suspect that no discipline of disputation exists, and no art of reasoning. All philosophers oppose them with one voice and one cry, affirming both natural logic and artificial logic, as will be plainly shown by what we shall presently set down and establish.

Note, from Sarnanus (just cited, near the beginning of q. 1), Tataretus (ibid.), Scibilis (I), Fuentes (art. 1), and the Conimbricenses (*Commentary on the Physics*, 9.6, art. 2), following Aristotle (*Rhetoric* I.1), that Logic is divided into natural and artificial. Against the protests of Rubius (*Logic*, q. 1), natural logic is the natural inclination or natural ability of the intellect by which the intellect itself naturally inclines and is rendered capable of assenting more readily to what is true than to what is false, and by which, from this assent, it proceeds from knowledge of the known to knowledge of the unknown. Every human being possesses this logic by his very nature, without any labor or study, inasmuch as he is by nature intellectual and capable of reasoning. Artificial logic, on the other hand, is that which, through the help of a master or by one's own industry, hands down the method of reasoning well. It is divided into the teaching part and the using part. The teaching part (*logica docens*) provides the norm for dividing, defining, and arguing well. The using part (*logica utens*) treats of probable matters, or serves other disciplines, or arises from use and practice — concerning which, see below at length, q. 2.

First assertion: natural logic exists. Scotus presupposes this at q. 1 of the universals, where he asks whether Logic is a science; since this question is raised by the Doctor concerning artificial logic, natural logic is already presupposed, because the artificial presupposes the natural, just as art presupposes nature — from which art is said by Aristotle (*Physics* II.1) to differ. The foregoing assertion is proved first from Aristotle himself (*Rhetoric* I.1, cited), who says that men are by nature rhetoricians and dialecticians. Before him, Socrates and Plato taught this, as is found in Plato's *Philebus*. Second: the intellect takes pleasure in the natural inclination and capacity for proceeding from what is known to what is unknown, as is clear from *Metaphysics* I.2; for it is naturally discursive and rational. Now this natural propensity and capacity for reasoning is called natural logic, as has been set out in the note given above. Natural logic is therefore not to be denied. Third: each and every thing possesses an inclination and capacity for acquiring its operations and perfections. Thus Aristotle (*Metaphysics* I.1) reports that men are naturally inclined toward knowing and brutes toward sensing. Now a man, with no previous master and with no undertaking of labor, reasons and argues about many things, as the same philosopher states (*Sophistical Refutations* I.11). Hugh of Saint Victor (*Didascalicon* I) notes this well, and Augustine (*On Eighty-Three Questions*, q. 80, and *Part II of the same*, q. 41) confirms it. Natural logic is therefore to be established — and indeed to be supposed rather than proved, as the Stagirite shows by analogy in *Physics* II.

Fourth assertion: artificial logic is also to be admitted. Scotus presupposes this in the place to be cited below, and it is proved: first, from Aristotle (*Rhetoric* I.1, cited), where he recalls the origin of dialectic, saying that when men observed themselves sometimes reasoning well and sometimes poorly, they noted down certain rules and precepts, by the observance of which a good and legitimate syllogism and discourse is always produced. Moreover, Aristotle himself composed an artificial logic that is perfect and complete in all respects, in the manner of syllogizing, which he distinguished under the name of the *Organon* and which the Subtle Doctor enriched and expanded with most subtle questions in his noble work on Logic. And many others have shed great light on this doctrine of disputation, among whom are Plato, Augustine, and others cited by Titelmans in his *Apologetic Prologue to the Dialectic*. Second: among us there exist the art of speaking well, which is Grammar, the art of speaking eloquently, which is Rhetoric, and other arts discovered as useful and necessary for conducting the works of human life. And that Logic is not merely useful but indeed necessary for acquiring the other sciences will be plainly shown in q. 4 of this book. Moreover, just as Ethics is conceded by no one's denial to be granted for the purpose of regulating and perfecting the will, so for the purpose of adorning and perfecting the intellect — lest it stumble in its reasonings — artificial logic should by common reckoning be received, committed to letters, and celebrated with praise.

You will object first, against the first assertion: if natural logic exists, it is either the natural inclination of the intellect for reasoning from what is known to what is unknown, or the intellect itself, which can reason without rules and precepts, or it is the natural light by which the intellect reasons without any art and order. But none of these can be said. Therefore there is no natural logic. The major is evident from a sufficient enumeration of what can be adduced to introduce natural logic. The minor is proved: it is not the aforesaid natural inclination, which is a property of nature — which, being a relation according to Scotus (*Sentences* I, d. 3, q. 4, near the end, §*On the second knowables*; *ibid.* d. 30, q. 2, *before Q.*; and *ibid.* III, d. 17, q. un., C.), is not of the genus of active things. Nor is it the intellect, which is really a substance (*Sentences* II, d. 16, q. un.). For natural logic, being a natural capacity for reasoning, is an accident, namely a quality — as Scotus holds concerning every natural potency so taken (*Quaestio* 32 on the *Predicaments*, together with Aristotle, *Categories*, ch. on quality). Nor is it the aforesaid light, for that is common to all doctrines by which our intellect is illuminated and enlightened. Fuentes (just cited) responds that natural logic is reason, that is, discourse instilled by nature, acquired without any art or labor, such as is seen in rustics recognizing that the whole is greater than its part and that the sky is greater than the earth. This response does not please me, since natural logic is the principle of discourse, as is clear from its description given above in the note. Therefore it cannot be the discourse and intellect themselves; for the same thing with respect to the same cannot be both principle and product, cause and effect. And Fuentes himself seems to catch a scent of this shortly afterward, saying that natural logic can be taken for the intellective power insofar as it is a sufficient principle for eliciting such acts. Moreover, the same author adduces examples to confirm his doctrine: of the whole, which is greater than its part, and of the sky, which is greater than the earth. But these examples belong not to dialectic but to the habit of first principles, which consists, by common assertion, not in discourse but in the mere explanation of terms.

I respond: granting the major and denying the minor, one may say in answer to its proof that natural logic is formally the aforementioned inclination, which is a property of the intellectual nature, and radically the intellect of that nature. Or it should be said that it is formally the capacity for reasoning, and fundamentally the intellect, as Tataretus intimates (*Logic*, q. 1).

You will press further: natural logic cannot be separated from the intellect from which it flows by any power, even divine, since it is its property — which, according to Scotus (*Sentences* II, d. 16, q. un.), is really identical with the thing of which it is a property. But the capacity for reasoning, being a quality belonging to the genus of absolute things, can at least be separated by divine power from the subject in which it inheres. Therefore natural logic is in no way a capacity or natural power for reasoning. One must respond, in accordance with the two opinions on natural logic intimated above, by saying that the major is true of

natural logic taken as a natural inclination for reasoning, but false of natural logic taken as a capacity and natural power for reasoning. To argue from one to the other is an invalid inference. Just as it does not follow, "the natural inclination is a relation; therefore the natural capacity and power is likewise a relation" — since the latter belongs to the second species of quality while the former does not.

You will press further: if the natural capacity and power for reasoning can be separated from that of which it is a capacity, then at least by the power of God the intellect could exist without this capacity, which is impossible — just as it is impossible for the intellect to exist and not be discursive and capable of reasoning. And thus natural logic does not seem to be the aforesaid natural capacity. The objection is met if one says, given the hypothesis, that the intellect is always radically discursive even if that capacity is removed from it, since the root and principle of reasoning is the intellect itself, which is followed by the aforesaid capacity and natural power of reasoning.

You will object secondly, against the second assertion: every science is about a thing, because the sciences are divided according to things (*On the Soul* III.8, T. 38). This is implied by the Doctor (*Logic*, q. 3 on the universals, before §*Ad rationem positionis tertiae*). But Logic is about no thing; otherwise it would be a real science, which contradicts the Doctor (*ibid.*, q. 1, in the solution to the second argument). Therefore there seems to be no artificial logic. I distinguish the major: every real science is about a thing — granted; a rational science, such as Logic — denied. The saying of Aristotle thus cited is interpreted accordingly. Or say that every science treats of a thing taken broadly, not strictly as signifying a real being existing or capable of existing outside the operation of the intellect, as Scotus excellently deduces (*Quodlibet* 3, §*De primo*), which Siretus and other Scotists pursue at length (*Tract on the Formalities*, fol. 12, p. 2). All the more so, since the argument does not prove that Logic does not exist, but that it is not a science — which I shall examine in q. 2.

Article II: How Logic Is Named and What It Is

This article has already been worked through and nearly resolved by what was said in the *Summulae*, Book I, q. 1, art. 1, where the proper and improper names of this discipline and their etymologies, as well as descriptions of it, were set out. All of that is to be reviewed there, so as not to carry water to the sea; here I shall only add what seems to be missing in that place.

Note that the noun *Logica* is not found substantively in Aristotle, as the Conimbricenses (*On Metaphysics*, q. 4 proem., a. 1) and Fonseca (*Metaphysics* II, q. 1, sect. 2) observe, against Fuentes (near the end of the second article cited), who asserts that Aristotle uses this word more frequently to signify the whole art of reasoning. I find, however, that Aristotle uses the word *logica* in an adjectival or adverbial sense, as at *Posterior Analytics* I.43 and I.18, T. 39; at *Topics* I.16, T. 36,

and at its end; at *Posterior Analytics* II.5; at *Topics* V.1; and at *Metaphysics* VII.17 and XII.1, T. 4. And at *On the Generation of Animals* I, the Philosopher calls arguments "logical" which consist of logical terms. Orbellus adds (*Metaphysics* VII, ch. 2) that the Philosopher treats of the quiddities of sensible things through logical arguments. Nor is Scotus unaware of this (*Metaphysics* III, commentary on the text, p. 63; and *Metaphysics* IV, p. 100, according to the recent edition of Cavellus). But nearly all the later dialecticians use it substantively, establishing this distinction between *Logica* and *Dialectica*: that *Logica* is taken only for Analytics, that is, for the part that teaches the mode of demonstration, as Alexander notes (*Topics* I.1 and *Posterior Analytics* II.1) — a distinction elicited from Aristotle (ibid., I.1 and 2) — while *Dialectica* refers only to Topica, which treats of probable matters only, as is found in Ammonius (*On Interpretation*, I.1) and other ancient Peripatetics, as Scotus indicates (*Logic*, qq. 1 and 2, *Sophistical Refutations*).

First assertion: the whole of this doctrine is conveniently called Dialectic. The Doctor indicates this (*Logic*, q. 2, *Sophistical Refutations*, §*Ad 1. q.*). Proved first from Aristotle (*Rhetoric* I.1), who says that every syllogism belongs either to universal Dialectic or to some part of it, as Aureolus correctly notes (*Sentences* I, d. 33, a. 2, defect 94). And this is derived from *Topics* I.2, whose words Fuentes cites in the passage just cited. Augustine supports it (*Against Cresconius* I; *Against Julian* III.7), and Cicero agrees (*On Fate*), along with the whole modern school. Second: Dialectic, according to the interpretation of its name, is the same as the doctrine of disputation, as St. Basil indicates (*Commentary on Isaiah*, ch. 5). But this whole discipline considers discourse taken precisely, abstracting from both topical and analytical discourse; hence it is called by Cicero (*On Ends* III), Quintilian (*Oratorical Institutions* XII), and Augustine (*Against Cresconius* I.13; *On Dialectic*, ch. 1) the art of disputation. And disputation is carried out both by the topical and by the demonstrative syllogism. Likewise, every science takes its name from its end or from the object with which it is concerned (*On the Soul* III.4). But this discipline is concerned with the discourse of anything whatsoever, whether probable or necessary. Therefore the name "Dialectic" is not unfittingly adapted to the whole of this doctrine.

Second assertion: the whole of this discipline is rightly called Logic. The Doctor holds this in the place to be cited below. Proved first: words are to be used in accordance with the usage of authors, as Scotus notes (*Sentences* I, d. 14–15, q. un., under *E*; and IV, d. 1, q. 2, §*De secundo infra F.*). But among the philosophers, usage has now prevailed that the name "Logic" is employed for the whole of this science, as we hear in daily disputations and find written everywhere in books — especially in Cicero (*On Fate*), Diogenes (*Life of Aristotle*), Boethius, Scotus, and others who have published useful and subtle questions on the whole discipline of reasoning, as is clearly evident from the inscription of our Doctor's work according to the edition of Cardinal Sarnanus. And Scotus himself uses this word (*Logic*, q. 4, under *H*; and q. 4, *Prologue*, §*Dico igitur A.*). The whole of this

doctrine is therefore rightly called Logic. Second: Logic, according to the interpretation of its name, is the same as "rational," as Scotus touches upon in the *Epitome*. But this discipline is rational, or a discipline of reasoning, since it teaches the method of reasoning. It is therefore rightly designated by the aforesaid name.

Third assertion: Logic is properly defined as rational science. This is stated explicitly by the Doctor (q. 1 of the universals, near the end; and *Metaphysics* VI, q. 1, §*Inter dictas*). Faber (*Theorems*, 16, ch. 1) and Zabarella (*On Methods*, III.13) agree. Proved first: a good definition is one composed of genus and difference, as is clear in the *Epitome*, Book II, q. 7, art. 2. But the aforesaid definition is composed of genus and difference. For its genus is "science," in whose nature Logic agrees with the other sciences, and its difference is "rational," by which it differs from the remaining sciences. Therefore it is an apt definition. Second: all the laws of a good definition, enumerated in the place cited above, are properly applicable to it. For it distinctly explains the nature of Logic, is adequate to it, and contains nothing deficient or superfluous, as is evident to anyone who runs through each of its parts. Moreover, Physics is defined as natural science because it treats of natural things, and Ethics is moral science because it is concerned with moral matters. Therefore Logic is aptly defined as rational science, since it is concerned with the syllogism, which is the work of reason.

You will object first, against the first assertion: Aristotle (*Posterior Analytics* I.2, T. 5; *Sophistical Refutations* II.8; and *Topics* I.2) takes Dialectic as only that part which treats of probable matters, and Logic as that part which treats only of demonstration. Cicero (*On the Nature of the Gods* III) thinks the same, and Scotus inclines to this view (*Prior Analytics* II, last q., §*Ad q.*; and *Sophistical Refutations* I, q. 1), as does Trombetta (*On Formalities*, fol. 13, p. 1). Therefore by "Dialectic" one does not understand the whole discipline of reasoning. I respond that Aristotle indeed more frequently uses "Dialectic" for Topica alone, and that the ancient Peripatetics followed this sense. Yet by the judgment of later philosophers, Dialectic should not be restricted to Topica alone, nor Logic to Analytics alone, as Orbellus notes above all others at the beginning of his commentary on Peter of Spain. All the more so, since as the Philosopher testifies (*Topics* VI.1) and Augustine confirms (*Music* III.1): when the thing is established, no great stress is to be placed on the name, which is invented by human convention. Scotus accepts this (*Sentences* I, d. 1, q. 3, §*Quod autem frui.*; and III, d. 6, q. 1, §*Concedo sub D.*). Gregory Nazianzen adds (*Oration on the Holy Lights*): names should not be made a subject of contentious controversy so long as the syllables convey the same meaning. There was once a dispute among the Greeks and Latins distinguishing the names *hypostasis* and *person*, and *ousia* and *substance*, which was resolved and brought to concordance in certain Councils that we adduced in the *Treatise on the Triune God*, disp. 4, q. 1, so that *hypostasis* and *person* are taken for the same thing, and likewise *ousia* and *substance*. The same holds in our matter concerning the said terms "Dialectic" and "Logic."

You will object secondly, against the third assertion: Logic is called "rational" on account of its object, which is the syllogism, which is a being of reason, as Tataretus affirms in the place cited (*Scibilis* 4). But the designation and distinction of an object is extrinsic and *a posteriori* for a science, just as it is for a power and an act, as the Duke of the subtle ones proves (*Quodlibet* 13, §*Sed ista*, after *HH*; and *Sentences* II, d. 16, q. un.). But an absolute thing is not distinguished by a relation or by something extrinsic, as the same Doctor forewarned (ibid., §*Tertio sub CC.*). Now a definition is assigned through intrinsic and intimate principles of a thing; and a science is something absolute, residing in the category of quality. Therefore the said definition of Logic is not adequate. I respond: sometimes a definition is given through things more known and more evident to us, because the essential difference of the thing escapes us; in this way Aristotle (*On the Soul* II, T. 22–23) seems to define powers through acts and acts through objects. And in *Metaphysics* V, *ch. on quantity*, T. 18, he defines quantity through divisibility, which is its property. And Aristotle states this explicitly (*Metaphysics* VII.6), saying: when the *per se* and essential differences cannot be assigned because they are hidden from us, accidental differences are given. And he does this in *On Generation* I, T. 7, affirming that qualities are the first principles and first differences of the elements, which are established to be their properties and passions only.

Article III: How Logic Was Discovered

Three things are to be investigated by us concerning the discovery of Logic: namely, by what act of the intellect was Logic itself discovered? Who is its discoverer? And was it discovered after the other sciences? The first is examined in this article; the second and third will be discussed in the next two articles.

Note first that although a man is by his very nature discursive and capable of knowing all things, his intellect nevertheless possesses no knowledge of anything that is innate to it. For it is like a blank tablet on which nothing is painted, as Aristotle says (*On the Soul* III.4, T. 14). And there is that familiar saying: all our knowledge has its origin from the senses, as Orbellus notes (*Metaphysics* II, ch. 1). The intellect possesses only the aptitude and power of knowing all things gradually, with the passage of time, labor, and study. Aristotle shows the same thing (*Ethics* I.5) concerning the sensitive powers, specifically sight: as sight inheres in the pupil, so intellect inheres in the soul. That is to say, just as sight by nature has no actual vision but only the capacity for seeing any visible thing, so likewise the intellect by nature acquires no innate knowledge but only enjoys an aptitude and power by which, over the course of time, it can acquire knowledge of any thing whatsoever. Thus a man is indeed capable, guided by nature, of knowing any being whatsoever and of proceeding from knowledge of what is known to knowledge of what is unknown; nonetheless, he does not possess a certain and always reliable way and rule of knowing well and reasoning rightly, but reasons sometimes well and sometimes poorly — on

which topic Hugh of Saint Victor (*Didascalicon* I) and Rudolf Agricola (*On Discovery*, II.5) treat at length. Observing this, men, lest they fall into bad reasoning henceforth and lest they further deviate from the right path of truth, prescribed for themselves and gathered into one body certain rules and indubitable canons by which a true and certain mode and method of reasoning well is provided — and this is Logic. All of this is plainly shown and explained by Maximus of Tyre and by the Stagirite (*Rhetoric* I.1): many do these things rashly and by chance; some, however, do them by practice and habit. And this can be illustrated by the following comparison. Just as the intellect devised certain means for avoiding the deceptions that occur in things perceived by the senses — namely, external measures, like the balance, the ell, and other things of the sort, by which the quantity of a bodily thing is known definitively by the senses, even though the senses often judge poorly about this — so it is fitting that the intellect, which corrects the errors of the other powers, should also take counsel for itself and lay down certain laws by whose help it attains an undoubted knowledge of truth; and it is for the purpose of fulfilling this function that Logic was discovered.

Note secondly, from Aristotle (*Metaphysics* I.1), Scotus (ibid. and *Quodlibet* 7, §*Hic praemittenda*, before *B.*): a man acquires art and science for himself through experience. Since our knowledge draws its origin from the senses, as Scotus writes after Aristotle (*Posterior Analytics* I, q. 46, §*Ad q.*; and *Sentences* I, d. 3, q. 4, §*ult. de 2. cognoscibilibus*) — the senses perceiving only singulars — and since experience is the collection of many remembered singulars (as is gathered from the *Quodlibet* cited), from these the intellect collects universal precepts, certain and determinate, from which art and science are generated. Thus, because by the ministry of sense we have experienced that this fire heats and that fire heats, and so on for the rest, we infer the universal proposition: every fire heats. And those who deny this need sense and punishment, and are to be exposed to fire until they confess that fire heats — as Avicenna (*Metaphysics* I, near the end) warns, and the Doctor (*Sentences* I, d. 39) and Faber (*Theorems*, 93.6.1) note. Moreover, the admonition of Zabarella is not to be despised (*On the Nature of Logic*, I.10): so great is the weakness of man that he is scarcely capable of making any progress by himself, without external help, either in contemplation or in action. No one has yet been found who, thinking and reasoning alone, attained full and complete knowledge of things to be known and things to be done. Rather, all arts and sciences have been discovered and perfected by addition. One person, instructed in some science, discovered something — but something rough and imperfect; another, aided by that beginning, found something else; then another added still something else — until through the labor of many, the science was produced. Nor is the same mode and norm followed in acquiring the sciences: the first authors of sciences and arts follow one path and norm in acquiring real disciplines and another in acquiring rational ones. To make this more conveniently understood,

Note thirdly, from Scotus (*Quodlibet* 13, §*Nunc 3. P.*), Trombetta (*On Formalities*, Part 2, fol. 19), and Sarnanus (q. 6 of the universals), that there is a triple act of the intellect: direct, collative, and reflexive. The direct act is one by which the intellect is carried directly toward an object outside the intellect itself and tends toward it as its terminus — as the act by which I conceive a rose. The collative act is one by which the intellect compares one known object to another known object, as when it compares the superior to its inferiors — for instance, genus to its species, and species to its individuals. The reflexive act is one by which the intellect reflects upon itself; and this act can be performed in many ways according to the Doctor (*Commentary on Peri Hermeneias* I, q. 2, §*Ad 9.*). For the intellect may reflect upon itself as knowing, because it understands itself understanding and knows itself knowing; or it may reflect upon its own act, which is the intellection itself — that is, it understands its own intellection, by which it is formally called "understanding," and tends toward that intellection as its terminus; or it reflects upon the known object, as when I understand myself understanding a rose, and the intellection tends toward the rose insofar as it has already been known and understood by me; or it reflects upon the manner in which it understands, observing all those things that are required for a true discourse — as when the intellect syllogizes in this way: every whole is greater than its part; every human body is a whole; therefore every human body is greater than its part. The intellect, reflecting upon itself, observes the mode it has maintained in that true and legitimate reasoning, and notices that it has disposed the terms in a mode and figure such that the middle term is subjected in the major and predicated in the minor, and that from two universal affirmative premises a universal affirmative conclusion is drawn in Barbara. Thus is obtained, by reflexive act, the scientific rule of Logic concerning any matter whatsoever. Nearly the same is noted concerning the other precepts of Dialectic, as Sarnanus intimates (q. 1 of the universals, p. 1) after Scotus (*ibid.*, q. 3, in the solution to the second argument). From all this it is inferred that rational science was discovered through the reflexive act, and real science through the direct act.

Assertion: Logic was discovered through the reflexive act of the intellect. This is derived from Aristotle (*Rhetoric* I.1), Scotus (place cited), and *Posterior Analytics* I, q. 46; Bonetus (*Metaphysics* I, ch. 4, §*Est autem*); Toletus (q. 1, fundament. 3); as well as Racon (Sect. 1, *Praeludia*, ch. 3, prop. 2). Proved first: Logic treats of second intentions applied to first ones, as the Doctor writes (*Sophistical Refutations* I, q. 1, near the end). But second intentions, of which the syllogism is one, were discovered through the reflexive act, as the same Doctor asserts (q. 3 of the universals), and as the reasoning offered in the third note confirms. Therefore Logic was discovered through the reflexive act of the intellect. Second: one who understands himself understanding and knows himself knowing elicits a reflexive act, as is clear from the description of the reflexive act given above. But whoever has acquired Logic understands himself

understanding and knows himself knowing; he lays down certain rules and canons, and distinguishes and separates true argumentation and right reasoning from bad reasoning. Therefore the discovery of Logic was accomplished through the reflexive act.

You will object first: what receives its being through experience is discovered through a direct act, because experience consists of many singulars whose knowledge is produced by a direct act. But Dialectic received its being through experience, just as every art and science does, as is clear from the second note. Therefore it was discovered through a direct act. I deny the major. For although that act is direct by which the intellect experiences the action of this and that singular, nonetheless, once that act has been performed, the intellect reflects upon its own intellection before it acquires the science — reasoning thus: whatever occurs in the majority of cases from some cause that is not free is the natural effect of that cause; but, for example, the eclipse of the moon from the interposition of the earth between the moon and the sun occurs in the majority of cases; therefore the eclipse occurs as many times as this interposition takes place. The intellect, moreover, notices that the discourse is good, ordered in mode and figure, with the rules of good discourse observed as handed down by Logic, and of this it has true science through the reflexive act. This doctrine is drawn almost entirely from Scotus (*Sentences* I, d. 3, q. 4, §*De secundis, E.*).

You will object secondly: Philosophy was discovered through wonder, which arises from ignorance of the causes of effects known to men, as is stated in *Metaphysics* I.2, where that familiar saying is found: men began to philosophize from wondering. But wonder is a direct act by which the intellect knows an effect while its cause is still unknown. Therefore, since Logic is a part of Philosophy — as will be said below — its discovery was made through a direct act. I respond through a distinction in the major and an explanation of Aristotle's testimony: of the remote starting-point of Philosophy — granted; of the proximate starting-point — denied. For the wonder at some newly known effect does not generate science, but stimulates the intellect of the beholder of that effect to pursue and know its cause. Rustics indeed have wonder at such an effect, but they do not attain science. Therefore it must be admitted that wonder at such an effect is not the proximate cause of science. Repeated experience of such an effect proceeding from such a natural cause, on the other hand, is the proximate origin of science, as I indicated in the solution to the preceding objection and as the Doctor intimates in the passage cited. Or say that that saying is to be understood of real Philosophy — specifically of Astronomy, whose example Aristotle adduces there concerning the properties and effects of the moon, the sun, and the stars — but not of rational philosophy, such as Logic.

Article IV: Who Is the Discoverer of Logic

Just as no one doubts that certain men in earlier ages were the discoverers of many arts and sciences (as Sacred Scripture, *Genesis* 47, Aristotle, *Metaphysics* I.1

and 2, Scotus (ibid.), and very many others testify), and that in later times the arts of printing, gunpowder, and artillery were found by some — so it is established that the earlier philosophers were without Dialectic, as Aristotle himself reports (*Metaphysics* I, ch. 6, T. 8), and that by ignorance of it they fell into many errors, as he writes (*On the Parts of Animals* I.1). But concerning the discovery of Logic itself, there is not one universal opinion. Some think its discoverer was Parmenides, who devised it on the summit of Mount Caucasus, according to Genebrard (*Chronology* II, p. 133). Others hold it was Zeno of Elea, as Laertius (I.1), Zabarella (*On the Nature of Logic*, II.17), and Cicero (*On Ends* II) report — Zeno being accustomed to indicate the difference between Rhetoric and Dialectic by the hand. Contracting the hand and making a fist, he signified Dialectic; stretching the hand wide, he indicated Rhetoric. The Philosopher also explains this not obscurely at the beginning of the *Rhetoric*, offering these words concerning both: that mode of speaking is broader, this mode of speaking is more contracted. Others make Trismegistus its author, who, as Strabo reports, painted two dragons looking at each other, which is a symbol of Dialectic — which disputes on both sides and is exercised between two, namely an objector and a respondent. Many freely and forcefully proclaim and defend Plato as the discoverer of Logic, and the rest Aristotle.

Note that the discoverer of any art or science can be twofold: primary and secondary. The primary discoverer is one who finds the art or science by himself and through himself, such as God, the origin and source of all arts and sciences. The secondary discoverer is one who by his own genius and labor perfects and completes an art or science still imperfect, or restores and rescues from ruin one nearly extinguished by the injury of time. Furthermore, three categories of philosophers are not to be forgotten: for some put forward demonstrations concerning things proposed for inquiry and were called philosophers; others disputed about things on both sides and were called dialecticians; and others reasoned about apparently true things and were called sophists, against whom Aristotle testifies, in the work now under review, that he had written his books on the *Sophistical Refutations*.

First assertion: the primary discoverer of Logic, and of every science, is God, most good and most great. So Scotus (*Prologue to the Metaphysics*, near the end, p. 2) and Sarnanus (q. 7 of the universals, p. 133). Proved first from Sacred Scripture: *1 Kings* 2: God is the Lord of sciences. *Psalms* 92: who teaches man science. And *Ecclesiasticus* 38: he gave men science. But Logic, from what will be said in the next question, is a science. Therefore its primary discoverer is God. Plato adds to this, making the first masters of Logic to be the gods and their messenger and interpreter to be Prometheus. Augustine agrees (*On Eighty-Three Questions*, q. 1; and *City of God* VII.29): God, who created human intellects, also granted them the sciences of the various arts as aids to life and nature. Second: every good flows from God, according to James 1: every excellent gift and every perfect endowment is from above, descending from the Father of lights. But

Logic is some perfect good of our intellect, for it distinguishes truth from falsehood and prepares the way for learning every other science. Therefore its primary parent is God. Third: Adam was endowed with the sciences. For he assigned names to things, as is clear from *Genesis* 2: whatever Adam called each living creature, that was its name — which cannot be accomplished without knowledge of things, as Lyra correctly deduces there. And it was fitting that the first man created by God should be adorned with the knowledge of things, since in a work the power of the workman shines forth. But any other science without Logic is imperfect, as will be shown in q. 4 of this book. Therefore Logic was instilled in Adam by God along with the other sciences, and consequently God is its primary Author.

Second assertion: whether Logic perished through human negligence or through the injury of time, certain outstanding men named above recalled it from ruin by their own industry and art; among these, the chief restorer and secondary discoverer is to be considered Aristotle. This assertion contains two parts, which are gathered from Scotus in the place cited. The first part is evident from what was said at the beginning of this article, where I reported that the earlier philosophers were entirely unarmed and naked of the art of reasoning, and where I also enumerated the first leaders and parents of Logic; concerning whom Rudolf Agricola (*On Discovery*, II.5) adds beautifully: eminent intellects arose who gathered what was scattered, ordered what was confused, completed what was imperfect, polished what was rough, and embraced everything — not only what had been done but what could also be done; and so what had previously been a matter of chance began thenceforth to be a matter of reason. The second part is proved first from Cicero (*Topics*), who calls Aristotle the prince of Dialectic; to whom St. Isidore (*Origins* II.22), Zabarella (*On the Nature of Logic*, II.1 and *On the Four Figures*, ch. 5), and Toletus (*Preface to Logic*) agree, asserting that Logic written by Aristotle is not only perfect and complete in all respects, but also arranged in admirable order. Second: one who orders and arranges something disordered and unstructured can rightly be called its secondary author and maker, as is clear in the case of a house-builder and other craftsmen who bring unstructured materials into order. And this is how Aristotle proceeded in constructing Logic, which before him was imperfect and disordered, as Plotinus (*Enneads* III.1, cc. 4–6) affirms of Plato, who did not distinguish it from Metaphysics — a distinction which Aristotle made first. Therefore he can rightly be called its restorer. Third: one who discovers the subject-matter with which a science is concerned can justly be called its author, since it is a celebrated saying of the philosophers that science is generated from object and power. Now Aristotle discovered the subject-matter with which Logic is concerned, namely the syllogism, of whose discovery he himself boasts at the end of the *Sophistical Refutations* I.2. Aristotle can therefore justly be called the discoverer of Logic and its restorer.

You will object first, against the first assertion: Logic was discovered through the reflexive act, from what was said above in art. 3. But God, being without discourse, is not capable of a reflexive act. For he sees all things in a single most simple act; *Hebrews* 4: all things are naked and open to his eyes. Therefore God is not the discoverer of Logic. I respond that the major holds of Logic discovered and restored by man, but not of Logic infused and bestowed upon Adam. You will press: the Logic of Adam and our Logic are of the same intelligible character and nature. Therefore if ours is obtained through the reflexive act, the same must be asserted of the Logic of Adam. The antecedent is granted; the consequence is denied. For both are of the same nature, yet obtained by different modes: one is infused, the other acquired. The example is ready at hand from fire, which is of the same species whether produced by fire, by the sun, or by two bodies colliding with each other.

You will object secondly, against the second assertion: before Aristotle, Logic was already perfect — therefore Aristotle is not to be considered its maker. The antecedent is proved. Cleanthes, who was older than Aristotle, treated of Dialectic and the Categories, as Laertius reports (VII.1), and Archytas of Tarentum also discussed these, and it is clear from *Metaphysics* VIII.6 that he had also mastered the art of defining. Some ancient writer indicates that Socrates was instructed in Dialectic by Zeno. Further, Plato treated of division, as is read in *Prior Analytics* I.33 and *Posterior Analytics* II, T. 4; and Plato's imbuing in Dialectic is found in *Metaphysics* I.6. Moreover, Zeno and Euclid taught demonstration. Finally, Zwinger (*Theater of Human Life*) testifies that Protagoras practiced sophistic. Therefore, since all parts of Logic were found before Aristotle, he does not appear to be its discoverer. I deny the antecedent. In response to its proof, I say that although parts of Logic preceded Aristotle, they were scattered and unordered; but he was the first who brought them together into one, taught the whole of this discipline as distinct from the others, handed down the mode and rules of reasoning well, and marked it with the name *Organon*, as is clear from its inscription. This Aristotle himself implies, adding at the end of the *Sophistical Refutations* II: the same thing has happened to the earlier philosophers as to someone who promises that he will give a certain faculty so that one's feet will not hurt when walking, but who does not provide the cobbler's art by which shoes are made. Add that the earlier philosophers, in their philosophizing, still seemed to be stammering, as is written in *Metaphysics* I.6, and to be defining in a superficial way (ibid., T. 4).

Article V: Whether Logic Was Discovered After the Other Sciences

To flee ignorance and on account of wonder, men in their philosophizing have proceeded from the easier to the more difficult, from the lesser to the greater, from the more necessary and useful to the less necessary and less profitable, which things are for their own sake — as Aristotle reports (*Metaphysics* I, chs. 1–2). Hence the practical arts and sciences, which pertain to the conduct and

cultivation of life, were discovered before the speculative ones, which were sought and found by men of leisure — as is evident from the Egyptian priests who obtained the mathematical disciplines, and especially astronomy, as the same philosopher testifies in the passage cited above.

Assertion: Logic was discovered after the other sciences. So Scotus (*Posterior Analytics* I, q. 46, ver. *Item 2. intentiones*), and this is derived from Aristotle in the passage just mentioned. Hugh of Saint Victor (*Didascalicon* I) also states it clearly: the other arts were found first, but it was necessary for Logic also to be discovered, since no one can fittingly discuss things unless he has first come to know the method of speaking. Zabarella agrees (*On the Nature of Logic*, I.12): from these considerations it is evident that artificial Logic, of which we now speak, is a certain work and offspring of Philosophy. For it could be produced and generated by no one except philosophers alone and through the habit of philosophy — and most of all it drew its origin from contemplative philosophy, whose aim is knowledge. The assertion is now proved. First: what is acquired through a reflexive act and second intention is found later than what is generated through a direct act, just as second intention presupposes first — as is clear in natural things from the light of the sun, which is first directed at a wall before it is reflected, and from a ball projected, which first tends directly toward a rock before it rebounds from it. But Logic was discovered through the reflexive act, as shown above in art. 3, while the other sciences were obtained through the direct act, as asserted there. Therefore the discovery of Logic is later than the others. Second: what is more difficult is more laboriously investigated and found later, since nature begins from the easier (*Physics* I.4 and *Ethics* I.4). But Logic is more difficult than the other sciences, being about second intentions, which — just as they have minimal entity — have minimal intelligibility. Therefore the discovery of Logic presupposes the discovery of the other sciences. Third: things that are more remote and abstract from our senses are known by us later than those that are closer to the senses, since the senses are the first guides of our knowledge. But the object of Logic is more remote and distant from the senses than the object of any other science; indeed, the very object of Dialectic does not fall under the senses, as will be clear in q. 3 of this book. I add that Logic is speculative, as will be proved in the next question — and speculative science is discovered later than practical science, as I indicated with Aristotle at the beginning of this article.

You will object first: St. Augustine (*On Order*, II.12) says that Grammar was discovered first, then History, then Dialectic, and that after these men proceeded to the other sciences. Therefore, according to Augustine, Logic was discovered before the other sciences. Some respond that Augustine's words concern Logic in a rough and imperfect state, not Logic perfected and reduced to rules and art, as Rudolf Agricola writes elegantly (*On Discovery*, II). But against this: the other sciences without Logic are imperfect, as will be said below (q. 4). Therefore, just as imperfect Logic precedes the other imperfect sciences, so

equally perfect Logic precedes the other perfect disciplines in the order of discovery. One may say that, although before Logic there were other sciences in an imperfect state and men guided by natural instinct maintained a certain method in contemplating things, proceeding from some known principles proposed to themselves toward the unknown — nevertheless at that time the precepts and rules had not yet been collected from which later philosophers subsequently composed artificial Logic. Therefore Logic is placed after those sciences in the order of discovery. Augustine in the passage cited can be interpreted accordingly. If someone says this interpretation cannot be sustained, in this and in certain other matters he is not to be heeded, inasmuch as he is speaking as a philosopher and not as a saint treating matters of faith, as Trombetta rightly notes (*On Formalities*, fol. 12, p. 1) — which Durandus also warns of in a similar case near the end of his preface. Otherwise one would have to hold that vision is achieved through extramission, which contradicts Aristotle (*On the Soul* II, T. 74); that angels are corporeal; that the heavens are made of fire; and similar things that Augustine taught as a devotee of the Platonic sect, as he himself declares (*City of God* VIII, near the end of ch. 12). I add that the holy Doctor does not always defend everything he once asserted. For in the prologue to the *Retractions* he writes: therefore let those who shall read these works not imitate me when I err but rather when I make progress toward what is better. If therefore he himself frankly confesses that he sometimes thought poorly, we ought not to suppose that he himself always thought and spoke rightly. The same Doctor adds (*On the Literal Meaning of Genesis* XII.8, concerning Paul caught up to the third heaven): who dare say he knows what the Apostle says he does not know? And (*On the Gift of Perseverance*, II.21): I do not wish anyone to embrace all my views in such a way as to follow me except in those things where he has seen that I do not err. For that is the reason I am now producing books in which I have undertaken to reconsider my smaller works, in order to show that even I myself was not secure in all things. Again (*Letter to Vincentius Victor*, II): I cannot and should not deny — just as in major matters — that there are many things in my smaller works that can justly and without rashness be criticized. From all this it is evident that Augustine and any other man great in talent and learning is liable to error and censure, and that human authority should not always and without reservation be relied upon. God alone is impeccable and incapable of failing, and to him and to truth we must firmly and constantly adhere.

You will object secondly: an instrument precedes what is to be made by it, as is clear from a hammer, a saw, an axe, and other instruments that precede, for example, a ship or house to be constructed. But Logic is an instrument of the other sciences and is necessary for their attainment, as will be shown in q. 4, art. 1. Therefore Logic precedes the other disciplines in the order of discovery. I distinguish the major: with respect to an instrument absolutely necessary for making something — granted; thus without a hand and a pen, characters cannot

be formed on paper or marble, and without the organ of sight no vision can take place. With respect to an instrument necessary only in a qualified sense, that is, for perfecting something — denied. For something can indeed be accomplished without it, though not as well. In this way bread can be broken and eaten without a knife, and wine can be drunk without a cup. But Logic is not an instrument of the first kind but of the second. Accordingly, the other sciences preceded it in an imperfect state and afterward, with its assistance as a means, attained a perfect state.

Article VI: Whether Logic Is to Be Learned Before the Other Sciences

Plato (*Republic* VII) thinks that one should begin from mathematics, and does not want dialectic to be learned by the young before the age of thirty. Hence it is reported that above the doors of his Academy he had inscribed: let no one ignorant of mathematics enter here. Some, like Panzano, hold that one should begin from Physics. Others, like Diogenes, from Ethics. Still others are of the opinion that one should begin from Dialectic.

Note that order is twofold: the order of nature and the order of teaching. The order of nature is the series that things observe among themselves — thus in the order of nature "animal" precedes "man," and "man" precedes "Peter." The order of teaching, on the other hand, is the series that men maintain in teaching and learning, which appears to correspond to what is easier for our cognition. Therefore Aristotle (*Physics* I, T. 4) directs that one begin from the more sensible and composite things, since these are easier for us to know.

Assertion: in the order of teaching, Logic is to be placed before the other sciences. So Scotus (*Posterior Analytics* I, q. 46, ver. *Tertia*; and *Metaphysics* II, ch. 3, in the exposition of the text); whom follow Tataretus (*Summulae*, tract. 1, *Scibilis* 3, fol. 1), Sarnanus (q. 1 of the universals, p. 29), and Hurtado (*Summulae*, disp. 5, sect. 1). Hugh of Saint Victor (cited above) is in favor of this view. Proved first from Aristotle (*Rhetoric* I.1 and *Metaphysics* II, T. 15): it is absurd to seek science and the mode of knowing at the same time. That is to say, Logic must be learned before any other science, because it is the mode of knowing; otherwise the situation would arise that is described in the case of one who wants to teach the way to travelers while simultaneously learning it himself, or the one who wants to treat a sick man while simultaneously learning medicine — as Averroes, cited by Sarnanus (in the passage cited), reports of a certain man: summoned to a patient, he administered medicine; returning home, he consulted Avicenna's book. Meanwhile the patient died. Cicero (*On the Orator* I and *On Famous Orators*), Augustine (*Against the Academics* III and *On Order* II) agree, the latter calling Logic the discipline of disciplines because it is preferred to the other doctrines. Fonseca confirms this (*Metaphysics* II, q. 1, sect. 7). Second: the order of teaching demands that what cannot be perfectly possessed without prior knowledge should be treated first. But the other sciences cannot be perfectly

acquired without Logic, since it is the instrument of knowing, without which science is not perfectly generated — science being the effect of the demonstrative syllogism, as the Philosopher states (*Posterior Analytics* I.2). Therefore Logic in the order of teaching is to be placed before the other sciences.

You will object first: in the method of teaching, Rhetoric precedes Dialectic, as the usage of every school teaches us. Therefore Dialectic is not to be taught before the other sciences. I grant the antecedent and deny the consequence, because Rhetoric is an art while Logic, being a science and a mode of knowing, is therefore to be taught before the other sciences — but not before the arts, otherwise it would precede Grammar, which no one suspects. I add that Scotus (*Prior Analytics* I, q. 2) seems to include Rhetoric among the parts of Logic; and thus there would be no difficulty, because Rhetoric as one part of the doctrine of Logic would precede another part in the order of teaching, just as the analytics precedes the posterior analytics. The Stagirite also suggests this (*Rhetoric* I) by calling Rhetoric an offshoot of Dialectic.

You will object secondly: in the order of teaching, one should begin from the easier things (*Physics* I.1; *Metaphysics* IX.1; and Scotus on the latter, note, p. 270). But Logic is more difficult and more obscure than the other disciplines, since it treats of second intentions, which are far removed from sense. Therefore Logic does not excel the other disciplines in the order of teaching. I respond that the major holds unless necessity from another quarter demands teaching the difficult things first, as is the case in our matter. We place Logic before the other sciences precisely because, although it is harder and thornier, nonetheless without it the other disciplines cannot be perfectly acquired. And the Philosopher does the same in *Physics* I, treating first of the parts of natural body before treating of natural body itself, even though the natural composite is more sensible and accordingly more easily known than its parts.

Question II: On the Nature and Quality of Logic

Article I: Whether Logic Is an Art

Some of the ancient and modern philosophers, among whom Cajetan (*Proem to the Categories*), Scaliger (*Exercises*, 3), and Flamminius are cited, place Logic in the ranks of the arts. But nearly all the Latins hold the opposite, especially Scotus (q. 1 of the universals), the Angelic Maurice, and the other Scotists in the same place — from whom the Thomists do not dissent, removing Dialectic from the catalog of the arts. Note, from Gerard of Odo (*Ethics* VI, q. 8) and Tataretus (*Summulae*, tract. 1, *Scibilis* 2, fol. 1), that "art" is used in two ways. First, broadly and improperly, for any true habit whether practical or speculative; in this sense Aristotle takes "art" (*Rhetoric* I.1; *Posterior Analytics* I.1; and *Metaphysics* I.1) where he calls the mathematical disciplines "arts," which in *Metaphysics* XII, T. 44, he calls "sciences" — and rightly so, since it is established by all that they are

properly and truly sciences. Augustine (*On the Trinity* IX.10) recalls this sense of "art," saying that ethics is an art, which all admit to be a practical science. And Scotus uses it similarly (*Sentences* II, d. 1, q. 4, before §*Quod si adhuc, sub C*; and d. 42, q. 4, §*Sequitur, infra L.*). Second, strictly and properly, for a productive habit (*habitus factivus*) whose work passes into external matter and is exercised by some bodily instrument; in this sense it is taken by Aristotle (*Ethics* VI.3) and Scotus (*Sentences* I, d. 3, q. 7, §*Contra istam ante F.*). Every habit that can rightly bear the name of art is indicated by the following couplet: tongue, trope, reason, number, tone, angle, stars; field, grove, arms, ships, wounds, wool, the craftsman.

Note secondly that a habit is a quality rooted in a power, inclining that power to operate easily, promptly, and with pleasure. Habit is divided into intellectual and moral. A moral habit is one that resides in the will or in another power subject to the will, for regulating the acts of the will — such as the virtues called moral. An intellectual habit, from the same Aristotle (just cited), is one that is grounded in the intellect and facilitates it in performing its acts. It is of five kinds: understanding (*intellectus*), wisdom (*sapientia*), prudence (*prudentia*), art (*ars*), and science (*scientia*). Understanding is the habit of first principles, which are known from the mere explanation of their terms — as "every whole is greater than its part": as soon as it is explained what a whole is and what its parts are, the intellect gives assent to this. Science, on the other hand, is a habit acquired through demonstration; hence the Doctor adds (*Posterior Analytics* I, q. 2, §*Ad 1.*): understanding is of principles and science is of the conclusion. Prudence is a habit of acting with right reason, or a habit of deliberating, as Scotus states (*Sentences* III, d. 34, q. un., §*His suppositis, O.*; and implied already in the *Prologue*, q. 4, §*Ad argumenta principalia, AA.*). Wisdom is the habit of the highest and most universal things. Art is a productive habit with right reason, as the Doctor explains (*Sentences* I, d. 38, q. un., §*Ad auctoritatem F.*). The right reason posited in the definition of art is the same as what is directive, or what rectifies the other power whose function it is to operate according to the art. Art in a diminished sense, however, is a habit with true reason, when it is only an apprehensive habit of the rectitude of things to be done but not a directive or rectifying habit in the doing — in which sense art can be attributed to God, as the same Scotus affirms in the same place and at *Sentences* III, d. 8, q. un., §*Ad argumenta A.*: insofar as his intellect knows the rectitude and order of things to be done, but not insofar as it directs a power toward operating, since his will — which is most right, or rather is the first rule that cannot deviate from rightness — is the power and principle of all things ad extra.

Assertion: Logic is not properly an art. This is derived from Scotus (q. 1 of the universals), where he shows at length that Logic is a science, which is a habit distinct from art, as is clear from the second note and will be proved in the next article. The foregoing assertion is argued as follows: art is a productive habit with right reason, as is established from the place just cited. But Logic is not of this kind, for it is concerned with the syllogism, which is not an external work

and is not administered by any bodily instrument. Therefore Logic is not properly an art. For this reason, the same conclusion seems to follow. *Physics* II, T. 3 and *Metaphysics* XII, T. 13: art is a principle of operating in another, and the act of art extends to production, as the Doctor asserts (*Sentences* I, d. 3, q. 7, §*Tertia opinio*). And in this it differs from nature, whose principle is in that which participates in nature. But Logic does not operate in another — that is, its work is not received in another, namely a material and corporeal subject — since, as is clear from *On the Soul* III, T. 38, every intellection resides only in the intellect. Therefore Logic is truly not an art.

You will object first, from *Topics* I.1: Logic is defined as a method or art of reasoning about any question proposed from probable premises. And by Cicero (*On Famous Orators*) it is called the greatest of arts. And in *Academic Questions* I it is called the art of disputing. Jerome, Augustine (*Against Cresconius* III.20; and *On Order* II.12), and Peter of Spain (*Summulae*, beginning) agree. And the common run of philosophers place it among the liberal arts, which are comprehended under the number seven, among which Logic itself stands. Confirm: the logician is an artist, for he has artificial logic. Therefore Logic is an art — the consequence holds by the place of conjugates, and Scotus uses a similar form of argument (q. 1 of the universals, ver. *Item haec est*). I respond: the authorities cited and similar ones that can be adduced are to be interpreted of art taken in the first sense, not of art taken in the second sense, of which we are speaking in the foregoing assertion. And Aristotle openly intimates this (*Metaphysics* IV, ch. 3, T. 8), where he calls Analytics an "art," which is established to be a science. By the same distinction the confirmation is met. Or say that these are to be interpreted of the Logic that uses (*logica utens*), which is Topica, as is clear from the words of Aristotle cited above; but not of the Logic that teaches (*logica docens*), which I shall show to be a science in the following article.

You will object secondly: art is a productive habit with right reason. But Logic is of this kind. Therefore Logic is an art. The major is known from the definition of art given in the second note. The minor is shown: at *Prior Analytics* I.1, sects. 2 and 3, q. 1, Aristotle writes that he is handing down the generation of syllogisms — that is, how syllogisms are to be made, and how men are rendered apt to construct them correctly. But to teach how something is to be made pertains to art, as is clear from the art of house-building, which gives the mode of constructing a house. Moreover, *Posterior Analytics* II, at the relevant passage, it is read that science is of being and art is of generation. That is, science is had concerning things that already are; art, however, concerning things that are being made. Hence the Stagirite adds (*Ethics* VI.4): art is concerned with generation — that is, with the making of an artificial thing. Therefore, since Logic structures divisions, definitions, and argumentations, it is clearly established that it is to be referred to the number of the arts. I grant the major and deny the minor, since the production of art passes into external matter and is exercised by a bodily instrument, as is clear from the foundations and proofs

already given — by which the testimonies of the Philosopher just adduced are also illuminated and dissolved. For the production of a syllogism, and of any other second logical intention, is exercised by the intellect alone and resides in the intellect alone, and therefore does not share in the proper nature of art.

Article II: Whether Logic Is a Science

Some, cited without name by Zabarella (*On the Nature of Logic*, I.9), think that Logic is a faculty that does not coincide with art and science. Others — Themistius and nearly all the Greek commentators, to whom Zabarella (*ibid.*, ch. 10) adheres — hold that Logic is an instrument, constituting an "instrumental discipline" distinct from art and science. Nor are there wanting those who, while admitting Logic to be a science, do not distinguish it from the other sciences, as Abbate (*On the Predicaments*, tract. 1, ch. 1) testifies. And this opinion perhaps draws its origin from Plato, who in *Republic* VII confounds Dialectic with Metaphysics, as his followers do not deny — namely Plotinus (*Enneads* I.2, c. 4) and the rest. The common view, however, is that of Scotus (q. 1 of the universals; and *Sentences* IV, d. 1, q. 2, §*De 2. principali*, shortly before I.), Sarnanus, Maurice (*ibid.*), Odo (*Ethics* VI, q. 8), and many others — from whom the Thomists with St. Thomas (*Metaphysics* IV, lect. 4) do not dissent — all teaching that Logic is a science.

Note first that the division of Logic into the teaching part and the using part is celebrated, from Scotus just cited (§*Dicendum*; *Sophistical Refutations* I, q. 1; and II, q. *Ad 1. q.*), which Aristotle touches upon (*Metaphysics* VII, T. 13): of any art, one part teaches and the other uses. The Greeks approve this, calling the teaching Logic something removed from things and the using Logic something concrete with things. The teaching Logic (*logica docens*) is described as that which provides the mode of dividing, defining, and arguing well. The using Logic (*logica utens*) is taken in three ways: either for the same teaching Logic as applied to other sciences and serving them — in which sense it can more fittingly be called the "used" than the "using," as the Angelic Maurice, the aforesaid Angelic writer, and the most eminent Sarnanus (*ibid.*, p. 25) note, and Orbellus also mentions (*Metaphysics* I, near the end of q. 2) after Scotus (q. 2 of the universals), where he gives the reason why Logic is called a common science: its subject falls under the use of the other sciences; or for the habit acquired through frequent use and practice of arguing — those endowed with this being called good logicians, as I noted above; or for the habit that treats of probable matters alone, which is called simply Topica by all.

Note secondly, from Scotus (q. 1 of the *Posterior Analytics* and *Sentences* III, d. 24, q. un., §*Ad q. igitur, D.*; and in the Parisian reading on the present question and also on *Physics* I, q. 1), that "science" has many accepted senses. First, it is taken for knowledge with firm adherence; in this sense we are said to know things we have heard narrated to us by others. Augustine (*City of God* XI.2) recalls this sense of "science": since those things that are remote from our senses we cannot know

by our own testimony, we seek other witnesses for them. Perhaps the text of St. Paul (*1 Corinthians* 8) belongs here: we all have science — that is, we all know things that we have learned from others reporting them to us. Second, it is taken for certain though not evident knowledge — which our men call science from *Ethics* VI, since in that book (chs. 4 and 7) the Philosopher speaks of science insofar as it is only a certain habit by which we speak the truth, as the Doctor adds (q. 3 of the *Prologue*, §*Ad aliud*, D.). It is distinguished from opinion and suspicion. In this sense Grammar is called a science at *Predicaments* I, ch. 2 and *Topics* VI, ch. 1. *Luke* 1 recalls it: to give knowledge of salvation to his people. And Job professed it (*Job* 19): I know that my redeemer lives. Third, science is taken in the strict sense of *Posterior Analytics* I, T. 5, ch. 2, described as certain and evident knowledge of a necessary thing, acquired through its proper cause by syllogistic discourse. Four conditions required for science thus taken are noted by the Doctor (ibid. and q. 4 of the *Prologue*, near the beginning), and are explained by Pelbartus (*Rosarium*, vol. I, ver. scientia, §1) and Vulpes (*Summulae*, vol. I, disp. 2, §7). The first condition is that it be certain, to exclude doubt and suspicion. The second, that it be about a necessary object, to distinguish it from art, which is about contingent things. The third, that it be through an evident cause to the intellect — to exclude faith, which is obscure and enigmatic, and also to exclude the habit of first principles, which is acquired by the mere explanation of terms alone. The fourth, that it be generated through syllogistic discourse, to exclude the science of God, which is without discourse, as is clear from Scotus (cited). And I showed this at length in the *Treatise on the Science of God*, disp. 1 and 10.

Note thirdly, from Aristotle (*Metaphysics* I.2) and Scotus (ibid., in the exposition of the text, p. 11): one science is for its own sake — or what serves nothing else — such as Physics and Metaphysics. Another is instrumental (*instrumentaria*), which assists the other sciences, such as Dialectic, which supplies to the other disciplines the instruments of dividing, defining, and syllogizing. Hence Aristotle (*Topics* I.9) enumerates three kinds of problems: active, contemplative, and logical. And he adds there: the active is that which in itself respects avoidance and choice; the contemplative, knowledge alone; the logical, however, assists both. That is, the logical is not for its own sake but for the sake of the other sciences, both speculative and practical. Hence it does not follow well, as Zabarella thinks (ibid., ch. 6), that Logic is not a science, but only that Logic is an instrumental science, the administrator of the other sciences, and therefore not as noble and excellent as the others, which are for their own sake. Accordingly, that condition which some attribute to science — that it be for its own sake — is vacuous. Otherwise beyond the speculative there would be no practical science. This contradicts Scotus (q. 3 of the *Prologue*, §*Ad 1. arg. sub s.*), where he mentions moral science and medicine, which are practical. And Aristotle (*Metaphysics* VI, ch. 1, and ibid. XI, ch. 1) distributes science into practical and speculative. The reason is that both objects — speculative and practical alike — possess

properties that are knowable and demonstrable. Therefore, just as about a speculative object there is speculative science, so equally about a practical object there is practical science.

Note fourthly, from *Posterior Analytics* I, ch. 6: science is about necessities and eternal things — which is not to be interpreted in terms of the entity of the science, because science can be lost either by forgetting or by other causes to be stated elsewhere; nor in terms of the existence of the knowable object, since science abstracts from the existence of the object, as the Doctor writes (*Sentences* I, d. 13, q. un., §*Aliter ponitur, ver. si dicatur*, where he says: there is knowledge of a rose that does not exist; and d. 36, q. un., §*Ad 1. sub H.*; and II, d. 3, q. 6, §*Ad q. igitur, B.*; to whom Odo (*Ethics* VI, q. 7, lect. 5) adheres). Rather it is to be interpreted in terms of quidditative and objective being, insofar as it concerns things that are necessarily connected with each other and perpetually united by a bond, whether they exist or not, whether they are present or absent. Hence, to defend the claim that Logic is about a necessary object, one need not devise three degrees of necessity — of substance, accident, and second intention — as Faber (*Theorems* I.3) handed down and Sarnanus touched upon (q. 1 of the universals, p. 47). For apart from God, nothing is necessary in terms of entity, but only in terms of objectivity — that is, the object of science is necessary not with the necessity of an incomplex term but of a complex one, insofar as between the subject and its knowable properties there obtains a perpetual and indissoluble connection, as is clear from *Sentences* I, d. 3, q. 4. Now since a being of reason possesses its own rational properties, just as a real being enjoys real properties (which Scotus proves explicitly concerning the universals, q. 6 of the universals), it is plainly deduced that the habit concerned with it is scientific. Therefore it is required only for science that it proceed from true and necessary premises as its principles and causes, as is clear from *Posterior Analytics* I, chs. 2, 7–8. But Logic proceeds from true and necessary principles, as may be observed in the modes of the three useful figures enumerated in the *Epitome*. For this logical proposition is as necessary as a proposition of Physics: the syllogism consists of three terms and three propositions, just as the physical proposition: a natural body consists of matter and form. The necessity of the object of Logic, therefore, is not derived from necessary things — both because Logic properly is not about things, and also because no science consists in the connection of a first and second intention, but rather in the connection that formally obtains between the second intention itself and its knowable properties. Moreover, a second intention has only objective being in the intellect, and ceasing with its operation, its being likewise ceases; but science is about perpetual things that cannot be separated from each other. But between a first and a second intention there is no perpetuity and inseparability, because between a real being and a being of reason there is no necessity. Therefore the necessity of the object of Logic is not derived from the real and fundamental being of secondary intentions.

First assertion: natural logic is not a science. Scotus presupposes this (q. 1 of the universals), raising the question only about artificial logic, as Cardinal Sarnanus explicitly holds in that place (p. 5). Proved first: no one is properly knowing (i.e., a scientist in the strict sense) except through his own industry or with the help of a master; otherwise rustics would be scientists because they possess natural logic. Therefore natural logic is not a science. Second: nothing natural is artificial (*Physics* II, T. 2, where the Philosopher distinguishes natural things from artificial ones). But every science apart from the infused is artificial, being acquired through study and labor. Therefore natural logic is not a science. Third: from the double opinion about natural logic recounted in q. 1 of this book, art. 1 — if natural logic is taken for the natural capacity for reasoning, it is placed in the second species of quality; if it is taken for the natural property of reasoning, it is really identified with the intellect and resides in the predicament of substance, as will be stated elsewhere. But science is in the first species of quality. Therefore in whatever way natural logic is taken, it is to be excluded from the ranks of the sciences.

Second assertion: artificial logic is not properly a faculty, nor an instrument distinct from art and science. This too is presupposed by the Doctor in the passage above, and is divided into two parts. The first part is proved first: a faculty, properly speaking, according to Alexander (*Preface to Topics* I) and as Aristotle touches upon (*Sophistical Refutations* II, ch. 8), is a habit by which one, being endowed with it, can dispute on both sides of any matter. But Logic treats of necessities, as is clear in the *Posterior Analytics*. Therefore Logic is not properly a faculty. Second: Topica alone is a faculty, from *Rhetoric* I.1.4 and *Metaphysics* I, ch. 6, and the same work IV, ch. 2 — Topica being called the using Logic, as I indicated above and will show more clearly below. Therefore artificial logic is not to be classified among the faculties. The second part is argued as follows: first, every true intellectual habit is contained under one of those five enumerated by Aristotle (*Ethics* VI.4); otherwise that philosopher would have been defective and incomplete in enumerating them. But Logic is a true intellectual habit, as is evident to anyone. Therefore, since it cannot be wisdom, prudence, or understanding, it follows that it is not distinct from art or science. Second: Grammar, according to Zabarella (against whom we now argue), is properly an art, although it is an instrumental habit. Therefore even though Logic is instrumental, it does not follow properly that it is distinguished from art and science. Moreover, Logic is not an instrument in the straight sense but in the oblique — which is to say: Logic treats of the instrument of knowing, which is the mode of knowing or the syllogism. Hence the Doctor adds that Logic is not the mode of knowing formally but only materially.

Third assertion: the teaching Logic is properly a science. So Scotus (in the passage above, §*Dicendum*), and this is derived from Aristotle (*Prior Analytics* I.1), who promises to treat of demonstration and demonstrative science, which is Logic itself. Augustine (*City of God* VIII.4) and Cicero (*On the Orator*) expressly call

it a science. Proved first: science is a demonstrative habit; and Logic is a demonstrative habit. Therefore Logic is a science. The major is Aristotle (*Posterior Analytics* I, ch. 2 and II, ch. 3; *Ethics* VI.3; and *Metaphysics* I.7, T. 48). The minor is shown: Logic makes demonstrations, as in: every discourse in which, certain things being posited, something else necessarily follows from what has been posited, is a syllogism; but a demonstration is of this kind; therefore a demonstration is a syllogism. The major is the definition of a syllogism; the minor is clear from the definition of a demonstration, which is a syllogism producing knowledge. Again: principles are more known than the conclusion. Further: a universal affirmative is drawn from two universal affirmative premises disposed in mode and figure. Moreover: a necessary conclusion follows from necessary premises. The definition is clearer than the defined. Finally: all syllogisms that are in the first figure, especially in its four primary modes, and are supported by the principles "said of all" and "said of none," evidently conclude and produce science — just as other physical and mathematical demonstrations.

Zabarella responds (in the place cited, ch. 6), denying the minor: the object of science is necessary and eternal, but the subject of Logic — which is the syllogism or something else to be assigned in q. 3 — is contingent, a work and fiction of our own; and therefore it is not a fitting object of science. All the more so, if Scotus's argument holds, all productive arts would be sciences — as if some art were constituted for teaching, such as the art of building, providing the norm for how a house is to be constructed so as to be useful for habitation and for protecting us from the inclemencies of the weather, and specifying that it must be made in this or that way and composed of this or that material. No one up to now, however, has placed arts of this kind in the number of the sciences. Therefore Logic is not to be placed among the sciences either. Against this: in the fourth note I made clear what necessity the scientific object requires. The syllogism, however, although it is our work, is nonetheless not a fiction, but has a foundation in reality, as the Doctor writes (q. 4 of the universals, near the end). Nor does it follow correctly that all productive arts are sciences through Scotus's argument; for science proceeds demonstratively, but arts do not; and if at times by them some reasoning is brought forward, that is accidental. For the arts only provide the mode by which artifacts are made.

Second: the logician is one who knows. Therefore Logic is a science. This form of argument is used by Aristotle (*Topics* IV, last ch.): the musician is one who knows; therefore music is a science. Scotus also argues this way (q. 2, *Sophistical Refutations*), and Gadius defends it (*Quodlibet* 13, fol. 131, p. 2, cols. 3–4). The antecedent is proved: whoever knows demonstratively is truly a scientist; but the logician knows demonstratively, as is proved by the first argument. Therefore the logician is one who knows. The first consequence holds by the place of conjugates: white is colored; therefore whiteness is a color.

Third: every true intellectual habit, from Aristotle (*Ethics* VI.3) and Scotus (*Metaphysics* I, exposition of the text, p. 8), is wisdom, science, prudence, understanding, or art. But Logic is one true intellectual habit, as all concede. And it is not wisdom, prudence, art, or understanding, as is clear from their definitions given in the preceding article, note 2. Therefore, from a sufficient enumeration of these, it is a science. Finally, all the conditions of science set down and explained in the second note apply to Logic, as is evident to anyone who runs through them and applies them. It is therefore to be placed in the number of the sciences.

Fourth assertion: Logic is a science distinct from the others. Proved first by the authority of Aristotle, Scotus, and others, who in their works distinguish and teach Logic apart from the other disciplines. Second: from a distinct object a distinct science is obtained, since the sciences are distinguished according to the distinction of objects (*On the Soul* III.8, T. 38). But the object of Logic differs from the objects of the other sciences, as Scotus affirms (q. 2 of the universals). Therefore Logic is distinguished from them. Add the division of science into real and rational, which would be vacuous if Dialectic — which is a rational science — were not distinguished from the others, which are real sciences. Moreover, Logic is an instrumental science while the others are principal sciences. Therefore Logic is distinguished from them.

You will object first: Aristotle (*Rhetoric* I.4) says that if anyone tries to instruct and teach both Rhetoric and Dialectic not as faculties but as sciences, he destroys their very nature in this transition. And he gives the reason there: neither of them is a science of how anything determinate is the case. Nor is it valid to say that the Philosopher is speaking there of the using Logic, since he expressly says "tries to instruct and teach." Confirmation first, from *Topics* I.1: the function of Dialectic is to dispute about probable matters; but what treats of probable matters is not truly a science, which is had about necessities. Confirmation second, from *Topics* I.9: three kinds of problems are enumerated — contemplative (such as whether the world is eternal), active (such as whether pleasure is a good), and logical (such as whether there is a fourth figure). But the logical problem is said to assist both. Therefore if it only aids and serves the other sciences, it follows that it is not itself a science. I respond: that passage is aptly interpreted of the using Logic, which is called Topica, as the reason adduced there makes clear. Nor do the words "to instruct and teach" prevent this, since Topica itself is also instructed and taught in schools. Why it should be called "using" rather than "teaching" seems to be a verbal dispute to be settled in the next article. The same must be said to the first confirmation. To the second: I answered in the second note. For by those words Aristotle does not wish to exclude Logic from the series of sciences, but only to denote that it is the servant and handmaid of the other sciences.

You will object secondly: no mode of knowing is a science; but Logic is a mode of knowing; therefore it is not a science. The major is argued by analogy: no mode of seeing is sight or vision. The minor is supported by the testimony of Aristotle (*Metaphysics* II, ch. 3, T. 15), which Scotus cites (*Sentences* I, d. 29, q. 1, §*Quoniam, before A.*): it is absurd to seek science and the mode of knowing at the same time — where by "mode of knowing," Averroes and the other commentators understand Logic. Confirmation first, from *Posterior Analytics* I.23: science is concerned with a proper and determinate object. But Logic has no determinate object, from the same work I.8 and *Metaphysics* IV, ch. 3, T. 7. Confirmation second, from *Metaphysics* II.1 and the same work VI.2: every science is either speculative or practical; and there the speculative sciences are enumerated, among which Logic is not placed — which it would be, if it were a science, since it is speculative, from what will be said in art. 5.

I grant the major together with Scotus, and distinguish the minor: Logic is the mode of knowing formally — denied; materially — granted. That is to say: Logic is about the mode of knowing, which is the syllogism. Or I say with John of the Masters (q. 1, *Logic*) that Logic is the directive mode of knowing — not the objective one. Or with Tataretus (*ibid.*, dub. 1): Logic is the mode of knowing acquired through demonstration, but not the one produced through use and practice. And Aristotle in the passage cited is arguing against those who wish to learn Logic and the other sciences simultaneously — just as those are reproached who wish to treat a sick man and learn medicine simultaneously, as I noted above, q. 1, art. 6. You will press against the first response: neither materials nor material things are predicated in the straight sense; but formal things and what is formal are, as is clear (*Metaphysics* VII, T. 34). But the mode of knowing is predicated in the straight sense of Logic — indeed, it is placed in its definition, as is clear from *Topics* I.1 and II.1. Therefore Dialectic is not only materially but also formally the mode of knowing. I say: the passage of the Philosopher adduced is to be interpreted not essentially but denominatively, just as a chest is called wooden and a man fleshly. Through this distinction the argument is dissolved. For in truth Logic is called the mode of knowing extrinsically and objectively, just as Physics is called natural because it concerns natural body, as Fonseca well notes (*Metaphysics* II, q. 1, sect. 8).

To the first confirmation: I grant the major and deny the minor; in response to Aristotle, I say he is to be interpreted of the remote object, not the proximate. Or of the using Logic and not the teaching. To the second confirmation: I say with Scotus (at the end of q. 1 of the universals; and q. 3, *Prologue*, §*Contra istas*, 1.) that Aristotle is speaking of real sciences and not of rational ones such as Logic. Zabarella presses (*ibid.*, ch. 3): it is ridiculous to say that Logic is rational, for this amounts to saying that Logic is not a science; therefore that distinction of science into real and rational is worthless. The antecedent is shown: it is futile to demonstrate that a dead man is a man; therefore it is equally futile to say that Logic is a rational science. The consequence is derived: the being of reason

about which Logic is concerned is not knowable; it is our work, which can be made or not made at our pleasure. I say that the division is legitimate, just as the division of being into real and being of reason is good, as the Doctor writes (*Sentences* I, d. 36, q. un., §*Contra istud, F.*), to which Siretus adheres (*On Formalities*, art. 2, main point). Accordingly, in the formal argument I deny the antecedent. To its proof I grant the antecedent and deny the consequence, as is clear from the fourth note. Nor does it matter that a being of reason is our work, since a moral act is our work and yet there is Ethics about it, which is a true science. Similarly, every practical science has some object of operation for its concern and yet is properly a science — unless someone wishes to reject the division of science into speculative and practical, which all confess with one voice.

You will object thirdly: if Logic were a science, it would be acquired through demonstration, since science is generated through demonstration. But it cannot be acquired through demonstration; otherwise demonstration would be presupposed before demonstration, and Logic would be presupposed before Logic, leading to an infinite regress. Therefore, to avoid falling into this absurdity, it is better to exclude Logic from the list of sciences. Confirmation: if there were some art that produced all hammers, it could not use a hammer to make all hammers, otherwise it would use the same to make the same and to make itself — which is impossible. Therefore, since Logic composes all demonstrations, it cannot use a demonstration to make a demonstration, and accordingly is not a science. Granting the major, I say in response to the minor that natural logic is presupposed to artificial logic, and imperfect artificial logic is required before perfect artificial logic, and that the latter is generated through habitual use; for everything natural is presupposed to the artificial, since art perfects nature (*Physics* II, T. 9). And one proceeds gradually from imperfect to perfect. In response to the confirmation: the parity is to be denied, since the art of hammering is not reflexive of itself, as Logic is. Therefore if it is to produce all hammers, to forge a particular hammer — the first one, for instance — it must use another instrument that is not a hammer.

You will object fourthly: Dialectic is situated in the various opinions of men, and so one person can use the aforesaid mode of argument of the Subtle Doctor: the logician is one who holds opinions; therefore Logic is opinion. The antecedent is evident. For in former times the Academics followed Plato, the Peripatetics Aristotle, the Stoics Xenocrates and Aristippus; now the Thomists follow Thomas, the Scotists Scotus, and the Nominalists Ockham, defending their respective positions most keenly. I respond: although in every science there are many things that depend on the will and judgment of men, science is nonetheless not had of these but only of those things that have among themselves a necessary connection. Therefore, even if some part of Logic is situated in the opinion of men and is contingent, there is nonetheless a greater part that is necessary and about which demonstrations are made whose effect is

science. And since the denomination is taken from the nobler part, Logic is consequently called a science.

Article III: On the Using Logic

Five things can be investigated in this article: (I) whether the using Logic is said to belong to the whole discipline of reasoning; (II) whether the using Logic is a science; (III) whether it is a habit distinct from the teaching Logic; (IV) whether it is distinguished from the other sciences to which it is applied; and (V) whether Topica and Sophistica are sciences — all of which are divided into the five following points of debate for the sake of distinction and clarity.

Point of Debate I: Whether the Using Logic Can Be Said to Belong to the Whole Discipline of Reasoning

Fonseca (*Metaphysics* II, ch. 3, q. 1, sect. 6) and the Conimbricenses (q. 4 proem., art. 2), following St. Thomas (*Metaphysics* IV, lect. 4), to whom Maurice (q. 1 of the universals) seems to agree, think that the using Logic is only one part called Topica; the remaining parts are in no way the using Logic. Others, however — among whom are Scotus (to be cited below), the Angelic writer (q. 1 of the universals), Mastrius and Bellutus (q. proem.), and Fuentes (*ibid.*, q. 1, arts. 3–4) — assert that the whole discipline of reasoning is divided into teaching and using. Note and remember from what was said that the using Logic can be considered in three ways. First, insofar as it is applied to other sciences, or insofar as the other sciences use it — in which sense it can more fittingly be called the "used" (*usa*) than the "using" (*utens*), as the aforesaid Angelic writer, Maurice, and the most eminent Sarnanus (*ibid.*, p. 25) note; Orbellus also mentions this (*Metaphysics* I, near the end of q. 2) after Scotus (q. 2 of the universals), giving the reason why Logic is called a common science: its subject falls under the use of the other sciences. Therefore according to Scotus, Logic serves the other sciences by reason of its subject, which those others use. Second, for the habit acquired through frequent use and practice of arguing — those endowed with this being called good logicians, as I noted above. This Scotus recalls (q. 1 of the universals and q. 3, *Sophistical Refutations*, §*Ad 1. q.*), as do Tataretus (q. 1, *Scibilis* 1) and Faber (*Theorems* I, ch. 1). Third, for the habit that treats of probable matters alone, which is absolutely called Topica by all.

Assertion: the using Logic is diffused throughout the whole discipline of reasoning. This is gathered from Scotus (q. 1 and 2, *Sophistical Refutations*), and proved first: Logic supplies to all sciences the topical and analytical syllogism, as Scotus correctly notes (*ibid.*, q. 1). Therefore the using Logic extends through the whole of rational doctrine. Second: what is handed down by the teaching Logic is exercised, or at least can be exercised, by the using Logic; for the precepts and laws of the teaching Logic are directed toward use and practice. Therefore the scope of the teaching and of the using Logic is equal. All the more so, since Logic is a science common by the commonality of use and application,

as — following Scotus (q. 2 of the universals and *Metaphysics* II, com. 15) — we shall show below in art. 6.

You will object: Aristotle (*Topics* I.1 and elsewhere) and his principal commentators openly assert that the using Logic is employed only for Topica. Therefore whoever takes the using Logic as another part of Logic does not use it but abuses it. For words are to be received in accordance with the usage of authors, as the Doctor warns (*Sentences* I, d. 14–15, q. un., under C.). Confirmation: no other science is divided into teaching and using; therefore Logic is not to be divided in this way either. And if it is ever called "using," it should be understood only of Topica, as the Doctor explains (q. 1 of the universals, *R.*).

I say it is true — in the antecedent — according to the older Peripatetics, who spoke of the using Logic too narrowly; the reason for which can be adduced, because the function of Dialectic is to dispute on both sides of probable matters — which, being uncertain and contingent, generate no science. And therefore although it is applied about other things, it nevertheless retains the name "Dialectic," which can demonstrate one and another conclusion in one and another science through the same medium, as Scotus observes (q. 1, *Sophistical Refutations*), since we very often use probabilities whose arrangement pertains to Dialectic. But absolutely and in the broad sense, there seems to be no reason to prevent the other parts of this doctrine — insofar as they assist other disciplines — from deserving the name of using Logic. Nor is it incongruous to apply it to the whole expertise in reasoning, just as it is not incongruous to employ "Dialectic" for the whole discipline of reasoning, as was proved above (q. 1, art. 2). To the confirmation: I grant the antecedent and deny the consequence. The reason is that the other sciences are not instrumental in the way that Logic is — whose instruments serve both itself and the other disciplines. To Scotus: I say he is speaking there in the sense of the old Dialecticians, as I touched upon above.

Point of Debate II: Whether the Using Logic Is a Science

Very many moderns — notably Rubius (q. 3 proem.), Hurtado (*Logic*, disp. 2, sect. 1), and Arriaga (disp. 3, sect. 2) — deny that the using Logic is a science. On the other side, others who do not distinguish the using from the teaching Logic do not remove it from the number of sciences. For our part, to resolve this point of debate, we must make a distinction in accordance with the triple sense of the using Logic set out in the note of the preceding point of debate.

First assertion: the using Logic taken for Topica, and also taken for the habit acquired through frequent use and practice of arguing, is not a science. So Scotus (q. 1 of the universals). The first part is proved first from Aristotle (*Rhetoric* I.4 and other places), who separates Dialectic — which he more frequently takes for Topica — from the sciences and places it among the arts and faculties, especially at *Sophistical Refutations* II, ch. 8, saying: we therefore

premise the faculty of discovery. And all the Peripatetics with one voice proclaim that by "Dialectic" in this context the using Logic is to be understood. Second: science is not from common and contingent things but from proper and necessary ones (*Posterior Analytics* I.1). But Topica proceeds from common and probable matters. Hence Aristotle (*Topics* I.1) adds that the function of Dialectic is to dispute about any probable matter whatsoever — which Scotus equally confirms at the end of q. 1, *Sophistical Refutations*. Third: science has a determinate object (*Posterior Analytics* I.8). But Topica is not restricted to any determinate object, as is stated there and in *Metaphysics* IV, ch. 2; and Scotus gives the reason with Aristotle there: if Dialectic were of some determinate genus, it would not raise questions. Therefore the using Logic taken for Topica is not a science. The second part is proved first: use and practice do not make a man knowing but only easy and prompt in acting. Therefore the using Logic taken for the habit produced through use and practice is not a science. Second: use and practice are required for all arts, even the servile ones, as experience confirms — and that these are far removed from science is plain to all, as the twin Scotists well and at length show (q. proem., art. 1). Thus accepted, the using Logic is therefore not a science.

Second assertion: the using Logic taken for the knowledge acquired through demonstration by which we make use of it in other sciences is a science. This assertion is opposed to Faber (cited), whom Tataretus (in the passage above) supports. Proved first from Scotus (q. 2 of the universals), who calls Logic a common science, implying that its use and commonality do not take away from it the character of science. Therefore Logic, insofar as it serves the other sciences, is a science. Second: Logic, insofar as it expends its care on the other sciences, is not essentially changed; rather the same habit persists and there only accrues to it the relation of use and application, which follows upon Logic itself. But a relation accruing to an absolute being does not essentially change it, as is self-evident. Now Logic is an absolute being, being of the genus of quality. Therefore as applied to the other doctrines, it is not to be removed from the list of sciences. Third: according to Faber at the beginning of the first chapter, the using Logic insofar as it is concerned with the other disciplines is the whole teaching Logic; but the teaching Logic is a science, as Faber himself affirms (*ibid.*, concl. 1). Therefore the using Logic so accepted also partakes of the character of science.

Faber responds: the using Logic as such is nothing other than use and application; and that this application is not a science is evident, because it is a relation, as I taught in the *Treatise on Augustine*, disp. 4, q. 2. And Faber himself does not deny (*ibid.*) that science, as I was just saying, is an absolute being. Therefore Logic limited by use and application is not a science. The consequence is shown: a condition specifying something restricts it under such a consideration — as a man insofar as he is a fisherman is not a rational being. Therefore Logic under the character of use and application is not a science.

Against this: Logic through use and practice does not lose its essential and quidditative being but retains it fully, as I was just arguing. Therefore it is not formally use and application. Nor does just any condition that determines something specify it in such essential being, unless it is a constitutive principle and essential ground — not an adventitious and accidental condition such as application is. For a thing is first what it is in its own being before it is applied to another. Therefore the relation of application accruing to Logic, insofar as it assists the other sciences, does not take away its essential being, just as the relation of fatherhood accruing to Peter does not remove his substantial and suppositional being.

You will object first, against the second assertion: the object is not a science, since the object is that about which science labors. But the using Logic has the character of an object, as some modern author suspects. Therefore the using Logic is in no sense a science. I grant the major and deny the minor. For a habit is one thing and the object about which the habit labors is another, as is evident to anyone. Therefore even though the using Logic is exercised about an object, it does not on that account acquire the character of an object.

You will object secondly: the using Logic is not formally knowing but acting and operating. Therefore the using Logic is not formally a science. The antecedent is proved: the using Logic is acquired through work and not through demonstration. Confirmation: science is about universals while the using Logic is about singulars. Therefore it does not partake of the character of science. The antecedent may be denied. For the intellect and its act is both cognitive and productive. Likewise, the practical sciences are both cognitive and operative. Most of all because demonstration, through which science is generated, is a work — not external, to be sure, but internal, remaining within the limits of the intellect. To the confirmation: I grant the first part of the antecedent and deny its second part. For the using Logic is applied to universals in much the way that the teaching Logic hands down universal precepts — the using Logic exercises those precepts, even though it also touches singulars; and in respect of these latter it falls short of the character of science.

Point of Debate III: Whether the Using Logic Is Distinguished from the Teaching Logic

Faber (*Theorems* I, ch. 1), Fuentes (q. 4, diff. 2, art. 1), the Conimbricenses, Fonseca, and the aforesaid Thomists cited by our moderns (q. proem., art. 1) affirm that the teaching and using Logic are one and the same habit. But Cardinal Sarnanus (q. 1 of the universals, p. 44), Maurice (*ibid.*, cited), and other students of Scotist doctrine assert that the teaching and using Logic are distinct habits.

First assertion: the using Logic taken for Topica is not the same habit as the teaching Logic but appears to differ from it really. This assertion has two parts

and is gathered from the Doctors (q. 1 of the point of debate) and from the places cited, as well as from *Prologue*, q. 4, in the solution of arguments 1–3, *BB*. The first part is argued as follows: science and art are two distinct habits (*Ethics* VI.4). But the teaching Logic is a science, as is established from art. 2 of this question; while the using Logic taken for Topica is not a science, as I showed in the first assertion of the second point of debate. Therefore the teaching Logic and the using Logic so accepted are not the same habit. Second: things that have distinct objects are not the same habit, since from the distinction of objects the distinction of habits is inferred, as Scotus and Gadius say (*Quodlibet* 13, fol. 14.1, col. 3). But the teaching and using Logic have distinct objects. For the object of the teaching Logic is proper, determinate, and necessary; while that of the using Logic is common, indeterminate, and contingent. Hence Rubius is not to be heeded when he says that the teaching and using Logic are the same habit even if the teaching is a science and the using is an art. For science and art are narrated by Aristotle (just cited) as distinct habits. Nor does it help him to say that the character of science in the same habit of Logic is primary and the character of art is secondary. For a primary character differs from a secondary one as the first differs from the second, or as substance from accident, or subject from property. Therefore since, according to Rubius, the primary and secondary characters in the teaching and using Logic differ, it is perspicuously established that the teaching Logic does not coincide with the using Logic. The second part is proved first: between things of which one can exist without the other there falls a real distinction, as will be shown in the following book (q. 1, art. last). But Topica can exist without Analytics; for a person can learn Topica without Analytics. Therefore Topica is really distinguished from Analytics. Second: a person can be an expert in the teaching Logic even if he does not apply it to the other sciences or practice it, as is evident in the case of one who is without experience in the practice of Logic. But this is a clear indication of real distinction. It is therefore plausible that these habits really differ from each other, notwithstanding the objection of Poncius (disp. 4, q. 6, n. 59).

Second assertion: the using Logic insofar as it is applied to other disciplines is the same habit as the teaching Logic, but differs from it in some respect. This is also gathered from Scotus (in the passage above). The first part follows from what was said in the second assertion of the preceding point of debate: for the using Logic so accepted is a science just as the teaching Logic is, as was proved there. Therefore it is the same habit. Moreover, Logic is one science by the unity of its subject, from what will be said in art. 4. Therefore it is one habit of both the teaching and using Logic. The second part is proved: to the using Logic there is added use and application, which is a relation, as I noted in that passage. Therefore the teaching and using Logic so taken differ from each other by some relation. Again: the same habit is taught and is exercised through application to an object. But the teaching Logic hands down precepts of reasoning, while the

using Logic applies those same precepts to the other sciences. Therefore they differ by a different relation.

You will object first: the multiplication of beings without necessity is to be avoided (*Physics* I, T. 41 and 50). But if the using and teaching Logic were distinct habits, there would be a multiplication of beings without necessity. Therefore they are not distinct habits. The major is evident; the minor is proved: the same habit can both teach the rules and use them. I grant the major and deny the minor. In response to its proof, I say that beyond the teaching habit — which is from necessities — there is given a using habit that proceeds from probable matters, which makes us easy and prompt for syllogizing; and that these are distinguished from each other our recent authors (cited in the preceding point of debate) pursue at length.

You will object secondly: the using Logic draws its form from the teaching Logic; and the unity of form is the cause of identity of a thing, while its diversity is the cause of its distinction. Therefore, since the scientific form of both is one, there is no distinction of habit. The antecedent is denied: for the using Logic (*Topica*), being a certain faculty, enjoys a distinct form from the teaching Logic, as will be clear below in point of debate V.

You will object thirdly: Scotus (*Sentences* II, d. 27, q. un., §*Ideo alia, sub B.*) distinguishes charity from grace by their diverse connotes and denominated things; and he asserts the same of the intellect and intellectual memory. Therefore the same judgment is to be passed concerning the teaching and using Logic, as the Doctor implies (q. 1 of the universals, *R.*). The argument concludes concerning the using Logic according to the second assertion, not according to the first assertion. In this way Scotus is to be interpreted in both places just named.

Point of Debate IV: Whether the Using Logic Is Distinguished from the Other Sciences It Serves

Zabarella (*On the Nature of Logic*, I.1), Vasquez (*Summa Theologiae* I, disp. 8, n. 19), and not a few moderns, not distinguishing the using Logic from the other disciplines to which it ministers, think that it becomes the very science it serves — so that if it assists Physics it becomes Physics, and if it is applied to Metaphysics it becomes Metaphysics. Faber (*Theorems* I), Rubius (near the end of q. 3), and other moderns openly deny that the using Logic becomes the science to which it is applied.

Note that an instrument does not become the thing of which it is an instrument: a saw is indeed a suitable instrument for cutting wood, but in cutting wood it does not become wood. And if at times the instrument itself can be materially the same as the thing it serves — as when iron hammers are used by blacksmiths to produce their iron works — it nevertheless cannot formally become numerically the same. For an instrument is something extrinsic assisting the

craftsman in making the work he intends to produce. Therefore if someone uses one hammer to forge another, the hammer that is the instrument does not become the hammer that has been produced, but remains distinct from that hammer.

Assertion: the using Logic does not become the science to which it is applied. This is drawn from Scotus, who writes (q. 2 of the universals and elsewhere) that Logic is a common science through the application of its subject, because its subject is applied to the other sciences. But what is applied to another is not changed into the nature of that to which it is applied, as is clear from the hand applied to the head to support it, and from medicines applied to sick bodies, without being converted into their substance. The assertion is argued from the foregoing note: the instrument is not converted into the thing of which it is an instrument, as was explained there. But the using Logic is an instrument of the science to which it assists. Therefore it does not become the science it serves. Moreover: the other sciences use Logic or Logic's instruments. Therefore Logic remains in itself according to its essential being, and only its instruments are employed by the other sciences for drawing their conclusions — and accordingly Logic does not pass into their essence. Furthermore: in a physical demonstration, for example, two things are considered — the matter about which physical science is had, and the syllogistic form by which the demonstration is constructed in the proper mode and figure; and the latter is distinguished from Physics, which borrows it from Logic. Therefore: it must be concluded that the using Logic does not penetrate into the nature of the science it serves.

You will object: the science to which the using Logic gives assistance is nothing other than a collection of syllogisms of the science to which Logic itself ministers. Therefore the using Logic coincides with the science it serves. Granting the antecedent, I distinguish the consequent: materially and objectively — granted; formally and essentially — denied. For the syllogistic form is derived from Logic, while the object or matter to which it is applied belongs to the science it serves.

Point of Debate V: Whether Topica and Sophistica Are Sciences

The Subtle Doctor (q. 3, *Sophistical Refutations*) investigates this difficulty by design and resolves it, noting there (§*Ad 1. q.*) that Dialectic can be considered in two ways. First, insofar as it provides a norm for proceeding from certain principles to certain conclusions — and this is called the teaching Topica. Second, insofar as it uses that same norm in itself and in the other sciences — and this is called by the earlier philosophers simply "Dialectic," and by later ones the using Logic. The same is noted equally of Sophistica, which can be viewed insofar as it proceeds from certain sophistic principles to certain sophistic conclusions, in which way it can be called the teaching Sophistica; or insofar as it

employs those principles to conclude falsely through a sophistic syllogism — in which way it can be called the using Sophistica.

First assertion: the teaching Topica is a science. Scotus holds this (cited), saying that the science of Dialectic is handed down through demonstration, though its use consists in probable matters. Sarnanus (q. 1 of the universals, p. 26), Toletus (q. 2 proem.), and the cited moderns in the preceding points of debate agree. Proved first from *Posterior Analytics* I, T. 5: a habit caused from determinate principles to determinate conclusions through a proper medium is a science. But the teaching Topica is of this kind; for it has proper principles from which, through a proper medium, it descends to proper conclusions. Therefore it is a science. Second: just as through an analytical syllogism necessity is demonstrated, so through a topical syllogism probability is shown, and through a syllogism taken in general the necessity of inference (*necessitas illativa*) is shown, as is clear (*Sophistical Refutations* I, ch. 2). But science is generated through the analytical syllogism. Therefore science is also produced through the topical syllogism — and accordingly the teaching Topica is a science.

Second assertion: the teaching Sophistica is likewise a science. So Scotus (in the passage above). Proved first from Aristotle, who at the end of the *Sophistical Refutations* II expressly says that he himself discovered the science of Sophistica. Second: the subject of Sophistica is knowable; it has knowable and demonstrable properties, as the Philosopher affirms (*Sophistical Refutations* I.1). Therefore of it there is sophistic science. I add that just as through a Dialectical syllogism probability is demonstrated, so through a captious syllogism appearance is shown — especially through unity as its proper medium — just as of a triangle it is demonstrated, through its definition, that it has three angles.

You will object first, against the first assertion: science is about necessary and eternal things, as I have frequently insisted above. But Topica is about probable and contingent matters, as is clear from its definition. Therefore Topica is not a science. I grant the major and distinguish the minor with Scotus (q. 3 of the *Prologue* and *Sentences* I, d. 3, q. 4, §*Quantum ad 1., I.*): as regards existence — denied; as regards the necessary connection of predicate with subject — granted. In this sense, contingent and probable things so viewed can be said to be necessary and eternal, as the undivided Scotists observe (q. proem. of *Physics*) and Vulpes (*Summa* I, disp. 2, §8).

You will object secondly, against the second assertion: Sophistica is not true but only apparent wisdom (*Sophistical Refutations* I.1; and *Metaphysics* IV, T. 5). Hence it is called an "art" at *Sophistical Refutations* I.13. Therefore it is not rightly placed among the sciences. Confirmation: no science tends to deception, since it is a true intellectual habit (*Ethics* VI.4). But Sophistica tends to deception; for it aims at the fallacious and captious syllogism. Therefore it does not merit the name of science.

I grant the antecedent and deny the consequence: for the teaching *Sophistica* proceeds after its own fashion from certain and necessary principles to certain and necessary conclusions, as I declared in the foregoing note. The testimony of Aristotle is interpreted of the using *Sophistica*, not the teaching. And Scotus implies this through the following words: if *Sophistica* is taken for false credulity engendered by a sophistic syllogism, the argument holds — but not if it is taken for *Sophistica* handed down through demonstration. To the confirmation: I distinguish the major: *per se* — denied; *per accidens* — granted. For *Sophistica* was not discovered in order that we may deceive or be deceived, but that we may avoid deception.

You will object thirdly: the obliquity of something right is not known except through knowledge of what is right, since the right is the standard of itself and of the oblique, as Scotus notes (*Sentences* IV, d. 15, q. 2, §*De tertio* X.). But the sophistic syllogism is essentially the obliquity of the Dialectical syllogism. Therefore there is no science *per se* of the sophistic syllogism. Confirmation: there is no science of non-being, since science is a real and true habit — and being and truth are convertible (*Metaphysics* IV, T. 28). But the sophistic syllogism is non-being (*Metaphysics* VI, T. 14), where Aristotle says that Plato did not act badly in placing *Sophistica* under non-being.

The Doctor responds (in the passage cited, §*Ad aliam* q.): granting the major and denying the minor. The reason is that the obliquity of a certain nature is constituted in being through the mere negation of what is right; but the sophistic syllogism is not constituted in being through the negation of the Dialectical syllogism, but through the appearance of truth, which pertains to its own right and essential being. You will press: the Doctor (q. 3 of the universals, before §*Ad 1. arg.*) affirms that the sophistic syllogism is a privation of the true and perfect syllogism, and accordingly it belongs to the same science to know a habit and its privation — for of opposites there is the same discipline (*Post-Predicaments*, ch. on opposites). Therefore the foregoing response is worthless. I say indeed that the privation of true science accompanies the sophistic syllogism, but that it is essentially constituted through the said appearance — and in this way the two passages of Scotus that seem to conflict with each other are reconciled.

To the confirmation: the Scotists also distinguish the minor: if the sophistic syllogism is considered insofar as it falls into the use of arguing sophistically, it proceeds from falsehoods, and of it so viewed there is no science. But if it is examined insofar as it is handed down from determinate principles and media to determinate conclusions, then especially of it there is science.

Article IV: Whether Logic Is One Science

I encounter principally two opinions in this article. The prior is that of St. Thomas (*Posterior Analytics* I, ch. 22, q. 24, art. 3), Cajetan (*ibid.*), Capreolus (q. 3,

Prologue), and Rubius (q. 4 proem.), affirming that Logic is one in species, or one simple quality, diffused through all its parts and all its conclusions — just as the heat of fire is one simple thing extending to kindle the distinct pieces of wood placed next to it. The latter is defended by the Scotists: Tataretus (*Logic*, q. 1, dub. 3), John of the Masters (*ibid.*), and very many others, from Scotus (q. 3 of the *Prologue*; and q. 2, *Posterior Analytics*, §*Contra istud arguitur, sub D.*; and *Sentences* III, d. 23, q. 2, §*Ad 2. quaesitum*, 6.; and d. 36, q. un., §*Quantum ergo.*; and *Metaphysics* VI, q. 1) — to whom the Nominalists agree (in the *Prologue* cited), who deny that any total and habitual science is one simple quality, affirming that it is one by the unity of its subject about which Logic, or any other science, is concerned.

Note, from Scotus (just cited in the *Metaphysics*), that the unity of a science is twofold: intrinsic and extrinsic. Intrinsic unity is that which follows upon the very entity of the science, which is of the first species of quality, really distinct from the object about which it is science. Now since there is principally a triple object — individual, specific, and generic — there is also a triple unity of science, corresponding to the triple formal, virtual, and potential habit, as the Doctor notes (*Sentences* III, d. 25, q. 2, §*Ad 2. quaesitum*). The formal habit is the particular habit of a demonstrated conclusion, inclining precisely toward the evident knowledge of that conclusion — such as the knowledge that is had of the lunar eclipse from the interposition of the earth between the moon and the sun, as of the year 1643 at the seventh hour of the afternoon. The virtual habit is the habit of the first and adequate specific object, containing in itself virtually all the knowable conclusions concerning that object, inclining formally toward knowledge of it and virtually toward knowledge of all things virtually contained in it — such as the science generated of man and of all things pertaining to him. The potential habit is the habit of the generic object and of all things potentially contained in it — such as the science of animal and of all things pertaining to it in any way.

First assertion: Logic is not one simple quality. This is derived from the principles of Scotus (cited at the beginning of this article). Proved first: objects distinct in species cause habits distinct in species, according to Scotus (*Sentences* I, d. 3, q. 7, §*Ad 1. arg. DD.*; and III, d. 31, q. un., §*Respondeo, D.*). But the objects of Logic are distinct in species — namely the three instruments of knowing: definition, division, and argumentation, or rather the syllogisms of the first, second, and third figures. For who can be expert in arguments made in the first figure while not knowing the syllogisms constructed in the second or third? And likewise someone can master the mode of defining while being ignorant of the mode of arguing. Therefore Logic is not a simple quality. Second: a habit is posited in order that the power may operate easily, promptly, and with pleasure, as the Doctor teaches (*Sentences* I, cited). But one can have a habit concerning incomplete terms without having one concerning complete terms. Again: one can know what belongs to the *Prior Analytics* without knowing what belongs to

the *Posterior Analytics*. Therefore since Logic comprises all of these, it is clearly gathered that it is not a simple quality, which is acquired all at once in its entirety. Moreover: things that are compatible with some but not with others are not of the same species and one simple quality, as is clear from fire, water, and other contraries and impossibles. But certain things treated in Logic are compatible with some and not with others, as is clear from the analytic, topical, and sophistic. Therefore Logic is not one simple quality.

Second assertion: Logic is one science by the unity of its subject that potentially contains all things comprehended in it. So Scotus (q. 4 of the universals, near the end, §*Ad rationem positionis*), and this is derived from the first already recounted, from *Sentences* III, d. 36, q. un., §; and from *Against Pompanatius*, disp. 2, q. 9, concl. 3. Proved first from Aristotle (*Posterior Analytics* I.23, T. 43), who speaking universally of science writes: science is one of one generic subject. But the subject of Logic is one in genus — namely the syllogism, or mode of knowing, which is divided into definition, division, and argumentation as its species. Therefore Logic is one by the unity of its subject. Second: acts and habits are distinguished by the distinction of objects (*On the Soul* II, T. 33 and 36; and *Quodlibet* 13, §*Ad ista HH.*), and they have that unity which their objects have. But the object of Logic is one in genus — namely the syllogism or mode of knowing. Therefore Logic is also one in genus. Third, from *Sentences* I, d. 3, q. 9, §*Ad 1.*, near the end of that question: an act is generative of a habit, as cause produces effect; and an act takes its unity and distinction from the object, which is the proper terminus of its dependence. Therefore the habit that arises from the act — and thus Logic — is one by the generic unity of its subject. More will be said in *Physics* I, q. 2, art. 3.

You will object first: a power respecting objects distinct in species is one simple quality — as the visual power, which is carried toward colors distinct in species, such as white and black. Therefore Logic is also one simple quality, even though it regards objects differing in species. Granting the antecedent, the consequence is denied. For a power emanates from the soul or from the whole compound; but a habit is partially caused by the object. Therefore a habit is determined by that object by which it is produced; not so with a power, which by its very nature is indifferent and undetermined with respect to any object contained under it.

You will object secondly: an infused habit is a simple quality — such as faith, hope, and charity, which are concerned with many objects distinct in species; for charity regards God and neighbor. Therefore an acquired habit, such as Logic is, is also a simple quality. Granting the antecedent, the consequence is denied. The reason for the difference is that an infused habit has its unity from itself and in itself formally, and effectively from God. But an acquired habit draws its unity from the object by which it is partially produced, as the Doctor rightly observes (*Sentences* III, d. 25, near the end of q. 2). Or it can be said that the difference lies in the fact that the infused habit is supported only by the faith

of God revealing, as the same Doctor affirms (*Sentences* III, d. 23, q. un.; and IV, d. 14, q. 2, §*Hic dicitur, F.*). But the acquired habit rests on formal, specific, and generic motives and principles. Therefore the former, but not the latter, is a simple quality.

Article V: Whether Logic Is a Speculative Science

This difficulty seems to rest on the acceptance and explanation of the name "praxis," through which a science is called practical. For some employ that word more broadly and others more strictly — from which a controversy arises among them, not easy to explain, especially on account of many other considerations of no small weight that are introduced into it. Therefore, so that this article may be more conveniently resolved, I divide it into the two following points of debate. This is consonant with the style and method of the Subtle Doctor, who — as Vigerius carefully notes in his exposition (§*Ad istas qq. solvendas, q. 4 of the Prologue*) — when some very arduous and difficult question arises, divides it into collateral questions and articles.

Point of Debate I: What Praxis Is

Since — by the common judgment of philosophers — that science is called practical which directs praxis, and conversely that is speculative which does not direct praxis but rests in the mere contemplation of a thing, we have rightly undertaken first to define and explain praxis itself, so that from this we may distinguish which science is practical and which is speculative.

The Subtle Doctor (q. 4 of the *Prologue*, §*Dico igitur, A.*), defining praxis properly so taken, says: praxis is an act of a power other than the intellect, naturally posterior to intellection, apt to be elicited in conformity with right reason, so that it may be a right act. This definition of praxis is attacked by many — Ockham (q. 5 of the *Prologue*), Aureolus (ibid., art. 2, §*Quamvis autem, p. 37*), Gregory, Vasquez (*Summa Theologiae* I, disp. 8), Suárez (*Metaphysics*, disp. 44, n. 20), and very many others — who affirm that praxis is an operation of the intellect, will, or other power that is directable. In order that the truth and probability of the Scotist position may appear and be defended against the weapons of the opponents' arguments:

Note first that praxis, as Pelbartus notes from Major (*Sentences* I, d. 48) (*Rosarium*, vol. I, ver. praxis, §1), is a Greek word, which in Latin is the same as "operation," as Scotus indicates (*Sentences* I, d. 28, q. un., §*Quamvis, A.*), and Bonetus (*Metaphysics* II, ch. 4) and Orbellus (*Metaphysics* I, ch. 4, q. 2) explicitly hold. For it derives from the Greek verb *prattō*, which is the same as "I operate, I make, I act," as is read in the lexicon. Hence by the force of the word *praxis* it signifies the operation, making, or action of any natural or free power. But the Scotists — notably the aforesaid Vigerius and Tataretus (q. 2, *Scibilis* 2) — following the commentator Eustratius (*Ethics* I, com. 1) observe that praxis is employed in four ways. First, for the activity (*energia*) that consists of the operation of any power

whatsoever — and this acceptance is derived from the etymology of the word *praxis*, as I noted above. Second, for the operation of the power of knowing or desiring alone — in which sense the operation of the intellect and also the affections of the soul can be called praxes, about which the Philosopher speaks (*On the Soul* I.1, T. 12). Third, for the operation of the will alone, whether good or bad — in which sense Eustratius and Odo (in the passage above) take it. Fourth, for the right operation of the will — and in this sense Eustratius describes it as the work of virtue; and in this sense Scotus and his disciples take it (q. 4 of the *Prologue*, §*Secunda via*), affirming that *praxis* is the operation according to choice. Therefore Scotus, taking *praxis* in this way, speaks according to the mind of Eustratius and the Greeks — as Vulpes (*Summa Theologiae* I, disp. 4, q. 1, n. 9) correctly notes against Molina (*Summa Theologiae* I, disp. 1, art. 4, q. 1), and as is clear from the lexicon cited above. Nor should this multiple acceptance of *praxis* seem strange to anyone. For it is common among authors for words to admit of many senses, as is clear from Dialectic (q. 1, this book, art. 2); from science (q. 2, this book, note 2); and from what is most immediately relevant to our matter, from "action" and "production" in the writings of Aristotle. For sometimes "action" is used for operation both immanent and transient (*Metaphysics* VI, ch. 1); sometimes through "action" immanent operation is meant and through "production" transient operation (*Metaphysics* IX, ch. 9); sometimes through "action" is understood that which leaves no work after it, and through "production" that which leaves a work after it (*Magna Moralia* I, last ch.). And the most proper usage of "action" is for moral action, and of "production" for manual operation. Hence it is said that action belongs to the domain of the "doable" (*agibilia*) and production to the domain of the "makeable" (*factibilia*). That is, action is concerned with moral matters and production with manual or mechanical ones. Hence Aristotle (*Ethics* VI.4) defines art as a productive habit with right reason, and prudence as an active habit with right reason. And therefore the "doable" and the "makeable" are the objects of the practical sciences — by reason of which the practical habit taken in general is divided into active and productive, as the Doctor teaches (*Sentences* III, d. 34, q. un., §*Notandum ulterius, D.*), and as Aristotle shows in the place just cited. But to make clearer to ourselves what we are investigating, we must work out whether *praxis* strictly taken is concerned with the "doable" or the "makeable." For if we shall find that it is concerned only with the "doable," then what the Doctor and his disciples say about *praxis* will be true — and the Thomists agree with them, among whom are the Complutenses (disp. 1, q. 6, §1).

That the name of *praxis* properly speaking should be used as Aristotle, the common master of all, took it is found and drawn from *On the Soul* III.10, T. 49: the intellect becomes practical through extension — the general axiom. And the reason is rendered: because the speculative intellect is that which rests in the mere contemplation of a thing; therefore the practical intellect, insofar as it is distinguished from the speculative, extends itself to regulating *praxis* — and

from this relation it is formally denominated "practical." The same must be said of science, which regulates a work that is formally practical. Hence the Philosopher adds (*Ethics* I.3): the end of speculative science is truth, while the end of practical is the work. Therefore in the view of Aristotle, that doctrine is formally speculative which is placed solely in the speculation of truth, and practical which regulates praxis or the work. For this reason the same Aristotle had previously stated (*Ethics* I.3): the end of practical science is not cognition but action. Although this saying is not found expressly in the text cited, it is nonetheless gathered from it; for there these words are read: the practical intellect is that which reasons on behalf of something. For it is the principle of action, and this differs from the contemplative intellect by its end, since the speculative contemplates truth for its own sake while the practical does so for the sake of the work; for every appetite tends toward something to be acquired, and the practical intellect is that which moves the will, which is a certain appetite. And T. 51 is added: the appetible is its end, from which the consideration of the practical intellect arises. I have adduced these texts on account of Baccon (q. 4 of the *Prologue*), Fonseca (*Metaphysics* III, q. 2, sect. 4, c. 2), and Molina (in the passage cited), who say that this saying is not Aristotle's and can be denied, and that it is supported by no foundation. Arriaga adds (disp. 1, sect. 4, n. 5). Finally Hurtado (disp. 2, sect. 2, §14) thinks it is not from any proven author — yet Hurtado himself (disp. 1 *On the Soul*, sect. 3, §15) falls into the same position. And Abbate (*Commentary on the Soul* IV, tract. 4, lib. 3), Aureolus, Toletus (q. 4 proem., near end of note 2), following Augustine (*On the Trinity* XV.1), receive and defend this. And the Thomists agree with St. Thomas (*Summa Theologiae* I-II, q. 17, art. 1, ad 2), along with Eustratius, Odo, and very many other most approved authors, using the name "praxis" as we do. From this it is clear that Vasquez, Suárez, and others to be cited below in the third assertion are not thinking correctly when they suppose this to be a verbal dispute and that the description of praxis handed down by the Doctor is voluntary and gratuitous.

That praxis properly speaking is not an act of the intellect but of the will is more expressly found in *Metaphysics* I.2 and *Ethics* I.1: speculative science was discovered for the sake of fleeing ignorance; practical science was discovered not that we may know but that we may become good. The same is indicated at *Topics* I.9. Therefore, according to the Philosopher, that science is properly practical which precisely regulates praxis — by reason of which we are named and are good. But the operation according to which we are called good is not the operation of the intellect — which is indeed called "true," but not "good." Whence the Doctor rightly says that praxis properly speaking is the operation of a power other than the intellect, namely the will. And praxis itself requires three conditions. The first is that it be an act of a power other than the intellect. For only that operation is called praxis toward which the intellect extending itself becomes practical. But toward no operation of itself does the intellect extend itself, because to extend is to tend outside oneself, as the verb *extendo* implies;

and so praxis is not an operation of the intellect, which does not go beyond its own limits. Second, that it be naturally posterior to intellection. Hence the operations of the vegetative and sensitive powers of souls are not properly praxes, because they do not naturally follow intellection, nor are they subject to its direction; for they are common to us and to the brutes. Even if in some way they are directed by us and accompany intellection, just as the acts of the intellect that are commanded and governed by the will, they can in that sense be called praxes — since both the elicited and the commanded act of the will are praxes, as is clear from q. 4 of the *Prologue*. The third condition, which Vulpes (in the passage cited) admits, is that it be in conformity with right reason, which Aristotle posits (*Ethics* VI.2): right choice necessarily requires right reason, to which it must conform — where the Philosopher by "choice" understands the elicited act of the will, and by "right reason," the right dictate of the intellect.

Note thirdly, from the same Doctor (*Prologue*, §*Contra de necessitate, sub D.*; and also q. 1, *A.*): that speculation, as it is distinguished from practical knowledge, is an operation of the intellect remaining within its own limits and not ordered to the operation of another power distinct from the intellect, as the Doctor intimates (*Sentences* I, d. 38, q. un., §*Quamvis, A.*). "Speculation" derives from the Greek verb *skopeo*, which is the same as "I consider" or "I contemplate." Hence that is speculative science which is placed in the contemplation of the thing, and that is practical which directs praxis. Two conditions accord with this: the first, that it be an operation of the intellect — from the defect of which sight, hearing, or the operation of another power distinct from the intellect is not speculation, nor is science denominated speculative through it. The second, that it remain within the limits of the intellect — namely, that it be for its own sake, or that it not direct another operation of a power distinct from the intellect. Whence it comes about that although every speculation is an act of the intellect, not every act of the intellect is speculation — as Hurtado and Arriaga (aforesaid) do not correctly impute to us. For besides speculative knowledge, there is practical knowledge, as the Stagirite teaches (*Metaphysics* I.2), where he places speculative before practical, since the former is sought for the sake of knowing and the latter for the sake of the work, as the same Philosopher forewarns (*On the Soul* III, T. 50), to whom the Doctor (in q. 1 cited) agrees.

Assertion: praxis broadly taken is a directable operation. This assertion counters Arriaga (disp. 1, sect. 4, subsect. 2, n. 49), who thinks Scotus denies this; but as often happens, Arriaga and some others argue against Scotus without reading or understanding him, as Oviedo similarly notes in a comparable case (*Controversies* I, Meta., point 2). Arriaga is therefore mistaken, as is clear from the *Prologue* cited (§*Dico igitur, sub A.*, ver. *Respondeo licet*), and this is derived from what was said in note 1. For praxis, as its name indicates, is an operation, but an operation of any power whatsoever is in some way directable — most especially the operation of the intellect, as even the opponents admit. Therefore praxis so accepted is a directable operation. The cognition of the intellect that is had of

principles is ordered to the knowledge of the conclusion as cause to effect; and such cognition is a directable operation. Therefore it is also praxis broadly taken. Moreover, speculation is an operation of the intellect that is not directable, as Odo says (*Ethics* VI, q. 9, lect. 1). Therefore on the other side, praxis is a directable operation — the consequence holds because speculative is that which does not direct praxis; therefore practical is that which directs praxis; and thus just as every undirectable operation is speculation, so a directable operation is praxis broadly taken.

Second assertion: praxis properly is an operation of the will. So Scotus (cited), whom Odo (*Ethics* VI, in the passage above), Orbellus (*Metaphysics* I, q. 1), and Fuentes (*Physics* proem., diff. 2, art. 1) follow. Proved first: praxis presents extension toward work, as I observed in the second note. But the intellect resting in its acts does not extend itself to work, because it does not tend outside itself. Therefore it extends itself to the act of another power, naturally posterior to intellection, which is the act of the will. Second, from *Metaphysics* II: the end of practical science is that we may become good. But goodness pertains to the will and truth to the intellect. Therefore praxis is an act of the will. Third: the practical act is a principle of action (*On the Soul* III, T. 50, and *Metaphysics* I, just cited). But nothing is more in the power of an agent than the act of the will, according to Scotus (*Sentences* I, d. 1, q. 4, §*Ad argumenta*). For the craftsman (*Ethics* VI.5) needs virtue or art to operate rightly; but does not need virtue with respect to what is not in his power. Moreover, every operation to which prudence extends itself is praxis, because prudence is an active habit that regards "doable" things (*Ethics* VI.6); and prudence extends itself to things in our hand, as is found there, and as Odo (aforesaid) pursues excellently. Furthermore: the practical work is either active or productive, and every practical science is either active or productive; but both the active and the productive are in the power and will of the one practicing. Therefore praxis strictly taken is the operation of the will.

Third assertion: praxis is properly defined as an act of a power other than the intellect, naturally posterior to intellection. This assertion is maintained by Scotus and Odo, and is opposed to the Nominalists and to most moderns, notably Vasquez, Suárez, Arriaga, Hurtado, and others who think this dispute between the Scotists and the Nominalists is merely verbal — to whom the twin Scotists agree (disp. 12, q. 5, art. 1) and Oviedo (*Controversies*, I, p. 2). The foregoing assertion is proved: a definition is right that consists of genus and difference, as is clear in the *Epitome*, Book II, q. 7, art. 2. But the aforesaid definition is of this kind. Therefore it is legitimate. The major is known. The minor is also evident: for "act" is placed in the role of genus, and the remaining particles are added in the role of difference, as is clear to anyone who runs through them.

You will say: Scotus adds to the definition of praxis other particles, namely "apt to be elicited in conformity with right reason, so that it may be a right act." Therefore the foregoing definition is insufficient, or Scotus fails in not giving a definition comprehending all praxis — both good and bad — or rather one that abstracts from good and bad praxis. I say that Scotus defined only good praxis; for evil is not known except through the good — just as the oblique is not known except through the right, according to the saying: the right is the standard of itself and of the oblique. The Doctor cites this (q. 3, *Sophistical Refutations*, near the beginning; and *Sentences* III, d. 28, q. un., §*In ista q. ante A.*; and d. 4.11, q. 3, §*De tertio*, X.) after Aristotle (*On the Soul* I, T. 85, ch. 5; and *Metaphysics* VII, T. 23, cited by Scotus, *Metaphysics* VI, q. 2). Moreover, from the Doctor's definition it is easy to abstract the common definition of praxis, leaving aside the last few words, as I did in the foregoing assertion. And sometimes the Philosopher appears to do the same — as at *Peri Hermeneias* I.4 and *Prior Analytics* I.1, defining enunciation through affirmation and negation, which are its species; and *Posterior Analytics* I.2, giving the most strict definition of science; and also *Metaphysics* V, ch. on quantity, describing quantity through divisibility, which is its property. Vulpes adds (disp. 4, q. 1, near the end): Scotus therefore defines only good praxis because this is properly called *praxis* in Greek — although in fact praxis comprehends every free operation, whether good or bad, abstracting from both, as Odo the moral Doctor well and at length shows, to whom Veglia (*Vestibule* II, q. 13, n. 58) seems to agree. Moreover, by defining good praxis, he also defines evil, just as *Topics* VI.2, which defines science, also in a certain sense defines ignorance.

You will object first, against the second assertion, with Hurtado (cited, §15): the act of the intellect can be a directable object through another act of the same intellect, so that it may be done rightly. Therefore the act of the intellect can be praxis. The antecedent is at hand: just as the intellect can err, so it can be directed and corrected. The consequence is evident: for praxis is a directable object through an act of the intellect, so that it may be done rightly. Confirmation: that act which directs another act does not rest in the mere contemplation of it but proceeds further to rectifying it. Therefore such an act is practical. The antecedent seems evident: such an act indeed teaches the "makeability" (*factibilitas*) of the object, just as architecture the makeability of a house. The consequence is derived because the speculative act remains only in the speculation of its object. I grant the antecedent and deny the consequence and its proof, unless it is understood of praxis broadly taken, according to the first assertion. To the confirmation: I similarly grant the antecedent and deny the consequence. For this is not sufficient for praxis properly speaking, but it is required that such an act be an act of the will. To its proof I say there is a difference, since the intellect remaining in its acts does not extend itself but dwells within its own limits, as Odo notes after Scotus (cited, reason 6 against the

opposite) — just as happens in constructing a house: then it goes outside itself and tends to regulating the act of the exterior power.

You will object secondly, with Arriaga (disp. 1, sect. 4, subsect. 2, n. 49): a reflexive act does not rest in the mere contemplation of the thing but tends toward producing it. Therefore it is practical. Confirmation first: just as the intellect providing the rule and mode for making an act of the will is practical, so the act of the intellect that teaches the mode in which another act of that same intellect is to be made ought to be practical. Confirmation second: every act of moral virtue is praxis; but certain acts of moral virtue are intellectual — such as acts of faith and prudence. Therefore the act of the intellect can be called praxis. Granting the antecedent, the consequence is denied. For from q. 4 of the *Prologue* (§*Ad argumenta, AA.*): every act of the intellect is either productive or operative; yet no one concedes that every act of it is praxis — but only that act which is regulative of the act of a power other than the intellect. To the first confirmation: the parity is to be denied, for the same reason, because the former regulates the act of the will, and therefore is practical; but not the latter, which does not transgress the boundaries of the intellect. To the major of the second confirmation: I say that every act of moral virtue is indeed praxis or practical; nonetheless that act which is denominated "practical" is not praxis. The reason is given by the Doctor: because the act of the intellect is apt to be denominated quasi-accidentally from the praxis toward which it extends itself, although it is not the terminus of this extension. Suárez and Hurtado (aforesaid) press, contending that these responses are petitions of the principle. For why (they ask) is an intellectual work not praxis just as a work of the will is? To these and similar objections I gave abundant answer above through authorities and arguments, which are not to be repeated here.

Point of Debate II: In Which the Chief Difficulty Is Weighed — Whether Logic Is Speculative

There are four different opinions on this point of debate. The first is that of Godfrey (*Prologue*), Niger (*Clypeus*, q. 14), and others who think that Logic is neither practical nor speculative — to whom the Greeks seem to agree, who deny that Logic is a science and a part of philosophy, asserting only that it is its instrument. The second is that of certain moderns — Suárez (*Metaphysics*, disp. 44, sect. 13, n. 54), Vasquez (*Summa Theologiae* I, disp. 9, n. 2), and Rubius (q. 5, n. 14) — who think that Logic is partly practical and partly speculative; they seem to have derived this from Godfrey (*Quodlibet* 12, q. 1) and others who hold that Theology is simultaneously practical and speculative. The third is that of Ockham (q. penult. of the *Prologue*), Aureolus (ibid., art. 2, §*Quamvis autem*, p. 37), and the Conimbricenses (q. 4, art. univ.), who assert that Logic is practical. The fourth is handed down by Scotus (q. 4 of the *Prologue*, §*Dico igitur, A.*), Anthony Andrew (ibid.), Faber (disp. 9, ch. 1), Odo (*Ethics* VI, lect. 3), Merinero (*Unitary*

Disputation, proem., q. 6, sect. 2), and other Scotists, to whom the Thomists and Bacon (q. 4 of the *Prologue*) agree — all affirming that Logic is speculative.

Note first, from *On the Soul* III.8, T. 38: since the sciences are divided according to the division of things or objects — some objects being speculative and others operable — it follows that science taken in general (despite the protest of Ferch, *Vestiges* q.) is divided into practical and speculative, from Scotus (cited, §*Ad argumenta principalia*, BB.; and *Sentences* I, d. 38, q. un.; and *ibid.* d. 34, third q., q. un., §*Ad istam q.*, B.; and IV, d. 14, q. 3, §*Hic dicitur*, D.) after Aristotle (*Metaphysics* II and VI, T. 2). Speculative science is subdivided into real speculative and rational speculative, as the Doctor writes (cited, D.): real speculative is threefold — Physics, Mathematics, and Metaphysics. Rational speculative is distributed into Dialectic, Rhetoric, and Grammar. And practical is divided into active, which is concerned with the "doable" such as Ethics, and productive, which labors over the "makeable" such as Medicine — hence those who work with their hands are called practical (*Metaphysics* I.1).

Note secondly, from the same Doctor (*Prologue*, §*Contra de necessitate*, sub D.; and also q. 1, A.): that practical science includes a twofold respect of priority and conformity to praxis — not actual but aptitudinal, of which speculative science is devoid. For practical science regulates praxis, endowing the practically operating power with the norm of operating well. Hence it is prior to praxis, since a rule naturally precedes its regulated object and is conformed to it (*Ethics* VI.3). Priority belongs to it from the order of powers so disposed in being and operating; conformity, however, belongs to it from the side of the object. Furthermore, the Doctor notes (in the distinction cited, §*Ad auctoritatem*, F.): the right reason placed in the definition of art is nothing other than the directive reason, or the one rectifying another power whose function it is to operate according to art. So that art properly is the directive and rectifying habit of the "makeable," just as Ethics is the directive habit of the "doable." Now since a knowledge can extend itself to praxis by formal and virtual extension, and likewise by formally actual and most formally actual extension, from this arises a twofold practical — formal and virtual. Formal practical is again divided into actual and most actual, concerning which the Doctor treats in the *Prologue* cited (§*Ex hoc patet*, A.). That is formally practical which formally dictates concerning the praxis to be chosen or avoided, according to formally practical principles and conclusions. But the virtually practical is the simple knowledge of an object virtually containing the knowledge of practical principles and conclusion — such as the knowledge that is had of God, of whom this practical syllogism can be formed: everything supremely good is to be loved; but God is supremely good; therefore God is to be loved. The rest that can be said here is relegated to its proper place for examination.

Note thirdly, from the same Doctor (*ibid.*, §*Ad rationes pro opinione opposita*, sub EE.): when two opposing extremes exist, the more something recedes from one

of the opposites, the more it approaches the other. Now the most actually practical cognition is that which is immediately conformed to the praxis to be formally elicited — and the more distant something is from this, the more it approaches the speculative habit. Hence the universal habit that is not immediately conformed to the praxis to be elicited can be called speculative with respect to the habit that is immediately conformed to the praxis to be elicited. Whence art can be called speculative with respect to the experienced habit, since art is a more universal habit and not so immediately directive. And the Philosopher implies this at the beginning of the *Metaphysics*: the craftsman will frequently err; but the experienced one will not err in the same way. In this manner Medicine can be distinguished into speculative and practical: the former concerns the more universal causes and treatments and is the cognition more remote from the praxis to be elicited, while the latter regards particulars and those more immediate to praxis — even though that universal one, which is relatively called speculative, is absolutely practical, since it proceeds from practical principles and virtually includes the particular one formally conformed to praxis. From this it is inferred, against Arriaga (disp. 1, sect. 4, subsect. 2, near the end) and Hurtado (ibid.), who contend that the same act about the same object can be both speculation and praxis — that the same act of the same object cannot be both speculation and praxis, but is simply either praxis or speculation; unless it is called speculation or praxis relatively, in approximately the way I was just now saying about Medicine. For every act is derived either from speculative or practical principles. Likewise, every speculative or practical conclusion is resolved into speculative or practical principles, from the Doctor (cited, §*Contra haec, sub R.*). Similarly every cognition is either about a speculative or an operable object, and thus is formally or virtually speculative, or formally or virtually practical, as the Doctor indicates (in the passage above, §*Secundus art.*): "and this, that man should sometimes fast, is not only practically known to a man who knows, but also to an angel and to God. Likewise: that the heaven is to be moved by an angel is practical knowledge for man and for God." Nor is the argument valid that Hurtado adduces about a house to be constructed, saying: the architect has a practical cognition and the angel a speculative one. For that cognition of a house to be built, whether in the builder or in the angel, is practical, because it is about an operable thing and a practical object — though the Doctor seems to be undecided on this matter, both here and at *Sentences* I, d. 38, q. un. See my *Treatise on the Science of God*, disp. 1.

First assertion: Logic is either speculative or practical. This assertion is opposed to the authors of the first opinion, and is favored by Scotus (cited), who approves the division of science into speculative and practical. For if every science is either speculative or practical, as is clear from the first note, then since Logic is a science — from what has been said — it is clearly inferred to be speculative or practical. Moreover, every habit with a speculative or operable object is

speculative or practical. But Logic is a habit with a speculative or operable object. Again: what is under some genus participates in some difference of that genus and is some species of that very genus, since inferiors participate in the common character of their superior. But Logic is under the genus of science, as I proved in art. 2 of this question. Therefore it is either speculative or practical.

Second assertion: Logic is neither partly speculative nor partly practical. This is gathered from Scotus (ibid., §*Contra de necessitate*; and §*Alia opinio ante O.*; and §*Ad rationes pro opinione, EE.*). Proved from Aristotle (*Metaphysics* VI, ch. 1), who divides science into speculative and practical. But the members of a good division must be opposed, from what was said in the *Epitome* (q. 7, art. 1, §2). Second: one and the same species cannot participate in two opposed differences of its proximate genus. For each difference of a genus constitutes one species essentially distinct from another species, as is clear from "rational" and "irrational," of which one constitutes man and the other brute. But "speculative" and "practical" are two opposed differences of science in general, from what will be proved elsewhere. Therefore Logic, which is one species of science taken in general, cannot be simultaneously speculative and practical. Third: two contradictories cannot be simultaneously affirmed of the same thing; but if Logic were simultaneously speculative and practical, two contradictories would be simultaneously affirmed of it. For it would extend to praxis and not extend to praxis — it would extend, because it would be practical; it would not extend, because it would be speculative. Whatever Hurtado (*On the Soul*, disp. 11, sect. 3 and 4) and Arriaga (*Logic*, disp. 1, subsect. 4, near the end) may say in the opposite direction, asserting that the same act can be simultaneously practical and speculative.

Third assertion: Logic is not practical. So Scotus in the *Prologue* cited. Proved first: every practical science is either active or productive (*Topics* VIII.2 and *Metaphysics* VI.1). But Logic is not productive, being concerned with operations that pass into external matter; nor is it active, being concerned with moral operations. For *Ethics* II.2: the doable and the choosable are the same, and the principle of action is choice. Hence Hurtado (disp. 2, sect. 2, near end, §22), Fonseca (*Metaphysics* II, q. 2, sect. 4), and other moderns who assert that Logic is practical are without doubt departing from the doctrine of Aristotle. Second: the end of practical science is a work or something outside the intellect; but the aim of speculative science is truth (*Metaphysics* II.2), where Averroes (com. 3) adds: through speculative science we know; through practical science, however, we are knowing so that we may operate, because the end of practical science is the work. But Logic we know in order to know; for its end is the pursuit of truth in the works of the intellect, as Scotus intimates (q. 2, *Prior Analytics*, §*Quantum ad* 3.). And there is also the doctrine of discerning truth from falsehood, from what has been asserted elsewhere. Nor is the instrument and mode of knowing operable, as Arriaga himself admits (disp. 2, n. 56). Therefore Logic is not found in the number of the practical sciences.

Fourth assertion: Logic is speculative. This is expressly handed down by Scotus (cited) and (*Metaphysics* VI, q. 1), and by his disciples there. That the Philosopher held this, Laertius testifies (*Life of Aristotle*); Augustine (*City of God* VIII.4) indicates it; and Zabarella (*On the Nature of Logic*, II.17) agrees. And it follows from the three foregoing assertions. Proved first: that science is speculative which does not direct praxis, as I have noted not once above. But Logic does not direct praxis, which properly and primarily is an elicited act of the will and secondarily a commanded act of it. Therefore Logic is speculative. Second: that which proceeds after the speculative manner is speculative, as is clear. But Logic proceeds after the speculative manner: for it contemplates division, definition, and argumentation, investigating their principles, "said of all" and "said of none," the parts and all the properties of the syllogism. Therefore Logic is to be classified among the speculative sciences. To this all the authorities and arguments of the three foregoing assertions pertain. I add: *Metaphysics* I.4: it belongs to the dialectician to speculate about definitions and universals.

You will object first, on behalf of the first opinion, from three passages of Aristotle. First, from *Rhetoric* I.1: Dialectic was discovered to direct the operations of the intellect, which taken precisely are neither speculative nor practical, just as the intellect in itself is neither speculative nor practical. Second, from *Topics* I.9: three problems are enumerated — speculative, practical, and those assisting both; and these last are logical. Third, from *Metaphysics* VI.1: Logic is not placed among the speculative or practical sciences. Therefore this is a clear indication that in the Peripatetic school Dialectic is neither speculative nor practical, but only the instrument of both. To the first passage: I deny that the operations of the intellect that do not direct praxis are not speculative properly speaking, as is clearly established from the first assertion — though they can improperly be called practical, as is clear there, and as the Doctor signals (*Metaphysics* VI, q. 1, §*Ad 1. principale*). But the intellect through the reception of a practical or speculative cognition is denominated practical or speculative — just as a wall is called white or black through the reception of whiteness or blackness, although the wall in itself is neither white nor black. To the second: I say Aristotle only wishes to indicate there that Logic is an instrumental science; and by reason of this, just as it is not excluded from the character of science, so it is not excluded from the character of a speculative or practical habit. To the third: I say that Aristotle there recounts only the real speculative sciences, from whose list Logic is removed since it is rational, as I shall show in the next article.

You will object secondly, on behalf of the second opinion: practical science proceeds in the practical or compositive manner, and speculative science in the speculative or resolute manner. But Logic proceeds in both manners. Therefore it is simultaneously practical and speculative. The major is evident; the minor is shown with respect to the first part: Dialectic treats of the operations of the intellect, which are operable and directable. With respect to the second part: the mode of knowing, which is the object of Dialectic, is

speculable, and the resolution of the syllogism — most especially of the demonstrative — is handed down all the way to its principles and terms. I grant the major and deny the minor. To its proof: I grant the first part and deny the second; for such operations do not properly direct praxis, and therefore are not properly practical, as Aristotle implies (*Metaphysics* I.4) and Scotus (*Metaphysics* VI, q. 1, ad 1).

You will object thirdly: whose end is a work, it is a practical habit (*Metaphysics* II.2). But the end of Dialectic is a work — namely the syllogism, which is constructed by Logic. Therefore Logic is practical. Confirmation first: practical science provides the precepts of dividing, defining, and arguing well; therefore it is practical. Confirmation second: Logic is for the sake of the other sciences; for it is the organon and minister of the disciplines. But an instrument is directed toward operating and not toward speculating. Confirmation third: Logic is divided into teaching and using, and makes its object. But no speculative science makes its object — as is clear from Physics, which does not make a natural body, and from Astronomy, which does not create the heavens and the stars but only contemplates them. I respond through an explanation and distinction of the major: of the proximate end — granted; of the remote end — denied. To the distinction of the major, the minor is to be distinguished: for the proximate end of Logic is not the making of the syllogism but its knowledge and truth; and from this knowledge its construction consequently follows — just as from knowledge of a triangle there follows its construction, even though the triangle belongs to Geometry and the astrolabe to Astronomy, which are speculative sciences. Or it can be said that the major holds of the operation of a power other than the intellect, as St. Thomas teaches (*Summa Theologiae* I-II, q. 17, art. 1, ad 1) beyond Scotus. To the first confirmation: in accordance with the distinction given above, I say that practical science provides the norm of operating well in the operation of a power distinct from the intellect, which Logic does not do. To the second confirmation: I grant the antecedent and deny the consequence. For even though Dialectic serves the other sciences, it is nonetheless not practical, since it does not regulate the operations of the will or of another power subject to the command of the will. To the third confirmation: I similarly deny the consequence, for this is not a sufficient reason for establishing a practical science, as is sufficiently clear from what has gone before.

You will object fourthly: a science that directs praxis is considered practical by all. Therefore equally a science that directs the operations of the intellect is practical — and Logic is of this kind, since absolutely that is to be considered practical which directs an operation, which then can be divided into that which directs the operations of the will and that which directs the operations of the intellect. I grant the antecedent and deny the consequence. For only that is properly and strictly practical which directs moral or manual operations; hence practical is well divided into active and productive alone. I add that just as

Metaphysics — as Baccon (q. 4 of the *Prologue*) and Suárez (*Metaphysics*, disp. 1, sect. 4) testify — directs the other sciences with a speculative direction, so Logic directs the operations of the intellect with a speculative direction. Finally: Geometry measures and Arithmetic numbers, yet no one has ever dared to remove them from the seat of the speculative sciences.

Article VI: Whether Logic Is a Real Science

The present difficulty is treated clearly and at length by Tataretus (q. 1, *Scibilis* 4), John of the Masters (ibid.), and Fuentes (q. 5, diff. un., art. 4). For its explanation and resolution:

Note, from the Doctor (*Metaphysics* VI, q. 1; *Quodlibet* 3, §*De* 1.; and *Sentences* III, d. 34, q. un.): science is divided into real and rational. Science is called "rational" in four ways. First, subjectively, because it is in reason or the intellect as in its subject; in which way, since every science resides in the intellect, every science can consequently be called rational. Second, comparatively, because it is obtained through an act of reason or intellect pursuing what is unknown from what is known; in which way also, since every science is acquired through an act of reason, it can equally be called rational. Third, directly, because it directs the operations of reason — in which sense too Logic is called rational; but this sense is not what is under investigation here. Fourth, objectively, because it is about an object that is a being of reason (*ens rationis*); and it is chiefly this sense that is the subject of the present discussion. Conversely, that science is real whose object is a real being. Science can also be called real formally and in terms of entity (*entitatively*), since it possesses real entity. Thus science can be called real in two ways — entitatively and objectively — and likewise science can be called rational both in terms of its entity and in terms of its object. And both senses are investigated and touched upon here by the Doctor (q. 3 of the *Prologue*, I, §*Contra istas*).

Assertion: Logic intrinsically and entitatively is a real science; extrinsically and objectively, however, it is rational. This assertion has two parts and is defended by Lychetus (*Sentences* II, d. 16, q. un., before §*Ad arg. principalia*), Bonetus (*Metaphysics* I, ch. 3, near the end, §*Quarta prop.*), the Parisians (*Physics* I, q. 3), and Zabarella (*On the Nature of Logic*, II.13). The first part is gathered and argued from Scotus, who in the places cited places Logic among the sciences; but science formally is a real being residing in the category of quality. Moreover, every habit immediately caused through the real acts of the intellect is real, since a real cause *per se* has a real effect. But Logic is a habit generated through the real acts of the intellect, as is evident. Therefore it is formally and entitatively real. The second part is found everywhere in Scotus, especially here (q. 1, near the end; and q. 7, §*Ad* 1. q.; and *Sentences* I, d. 36, q. un., §*Ad* 1. princ.; and IV, d. 1, q. 2, §*Hic sub R.*). Proved: a science is denominated from the object it considers, as is clear from Physics which is called natural from the natural body with which it is concerned. But the object of Logic, which is the syllogism, is a being of reason.

Therefore Logic is rational. Moreover: that which is concerned with a real being is a real science, as is clear from *Metaphysics*. Therefore, on the opposite side, that which labors about a being of reason — such as Logic — is rational, from Scotus (q. 3 of the *Prologue*, I). Nor is it valid to say with Mastrius and Bellutus (q. proem., art. 5) that Logic is real in itself and by its nature, but is rational insofar as it is handed down and elaborated by Aristotle. For its object — since the syllogism is a being of reason — is a being of reason, and what is treated in Logic consists of beings of reason, as the aforesaid moderns themselves admit (art. 3 of the same question). Moreover, the members of a good division do not coincide but are opposed; but Logic, from Scotus (cited), is classified under the member of rational science. Again: Logic does not treat of the active but of the passive acts of the intellect, from what will be said elsewhere. Furthermore, since Logic is a science about eternal and immutable things, as will be clear in art. 5 — to the pleasure of Aristotle or of any other author it cannot be changed from real to rational. Finally, the things that are in Logic are beings of reason, such as predicate, subject, major, minor, and other things of this form. Therefore, at the pleasure of Aristotle, Logic is not called rational — but for the reason given above.

You will object first, against the first part of the assertion: from object and power knowledge is generated, as the common opinion of the philosophers holds, and as Augustine (*On the Trinity* IX.12) teaches. But the object of Logic — which is the syllogism, being a being of reason — cannot be the cause of a real being, as the Doctor writes (*Sentences* I, d. 13, q. un., §*Aliter, sub a.*; and III, d. 8, q. un., §*Ad argumenta, H.*). Therefore Logic formally and entitatively is not real. And likewise from *Sentences* III, d. 23, q. un., sub *E.*: a real habit has a real formal object. Therefore since the object of Logic is not real, it is deduced that it is not entitatively real. I respond: the major holds for a real science, but not for a rational science such as Logic — and this is gathered from the Doctor (*Sentences* IV, d. 1, q. 1, sub 5). Or the major is to be taken of the moving object and not the terminating object, as Fuentes (q. 3, diff. 3, art. 1, near the end) explains from Scotus — though Fuentes himself (q. 5, near the end of art. 3) says that a being of reason known through reflexive cognition can cause a real cognition; whether this is rightly said is to be weighed elsewhere.

You will object secondly: to generate science, a definition must be taken as a medium to demonstrate a property of a subject, as will be clear in art. 5. But of a being of reason there is no true definition, as Scotus affirms (*Prior Analytics* I, q. 5; and *Sentences* IV, d. 1, q. 2, §*Hic primo videndum, B.*). Therefore Logic is not a true and real science. Confirmation: science demonstrates properties of its subject. But a being of reason does not have proper properties, since it is not properly a being, as the Doctor adds (in *Sentences* IV, cited), after Aristotle (*Metaphysics* V, T. 14; and *ibid.*, VI, T. 8). The major is known; the minor is from Scotus (q. 15 of the universals, §*Ad 1. arg.*), who says: the properties of a being of reason are produced by the intellect, while the properties of a real being

proceed from its nature. I grant the major. To the minor I say that, according to the diminished being of a being of reason, there is a definition of it, and in its own way it is a true definition — just as the definition of accident, even though it is not simply quidditative, is nevertheless a true definition. Scotus notes this concerning the definition of the syllogism (*Prior Analytics* I, cited, §*Quantum ad* 2.; and q. 1, *Sophistical Refutations*, near the end). To the confirmation: the major is to be granted and the minor denied, as is clear from the same Doctor (qq. 2, 3, 7 of the universals), where he assigns the properties of the syllogism.

You will object thirdly: no relation is a cause, since it is not of the genus of active things. But a logical demonstration is a relation, because it is formally a being of reason. Therefore Logic formally is not real. Confirmation first: nothing more noble is produced by something less noble, since an effect does not exceed its cause. But science, being real, is nobler than a second intention, which is a being of reason. Therefore, etc. Confirmation second: between the subject, predicate, and medium of a demonstration there is a formal distinction; but between relational intentions (*respectus intentionales*) there is no formal distinction, since they are not without the operation of the intellect, unlike a formal distinction. I distinguish the major: of a cause acting through motion and mutation — granted; of a cause operating through emanation — denied. This distinction is to be explained in the book on causes and in the book on the soul. Better: the major is true of cause taken materially, false of cause taken formally, as will be clear in the place just cited. To the first confirmation: I grant the major and distinguish the minor: science considered absolutely excels second intentions in nobility — granted; science considered under the character of what can be produced and of an effect — denied. For in this respect the character of producer is nobler than the character of what is produced. Or: this is true of a total cause, but not of a partial cause. To the second confirmation: the major is understood of material demonstration, or of demonstration taken in a first-intentional sense; but not of formal demonstration, or of demonstration taken in a second-intentional sense, as a logical demonstration is.

You will object fourthly: with second intentions and other beings of reason removed, Logic would still remain, because a man could still reason and operate with his mind; since in operating he does not depend on a being of reason, and his operation could be directed and regulated according to the precepts of Logic. Therefore Logic is not a rational science. I deny the antecedent. For this would happen by chance and not without error; hence Logic is required, resting on certain rules and precepts, which cannot be established without second intentions, as is clear from what was said in q. 1, art. 3 of this book — and the aforesaid moderns themselves catch a scent of this at the beginning of disp. 4, saying that Logic per se considers second intentions.

Noted — no numbers in front of paragraphs. Here is the translation from the beginning, corrected throughout:

Article VII. Whether Logic is a Universal Science.

Our Doctor appears to touch upon and resolve this difficulty in three places, namely in *q. 2 univers.*, *q. 1 Elench.*, and *1 post. q. 43*, though he proceeds differently in each. For in *q. 2 univers.* he treats of Logic taken absolutely; in *q. 1 Elench.* of Logic as compared with Metaphysics; and in *1 post. q. cit.* of Dialectic insofar as it is distinguished from Analytics. Setting aside the other senses of the term "universal" reported by Tataretus in *q. 1 scibili 4* and Sarnanus in *q. 1 univers.*, I observe with Scotus in the same place that a science is called universal in two ways: first, by universality of predication, because its subject can be predicated of the subjects of other sciences — and in this sense Metaphysics is universal, since its subject is being, which is predicated of the subjects of the other disciplines. Second, by universality of application, because its subject is applied to the other sciences and falls within their use. It is this second kind of universality that is at issue in the present discussion, as Tataretus also notes in *1 Phys. q. 2 scib. 1*.

Thesis. Logic is a universal science by universality of application of its subject. So holds Scotus in the places cited above, whom his disciples follow. This is proved: first, from Aristotle in *1 Elench. c. 11* and Scotus in *q. 1 §. Ad q. dicendum* — if Logic belonged to some determinate genus, it would not pose questions across all fields. Boethius and Avicenna concur, along with the common adage of the dialecticians: Logic is concerned with second intentions applied to first intentions. Therefore Logic is universal by universality of its subject through its own application. Second, Logic is concerned with the syllogism as its subject; and the syllogism is universal by universality of application, for it can be applied to any science, since every science is set out by means of syllogisms. Hence Aristotle adds in *1 Top. 2* that Dialectic, being investigative, prepares the way to the principles of all methods. It is therefore concluded that Logic is a universal science.

First Objection. A science is universal whose subject is universal, since the universality or particularity of a science is derived from its universal or particular subject — from which it is likewise specified, as stated in *2 de anima T. 33*. But the subject of Logic is not universal. For since Logic is a science distinct from the others, it plainly has a subject distinct from their subjects. Therefore Logic is not a universal science. *Reply.* I grant the major. I distinguish the minor: by universality of predication, I grant; by universality of application, I deny, as I explained in the preceding note.

Second Objection. Metaphysics is a universal science, having as its subject being, which is common to all things that have existence. Therefore Logic is not a universal science; otherwise there would be two universal sciences, which does not seem consonant with reason. *Reply.* By the same distinction. Metaphysics is a universal science by universality of predication of its subject — I grant; by universality of application of its subject — I deny. Accordingly, it is not

incongruous that both sciences should be called universal, albeit in different respects and under different considerations.

Article VIII. Whether Logic is Distinguished from Metaphysics.

This question draws its origin from the preceding article. For having said there that both Logic and Metaphysics are universal sciences by universality of subject, it remains to inquire in what they differ from one another. This is especially so because Aristotle in *4 Met. T. 5. 6. 2* adds that each is concerned with being that is common to all things. And although we showed above that Metaphysics is universal by universality of predication of its subject, it still remains to be examined how both sciences contemplate the same subject — which Aristotle in the cited place acknowledges to be being. This is investigated by Scotus in *q. 1 Elench.* and by Fuentes in *q. 4 proaem. diff. 1. q. 1.*

Note, from the Doctor just cited, that being is twofold: the being of nature and the being of reason. The being of nature is real being, whose existence does not depend upon the soul or the intellect. The being of reason, however, is that whose existence depends solely upon the operation of the intellect — such as genus, species, and the other second intentions. Both kinds of being enjoy equal breadth and universality; for there is no real being upon which some second intention of genus, species, or some other logical relation cannot be founded.

Thesis. Logic differs from Metaphysics in this: that Metaphysics considers real being, while Logic considers a certain being of reason. Or more explicitly: Metaphysics contemplates the common quiddities of things, while Logic considers second intentions. So holds Scotus in the place cited above, §. *Ad q. and q. 8 univers.* §. *cum autem obiicitur*, near the end — and this view appears to run counter to Plato and others who, as reported by Plotinus in a passage cited by us elsewhere, confuse Logic with Metaphysics. The stated thesis is proved as follows. Metaphysics is real science and first philosophy, whose proper task is to contemplate being, its attributes, and the common essences and natures of things taken universally. Logic, on the other hand, is a science whose function is to contemplate second intentions applicable to first intentions, as Aristotle indicates in *1 Met. c. 4*. The distinction between the two disciplines that has been assigned above is therefore established.

Objection. One power or science has one per se object, as is inferred from *2 animae T. 33*. But being taken in its general sense is the subject of Metaphysics. Therefore it is not the subject of Logic. *Reply.* I grant the major. I distinguish the minor: real being taken in its first-intentional sense is the subject of Metaphysics — I grant; being of reason taken in its second-intentional sense — I deny. You will press further: to whomever it belongs to consider real being, to that same one it belongs to contemplate being of reason, which is as it were an image or shadow of real being; but Metaphysics, by concession, meditates upon real being — therefore it also contemplates being of reason, such as being taken in its

second-intentional sense. I reply that Metaphysics and Dialectic contemplate being of reason in different ways. For Metaphysics considers being of reason as a common and general quiddity reducible to real being, while Logic regards being of reason insofar as it is a second intention applicable to things, as the Doctor rightly notes at the end of the question cited above and in *q. 8 univers. in respons. 1. 2. arg.*

Article IX. How Logic Differs from Rhetoric.

On the agreements and differences between Rhetoric and Dialectic, Zabarella in *2 de natura Log. c. 17* and Toledo in *q. 5 proaem. fund. 1 post Arist. 1 Rhet. 1* reason learnedly and at length, noting their similarity and dissimilarity with respect to subject-matter, and saying that both treat of every proposed subject and dispute on either side of it. They then add that Rhetoric is occupied with matters of action, while Dialectic is occupied with reasoning about any proposed subject. From this it can be gathered that the primary difference between them consists in the fact that Dialectic aims at knowledge, while Rhetoric aims at action. For the dialectician argues not in order that the listener may act, but in order that he may know and judge truth from falsehood. Rhetoric, on the other hand, frames its discourse so that listeners may act and their minds may be moved to agree with and to do what the discourse intends them to do — as Zabarella excellently pursues in the passage cited and as I indicated above in *q. 1 art. 4*. Moreover, both are called discursive sciences because they make use of language, though in different ways. For Rhetoric uses ornate language — just as Grammar uses grammatically correct language — while Dialectic uses syllogistic language, by which true or false conceptions of the mind are made manifest to listeners. The question may be raised, however, whether Rhetoric is a part of Dialectic — on which Zabarella treats at length in the same place, and concerning which we briefly determine the following thesis.

Thesis. Rhetoric is not properly a part of Dialectic. This is gathered from Scotus in *q. 3 univers. §. dicendum ergo*, where, enumerating all the parts of Logic, he makes no mention of Rhetoric — which would be a defect if Rhetoric were one of its parts. The same is inferred from Aristotle, who in his *Organon*, in which he undertakes to set forth all its parts, does not include Rhetoric but treats it in a separate volume; and it is commonly taught by masters as a distinct subject. Moreover, the same Philosopher in *1 Rhet. 1* calls Rhetoric an offshoot of Dialectic — or its scion, as Zabarella says in the passage cited. But an offshoot or scion grafted onto a tree is not a part of that tree but something distinct from it. Furthermore, an art is not a part of a science, since they are distinct habits, as stated in *6 Eth. 4*; and Rhetoric is an art while Logic is a science. Again, the end of Rhetoric is action or persuasion, while the end of Dialectic is the cognition of truth, in the manner explained elsewhere. Rhetoric is therefore not to be numbered among the parts of Logic. The same reasoning plainly applies to Poetics and History as applies to Rhetoric, as Fonseca asserts from Cicero in *1. 2.*

de orat. in 2 *Met.* q. 2 sect. 4, and as Toledo holds in *praef. Log.* c. 2. The reason is that both History and Poetry employ a certain ornament to please the minds of listeners, and must therefore be reduced to oratory — whatever Zabarella may say in the chapter cited above.

First Objection. Aristotle in 1 *Rhet.* c. 2 defines Rhetoric as follows: "Rhetoric is a certain faculty of discerning in any subject what is conducive to persuasion." But this definition seems to apply to Dialectic as well, as the same Philosopher hints in that place. Therefore Rhetoric is not a distinct part separate from the parts of Dialectic. *Confirmation I.* From the same Philosopher who in the same place calls Rhetoric a part of Dialectic. *Confirmation II.* Scotus in 1 *prior.* q. 2 mentions Rhetoric and Poetics among the parts of Dialectic. *Reply.* I grant the major; I deny the minor. In reply to Aristotle, I say that he there merely indicates a similarity that exists between the two. For he always speaks of them as distinct habits, as Zabarella notes in *l. cit. cap.* 18. In reply to *Confirmation I*, I say that the very passage carries its own solution, for it is added there that Rhetoric is an offshoot of Dialectic; but just as an offshoot is not a part of the tree from which it has grown, so neither is Rhetoric a part of Dialectic — unless we say that Rhetoric is a part of Dialectic only in a likeness-based sense. Or Rhetoric may be called a part of Dialectic in a loose sense, because it makes use of the syllogism and especially the enthymeme, as Toledo notes in q. 5 *proaem. in fine 1. fundamenti*. In reply to *Confirmation II*, I say that Scotus must be understood as speaking of a remote part, insofar as Rhetoric, by the act of persuasion, directs its care to human practical affairs, and for that purpose employs the instruments of Dialectic.

Second Objection. Rhetoric treats of the construction of the syllogism, the enthymeme, and other logical instruments. Therefore Rhetoric is a part of Dialectic. *Reply.* Rhetoric treats of these matters only incidentally, whereas Logic treats of them by design — especially because the end and object of Rhetoric is not the syllogism, since it is entirely devoted to persuading in matters of human practical action, as the Doctor sets out in the place cited above.

Article X. Whether Logic is a Part of Philosophy.

No slight controversy exists among the ancient Peripatetics as to whether Logic is to be counted among the parts of Philosophy. For Philoponus at the beginning of the *Prior Analytics* and Ammonius at the beginning of the *Categories* remove Dialectic from the parts of Philosophy and consider it only its instrument — among whom is Zabarella in 2 *de natura Log.* cap. 10. On the other side, Simplicius at the beginning of the *Predicamenta* and Boethius in his commentary on Porphyry vigorously maintain that Logic is a part of Philosophy, and the greater part of more recent authors agree with them. Avicenna, however, at the beginning of his Logic holds that this dispute is grounded merely in a different understanding of the name "Philosophy." For

some use the term more broadly, others more narrowly — as Tataretus observes with some care in *q. 3 scib. 1*.

Note I. The Greek word *philosophia* means in Latin "love of wisdom," and *philosophos* means "lover of wisdom," as Augustine notes among others in *8 Civ. c. 1* and *13 Trin. c. 1*. This term was invented by Pythagoras in order to avoid the charge of arrogance, since previously thinkers had been called *sophoi* (wise men) and what is now called philosophy had been called *sophia* (wisdom), as Scotus notes in *1 Met. in exp. Tex. c. 2*. Wisdom, moreover, is knowledge of the causes of things, and the wise man is one who knows the causes of things, as Aristotle clearly teaches in the work just cited: "We esteem master craftsmen in any art more honorable, more learned, and wiser than workmen, because they grasp the causes of the things that are made; whereas the workmen are like certain inanimate things that act, but act without any knowledge of what they do — just as fire burns, and inanimate things each produce their effects by a certain nature, whereas craftsmen act by habit — so that men are not wiser on account of being capable of acting, but because they hold the account and know the causes." And a little further on he adds: "No sense-perception is wisdom, since from sense-perception no cause is assigned — for example, why fire is hot — but only that it is hot." And in 2 of the same book: "We consider that man wise who is able to grasp difficult things and those not easily known by a human being." And he adds: "The man who is more exact, and who is better able to teach the causes of things, we judge wiser in any science whatsoever. And we consider that science which is to be sought for its own sake and for the sake of knowing to be more truly wisdom than that which is sought for its results; and that which presides over others, rather than that which serves." From all this it is plainly gathered that wisdom taken universally is knowledge of causes; and since this kind of knowledge is partly speculative and partly practical, a twofold wisdom is accordingly established in *2 Met. c. 1 T. 3*: speculative and practical — and that which is speculative is more truly wisdom than the practical, and among the speculative sciences the highest place is held by that which investigates the first causes. And since the causes of things were unknown to the ancients, their philosophy is called stammering by Aristotle in *1 Met. c. 1 T. 51*. That philosophy had its origin in the inquiry into unknown causes is attested in the same work, *c. 2*. Thus, since wisdom and philosophy entirely coincide, that will be a part of philosophy which is cognitive of the causes of things, and conversely, that which is ignorant of the causes of things is to be expelled from the parts of philosophy.

Note II. Philosophy can be understood in two ways: first, broadly, as knowledge of the truth of every entity, whether real or rational — and philosophy taken in this sense encompasses every science, both real and rational, and under this division Logic is contained, since, as has been established, it is a rational science. Second, strictly, as knowledge of the truth of every real entity only — and this encompasses only every real science. From this broad and narrow

understanding of philosophy, different descriptions of philosophy have arisen, of which two are drawn from Aristotle. The first comes from *1 Met.* in the place cited: *Philosophy is knowledge of things through causes* — which coincides with the description offered by Ammonius at the beginning of the *Predicabilia*: *Philosophy is knowledge of things as they are*. The second comes from *2 Met. c. 1 T. 3*: *Philosophy is the contemplative science of truth*. A third may be added from Plato, as attested by Plutarch in *1 de placitis c. 1* and Augustine in *13 Trinit. c. 1*: *Philosophy is knowledge of divine and human things*. Philosophy may moreover be divided into speculative and practical, and likewise into principal and instrumental, as I touched upon above.

Thesis. Logic is a part of Philosophy. This is gathered from the Doctor, who in *q. 1 univers.* places all of Logic among the sciences; and who in *Quol. 3 §. de 1. d.* and elsewhere accepts the division of science into real and rational, under which Logic falls. This is proved: first, from Aristotle in *1 Top. 12*, who, after enumerating three kinds of problems — natural, moral, and rational — adds that the Philosopher deals with all of them; and the rational problem is a logical one, about which Aristotle treats, as all authors unanimously confirm. And in *1 Met. c. 2 T. 6* he says that the ancient philosophers, lacking Dialectic, fell into many errors. Therefore, since Logic is the norm and mistress of truth, it is not to be banished from the parts of philosophy. Cicero adds in *1 Academ. qq.* that he recalls the celebrated and ancient division of philosophy into natural, moral, and rational, which was handed down by Aristotle in the place cited, by Augustine in *8 Civ. 4*, by Plato, and by other most distinguished men. Second, Philosophy, as has been noted above, is knowledge of things through causes. For wonder arising from ignorance of causes and knowledge of effects impelled men to philosophize, as the same Aristotle attests in the passage cited and Damascene in *Dialogus c. 49*. But Logic is of this character, since we assent to the conclusion through assent to the premises, and we know many things through their cause, as I said in *2 art. q. 2*. Therefore Logic is a part of Philosophy. Third, Philosophy, as Aristotle states in the second note above, is the contemplative science of truth; and Logic contemplates truth and distinguishes it from falsehood, as is clear from its definition. Moreover, Ethics, which is concerned with the goodness or badness of the will, is a part of Philosophy — as no one at all disputes. Therefore Logic, which judges truth from the falsity of acts of the intellect, is likewise to be inscribed among the parts of Philosophy, with the agreement of Scotus in *4 Met. in expositione Tex. 5*.

First Objection. Four passages of Aristotle: first, in *1 Top. 2*: "Dialectic is useful for the philosophical disciplines." Second, in *ibid. c. 12*: "Those matters that are brought into question are treated differently by the Philosopher and differently by the Logician." Third, in *Top. 8. 6. 1*: "As regards the discovery of topics, this is common to the Philosopher and the Dialectician." Fourth, in *q. 2. 7. 4 quarti Met.*: "There are as many parts of Philosophy as there are substances." And in the same place: "One who approaches philosophy ought to be instructed in Analytics."

Therefore, according to Aristotle, Logic has no place among the parts of Philosophy. *Reply.* In those passages Aristotle speaks of philosophy taken strictly, which encompasses only the real sciences, or only the principal, more dignified, and more excellent sciences that exist for their own sake. Or by "philosophy" he means Metaphysics, which is called philosophy par excellence and is termed by the Doctor in *q. 1 Elench.*, following Aristotle in *6 Met. T. 2*, "first philosophy." He does not speak of philosophy taken broadly, under which Logic is contained. Or "Dialectic" in those passages is to be understood as Logic in use, which, as has been said, is excluded from the number of sciences, and is likewise excluded from the parts of philosophy.

Second Objection. Logic is a rational science, as established in *art. 6 of this q.* But Philosophy is knowledge of things through causes, as is clear from *Note I.* Now, "thing," since it is transcendent, is independent of the work of the intellect. Therefore Logic is not a part of Philosophy. *Reply.* From Scotus in *Quol. cit.*: being and thing are taken in two ways — first, for the real and real being, which Aristotle calls "being outside the soul"; and in this sense being and thing are transcendentals, real, and positive. Second, for the thing and being fashioned by the intellect, which has its being only objectively from the intellect; and in this way thing and being are beings of reason, called by Aristotle "beings in the soul." Logic is said to be about thing and being taken in this second sense.

Third Objection. Nothing can be both a part and an instrument of one and the same thing. But Logic is an instrument of Philosophy — whence it is called an Organon by Aristotle. Therefore it is not itself a part of that same philosophy. *Reply.* I deny the major, as is clear from the hand, which is both a part of the craftsman and his instrument, as stated in *3 animae c. 8 T. 38* and Galen in *1 de usu partium*.

Fourth Objection. The definition of wisdom as knowledge of the highest things does not apply to Logic, which is concerned with diminished and minimal being. Therefore, since wisdom is identified with philosophy, it follows that Logic is not a part of philosophy. *Reply.* That definition is given of wisdom taken strictly, not of wisdom or philosophy taken broadly — and it is to the latter that we affirm Logic rightly belongs.

Question III. On the Object of Logic.

Article I. What the Object Is in Its Several Kinds and What Is Required for It.

That any science derives its unity and distinction from its object is clearly apparent from *1 post. c. 23* and *2 animae 6. 2*. It is now our pleasure to set forth the definition, division, and conditions of the object, from which it will be quite easy to grasp all that is necessarily required for the object of any discipline. First, following Sarnanus in *q. 3 univers. pag. 56*, I observe that the word "object" is

derived from the verb *obiicio*, meaning to place before, to offer, and to present. For that which is considered by a science is placed before it, offered to it, and presented to it as something to be examined and surveyed — like a term attainable through its operation. And just as what is attained by a knowing power is called its object — as color is the object of sight and sound the object of hearing — so likewise what is weighed by a science is rightly called its object. Thus by the force of the word, the object is what is placed before or presented to a power in operation, as Vorrillon notes in *2 d. 35*. Moreover, although there is some difference between "object" and "subject," as Durandus, Ockham in *prol. q. 9*, and Raconis in *praeludio postr. Log. sect. 1* maintain, among philosophers both old and recent the terms are used interchangeably. Therefore, according to Scotus in *q. 3 prol. §. Ad 1. arg. 1. q. R., q. 4 §. Ad arg. principalia 1. q.*, and other authors, what a science labors about is called object, subject, and the matter about which it is concerned — under different respects, however. The same Doctor notes in *q. 2 primi Prio. §. Quantum ad 1* that the word "subject" is equivocal, and he gives six senses of it there; and his disciple Maior adds many more in *l. praedicabilium q. 3*. Following Bonaventure in *1 Met. c. 3*, we will report four principal ones. One is called the subject of inherence or the subject of an accident, from *q. 3 prol. §. Ad idem arg. prima q. R.*, in which accidents inhere — as a wall is called the subject of whiteness in which whiteness itself inheres. A second is called the subject of transformation, in which substantial or accidental transformations take place — as matter is the subject of form, *1 Phys. T. 82*. The third is the subject of predication, of which something else is predicated — and this is called the logical subject, treated in the *Epitome*. The fourth is the subject of consideration or attribution, from *prol. cit.*, whose knowable attributes are considered, demonstrated of it, and assigned to it in the treatment — and this is called the subject of science by Aristotle in *1 post. 6. 23* and *4 Met. 1*. And it is this last of which we treat in the present discussion.

The subject is first divided into material and formal, from *q. 3 prol. §. Ad 1* and *1 d. 8 q. 4 §. Contra. sub E.* and *2 d. 24 q. vn*. The material subject is what is considered by a science; and since it is very diffuse and broad, several sciences regard it, and it is not determined by any one of them. It is therefore called material, because just as matter is indifferent and undetermined to receiving this or that form, so this kind of object is undetermined as to belonging to this or that science — in this sense God is the material object of both Theology and Metaphysics, since he is examined and considered by both. The formal object, on the other hand, is that which belongs to one science only, from which the science derives its unity and distinction. It is called formal because just as form determines and specifies matter, so the formal aspect of the object determines and specifies the science of which it is the object — as God as God is the formal object of Theology, and being as being is the formal object of Metaphysics.

The subject is divided second into proximate and remote — and this division seems to coincide with the prior one, which is why the Doctor does not

expressly state it. For the proximate object is what is considered immediately and per se by the science, as grammatically correct speech is the proximate object in Grammar. The remote object is what is considered by the science only mediately and by reason of something else — as letters are the remote object in that same Grammar.

Third, it is divided into adequate and inadequate, from Scotus in *1 d. 3 q. 3 §. Ad q. igitur* and *quol. 5 §. circa 3*. The adequate or total object is that which neither exceeds the science nor is exceeded by it. Or, as Scotus says in *q. 3 prol.* and *2 later. §. de 2. sub A.*, the adequate object is that which primarily contains in itself all the truths of the habit of which it is the object. To this belong community and virtuality, of which the same Doctor treats in *1 d. 3 q. 3 §. Ad q. igitur*. An example may be given for clarification: the natural body is the adequate object of Physics. The inadequate or partial object, however, is that which is exceeded by the science and is regarded by it as a part — as the animate body is the inadequate object of the same Physics.

Fourth, it is divided into principal, which is the preeminent part of the science — as demonstration is in Logic — and less principal, which is its less preeminent part — as Topics in that same Logic. This is mentioned by Scotus in *1 Met. q. 1*.

Fifth, from *2 d. 9 §. Ad arg. pro 1. opinione T.*, into the motive object, which moves the power to knowledge of itself — as color is the motive object of sight — and the terminative object, which terminates its act — as the white wall terminates the act of the power of sight. Likewise, the creature is the terminative object of God's science, *1. 2. 33 q. vn. M*. This division of object is treated at length in the treatise on the science of God, *disp. 1* and following.

Sixth, from *ibid. d. 3 E.*, into the object of natural attainment, which is known by us by our natural power — as the quiddity of a sensible thing — and the object of natural inclination, to which the intellect tends by its very nature — as being in its full height. This is signified by Aristotle at the beginning of *1 Met. 1* when he says that all men by nature desire to know — which, according to Scotus in the same place, is to be taken of the natural appetite by which man naturally tends toward knowledge of every being. The reason is that the intellect is perfected by the knowledge of any being whatsoever. These matters are treated in the cited treatise on the knowability of God, *disp. 1*.

Three principal conditions are enumerated by the Doctor in *q. 3 univers.* as required for the adequate object of any scientific habit. First, it is presupposed of the object whether it exists and what it is, as stated in *1 post. 7. 2*. For since demonstrations are to be constructed about it, it must be known in advance whether it exists or whether existence is repugnant to it, and what it is — that is, its essence, definition, or quidditative concept — as we will show at length in *1. 5*. Second, that through the definition of the subject the properties of that subject be demonstrated — since it is through the middle term, which is the

definition of the subject, that its properties are demonstrated. Third, that everything treated in the science be referred back to the subject itself, either as to a principle, or as a part of it, or as properties of the same, or in whatever other way one thing is reduced to another.

Objection. Scotus in *1 prio. q. 2 §. quantum ad 1* establishes six necessary conditions for a scientific object. Therefore either Scotus contradicts himself, or more than three conditions of the object must be enumerated. *Reply.* Scotus explains himself, for he says in *q. 3 univers.* that there are three principal conditions of the object, which he repeats again in *ibid. q. 8 §. Ad q.* — and to these the remaining less principal conditions are reduced.

Second Objection. Only two conditions of the object appear to be given by the Doctor in *q. 3 prol.* and *1 d. 3 q. 3 §. Ad q. igitur E.:* community and virtuality, which Vulpes observes in *Tom. 1 primae partis, disp. 3 a.* For the object must be universal and virtually contain everything that is treated in the science. Therefore the Doctor does not seem to have spoken consistently, assigning now two, now three, and also six conditions of the scientific object. *Reply.* These are not properly conditions of the object but pertain rather to its essence and definition, as is clear from its definition given above.

Nor does the objection of the Conimbricenses carry any weight — who in *q. 5. 4. 1* say that it is not necessary for the subject to be univocal, but that it suffices if it is analogical, as is evident from Metaphysics, whose subject — being — is analogical, and from Perspective, whose subject is the visual line, which is a being per accidens. For they prove nothing against us, who, following Scotus, affirm that being is univocal, and that Perspective is a subalternate science whose subject always has an accidental difference added above the subject of the subalternating science, which is Geometry. As for their further claim that it does not belong to practical science to explain the essence of its subject — this they assert gratuitously, since a scientific craftsman must know the matter upon which he acts; otherwise he would not be operating. For who could act correctly if he did not know what he was to do and upon what? All the more so because Logic, according to Scotus, is a speculative science, as discussed in the preceding question, *a. 5 dub.* Nor does Scotus maintain that everything known in a science must necessarily be connected with its object. For he makes himself clear enough in many places, especially in *6 Met. c. 1*, and only wishes that everything treated in a science be in some way referred back to its subject — as may be seen in *1 prio. q. 2* with these words: "And so with the other ways in which a reduction of one thing to another takes place."

Article II. Whether All Things Are the Object of Logic.

It is so difficult to determine the subject of Logic, on account of the variety and diversity of opinion about it and the fierce contention among dialecticians in deciding it, that Zabarella in *1 de natura Log. c. 14* judged their dispute to be vain

and like the quarrel of the blind. I shall proceed in its investigation by first reporting and refuting the views of others, and then setting forth and defending the Scotist position. There is an opinion of Rudolph Agricola in *2 de inventione c. 3* and of certain others who hold that the subject of Rhetoric and Dialectic is entirely the same, namely all things — from which Scotus dissents in *q. 3 univers.* and *1 d. 2 q. 3 §. Ad illa. C.* and elsewhere, distinguishing science into real and rational; as do the remaining philosophers who deny that Logic directs its care toward all things.

Thesis. All things are not the proximate and immediate object of Logic. This is inferred from Scotus just cited, and more clearly from *q. 1 praedicam. §. Ad q. dici potest.* This is proved: first, Logic is a single science distinct from the others by the unity of its subject, as established above. But if all things were the proximate object of Logic, it would not be a single science distinct from the others — since sciences differ by differences of things, *2 animae c. 4.* Therefore its immediate object is not all things. Second, Logic is about second intentions applied to first intentions, according to Avicenna in *1 Met.*, Boethius, and the other philosophers. But second intentions properly are not things but rather constructions and works of the intellect. Third, Logic is a rational science, as established above in *q. a. 6.* But if Logic attended to all things, it would be a real science — which Scotus infers as absurd in *q. 3 univers.* Therefore Logic does not consider all things. Nor is the response of Fonseca in *2 Met. q. 1 in fine sect. 3. 6. 3* and the Conimbricenses in this place *q. 5 a. 2 in solut. 1* satisfactory — who say that those sciences are called real because they deal with things as distinguished from words, and that those which treat only of words and speech are called discursive and rational insofar as they direct the acts of the intellect. On the contrary, if their reasoning were valid, the science of the soul — which treats of the operations of the intellect — would be rational, as would other sciences that are taught by reason. Scotus objects to this in *q. 1 praedicament.*, which is seen to be false. For sciences are called real on account of the real objects upon which they bear; therefore sciences are called rational on account of the works of reason, which are second intentions — or, as the Doctor says in the cited place, on account of the concepts formed by the act of reason. Furthermore, in their view, Logic is directive not of things; for it does not direct animate or inanimate, corporeal or incorporeal things, as Arriaga shows at length in *disp. 2 Subf. 2.* Finally, it remains to be proved in the following article that Dialectic is concerned not with the active acts of the intellect but with the passive ones, which pertain to beings of reason. Therefore the object of Logic is not all things.

First Objection. Aristotle in *1 Rhet.* writes that Rhetoric and Dialectic are concerned with the same object, and the object of Rhetoric is all things, as the same Philosopher attests there. Therefore this is also the object of Dialectic.

Confirmation, from *4 Met. 2:* dialecticians and sophists dispute about everything. I add that Scotus in *6 Met. q. 3 §. Ad propositum* says: the Logician considers all things just as the Metaphysician does. *Reply.* The Philosopher in both passages is

to be interpreted as speaking of the remote object, not the proximate and immediate one about which we are speaking here. This response is drawn from Scotus in *q. 3 prol.*, where he says: Logic is about things insofar as second intentions are attributed to them. The same is to be said in reply to the confirmation and to Scotus's passage.

Second Objection. Dialectic provides rules for dividing and defining well, as all agree. But definition applies to a thing, since it is a discourse distinctly explaining the nature of a thing; and likewise division is adapted to a thing, since it is a discourse distributing a whole into its parts. Therefore Logic is about things. *Reply.* I grant the major. As for the minor, I say that Logic treats of those instruments which are not formally things but are declarative of things. For Logic does not treat of rational animal but of its definition, which declares what a rational animal is. Hence Lychetus in *2 d. 3 q. 1*, following Scotus in *q. 8 univers. in fine*, adds that Logic does not regard things per se except insofar as they are the foundations of second intentions, which the Logician considers per se. This Aristotle already indicated at the end of *6 Met.*: combination and division are in the mind and not in things.

Article III. Whether Logic Is Concerned with the Active or Passive Acts of the Intellect.

That Dialectic treats of the active acts of the intellect as its material object is defended by Hurtado in *disp. 1 sect. 5* and Arriaga in *disp. 2 sect. 2*, following Suárez in *1 Met. disp. 1 sect. 4* and Fonseca in *2 Met. c. 3 q. 1 sect. 5*; and Ponce in *disp. 2 q. 5 concl. 1* leans in their favor. Against them stand the other philosophers, especially Scotus in *q. 1 praedicam.* §. cited in the preceding article; Aureolus in *1 d. 23 q. 2*, citing in support of this view Averroes in *3 animae com. 18. 43*; Sarnanus in *tract. de 1. 2. intentionibus*; and Fuentes in *q. 2 q. 2* — all of whom defend the view that Logic is concerned with the passive acts of the intellect, which Scotus in the cited place calls concepts formed by the act of reason, and Aureolus calls objective concepts.

Note I. Just as in corporeal things an agent never acts without a patient undergoing something, and consequently there is never action without passion, so too in spiritual things the intellect is never understanding unless something is understood — so that there are both an active and a passive act of the intellect. The active act is that by which the intellect understands; the passive act is that by which the object is understood. In somewhat the same way as sight sees by an active vision and the wall is seen by a passive vision. The former is called the formal act, the latter the objective act. The former is real being residing in the predicament of quality and pertaining to the science of the soul; the latter is a being of reason pertaining to Dialectic. For it is a rational respect left behind in the object by the application of the intellect to that object, and it is described by the Doctor in *4 d. 1 q. 2 §. Hic primo. sub B.* as the passive comparison of one

known object to another known object. It is called a second intention, which depends upon the act of the intellect, and without which it has no being.

Note II. In every real object — take a stone, for example — two things can be considered: the nature of the stone, which is understood, and the very fact of its being understood, which the stone receives from the intellect. The nature of the stone that is understood is real being; but the fact of its being understood is a being of reason. Moreover, each being has its own properties: from the nature of the stone real properties flow, and from the fact of its being understood there follow rational properties — as Sarnanus notes in *q. 3 univers. pag. 61*, following Trombetta in *tract. form. parte 2 fol. 20 pag. 2 in fine*. The first consideration of the stone pertains to Physics; the second pertains to Logic. The former is real, the latter is rational.

Thesis. Logic is concerned with the acts of the intellect — not the active but the passive ones. So holds the Doctor in the place cited at the beginning of this article, in *q. 3 univers.*, Lychetus in *1 d. 8 q. 3 §. In ista ratione*, and the other philosophers commonly who teach that Logic treats of second intentions — nor does Hurtado deny this in §. 93. But second intentions are passive acts of the intellect, as is clear from the definition of being of reason given at the end of *Note I*, which plainly fits second intentions. This is also consistently held by those who establish being of reason as the object of Logic, and it is gathered from *4 Met. 2*. Therefore Logic directs its care to the passive and objective acts of the intellect. Furthermore, knowable properties are demonstrated of the object that a science examines, as I noted in *art. 1 of this q.* before the first objection; but knowable properties are demonstrated only of the passive acts of the intellect — as it is demonstrated of the syllogism that it consists of three terms, is in mode and figure, and necessarily infers the conclusion. Again, Logic treats of predicate, subject, and the like; but these are not active and formal acts of the intellect — since one active act of the intellect is not predicated of another. For the concept of animal is not affirmed of the concept of man; but animal is rightly predicated of man as the superior of its inferior. Nor does Logic anywhere treat of the formal acts of the intellect, but only of those formed by the intellect. Aureolus therefore concludes in the passage cited: "It is remarkable that it should enter the mind of anyone philosophically wise that second intentions are formal acts of the intellect, rather than formed concepts." Finally, the active acts of the intellect are real, pertaining to the science of the soul, which, treating ex professo of the soul, its powers, and faculties, must consequently treat of their formal acts. Hurtado replies in *cit. §. 83* that considering the acts of the intellect in themselves and precisely — whether they are of the genus of quality or action, and the like — pertains to the science of the soul; but that considering the acts of the same intellect insofar as they are affected by some accidental aspect, namely how they are to be arranged in mode and figure for inferring a conclusion, is the function of Logic. On the contrary: that collocation and arrangement which by Hurtado belongs to Dialectic alone is

found in the extremes of the proposition and syllogism, because it is the terms and propositions that are collocated and arranged for the construction of the syllogism. Therefore the consideration of Logic regards the passive acts of the intellect. The consequence holds, because the object of a craftsman is not that by which he operates but what he operates upon or in. For the object of the builder is not the act of his intellect or will by which he intends to build a house, but the house itself to be built. Therefore the object of Logic is not the act of the intellect by which it syllogizes, but the syllogism itself, which is the whole of its labor. Again, Hurtado adds in §. 96 that the active act is ordered to the passive, and the ultimate thing attained by a science is its object, since it is the terminus beyond which it proceeds no further. Therefore it is not the active but the passive act that Logic weighs. Nor is it helpful to say that both are the adequate object of Logic, since the properties of neither are considered by it, nor do the conditions of the object appear to fit either of them.

First Objection. St. Augustine in *1 contra Cresconium c. 13. 14* calls Dialectic the art of disputing, because it teaches how to dispute, divide, define, and argue. But disputation is an act of the intellect, as are also division, definition, and argumentation. Therefore Logic is concerned with the formal and active act of the intellect, not the passive one. *Reply.* I grant the major. I distinguish the minor: disputation and the rest of what has been enumerated pertain to Logic as that by which it proceeds — I grant; as that about which it is concerned — I deny. And thus it is not the active but the passive act of the intellect that Logic regards. In this way Augustine in the cited place is to be explained.

Second Objection. The passive and objective acts derive their being from the active and formal acts. Therefore Logic is occupied with the formal acts rather than the objective ones. *Reply.* I grant the antecedent; I deny the consequence. For although Logic derives its being from the intellect, no one has ever ventured to say that the intellect is its object.

Third Objection. Truth is the adequation or conformity of the intellect with the thing understood. But Logic treats of the truth and falsity of propositions and argumentations. Therefore the labor of Logic bears upon the active and formal acts of the intellect. *Reply.* I grant the major. I distinguish the minor: Logic treats of truth taken actively — I deny; taken passively — I grant, as will be made clear in *1. 4 of this work*.

Article IV. Whether Spoken Words Are the Object of Logic.

An opinion of certain ancient thinkers is reported by recent philosophers — namely that the matter with which Dialectic is concerned is spoken words. This view is said to have been held by Roscelin, who was refuted by St. Anselm in the *Epistle on the Incarnation of the Word*, as reported by Zwinger in *vol. 2 l. 4 Theatri* and Fuentes in *q. 3 diff. 3 art. 2*. And this view is commonly attributed to Ockham and his followers, as Hurtado in *disp. 1 sect. 3 Subf. 1* and Arriaga in *disp.*

2 sect. 3 observe — though that these authors held otherwise is clear to anyone who reads their works, especially Ockham in his Logic and in *1 d. 2 q. 8*, where he asserts that the mental concept, and not spoken words, is the subject of Dialectic — as he had learned from the Doctor in *q. 1 praedicam. §. Ad q. dici potest*, where he explicitly maintains that no part of Logic is about spoken words. Whatever the opinion of the Nominalists may be — and it appears to be a matter open to debate, as may be seen from Ockham in the cited place and Gabriel in the same — the matter will become clearer and more explicit in the following book, *q. 1*.

Thesis. Spoken words are not the object of Logic. So holds Scotus in the place just cited and in *1 perih. q. 1*. What is the formal object of one science is not the formal object of another discipline, as is clear from *2 animae c. 4* — since by distinct objects distinct sciences are constituted. But spoken words are the formal object of Grammar, as Aristotle acknowledges in *4 Met. c. 2*, whose function is to examine their significations, declensions, syntax, and the correctness of speech. Therefore, etc. Second, spoken words lack the conditions required for the proper subject of Logic. For it is not presupposed of them whether they exist and what they are, nor are their properties demonstrated, nor is what is treated in Logic held on their account — as is clear to anyone reading the books of Logic. Third, the object of a science always persists the same, since science deals with necessary and eternal things, *1 post. 6*; but spoken words and names vary according to the variety and diversity of nations and change with the vicissitudes of time and the judgment and pleasure of distinguished men. Fourth, a person unacquainted with spoken words can be a logician, since words are only signs and instruments for expressing the concepts of the mind that lie hidden in the soul, *1 Perih. 1 A*. For division, definition, and argumentation can be performed by the intellect alone. Therefore spoken words are not established as the object of Logic.

First Objection. Aristotle in his Organon very frequently uses non-significant words and letters in constructing his reasonings, as is clear in the books of the *Prior Analytics*, *Posterior Analytics*, *Topics*, and *Sophistical Refutations*. Therefore according to Aristotle, spoken words are reckoned the object of Dialectic.

Confirmation I. The same Philosopher in *1 praedicam.* hands down the antepredicamental divisions and definitions — and these are expressed and signified by words. But to be expressed and to be signified pertains to spoken words and names. *Confirmation II.* The *Isagoge* of Porphyry is entitled "On the Five Words," and according to Boethius in *1 praedicam.* it treats of "the ten words." Therefore the object of Logic consists of spoken words. *Reply.* Aristotle did this not because he considered words to be the subject of Dialectic, but in order to show that the syllogistic form is valid in non-significant words no less than in significant ones, and in letters and syllables — as his expositors note in that place. In reply to *Confirmation I* and *Confirmation II*, I say, following Scotus in the *praedicam.* cited, that both Aristotle and Porphyry used the passive in place of the active — "on

the five words" meaning "on the five universals signified by five words," and "the ten words" meaning "the ten predicaments expressed by ten words." More briefly it may be said that the said authors used metonymy, taking words for concepts and second intentions, for which they stand.

Second Objection. Logic, from the interpretation of its name, is a discursive science, as I made clear in *Epit. l. 1 q. 1 art. 1*. Therefore its object consists of spoken words — for Logic treats of the simple word signifying a simple concept in *l. praedicam.*, and of the complex word signifying a complex concept in *l. Perih.* Scotus replies in the same place that Logic is called discursive for two reasons: first, because the concept is the immediate significate of the word, and it is of this concept — or second intention — that Logic is concerned. Second, because the properties of the concept are present in the significant word — just as the incomplexum and complexum signify truth or falsity as a sign, through the nature of what is signified.

Third Objection. Logic makes the unknown known from the known, since it is a discursive science proceeding from the known to the unknown. But spoken words make concepts known, since they are signs of those concepts, *1 Perih. 1*. Therefore it cannot be denied that Logic labors about spoken words. *Reply.* I grant the major. I distinguish the minor: with respect to external manifestation — I grant; with respect to internal manifestation — I deny. For spoken words are external signs manifesting the internal concept that lies hidden in the mind, as I was just saying with Aristotle. In reply to the confirmation, given the hypothesis, I say that vocal definition pertains to Logic not per se but per accidens, as Mauritius notes in *expost. q. 1 univers.*, insofar as Logic itself uses spoken words as significative instruments. And the other sciences do the same. For since things cannot be brought directly into dispute, we employ words to represent those things and to offer them to the minds of listeners — as I observed from Aristotle in *Epit. 1. 2 q. 2 art. 3*.

Article V. Whether Being of Reason Is the Object of Logic.

Several ancient and recent dialecticians maintain that the object of Logic is being of reason, and they are divided into two groups. Some, such as Jandun in *2 Met. q. 12* and Averroes in *4 Met. com. 2*, appear to hold that being of reason taken in its full breadth is the subject of Dialectic. Others, such as Thomas Aquinas in *4 Met. lect. 4*, Toledo in *Log. q. 5 proaem. concl. 4*, and Rubius in *ibid. q. 6* — among whom Scotus is cited by Fuentes in *q. 3 diff. 3 art. 1* — affirm that being of reason produced indirectly by the intellect is the formal and adequate object of Logic. Against these stand Fonseca in *2 Met. q. 1 sect. 3*, Hurtado in *this disp. 1 sect. 4 subf. 2*, and Arriaga in *disp. 2 sect. 2*, who deny that being of reason taken in any way whatsoever is the formal object of Logic and assert that real being is its subject.

Note I. "Being" is derived from the verb *sum, es, est*, which taken in its broadest sense signifies "that which has being," a description common to both real being and being of reason. Being is first divided into real being and being of reason, 4 *Met. T. 4*, as Scotus notes there in *q. 1 Elench.* and *1 post. q. 11* and *1 d. 36 q. vn. F.*, and as do Antonius Sirectus in *Tract. form. art. 1*, Trombetta, and others in the same place. Real being is that which has being without the work of the intellect, or to which being is not repugnant, from *1 d. 8 q. 4 §. contra istam opinionem F.* and *q. 2 praedicam.* and *q. 1 Elench.* and *quol. 1*. Being of reason, on the other hand, from the places just cited, is that which has being from the intellect alone. For "reason" and "intellect" are here taken as the same thing, as Sarnanus rightly notes in *q. 3 univers. pag. 63* and Pelbartus in *tom. 1 Rosarij, ver. voluntas, §. 7*. Being of reason can moreover be used in three ways according to Scotus in *4 d. 1 q. 2 §. Hic primo videndum B.*: objectively, subjectively, and comparatively. Being of reason objectively is what is placed before and presented to the intellect as an object of consideration — such as a common nature offered to the intellect in order to become formally a universal, as will be made clear in *1. 2 q. 1*. And any other being that moves the intellect to its cognition can in this way be called a being of reason. Being of reason subjectively, on the other hand, is that which is subject to and inheres in the intellect as in its subject. In this sense any science whatsoever can be called a being of reason, since it resides in the intellect — as Scotus notes in *q. 25 praedicam.* — even though it is real being situated in the genus of quality. This sense of being of reason is indicated by Aristotle in *7 pol. c. 14* when he calls the intellectual arts beings of reason. Finally, being of reason comparatively is the passive comparison of one known object to another known object. This is called a second intention, a diminished being, a qualified being, and a thing in the soul, by Briançon in *4 q. 3 coroll. 3*, following Scotus in the place cited — as Vulpes notes in *1 tom. 1 p. disp. 28 art. ult.* What some others call "logical being of reason" — that which has being only objectively in the intellect. Its formation is explained thus: the intellect knows animal, and animal thus known is called a first intention. Likewise it knows man and lion, and these thus known are called two first intentions, as I set out in *Epit. l. 1 q. 1 art. 10*. Thereupon it compares the known animal to man and lion, insofar as animal is something common to both, since man and lion share the common account of animal. This comparison of animal to man and lion and to the other species is a second intention, which is called genus. The comparison by which man is compared to his individuals — say, Francis and Louis — is called species. The same judgment is to be made about the other logical beings of reason: predicate, subject, antecedent, consequent, and others, whose explanation is given by Sarnanus in *Tract. de 2. intentionibus cap. 2* and *q. 3 univers. pag. 67*.

Note II. Being of reason does not flow from real being the way a real property follows from the nature of its subject — as Scotus acknowledges in *1 d. 8 q. 4 §. Ista tamen sub M.*: because in no way is being of reason caused by the object. For over and above the said passive comparison, nothing precisely is found in the

object considered; and that comparison depends entirely upon the intellect, which produces it — or rather leaves it behind — in the object considered and compared, as the Scotists write among others: Sarnanus in the cited place and Lychetus in *1 d. 3 q. 7 ante §. Alia est opinio* and *2 d. 1 q. 1 §. secundo principaliter* — who affirm that second intentions, or logical beings of reason, are not properly caused but left behind, in somewhat the same way as colors are left behind on a wall or other surface by the brush of a painter and the movement of his hand, as I explained at the end of *Note I* through the examples given there. Nor is the distinction of being of reason established by the Doctor in *1 d. 36 q. vn. §. per idem circa M.* to be omitted: namely into the chimerical or fictitious — which is entirely useless, as a golden mountain or a hippogriff, what is commonly called a being of reason having no foundation in reality — and the logical being of reason, which is founded upon a real object. For a second intention does not exist without a first intention, since a relation presupposes its foundation. And since a second intention is a rational relation, it is plainly inferred that the second intention presupposes the first, which is the object first known and considered, from the Doctor in *4 cit. and q. 1 Elench. §. Ad q.*

Note III. By "being of reason" — which Thomas Aquinas and his followers establish as the object of Dialectic — Hurtado in *subf. 1 §. 46* and other recent authors endeavor to interpret an extrinsic denomination, that is, being of reason denominatively, or the act of the intellect as the denominating object. But since an extrinsic denomination designates a form adjacent to another, it exists outside the denominated thing — as the very name indicates — and can therefore exist without anyone thinking of it, as Vulpes asserts in *disp. 17 art. 9. 1. 6 tom. 1 primae partis* and the united Scotists in *disp. 3 art. 1 q. 2* — though Orbellus in *4 Met. q. 1* and Smiling in *Tract. 3 de Deo uno n. 184* hold the opposite. For the same form denominates a subject in which it is not present — as a bench is called human not through humanity in itself but through humanity existing in the man by whose skill and labor it was fashioned. And the wall is denominated "seen" through the vision existing in the eye and terminated to that wall — as Scotus writes in *Quol. 12* and *3 d. 8 q. vn. §. Ad 4.* For the vision is in the eye, and it denominates the eye by an intrinsic denomination. But the being of reason about which the Thomists and Scotists speak depends for its existence and production upon the work of the intellect. Therefore being of reason taken in this sense is not an extrinsic denomination, which according to the younger authors cited is real, since they do not distinguish it from the act of the intellect, which is real. The antecedent is clear from Thomas Aquinas in *opusc. 43 c. 4*, where he says: "The intentions of genus and species are not found in the nature of things, but follow upon the actions of the intellect, and a being of this kind is the subject of Logic." Likewise, according to the Thomists, the being of reason which they consider to be the object of Logic is that which has being only objectively in the intellect — as Hurtado does not deny in *disp. 1 sect. 5 §. 85. 86* — or that which results from the work of the explicating intellect, as Rubius

expounds in *q. 6*. But extrinsic denominations exist independently of the work of the intellect — as "being seen," "being heard," and "being known."

Furthermore, what follows upon an operation of the intellect is not the operation of the intellect itself. Therefore it is not an act of the intellect, contrary to Arriaga in *disp. 3 sect. 2 n. 20* and Hurtado above in *art. 3*, who have been rejected.

First Thesis. Being of reason taken universally cannot be the formal and adequate object of Logic. This is inferred from Scotus in *q. 3 univers. §. dicitur verf. due 1. conditiones*, where he denies that the concept taken broadly is established as the object of Dialectic. This is proved: first, the adequate object of a science does not extend further than the science, as is clear from its definition given in *art. 1 of this q.* But being of reason in its full breadth extends further than Logic, for it encompasses the beings of reason of Grammar and Rhetoric — namely the significations of nouns, declensions, conjugations of verbs, figures, tropes, and similar things, the consideration of which is foreign to Logic. Second, Logic does not explain the principles, nature, and properties of being of reason taken broadly, as is clear to anyone reading the books of Aristotle's Logic. Therefore being of reason taken broadly is not the adequate object of Logic. The consequence holds, and the antecedent is plain from the conditions reported in the place cited.

Second Thesis. Being of reason that follows from the operations of the intellect, or that is produced indirectly by the intellect, is not the formal object of Logic. This is gathered from Scotus in the same place and is opposed to virtually all the Thomists who profess the genuine doctrine of Thomas. This is proved: first, to being of reason taken in this way the first condition of the scientific object is lacking, which is that of the object itself it must be presupposed whether it exists and what it is. Therefore being of reason proposed with this qualification is not established as the formal object of Logic. The antecedent is at hand: for in no part of Aristotle's Logic is a definition of being of reason given, as Scotus warns in the cited place, nor are its principles and properties explained anywhere. Second, the subject of predication is not the object of attribution, as is clear from *art. 1 of this q.*, and can be shown of the individual subjects of whatever science about which being is predicated. But being of reason in Logic is the subject of predication: for it is predicated of the proposition, argumentation, and the other logical entities, as Mauritius attests in *q. 3 univers.* Third, what directly directs a directive science is not that by which something is directed, but that which is directed. But Logic is a directive science — even according to its adversaries. Therefore the major is shown by induction: from Grammar, whose proximate object is not the noun and the verb from which grammatically correct speech is formed, but that grammatically correct speech itself; and from Rhetoric, whose object is not well-arranged words but the ornate discourse made from them. The same can be induced from Ethics and the other directive disciplines. But being of reason is the that-by-which or the from-which intellect

operations are directed — namely from the subject, predicate, propositions, and the rest — and not the that-which is directed. Therefore being of reason taken in any sense whatsoever is not the object of attribution of Logic.

First Objection. Aristotle in 4 *Met. c. 2* *Tom. 5* writes that Metaphysics and Logic labor about the same object, but with this difference — Scotus adds in *q. 1 Elench. §. Ad q. dicendum* — that Metaphysics treats of real being and Logic of being of reason. The same is handed down in *q. 15 §. Ad 1. rationem* and *q. 2 praedicam.* Therefore being of reason is the subject of Logic. *Confirmation:* being of reason is knowable in its own way; for it has properties demonstrable of it, several of which Scotus presents in *q. 2 praedicam.* And it does not appear to be considered by any other science than by Logic, which for this reason is called rational — because it treats of being of reason. Therefore being of reason is the object of Logic. *Reply.* Even if that distinction is granted, I say that being of reason is the subject of predication in Logic, not the subject of attribution — about which the whole dispute turns, as Sarnanus rightly saw in *q. 3 univers. pag. 56*, and before him Scotus in *1 post. q. 27 ante §. Ad q.* The same is to be said in reply to the confirmation. Or say that Aristotle and Scotus are speaking of Logic in use, not Logic as a teaching science. Or alternatively it may be replied that Dialectic treats of every being by reason of its subject, which is applied to all things. This is why I said Logic is a universal science in *q. 2 art. 7.*

Second Objection. Everything treated in Logic is a being of reason or is reducible to being of reason. Therefore the formal object of Logic is being of reason. The antecedent is conceded: for what is found in Logic are subject, predicate, genus, species, proposition, syllogism, and the like — all of which, even according to the Scotists, and expressly according to Maior in *1 d. 2 q. 13 §. ideo propter*, are beings of reason. *Confirmation I:* a science derives its denomination from its object; but Logic is denominated rational. Therefore it derives this from being of reason, which is its object. *Confirmation II:* the object distinguishes the science; and being of reason distinguishes Logic from other sciences. Therefore it is its object. *Reply.* The argument proceeds from an insufficient enumeration — namely from one condition of the subject to all of them. Therefore, granting the antecedent, the consequence is denied. For the fallacy of accident is committed: it is no better argued that matter is being, form is being, and everything in Physics is a being — therefore being is the formal object of Physics. The same happens in our case: although everything contained in Logic is a being of reason, nonetheless, because all these things are treated on behalf of the syllogism, therefore not being of reason but the syllogism is established as the object of Logic. In reply to *Confirmation I*, I say that a science can be denominated from its object in multiple ways: sometimes from the principal part of the subject — as Metaphysics is called divine because it treats of God as its principal object, and the science of the heavens is called Astrology because its principal part is the stars; hence the common saying that denomination is made from the nobler part. Sometimes from the total and adequate subject — as

Physics is called natural because it contemplates the natural body, which is its adequate subject. Sometimes from the subject of predication — as Metaphysics is called real because it contemplates real being, which is common to the other real disciplines. And it is in this sense that Logic is denominated rational, because it considers being of reason, which is its subject of predication. In reply to *Confirmation II*, the major holds of the subject of attribution, not of the subject of predication — and it is being of reason that is the subject of predication.

Third Objection. The adequate subject of Dialectic is either real or rational, since between real being and being of reason no middle term intervenes — as is clear from the Formalists. But the subject of Logic is not real, as I proved above in *art. 2* and *3 of this q.* Therefore it is being of reason. *Reply.* The argument does not conclude. For as I noted in *Epit. l. 3 q. 1 art. 10*, when the minor is negative in the third figure, the syllogism does not hold. The reason is that the middle term is not distributed in the premises — that is, the argument proceeds from the non-distributed to the distributed. But if the subject is supposed only for the subject of predication, the entire inference is good; whereas if it is taken for the subject of attribution, the reasoning is faulty. For Logic does not inquire into just any being of reason, but only that being of reason which is the syllogism or the mode of knowing, as will be made clear in *art. 7*.

Article VI. Whether the Three Operations of the Intellect Are the Object of Logic.

Scotus in *q. 3 univers.* and Antonius Andreas in a certain question after the exposition of the old Logic report the opinion of certain thinkers who hold that the concept formed by the act of reason is the subject of Dialectic. From this some perhaps took occasion to suspect that the operation of the intellect is the object of Logic, among whom Raconis is listed in *praeludio postr. art. 4 sect. ult.* Most recent authors, however, hold that there are three operations of the mind, and they dispute among themselves. Some, such as Suárez in *disp. 1 Met. Sect. 4*, establish these as the things to be directed; others establish them as directive; and still others as directed. The opposing view is held by Scotus in the place cited above, §. *Ad oppositum*; Joannes de Magistris in *q. 1 dub. 2*; Zabarella in *2 de natura Log. c. 3*; Fuentes in *q. 3 art. 3*; and the other Scotists — all of whom deny that the operations of the intellect taken in any way whatsoever are the formal subject of Dialectic.

Note, from Aristotle in *3 animae T. 13* and Scotus in *q. 28 praedicam. §. Ad 2, q. 1 perih. q. 1, 1 post. q. 46, 1 Met. q. 4 §. ubi sciendum*, and Maior in *tract. de syllogismis c. 1 fol. 140*, that there are three operations of the intellect. The first is called the apprehension of simple terms — as "man" apprehended. The second is called enunciation, or composition or division of those incomplex terms — that is, the affirmation of one of another, as "man is an animal," or the negation of one from another, as "man is not a stone." The third is called discourse, which is the progression from the known to the unknown — that is, from premises to

conclusion — as "man is an animal; Peter is a man; therefore Peter is an animal." These operations can be considered in two ways, as Zabarella notes in *1 de natura Log. c. 3* and *2 of the same book, 6. 3* — which Scotus also signals in *q. 3 univers. ver. si 1. modo*: first, with respect to their proper nature and as proceeding from the soul and intellect — which are their principles — in which case they pertain to the science of the soul. Second, with respect to the three degrees of second intentions that result from them, or with respect to the intentional being caused by the intellect alone or left behind by it, by reason of which they are ordered and directed toward the good syllogism — and in this respect they are objects of logical consideration. This can be illustrated by the example of iron: considered absolutely, iron pertains to Physics, since it is a natural body and of the genus of metal; but if it is examined as capable of being shaped in this or that way, it pertains to the art of the smith.

First Thesis. The operation of the intellect insofar as it is directable is not the formal and adequate object of Logic. This seems to be the view of Scotus just cited, *ver. due similitudines*. This is proved: first, in no part of Logic is the operation of the intellect defined, nor are its principles and properties shown according to its general account — which is required for the formal object of a science, as I noted above. Therefore the directable operation of the intellect cannot be the formal object of Logic. The consequence is clear; the antecedent is plain to anyone who reads all the works of Dialectic. Second, either the operation of the intellect is established as the object of Logic according to its quidditative being — and this is not the case, because as such it pertains to the science of the soul, as is clear from the end of the preceding note — or as invested with the second intention of directability, and this is in no way admissible. For thus it is nothing other than a being of reason — which Raconis refuted in *art. 4 sect. 2*, and against whom this thesis is directed. Again, action is not aimed at per se by Logic but for the sake of the syllogism. It is therefore established that the operation of the intellect is not the proximate and formal object of Logic.

Second Thesis. The operations of the intellect cannot be established as the proximate and formal object of Logic — neither as directable, nor as directive, nor as directed. This three-part thesis is signaled by Scotus in the place cited above. The first part is proved: first, one science, being one, has only one formal and adequate object, *1 post. T. 43*; but Logic is a single science, as established above; and there are three operations of the intellect. Again, one science must have one middle term for demonstration, which is the definition of the subject — since all its knowable and demonstrable properties are demonstrated of that subject. But since there are three operations of the intellect, it is plainly shown that they are not the formal object of Logic. You will say that they are the formal object of Logic under the aspect of directability, as Antonius Andreas signals in *1 Met. q. 1 art. 2 ver. contra 3. dictum*. On the contrary: each operation possesses its own directability just as it has its own entity. Therefore just as there are three

directable operations, so there are three directable aspects — and so those operations are not the object of Logic under the aspect of directability. Second, the directability of any operation is either a natural aptitude or a natural or obediential potency. Not the first: because such a natural potency pertains to the science that contemplates the nature from which it flows — as is the case with the science of the soul. Nor the second: because obediential potency is passive with respect to the ordering and directivity that is a being of reason fashioned by the intellect — which the adversaries themselves remove from the object of Logic. Furthermore, the operations of the intellect are real; but Logic is rational. Moreover, it would be subalternate to the science of the soul, for it would add an accidental difference above the object of that science — namely directability. It must therefore rather be concluded that such operations are not the proximate object of Logic. The second part remains proved from *art. 3 of the present q.*, where we showed that the active acts of the intellect do not fall under the formal object of Logic. The third part is argued thus: a directive science does not presuppose a directed object; otherwise it would not be directive, since it would not direct it, nor could it — just as a productive habit does not presuppose an already produced object but one producible, as is clear by induction through all the mechanical arts. But Logic, by the common consent of dialecticians, is directive. Therefore its formal object cannot be the operations of the mind as directed.

First Objection against the First Thesis. Scotus in *q. 1 praedicam. §. Ad q.* says that Logic is about the concept; but a concept is an operation of the intellect. Indeed, in *Epit. l. 3 q. 1 art. 2* it is granted that the syllogism is an operation of the intellect. Therefore the operation of the intellect is the object of Logic. *Reply.* The Doctor explains himself there. For he says that Logic is about the concept formed by the act of reason — and this concept coincides with being of reason and with the second intention, which I indicated above to be the subject of predication in Logic, not its subject of attribution. By this distinction the apparent contradiction in the Doctor's writings is resolved. For in *q. 3 univers.* he denies that the formed concept is the subject of Logic, while later in *praedicam. q. cit.* he establishes it as the object of Logic itself — as is clear from *ver. Ad aliud dico*, where he proves that Logic is not a real science nor a discursive one, because it is not about a thing or about a word but about the concept. The apparent contradiction is resolved, I say, because in *q. univers.* Scotus speaks of the subject of attribution, while in the said *q. praedicam.* he treats of the subject of predication, which he rightly asserts to be the proper subject of Dialectic — namely as being of reason and second intention, which the three questions cited in *univers.* he takes to coincide.

Second Objection. Everything treated in Logic is referred back to the three operations of the mind as directable. Therefore the three directable operations of the mind are the object of Logic. The antecedent is established from the distribution of the books of Aristotle's Logic, received from Scotus in the places

cited above and in *1 perih. q. 1*. For concerning the first operation of the intellect there is *1 praedicam.*, in which incomplete terms are set out. Concerning the second operation there are the books of the *Perihermeneias*, in which complex terms are handed down. And concerning the third, in the books of the *Prior Analytics*, *Posterior Analytics*, *Topics*, and *Sophistical Refutations*, in which the syllogism, its subjective parts, and its properties are accurately taught. *Reply*. I grant the antecedent; I deny the consequence. For the argument proceeds from an insufficient enumeration of the conditions of the subject, and the fallacy of the consequent is committed. For the two prior conditions required for the formal object are lacking in them. Or it may be said that the argument concludes about the remote and material object, not the proximate and formal one — about which the present controversy turns.

Third Objection. The operations of the intellect insofar as they are directable are knowable and demonstrable. Therefore they fall under the object of some science. But they cannot be considered by any other science than by Logic, which alone provides the rules and precepts for rightly directing them, as is clear from its nature and purpose. Therefore such operations are the formal object of Logic. *Reply*. I distinguish the minor taken in its second premise: if it concerns natural and real directability — I deny it. But if the discourse concerns artificial and rational directability caused — or rather left behind — by the intellect, I grant that this is regarded by Logic. But since this ordering and direction does not stop there but tends to the syllogism or mode of knowing, consequently not the operations of the intellect but the syllogism is established as the proximate and formal subject of Dialectic.

Article VII. Whether the Syllogism Is the Object of Logic.

Algazel in his *Logic c. 3* and Avicenna in the same place make argumentation the subject of Logic. Simplicius in *prol. praedicabilium* and other ancient Peripatetics, whom Hurtado in *disp. 1 sect. 8 subf. 4* and Arriaga in *disp. 2 sect. 5 subf. 3* follow, hold that it is demonstration. Among the Scotists there are two positions: one defended by Faber in *Theor. 6*, Orbellus in *q. 1*, Mauritius, and Sarnanus in *q. 3 univers.* from Scotus in the same place, asserting that the syllogism is the adequate object of the whole of Logic; the other held by Tataretus in *q. 3 art. 2*, Joannes de Magistris, Fonseca in *2 Met. q. 1 sect. 5*, and the Complutenses in *Log. disp. 1 q. 3* from Scotus in *1 Prio. q. 2*, who affirm that the total subject of Logic is the mode of knowing.

Note I, from Sarnanus *pag. 77* and the other Scotists cited: that the syllogism is here taken in common, as it abstracts from every kind of syllogism — dialectical, demonstrative, and sophistical — or, as others say, as the syllogism is supposed simply and not personally, completing the integral subjective parts, the principles and properties of the syllogism, of which there is abundant treatment in *Epit. l. 3*. The syllogism can moreover be taken in a first-intentional sense — which is a mental, vocal, or written discourse composed of three

propositions — and in a second-intentional sense — which is the rational relation of the premises to the conclusion. Note also that the mode of knowing is twofold: formal and objective. The formal mode is the act of the intellect by which we divide, define, and argue. The objective mode is the object or objects about which there are divisions and argumentations. The mode of knowing can indeed be described as the instrument by which one arrives from knowledge of the known to knowledge of the unknown — or more briefly, the progression from the known to the unknown.

Note II, from the same authors: that Logic can be examined in two ways. One way is according to itself and in its full breadth, insofar as it encompasses *1 Porph.*, the book of the six principles, the book on division, and whatever else has been added and enriched by other dialecticians. The other way is insofar as it was handed down by Aristotle in at least those books that have come down to us. Now, to Logic taken in the first way the mode of knowing is assigned as its object; to Logic considered in the second way the syllogism is established — as Sarnanus rightly notes *pag. 78*, Toledo in *q. 5 fund. 2*, the Conimbricenses in *ibid. art. 3*, and Fonseca in the place cited. Much as certain Scotists philosophize about the subject of Physics, which considered in its whole range they say has finite being as its object, or as written by Aristotle — and then they hold its object to be the natural body, as may be seen from the twin Scotists in *q. proaem. in phys.* a little before *art. 1*.

First Thesis. Argumentation is not the total subject of Logic. So holds Scotus in *q. univers. §. Ad rationem positionis 3*. And this is proved by him there. First, argumentation lacks the first condition required for the subject: for argumentation in general is never defined by Aristotle, nor is its definition posited as a principle of the science. Therefore argumentation is not the adequate subject of Dialectic. Second, argumentation does not have properties demonstrable of it, as the second condition of the subject requires, since it has no definition. Third, the third condition is likewise lacking to it: for either argumentation is something equivocal or something analogical. If it is equivocal, since it lacks unity, the unity of Logic cannot be derived from it — since the equivocal is not knowable or demonstrable. Or it is analogical with respect to what is contained under it; in which case Logic will not be one from that analogue itself, but from the unity of its principal analogue to which all the rest are referred — and this is the syllogism, as is clear from the unity of Metaphysics, whose unity derives from the unity of substance to which the other beings are referred. Hence argumentation is not the total subject of Logic — unless we say that it coincides with the syllogism, as I noted from Aristotle in *1 prio. 1, 1 Top. 1, 1 Elench. 2* in *Epit. l. 3 q. 1 art. 3*.

Second Thesis. Demonstration is only a partial subject of Logic, though the principal one. This is touched upon by the Doctor in *1 Prio. q. 2* near the end, where he brings in the division of all the parts of Logic, among which he places

demonstration as most preeminent. Aristotle supports this in *1 post. T. 21*, treating of Demonstration as a partial subject of Dialectic and presenting its principles, species, and properties. This is proved: first, the adequate object of a science encompasses everything treated in the science of which it is the object, as is clear from the very notion of the word "adequate"; and the inadequate object contains only a part of the science, as the word "inadequate" itself indicates. But demonstration does not encompass the topical, sophistical, and paralogistic syllogism. For these differ from demonstration, as is clear from their definitions. Therefore demonstration is only a partial and inadequate subject of Dialectic — though the principal one, since it is its principal part and the instrument that generates science. Second, of one science in genus there is one subject in genus, *1 post. T. 43*. But Logic is one science in genus, as established above. Therefore its subject is one in genus — which demonstration is not, since it is contained under the mode of knowing and the syllogism taken generally. Hence demonstration is only a partial object of Logic.

Third Thesis. The syllogism is the adequate object of the Logic as written by Aristotle. Scotus doubtless holds this in the place just cited, *q. 3 univers. §. dicendum ergo*, which he proves from the partition of the books of Aristotle's Organon. Zabarella agrees in *1 de natura Log. c. 18*, saying that those who hold the syllogism to be the object of Logic are to be preferred to others. This is proved: first, from Aristotle in *1 Prio. 1 in initio* and at the end of *2 Elench.*, where he asks to be credited because he discovered the syllogism, invested great labor in it, and directed all the works of Dialectic toward it — as the Doctor attests in the place cited, and Fonseca confirms in *1 Met. cap. 3 q. 1 sect. 3*. Second, the syllogism possesses all the conditions required for the adequate subject of Logic. Therefore it is its adequate object. The antecedent is proved: of the syllogism it is presupposed whether it exists and what it is, as is clear at the beginning of *1 prio.*, where its definition is given. Likewise its demonstrable principles and properties are given — both in the books of the *Prior Analytics* and in the remaining books. And everything treated in Logic is referred back to it in some way — either as administering to it, such as definition in *6. 7 Top.* and *2 post. 2*, and division in *8 Top. 1* and *2 prio. sect. 2 c. 3*; or as the imperfect to the perfect, such as the enthymeme, example, and induction in *2 prio.*; or as integral parts or remote matter in *1 praedicam.*; or as proximate matter in *l. perih.*; or as subjective parts in *l. post. Top.* Again, the syllogism contains all the truths that can be had in Logic and provides it with unity and distinction, just as any object provides unity and distinction to its science. Therefore the syllogism is the total and adequate subject of Aristotelian Logic.

Fourth Thesis. The mode of knowing is the total object of Logic considered in itself. So Scotus holds in *1 Prio. quest. 2 §. Quantum ad 3. concluf. 2*. This is proved: first, from Aristotle in *2 Met. 6. 3. 7. 15*, where Logic is called by the Philosopher himself "the mode of knowing" — because it is entirely devoted to the objective mode of knowing as its proper object, as distinguished Scotists expound that

passage. Therefore it is consonant with Aristotle's mind that the mode of knowing is the adequate object of Logic in its full breadth. Second, from the refutation of the other opinions: for every science must be assigned an adequate subject from which it derives its unity and distinction from other disciplines, *1 post. T. 43*. But Logic is a single science distinct from the others, as established above. Therefore it must be granted one adequate subject — which is not spoken words, nor all things, nor being of reason, nor the operations of the intellect, nor demonstration, nor the syllogism, since division and definition are modes of knowing distinct from the syllogism. Therefore it is evidently and sufficiently concluded that the adequate object is the mode of knowing. Third, all the conditions necessary for the total subject of Logic are rightly adapted to the mode of knowing. Therefore the mode of knowing is established as the total object of Logic taken absolutely. The antecedent is clear to one who runs through those conditions one by one. For it is presupposed of the mode of knowing whether it exists and what it is; knowable properties are demonstrated of it; it does not overstep its bounds. For every mode of knowing is either division, definition, or syllogism. Likewise it either is a remote part — such as a term — or a proximate part — such as a proposition — and if anything else is considered in Logic, it is aptly reduced to the mode of knowing, as Scotus shows at length at the end of the cited question.

First Objection. Aristotle in *1 prio. in principio* proposes to treat of demonstration, and in *2 of the same work c. 17* adds that he has treated of demonstration itself. But what a scientific craftsman devotes his care to is its object. Therefore, since Logic cultivates demonstration, it is inferred that demonstration is its adequate object. *Confirmation I.* Logic provides the mode of knowing; but the mode of knowing is demonstration, which is defined in *1 post. T. 1* as "a syllogism that produces knowledge." *Confirmation II.* The intellect is adequately perfected by demonstration alone, since through it the object and its demonstrable properties are known. Therefore demonstration is the total object of Logic. *Reply.* Those and similar passages are to be understood of the principal partial object, not of the total object. For in the first cited passage Aristotle expressly adds that he wishes to inquire what a ratiocination is, and which are perfect and which imperfect. And shortly after he presents the definition of the syllogism in general, insofar as it encompasses the topical and analytic syllogism. In the second cited passage he openly acknowledges that he has treated of ratiocination and demonstration; but ratiocination is broader than demonstration. Moreover, in *1 post.* he treats ex professo only of demonstration, its principles, species, properties, and effects — from which it follows that Aristotle by no means placed the adequate object of Logic there, just as he did not place the animate body in Physics or God in Metaphysics. In reply to *Confirmation I*, I grant the major. As for the minor, I say that demonstration is indeed a mode of knowing, but not every and total mode of knowing — only the

principal partial one. In reply to *Confirmation II*, I deny the antecedent: for what is required for a thing are not only necessary means but also probable ones.

Second Objection. All the conditions for the total object of Logic are present in the syllogism. Therefore the syllogism is its total object. The antecedent is proved: if any condition were lacking to it, it would above all be because not everything treated in Logic is referred back to it — such as division and definition. But such instruments are indeed reduced to the syllogism itself, as things administering to it; and not rarely from them are premises formed. The remaining things are likewise reduced to that same syllogism as the imperfect to the perfect. And the other species of argumentation derive their inferring force from it — as Aristotle openly acknowledges for the example and induction in *2 prio.* and Scotus in *ibid. q. 8* and *1 prio. q. 2*. Therefore that distinction of the subject of Logic in itself and the subject of Logic as left by Aristotle is pointless, since the same object is to be assigned to Logic whether considered in itself or as handed down by Aristotle. *Reply.* I deny the antecedent. In reply to its proof I say that division and definition are distinct modes of knowing from the syllogism, and are partial objects of Logic, about which several demonstrations can be made. Therefore if they are taken precisely, they do not belong to the syllogism per se but only per accidens, insofar as they in some way serve the syllogism. Nor does it stand in the way that Aristotle in *1 Met. c. 7* mentions definition and demonstration while omitting division: for there he enumerates those two modes of knowing as the principal ones, without thereby excluding the third — namely division — which is a less principal instrument of knowing, as Aristotle attests in *2 Prio. sect. 2 c. 3* and Scotus agrees in the place cited, *ver. undequia*. You will press further: definition is reduced to demonstration as terms are to the proposition; but terms per se belong to the proposition, since they are its per se parts. Therefore definition too belongs to demonstration. *Reply.* I deny the parity of the major. For a demonstration can exist — at least a demonstration that is not the most perfect kind — without a definition, whereas a proposition cannot exist without terms. You will urge further: the essence, once known through its definition, naturally leads to knowledge of its property, and is therefore per se inferential — and hence pertains to demonstration as its per se part. *Reply.* Although once the knowledge of an essence is had one can arrive at knowledge of its property and infer a conclusion, this is nonetheless not necessary nor required for the nature of a definition. For God, once the definition of an essence is had, elicits no inference from it — and the same is common to the angel according to Thomistic doctrine. Therefore definition by its own nature and intrinsically claims no inference whatsoever and no discursive function.

Third Objection. Scotus in *q. 3 univers.* affirms and proves that the syllogism is the total object of Logic. Yet in *1 Prio. q. 2 concl. 1* he expressly denies that the syllogism is established as the adequate object of Dialectic, and wishes in that place in *concl. 2* that it is the instrument or mode of knowing. Therefore Scotus

plainly contradicts himself. Faber replies in *cap. 3 Theor. 6* that those books are not Scotus's, since they contain many things not in conformity with his doctrine. But this response is unsatisfactory, since in *qq. univers.* he equally puts forward things that conflict with what he wrote in the *Sentences* — such as that being is equivocal, that the subject of accidents is matter, and the like. All the Scotists nonetheless concede that those questions belong to the Subtle Doctor, as indeed they do. Therefore those books are not to be denied but explained if anything in them appears to conflict with Scotus himself. Hence Veglia in *vestig. 1 q. 6 n. 16* aptly adds that it is the refuge of the wretched to deny either the author of the book or the book of the author when they cannot otherwise escape the force of an argument. Fuentes in *q. 3 art. 5* addresses the matter by explaining Scotus in *1 prio. cit.* as speaking of the subject of predication, and *3 q. univers.* as speaking of the subject of attribution. And he says that therefore there is no contradiction in what the Doctor has said, since the mode of knowing is the subject of predication and the syllogism the subject of attribution. But this response does not resolve the difficulty either. For the mode of knowing is not the total subject of predication in Logic, since the mode of knowing itself cannot be predicated of many things treated in Logic. For a term is not a mode of knowing, nor is a proposition a mode of knowing. Moreover, the subject of predication for the most part transcends the limits of the science of which it is the subject, as is clear from being of reason, which I asserted above in *art. 5* to be the subject of predication of Logic. Again, I proved in the last thesis that division and definition are not reduced to the syllogism. Therefore that distinction of subject of predication and subject of attribution does not resolve the stated apparent repugnance. Cardinal Sarnanus at the end of the question attempts to remove that contradiction by the following distinction — namely that Scotus in the first passage treats of the principal object, and in the second of the total object. But this response plainly conflicts with Scotus's text: for in both passages the Doctor reasons about the total and adequate object, as is clear to one who examines *q. 3 univers. §. Dicendum ergo, quod subiectum primum, idest, adequatum*, as the said Sarnanus declares at *pag. 78*. This is also established from *1 Prio. q. 2*: "Then the first conclusion is formed: that this term 'syllogism' is not the subject in the whole of Logic." And a little after: "The second conclusion is that this term 'instrument of knowing' is the subject in the whole of Logic." To me it seems that the apparent contradiction is entirely dissolved if it is said that in *q. 3 cit.* Scotus is speaking of the subject of Logic as handed down by Aristotle — at least according to the books of his that have come down to us — while in *q. 2 alleg.* he speaks of the subject of Logic considered in itself. This response would not have been rejected by Sarnanus, had he remembered what he said at *pag. 78* — that the question cited above is moved about Logic as given by Aristotle — nor would it have been alien to Faber in *sit. in sol. 3. 4. rationis*, had he not reduced division and definition to the syllogism in resolving the first argument and not repeated below in *cap. 4* what he said there. Or it may be said that Scotus in that volume of Logic said many things according to the common opinion, as Bargius

notes in *q. 3 prol.* as reported by Sarnanus in the margin of *q. 34 univers.* — things that he plainly refutes elsewhere in his writings. And Aristotle too does this in the chapter on quantity, enumerating certain species of quantity which he entirely omits in *5 Met. c. de quanto.*

Fourth Objection. Nothing can be the adequate subject of both the whole and a part, as is clear from the terms. But the syllogism is the adequate subject of the books of the *Prior Analytics*, which are only one part of Logic. Therefore the syllogism is not the total subject of Logic even as elaborated by Aristotle. *Reply.* I grant the major. I distinguish the minor: with respect to its inferential form — I grant; with respect to all its properties in itself, or in its subjective and integral parts and in what is reducible to it — I deny.

Fifth Objection. No science forms its own object: for the object is presupposed to it as the cause is to its effect. For science is produced in part from the object, according to that dictum of Augustine in *11 Trin. c. 12*: "From the knower and the known, knowledge is born." Therefore, since the syllogism is made by Logic, it is inferred that it is not the subject of Aristotelian Logic. *Reply.* I distinguish the major: of real speculative science — I grant; of a rational and directive science such as Logic — I deny. So Mauritius and other commentators on Scotus in the present question. You will ask whether the syllogism is the formal object of Aristotelian Logic. Faber in the passage cited replies affirmatively, before the resolution of the arguments. For a formal aspect is added only to that object which extends more broadly than the science of which it is the object, and is thereby narrowed and limited by the formal aspect added to it so as to fall under this rather than that consideration — as the natural body, through healability, which is one of its formal aspects, fits Medicine alone and is adequate to it. But when the object is of itself equal to the science, Faber says, no formal aspect need be added to it. So the syllogism in every way in which it is to be considered is weighed by Peripatetic Logic, and requires no formal aspect restricting it. It may better be said that the syllogism as an instrument of knowing is the formal object of Aristotelian Logic — but not absolutely. For if it is examined as a being of reason, it pertains to Metaphysics, as Aureolus notes among others in *1 dist. 23 art. 2*, and Sarnanus in *q. 8 univers. pag. 154*, and Scotus and Anglitus agree in *ibid. q. 7 fol. 74 col. 2 in fine*. And if it is considered as an act of the intellect, it pertains to the science of the soul. But if it is examined as a grammatically correct discourse, it is treated by Grammar.

Question IV. On the Utility and Necessity of Logic.

Article I. Whether Logic Is Useful.

That Epicurus and his followers despised Logic as vain and useless is reported by Cicero in *2 de finibus*, Diogenes Laertius in *l. 10*, and Lactantius in *3 Instit.* Their errors are recounted and brilliantly refuted by Lactantius there, and Augustine hints at the same in *1 contra Cresconium cap. 13*. The Cyrenaic followers

of Aristippus agree with them, as attested by Clitomachos and Meleager in Diogenes Laertius, *l. 1*. So too do the sectarians who attack the liberal arts and pursue them with great hatred — because good dialecticians expose their tricks, break their knots, shatter their snares, mock their sophisms, and reduce them to nothing. All these are rightly condemned by orthodox Doctors, who determine and proclaim that Logic is most useful and profitable to us, and cultivate it as the mistress of discourse.

Thesis. Logic is to be extolled with praises and studied by us as a useful discipline. This is presupposed by the Doctor in the volume he edited and completed on Logic. This is proved: first, from Aristotle in *1 Top. 2*: "Dialectic prepares the way to the principles of all methods." In *1 Met. cap. 1* and *2*: through inexperience in Dialectic, the ancient philosophers fell into many errors. And in *2 Met. cap. 3 T. 15*: Dialectic is called the mode of knowing. But the norm of knowing, the rule for avoiding errors, and the instrument for acquiring other sciences is useful and profitable. Plato in the *Phaedrus* and *7 de Rep.*, Augustine in *3 contra Academicos c. 17*, Boethius in *Top.*, Cicero, and Hugh of Saint Victor in *1 Didascalice eruditionis* and others greatly commend Dialectic and bestow great encomia upon it to make known to us its dignity and utility. Hence Augustine in *3 contra Cresconium* shows that Christ the Lord and St. Paul used Dialectic in their preaching and argumentation. And in *2 de doctrina Christiana cap. 31* he adds that it contributes greatly to penetrating and resolving all the kinds of questions found in sacred scripture — and warns there that the lust for wrangling and the puerile vanity of deceiving an adversary must be carefully avoided. Second, what is sought for the sake of acquiring something else is useful. But Logic contributes to the acquisition of the other sciences, since it is the mode and instrument of knowing. Therefore Logic is useful. Third, what adorns and perfects our mind and labors for the sake of something else is useful. But Logic adorns and illuminates our intellect and devotes its labor for the sake of the other disciplines. Therefore it is to be cultivated by us as useful and profitable. Four utilities of Logic are enumerated by Tataretus in *q. 3 dub. 3*: the first is facility in dividing, defining, and arguing; the second is facility in distinguishing truth from falsehood; the third is facility in arguing and responding in every kind of matter; the fourth is facility in resolving paralogisms defective in form.

Objection. What is harmful to the Christian religion is vain and useless. But Logic is harmful to the Christian family. For *1 Cor. 8*: "Knowledge puffs up, charity edifies." And Logic, as has been established, is a science that appears to oppose our salvation, as may be inferred from *Ps. 70*: "Since I have not known the art of letters, I shall enter into your power" — where the Gloss has "into the Christian religion." Therefore Dialectic is not profitable to us. *Confirmation:* from Arius, whose heresies were bolstered by Dialectic, as Jerome writes in his work against the Luciferians. And likewise from Matthew, Luther, Calvin, and many others who construct knotted syllogisms to lead men into error. *Reply.* I grant the

major; I deny the minor. In reply to its proof I explain that testimony with Augustine in *9 Civ. 20* as speaking of knowledge without charity, not of knowledge joined with charity. The same Doctor writes in *In Ps. 118 Con. 17, tract. 27 in Ioan.*: "What is 'knowledge puffs up'? Knowledge alone without charity. This is why evil angels are called demons — because puffed up with knowledge they are proud, perversely presuming, like frenzied men who are rejected lest they enter into the power of the Lord." Thus the cited passage of the Psalm is explained by the same Augustine there, who says that by "letters" are to be understood those who glory in the earth and presume on their own powers. This response is plainly gathered from the Apostle in the same place, who adds: "If I should know all mysteries but have not charity, it profits me nothing." In reply to the confirmation, I say this is per accidens. For it is not bad Dialectic but bad men who use it badly that are at fault — and it is not the use but the abuse that is condemned. This is what Scotus hints at in *2 d. 42 q. 4 §. sequitur ante M.* following Augustine in *9 Trin. 10*: "To define intemperance pertains to the moral art; to be intemperate pertains to what is blamed in that art. Just as to know and define a solecism pertains to the art of speaking, but to commit one is a fault comprehended in that art." Rudolph Agricola also shows this elegantly: "It is not the fault of the art but of wickedness to embrace what should be fled and to pursue what should be embraced." Nor should Augustine be omitted, who in *1 contra Cresconium cap. 1* declares our case with excellent examples: "A soldier should not go unarmed for his country because some have taken up arms against their country; nor should good and learned physicians refuse to use medicinal instruments for the preservation of health just because uneducated and wicked men abuse them for destruction."

Second Objection. St. Jerome, writing to Pope Damasus, leaves this: "Does it not seem to us that one who is tormented day and night in the art of Dialectic enters into vanity of sense and obscurity of mind?" And this is inscribed in *Canon. d. 37 c. Nonne*. And in the same place, *c. Omne vim*: "Heretics put all the force of their inventions in dialectical disputation — which, in the judgment of the philosophers, is defined not as building up but as tearing down; but it was not in Dialectic that it pleased God to save his people." Here too belongs the statement of the same Jerome who, when reading the books of Cicero, was corrected by an Angel for devoting himself to the fictions of pagans as a Christian man. Origen agrees, explaining through the frogs and flies by which the Egyptians were struck, the vain garrulity of the dialecticians and their sophisms. *Reply.* In all these authorities only those are reproved who devote all their care and solicitude to acquiring Dialectic while abandoning the precepts of Christ, as if eternal salvation consisted in the acquisition of Dialectic. This solution and explanation is plainly gathered from the very words prefaced — "it was not in Dialectic that it pleased God to save his people." In reply to St. Jerome, I say that he was not corrected by the Angel for perusing the volumes of Cicero, but for caring too much for them and reading them more than the sacred scriptures,

that his speech might be more ornate and polished. Origen, moreover, is to be interpreted as speaking of the sophistical and counterfeit Logic — as his words cited above plainly demonstrate — and this is confirmed by Augustine in 9. 100 *novi et veteris testamenti*.

Third Objection. Logic either profits itself or profits other sciences. But in neither way does it profit. Therefore as useless it is to be despised. The major is clear. The minor is argued: it is not profitable to itself, since it contains many superfluous things — such as insolubles, obligations, the method of finding the middle term, captious objections and responses. Nor does it profit other disciplines, because expert logicians try to teach the true as false and the false as true. *Reply.* I grant the major; I deny the minor. In reply to the first proof I deny those things to be superfluous; for they greatly assist the sciences, and those who are ignorant of them frequently go astray. In reply to the second proof I say this happens not per se but per accidens — just as a helmsman sometimes capsizes the ship and a physician kills the patient. These are the faults of men, not of arts. Hence Augustine in 2 *de doctrina Christiana* c. 36 says: "It is not the faculty that is to be faulted but the perversity of those who use it badly."

Article II. Whether Logic Is Necessary for Acquiring the Other Sciences.

Three opinions are reported in this article: two extreme and a third intermediate. The first is that of Avicenna in c. 2 of his *Logic*, Algazel in *ibid.* c. 3, and Burleigh in q. 3 *praedicabilium*, who hold that Logic is simply necessary for undertaking the other sciences. The second is that of Jandun in 2 *Met.* q. 12 and Javelli in *Log. Tract.* 1 q. 4, who hold that Dialectic is only useful and profitable for acquiring the other doctrines. The third is handed down by Gadius in *quol.* 16 fol. 165 col. 3, Fuentes in q. 1 *dif.* 2 art. 2, and Fonseca in 2 *Met.* q. 4 sect. 2, toward which Tataretus inclines in q. 3 *dub.* 3; and Scotus is cited for this view in 2 *Met.* q. 12 by the Conimbricenses in q. 6 art. 2 (though Scotus there says nothing about the necessity of Logic). These authors teach that the other disciplines can be acquired by us imperfectly without Logic, but that Logic itself is necessary for acquiring the other sciences perfectly.

Note I, and recall from what was said in q. 2 art. 2 *not.* 1, that Logic is twofold: natural and artificial. Artificial Logic, according to the Doctor in q. 3 *univers.* and Sarnanus in *ibid.* pag. 65 and q. 3 *Prol.* §. *Dicendum ergo*, is divided into old and new. Old Logic encompasses the integral parts of the syllogism, which are given in the books of the *Predicamenta* and *Perihermeneias*, and is called old insofar as it precedes the other subjective parts in time. New Logic contains the subjective parts of the syllogism, which are handed down in the books of the *Prior Analytics*, *Posterior Analytics*, *Topics*, and *Sophistical Refutations*, and is called new insofar as it comes after the aforesaid integral parts, with respect to which it is called old Logic. Moreover, Logic is divided into total and partial. Total Logic is

that which encompasses the whole doctrine of discourse; partial Logic is that which takes in only one part of it.

Note II, from Aristotle in *5 Met. c. 5 T. 6*, Orbellus in *ibid. q. 1*, and Scotus in *1 d. 39 §. Ad arg. 1 q. v.* and *4 d. 10 q. 4 §. Hic duo sunt ante C.*: that the necessary is twofold — absolutely and conditionally. The absolutely necessary is that which according to itself cannot be otherwise — such as God, who is the first existing being and wholly independent; and besides God himself there is nothing else absolutely necessary, according to Scotus in *1 d. 8 q. 5 §. Ad q. Y*. The conditionally or hypothetically necessary is that which is necessary from some cause, and it is fourfold according to the fourfold genus of causes. Necessary from an efficient cause is that which, given the efficient cause, cannot fail to be produced — as given fire, heat is posited. Necessary from a material cause is that which, given that cause, its effect cannot fail to come about — as a body composed of matter and form is corruptible. Necessary from a formal cause is that which, given the formal cause, its formal effect follows — as given the soul in a suitably organized body, its animation follows. Necessary from a final cause is twofold: one is that without which the end can in no way be obtained — as without respiration and food an animal cannot live, and this is called simply necessary. The other is that without which the end can be acquired but not as conveniently, and this is called necessary in a qualified sense — as a horse is necessary for a man making a journey. Aristotle mentions both of these necessities in *1 de partibus c. 1*. The question in the present discussion is whether Logic is necessary for acquiring the other sciences — with the necessity of a final cause only simply, or in a qualified sense.

First Thesis. Natural Logic is simply necessary for the acquisition of any science whatsoever. This thesis is presupposed by the Doctor and denied by no one I have seen. This is proved: first, that is simply necessary to someone without which it cannot be acquired; but without natural Logic no science can be had. Therefore Logic is simply necessary for acquiring any science. The major is clear. The minor is argued: without capacity and natural aptitude nothing is produced by a natural agent — as a stone does not see, because it is not capable of vision. Therefore since natural Logic is the natural inclination or aptitude for discoursing, as is established from *1 q. art. 1*, it is plainly inferred that without it no scientific habit can be acquired. Second, art does not operate where nature does not operate, for art presupposes nature, as we observe in all the works of art. But every science acquired by human effort is an artificial work. Therefore it necessarily presupposes natural Logic as the natural inclination, aptitude, and capacity for knowing and inferring one thing from another — and is therefore simply necessary to it.

Second Thesis. One part of artificial Logic is simply necessary to another part of that same artificial Logic. This too is presupposed by the Doctor in his volume of Logic. This is proved: first, the knowledge had of incomplete terms is simply

necessary for the part that treats of complex terms. For, as stated in *1 post. T. 21*: "We know principles insofar as we know their terms." And what follows from principles cannot be known without knowledge of those principles. For the second operation of the intellect presupposes the first, just as the third presupposes the second. Therefore one part of artificial Logic is simply necessary to another. Second, in order to know a whole distinctly, it is necessary to know its parts — since with the parts unknown, the whole must likewise be unknown, just as one who does not know letters will not know syllables or words either. But the syllogism is a kind of whole composed of parts — namely terms and propositions. Likewise the syllogism in its own way participates matter and form: its form is treated in the books of the *Prior Analytics* and its matter in the books of the *Posterior Analytics* and the rest. Therefore to know it one must know its matter and form. And thus one part of artificial Logic is simply necessary to another.

Third Thesis. Total artificial Logic is not necessary for acquiring the other sciences imperfectly, but it is necessary in a qualified sense for acquiring them perfectly. This thesis is divided into two parts. The first part is gathered from Scotus in *1 Prio. q. 46 §. Ad 1. arg.* and is proved by him thus: first, what is prior does not depend in its existence on its posterior, as is clear; but the other sciences are prior to Logic in priority of time, as was seen in *1 q. art. 5*. Therefore Logic is not necessary for their imperfect acquisition. Second, the other sciences have their own proper principles, divisions, and definitions independent of Logic, as may be seen in any science. Moreover, many men have excelled in the sciences and doctrines — notably Thales of Miletus in Physics, Hippocrates in Medicine, and not a few in Mathematics and Jurisprudence — who never so much as greeted Dialectic at its threshold. Therefore for their imperfect acquisition, Dialectic is not necessary. The second part, which is inferred from the Doctor in *q. 1 univers.* and *Met. c. 3 in expof. T. 15*, is argued: first, from Plato in *7 de Rep.*: "It is impossible for the intellect to attain anything exactly without Dialectic." And Aristotle in *2 Met. T. 15*: "It is absurd to seek science and the mode of knowing at the same time" — where Averroes in *com.* there and Scotus in that place and the cited *q. univers.* take "mode of knowing" to mean Logic. Therefore, in order that no one fall into absurdity and error — that is, in order to know the other disciplines perfectly — Logic is necessary to him. All the more so since *1 Top. 1*: Logic prepares the way to the principles of all methods, for it hands down the mode of dividing, defining, and reasoning. It is therefore necessary for acquiring the other sciences. Second, Augustine in *1. 2 de ordine c. 13* writes: "When reason has proceeded to fabricating other things, unless it itself distinguished, noted, arranged, and set forth those very mechanisms and instruments of its own, it would produce that discipline they call Dialectic." Cicero in *2 de finibus*: "Epicurus despises Dialectic, which alone contains the entire science of discerning what is in each thing, and of judging what each thing is." The same is handed down by Augustine in *1 Civ. c.* Lactantius in *3 Inst.*

adds that through ignorance of Logic, Epicurus fell into absurd errors. Hugh of Saint Victor in *1 Didascalice eruditionis*: "The other arts were discovered first, but it was necessary that Logic also be discovered, since no one can treat of things suitably unless he has first known the right mode of speaking." Vives reports the same in *com. 8 Civ. c. 7*. Third, a thing is not perfectly known unless it is known that it cannot be otherwise, *1 post. c. 2*. But this is provided by Logic alone, which gives the norm for syllogizing in the proper mode and figure. Again, we cannot know a thing except by discovering and judging; but Logic alone teaches the mode of discovering and judging, and also of drawing true conclusions from true premises. Furthermore, without the instrument of knowing, science is not acquired — since science is generated through demonstration, and Logic, as has been established, is the instrument of knowing and the instrumental science. Therefore it is necessary for acquiring the other sciences perfectly.

First Objection. The works of nature are more certain and more perfect than the works of art, *2 Phys. c. 2*. Therefore since we have natural Logic, it suffices for us to acquire the other sciences without learning artificial Logic. *Reply.* The effects of nature are of two kinds. Some are so certain and determinate that they always come about in the same way — as heavy things tend downward, light things upward; fire heats and water cools. For producing these aptly no art is necessary. Others, however, do not have a certain and determinate mode but can come about well or badly, and for directing these correctly some doctrine is necessary. Plato hints at this in the *Philebus*, where Socrates teaches that all men are by nature logical, but that this natural ardor of human reason is rash unless regulated by counsel. By the distinction given above the response to the objection posed is readily rendered: for the antecedent is true of the works of nature of the first kind, but not of the natural effects of the second kind, with respect to which art is said to be more perfect than nature. And from the same author in *4 de finibus*: "Art is a more certain guide than nature." This is the way Aristotle — adduced by Raconis — is to be explained, though I have not found this in the cited text.

Second Objection. If Logic were necessary to the other sciences, it would be necessary to itself, since it is itself a science, as I showed in *q. 2 art. 2*. But one and the same thing does not appear to be necessary to itself — otherwise the same thing would be both prior and posterior, presupposing and presupposed with respect to the same. Therefore Logic is not necessary to the others either. *Reply.* I grant the consequence of the major; I deny the minor. For natural Logic is necessary to artificial Logic, and one partial artificial Logic assists another partial Logic — just as the partial Logic given in the books of the *Predicabilia* and *Predicamenta* assists the one given in the books of the *Perihermeneias*, and this assists the next in sequence, and the whole imperfect Logic serves the whole perfect Logic, and thus serves the other disciplines — as is clear from the hand, which is of assistance both to itself and to the other members of the body.

Third Objection. Logic is considered necessary to the other doctrines for no other reason than the instruments of knowing that it furnishes. But the other sciences possess their own instruments — namely divisions, definitions, and argumentations — as is clear to anyone running through the individual sciences. Therefore Logic need not necessarily be studied in order to acquire the other disciplines. *Reply.* I grant the major. I distinguish the minor: as to form — I deny; as to matter — I grant. For although each science possesses its own material for elaborating the aforesaid instruments of knowing, nonetheless the form and mode of these instruments is derived from Logic — as Bassolis rightly notes in *q. 8 prol. art. 2*, and after him Toledo in *q. 1 in solutione 2*, and as I already explained in *q. 2 art. 3 dub. 4*.

First Query. What is the function of Logic? *Reply.* It is to discern truth from falsehood through the mode of knowing, as Augustine indicates in *1 contra Cresconium c. 15*.

Second Query. What is the end of Logic? *Reply.* Following the twofold end — formal and objective — to be explained elsewhere, the formal end of Logic is the perfect knowledge of the mode of knowing, or of the syllogism, as Tataretus indicates in *q. 2 dub. 2*. The objective end is the mode of knowing, or the syllogism, with which it is entirely occupied. And since the intrinsic end of a science coincides with its object — as Faber observes at the end of *Theor. 1* from Scotus in *q. 3 prol. ante T.* — nothing else need be investigated beyond what I have already handed down above on the object.

Book II: On Universals

Aristotle warns in *On the Parts of Animals*, I.1, that the investigation of universals should precede the investigation of particulars. Following in his footsteps and carrying out his directive, I shall treat first of universals taken generally, and then of each one in particular — so that, once the universal is known in common, each particular may be understood more conveniently. Although an ample and extended treatment of these matters pertains more properly to Metaphysics than to Logic, as Hurt. objects at *disp.* 3, §. 1, and although he censures this as an abuse in the schools and endeavors to remove it entirely: nevertheless, because many things in Dialectics as well as in the remaining sciences cannot be grasped by beginners without knowledge of universals, we are compelled to set forth their treatment here, together with Scotus and the other philosophers — especially since Logic treats universals according to intentional being and Metaphysics treats them according to real being. As Joannes Anglicus notes at 9.24, there is nothing logical that cannot be investigated metaphysically, and nothing metaphysical that cannot in its own way be examined logically, on account of the agreement and affinity between the two disciplines, concerning which see above, *q.* 2, *art.* 7 of the preceding book. All the more so because the aforesaid Hurt., unwilling to do so, nevertheless falls into metaphysical questions from which he had resolved to abstain, as though he had corrected a common error. For this author, at the very beginning of *sect.* 1, inquires whether the higher degrees are formally distinguished from the lower ones. And at *disp.* 6, *sect.* 3, he investigates whether the concept of the subaltern difference belongs to the formal concept of the ultimate difference. These and similar matters are considerations proper to Metaphysics, and so Hurt. is caught in his own net, the very one he wove for others. Accordingly, I have resolved to discuss and settle here whatever of the matters to be transmitted in the course of this work must be known before we reach Metaphysics.

Question I: On Universals in Common

Article I: Whether Universals Exist

The Subtle Doctor at *1.d.3.q.4*, §. *quantum ad 3, art.*, shortly before I, together with Lych., Vigerius there, and Aur. *d.* 36, *art.* 1, records the opinion of the Heracliteans, whose foremost leaders are Heraclitus and Cratylus. These men, as Aristotle testifies at *3 Caeli*, T.3, *1 Met.* T.5, and 4 of the same work at T.22, perceiving that all things are in perpetual flux and subject to corruption, deny that there are any universals in things and abolish entirely all science that is had of universals. But they are sharply attacked and vigorously refuted by the Stagirite and Scotus in the cited passages, together with Socrates and the other philosophers, all of whom write with one pen that universals are given. With the various accepted senses of the universal presupposed — senses which Maior sets

out at *1 praedicabiliū*, q. 3, not. 1 — and with what I have gathered and explained in the *Epitome*, l. 1, q. 3, art. 1 and 2 regarding the division and definition of the universal and its conditions recognized, the following assertion is made.

Assertion: Universals exist. So Scotus in the cited passage and at q. 4 *univers.*, where he proves that the universal is a being. And at *2.d.3.q.1*, it is argued: first, from Aristotle at *1 Perih.* c. 5, where he divides things into universals and singulars; and at *1 Phys.* T. 49; and at *2 De Anima*, q. 5, T. 60; and at 3 of the same work, T. 58: intellect is of universals and sense is of singulars. Second, those things ought to be admitted for which there is a definition, *7 Met.* T. 14 and 29 — for of what is not a being, no definition is given, as the Doctor notes at *4.d.1.q.2*. But universals are defined at *1 Perih.* 5 and *1 Post.* 25; universals must therefore be conceded. Third, the objects of the sciences, with which the sciences are occupied, cannot be denied, as Scotus touches upon at q. 3, *prol.* 5, *Ad 1, arg.* 1, q. But the objects of the sciences are universals, *7 Met.*, cited by the Doctor at *coll.* 76, §. *Ad 1 istorum*. And of singulars there is no science: *1 Post.* T. 62 and *7 Met.* T. 53. The reason is given by Scotus at *2.d.9.q.2*, §. *Ad arg. pro 1 opinione in solut.* 4, namely, because singulars do not have proper knowable and demonstrable attributes. This is confirmed by the same author at *3.d.22*, sub F. 4, from Aristotle's chapter on relation: when one relative is posited, the other is also posited, since correlatives are simultaneous by nature. But singulars are given, as is plain to all; therefore universals must be established as their correlatives.

Fourth objection. First: Everything that exists in the world is singular; therefore no universal is given. The antecedent is proved: everything that exists is either created or uncreated; but both the created and the uncreated are singular. For God alone is uncreated, and he is singular; and everything created is likewise singular, for creation and every kind of production is of singulars, *1 Met.* c. 1. Confirmation from Boethius: everything that exists, exists precisely because it is numerically one. But the universal is not numerically one, which is what is singular; therefore no universal is given. I distinguish the antecedent with Tatar. q. 1 *Praedicabiliū dub.* 3 and Orbel. *1 Met.* q. 1 in fine 2.2: through itself, I concede; through accident, denominatively and really, I deny. This distinction is derived from *1 Met.* c. 1, where Aristotle, asserting that experience is of singulars and art is of universals, adds: for the physician does not cure a man except per accidens, but Callias or Socrates, to whom it is an accident to be a man. Or — which comes to nearly the same thing — the antecedent may be distinguished: primarily and immediately, I concede; secondarily and mediately, I deny. This response is drawn from Aristotle in the *Praedicamenta*, chapter on substance: when primary substances are destroyed, the secondary substances are destroyed also. Now primary substances are singulars, and secondary substances are universals. Therefore production and destruction touch singulars immediately and universals only mediately. Thus when Peter is born or dies, this man who is called Peter is immediately born or dies; but man is born or dies only mediately.

Scotus responds the same way at *2.d.3.q.6*, §. *Ad q. D.*, and at *3.d.22, q. un.*, §. *Ad 1*, G.

You will press the point: at *q. 4 univers.*, Scotus argues that Boethius must be interpreted as speaking of what exists apart from the operation of the intellect, which is not the case with the universal, which has its being through the work of the intellect; therefore the foregoing distinction is worthless. Moreover, the argument from the negation of the inferior to the negation of the superior does not hold. For it does not follow: man does not exist; therefore animal does not exist. Nor: animal does not exist; therefore body does not exist. It is therefore not well argued that when singulars are removed, universals are removed as well. And Porphyry expressly teaches this in the last chapter of the *Isagoge*, saying that when all individuals are removed, the species is not removed; and when all species are removed, the genus is not removed — since the prior can exist without the posterior. Therefore the genus can exist without the species, and the species without the individuals.

I reply that Scotus in that passage speaks of the logical universal, not of the metaphysical universal, for which the aforesaid response stands. To the other inference I say that the argument is not from the negation of the inferior to the negation of the superior, but from a sufficient enumeration of the parts: when all the parts of some whole are removed, the whole must necessarily be removed. As for Porphyry, I say that he must be interpreted as speaking of objective and cognized being, not of the being of real existence, as Aristotle says in the passage cited.

Fifth objection. Second: Everything other than primary substance is either predicated of primary substance or is in primary substance. But the universal is other than primary substance and is neither in primary substance nor predicated of primary substance — for only secondary substances are predicated of primary substances; and if it were in primary substance, it would be an accident, like whiteness which is in the wall. I concede the major. I distinguish the minor: the universal taken precisely, I concede — for so taken it abstracts from substance and accident, just as being taken precisely abstracts from finite and infinite. But if the universal is taken specifically, as a per se subsisting being, then secondary substances are universals, and they exist in primary substances by inexistence and not by inherence as accidents do, and are predicated of them, as: Peter is a man.

Sixth objection. Third: Whatever exists either comes from nature or from intellect. But the universal does not come from nature, since nature regards only the singular; therefore the universal comes from the intellect, and is hence a fiction. I concede the major. I distinguish the minor: that the metaphysical universal exists on the part of the thing, I concede; the logical universal, I deny — for it comes from the intellect, yet is not a fiction because it has a foundation

in the thing, as the Doctor intimates at *q. 4 univers.* and *Theor. 4*. This will be explained below.

You will press: if the logical universal comes through the intellect, as is conceded, then it is poorly investigated whether universals exist. The consequence is argued: a proposition with two terms signifies real existence, as "man exists," in which what exists only through the intellect cannot participate — as is the case with the logical universal. I concede the antecedent and deny the consequence. To the proof I say that the proposition is not an absolute proposition with two terms, but is a dubitable proposition, or a dialectical problem, as may be seen at *1 Top. 1*. Or one may say that there is a twofold existence: real, which a real being possesses; and intentional, which a being of reason enjoys — such as the logical universal.

Article II: Whether Universals Are Spoken Words or Concepts

The Nominalists, whose prince or rather restorer is Ockham in the *Logic* c. 14, *1.d.2.q.4*, and *Quel. 4* and *5* — his faithful companion Gabriel in the same places, and Greg. at *1.d.3.q.1, art. 2*, to whom Aur. seems to assent at *1 dist. 33, art. 2* — hold that universals are nothing other than spoken words or concepts. They think that the universal in predication coincides with the universal in signification, not in the sense that the universal in signification signifies a common nature — since every nature is singular — but because it immediately signifies several singulars: thus the word "man," by its primary and immediate signification, designates all and each individual man. These thinkers are called Nominalists because they attribute much to names, as may be seen in the cited passages. They are indeed very learned and ingenious men, though accepted and received by few; they are graduates of the Scotist school, praised and defended by Hurt. at *disp. 1, sect. 3* and *disp. 5, Met. sect. 10, subsect. 2*. Although the said Hurt. endeavors to draw and reduce them to the Thomist position, they are perhaps unwilling to embrace it, since they constitute and advance a third class differing in every way from both the Thomist and the Scotist positions. But whatever may be said of this, all the realist philosophers defend the opposing opinion, categorically denying that universals are spoken words or concepts.

Assertion: Universals are neither names nor concepts. This assertion is twofold and is drawn from Scotus at *q. 4 univers.*, where he proves that universals are beings, and at *q. 1 praedicam.*, §. *Ad q.*, and *7 Met. q. 18* after Scholium I of Canellus. Hence the same Doctor at *1.d.26.q.un.*, §. *Quantum ad 3 viam*, G, adds that problems that are merely about spoken words are vain.

The first part is argued: first, from Aristotle at *1 Perih. c. 5*, who calls things universal, not spoken words and names. At *1 Post. c. 2*, universals are better known than singulars. At *7 Met. T. 4* and *45*, the universal is one in many. And there at *T. 24* and *51*, disputing against Plato, he does not contend that universals are names, nor does he reproach Plato on this account; rather, presupposing

that universals are beings, he vehemently refutes and sharply rebukes him precisely because Plato placed them outside and really separated and abstracted from singulars. Second, from St. Anselm, *l. de Incarnatione Verbi*, c. 2: "Those dialecticians of our time who think that universal substances are nothing but the blowing of a voice ought certainly to be warned." And shortly after: "For one who understands the world — how several men are one man in species — how will he comprehend in that most secret and most lofty nature how several persons, each of whom is perfect God, are one God?" Third, no science is about spoken words and names, as is plain to anyone who runs through the individual objects of any science. A dispute about a name is considered trivial by all. Hence Augustine at *1 Retract.* c. 15 says: when the matter is settled, undue force should not be applied to the name. And Scotus at *1.d.8.q.1*, E, calls an objection about a name childish. But science is about universals, from Aristotle at *2 Met.* T. 10 and Scotus there, and at 3 of the same work toward the end; therefore universals are not spoken words. Further, definition is of universals, from the same authors at *7 Met.* T. 35, which properly explains not the nature of a name but the nature of the thing. Again, when "animal" is divided into rational and irrational, it is not the spoken word "animal" that is divided, but something distinct from the word itself and signified by it. Moreover, universals are said to be eternal, to abstract from singulars, and to be predicated of them as superiors of inferiors — as Lych. argues acutely against Ockham at *2.d.3.q.1*. These and similar properties are appropriately applied not to spoken words but to things. It must therefore be denied that universals are spoken words.

The second part is proved: first, every concept is either formal or objective. But universals are not objective concepts, as the adversaries themselves admit — for objective concepts are things known and understood, which they do not allow. Nor are they formal concepts, since formal concepts, being entirely acts of intellection residing in the category of quality, while some universals are substances and some are accidents — as is plain in Porphyry's *Isagoge* and Aristotle's *Praedicamenta* — it clearly follows that universals are not formal concepts. Second, universals enter into the essence of singulars, as "rational" belongs to the essence of Peter and "irrational" to the essence of Bucephalus; but formal concepts are outside the essence of singulars, for they reside in and perfect the intellect, *9 Met.* 16. Therefore universals are not formal concepts. Third, these propositions are true: "Peter is a man," "Bucephalus is a horse"; but these are false: "Peter is a concept," "Bucephalus is a concept." Since universals are therefore predicated essentially of singulars, but concepts are not, as the cited propositions make plain, it is evidently concluded that universals are in no way concepts.

You will say that universals are concepts that suppose not simply or for themselves but personally — that is, for the things they signify — just as spoken words stand proxy for things. Against this: if concepts suppose for things, and if all things, according to the opponents, are singular, then the aforesaid

propositions would also be false: "Peter is a man," "Bucephalus is a horse." For the sense would be that Peter is every man, since "man" is a common term and would suppose for each individual of human nature. Likewise, in "Bucephalus is a horse," the term "horse" would suppose for all and each individual horse — and these and similar conclusions are redolent of absurdity and falsity.

Thirteenth objection. First: Universals are not confined to a particular place and time, because they are said to be eternal and everywhere. But all things except God are confined to a particular place and time; therefore no universals exist besides spoken words and concepts. I concede the major. I distinguish the minor: singular things, I concede; universal things, I deny. For the division of things is into singulars and universals, *1 Perih.* 5. And universals are said to abstract from place and time and to be everywhere, not positively but negatively, as will plainly appear from what is to be explained below.

Fourteenth objection. Second: To signify belongs to names; but universals signify; therefore universals are names. The major is known from the *Epitome*, where I presented and explained the definition of a name as a spoken word signifying by convention. The minor is supported by the authority of Aristotle in the chapter on substance: secondary substances, which are counted among universals, signify a kind of what. And at *4 Pol.* 2: to dispute about the best constitution of a state is nothing other than to discuss these names — where he had just mentioned kingship, aristocracy, and democracy; therefore the Nominalist opinion is true and Peripatetic. I reply that the Philosopher used metonymy, taking names for things, which he explains at *1 Elench.* 1 by the likeness of counting-tokens used in place of money. And this is plainly demonstrated in the passage cited in the objection, where he says that primary substances signify this individual thing. But it is certain to all that primary substances are not names but true singular things subsisting per se. This manner of speaking is found at times in sacred scripture, as at *2 Reg.* 1: "What is the word? Tell me" — that is, show me what has been done. And more clearly at *Luke* 2: "Let us see the word that has come to pass" — that is, the thing that has come to pass. The Doctor intimates the same at *q. 1 praedicam.*, §. *Ad q. dici potest*, toward the authority of Boethius. And earlier, Aug. *q. 19 in Indic.*

Fifteenth objection. Third: From Scotus now cited, toward *Ad aliud dico*: Logic is about the concept; thus the Nominalists seem to wish universals to be concepts signified by spoken words, in which sense Hurt. in the cited passage interprets them and Tol. *q. 2 in Porph.* indicates the same exposition. Therefore the Nominalists do not depart from Scotus's teaching. The response to this objection is to be found at *l. 1, q. 3, art. 6*, where it is said that Scotus holds Logic to be about the concept formed by the act of reason, which coincides with the being of reason and the second intention, which I have established as the subject of Logic according to predication, not according to attribution — from which the Nominalists appear to differ greatly.

Article III: Whether Universals Are Platonic Ideas

The opinion of Plato, who supposed universals to be ideas of things — that is, common specific natures existing per se, really separated from singulars, necessary, eternal, incorruptible, principles and efficient causes of singulars — is recited and refuted by Aristotle at *1 Met.* c. 7, T. 15, and at 7 of the same work, c. 6, T. 28, 44, and elsewhere throughout. This seems to be Plato's view in the *Timaeus*, the *Theaetetus*, and *10 de Rep.* This position is recalled by Scotus at *1 post. q.* 31, §. *Ad probationes contra hoc*, and at *1.d.35, q. un.*, §. *Ad ista sub J*, and at *2.d.3.q.6*, §. *Ista positio*, sub A, and in the same distinction at *q. 1*, §. *sed contra istud.* Maior calls it a fiction at *l. praedicabilium, q. 3, Not.* 1. Orbel. at *7 Met.* c. 7, Pelbar. *Tom. 1 Rosar.* ver. *Idea* §. 5, and others likewise. Bonet, however, at *7 Met.* c. 2 and 3, expresses and defends it plainly and fully in ten assertions as a problem. The rest, perceiving its falsity and absurdity, attempt to repel this alleged calumny imposed on Plato by Aristotle and to defend Plato himself against it — among these are Aug. *22 Civ.* c. 26, and *3 contra Acad.*, and *7 Conf.*, Jambl. in his commentary on Plato, Bessarion, *l. 2*, Mayr. *1.d.47*, Rich. *d. 36*, and Vulpes *disp.* 29, *art.* 1. With these seems to agree Scotus at *4.d.50.q.3*, §. *Respondeo*, D, and at *1.d.35.q.un.*, §. *Ad ista sub I*, and Antonius Andreas at *7 Met. quest.* 16 — interpreting Plato charitably as speaking of ideas of things existing in the divine mind, roughly in the way theologians admit them; and so the divine Plato spoke divinely. But Aristotle rightly attacked Plato, as Aur. *1.d.36.art.1*, fol. 843, and Cyril *2 contra Julianum* demonstrate. Nor does it seem probable that all Plato's disciples, living in the same city, would attribute to him a position that is false and absurd. For Aristotle is not unaware that Plato established an eternal exemplar of the world, as is plain from *1 Caeli* — but Plato does not place the ideas of things in the divine mind as theologians do; rather, he places them as subsisting in themselves and as something really distinct and separate from and subsistent apart from singulars. Whatever Plato's meaning, what we must attack is this — whether it was taught by Plato, or by Xenocrates, or affirmed as a Platonic doctrine by other philosophers of the same period, as August. indicates at *7 Civ.* c. 28 — moved by the triple cause recounted by Aristotle in the cited passage, Scotus at *7 Met.* p. 216 in the note on the text, and Gadius *quol.* 7, fol. 85. The first is on account of the formal entity of things, since singulars are beings by participation. The second is on account of science, which is of necessary universals — for singulars are contingent and corruptible. The third is on account of the perpetual generation of things, for which singular agents do not seem adequate and sufficient.

Assertion: Universals are not Platonic ideas. This is pursued sharply against the afore-named Plato by Aristotle and Scotus in the cited passages, and by the remaining philosophers, both realists and nominalists. Proved: first, from *1 Met.* c. 7, T. 34: what belongs to the essence and quiddity of something is not really separated from it, for nothing is more intimate to a thing than its essence and quiddity. Or, as Scotus says at *2.d.3.q.1*, §. *sed contra L*: every substance existing

per se is proper to that whose substance or essence it is. But universals are the essences of singulars — the essence of Peter is to be rational, animal, body, etc., which are universals. Universals cannot therefore be Platonic ideas. Second, those Platonic ideas, or specific natures subsisting per se, are of the same nature as their singulars, and are themselves incorruptible, immaterial, and eternal; but their singulars are corruptible, material, and temporal according to Plato. Yet, as Aristotle argues at *3 Met.* c. 2, T. 6, it involves a contradiction to establish, among things of the same nature and kind, some as incorruptible and others as corruptible — since, as he says at *13 Met.* 6.9, T. 25, the corruptible and the incorruptible differ in genus. Third, a specific nature really separated from its singulars would both be common to many and not common to them. It would indeed be common, as Plato concedes — for what is participated in by many is common. But it would not be common, because what exists per se and immediately on the part of the thing is singular and incommunicable, which is opposed to the communicable and common; for only the singular exists per se and primarily, as I said in the first article of this question. Fourth, the universal is univocally predicated of its inferiors — as "Peter is a man," "Bucephalus is a horse." But the Platonic idea is not predicated univocally of its inferiors and singulars. For it is not well said: "Peter is the idea," "Bucephalus is the idea." Furthermore, if Platonic ideas were to be posited, it would be principally on account of the three aforesaid motives advanced before the asserted proposition; but these do not compel us to admit them in that way. And indeed not because of the first — for this man, for example, is truly a man, not by participation in a separated man, but by participation in human nature, which is common to individual men. Nor because of the second — for of mutable and corruptible things, science is had in view of the necessary connection between subject and predicate. Nor because of the third — for generation is of singulars, as is every other action; following that dictum of *1 Met.* c. 1: actions are of singulars. Therefore universals are not the afore-named ideas, but must be consigned, with Aristotle cited just below at T. 32, among empty verbiages and poetic metaphors.

Eighteenth objection. First: What is immutable and incorruptible cannot exist in what is mutable and corruptible; otherwise it would be changed and corrupted along with the latter's change and corruption. But universals are immutable and incorruptible, while their singulars are mutable and corruptible, as we experience daily. Therefore universals do not exist in singulars but remain separated from them — and these are what Plato calls the ideas of things. I reply that the major may be denied: for the rational soul, immortal and incorruptible, exists in the mortal and corruptible body. Likewise God, eternal and immortal, exists in things subject to time and change. As for our question, universals are in singulars, as is plain from the definition of the metaphysical universal — that is, one in many — just as superiors are in inferiors and quiddities in those whose quiddities they are. They may be said to be mutable, generable, and corruptible

not per se but per accidens, as I explained in the first article in response to the first objection. By this distinction the minor is answered: universals are immutable and incorruptible not simply and in an unqualified sense — for they are generated with the generation of singulars and corrupted with their corruption — but in a qualified and compound sense, as Scotus notes at *3.d.22, q. un.*, G.

Nineteenth objection. Second: Everything one thing that is participated in by many necessarily exists separately from them; otherwise it would not be one but many. But "man," for example, is something one and is participated in by many and univocally predicated of them; therefore a specific man must be granted as really separated from his singulars, and this is what is called the Platonic idea. And the same must be affirmed of the remaining specific natures. I deny the major, if that one thing is quidditative and essential common to many, as will be plain in the two following articles, in which it will be shown that common natures are given which enjoy unities lesser than numerical unity.

You will press: if we concede real common natures, we equally admit Platonic ideas, which mean nothing other than common specific natures participated in by many individuals, as may be seen in Maior at *1 praedicabilium, q. 30, not. 1*. And so, unwilling though we are, we fall into Platonic ideas, as some object to us. I deny the inference. For, as the Doctor says at *1 post. quest. 21* toward the end, there is no small difference between us and Plato. Because Plato placed common specific natures as really separated from singulars — as certain intelligences and minor gods, as Bonet, his auditor, notes after him at *8 Met. c. 1*, eighth statement. We, on the other hand, hold that common natures exist in singulars and have no existence distinct from the existence of singulars, as Aristotle intimates at *6 Eth. 11*: from singulars, universals arise.

Twenty-first objection. Third: Without any singular man being understood through the species of man, we understand man. But man as understood through such a species is not joined to individual men; otherwise he could not be understood without them. Therefore he is really separated from them. I reply that man is understood precisely without his singulars through abstraction of the intellect, not through real separation from singular men. For abstraction does not involve falsehood, *2 Phys. 12*. And thus it does not follow that a specific man separated really from his singulars is given; it only follows that man in himself is understood with singulars excluded — that is, without them being understood — for the superior can be understood without the inferiors on which it does not depend.

Article IV: Whether Real Common Natures Exist

Two highly celebrated and diametrically opposed opinions of the philosophers shine forth in this article. The first is that of St. Thomas in the opusculum *De Ente et Essentia*, c. 4, Cajetanus there, Ockham *1.d.2.q.6*, Gabriel in the same

place, and many others who deny that real common natures are given; Ponc. *disp.* 3, q. 2 lends his support to this view. The latter opinion belongs to Scotus at 7 *Met.* q. 16, 2.d.3.q.1, §. *Ad q.*, E and F, Antonius Andreas, Gratianus Brixienis there, Raconius *Tract.* 1 *de univers.* q. 2, Fons. 5 *Met.* c. 28, q. 4, and all the Scotists, who affirm that real common natures exist on the part of the thing.

Note I, from Scotus at q. 11 *univers.*, §. *Ad 1 q.*, and Vallo *Tract. form.* fol. 139 and 140, that a common nature can be considered in three ways. First, as it has being in its singulars — in which case it is determined, contracted, and singular through individual differences, which the Scotists call haecceities. This is called its material and fundamental being, in which common accidents inhere, such as whiteness, blackness, and the like. Second, in itself or according to its quidditative and essential being, to which only essential predicates belong — such as, for human nature, "sentient," "rational," and the like — and to which proper accidents belong, such as for said humanity, "risibility" and "teachability." Third, in known being, insofar as it is apprehended through an intelligible species by the intellect — as when the intellect perceives human nature as communicable and predicable of many, and moved by this attribute causes or leaves behind in the nature thus known a second intention, which is called a species. This distinction is commended as golden by Joannes Anglicus and Sarn. at q. 9 *univers.* p. 163, and is also indicated by the Doctor at 2 of the cited passage, and at 1 *Perih.* and 1.d.25.q.un., §. *Et relatio* sub G.

Note II: Although a common nature cannot exist without its singulars, as the Philosopher demonstrates against Plato in the preceding article, it is not on that account singular of itself — since the singular is incommunicable and indivisible into subjective parts, whereas the common nature can be participated in by many and is divisible into subjective parts. Rather, it is prior by priority of nature to all singulars. For common things naturally precede singulars, and the more common precede the less common — thus being precedes substance, substance precedes body, and so on for the rest of the quidditative and essential predicates. In this prior state, Scotus adds at 2 of the cited passage, before F, that the nature is whatness, or essence, or quiddity, and is the per se object of the intellect pertaining to Metaphysics, whose consideration concerns every nature and quiddity in light of its essential predicates, which are enclosed in its definition; and the propositions formed of it thus taken are called propositions of the first mode of per se predication. The nature is then followed by its modes and attributes — principally unity, intelligibility, and the like. And since, in accordance with a thing's entity, there is a unity of being proportional to it, a unity lesser than numerical unity arises from the common nature. The nature itself, possessing the aforesaid attributes, is still indifferent to singular and universal being. For it receives the character of each in different ways, and is determined by haecceity to singular being and by the operation of the intellect to universal being, as will be made plain below. The remaining things that might be added here I leave to Metaphysics.

Assertion: Real common natures exist. So Scotus in the cited passages and at *10 Met. in exp.* T. p. 301. *Gadius quol.* 2, Vallo fol. 22, and Tatar. *q. 1 univers. dub.* 1. Proved from Aristotle at *1 Perih.* c. 5, where he divides things into universals and singulars; at *1 Eth.* 6: the nature of whiteness is the same in snow and in lead-white; and at *7 Met.* T. 45: "the universal is what is common; for that is called universal which by nature is apt to be in several things." And at T. 46: "the essence of animal is common to man and horse." From these and from the six hundred other passages one plainly gathers through Aristotle that real common natures exist, without anyone having to think further. Moreover, Aristotle himself pursues the Heracliteans, who admit only singular natures; therefore, unless common natures are conceded, he would attack them without reason. And I press the same point against the Nominalists and Thomists who teach that all real natures are entirely singular.

Second, against Masius *sect. de univers. q. 3, concl.* 8, the authority of August. *19 Civ.* c. 12 arises to meet and aid us: "Whoever contemplates with me human affairs and common nature, however partially, recognizes..." And in *Ps.* 118, *conc.* 8: "No remoteness of genus need be thought of where there is a common nature." The same is intimated by Damasc. *1 Fidei* c. 11 and 2 of the same work c. 22, and *1.3.6.3*, and Chrysost. *Hom.* 3 in *1 Cor.* 3. If every nature is singular of itself, there is no common nature — for singular and common are opposed; the singular is incommunicable, while the common is communicable to many. But it is established that human nature is common to many individuals of that nature — to Peter and Paul and the other singulars of that nature. Therefore real common natures must be admitted.

The adversaries respond that such commonality of nature is through the intellect, which abstracts the nature from its singulars, not on the part of the thing; and individuals of the same species are said to be such not formally but only fundamentally, as may be seen in Hurt. *disp.* 5, *Met. sect.* 2, §. 11. Against this: those that formally have the same essence on the part of the thing participate in the same common nature formally on the part of the thing. But the individuals of human nature formally have the same essence on the part of the thing — namely, the same humanity formally — for they are univocals, those whose essence is one and the same common to many, without anyone having to think further; otherwise their natures would be as distinct as their haecceities, as Hurt. contends in the cited passage. But in the common opinion they differ numerically in their haecceities and are the same in species according to the same specific nature formally — because they formally and really possess human nature, because they are really and formally men by participation in humanity that is not singular (which would be incommunicable to several) but rather common (which is communicable to several). Fourth, nature is understood as common; therefore it is truly really common. The antecedent is conceded by the opponents. The consequence is proved: if nature were not common and were understood as common, the understanding would be false —

for that understanding is false by which a thing is understood otherwise than it is, and the intellect understanding a thing otherwise than it is errs, as St. August. notes at *1.83.qq.32*. And that understanding is true by which a thing is understood as it is. Hence Aristotle adds at *1 Perih.* c. 3: because a thing is or is not, a proposition is true or false. Fourth, without any work of the intellect, Francis and Anthony agree more with each other than Francis and Bucephalus — because the former are of the same species, while the latter are of different species. But that in which they agree is not singular, because the singular is incommunicable to many; therefore it is common to many, which is what we call a specific common nature. Again, the definition explains the nature of the thing, as every school holds; but the nature which the definition expresses is not singular, because *7 Met.* T. 35: definition is of universals. Therefore it is a common nature. The formal distinction between higher and lower grades, which is introduced in *Metaphysics*, and many other things supposed here, powerfully and effectively establish common natures.

Twenty-seventh objection. First: Entities should not be multiplied without necessity, as Scotus teaches at *2.d.2.q.2*, §. *Ad 2 partem q. 7*, following Aristotle at *1 Phys.* T. 1. But if real common natures are admitted, entities are multiplied without necessity — for singular natures suffice, of which all actions are, *1 Met.* 1. Therefore, since being is for the sake of acting and actions belong to singulars, it is clearly concluded that there are no real common natures. I concede the major and deny the minor. For the reasons given and to be given in the following article amply and plainly show that such common natures must be conceded. As for how actions are said to belong to singulars, I made this plain in response to the first objection of art. 1 of this question.

Twenty-eighth objection. Second: Given a real common nature in many singulars, the singulars themselves would not differ from one another but would be entirely the same, according to the axiom of *1 Priora*: things that are the same as a third thing are the same as each other. But it is absurd for singulars not to be distinguished from one another; therefore it is absurd to introduce a real common nature into them. I deny that the inference of the major holds. That axiom is explained by the Doctor at *1 Prior.* q. 9, *1.d.2.q.7*, §. *Ad 1 arg.* II: things that are the same as a third are the same as each other in that identity in which they agree. In this way singulars are identified in the common nature they participate in, but not in their singularities, in which they differ from one another.

You will press, with Suarez *1.4. de Trin. Tract.* 3, q. 3, and Vasquez *disp.* 123, c. 2: once Scotus's explanation is admitted, the fallacy of *petitio principii* is committed. For the meaning would be: things that are the same as a third are the same in it, or are united in it — which is to beg the question. But that axiom has an inferential force: from the fact that certain things are the same in a third, it is inferred that they are the same as each other in the same identity — just as they are the same in the third formally, so they are the same as each other

formally. It may be said, with Faber *1. disp.* 19, that although that general principle admits the aforesaid sense, nevertheless the question is not begged — for someone might know two extremes and be ignorant of whether they agree in a third. From knowledge of the third in which they agree, one can rightly conclude that they also agree with each other in the manner in which they agree in the third, which was previously unknown. And through this proposition thus understood every formal syllogistic form holds, Scotus adds there; with the other condition omitted — either the unity of the middle term between itself, or of the extremes with the middle — it is not a syllogism but a parallogism of accident. Or it may be said, with the same Doctor there, toward *Alia responsio*, that the axiom holds for finite and limited things but not for infinite and unlimited ones, as I explained in the *Epitome*, *l.* 3, *q.* 1, *art.* 4. Now a common nature is in some way unlimited, because it is of itself indifferent to being contracted by this or that singularity; and when it has been contracted through one haecceity, it does not repugn that it be contracted through another haecceity, as Scotus notes at *2.d.3.q.1*, §. *sed contra istud* L.

Thirtieth objection. Third, with Ockham *1.d.2.q.6*: one and the same thing cannot be divided into several things that are adequately identified with it. But nature existing in singulars is not one but multiple, in accordance with the multiplicity of haecceities. Therefore no nature is really common. The major is plain: one is undivided in itself and divided from everything else. The minor is obvious: for Francis, Anthony, and John, for example, are three men, not one man. You reply that the argument concludes about a thing that is one in number, not about a thing that is one with a unity less than numerical unity — such as is the common nature. From this, that proposition of Porphyry, examined by the Doctor at *q.* 21 *univers.*, §. *Ad q.*, and by Tatar. in the chapter on species, appears true: several men by participation in the species are one man.

Thirty-first objection. Fourth: If the same created nature is communicated to many singulars, it follows that in created things there is a mystery analogous to the Trinity — just as in divine things — because the same created nature is really identified with its singulars, just as the divine nature is really the same as the three divine persons. Nor does it help to say that the created common nature is formally distinguished from the singularities, since, even according to Scotus, the divine nature formally differs from the three divine personalities. I deny the inference — because created nature is not of itself singular but indifferent to singularity and universality. But divine nature is of itself singular and is incompatible with being determined through several haecceities. It is therefore wrongly inferred that the mystery of the Trinity exists in created things from the fact that a common nature is given to many singulars. As for what is added about the formal distinction of the nature from the singularities, it is indeed true, but nothing is inferred against us who have assigned the difference and disparity between the divine and created nature, which Scotus likewise intimates at 2 in the cited passage, §. *sed contra*, around H.

Thirty-second objection. Fifth: Scotus at *quol.* 3, §. *Respondeo Q*, says that in created nature there is a commonality of reason; therefore, according to the Doctor, the real commonality of the common nature is not to be admitted — or else the Doctor plainly contradicts himself. Lych. and Gadius reply there that Scotus speaks in the aforesaid *Quodlibet* of commonality and universality in act and in the logical sense, which is effected by the intellect; not of the metaphysical commonality and universality which exists on the part of the thing independently of the intellect, and which the same author evidently taught and vigorously defended in the cited passages.

Article V: Whether a Common Nature Is in Many Things Through Inexistence or Through Indifference

Although all Scotists subscribe with one pen to the view that there is a real common nature in many things without any work of the intellect, they nevertheless disagree among themselves: some, like Lych. *2.d.3.q.1* and Tatar. *q. 1 praedicab. dub. 3*, to whom Fuentes *q. 6, dif. 2, art. 2* and two younger authors at *disp. 4, q. 1, art. 1* assent, hold that the real nature is common to many through indifference. Others, such as Bonet *1 Met. c. 2* and *3* of the same work *c. 1*, and Canonicus *1 phys. q. 6*, hold that the common nature is common to many through inexistence — that is, through actually residing in them. Faber *Theor. 93* strikes the same anvil. For a more convenient grasp of this:

Note: for a nature to be common through inexistence means nothing other than that it exists in many inferiors and singulars and is really participated in by them — so that humanity, for example, is truly and really found in Peter, Paul, and the other individuals of that nature, contracted through their individual differences, in such a way that these individuals are distinguished from one another only by numerical differences. For a nature to be common through indifference, on the other hand, means that each individual possesses its own proper nature, so that the humanity of Peter is different from the humanity of Paul, prior to being conceived as contracted through their haecceities. It is nevertheless called a common nature because, although it is contracted and determined through its individual differences, it is still indeterminate and indifferent — not being determined or contracted more to one individual difference than to another of itself, but always being indifferent and indeterminate to any of them, to whichever of them the generating agent determines it. What indetermination and indifference are, and how many kinds there are, will be shown below in art. 7, not. 4.

Assertion: It is probable that the common nature is in its inferiors through inexistence. Proved: first, from Scotus *2.d.3.q.1*, §. *sed contra*, and there at *q. 6*, sub D, asserting and saying that a unity less than numerical unity belongs to the common nature insofar as it abstracts from individuals, and he gives the example of the specific nature which is found in its singulars. For he has these explicit words in the afore-named passage, sub I: "Therefore there is something

common in the thing, which is not of itself this." Thus, since, according to the same Doctor, a real unity distinct from numerical unity belongs to the common nature insofar as it abstracts from the universal and the singular — and it is the object of the intellect and the ground of acting, while singularity is the ground of the agent — it plainly follows according to Scotus that the common nature is in many through inexistence. Second, the whole exists in its parts and the superior in its inferiors; but the common nature is a kind of whole and something superior with respect to singulars, and is their essence and quiddity. Therefore the common nature is in them through inexistence, as Aristotle argues against Plato in the cited passages of art. 3 of this question. As for what the advocates of the opposing position press — especially the two more recent authors — one can satisfy them without difficulty. First, Scotus does not much favor them, as is plain to anyone who reads his passages cited by them. For the Doctor does not assert what the afore-named recent authors impute to him. *2.d.3.q.7, d. 3, d.8.q. un.* in fine, as is plain to one who examines his text. Although at *d. 3, q. 6* of the second book cited, §. *Ad q. sub D*, he expressly says these words: "I therefore concede that a real unity is not of anything existing in two individuals, but in one." Yet a little later he excellently explains and illustrates this by a distinction, saying: "I concede that whatever is in this stone is numerically one — either primarily, or per se, or denominatively. Primarily, perhaps, as that by which such unity belongs to this composite per se, as this stone, of which that which is primarily one with this unity is a part per se. And denominatively only, as that potential element which is perfected by the actual element, which as it were denominatively regards the latter's actuality and unity." He then adds, further explaining this solution, as follows: "This entity, from which this perfect unity arises, can be explained by analogy with the entity from which the specific difference is derived. For the specific difference can be compared to what is below it, to what is above it, and to what is alongside it." See more there and in Ockham *1.d.3.q.6*. From this it is plainly derived that Scotus wishes the common nature to inexist in its singulars — not primarily, indeed, but secondarily, as I explained in art. 1 of this question in response to the first objection. The same Doctor adds in that place that the singular entity is indivisible into subjective parts, while it does not repugn the common nature — which has a unity less than numerical — to be divisible into subjective parts. And this he states more clearly there sub K: "Whatever is common and yet determinable can still be distinguished, however much it is one thing, into several formally distinct realities, of which this is formally not that — but this is formally a singular entity, and that is formally the entity of the nature. Nor can these two realities be thing and thing, as they can be reality and reality; whence the genus is derived, and the reality whence the difference is derived, from which the specific reality is derived — but they are always in the same thing, whether part or whole, as formally distinct realities of the same thing." Again, the reasons the Doctor adduces to establish the aforesaid common nature effectively corroborate and evidently confirm its inexistence in singulars. And

the formal distinction which the same Doctor introduces among the metaphysical grades or essential predicates does not obscurely intimate this inexistence. The same is illustrated by the example of specific and generic nature, which would be to no point if the common nature were in its inferiors through indifference only — for then every nature would plainly be singular, as those earlier philosophers cited in art. 1 of this question maintain, and there would be no difference or disagreement between them and Aristotle, nor among Thomas, Scotus, Ockham, and their respective followers — whom, however, their own minds and writings clearly show to differ from one another and to arrive at no agreement. Likewise the solutions to the objections now to be adduced will make the same thing plainly manifest.

Thirty-sixth objection. First: One and the same nature cannot simultaneously be wretched and damned, and blessed and glorious — for this involves a contradiction. But if a common nature in many through inexistence is conceded, that very same nature would be both reprobate and elect, simultaneously wretched and blessed — wretched and damned in Judas, blessed and glorious in Christ the Lord. Therefore a common nature through inexistence in many does not seem to be conceded. I reply by conceding the major and denying the minor. For none of the aforesaid inconveniences is inferred — since actions and passions are of singulars, *1 Met.* 1, as Scotus notes at *4.d.8.q.2*, §. *Istas omnes*, and at *d. 12, q. 3*, and Bonet at *1 Met.* c. 2 and 8 of the same work, c. 1. For the common nature is not said to vegetate, sense, or understand, or to perform other actions, since all of these are effected only by singulars. Nor is it inconvenient that certain individuals of the same species should suffer perpetual punishment on account of their demerits — as Judas — while others enjoy eternal glory on account of their merits — as Christ the Lord. For individuals of the same species have singular natures through the contraction of individual differences, from which distinct actions arise; if these are good and meritorious, they deserve reward; if evil and demeritorious, they deserve punishment. Therefore the objection of Ockham and the afore-named recent authors — claiming it is absurd for one and the same nature to be affected with the afore-listed predicates — is of no force. For this holds of one and the same numerically identical nature, not of a nature numerically distinct from another, as is shown in the case of the nature of Christ and of Judas. The Doctor asserts this against those recent authors cited by them. Nor does Aristotle dissent at *12 Met.* T. 12, saying: "For singulars there is a different matter, and a different mover, and species; but by universal reason, the same."

You will say: either the humanity of Christ is the same as the humanity of Judas, or it is different — for between the same and the different there is no mean, *10 Met.* 12. But it is not the same; otherwise the same nature would participate in the aforesaid opposite predicates. Nor is it different — since it is only diverse haecceities that come to the nature; rather, the haecceities are different rather than the nature determined and contracted through such haecceities. I reply

that the nature is the same in species but not the same in number. For the specific nature is divided into subjective parts and multiplied numerically in accordance with haecceities — just as the generic nature is contracted and determined to species through specific differences, so the specific nature is determined and contracted to individuals through individual differences, as Scotus subtly notes at 2.d.3.q.6, §. *Ista positio*. These individual differences are neither singular natures nor singulars, but singularities, or grounds and constitutive principles of singulars. Hurt., not properly weighing these and similar points at *disp.* 5, *Met. sect.*, thinks himself to be demonstrating something against the Scotist school. But what he advances is entirely without force for us, who distinguish specific nature, singularities, and singulars. For the specific nature is communicable to many individuals; singularities are the constitutive differences of singulars that are primarily diverse; and singulars are constituted, incommunicable, and indivisible through the aforesaid haecceities and singularities, as the Doctor teaches learnedly and eloquently in the cited passage.

Thirty-eighth objection. Second: If a common nature inexisted in many singulars, God could neither create nor annihilate any individual of that nature, as the authors of the first opinion argue. But this conflicts with orthodox faith, as is plain from *Gen.* 1 and proved in Scotus at 2.d.1.q.2 and 4.d.1.q.1. Therefore the aforesaid common nature through inexistence in many is not to be admitted. The consequent of the major is argued: creation is the production of a thing from nothing — that is, with no presupposition of it — from the Doctor there and 2 *Report. d.* 1, *q.* 3. And annihilation is the destruction of a thing into nothing — that is, with nothing of it remaining. But if God were to create Francis, the common human nature already pre-exists in Peter and Paul; therefore God could not create the said Francis, nor annihilate him, because the same common nature would persist in the afore-named Peter and Paul. Confirmation: in the Eucharist there would not be a total transmutation of bread and wine into the body of Christ, because the common nature of substance and body would still persist in the body of Christ himself — which is redolent of heresy and conflicts with Scotus at 4.d.10.q.1. The consequent of the major is to be denied. To its proof I say that creation and annihilation touch not the common nature but singulars — as I was just saying about any action and passion in response to the preceding objection. The same is to be said for the confirmation.

You will say: Scotus in the second cited passage, §. *quantum ad istum art.* C, explaining how God can create something from nothing, says: "from nothing, that is, not from anything according to its being of existence, nor from anything according to its being of essence — because the being of essence is never really separated from the being of existence." But if the common nature were presupposed to already exist in certain individuals, the newly produced individual would be produced from that quidditative being and the being of the

essence and nature pre-existing in the other individuals; and therefore God could in no way create another individual of the same nature.

I reply that Scotus there, and at *Report. 2, dist. 12, quest. S*, teaches only that the being of essence is not really distinguished and separated from the being of existence — against Henry and others who think the essences of things exist from eternity, as is plain at *1 dist. 36, q. un.* But that the common nature and its quidditative being do not fall under creation, I showed and made evident sufficiently above. All the more so because, just as the possible and cognized being of things in the divine mind from eternity does not impede their creation in time, so the common nature pre-existing in certain individuals does not prevent other individuals from being created — since creation is of singulars alone. Finally, by the admission of the inexistence of the common nature in singulars, no universal is formally conceded on the part of the thing, as will be shown below in art. 7.

Article VI: Whether a Common Nature Has Its Own Unity Distinct from Numerical Unity

The opinions entirely opposed to each other, and the same authors holding different views, recounted in the fourth preceding article, are found here as well. And the dissolution of this question appears without doubt to depend on the solution of that one. Therefore, for its grasp and explanation:

Note: unity is convertible with being as a property that follows from it, *4 Met. c. 2, T. 3*. Unity is said in as many ways as being, *1 Top. 5*. And the Doctor receives this at *q. 10 praedicam., §. Ad q. dicitur*. Now, in accordance with the entity of each thing, a unity proportional to it accompanies it — if the being is singular, its unity is numerical; but if the being is common, its unity is likewise common. Since therefore the nature is not of itself this or singular, as I showed in the preceding article, it follows that it is one with a common unity, which is called by Scotus and his disciples a unity less than numerical unity — so called in relation to numerical unity, which is the greatest unity — as Sirect affirms at *Tract. form. fol. 9, in fine 1, pag. art. 1 principal*. For the higher the unity, the less it is, according to Scotus — because inferiors are more undivided, and greater unity entails less unity, but not conversely, less unity entails greater. Hence that celebrated canon: from inferior to superior the inference holds, but not conversely. The remaining things that might be said about unity properly claim their place in Metaphysics.

Assertion: The common nature is one with a unity less than numerical unity. So Scotus in the above-cited passages and at *10 Met. in exp. tex. p. 106, in the note*. And this is indicated by Aristotle at *5 Met.* Proved: first, unity is a property of being, and a property is convertible with that of which it is the property, from what was said in the preceding note — for each thing has its own proper unity in accordance with its proper entity. But the common nature is a being; for it has

true and real being on the part of the thing, as is plain from art. 4. Therefore the common nature enjoys the aforesaid unity. Second, either only numerical unity is given, or another unity distinct from numerical unity is conceded. If the second, the intended conclusion is had. If the first — with only numerical unity admitted — only a singular nature is admitted; and thus the opinion of Heraclitus and Cratylus is true, which Aristotle, the Thomists, the Scotists, and the Nominalists cited in art. 1 of this question all strive with all their strength to destroy. From this it follows that Fuentes does not seem to speak consistently with the Doctor's mind when he says at *q. 6, art. 2, dif. 2, ob. 1*, that there are as many common natures as there are singular natures. For many things are predicated of the common nature that cannot be said of singular natures — such as: the common nature is communicable to many and divisible into subjective parts; it enjoys a common unity; it is not of itself this; it is prior by nature to singulars — and similar things which the Doctor infers in the second cited passage. Third, in every genus there is one which is the measure and standard of the others, *10 Met. T. 22*. But that one is not one with numerical unity, which belongs to singular nature alone; therefore it is one with another unity — the unity of commonality. Again, at *7 Met. T. 29*, in the lowest or infima species a comparison is made because the nature is one; but that nature of which the Philosopher speaks there is not numerical, as is plainly clear from his text. Therefore its unity is not numerical. Added to this: in the *Praedicamenta*, chapter on relation, and *5 Met.*, chapter on relation, the relations of identity, equality, and similarity are founded upon a real one — because they are real relations, as August. teaches at *1 de vera religione*, c. 31 and 36. But that one upon which the afore-named relations are founded is not one with numerical unity, because it is communicated and adapted to many; therefore it is one with the unity of commonality.

Forty-fourth objection. First: Either the whole common nature, with its unity, is found in one singular or not. If not, then that singular is not perfect, because it does not participate in the whole nature. If yes, then the common nature is not in another singular — because the whole is that outside of which nothing exists, *3 Phys. 68*. And so there would be only a singular nature with its numerical unity. I reply that the whole common nature with its unity inexists in one individual inadequately, but in all its individuals adequately. Let the example be the rational soul, which adequately exists in the whole human body it informs, but inadequately in each of its individual parts.

Forty-fifth objection. Second: What is in another denominates that in which it is, by what it is — as is plain of whiteness existing in Peter, which denominates Peter himself as white, and of humanity existing in Paul, which denominates Paul himself as a man. Therefore if the common nature together with its unity exists in a singular, the singular will be common and will be one with a unity other than numerical. But it is absurd for the singular to be common, since in created things these seem to be mutually opposed; and it is inconvenient for the

singular to be one with a unity other than numerical. Therefore it is equally inconvenient to admit a common nature with common unity. I reply that the antecedent admits of many counter-instances: for matter is in man, yet man is not matter; likewise water is in a vessel, yet the vessel is not water. Moreover, the stated antecedent holds where there is a univocal predicate, as "man is white" — as Vallo observes after Scotus at *3.d.7.q.3*, in *Tract. form.* fol. 64. But not where there is a determination and contraction of the common to the particular; for it does not follow: "form is in matter; therefore form is matter." And attributes that belong to the nature considered in itself and precisely do not get predicated of the nature as contracted through individual differences — just as if someone argued: "matter is indifferent and communicable to all forms; the matter of wood is per se matter; therefore the matter of wood is indifferent and communicable to all forms." The syllogism holds of matter taken from itself and precisely, not of matter as contracted to the form of wood or of another thing. For thus it is determined to one form, even though it does not repugn it to be determined through other forms. This can also be illustrated by the wall, which is in a neutral potency to receiving whiteness and blackness; nonetheless when it has whiteness, it is determined to that, though it has the potency to receive blackness — as is said in the divided but not in the composite sense. Therefore the consequence of the adduced objection is denied, because the nature in the individual is contracted; and therefore, as it is contracted through singularity, it is not denominated common — as Bonet excellently shows at *1 Met.* c. 5.

You will press: where the nature is, there too is its attribute — for these two are inseparable from each other according to Scotus. But the common nature is in a singular; therefore its attribute — common unity — is there too. But through the inexistent human nature, Peter is denominated a man; therefore through the unity of that very nature he is denominated common. But this conclusion is false; therefore one of the premises is also false. Not the major; therefore the minor — which is Scotus's proposition. I reply that although the common nature with its unity exists in the singular, it does not denominate the singular as common — because it is not predicated univocally of the singular, nor is it its univocal predicate, as is plain from the response to this objection. Hence Bonet's commentator at the cited passage writes that the singular is the subject of the common unity's inherence, but not of its denomination.

You will press further: either the nature, through individual contraction, loses its unity, or retains it. If the second, then the nature is common even as contracted. If the first, then the attribute really differs from the thing of which it is the attribute — which conflicts with Scotus's assertion that the attribute differs only formally from the thing of which it is an attribute. Fons. *5 Met.* c. 28, q. 3, sect. 4 replies that that unity belongs to the nature only in itself and in the state of precision; and that upon existing in singulars it is divested of it. Against this: the attribute accompanies the nature of which it is an attribute wherever and in whatever state it is; for it is reciprocally convertible with it per se and

necessarily, belongs to the same thing, and is really identified with it. Therefore, since the aforesaid unity is an attribute of the common nature, even as the nature is in singulars and as contracted, the nature does not lack such unity. I reply that the common nature indeed does not put away its proper unity insofar as it is contracted through the individual difference; nonetheless the individual is not denominated common, for the reason already assigned and illustrated by examples. But it can only be deduced and inferred that the individual has a common nature with the said unity — just as the transcendental and predicamental predicates exist in the individual with their attributes, as Bonet rightly notes in the afore-named passage.

Article VII: Whether Universals Exist Prior to the Operation of the Intellect

Although Arr. at *disp.* 4, *sect.* 4 thinks this difficulty and controversy is merely about a name, I see that the realist philosophers are sharply divided on this article, disputing most keenly about the matter itself. On one side, some — to whom Fons. 5 *Met.* c. 28, *q.* 5, *sect.* 3 and Racon. *Tract. univers.* *q.* 2 firmly adhere — maintain that universals exist prior to the operation of the intellect; Scotus and nearly the whole of his school are cited in support of this position, but undeservedly, as will appear below. On the other side, many defend with all the strength of their mind that universals exist after the operation of the intellect — the chief champions of this being: Scotus at *q.* 4 *univers.*, §. *Dicendum in solutione* 1, 3, and 7, and 7 *Met.* *q.* 18, and 2.d.3.q.1, §. *sed contra*, H; Mag. Thomas in 1 *de ente et essentia*, c. 4; Antonius Andreas 1 *sexprincip.* *q.* 5; Tromb. 7 *Met.* *q.* 9; Ferch. *vestig.* 1, num. 61; and nearly all the disciples of both groups.

Note I and recall from what was said in the *Epitome*, l. 1, *q.* 1, *art.* 10, that intention is twofold: first and second. The first intention is a known object — such as man as known. The second intention is a passive comparison of one known object to another known object. That is to say: the second intention is a relation of reason caused or left behind by the comparative act of the intellect comparing one known object to another known object — such as the comparison of species to its individuals, and of genus to its species, as was explained there with examples. Next, the division of the universal into logical and metaphysical, and the definition of each, given in the afore-named *Epitome*, *q.* 3, *art.* 1, are to be recalled: the metaphysical universal is one apt to be in many; the logical universal is one apt to be predicated of many.

Note II, from Scotus before *q.* 4 *univers.*, and at 7 *Met.* *q.* 18, and Orbel. there, c. 2, that the universal is a concrete name, the abstract of which is universality. A concrete accidental term, from what was said in the now-cited passage, *art.* 6, presents two things: form and the subject of it. The first, called formal, is its primary signification. The second, called material, is its secondary signification. Thus, since the universal is a concrete term, it can be taken in two ways: for its formal and for its material element. The universal taken for its formal element

is the same as the second intention, or the relation of reason of the predicable to that of which it is predicable — whose investigation per se pertains to Logic; and about this Scotus proposes to treat hereafter in the afore-cited passage. The universal taken for its material element, which amounts to the same as the universal taken for the denominated and the substrate, is a real being pertaining per se to Metaphysics. This material universal is further taken in two ways: for the remote denominate — called the universal in remote potency — which is the common nature existing in singulars, as Aver. writes at *1 Caeli comment.* 92; or for the proximate denominate — called the universal in proximate potency, or that which has the proximate potency to be predicated of several — which is the same common nature abstracted from its singulars by the intellect and divested of individual differences, shining forth in the intelligible species. The universal in act is that which is actually predicated of several and is actually known by the intellect as one predicable of many, by predication that says "this is this," or formal predication, as: "Peter is a man," "Bucephalus is a horse." All of this the Doctor expresses at 2 of the cited passage, H, toward *Ad 1 dico*.

Note III: that the nature from itself — that is, according to its proper and intrinsic entity and quiditative predicates — is neither one nor many, neither singular nor universal, as the Doctor notes in the just-cited passage, §. *Ad q. sub F*, from Avicenna *5 Met.* c. 1, who says: "horseness is only horseness." But the nature is followed by unity and plurality, singularity and universality. And common unity arises from the very nature itself as its attribute, insofar as it naturally precedes every singularity and universality. The nature, so indifferent, is determined to singularity through contraction and becomes numerically multiple in accordance with the multiplicity of individual differences. Through the operation of the intellect it is determined to universality — as, beyond the passage now recounted, Scotus asserts at *7 Met. q. 18* and *1.d.25.q.un.* in fine. But for such a nature to have actual and complete universality, it must possess an indifferent unity — one contrary to the contrariety of determination — by reason of which it is in proximate potency to be predicated of any of its inferiors. For this to be better and more clearly grasped:

Note IV, from Scotus *1.d.3.q.2*, §. *Quod autem dicit*, around Y, that the indeterminate is twofold: the privatively or negatively indeterminate — which is the singular — and the positively contrarily indeterminate — which is the universal. And there is likewise a twofold indetermination: privative or negative, and positive contrary. Privative indetermination, from the Doctor at *1 Met. q. 6*, 7 of the same work, *q. 18*, is the non-repugnance to being determined — belonging to a nature existing in one individual, by reason of which it does not repugn it to exist in others, though it is actually determined to this or that individual through the individual difference by which it is determined and contracted. Hence others describe negative indetermination as non-repugnance to limitation to one thing. Positive contrary indetermination is the repugnance to every limitation to inferiors — belonging to the nature insofar as it has been

abstracted from individuals by the intellect and considered as one predicable of many. It is called contrary indetermination because it is joined to actual determination, quasi as a contrary habit; and the nature under such indifference and actual indetermination is said to be a complete universal — as Lych. affirms with Scotus at 2 *dist.* 3, *q.* 1, in the exposition of §. *Sed contra*. Against this twofold indetermination and indifference asserted by the Scotists — ingeniously and admirably defended — Fons. at 5 *Met.* c. 28, *q.* 5, *sect.* 2 sharply inveighs, saying that the distinction is specious but that nothing of solid doctrine underlies the appearance. But Fons. has not reached or recognized the true solidity and elegance of this distinction, as I shall perhaps show in *Metaphysics*, easily refuting all that he himself advances in opposition.

First assertion: The universal taken materially, or for the denominate — which is called the metaphysical universal — is a real being preceding the operation of the intellect. So Scotus in the above-cited passages. Proved: first, from Aristotle in the passages of art. 4 of this question, to which I add the testimony drawn from 4 *Top.* 1, where these words are read: "When the genus is destroyed, the species and individuals are destroyed." But the destruction of a being of reason is not followed by the destruction of a real being, since there is no necessary connection between them. Individuals are real beings; therefore genus and species, taken for the denominate, are also real beings — since the corruption of singulars follows from their corruption. All the more so because destruction or corruption is properly of a real being, just as production and generation properly belong to a real being. Again, 5 *Met.* 14: real being is divided into ten categories, whose genera and species are universals. Likewise, the metaphysical universal is one apt to be in many, 7 *Met.* c. 15, T. 45. And without any work of the intellect, human nature is one in its individuals, because it is one species participated in univocally by all its singulars. Therefore the universal taken for the denominate is a real being. Second, what is divided into true things is a real being; but the universal is distributed into true things — substance into incorporeal and corporeal, animal into rational and irrational, quantity into continuous and discrete, quality into intellectual and moral. Again, if the dividing members are real, so too is the divided term. For real parts are only in a real whole; but the dividing members of the universal are real — such as Peter, Paul, and the other individuals of human nature. Therefore the human nature itself, which is distributed among them and communicated to them, must be real. Third, the quiditative and essential predicates of a real being must be real; but universals are quiditative and essential predicates — for "animal" and "rational" are essential predicates of man. Furthermore, with every work of the intellect excluded, human nature of itself is not this particular thing, which is singular, but indifferent and negatively indeterminate; it is properly defined, since it is the essence of man, as the Doctor notes at 2.d.3.q.1, §. *Ad q.*, E. Finally, the object precedes the act of the power whose object it is — as color precedes the sight of the eye, and sound precedes the hearing of hearing. But the

universal is the object of the intellect, *1 Phys.* c. 49. And the Doctor proves this in the first cited passage at *q. 6, §. Contra istam opinionem, A.* Therefore the universal taken for the denominate is a real being.

Second assertion: The universal for its formal element, which is called the logical universal, exists after the operation of the intellect and is a being of reason. The Doctor explicitly transmits this at *1 dist. 23, q. un., §. Item arguo, K,* and *d. 25, q. un.* toward the end, and *2.d.3.q.1, §. Sed contra, H,* and *I.* Proved: first, from Aver. *de anima, com. 5*: "The intellect produces universality in things by stripping away what is the essence of a thing existing in the phantasm." And this Aristotle plainly indicates at *1 De Anima, c. 1, T. 8*: "the universal is nothing, or it is later" — that is, after the operation of the intellect that fashions such a universal formally. Hence the same Philosopher adds there: "And whatever else in the same way is predicated commonly." Note here the verb "is predicated," which is intentional. Second, every second intention and relation of reason is produced through the operation of the intellect, as no one doubts. But the universal formally is a second intention and relation of reason, by which the intellect compares a known superior to its known inferiors, as is plain from Notes I and II. Therefore the universal formally is had through the operation of the intellect and is a being of reason. Third, the universal formally is one apt to be predicated of many, *1 Perih. c. 5.* But nothing is predicated of many except through the work of the intellect — for to be affirmed, denied, predicated, and the like, being intentional operations, depend on a reflective act of the mind. Again, the logical universal requires two conditions for its complete being. The first is that the common nature be abstracted by the intellect from its singulars. The second is that actual predication be attributed to many, which are the inferiors of that nature. But both abstraction and predication are effected through the work of the intellect; therefore so too is the formal universal. Moreover, the formal universal is one intelligible thing and predicable of all its inferiors by exercised and direct predication, as the Doctor writes at 2 of the cited passage, *H.* But one intelligible thing cannot be predicated directly of many except through the work of the intellect. For although it does not repugn the common nature existing in one individual to be in another individual, it cannot nonetheless be predicated of each singular except through the intellect abstracting and predicating that very nature of its inferiors.

Fifty-third objection. First, against the Second Assertion: the formal universal is one apt to be in many, without anyone having to think of it; therefore the formal universal is a real being. The antecedent is from Aristotle, *7 Met. T. 45.* And it is argued: two things are required for the universal — unity and aptitude for being in many. But without any operation of the intellect, it is one apt to be in many — as human nature is one apt to be in many and is actually found and exists in many individuals. I distinguish the major: the metaphysical universal, I concede; the logical universal, I deny — as is derived from the Doctor at

1.d.3.q.6, §. *Contra istam opinionem*, A, and 2 of the cited passage, §. *Ad q.* before F, and 1 *Met.* q. 6. Whatever Fons. objects in the last cited note.

You will press: the logical universal, from what has been said, is one apt to be predicated of many; but without any work of the intellect, human nature is one apt to be predicated of many — for without anyone thinking of it, "Peter is a man" and "John is a man." Therefore the aforesaid argument does not conclude only about the metaphysical universal but also about the logical universal. It may be said, from Scotus in 2 just cited, I, that such a thing is not a logical universal in act but only in potency. The reason is that it lacks the indifference by which the universal is completely a universal. For the actual and formal universal demands a unity and positive contrary indifference, which it receives from the intellect — whereas on the part of the thing it has only unity and negative indifference.

You will press further: the formal universal does not require actual being for its essential being, but only potential and aptitudinal being, as is plain from its definition; therefore the aforesaid distinction of the universal in act and in potency does not resolve the foregoing pressing objection. I say that although this is true in objective being and the being of essence, it is not true in the being of existence — because for the ultimate completion of any thing, existence is required as its actual mode, by reason of which it has actual and complete being.

Fifty-fourth objection. Second: The universal is a real being, from the First Assertion. Therefore the formal universal is likewise a real being. The consequence is shown: that of which one part is real is also real in its other part — as is plain in the physical composite, whose parts are matter and form, which are real beings. I concede the antecedent and deny the consequence. To its proof I distinguish: of the physical whole, I concede; of the logical whole, I deny. Because the logical whole is in the mind, as Ferch. notes at *vestig.* 1, num. 61.

You will press: a real being does not receive its completion from a being of reason. But the material universal is a real being and the formal universal is a being of reason, from what has been said; therefore, etc. The major is evident: for a real being is a being simply, while a being of reason is a being in a qualified and diminished sense. Again, formal being is more noble than material being, as is plain from form, which surpasses matter in nobility. Since therefore the material universal is real, it does not seem to be completable in its being by the formal universal, which is of reason. I distinguish the major: of real and essential completion, I concede; of intentional completion, I deny. For a rose in winter has being of reason, and substance is completed and adorned by accidents as by its ornaments. As for the other thing that is added, a distinction must likewise be made: of real formal being, it is conceded; of intentional formal being, it is denied. Thus a known house has formal being in the mind, which is simply surpassed in nobility by real being outside the soul.

Fifty-fifth objection. Third: What has one opposite properly belonging to it cannot have the other opposite — as Scotus argues at 2 of the cited passage, §. *Primo utrum*. But the singular and the universal are opposites, 1 *Met.* 3, q. 6, shortly before B. Therefore nature has either singularity or universality. But it has singularity: for it is singular on the part of the thing through contraction. Therefore universality is incompatible with it. Confirmation I: nature only formally differs from haecceity; therefore it is really identical with this or that individual, and hence is singular. Confirmation II: haecceity is really identical with nature; therefore just as haecceity cannot be multiplied numerically, neither can nature; and so only singularity belongs to it. I reply that singularity and universality belong to the nature in different ways from different agents. From the natural producer, singularity is conferred on it; and from the intellect, through abstraction and comparison to its inferiors, universality is given to the same nature. Therefore as contracted it is singular, but as abstracted and compared to its inferiors it is universal. The same applies to Confirmation I. For Confirmation II: I concede the antecedent and deny the consequence. Because communicability is not incompatible with nature, as it is incompatible with the individual difference. Therefore the former can be multiplied, but not the latter.

Article VIII: How the Formal Universal Comes to Be

That the formal universal is produced by the intellect is agreed by all, and especially by Scotus at q. 4 *univers*. The mode, however, in which such a universal comes to be, and through which act of the intellect — whether through an abstractive act or through a comparative act — is what we must open and explain. For the Angelic Doctor at *opusc.* 55 and 1 *p.* q. 25, art. 3, Loth. at q. 3 *praedicabilium*, and Tol. there at q. 2 hold that the formal universal is produced through the abstractive act of the intellect. But the Subtle Doctor at 1 *dist.* 3, q. 7 in the body, §. *Contra istam opinionem*, and at 2 *dist.* 3, q. 1, §. *Sed contra istud*, toward *Ex hoc apparet probatio* I; Lych. there; Barg.; Paulus Scriptor; Gadius *Quod.* 15; Tromb. 7 *Met.* q. 8; Fuent. q. 6, *aff.* 3, art. 2; and the Coimbrans affirm that the formal universal is completed through the comparative act of the intellect.

Note I, and it is to be presupposed from the book *De Anima*, that our intellectual cognition requires as a prior condition the cognition of the senses — both external and internal — following that dictum of Aristotle at 1 *de sensu sensato*, c. 1, cited and explained by the Doctor at q. 3 and 4 *univers*.: "Nothing is in the intellect that was not first in the sense." For objects existing on the part of the thing first move the external and internal senses through their species and likeness to knowledge of themselves, before they are reached by the intellect — as Scotus shows at 2 *dist.* 42, §. *Ad* 1 sub O. Thus the primary guides of our cognition are the external senses, followed by the internal senses — chiefly the common sense and the phantasy. After these come the agent intellect and the patient intellect: the office of the former is to make all things actual, and the

office of the latter is to receive all things, as Scotus writes at *Quod.* 15, §. *De tertio*, M, and §. *De isto*, N, after Aristotle, 3 *De Anima* T. 18.

Note II: the soul, as Aristotle testifies at 3 *De Anima* 37, is in potency all things — that is, it can know all things. It is in potency to all sensibles through sense, and in potency to all intelligibles through the intellect. That is to say: the soul through sense can perceive all sensibles, and through the intellect all intelligibles — with this distinction, however, that sense perceives singulars and intellect perceives universals, 1 *Post.* T. 33. Hence that celebrated dictum of 2 *De Anima*, 60: "sense is of singulars and intellect is of universals." Since therefore sense perceives material singulars, and the intellect in knowing is bound to sense, it is necessary that things be divested and stripped of material and individual conditions so that universals may be perceived — by abstracting common natures from their inferiors and singulars. For this to be better and more conveniently understood:

Note III: abstraction is a separation or setting apart of one thing from another, which is divided into real and intentional. Real abstraction is the separation of one thing from another, as the separation of gold from silver. Intentional abstraction is that by which one thing is perceived without another. And it is twofold, as Mauritius notes, cited by Vallo at *Tract. form.* fol. 133: divisive and precise. Precise abstraction is the apprehension of one thing conjoined with another, without apprehension of the other — such as the abstraction of animality from rationality; and of this that dictum of 2 *Phys.* T. 18 is to be understood: "those who abstract do not lie." Divisive abstraction is that by which one thing is denied of another, as "man is not a stone." This is subdivided by the Doctor at 7 *Met.* q. 16, §. *De illo igitur*, into actual — which is effected through actual knowledge of the intellect — and habitual — which is effected through the habitual species in which the object is represented. Therefore, according to Scotus at 1 *Post.* q. 3, §. *Ad arg.*: the cognition of the object to be understood having been previously obtained from the internal and external senses through the acquired species, the very same object — still clothed with singular and material conditions — is presented by the phantasy to the agent intellect, whose chief function is to render what is material spiritual (since nothing material can be received in something spiritual); and it is stripped by the agent intellect of singular conditions, and thus is said to be abstracted from singulars by precise abstraction, and is the universal in proximate potency. Thereafter the patient intellect, receiving in itself the species of the same object purified by the agent intellect, and considering that very object divested of every singularity and materiality, compares it to its inferiors and predicates it of them by formal and essential predication — and then the formal universal in act is had, as "man is a species." Hence, as Gadius well observes at *Quol.* 25, fol. 160, col. 4: the common nature existing in its singulars is the universal in remote potency, called the physical universal; the nature then, as abstracted from its inferiors, is the universal in proximate potency, called the metaphysical universal; and insofar

as thus abstracted it is compared to its individuals and predicated of them, it is the universal in act, called the logical universal and, absolutely, the universal. From this it is gathered that the intellect has two acts with respect to the universal: the abstractive — also called the absolute act — by which the intellect prescindes the common nature from its singulars and considers it precisely thus prescinded from them; and the comparative, by which the intellect compares that same nature to its inferiors and predicates it of them, in the way I just made plain.

Assertion: The formal universal in act is produced not through the abstractive but through the comparative act of the intellect. This assertion is twofold, transmitted by the Doctor cited at the beginning of this article; and the Complutenses at *disp.* 3, *q.* 6, §. 2 draw Aquinas toward this view. The first part is proved: first, through the abstractive act the common nature is a universal in proximate potency; therefore it is not a formal universal in act. The antecedent, beyond being evident from the foregoing, is also argued: nothing new accrues to the nature thus abstracted except precise separation from its inferiors; but such precise separation is not universality; therefore through it the abstracted nature is not a formal universal in act. The argument holds from the abstract to the concrete. The minor is shown: in the state of abstraction, the nature is only considered as separated from its singulars and represented in the intelligible species, known without any reference to singularity or universality — as is plain from the definition of abstraction given in Note III. Second, the definition of the formal universal in act is not adapted to the abstracted nature; therefore as thus abstracted it is not a formal universal in act. The antecedent is proved: the formal universal in act is one in many and of many, *1 Post.* c. 8, T. 63. But the nature thus separated is neither in many — since it is separated from them — nor said of many — since it is not compared to them. Third, the formal universal in act receives the positive contrary indifference spoken of in the afore-mentioned passage, as the Doctor intimates at *q.* 37 *univers.*, §. *contra*. But the nature segregated by the intellect has only privative indifference, as I made plain there. All the more so: the nature thus abstracted is not predicated formally and directly of its singulars, which as such it does not regard. Therefore insofar as it is abstracted through the absolute act of the intellect, it is not a formal universal in act.

The second part is derived from the first and proved: first, such as is the form, such is the thing that is informed by the form — for by form a thing is determined and specified. If the form is absolute, so too is what is informed by it. But formal universality is a second intention that regards the superior and the inferior, from Scotus at *1 dist.* 23, *q.* *un.*, §. *contra istud*. Therefore the formal universal in act comes to be through the comparative act of the intellect. Second, the universal is related to its inferiors, of which it is predicated, and they are correlatives related to one another. Therefore the formal universal in act comes to be through comparative knowledge. The consequence holds: a

superior and its inferiors cannot be formally compared with one another except through the comparative act of the intellect. For since the universal is a second intention — which is a relation of reason, or a passive comparison of superior to inferiors — it follows that it comes to be through a comparative act. Porphyry intimates this in his *Isagoge*, where in defining each universal he defines them through their inferiors. I add: a relation is not known except when its term by which it is specified is known; therefore the universal is not known unless its inferiors — which are its term — are known. And therefore the formal universal in act does not arise except through the comparative act of the intellect. Hence Suarez at *disp.* 6, *Met.* n. 7 and the Coimbrans at *q.* 5, *art.* 3 — who admit an absolutely formal universal — are refuted. For it is plainly established and clearly demonstrated that the formal universal is relative and that its form is relative. Moreover, the abstract, from what will be said in the following book, cannot be predicated of the concrete; but the nature through that absolute universality devised by the aforesaid authors is abstracted, as Suarez concedes in the cited passage; therefore it proximately cannot be predicated of its inferiors — which is required for the formal universal in act.

Sixty-second objection. First: Aristotle at 3 *De Anima* T. 18 writes that just as material light by its radiance renders colors actually visible that in darkness they were not, so too the agent intellect, producing the intelligible species in the patient intellect, renders the nature actually intelligible. From this I argue: the object of the possible intellect is the universal; but this universal precedes the possible intellect itself and its operation, because the object precedes the act of the power whose object it is; therefore through the abstraction alone of the agent intellect, the nature shining forth in the intelligible species becomes actually and formally a universal. I reply that nothing at all can be gathered from this testimony that is opposed to our assertion. For I admit the parallel — namely, that through the action of the agent intellect the nature becomes actually intelligible, just as color is rendered actually visible through the illumination of the medium (which derives its plausibility from Scotus at *Quol.* 15, §. *Si vero*, sub Q) — yet I deny that the nature thus made intelligible is a formal universal in act, unless the comparison to its inferiors is added to it. Therefore, in form, in response to the argument, I distinguish the major: the object of the patient intellect is the universal in proximate potency, I concede; in act, I deny. Or — which comes to the same — the object of the possible intellect is the metaphysical universal, I concede; the logical universal, I deny.

Sixty-third objection. Second: the nature abstracted from its singulars is not singular, as all concede; therefore it is universal. The consequence holds because there is no mean between singular and universal. I reply that the nature thus abstracted is the metaphysical universal, not the logical — or say that it is the logical universal in proximate potency, not in act.

Sixty-fourth objection. Third: The logical universal is defined at *1 Perih.* c. 5 as one apt to be predicated of many. But the nature prescinded from its inferiors is something one apt to be predicated of many. For a universal does not require that the nature be actually predicated, but it suffices that it have the aptitude for predication of many. Therefore the abstracted nature is a universal in act, not merely in potency. I concede the major and deny the minor. The reason is that the nature as abstracted does not have the form of universality in act — just as a wall is not said to be white unless it has whiteness inherent in it; so the nature is not formally and actually universal unless it actually has the form of universality, which is produced through comparison to its inferiors.

You will ask: is the formal universal produced through the act of the agent intellect or of the patient intellect? I reply that it is probable that it comes to be through the operation of the patient or possible intellect, as Scotus teaches at *2.d.3.q.1*, §. *Sed contra*, before I, followed there by Lych., Barg., and other Scotists. The reason is that before the act of the possible intellect, the nature abstracted by the agent intellect is only in proximate potency to becoming a formal universal in act. Moreover, the principal function of the agent intellect is to transfer objects from the order of material things to the order of spiritual things; while the function of the patient intellect is to understand what is presented to it by the agent intellect through intelligible species, and to compare the nature prescinded from its singulars to those very inferiors. It is therefore probable that the actual universal is produced by the possible intellect.

You will say: Scotus at *1.d.3.q.6*, §. *Contra istam opinionem*, D, in perspicuous words asserts that the production of the formal universal pertains to the agent intellect; and he asserts the same at *7 Met. q. 16*. Therefore Scotus does not appear consistent with himself. To the first passage, Mastrius and Bellutus at *disp. 4, q. 3* reply that this text is marked by Faber at *4 Met. q. 9, c. 4* as spurious. And if it is admitted as Scotus's own text, it does not follow from it that the universal in act is produced by the agent intellect, but only in habit — insofar as the agent intellect itself forms the intelligible species through which the patient intellect, understanding the nature separated from individuals, produces the actual universal. But against this, Scotus at *Quol. 15* expressly holds and probably defends this very view, at 6, speaking of this article, saying: "If the first way is held, it could be said that the agent intellect has two ordered actions. The first is to make actually intelligible from potentially intelligible, or actually universal from potentially universal. The second is to make actually understood from potentially understood." Therefore the aforesaid response does not remove the pressing objection. Secondly, the same afore-mentioned authors deal with it through Barg. at *1.d.3.q.6*, §. *Ex alio membro*: that Scotus in that passage embraced the common opinion, but in another passage stated his own opinion. And likewise in the *Met.* passage he spoke of the habitual universal and in the *Sentences* passage of the actual universal. But this exposition does not seem to be altogether according to the Doctor's mind, who in both passages evidently opens

his opinion and in both speaks of the actual universal. To me it seems that one should say that Scotus on this matter, as on many others, is problematic — as is not obscurely intimated by him at the *Quodlibet* just cited, where he probably defends that the agent intellect is the efficient cause of intellection, dissolving all arguments brought against this. Therefore the Scotists, perceiving that both opinions are probable — both in the matter itself and in Scotus — defend now the one, now the other opinion, as may be seen among our recent authors cited above; although the Doctor inclines more to the one than to the other, namely to that which holds the possible intellect to be the maker of the actual formal universal.

Article IX: What the Essence of the Logical Universal Is

In this article it is called into doubt whether the essence of the logical universal consists in being in many, or in being one apt to be in many; or rather in being predicated of many, or in being one apt to be predicated of many. For many, among whom are Ruu. *q.* 2, Alb., Sot., and Tol. (cited by Hurt. *disp.* 3, *sect.* 2), hold that the essence of the logical universal is to be one apt to be in many, while predicability of many is its attribute. This opinion is embraced from among our own by the two recent authors at *disp.* 4, *q.* 2, *art.* 2, who cite Scotus and certain eminent disciples of his in their favor. The common Scotist position, however, establishes the essence of the logical universal to be one predicable of many. Hurt. at the cited passage and Arr. *disp.* 6, *sect.* 9 subscribe to this.

Note I: Scotus has spoken variously on this difficulty in various places. For at *q.* 6 *univers.*, §. *Dicendum*, he proceeds doubtfully and problematically, saying: "If the definition of the universal is true — which is 'predicable of many,' given at *1 Perih.* 5 — then the convertible one, beyond the essence of the universal, will be that which is given at *1 Post.* c. 8: one in many and of many. And if that is a good and true definition, that will be its attribute; and so either one, through the definition of the universal, can be demonstratively concluded of the universal and thus known." He repeats the same at *q.* 8, §. *Ad* 1, *q.* But then at *q.* 15, §. *Dicendum ergo*, he expressly asserts that to be predicated of several is the essence of the logical universal, in these words: "Therefore it must be said in response to the question that this is the true definition, which is thus shown: the reason of the universal is to be predicated of several, according to Aristotle, *1 Perih.*; therefore since in the definition of genus it is placed that it is predicated of several, its genus is placed." The same is also intimated at *q.* 19, toward *Ad oppositum*. And Mauritius, Anglicus, Sarn., and others explain it there.

Note II and recall from what has been said: the metaphysical universal is the universal in being, as its definition indicates — "one apt to be in many" — whose attribute is predicability of many. But the logical universal is the universal in predication, as is plain from its definition: "one apt to be predicated of many." For the constitution of the first, only the abstraction of the common nature from its inferiors by the intellect is required. For the second, the comparison of

the nature thus abstracted to its inferiors is necessary — as Scotus affirms at *4.d.43.q.2*, §. *Respondeo*. Although the foundation of both universals is the same — namely, the common nature inexistent in many — still through the work of the intellect each is affected by distinct respects, by reason of which the division of the universal into logical and metaphysical is received, despite Hurt. objecting at *disp. 3, sect. 2, q. 15*. And they can be marked by different definitions, as will be plain below for genus, species, and the other universals. This can be illustrated by the case of man, who as a physical whole is defined as a natural body composed of body and rational soul, but as a metaphysical whole is defined as a rational animal.

Note III: beyond the two aforesaid definitions of the universal there is a third, given at *1 Post. c. 8* and the end of 2 of the same work, received by the Doctor at *7 Met. q. 13*, *2.d.3.q.1*, §. *sed contra*, H, and of the following form: "The universal is one in many and of many." This seems to embrace both of the aforesaid definitions of the universal, as I noted in the *Epitome*, *l. 1, q. 3, art. 1*. And Fuent. at *q. 6, dif. 3, art. 1* and *2 Met.* indicates: to be one in many is the metaphysical universal, and to be one of many is the logical universal. Indeed, from those two a more perfect and exact definition of the logical universal, as good as any that can be given, is formed and recognized by the Doctor in the cited passage and by other very eminent philosophers, who — setting aside both of the prior ones — approve, clarify, and celebrate this third in their later writings, which are judged to be of greater weight and authority. For its easier comprehension, I presuppose from what was said in art. 7 of this question, not. 2: the universal is a concrete name enjoying a twofold signification — material and formal. The nature existing in many, called the universal in remote potency, and the nature abstracted from many, called the universal in proximate potency, is the material element of the logical universal. And "of many," or "one predicable of many" by formal and direct predication, is the formal element of the logical universal itself — which is the second intention, or the respect of reason caused or left behind by the act of the intellect comparing the superior to its inferiors. Therefore what is defined by the said definition of the universal is the second intention, which is to be one predicable of many. What is materially described is the common nature, in which the said second intention is founded as in its true subject of denomination — as Fuentes excellently notes in the cited passage, art. 1. From this it is plainly gathered that to be one in many is not formally the essence of the logical universal, but only its material and foundational being — not its formal being. And I think Scotus must be interpreted in this way in the passages cited by our afore-named recent authors, so that the Doctor may speak consistently and his writings be well coherent throughout his Doctrine; and the more common Scotist opinion will be true and consonant with its Doctor, luminous to all. In this Aristotle greatly favors us — for at *1 Post. T. 36*, conceding to Plato that science is of universals, but denying to him that universals are ideas of things really separated from singulars, he asserts that the universals about

which sciences are had are universals in many, which are common natures that inhere in individuals, equally participated in by them, univocally predicated of the same — as Zab. and Toletus aptly interpret that passage. Therefore "being in many," which Aristotle places in the definition of the universal, is not being a being of reason but being a real being — which belongs to the common nature existing in its singulars prior to every work of the intellect, as, before others, the same Zab. observes in the cited passage. For this reason Aristotle, establishing universals in many, vehemently rebukes Plato for placing universals before the many — as I deliberately showed in art. 3 of this question. And hence collapse the arguments that the aforesaid recent authors pile up against the common Scotist doctrine, supposing that being in many constitutes the formal character and essence of the logical universal. For this designates only its material and foundational being, not its formal being — as will be made plainer and more evident from the solutions to their arguments to be subjoined below.

Assertion: Formal predicability is of the essence of the logical universal. So Scotus at *q. 12 univers.*, §. *propter istas tres*, and *q. 15*, §. *dicendum ergo*, and elsewhere where he approves the definition of the universal given at *1 Perih. c. 5*, or the other one at *1 Post. c. 8*, cited and pre-explained by us in Note III. Tromb. *7 Met. q. 8, art. 1* marvelously supports this: "For the reason of the actual universal what is required is both that it be actually participated in by many, and the intention of universality attributed to the nature through the act of the intellect comparing such nature, as predicable, to the individuals." Nor do Barg. *1.d.3.q.6* and other most outstanding Scotists dissent. Proved: first, from Porphyry in the last chapter of his *Isagoge*, saying: "to be predicated of several is common to all universals." And having previously defined nearly all of them, and the chief universals in particular, through "being predicated of several" — which he had certainly learned from Aristotle, who in the passage just cited defines the universal through predicability. Second, the logical universal comes to be through comparison of the intellect, as I proved in the preceding article. But such a passive comparison essentially includes formal predicability, since it is a relation of reason of the superior predicable of its inferiors. Therefore predicability is of the essence of the logical universal. The Doctor intimates this reason at *q. 14 univers.*, §. *propter argumenta*: "It must be known that to be predicated, since it is an intention, is an intention per se, but of a thing per accidens." Therefore since the logical universal formally is a second intention, it is plainly demonstrated that it is essentially constituted through predicability. Third, distinct sciences participate in the distinct formal characters of their objects, about which they occupy themselves without admixture — for sciences are divided as things are, *3 De Anima T. 38*. But Metaphysics deals with the universal in being; therefore Logic contemplates the universal in predication. This can in some way be applied to quality, which as conjoined with sensible matter is considered by Physics, but as separated from sensible matter is examined by Mathematics. All the more so because Logic does not meditate on

the essences and quiddities of things but on the subjections and predications of extremes — which are second intentions applied to things — as the Doctor clearly sets forth in the passage just cited.

Seventy-first objection. First, with the two Scotist authors: what we know first about something we say is its essence. But the first thing we know about the logical universal in act is being in many, as is plain from its definition at *1 Post.* c. 8, received by the Doctor at *2.d.3.q.1*. Therefore being in many is the essence of the logical universal. I reply that the major, in the way it is proposed, is not known or true, as those authors themselves think. For we know effect before cause; and accidents before the subject; and yet neither is the effect the essence of the cause, nor do accidents enter into the essence of the subject. But if they understand it differently — as Hurt. in the cited passage seems to wish, and if this is conceded to them — then to the minor I say that being in many is the material being of the logical universal, not its formal and actual being, as is sufficiently established and explained in the last note.

Seventy-second objection. Second: The prior is the thing itself; its attribute is posterior — for the attribute proceeds from the essence of the thing of which it is the attribute, as an effect from a cause. But predicability is an attribute of the logical universal — for a thing is prior to being predicable, just as a thing is prior to being intelligible and visible. Therefore predicability is not of the essence of the universal. Confirmation, from Scotus at *q. 6 univers.*, §. *Dicendum*, and *q. 11 praedicam.*, §. *Item contingit*, toward *contra*: to be predicated properly is the proper attribute of the universal; therefore, according to Scotus, predicability is not the essence of the universal. I concede the major and deny the minor. For although the nature is prior to being affected with predicability, it is not prior as a universal to being predicable — just as the wall is indeed prior to the whiteness that inheres in it, yet it is not white prior to receiving the whiteness through which it is constituted in white being. Or say that the argument pertains to the metaphysical universal, not to the logical. To the confirmation: I say that Scotus in the first passage speaks doubtfully, in the second problematically and disputatively, and perhaps not in his own opinion — since at *q. 15* and *12* he has openly declared his mind, namely that the essence of the logical universal is to be predicated of many.

Seventy-third objection. Third: The argument holds correctly: the nature is universal; therefore it is predicable of many; therefore it is universal — and so predicability is not of the essence of the universal. I reply that the argument holds of the metaphysical universal, not of the logical, which is constituted through predicability.

You will press: what is a property of one thing is not of the essence of another — as risibility, which is an attribute of man, is not of the essence of anything. But predicability is an attribute of the metaphysical universal; therefore it is not of the essence of the logical universal. I concede the major and distinguish the

minor: of fundamental predicability, I concede; of formal predicability, I deny. For the latter comes to be through the intellect, while the former emanates from the nature of the thing itself. Scotus at *q. 15 univers.* and Mayr. there, *pass. I*, touch on this solution.

Seventy-fourth objection. Fourth: Porphyry at *c. 1 Isag.* calls the definition of genus — given through predicability — a descriptive definition; and a descriptive definition is given through a property. Therefore predicability is an attribute of the logical universal. I reply with Scotus now cited, *§. dicitur ad q.*, that the text of Porphyry has "assigned" — that is, "defined" — as is argued from the same Porphyry at *c. de specie*: "It is necessary in the accounts of both to use both." For the account that a name signifies is the definition, as may be seen at *4 Met. c. 5, T. 28*, second summary.

Article X: How Many Kinds of Universal Are There

Joannes Maior, at *praedicabilium, q. 11*, thinks that the fivefold number of universals transmitted by Porphyry has been fenced off by the authority of our predecessors not by reason but by will — citing that verse of Horace: "So I will, so I command; my will stands for reason." Just as, he holds, this is the case for names imposed on things, and Scotus holds the same of the number ten for the categories at *4.d.13.q.1, §. Ad huius autem, C.* Those who try to adduce some reason for the number of categories disagree among themselves, as may be seen in Racon *tract. de universalibus, q. 3*. For some make ten, some six, others only two universals. But the common opinion of ancient and modern Dialecticians establishes only five universals.

Note that the aforesaid variety and diversity of opinions arose from the fact that to be predicable of many can happen in two ways: in one way as to what-it-is, or as to what-quality; in another way, immediately or mediately. Since predication as to what-it-is and immediate predication of many seems more excellent than predication as to what-quality and mediate predication, from this some, holding that only genus and species are predicated as to what-it-is and immediately of many, have established those two alone as universals, not the other three, which are predicated mediately and as to what-quality. Further, since difference has a greater affinity with genus and species than property and accident — because it is predicated as to what-kind-of-thing, and is of the essence of its inferiors — it is decreed by some to be the third universal. But others, using unity and predicability of many more broadly, enumerate more universals than three.

Assertion: There are only five universals — genus, species, difference, property, and accident. So Scotus at *q. 12 univers., §. Dicendum*, and *1.d.8.q.3, §. Alij probant* 5. Tatar. *q. 1 praedicab. scibili 2*, Joannes de Magistris *q. 5* in fine conclusionis responalis, and others commonly there. Proved: first, from Aristotle, who in the chapter on substance mentions genus and species, which he calls secondary substances placed in the straight line of the category of substance; and

difference, which he places in the lateral line; and everywhere he recounts property and accident, asserting the properties of substance, some of which flow from the essence of substance itself and are referred to the fourth universal, while others can be present or absent from substance without its destruction and are reduced to the fifth universal. The same is derived from *1 Top.* c. 3 and 4. And this greatly accords with Peripatetic doctrine, especially predicamental doctrine, for whose sake Porphyry constructed his *Isagoge*. Second, the number of universals is derived from the number of predicables; and the number of predicables is five; therefore the number of universals is also five. The major is plain: because predicability is of the essence of the logical universal, from what was asserted in the preceding article. The minor is argued: whatever is predicable is either predicable as to what-it-is, or as to what-quality. For the character of the universal and the predicable is divided into the predicable as to what-it-is and as to what-quality, as into its essential differences — as Scotus affirms in the cited passage, §. *Dicendum*. If it is predicable as to what-it-is: either according to a part of the essence, and as a potential whole, and it is genus; or according to the whole essence, and it is species. For nothing of the essence is found in one individual that is not in another — otherwise individuals of the same species would differ essentially, which our recent authors prove to be false most excellently against Aversa at *q.* 10, *sect.* 1. If as to what-quality: either as to what-kind-of-thing, or the essential quality, and it is difference; or as to the accidental quality — and this either is a convertible accident proceeding from the principles of the subject, and it is property; or it is a common accident, and it is the last universal.

Seventy-eighth objection. First: There are as many universals as are predicated essentially of their inferiors. But only the first three are predicated essentially of their inferiors; therefore only those three are universals. The minor is evident: because only genus, species, and difference are predicated essentially, while property and accident are predicated accidentally. The major is shown: universals are univocals, as is plain from the definition of the universal; but univocals are predicated univocally of their inferiors, as is plainly derived from the definition of univocals given in the *Praedicamenta*, c. 1. I deny the major — for some universals are predicated essentially, some accidentally. To its proof I say that universals are indeed univocals, yet not all are predicated univocally. For to be univocal is one thing and to be predicated univocally is another, as the Doctor notes at *3 dist.* 7, *q.* 1.

You will say: univocals are those whose name is common and whose account of substance according to that name is the same — as Bonet well explains at *1 Met.* c. 2. Therefore if universals are univocals, they are certainly predicated essentially of their inferiors — otherwise the aforesaid definition of univocals would be unsound. It may be said: taking "univocals" broadly, their common account is either essential or accidental, as Scotus intimates both at the cited passage and also at *1.d.3.q.3* and *d.* 8, *q.* 3. And our aforesaid recent authors

defend this at *disp.* 2, *q.* 4, *art.* 2. But strictly, only those are univocals that are predicated essentially of their inferiors, as is clearly seen from their aforesaid definition. And this can be argued from a parallel case: science, strictly taken, is defined at *1 Post.* c. 2, T. 5 as knowledge of a thing through its proper cause — which does not include science obtained through effect. Likewise, according to Scotus at *q.* 4 *prol.*, praxis, strictly taken, is an operation of good will; taken broadly, it extends to both good and bad.

Seventy-ninth objection. Second: There are as many universals as there are predicates — since to be predicated is the character of the universal, from what was said above in *art.* 9. But there are only four predicates, *1 Top.* 3: genus, definition, property, and accident. Therefore there are also only four universals. I reply, with Scotus at *q.* 12 *univers.*, §. *Ad 1 arg.*, by denying the equivalence — for Aristotle does not pursue the number of predicates in the same way as Porphyry pursues the catalogue of universals. For the Philosopher derives the quaternary series of predicates in view of essential, not accidental, predication — and also in view of convertible and non-convertible predication. For if essence is predicated, it is genus and definition; if essence is not predicated, it is property and accident. Again, if it is predicated convertibly, it is property; but if not convertibly, it is accident. But Porphyry investigates the register of universals in view of predication as to what-it-is and as to what-quality, as was sufficiently explained above. The reason, moreover, why Aristotle in that passage does not mention difference is that if difference is subaltern, it is reduced to genus; and if it is lowest, it is referred back to species because of the similar mode of predication. Or say that the Philosopher there recounts the topical predicates, which share a common subject — some of which are complex, like definition, and some incomplex, like the remaining three listed. But Porphyry enumerates only incomplex universals. And Aristotle says that difference is reduced to genus.

Eightieth objection. Third: To be predicated as to what-kind-of-thing of several differing in species, and of several differing in number, constitutes only one universal — namely, the generic and the specific difference. Therefore to be predicated as to what-it-is of several differing in species and in number makes only one universal as well, since the same reason holds in both cases — and so there are only four universals. I concede the antecedent and deny the consequence. The reason for the disparity is that the generic and specific differences wholly possess the same mode of predication — as to what-kind-of-thing. But this is not the case for genus and species. For genus is predicated as to what-it-is incompletely, while species is predicated completely — the latter giving the whole essence, the former giving only a part of the essence, as the Doctor excellently shows at *q.* 27 *univers.*, §. *dicendum ad q.* — specifically by way of an actual part and a potential whole — or it will be shown in detail at *art.* 2, *q.* 2.

Eighty-first objection. Fourth: The individual is a universal, and is not one of the five recounted above; therefore a sixth universal must be admitted. The antecedent is proved: the universal is what is predicated of many; and the individual is predicated of many — namely, of Peter and Paul; therefore it is a universal. It may be said that the universal is predicated of many non-equivocally, while the individual is predicated of many equivocally — as may be seen in Scotus at *1.d.25.q.un.*, §. *Respondeo*, A, saying: "This man is said of Socrates and Plato equivocally." Or say with the same Doctor in that passage, in the solution of 3, §. *Ad 1*: that the individual is a species of the second intention but not a species of the universal, which is a genus to those five above-named.

Eighty-second objection. Fifth: Being is a universal, since it is predicated of many as the character of the universal demands; and it is not genus, 3 *Met.* T. 10; nor any of the other universals, as is plain. Therefore beyond the five listed, there is another universal — namely, being. Scotus replies by denying the antecedent, because being is equivocal, and the universal must be univocal, as I noted in the *Epitome*, l. 1, q. 3, art. 1. Against Scotus: at *1.d.3.q.1* and elsewhere, he expressly holds that being is univocal to God and creature, to substance and accident; therefore the aforesaid response involves a contradiction in the Doctor's own statements. It may be said that Scotus in the *univers.* work cited speaks in the opinion of others — principally Porphyry, *c. de specie*, who says that if one calls things "beings," one will use the name equivocally. This the same Doctor does not infrequently in the said work, following Aristotle both in the chapter on quantity and elsewhere, as will be made plain in due course. Or it may be said that being is equivocal to real being and to the being of reason, but not to real being itself — as is plain from the same Scotus at *q. 21 praedicam.* and *q. 25, §. Ad 1 principale*, and his expositors there, and Sirect *Tract. form.* fol. 10, §. *Quantum ad 2, art.*, and fol. 27, pag. 2.

Eighty-third objection. Sixth: There are ten modes of being and ten categories; therefore there are ten modes of predication and ten universals. The consequence is to be denied. The reason is that the number of categories is derived from what is predicated of primary substance; and since there are ten things that are predicated in different ways of primary substance, ten categories are established. But the number of universals is derived from the mode of predication — essentially or accidentally — of inferiors. But since there is only a fivefold mode of predication, the number of universals is likewise fivefold.

Eighty-fourth objection. Seventh: In as many ways as one of two opposites is said, in so many ways is the other said, 1 *Top.* 12. But the universal and the singular are opposites, 1 *Post.* T. 5 — since the universal is communicable and the singular is incommunicable. Therefore since singulars are almost infinite, the same must be asserted of universals. I reply, with Scotus at *q. 12 univers.*, §. *Ad 2*, by distinguishing the major: of opposites taken formally, I concede; of opposites taken materially, I deny. In this way Aristotle in the cited passage and

Sot. at 5 *Met.* in the exposition of the text, fol. 150, in the notable passage, are to be interpreted. For "rational" and "irrational" are indeed opposed; yet it is not necessary that there be as many rational supposita as irrational ones. For there are far more irrational beings than beings capable of reason. As for the proposition that Sarn. says is famous, it is not expressly found there.

Article XI: Whether the Universal Is Univocal

Many, both ancient and modern — cited by the Coimbrans at *q. 7, art. 2*, among whom are Amm. in *Porph.* c. de genere, Alb. there, *Tract. 2, c. 9*, and Suarez *disp. 6, Met. sect. 8, n. 1* — hold that the universal is analogous to those five aforementioned. But the more common opinion at the present time is that of the Subtle Doctor at *q. 8 univers.*, Mayr. there, *pass. 30*, Fuent. *q. 6, dif. 6, art. 1*, Racon. *q. 2, sect. postre. prop. 2*, and others who teach that the universal is univocal to those five above-listed.

For a fuller knowledge of this difficulty and a more accurate resolution of it, what I brought forward in the *Epitome, l. 1, q. 1, art. 5* must be recalled, and what I noted at *l. 3, q. de Antepredicam.* presupposed, and in Metaphysics concerning the univocation of being, and also in the tract on the knowability of God. Here I only recall the distinction of the universal for its material and formal elements — since Coimbrans at the beginning of the cited article and Fons. 5 *Met. q. 12, sect. 2*, striving to reconcile both opinions, write that the universal for its material element, or as absolute, is analogous — because it belongs to substance and accident, between which nothing is univocally common; and it is fitting that it be predicated both essentially and accidentally, simply and in a qualified sense, which plainly seems to be analogous. But the universal for its formal element, or as relative, is univocal. This distinction seems to be scented by certain distinct Scotists at *disp. 4, q. 6*, citing in their favor Scotus at *q. 8 univers.*, §. *Ad istam q.* But Scotus rather impedes than helps them. For he explicitly attacks the authors of that opinion, saying: "Their reason does not conclude — because number is a multitude aggregated from units; yet it is not said analogically of binary and ternary, although the ternary consists of more units; but is said simply univocally." And at §. *propter hoc*, he evidently holds that the universal is univocal, and that it is predicated univocally of all five of those. Therefore the Doctor does not favor them, nor does the aforesaid distinction help to reconcile the patrons of both positions. For we contemplate the universal in view of its entity and quiddity, prescinded from any peculiar character of any universal whatsoever — just as when we abstract "animal" from "rational" and "irrational" and contemplate it thus, we assert it to be univocal. And although "rational animal" is more perfect and excellent than "irrational animal," that belongs not to the character of animal but to the character of its difference. Similarly we meditate on being in Metaphysics as prescinded from God and creature, substance and accident, and affirm it univocal to these — which the advocates of the opposing opinion deny.

Assertion: The universal is univocal to all five afore-named universals. So Scotus just cited. Proved: first, what belongs to many according to the same name and the same account is univocal to them, as is plain from the definition of univocals given by the Philosopher in the *Praedicamenta*, c. 1. But the universal belongs to those five according to the same name and the same account — for each of them is one apt to be predicated of many, which is the definition of the universal taken in general, *1 Perih.* 5. Therefore the universal is univocal to them. Second, if the universal were not univocal to them, it would be principally because it is participated in more perfectly by one than by another. For this reason Aristotle adds at *7 Phys.* T. 31: "In a genus, equivocations lurk." But this reason has no force. For what are equivocal in a physical sense are univocal in a logical sense, as the Doctor touches upon at the cited passage, §. *Ad istam q.* For the unity of a common concept suffices for logical univocation. Therefore since the universal has one concept participated in by them, it is plainly inferred that it is univocal to them.

Eighty-eighth objection: Aristotle at c. 1 of the *Praedicamenta* separates denominatives from univocals and equivocals; but the universal is denominative, as is plain; therefore it is not univocal. Confirmation: *4 Met.* T. 4: "If all things are predicated accidentally, there is no universal." Therefore, according to Aristotle, the universal is not univocal — at least to those that are predicated as to what-quality, or accidentally, of their subjects. One can respond from the Doctor at *q. 6 praedicam.* that Aristotle did not separate denominatives from univocals absolutely, but relatively — that is, under a denominative predicate, as man and horse under "white" are not univocated. For univocals participate in the same name and the same account according to that name; but the account of man and horse, or their essential character, is not whiteness. However if the account of denominatives is intrinsic and essential to them, they will without doubt be univocals — as Aristotle indicates in the chapter on substance, and Scotus at *2.d.12.q.1*, §. *Ad argumentum* I, I. To the confirmation: I say that the Philosopher spoke conditionally — namely, if all things were accidents there would be no predicable that is substantial and predicated as to what-it-is of its inferiors, which is conditionally true but not absolutely so, since both substances and accidents are predicated of their inferiors, as is plain from the aforesaid Aristotle.

Eighty-ninth objection. Second: Everything univocal that belongs to many belongs to them under the character of some universal; but the universal in common is not adapted to those five under the character of some universal. Therefore it is not univocal to them. The major is plain from the definition of univocals. The minor is argued: if the universal belonged to them under the character of some universal, it would be under the character of these five themselves or under the character of another. Not the first — because each of these is not essentially distinguished from another. Nor the second — otherwise a sixth universal would be given, which conflicts with Porphyry and Aristotle. I

reply that the universal is the genus and those five are its species, of which it is univocally predicated.

You will press: if the universal is the genus, then the genus is a species — because genus is subject to genus, and what is immediately subject to a genus is a species. But it is false that genus is a species; therefore it is also false that the universal is a genus with respect to those five. The subsumption is argued: no opposite is predicated affirmatively of its opposite — for the same thing with respect to the same cannot simultaneously be both superior and inferior. But these five universals are opposites, for they are species of a genus constituted by opposite differences. Therefore one cannot be predicated of another, and hence the universal is not a genus to them. I concede the consequence and distinguish the subsumption: essentially, I concede; denominatively, I deny. For as Scotus says at *q.* in question, §. *Ad 1 arg.*: each of these intentions can be taken either as a what or as a mode. For when it is what is being understood, it is a what; but when it is the manner in which something is understood, it is a mode — as the Doctor signifies at *1.d.1.q.3*, c, and *4.d.1.q.1* below T. To the proof of the subsumption I say, from the same Doctor, that second intentions are not opposed unless both are taken as a what or as a mode. Thus the proposition "genus is a species" is true insofar as genus is taken as a what and species as a mode — because under such a mode genus is understood with respect to the universal. And this can be illustrated by the example: "the plural is singular," where "plural" is taken as a what and "singular" as a mode. And the sense is: the plural in the nominative case is of the singular — that is, of the singular number — as Gadius notes at *quol.* 6.

Ninetieth objection. Third: The universal is not equally participated in by those five; therefore it is not univocal to them. The antecedent is proved: the essence of the universal is to be predicated of several, as was established above. But genus is predicated of more than species; therefore it participates more in the nature of the universal. And so the universal is analogous to them. I deny the antecedent. To its proof I say that from the argument one can only derive that genus is a greater universal — that is, extends more broadly than species — not that it is more a universal; just as the ternary is a greater number than the binary but is not more a number, because both equally participate in the nature of number — as the Doctor excellently notes in the cited passage, following Aristotle at *4 Top.* 1.

Ninety-first objection. Fourth: What is adapted by priority to one and by posteriority to another is analogous. But the universal belongs by priority to genus and species — especially when they are substances — and by posteriority to the others, especially the last two, which are accidents; and between substance and accident nothing is univocally common. Therefore the universal is analogous. I concede the major and deny the minor. For in Metaphysics it is shown that being is univocal to substance and accident. And priority and

posteriority are derived from proper and peculiar characters that contract and constitute such universals — not from the common account fitting all of these. Or it may be said that this holds of the physical universal, not of the logical universal, which formally is an intentional being.

Ninety-second objection. Fifth: What is included in differences is not a genus, as is plain from being — which is not a genus precisely because it is enclosed in differences. But the universal is included in the difference, which is the third universal; therefore it is not a genus. I concede the major and distinguish the minor: the universal is enclosed in the difference as a contracting character, I deny; as a genus in its species, I concede — just as "animal" is not contained in "rationality" but in "man," as its genus. For the difference is a universal not according to the formal character of difference but insofar as it is a species of the universal.

Article XII: Whether the Universal Is the Subject of Porphyry's Book

Alb., mentioned in the preceding article, Amm. in the preface to Porphyry, Aversa *q. 7, sect. 3*, and others constitute the five afore-named universals as the subject of Porphyry's little book. But the Subtle Doctor at *q. 7 univers.*, Sarn. there, and Maior *q. 3 praedicabilium not. 4, conc. 1*, establish the universal as the subject of the said opusculum.

Note that every cognition and science — whether total or partial — has a proper total or partial object by which it is specified and with which it is occupied. Since, therefore, in this *Isagoge* of Porphyry knowledge of universals is had, it is rightly investigated whether its subject is the universal or something else. For knowledge of this, what I said at *q. 3* of the preceding book about the object in common, its divisions, and its conditions bears greatly; and Maior in the cited passage is prolific in narrating and explaining these.

Assertion: The universal is the subject of Porphyry's *Isagoge*, not its five afore-named species. So Scotus in the cited passage, §. *Ad 1, q. dicendum*. Proved: first, one science has one object, *1 Post. T. 43*. But the doctrine of universals is one with the unity of its partial object, just as the whole of Logic is one with the unity of its total object; and this partial object is the universal, in which the individual subjective parts of the universal univocally agree, from what was asserted above. Second, the three conditions required for a proper subject of this little work are fitted to the universal; therefore the universal is its subject. The antecedent is argued: of the universal it is presupposed whether it exists and what it is; definitions of its species are given; and attributes are demonstrated of it — as Sarn. explains in this passage. And everything that is treated in this introduction is reduced to the universal in some way: either immediately, as species to genus; or mediately, as individuals; or as its attributes; or as its opposites — of which there is the same discipline, as Maior notes in the cited passage, *q. 7, not. 1*. These three conditions of the subject, then, being

rightly fitted to the universal, it is conspicuously concluded that the universal itself is the adequate subject of this little book.

Ninety-sixth objection. First: If the universal were the subject of this *Isagoge* of Porphyry, he would have mentioned it; but he does not do so, as is plain to the reader. Therefore there is clear indication that the universal is not its subject. The major is evident: because the subject is what the author expends his care upon and without which he cannot speculate and act. The other sciences treat of the universal, since there is no science of singulars, 7 *Met.* 53. Therefore the universal is not its proper subject. I concede the major and deny the minor. For Porphyry in *c. de genere* divides the universal into five members. And in the last chapter he adds that "to be predicated of several is common to all universals joined together." To the confirmation: I distinguish the antecedent: other sciences treat of the universal taken in the first intentional sense, I concede; taken in the second intentional sense, I deny. For this belongs to Logic alone.

You will press: in the books of the *Topics* as well the formal universal is debated; therefore the solution is null. I say that in the present work the universal, its species, and its attributes are treated as the main purpose; but in the cited place, only the universal insofar as it pertains to the problems of dialectics.

Ninety-seventh objection. Second: The object of Porphyry's teaching is what Porphyry takes up for discussion; but Porphyry proposes to treat of five words, or five universals; therefore the five universals are its subject. Confirmation I: if the universal is its subject, since every universal is fivefold, it follows that those five universals are the subject of it. Confirmation II: whatever is predicated of the superior is also predicated of the inferior, from the rule of the *Antepredicamenta*. Therefore if the universal is the subject, genus and the remaining universals are also the subject of the same. I concede the major. To the minor I say that Porphyry himself also differs concerning the universal in common, as is plain from the dissolution of the preceding objection; and he expressed its species as being more well-known. To Confirmation I: I deny the consequence — because the object of a science must be one common thing in which its inferiors univocally agree, 1 *Post.* 43. To Confirmation II: I say that rule is to be taken of essential and exercised predication, not of accidental and designated predication — as happens in our case.

Article XIII: Whether the Universal Is in the Thing or in the Intellect

Some — whose names Sarn. himself suppresses, mentioned at *q. 9 univers.*, and whom Tatar. at *q. 1 praedicabilium*, *Not.* 4 indicates after Scotus *quol.* 3 — hold that there is no subject of inherence for the formal universal and the other first intentions. Others, among whom is Mayr., make the intellect the subject of the universal and of the remaining beings of reason. But Scotus at *q. 9 univers.*, and *1.d.23.q.un.*, and *4.d.1.q.2*, together with Anglicus, Mauritius, and the rest, assert

that the formal universal and the other second intentions have their subject in the known and understood thing.

Note, from the Doctor at *q. 3 univers.* in fine, that the formal universal is an intentional accident — that is, a relation of reason caused or left behind by the comparative act of the intellect. Since, however, the being of accident is to be in something, *7 Met.* 2 and 14, it is rightly investigated what its subject is — whether the intellect or the thing to which the second intention is applied. It must not be supposed that the thing absolutely and according to its essential being is the subject of the said second intentions; rather, their subject is the thing according to its known and understood being. Thus their immediate subject is the known thing; and their mediate subject may be called the intellect, insofar as the known thing, according to known being, is said to be in the intellect as the known is in the knower.

First assertion: The universal and the other second intentions possess some subject. This is presupposed by the Doctor in the cited passage and proved: first, from Aristotle just cited — "the being of accident is to be in something," and the universal is an intentional accident; therefore it possesses some subject. Nor does it avail to say that this dictum of Aristotle is to be interpreted of a real accident, not of an intentional accident. For if a real accident needs a subject, by stronger reason so does an intentional accident, which is of lesser and inferior entity. Second, whatever exists either exists per se or in another, from the *Antepredicamenta*. But the universal is not a being per se, because only substance, to which alone being per se belongs, is of that kind. Therefore it is a being in another, and is supported by a subject.

Second assertion: The universal is not subjected in the intellect. So Scotus in the cited passage, toward *Ad oppositum*. Proved: first, by some authors — matter and efficient cause do not coincide, *2 Phys.* 70. But the intellect, from what has been said, is the efficient cause of the universal; therefore the intellect is not its subject — which is called the matter in which, because accidents have no other matter than the very matter in which they inhere. Against this one may press: the intellect is the effective cause of intellection and also its receptive cause; therefore the aforesaid reason has no force. Perhaps it may be said, in defense of the stated reason, that the antecedent holds of a real accident that immediately inheres in the intellect — like intellection — but not of an intentional accident that immediately resides in the known thing. Second, it is argued from Aver. *1 De Anima com.* 8: "The intellect produces universality in things"; therefore universality is not in the intellect — for universality is where it is produced, but it is not produced in the intellect; therefore it is not in the intellect. It is added: accident resides in what it denominates, as is plain of blackness which denominates the raven in which it inheres. But the universal does not denominate the intellect, as is plain; therefore it is not subjected in the intellect.

Third assertion: It is probable that the universal is in the thing as in a subject. This is intimated by the Doctor in the cited passage, §. *Ad 1, q.*, and *5 Met. q. 2*. Proved: first, every form that intrinsically determines something is in the denominated as in its subject — because every form that is in something through inherence informs it; and as it informs, so it denominates, as whiteness is subjected in the wall through which the wall itself is denominated white. But the universal denominates the thing — as "animal" is denominated genus, and "man" species, and things of that sort are called universals. Therefore the universal is subjected in the thing. Second, second intentions are denominatively predicated of first intentions — as genus is predicated of animal, and species of man, and individual of Peter. Therefore they are in those of which they are predicated.

One hundred and third objection. First, against the First Assertion: in the doctrine of Scotus, God causes second intentions from eternity and makes beings of reason, as I showed in *Met. l. 5, q. 2, art. 4*. But such beings of reason are not in things — because from eternity there are no things, as I showed to be an article of faith in the *Tract. de creatione, disp. 3*. Nor are they in the divine intellect, which on account of its infinite perfection is not receptive of any accident. Therefore no subject need be sought for the universal and the other beings of reason. I reply that the argument holds of real reception, not of intentional reception — as is plain in Metaphysics, whose partial principal subject is God, and in Theology, whose total subject is the same God.

You will press: if there cannot be real reception in the divine intellect, then neither can intentional reception — which is lesser and inferior. The full and complete satisfaction of this pressing objection is to be sought at the cited *Tract., disp. 1, q. 13*.

One hundred and fifth objection. Second: Being in its primary division is distributed into real being and being of reason. But real being is on the part of the thing; therefore the being of reason is in the intellect as in a subject — as the Doctor clearly teaches at *7 Met. q. 18*. I reply that the universal being in the thing can be taken in two ways: in the thing absolutely, with no operation of the intellect taken into account — and I deny; in the thing as known by the intellect itself — and I concede. The Doctor explains it thus in the cited passage, as he himself declares at *5 Met. q. 1*.

One hundred and sixth objection. Third: The possible intellect is a passive power, *3 De Anima 5*. Therefore it does not act outwardly by sending forth, as Plato supposes, but by inwardly receiving, as Aristotle thinks. Since, then, the universal is produced by the intellect, it follows that the universal does not go beyond the intellect's limits but is subjected in it. I reply that this is to be interpreted of real transmutation and reception, not intentional. And this can be illustrated by the spoken word "man," to which the intellect attributes number, figure, case, and similar things — which are found not in the intellect but in the

spoken word itself as in their subject. Still, the opposing opinion is also probable in itself and in the Scotist school. For it may be said that the formal universal and the other beings of reason are in the thing causally and occasionally, but formally in the intellect.

Article XIV: How Universals Are Distinguished

Since many things from what has been said above and from what is to be said below cannot be well and fully grasped by us without some knowledge of distinction, we therefore inquire into the nature of distinction and its number in the present passage, and declare it in some fashion. The Thomists establish only two distinctions — real and of reason — and subdivide the latter into the distinction of reasoning reason and of reasoned reason. The Scotists, on the other hand, place between the real distinction and the distinction of reason a distinction from the nature of the thing, which by the same authors is equally called a formal distinction.

Note that distinction taken in the broadest sense is the otherness of the extremes, as Mauritius says in the *Epitome formalitatum* — which is separated into a real distinction and a distinction of reason. For, as follows from Aristotle at 4 *Met.* 4 and Scotus at 1.d.36.q.un., §. *contra istud*, F, being in its primary division is divided into real being and being of reason; likewise the distinction that obtains between them is either real or of reason. Hence our two recent authors at *disp.* 1, q. 5, *art.* 2 do not seem to speak correctly when they say that there are two primary genera of distinctions — namely, from the nature of the thing and of reason. For although they perhaps agree in substance with the other Scholastics, yet in the use of the expression "distinction from the nature of the thing" they differ greatly from the common Scotist sense, which recognizes the distinction from the nature of the thing as a mean between real distinction and the distinction of reason — as may be seen in the Formalists in their *Tract.* They also conflict with Scotus, as is plain to the reader at 1.d.2.q.7, §. *Sed hic restat*, and 2.d.1.q.5, §. *Ad q. istam*, and *collat.* 23, and elsewhere not rarely. They also deviate from the Doctor's mandate at 1.d.14.11.q.un. sub E, prescribing that words are to be used in accordance with the usage of their authors. Moreover, they seem to be opposed to the very distinction which, since it is derived immediately from the other member of the division of being into real being and its plurality, must certainly be called a real distinction; just as that which is derived from the other member of being — into the being of reason — is fashioned by reasoning reason, or is found between beings of reason, or is found between what are only pluralized through reason, and rightly deserves to be named a distinction of reason. And this is also plainly indicated by the remaining distinctions to be adduced below, which derive their denominations from the things about which they are made. Now just as real being is taken in two ways — first, for everything that is on the part of the thing, without any intellect thinking of it (such as substance and its properties, accidents and their

attributes, modes, and the like); or, for what is actually separate from another, like Peter from Paul; or for what can at least be separated by God, like accident from subject; or for what has some proportion to those that can be separated, like motion from the heaven according to Aristotle (as Scotus notes at *2 dist.* 1, q. 4, §. *Ad q.* before N); or, although one thing is inseparable from another, one is nonetheless producing and the other produced, like the divine persons (from the same Doctor at *2 dist.* 25, q. un., §. *Ad primam rationem*, L); or finally, because one essentially depends on another, like the whole on its parts (as Scotus affirms at *3 dist.* 2, q. 2, §. *Quantum ad* 1, C) — between real beings of this second kind there is a real distinction, which the Doctor calls at *1 Report. dist.* 33, q. 2, §. *Dico ergo*, a real distinction simpliciter, which is found between thing and thing. And this is established as twofold by the Doctor at *1 dist.* 2, q. 7, §. *Sed hic restat* sub GG: one real distinction of natures, and another real distinction of supposita. Similarly, from the same at *Quol.* 18, q., from *ex isto sequuntur*, sub Y, one may add the positive real distinction that obtains between two habits, and the privative real distinction that obtains between two privations of them. But between real beings of the first kind there obtains a formal distinction, which from Scotus at the two just-cited passages is between reality and reality. Now a reality, or formality, is an objective and conceivable account prior to every operation of the intellect — for there is a formal distinction between distinct objective accounts, of the kind I recounted above in the first mode of real being, and which enjoy distinct definitions, as is plain from Sirect, Tromb., and the other Formalists in the *Tract. Formal.* The two recent Scotists in the cited passage make a twofold formal distinction — actual and virtual — and for the virtual one, about which there is difficulty alone, they cite Scotus at *1 dist.* 2, q. 7, before HH, and *Quol.* 1, §. *De secundo art.*, P, and *1 dist.* 8, q. 4, §. *Ad q. respondeo*, O. They endeavor to introduce this into the Scotist school, holding it to coincide with the distinction of reasoned reason maintained by the Thomists, and confirm this by the following reason: some things are contained virtually and eminently in something, like the powers of heating and drying in the sun; therefore between those powers there is some formal distinction (because several inadequate objective concepts are formed of them) — but not actual, because those powers are not actually in the sun but only virtually; therefore a virtual formal distinction must be admitted.

But such a virtual formal distinction is seen to be consonant neither with Scotus nor with the truth. For first: the passage cited by them does not help but rather hinders them. For shortly thereafter the Doctor adds: "Briefly, then, I say, passing over those words about the distinction of reason and the virtual distinction — not that they are poorly said, but because there is no need to use them." Especially since previously he had said that the distinction he wished to establish among the divine attributes precedes every act of the intellect — which cannot be said of the virtual formal distinction that they think coincides with the distinction of reasoned reason; because the distinction of reasoned reason

receives its completion from the intellect, as may be seen in the Thomists. Nor does the second passage favor them. For in that passage the Doctor only says that the account is taken either as an account from the part of the thing, or as an objective account and quiddity, or as an account caused by the act of the intellect — that is, as an account fashioned by the work of the intellect — as Gadius correctly notes there. And the third passage seems rather to oppose than to favor those same authors — since the Doctor expressly intends there that the formal distinction is a third distinction preceding every act of the intellect in every mode. Therefore Scotus does not hold that a virtual formal distinction is given that is identical with the distinction of reasoned reason — because the latter is not a third distinction different from real and the distinction of reason; rather, as those same recent authors say, it is comprehended under the distinction of reason, which they themselves also separate into the distinction of reasoning reason and of reasoned reason. Finally, the reason adduced by them has no force. For the power of heating and of drying is in the sun actually and formally — just as the powers and potencies of the soul are actually and formally in the soul, actually and formally distinct from the soul itself and from one another, as Scotus writes at *2.d.16.q.un.*, §. *Ideo dico*, before M — even though the sun is not formally hot and dry but only virtually, as the Doctor clearly teaches at *q. 4 Prol. 5, contra istud*, before GG. The two remaining Scotist distinctions — those of "totally objectively" and "totally subjectively" — are reduced to the one or the other of the afore-expounded and formal distinctions. The distinction "totally objectively" obtains between those that share no quidditative concept — such as two ultimate differences that are really distinguished from each other, and two attributes of different subjects that also really differ, and two attributes of the same subject such as risibility and grievability, which formally differ from each other. The distinction "totally subjectively" obtains between those that share no reality contractible to themselves — such as God and creature, which are really distinguished from each other. So Tatar. thinks at *q. ult. praedicabil. dub. 2*. The distinction of reason is described as one produced through an act of the intellect — such as that between genus and species and other second intentions; and likewise between predicate and subject in an identical predication — as "man is a man," where the intellect distinguishes man as subject and man as predicate. But the afore-mentioned recent authors submit the distinction of reason to division into the distinction of reasoning reason and of reasoned reason, and endeavor with all their strength to introduce this into the school of the Subtle Doctor. But they labor in vain, opposing themselves to the torrent of Scotists, who rightly repel the distinction of reasoned reason as Thomist from the Scotist arena. For if once this distinction is admitted in the way the Thomists teach, the sharp and celebrated controversy between the Thomists and Scotists about the number of distinctions will undoubtedly perish; and the contention between them would be merely about a name — as Suarez *1.4. de Trin. cap. 4*, num. 2 and Hurt. *disp. 6, Met. sect. 3*, §. 63 note before others, following certain interpreters of Scotus

whom Greg. 1 *dist.* 8, *q.* 5, *art.* 2 recalls and whose names Faber 1 *disp.* 19, c. 3, *tract. Formalitatum* c. 3 suppresses. But since this most serious dispute is still before the judge, and the aforesaid authors fight most keenly over the formal distinction and the distinction of reasoned reason, and their minds, reasons, foundations, and authorities on both sides intend and extend more than a mere difference of name, the distinction of reasoned reason is not to be tolerated among the Scotists — since neither their Prince nor his most eminent disciples have ever permitted it to be maintained and persisted in by voice or in writing. I have said that Scotus nowhere concedes a distinction of reasoned reason that coincides with the virtual formal distinction. For at 1.d.2.q.7, §. *Sed hic restat* before HH — from which our afore-mentioned recent authors think they draw the distinction of reasoned reason — nothing is found there that favors them. For, as Faber observes at the cited passage, c. 2, Scotus only says there are two distinctions: one of reason, which pertains to a different mode of considering the same formal object — either grammatically, as "man," "of man," or logically, as "man," "humanity." The other real, which pertains to distinct objects to which the intellect is directed by distinct acts; and if such objects are thing and thing, between them there is a real distinction simpliciter — as between man and ass; but if such objects are one thing and several realities, between them there is a formal distinction preceding every act of the intellect — as is had in whiteness between the character of color and the character of the dispersive. And the Doctor asserts the same in *Report.* 1, *dist.* 33, *q.* 2. The same he writes in 1 *Oxon. dist.* 8, *q.* 4, §. *Ad q. Respondeo* et dico: "that between essential perfections there is not merely a distinction of reason — that is, of different modes of conceiving the same formal object; for such a distinction is between 'wise' and 'wisdom'; and certainly a greater one between 'wisdom' and 'truth.' Nor is there there merely a distinction of formal objects in the intellect, because, as was argued before, that is never found in intuitive cognition unless it exists in the object known intuitively." These last words are omitted by those recent authors — perhaps deliberately, lest the distinction of reasoned reason they strive to build in the Scotist edifice be destroyed and reduced to nothing. For these words plainly indicate the formal distinction that is found prior between formally distinct objects, before the intellect conceives it between said objects; and the Doctor therefore concludes: "Therefore there is a third distinction there preceding the intellect in every mode." And before this he showed at §. *Ista tamen positio*, below M: "The distinction of such formal objects precedes the act of the intellect." Finally, at *Quol.* 1, §. *De 2, art.*, he mentions the distinction of reason — which comes to be through the operation of the intellect — and the formal distinction, which precedes the act of the intellect, as Gadius and other interpreters explain; and this is declared through the Doctor's own words: "If they are distinguished by reason — and this either by reason taken from the part of the thing, that is, as the quiditative account" (and with a few words interposed the same Doctor adds) "or caused merely by the act of the intellect." I add that at 4 *dist.* 49, *q.* 1, §. *Ad argumenta*, P: "Nor do I say that those accounts are otherwise caused together by

the act of the intellect, but from the nature of the thing, as was said in the question on the powers of the soul in 2, and there *q. 4, §. iuxta 1.*" Thus both there and elsewhere the Doctor neither mentions nor dreams of the distinction of reasoned reason; among Scotists I find only the distinction of ratiocinative reason, which is entirely the same as the formal distinction — as Sirect and Tromb. note at *art. 1, part.* of the cited passage. But the Scotists have no need of the distinction of reasoned reason in order to distinguish God's quiditative predicates; nor to discriminate the transcendental metaphysical grades. For these are distinguished from the nature of the thing, as before others the most subtle Lych. teaches at *Quol. 1, in comm., §. De altero termino* — roughly in the way in which things defining and what is defined are distinguished, as Scotus indicates there sub 15. For the predicates of the first mode are included in the account of the divine essence; while the attributes are predicates of the second mode that belong to the essence quasi as second acts, as the Doctor notes in that passage. But these formally differ — as he plainly intimates at *1 dist. 3, q. 3, §. Ad questionem igitur respondeo.* And Tatar. and other cited Scotists expressly hold this — especially Faber *Theor. 94*, citing Scotus at *1 dist. 8, q. 3, §. Ad 1 argumentum*, Y, who establishes a distinction between being and its modes prior to the act of the intellect; which distinction is called by our people the negative formal distinction. The reason is that the transcendental metaphysical grades are not merely formal concepts formed by the intellect but objective concepts preceding the intellect's work. Therefore, although we conceive them inadequately, our imperfect and inadequate cognition of them neither removes nor posits the formal distinction that they have among themselves: for the intellect truly conceiving a distinction in an object — unless it conceives it plainly as it is in the object and in the thing — conceives it truly. Because just as it does not truly know an object unless it knows it as it is knowable in itself (otherwise it would be deceived), so it does not know some things as formally distinct in an object unless they are formally distinguished in the very object — as the Doctor argues at *q. 4* of the cited passage, *§. Ista positio*, around N, and Tromb. pursues this at the cited passage, *part. 2, fol. 22.* Therefore the distinction of reasoned reason must be wholly expelled from the school of the Subtle Doctor as futile, useless to it, and uprooted as a foreign offspring redolent of Thomist doctrine; so that it is a wonder that certain of our new writers embrace it with both hands and fight sharply for it against the entire body of ancient and recent Scotists. They also do not hesitate — as those who do not favor them — to look down upon the Formalists, most learned and most acute men, and to disapprove their labor and work deserving all praise and celebration; from these I require religious modesty. And let them know that toward our predecessors — men of the highest eminence in every kind of learning — honor, not dishonor, glory, not envy, is to be rendered.

First assertion: Universals taken formally are distinguished by reason. This is explicitly transmitted by Lychetus at *2 dist. 4, q., §. Ad quaestionem istam*, and is

derived from the principles of Scotus in the afore-cited passages and at *Quol.* 13; and Vallo, Faber, and the other Formalists cited above follow him. Proved: such is the distinction as are its extremes, as I intimated above — for between extremes that are thing and thing there is a real distinction; between extremes that are reality and reality there is a formal distinction. Therefore between extremes that are beings of reason — as the formal universals are — there falls a distinction of reason. Moreover, a relation is specified by its term, according to Scotus at *3 dist.* 8, *q. un.*, §. *Contra istam rationem secundam*. And if the term is real, the relation is real; but if the term is a being of reason, the relation is a being of reason — as the Doctor writes at *Quol.* 13, §. *Circa* 1, P. The reason is that a relation cannot have being more truly than the term to which it is. Therefore those whose foundations and terms are beings of reason — as the formal universals are — are distinguished by reason.

Second assertion: Of universals taken materially, some differ really and some formally. This assertion is divided into two parts, and each part is according to the mind of Scotus in the cited passages. The first part is proved: first, those that do not imply a contradiction to be separated from each other really differ — as is plain from the definition of real distinction given in the preceding note. But it does not repugn substance and accident to be separated from each other, as is plain from the accidents of the most holy Eucharist, which have been divinely separated from their substance. But some universals are substances, like "animal," and some are accidents, like "color." Therefore some universals are really distinguished. Second, between thing and thing there is a real distinction, as I was saying above with Scotus. But some universals are thing and thing, as I was just signifying of "animal" and "color." Therefore some universals are really separated from each other. The second part is argued: first, those that are inseparable and enjoy distinct definitions formally differ — as is plain from the definition of formal distinction given above. But some universals are inseparable and have distinct definitions — such as "animal," "rational," "man," and "risible." Therefore some universals formally differ. Second, between reality and reality there intervenes a formal distinction, as is plain from what has been said. But some universals are realities, as those I now enumerated. I add that the attribute and its subject formally differ according to Scotus, as will be shown in *Metaphysics*; but the attribute is the fourth universal, and its subject is very often the first or second universal. Therefore some universals taken fundamentally enjoy a formal distinction.

One hundred and eleventh objection. First: Every being is either real or of reason — or, as Aristotle says elsewhere in a passage recalled by us, every being is either outside the soul or in the soul. But universals are beings; therefore between them there intervenes a real distinction, if they are real beings; or a distinction of reason, if they are beings of reason. And so none of them formally differ. I reply that the solution to this argument is plain from what was said in the beginning of the preceding note, where we brought forward the twofold

meaning of real being. For if real being is taken for everything that does not depend on the work of the intellect, then it is true that every being is either real or of reason. But if it is taken for what is incompatible with being without another and possesses a distinct objective account, or distinct reality and formality, then beyond real being there is found formal being — and between two formal objects a formal distinction is established, as was illustrated with examples above.

One hundred and twelfth objection. Second: A property is an accident that really differs from the subject in which it inheres. Therefore it was not well said above that the property is formally distinguished from that of which it is the property. The antecedent is denied. For a property is not what is commonly called a common accident; rather, it is called an accident taken for something extraneous — as I made plain elsewhere.

One hundred and thirteenth objection. Third: One and the same thing is not distinguished from itself — otherwise it would be both the same and not the same, which is a contradiction. But the first and the last universal are one and the same. Therefore they in no way differ from each other. The major is known. The minor is argued: the accident, which is the fifth universal, is likewise a genus, which is the first universal — as "color," which is an accident, is a genus with respect to whiteness and blackness. I distinguish the major: with respect to the same thing, I concede; with respect to different things, I deny. Thus accident, in view of the subject in which it inheres, is the fifth universal; in view of the inferiors of which it is essentially predicated, it is the first universal. This is the explicit response of the Doctor at *q. 19 univers.* in fine, saying: "Nothing is predicated as to what-it-is of that with respect to which it is an accident; but with respect to that with respect to which it is a genus — as color is not predicated of substance as to what-it-is, but of whiteness, with respect to which it is a genus."

Question II: On Genus

It was right to discuss the universal in common first, before its subjective parts — as I proposed at the beginning of the preceding question. The reason can be given: because the universal taken generally is the quiditative predicate and enters into the definition of each universal; hence the universal in common had to be pre-explained before proceeding to each universal in particular. Now, among the subjective parts of the universal, genus occupies the first place — as Aristotle intimates at *2 De generatione*, c. 3, saying that plant life precedes animal life, which is followed by rational life. Therefore genus must be treated first, before the remaining universals.

Article I: What Is Defined in the Definition of Genus

The accepted senses, divisions, and definitions of genus are to be known from the *Epitome*, *q. 3, l. 1, art. 3*. But concerning the present article, three opinions

circulate among Dialecticians, reported by Scotus at *q. 14 universalium*. The first is that of Venetus, c. de genere, Tol. *q. 1*, and others there, who hold that in the definition of genus is defined the thing or nature insofar as it underlies the second intention. The second is that of certain recent thinkers — namely Rumius *q. 2* and Hurtadus *disp. 4, sect. 2* — who think that what is defined in the said definition of genus is the aggregate composed of the nature and the second intention. The third is that which Scotus in the cited passage, §. *Dicendum igitur*, together with his interpreters there, Antonius Andreas c. de genere, Tatar. *dub. 1, art. 1*, Joannes de Magistris, and others nearly in common in that passage, defend: namely, that in the aforesaid definition of genus only the second intention is defined.

Note, from the Doctor in the cited passage, that genus is a concrete name whose abstract is genericity. A concrete term, from what has been said, denotes two things: one material and another formal. "Genus" taken materially signifies the generic nature — such as "animal." "Genus" taken formally signifies the second intention applied to the nature of genus. Now the question is: whether in the definition of genus is defined the generic nature, the second intention, or both simultaneously — that is, the aggregate of both. The Doctor further notes that genus in the first mode pertains to Metaphysics and in the second mode to Logic — as the Doctor intimates in the cited *q.* before §. *Propter argumenta*. And of the universal in common we showed this extensively in the preceding *q. art. 9*.

First assertion: The nature is not defined in the definition of genus. So Scotus in the cited passage, and it is derived from *Quol. 6, §. de tertio*, below 10. Proved: first, Logic does not deal with things per se but per accidens — since it is not a real but a rational science, from what was proved at *l. 1, q. 2, art. 6*. Therefore the definition of genus is not fitted to the thing or nature. Hence the Doctor excellently adds at the end of the cited *q. 14* that Porphyry gave examples from things as being more manifest — not because he gave a definition of them. Those who do not attend to this — Mastrius and Bellutus at *disp. 5, q. 1, art. 1* — say that the definition of genus was transmitted by the afore-named Porphyry as concerning both the thing and the second intention, and they affirm that the Doctor did not reject this. But since his expressed mind is had, it must not be wrested from its meaning. One need only read the Doctor both in the now-cited passage and in §. *Dicendum igitur*, where he says that only the second intention is defined. And it will be plain that Scotus does not approve of what those recent authors allege. Second: what is placed in the definition of genus is not real but intentional — as is plain to anyone who considers its parts, and especially the verb "is predicated," which I noted above to be an intentional verb. Therefore the aforesaid definition of genus is not adapted to the thing.

Second assertion: Nor is the thing, insofar as it underlies the second intention, defined in the definition of genus. This Scotus expressly holds at §. *Allegato, Ad*

quaestionem dicitur. Proved: first, what is here defined belongs univocally to things of all genera — such as "animal," "color," "figure," and similar things — and belongs to them according to the same name and the same account. But it is impossible for something to belong to things of all genera under a second intention. Therefore in the said definition of genus is not defined the thing under the second intention. The major is plain. The minor is argued: a thing cannot be signified in a more common mode than being. If therefore something under an intention were univocal, being under the intention of genus could be univocal to them; and hence "genus" would be universally univocal to them — which is false. Second: if the thing under intention is defined, the thing is defined per accidens — because the intention is accidental to the thing. But everything per accidens is reduced to something per se, from which the per accidens is said. Therefore since the thing has nothing except to be defined by intention, it follows that the thing is not thus defined at all.

Third assertion: Nor is the aggregate composed of the thing and the second intention defined. This too the Doctor maintains in the cited §. Allegato. Proved: first, from 7 *Met.* T. 13, the per accidens being is not defined. But the aggregate composed of the thing and the second intention is a per accidens being, as is self-evident. Therefore in the definition of genus the aggregate composed of both is not defined. Second: of the aggregate there is no demonstration nor science, as will be established at l. 5 of this work. Therefore neither is there a definition — which is the middle term of demonstration.

Fourth assertion: In the definition of genus, only the second intention is defined. So Scotus just recounted. Proved: first, what is considered per se by Logic is defined in the definition of genus. But the second intention is considered per se by Logic. Therefore the second intention is defined in the definition of genus. The major is evident: for whatever is known by something is known by it according to its quiditative being. The minor is supported by that well-known dictum of Avicenna, Boethius, and Scotus in *Report.* 2, *dist.* 1, *q.* 7, §. *Teneo igitur*, received by all: "Logic deals with second intentions applied to first intentions." Second: what is here defined is what the very definition of genus belongs to per se and primarily. But that to which the definition of genus is fitted is the second intention alone — for what is placed in that definition is intentional, as is clear from the verb "is predicated" and the other expressions. Therefore only the second intention is defined in the definition of genus. Thus all second intentions are defined, as Scotus plainly teaches at 4 *dist.* 1, *q.* 2, a little before §. *Ex his praedictis* 7.

Eighth objection. First: Genus is predicated of several differing in species as to what-it-is. But this does not fit the second intention — because the second intention is an intentional accident that is not predicated as to what-it-is. Therefore the aforesaid definition fits the thing; and hence in the definition of genus the thing is defined. I reply that "what-it-is" and "to be predicated as to

what-it-is" are different things: "what-it-is" indeed belongs to the thing, but "to be predicated as to what-it-is" is adapted to the second intention — and is a determination of the inherent, not of the inherence, which I made plain above. Therefore, to the argument in form: I concede the major and deny the minor for the reason just assigned.

Ninth objection. Second: The intention of genus is not predicated as to what-it-is except of this and that intention, which do not differ by more than number — as the Doctor writes at *Quol.* 6, §. *De tertio* sub X. But genus is what is predicated of several differing in species as to what-it-is. Therefore in the aforesaid definition of genus the second intention is not defined. Confirmation: if in the definition of genus is defined the second intention, the same will happen in the definition of species — since the reason is equal in both. Therefore genus could not be predicated of species — which is false. The consequence is proved: the opposite cannot be predicated of the opposite, nor the disparate of the disparate. But genus and species are disparate; therefore, etc. I reply, with Scotus both here and at *3 dist.* 7, q. 1, §. *Quarta videndum*, C: it is one thing for a predicate to be "what-it-is," and another for it to be "predicated as to what-it-is." For in every genus there is something "what-it-is," from *1 Top.* c. 7; but not everything in any genus is predicated as to what-it-is of anything whatsoever — only of its own inferior, in whose essential account it is included. Therefore since the second intention is a "what-it-is" with respect to this and that second intention, it is predicated of those differing in number; but for the substrates and first intentions, it is predicated of several differing in species. To the confirmation: I say that nothing prevents relatively opposed and disparate things from being predicated of each other, as long as the subject is taken as a "what" and the predicate as a "mode."

Tenth objection. Third: Porphyry in the present chapter, advancing the definition of genus, exemplifies it from things — as "animal" and "man." Therefore it is plainly evinced that in the said definition is defined the thing, not the second intention. I reply that Porphyry indeed adduces examples from things precisely because things are better known and more manifest than second intentions — not because he thought that the thing is defined in the aforementioned definition of genus, as Scotus excellently teaches at the end of *q.* 14 *universalium*; especially because what is designated by definition in second intentions is exercised in first intentions and in things, as the same Doctor notes there, §. *propter argumenta*. And that Aristotle did the same thing the Doctor himself rightly indicates at *q.* 9 *praedicamentali**, §. *Ad q.*, toward *Si autem dicatur*.

Article II: Whether the Definition of Genus Is Quiditative

Most extensively and learnedly does Cardinal Sarn. treat this difficulty together with Scotus at *q.* 15 *universalium*, reporting two opinions: the prior is defended, as Tol. *q.* 2 and the Coimbrans *q.* 1, *art.* 2 recount, by Ammonius and Boethius,

who hold the definition of genus to be descriptive — which Maior, Arriaga, and others embrace. The latter belongs to Scotus in the cited passage, St. Thomas in *l. de ente et essentia*, c. 4, Hurtadus *disp.* 4, *sect.* 1, and others who teach that it is quiditative and essential. "Genus is what is predicated of several differing in species as to what-it-is" — which is drawn from Aristotle *1 Top.* c. 4, *5 Met.* c. 28, and Porphyry in the *Isagoge*, c. de genere. What I said in the *Epitome*, l. 2, q. 7, art. 2 on definition and the conditions required for it must be recalled; and once recalled, this dispute is easily settled and this difficulty conveniently resolved.

Assertion: The aforesaid definition of genus is quiditative and essential. So Scotus in the cited passage. Proved: first, from Aristotle and Porphyry as cited — for Porphyry expressly speaking of the definition of genus transmitted by the Philosophers says: "which also those who describe have assigned" — that is (as Scotus and the Scotists explain), "defined." And in *c. de specie* he adds: "It is necessary to use the accounts of both." But account is definition, from *4 Met.* c. 5, T. 28. Therefore Porphyry seems to wish the aforesaid to be a definition, not a description, of genus. Second, from *6 Top.* 1 and *7 Met.* T. 37: what consists of genus and difference is a quiditative definition. But the aforesaid definition of genus consists of genus and difference — for "genus" is what is predicated of many, and the difference is found in the remaining particles through which genus is distinguished from the remaining universals. Third: that is a quiditative definition which possesses per se predicates, does not include the subject per se, and is convertible with the defined. But the definition of genus is of this kind; therefore it is quiditative. The major is from *7 Met.* T. 11, 13. The minor is plain to anyone who runs through all its particles. From this it is plain that Mastrius and Bellutus at *disp.* 5, q. 1, toward the end of *art.* 2 deviate from the truth and greatly decline from Scotus and his school, when they judge this controversy between the afore-named authors to be merely about a name — saying: "If 'to be predicated' is taken formally it is a description, because predication is a property of the universal; but if it is taken radically it is a definition, because the root of predication is the universal essence, which is expressed through being in many." But their assertion and distinction I vigorously attacked and effectively rejected in art. 9 of the preceding question. Therefore I hold they need not be further refuted or harassed in this place.

Thirteenth objection. First: An accident is defined through its subject, which is substance — which from *Met.* T. 4 precedes the accident in definition, knowledge, nature, and time. But genus is an accident because it is a second intention, as is plain from what has been said. Therefore it must be defined through the subject. But in the aforesaid definition of genus no subject is placed, as is plain. Therefore that definition is not exact and essential. I reply that the major holds of a real accident that is educed from the subject by a producer or follows from the subject by its own nature; but not of an intentional accident, which comes to be through the work of the intellect. Or perhaps it may be better said, by denying the subsumption: for as I said in art. 13 of the preceding

question, the subjects of the second intentions are the known things in which the designated predication are exercised.

Fourteenth objection. Second: A concrete term is not defined. But genus is a concrete term; therefore genus is not defined, whether exactly or not. The major is proved from 7 *Met.* T. 20 and 23. The reason is that the concrete term, being composed of two natures — subject and accident — is a per accidens being; which, from the same source at T. 20 and 21, is not defined. I reply by distinguishing the major: of a concrete term aggregated from two natures, I concede; of a concrete term consisting of one nature, I deny. Example of the first: musical man; example of the second: man. Aristotle is thus to be explained — as the Doctor intimates at *q. 5 praedicamentali*, §. *Ad q.*, and Mauritius approves in the exposition, *q. 12, Ad primum principale*, fol. 26.

Fifteenth objection. Third: What is defined is in a genus. But genus is not in a genus — which is Aristotle's dictum at 3 *Top.* c. 1, saying: "it is more in the genus than what is not in the genus, as justice rather than the just." I reply: with the major conceded, the minor is to be denied. The proof of the minor is explained as referring to the genus of virtue, not to the predicable genus. All the more so because, from what is to be said elsewhere, abstracts of accidents seem more properly placed in the genus than their concretes.

Sixteenth objection. Fourth: Only species is defined, from Aristotle 6 *Top.*, 7 *Met.* c. 4, and Scotus *q. 12 universalium*, §. *Ad primum arg.* The reason is that only species consists of genus and difference — which is required for an exact definition. But genus is not species, since genus and species are two distinct universals. Therefore, etc. I reply: with the major conceded, I distinguish the minor: with respect to the universal in common, I deny; with respect to the other universals in particular, I concede — as I showed in art. 10 of the preceding question.

Seventeenth objection. Fifth: The aim of an exact definition is that the defined be known and declared through the definition itself, from 6 *Top.* c. 6; hence it is given through what is prior and better known — namely, the essential and quidditative principles of the defined. But such is not the definition of genus — because it is assigned through what is simultaneous with or posterior by nature to genus itself — as species is. I reply that the argument holds for the definition of an absolute term, not a relative term; for it is necessary to place the correlative in the definition of a relative term, as the Doctor notes both here and at 4 *dist.* 1, *q. 2*, §. *De secundo principales*, H. The reason is that one relative cannot be known without the other, as is plain from the chapter on relation. Aristotle also intimates this at 6 *Top.* 1.

Eighteenth objection. Sixth: That is not a quidditative definition in which there is a tautology, from 6 *Top.* c. 3. But in the definition of genus there is a tautology — for it is tautologous to say "of several," since "several" in the plural already

includes multitude, just as species includes genus, from 5 T. 16, 10 Met. T. 12. Therefore, etc. With the major conceded, the minor is to be denied. To its proof I say that "difference" is placed not tautologically but expositively — for in order that genus may differ from the other universals, "differing in species" is rightly added for the sake of explanation and distinction.

Article III: Whether Genus Is Predicated of Species as a Whole or as a Part of It

Scotus is quite excellent at *q. 16 universalium* in clarifying and declaring the proposed difficulty — which Cardinal Sarn. indicates there at the beginning of his exposition to be both useful and difficult, both on account of the doubts that are adduced and resolved in it and on account of the objections that arise from them and are proposed. The philosophers are not in agreement on its resolution: for some, like Paulus Venetus *c. de specie*, think genus is predicated of species as its actual part. Others, like Canterus in this chapter, hold it is predicated as a potential part. Recent authors cited by Mastrius and Bellutus, *art. 4, disp. 5, q. 1* add that the metaphysical part is predicated of the whole, not the physical part — and with this distinction they think they resolve the entire difficulty. But Scotus and his disciples discern that genus is predicated of species not in the manner of a part but in the manner of a whole.

Note I, with the division of predication into designated and exercised presupposed — concerning which see Note 2 at art. 15 of the preceding question — that parts for now are of two kinds: essential and subjective. Essential parts are those that constitute the essential whole — as soul and body are the constitutive essential parts of the animate whole. Subjective parts are inferiors of which the superior is predicated — as Peter and Paul with respect to man, and man and brute with respect to animal. The former parts are actual insofar as they actually constitute the whole; the latter are potential insofar as they constitute the potential whole — which is the superior that potentially contains its inferiors. Of the former predication is not made; of the latter predication is most truly made — as "Peter is a man" and "brute is an animal."

Note II, from Aristotle 8 Met. T. 9 and Porphyry in the *Isagoge*, *c. de differentia*, and Scotus *q. 7 praedicamentali*: in species two things are found that compose the species as a whole as its parts — namely, the material or potential, and the formal or actual. The first is genus, which is called material and potential insofar as it is determinable and contractible through its differences and is of itself indifferent and indeterminate to this or that difference — just as matter is of itself indeterminate to receiving this or that form. The second is difference, which is called the actualizing and determining entity — because it actualizes and determines to such specific being, as "rational" determines "animal" to be man and "irrational" to be brute. And therefore just as form actualizes matter, so difference actualizes genus. Although genus is a part of species, it is nonetheless predicated of it in the manner of a whole, says the Doctor in the cited passage, §.

Dicendum, and with him Orbellus 3 *Met.* q. 1, and Scotus 1 *Post.* q. 23, §. *Ad primam*: for the mode of its signification in the concrete gives to be understood the whole, insofar as a predicate in the concrete consequently signifies the whole of what is imported through the subject in the manner of what has it.

Note III, and recall from what was said in the *Epitome*, l. 1, q. 1, art. 6: that there is a twofold abstract — from subject and from suppositum — and a twofold concrete: substantial or suppositival, and accidental. The first regards the suppositum, as "man" with respect to "humanity"; the second regards the form in the subject, as "white" with respect to "whiteness." The concrete moreover is signified in the manner of a whole, the abstract in the manner of a part. But a part is not predicated of the whole, especially in the abstract — for these are false: "humanity is animality" and "humanity is rationality." And Bonet not obscurely intimates this at 1 *Met.*, saying: "A concrete and an abstract differ in this: that an abstract is imposed to signify the quiddity precisely prescinding from every posterior predicate; while a concrete is imposed to signify the quiddity without any precision."

First assertion: Genus is aptly predicated of species, and every predication of superior of inferior is universally true. So Scotus just cited, and at q. 20 in fine. Proved: first, from Porphyry c. *de specie*, where he says that all superiors are predicated of inferiors; and Porphyry himself already gave the example in c. *de genere* of "animal," which is predicated of "man." Add Aristotle in the chapter on substance, saying that secondary substances are predicated of primary substances — as "animal" of "man" and of some man. And at 1 *Post.* T. 9: the first mode of saying per se is when the definition or a part of the definition is predicated of the defined — as "man is an animal," or "man is a rational animal." Second, the following is rightly inferred: "man runs; therefore animal runs" — because the opposite of the consequent is not compatible with the antecedent; but every enthymematic inference holds by virtue of some necessary middle through which it can be reduced to a syllogism; that middle is "man is an animal"; therefore it is necessary, as is plain from 1 *Priorum*, c. 28. And from one thing nothing sufficiently follows unless another is understood.

Second assertion: Genus is not predicated of species in the manner of a part, but in the manner of a potential whole. This too the Doctor transmits in the cited passage, citing Boethius at 1 *divisionum* toward the beginning, in these words: "Genus in predication is a whole; in definition, however, it is a part." And at the end of q. 20 of the same work. And at 1 *Post.* q. 23, §. *Ad primum contra hoc*. Proved: first, the same reason holds for physical and metaphysical parts as for real and rational parts. But the physical or real part is not predicated of the whole: for these are false: "man is matter," "man is rational soul." Therefore neither is the logical or rational part predicated of the logical whole — as species is. Second, genus regards many as its subjective parts, of which it can be predicated; but genus as a part connotes only the species that it constitutes.

Therefore it is predicated in the manner of a whole. Moreover, genus is predicated of species as a universal abstracted from its inferiors — but the universal abstracted from its inferiors contains their essence under a common account considered without the inferiors being considered, just as is plain of species abstracted from its singulars. Therefore it is predicated of them in the manner of a whole: for a part cannot be abstracted from the whole with the abstraction of the universal from its inferiors — it can only be prescinded from it, as the arm from man, which as is agreed by all is not predicated of the whole; for it does not hold: "man is an arm."

Twenty-fifth objection. First: That proposition is true in which a superior is predicated of an inferior, as is plain from what was said. Therefore this is a true proposition: "the superior is the inferior." But the consequent is false — for the opposite is predicated of the opposite. I reply, with Scotus at the end of the question, that it is the fallacy of accident: for it does not follow, "animal is a genus; therefore man is a genus."

Twenty-sixth objection. Second: No part is predicated of the whole, from 4 *Top.* c. 2, as "animal is not a hand." But genus is a part of species, from 5 *Met.* c. 3, and it is plain from its definition, in which genus is placed as a part of it. Therefore, etc. I reply by distinguishing the major: no part is predicated of the whole taken in the manner of a part, I concede; in the manner of a whole, I deny. Aristotle in the cited passage is thus explained. And this is illustrated by the example of Avicenna 5 *Met.* of "manuatum" (having a hand) and "capitatum" (having a head). For these two words signify a part determinately — "manuatum" signifies the hand and "capitatum" the head — yet each signifies in the manner of a whole; for "manuatum" signifies the same as "having a hand" and "capitatum" the same as "having a head" — as Scotus explains in the cited passage before §. *Quia verò.*

Twenty-seventh objection. Third: Every concrete term is denominative. But genus is a concrete term. Therefore it is denominative, and is predicated denominatively. But to be predicated denominatively and univocally are opposing modes. Therefore, etc. I reply that the major is true of accidental concrete terms, not of substantial concrete ones — as is plain from the third note.

Twenty-eighth objection. Fourth: If "man is an animal," either the whole nature of animal is in man himself or not. If not, then man is only qualifiedly an animal, because he does not participate in the whole nature. If yes, then since from 3 *Phys.* T. 63 the whole is that outside of which nothing exists, it follows that besides man there is no animal — and so lion would not be an animal, and so on for the rest. I reply that the whole nature of animal is in man inadequately, not adequately — as I made plain in the preceding question, art. 6. But the description of the whole is to be understood thus: the whole is that of which nothing required for it is outside; and in this way nothing of the nature of animal is lacking to man.

Twenty-ninth objection. Fifth: The whole is what consists of parts, as is plain from the very word; but the universal is a whole — as Aristotle writes at *1 Phys.* T. 4 and 7 of the same work, T. 31. Therefore it has actual parts. I reply according to the distribution of whole into actual and potential given above: parts are likewise distributed into actual and potential. We hold with Scotus at *q. 25 universalium* that genus is a potential whole, since it has a concept or grade prescinded from its differences and species, as the Doctor intimates at *1 dist.* 8, *q. 3*, following Aristotle both at *2 Post.* c. 8 and at *7 Met.* T. 42. Therefore to the argument in form, I distinguish the major: of an actual whole, I concede; of a potential whole, I deny. Aristotle is thus to be explained in the two passages just cited.

Thirtieth objection: A definition actually contains its parts of the defined. But the parts of the defined are genus and difference. Therefore it actually contains them. The major rests on the passage from Aristotle *1 Post.* c. 4, saying that the complete definition and its parts are predicated per se of the defined. I deny the major. To its proof from Aristotle I say that the parts of the definition are predicated of the defined not in the manner of an actual part but in the manner of a potential whole.

Thirty-first objection. Sixth: Genus is really identified with the differences into which it is divided — for they can in no way be separated from it. Therefore genus actually contains its differences; and hence it is predicated of them as of its actual parts. Brasavola replies at *q. 24 universalium* that differences are really identified by reason of the species, which is a third thing distinct from genus and its differences — not by reason of genus itself, which contains them only potentially.

Article IV: Whether Genus Demands Several Species in Act

Scotus examines this article with deliberate purpose at *q. 18 universalium*, where he reports some — among whom are Albertus *Tract.* 4, c. 6 and St. Thomas *1 Post. lect.* 12 — who affirm that genus requires several species in act. The opposing view is defended by most others — especially the Scotists in the exposition of the cited question — to whom Ruuius *q. 4 de specie* and Hurtadus *disp. 5, sect. 4* adhere, holding that genus can be preserved in a single species.

Note that the present doubt can be raised both about the logical and the metaphysical genus, and about its objective being and being of existence — which others, perhaps most notably Tatar. *c. de genere, scibilis* 4, express under other words as meaning: it can be understood according to existence, potency, and aptitude. And the Doctor in the cited passage, §. *Ad quaestionem dicitur*, plainly indicates this. It may also be doubted whether the same reason holds for genus with respect to species as for species with respect to individuals — as Aegidius asserts, against the authors of the first opinion in this article, as Fons. 5

Met. c. 28, q. 15, sect. 1, 2 testifies, and with whom the Complutenses at *disp.* 6, q. 1 agree.

First assertion: The metaphysical genus, and in objective being, does not require several species in act but only in potency and by aptitude. This is indicated by Scotus in the cited passage, §. *Contra hic modus dicendi*. Proved: first, from the definition of the metaphysical universal — "one apt to be in many." Therefore since the definition does not demand the existence of the thing, as I noted at q. 2, l. 1, art. 2, not. 4, it suffices for the metaphysical genus to be apt to be in many differing in species — even though neither it nor its species exist in act. Second, the generic nature taken objectively abstracts from all existence, as is plain in the passage just cited, just as every other quiddity does in objective being. Therefore, even if genus does not have species in act, it is nonetheless to be judged that it is a metaphysical genus.

Second assertion: Genus in the being of existence — which some call the physical genus — can be preserved in a single existing species. This is derived from Scotus in the cited passage, toward *Potest igitur dici ad q.* Proved: first, from Porphyry here, and Aristotle 4 *Top.* c. 2: "when the genus is removed, the species is removed; but when one species is removed, the genus is not removed, because it will remain in act in another species." Second, if all animals were destroyed except man — as will happen after the day of judgment — this proposition "man is an animal" is true and essential, being a predication of genus of species and superior of inferior; not only in the being of essence but also in the being of existence. Therefore with only one species existing, the thing is truly a genus. Third, what has the essence of genus is truly a genus — just as what has whiteness in itself is truly white. But genus existing in one species has the essence of genus — for if man exists, animal exists, which is its genus; if indeed man exists, animal exists, following that canon: from inferior to superior the affirmative inference holds. And hence genus can be preserved in one species alone. Moreover, genus is one apt to be predicated of several differing in species as to what-it-is. But with only one species existing, genus still possesses its definition — which regards potency, aptitude, and essence principally, not act and existence. Finally, correlatives mutually posit and destroy each other, from the chapter on relation. But genus and species are correlatives; therefore when one species is posited, its genus is posited. For it is not necessary that all the terms of a relation exist — as is plain of a father who does not have all his children begotten simultaneously, with respect to whom several paternal relations arrive successively, in accordance with the plurality of the children begotten — as the Doctor writes at 3 *dist.* 8, q. *un.*

Third assertion: The logical genus does not require several species actually existing but only apprehended by the intellect. This is taught by Scotus in the cited passage and his interpreters — most notably Barg. 1.d.3.q.6. Proved: first, the logical universal does not require existing inferiors but only possible and

objectively known ones, as is plainly established from the foregoing. Therefore for the logical genus it suffices that its species be apprehended by the intellect. The antecedent is shown: a rational comparison requires only known extremes, since truth is drawn from things in objective being. Moreover, species is placed in the definition of genus, as is plain from an examination of its parts; therefore for the logical genus it is necessary that its species be apprehended — for the definition cannot be fully understood unless what is placed in it is conceived. Again, correlatives are coïntelligible, from Aristotle as cited in the preceding assertion. Therefore since genus and species are correlatives, for the logical genus its species must be apprehended by the intellect.

Fourth assertion: A species is preserved in one individual just as a genus is preserved in one species. This is gathered from Scotus as cited, before §. *Ad q. dicitur*, and below §. *Contra*. Proved: first, both genus and species are universals, which are apt to be in many. Therefore the same judgment must be rendered about species as about genus. But genus can be in one species, as was shown. Therefore species can also be in one individual.

You will say there is a disparity — because genus is divided by two opposing differences, which does not apply to species with respect to individuals; hence genus requires at least two species for its preservation, constituted by two opposing differences. Against this, the Doctor argues in the cited passage: that which is placed in the definition of species ("differing in number") is the same as what is placed in the definition of genus ("differing in species"). Therefore there is no disparity. Second, the superior is essentially in its inferiors. But species is something superior with respect to individuals, just as genus is with respect to species. Therefore species is preserved in one individual, just as genus is in one species.

Thirty-ninth objection. First: Aristotle at 4 *Top.* c. 1 and 6 says: "Every genus has several species." And there: "it is appropriate that species be predicated of fewer things than genus." And at 6 of the same work, c. 2, he adds: "Where there is a genus, there must be also what divides it from the opposite." But the differences that divide the genus from the opposite are constitutive of the species; therefore genus cannot consist without several species. All the more so because the plurality of species is placed in the definition of genus, as the word "differing" denotes. Therefore, etc. I reply that the cited passages and similar ones to be adduced must be explained as referring to potency and aptitude, not to existence and act — unless several species are apprehended by the intellect, as is plain from the third assertion.

Fortieth objection. Second: From 2 *Caeli* T. 19, if one of two opposites is given, the other ought to be given as well. Therefore if one species is given — constituted by one opposing difference — another species ought to be given constituted by the other opposing difference. And hence genus requires at least two species in act. I reply, with Scotus at q. 40 *praedicamentali*, §. *Ad q. dicendum*,

and *q. 42, §. Secunda*: that dictum of the Philosopher adduced in the antecedent must be understood not of act but of potency. For if blackness exists, it is not necessary that whiteness exist — it only suffices that whiteness can exist. Likewise, if health exists, it is not required that disease exist — it suffices that disease can exist, as the Philosopher expressly holds in the chapter on opposites toward the end. Or that dictum is explained as referring to contraries that expel each other from the same subject — not to contraries taken absolutely, which are more generally called opposites, such as the two differences constitutive of two species; about which see Aristotle *5 Met. c. 9, T. 16*, and Scotus *q. 14 praedicamentali, §. Ad quaestionem*, and *q. 24, toward Contra 2 responsionem*.

Forty-first objection. Third: Correlatives are simultaneous by nature, from Aristotle in the chapter on relation. But genus and species are correlatives, as is plain. Therefore there cannot be genus in act unless its species exist in act — and thus genus cannot be preserved in one species. I reply that correlatives are indeed simultaneous by nature; but a relative does not require all its correlatives to exist — since one correlative alone suffices. For if there is a father, there must be a son; but it is not required for the being of a father that all his sons exist. The same must be asserted of genus, for whose being it is not necessary that all its species exist.

Article V: Of What Things Genus Is Predicated

The present difficulty can chiefly be moved about three things — namely, differences, species, and individuals. In accordance with these three matters, I briefly set forth three assertions, with what I wrote in the *Epitome, l. 1, q. 2, art. 2* about predication and its divisions presupposed and pre-known.

First assertion: Genus is not formally and essentially predicated of difference, but only materially and identically. The Doctor discusses and defends this extensively at *1 Post. q. 23**. The first part is proved: first, from Aristotle *4 Top. c. 2*, saying: "It is a fault if genus is predicated of difference" — add: formally and essentially. Second, what does not enter the essence of genus cannot be formally and essentially predicated of it, as is plain from the definition of essential predication given in the passage just cited. But difference does not enter the essence of genus, since it divides genus and constitutes species. Therefore genus is not formally and essentially predicated of difference. The second part is proved: those are predicated identically and materially which are really identified — as I noted in the cited passage of Scotus *3 Met. q. 1*. But genus and its differences are really identified, at least by reason of the species they constitute, as I noted with Brasavola elsewhere. Therefore the predication of genus of its differences is identical and material. Moreover, genus only potentially, not actually, contains its differences, from art. 3 of this question. Therefore it is predicated of them only identically.

Second assertion: Genus is immediately predicated of its species. The Doctor holds this at *q. 17 universalium*, §. *Ad oppositum*, together with Porphyry in this passage. Proved: first, genus proximately and immediately regards its subjective parts, as every universal does; and it is predicated immediately of those, as all Dialecticians acknowledge. But species are the immediately subjective parts of genus; therefore it is immediately predicated of them. Second, between genus and its species nothing is interposed in the straight line of the predicamental series, as is plain from the series of any predicamental line given in the *Epitome*, l. 1, q. 4. Therefore genus is immediately predicated of them. It is added: because genus is more immediately determined to the being of species than to the being of an individual, it is rightly concluded that genus is immediately said of its species.

Third assertion: Genus is only mediately predicated of individuals. This is defended by Scotus at *q. 17 universalium*, §. *Ad quaestionem*, and *2.d.12.q.2*, §. *Respondeo* before C; whom Suarez *disp. 6, Met. sect. 9*, num. 15, Arriaga *disp. 7 Logica, sect. 2*, and many others follow — against the Nominalists, to whom Hurt. *disp. 4, sect. 5* adheres. Proved: first, between genus and individuals the species intervenes — since there is no individual that is not the individual of some species. Therefore since genus is predicated of the individual through the species of which it is the individual, it follows that genus is predicated mediately of individuals. Second, between the highest and lowest things there are means — for there is no series or transition from the highest to the lowest except through means. But genus is the superior, species are the means, and individuals are the inferiors, as is clearly seen in the Porphyrian tree. Therefore genus is only mediately predicated of individuals. Moreover, the proximate correlative of genus is species; the remote correlative is the individual. Likewise there are generic and specific natures, which are contracted through individual differences, from which individuals are constituted. Therefore genus is predicated of individuals only mediately.

Forty-sixth objection. First: If genus is immediately and essentially predicated of species, there would be a tautology, which Philosophers must avoid. Therefore genus is not thus predicated of species. The antecedent is proved: when it is said "man is an animal," either it is the same animal as man, or it is a different animal from man. If it is the same animal, a tautology is committed — for it would be the same as saying "man the animal is an animal." But if it is a different animal — then it is not a genus, because it is not predicated as to what-it-is. I reply, with Scotus at *q. 16 universalium*, §. *Ad 3 principale*, that "animal" is predicated of "man" as prescinding from "man" and "brute"; for as indifferent to man and brute it is genus, but as contracted to the specific being through rationality or irrationality it is a part of the species — which together with the difference constitutes the species. Therefore to the argument in form, I deny the antecedent. To its proof, what is to be said is plain from the distinction given.

Forty-seventh objection. Second: This is a true proposition of genus concerning an individual: "this animal is an animal." But between "this animal" and "animal" no mean is interposed. Therefore the proposition of genus concerning the individual is immediate — and hence genus is immediately predicated of individuals. With the major conceded, I deny the minor — for since "this animal" cannot be without being rational or irrational, it is therefore presupposed to be of some species; and so between genus and individual there is always some species.

Forty-eighth objection. Third: The generic character can be immediately prescinded from individuals and predicated immediately of them. Therefore genus can be immediately predicated of individuals. The antecedent is proved: from this man and from this horse the common sensitive character — which is the generic character of animal — can be abstracted and compared to them and predicated of them. The consequence is shown: the generic character can be immediately predicated of those from which it can be immediately abstracted. But it can be immediately abstracted from individuals. Therefore it can also be immediately predicated of them. I reply that this generic character is abstracted from individuals not absolutely and immediately, but with species presupposed under which those individuals are comprehended. For this reason genus is put forward of individuals only remotely and mediately.

You will press, with Hurt. *disp.* 4, *sect.* 5, §. 45: in the given case no specific character is perceived, nor is any foundation required for perceiving it. Therefore no specific character is involved in such abstraction. I say that although the specific character is not explicitly known in such abstraction, it is nevertheless necessarily presupposed and implicitly contained — since there cannot be a species without being constituted by a difference and the generic character, before the species is determined to individuals through individual differences.

Fiftieth objection. Fourth: Scotus at *1.d.3.q.6*, sub E, and expressly at *4.d.8.q.2*, §. *Aliter*, *conclusionem* 9, O, and *1 Post. q. 23*, §. *Contra in definitionibus*, writes: "In singulars there is an order according to the order of universals — for any universal can be understood descending into its own singular before it is contracted by any difference to something inferior as to a species; so that we may have the order of these singulars: this being, this substance, this body, and so on down to Socrates. This is plain through Avicenna in his *1 Physics*: that we first see from a distance a body, then an animal, and then a man, etc." This is not to be understood of the universal — since sight does not see the universal — but of the singular of the more universal; therefore according to Scotus genus is immediately predicated of individuals. Confirmation: the demonstrative pronoun "this" signifies the singular of being, not the singular of something less common and universal; for when one asks "what is this?" (as the Hebrews asked at *Exod.* 16), one does not investigate whether this is a being — since it is already

supposed to be a being. And the same cannot be both what is supposed and what is sought, as is plain from *l. 5, q. de praecognitis*. Therefore through that pronoun, one inquires whether it is wood or another singular below being. And once the answer is given that it is wood, or stone, or something else special under being, the inquirer's mind is at rest. Therefore there are singulars of transcendentals and genera, of which they are immediately predicated — according to Scotus's Doctrine. I reply: even if the individual of the more common and universal can be understood prescisively — as the Doctor indicates in the passage just cited, saying that any universal can be understood descending into its own singular before it is contracted by a difference to something inferior as to a species — nonetheless not divisively; since no individual can exist without being the individual of some species, as the same Doctor clearly sets forth at *2.d.12.q.2, §. Respondeo* before C. Therefore we gladly admit that we can prescind and understand the singular of the more universal before that more universal is understood as contracted through its differences to its species; but we deny that such a singular exists on the part of the thing without being of some species. And hence we assert that the predication of genus of individuals is only mediate. To the confirmation the same must be said — which Mastrius and Bellutus could not deny at *disp. 5, art. 3, q. 1*, as advocates of the contrary position, as is plain from their responses to the reasons advanced in opposition.

Article VI. Whether Predication in What Distinguishes Genus from Difference

This doubt is raised and resolved by Scotus in *q. 19*, and is excellently explained by Sarnanus, Mauritius, Joannes Anglicus, and among more recent authors by Fuentes in *q. 7, difficulty 3, art. 3*. From the Doctor there cited, it is noted that predication, which was established in *q. 9, the preceding articles*, as constituting the logical universal, is divided into predication in what and predication in what sort, as the two primary modes of predication. Now predication in what is nothing other than predicating an essence in the manner of an essence included in some subject or in some inferior — which is proper to genus; whereas predication in what sort is predicating a form in the manner of something qualifying or adjacent to another — which fits difference. Since genus is taken from the material side, it predicates essence in the manner of something subsisting; but difference, since it is taken from the formal side of the species, predicates essence in the manner of something informing and qualifying the species itself. Moreover, since difference is an intrinsic part of the species, it is therefore predicated not in what sort absolutely, but in what sort with limitation — that is, in what sort of thing.

Assertion: Genus is rightly distinguished from difference in that genus is predicated in what and difference is predicated in what sort of thing. So holds Scotus in the place cited above, which is defended also by Aristotle in *4 Top. cap. 6* and by Porphyry in the present passage. Proof: predication in what is

predicating essence in the manner of something subsisting, as I noted in the preceding remark; but genus predicates essence in the manner of something subsisting, because genus is taken from the material side, which by itself subsists, as I observed above — and this is indicated by its being expressed with a substantive noun. Difference, on the other hand, predicates essence in the manner of something qualifying and adjacent to another. Therefore the aforesaid distinction between genus and difference is properly assigned. Furthermore, there are only two modes of predication appropriate to the species of the universal: but the mode of predicating in what belongs to genus. Therefore the mode of predicating in what sort of thing belongs to difference, as it is distinguished from genus and from the other universals.

Objection I. Aristotle in *7 Top. cap. 2* writes that both genus and difference are predicated in what. Therefore, according to Aristotle, no distinction intervenes between the predication of genus and that of difference. Reply: Aristotle there only asserts that difference belongs to the quiddity of the species and enters into its essence just as genus does; they differ, however, in that difference is like a form. For this reason it is deliberately placed in the definition of difference by the Dialecticians that it is predicated in what sort of thing, whereas genus is like matter, and therefore is predicated only in what, as has already been explained above.

Objection II. That which is predicated in what is that by which one aptly answers the question "what is it?", as Porphyry holds in *cap. de genere*. But to the question "what is it?" posed about a species, one does not rightly answer by giving the genus. Therefore predication in what is not proper to genus as it is distinguished from difference. The minor is shown thus: since genus in its definition is defined as a second intention, if one asks "what is man?", it is not well answered by saying "it is a genus," because genus is not the what or essence of the first-intention thing. And if one asks "what is the species?", it is not suitably answered by saying "it is a genus." Therefore, etc. Reply: there is a twofold interrogation about the species taken as an intention, namely "what is it?" and "what is predicated of the species?" If one asks what is predicated of the species, the answer "genus" is correct. But if one asks what it is when taken as a foundation, then the correct answer is "it is an animal." For the foundation of genus is predicated in what by the predication exercised concerning the foundation of the species.

Objection III. Predication in what does not distinguish genus from difference. Therefore there is no distinction between the two. The antecedent is proved: a superior difference is predicated in what of an inferior difference, as Aristotle holds in *7 Met. 7*, saying that the superior difference is predicated of the inferior per se in the first mode, which cannot be without predication in what. I deny the antecedent. In response to its proof, Scotus says that the whole coordination of differences is to be referred back to the coordination of species, just as a series

of parts is reduced to the series of a whole — something which we shall examine elsewhere.

Objection IV. Accident too is predicated in what. Therefore predication in what does not separate genus from difference and the other universals. The antecedent is proved from *1 Top. cap. 7*: in every genus there is a what — for color, for example, is predicated in what of whiteness and blackness. Reply: accident can be considered in two ways — as it regards the subject in which it inheres, in which case it is not predicated of that subject in what, for accident is not predicated in what of the substance which is its subject; and as it regards its own inferiors, in which case, if it is a genus, it is predicated in what of its species, as the example of color regarding whiteness and blackness aptly shows.

Question III. On Species

Article I. Whether Species is Rightly Defined by Porphyry

Cardinal Sarnanus in *q. 21 of the universals* assembles many reasons to show that after genus, species should be treated next, even though difference precedes species itself. We adduce only one reason, namely that species regards genus as its correlative, as Porphyry affirms in the present passage and Scotus in *q. 21 of the universals*, §. *Dicendum in solutione primi argumenti*, and also in *1 d. 23, q. un.*, §. *Contra istud*. Nearly everything investigated concerning genus can likewise be inquired about species in parallel fashion, as the Doctor notes in the place cited above before the section cited. Therefore, presupposing much from what preceded, we take care to add only certain things peculiar to species itself.

Scotus in the question cited above on the universals identifies two relations in species: one toward genus, according to which it is defined by Porphyry in the present passage — "species is that which is placed under an assigned genus" — and another toward individuals, according to which the same author defines it as "species is that which is predicated of many differing in number in what." That definition of species which is also adduced by Porphyry there — namely, "species is that of which genus is predicated in what" — coincides with the first of his definitions, as the Coimbrans note in *q. 1 de specie art. 1* and Arriaga in *disp. 7, sect. 1, n. 35*. It is merely a notification and exposition of it, as the Doctor notes in the place cited above before the response to the fourth argument. That one and the same thing can enjoy several definitions according to diverse respects is clear from Aristotle in *1 Post. cap. 2*, who attributes to demonstration two definitions: one according to the final cause — "demonstration is a syllogism that produces scientific knowledge" — and another according to the material cause — "demonstration is that which proceeds from true, immediate, prior, more known premises, and from causes of the conclusion." Likewise in *2 de anima cap. 2* he offers two definitions of the soul: first, "the soul is the first act of an organic body having the potentiality of life"; and second, "the soul is the principle by which we live, sense, are moved from place to place, and understand." Among

multiple definitions of a thing, the more exact and formal one is that which better explains the nature of the thing; the others can be called material and descriptive definitions. Observing this, the Doctor adds that the first definition is proper to species because it is given through its primary correlative; whereas the second is given through its secondary correlative, and is therefore not so exact and proper.

First Assertion: Species is rightly defined as that which is placed under an assigned genus, or that of which genus is predicated. This is defended with Porphyry by Scotus in the cited passage, against the opposition of Arriaga in *disp. 7, sect. 2*. Proof: a definition which distinctly explains the thing defined is a correct definition; but the aforesaid definition of species clearly explains the nature of species, inasmuch as it is immediately contained under genus and genus is predicated of it as of something inferior to itself. Therefore, etc. Furthermore, in the definition of a relative, its correlative must necessarily be placed, since a relative is toward another. But genus and species are correlatives, as I noted above from Porphyry, and genus is placed in the definition of species given above. Therefore that definition of species is good and suitable.

Second Assertion: There is only one definition of subiectible species, expressed in different words for the sake of greater explanation. This too is defended by Scotus in the place cited above, to whom Dominicus Soto adheres, while Cajetan and Camerarius oppose it. Proof I: to be subject to genus and to be that of which genus is immediately predicated are entirely identified, since a subject is that of which something else is said, and a predicate is that which is said of another, as I wrote in the Epitome. But Porphyry, defining subiectible species, says "species is that which is subjected to genus," and then adds "species is that of which genus is predicated." Therefore there is only one definition of subiectible species, expressed in different words. Proof II: there is only one relation of species toward genus. Therefore with respect to it there is only one definition. The antecedent is proved: relation, according to Scotus, is specified by its term; but the term of species above itself is only one, namely the genus under which it is comprehended. Therefore, etc.

Third Assertion: Predicable species is properly defined as that which is predicated of many differing in number in what. Scotus in the cited passage holds this and says it is to be proved in the same way as the definition of genus was proved. For this definition consists of genus and difference, and is therefore legitimate. The antecedent is evident: its genus is "to be predicated of many," in which it agrees with the other universals; "differing in number" — supply: immediately and completely — is the difference by which it is distinguished from genus; "in what" is that by which it is distinguished from the three last universals.

Objection I against the Second Assertion: Species, insofar as it is subject to genus, has two diverse formal characters. Therefore there is not one but a

double definition of subiectible species. The consequence is clear: of one formal character there is one definition, and of a double formal character there is a double definition. The antecedent is proved: the character of the universal is "to be one in many," and the character of the predicable is "to be one of many"; but to be a subject in which is a distinct character from being a subject of which. I deny the antecedent and its proof; for it is established from what was said that, according to Scotus, the character of the logical universal is "one of many," whereas the character of the metaphysical universal is "one in many," as I fully explained and proved in *q. 1 of this book, art. 9*.

Objection II. Species is per se subiectible. Therefore it is not per se predicable. The antecedent is well established from the first definition of species; the consequence holds: opposites cannot inhere in the same thing per se; but subiectible and predicable are opposites, as Mayronius notes in *passages 3 and 4 of the universals* above all others. Therefore they cannot belong to species per se. Granting the antecedent, I deny the consequence. In response to its proof, I distinguish the major: with respect to the same thing, I grant it; with respect to different things, I deny it. For species is subiectible insofar as it regards genus, and predicable insofar as it regards the individuals of which it is predicated.

Objection III. A definition is given through things more known, since it is devised to explain the essence of a thing; but genus is not more known than species, for more universal things, which require more difficult abstraction, are less known to us than less universal things, which are nearer to our senses. Therefore species is not well defined through genus. Confirmation: genus is defined through species; therefore species ought not be defined through genus, otherwise the same thing would be both more known and less known, and there would be a circle in the definitions — a thing most to be avoided by philosophers. I grant the major and distinguish the minor: genus taken formally, I grant; genus taken fundamentally, I deny. This resolves the confirmation as well; for those definitions presuppose their foundations, on which Tataretus in *c. de specie, scibile 2* is to be consulted, especially because the correlative is placed in the definition of the relative as something added to it, since it is extrinsic to it, as Scotus says in *q. 28 of the predicamentals, §. Hoc potest concedi*.

Objection IV. A good definition converts with the thing defined, according to the laws of good definition; but the aforesaid definition of species does not convert with the thing defined, that is, with species itself. For there are many species that are predicated of only one individual — the sun of only one sun in number, and the moon of only one moon in number. Therefore the definition of predicable species is not legitimate. Granting the major, the minor is to be denied. In response to its proof, I say that even if those species do not actually have many individuals, a plurality of individuals is not incompatible with them, as was said above concerning genus with respect to species, and as the Doctor expressly teaches in *1 Post. q. 35, §. Ad quaestionem dicitur* and *§. Ad primam rationem*.

Objection V. A definition is adequate to the thing defined; but the definition of predicable species exceeds its object, that is, species itself. For certain things are predicated of many differing in number that are not species — such as "instant" of many instants, "point" of many points, and "soul" of many souls. Therefore the definition of predicable species is not properly assigned. Granting the major, I deny the minor. In response to its proof, I say that by species we understand a complete nature, not an incomplete one such as soul, which is a part of the species, and point, which is the terminus of quantity.

Objection VI. God is predicated in what of the three divine Persons — for one may say "the Father is God," "the Son is God," and "the Holy Spirit is God" — yet God is not a species. Therefore the aforesaid definition of species is accommodated to things other than species itself. Reply: God is predicated of the divine Persons not as their individuals differing from one another in number; since there is only one God and one numerically divine essence without any division or multiplication of itself, God therefore cannot be a species, as Scotus teaches with Augustine in *7 de Trin. cap. 4 in 1 d. 8, q. 3, §. Contra, conceptus ille*.

Objection VII. The notion of person is predicated in what of the divine Persons — for these are true propositions: "the Father is a person," "the Son is a person," "the Holy Spirit is a person" — yet it is not their species. Therefore the definition of species is not adequate. Granting the antecedent, I deny the consequence. For according to Scotus, being is predicated univocally of God and creature, substance and accident, although it is neither genus nor species nor any other universal, since being is a transcendental. The same must be said of person, which is univocally predicated of the three Persons enumerated, as the Doctor writes in *1 d. 23, q. un., §. Item arguo*, and in *d. 26, q. un., §. Ad 1, tertia via sub*, whom Pelbartus follows in *Tom. 1, Rosary, verb. persona, §. 2*.

Article II. Whether Species is a Universal by Relation to Individuals

The two Cardinals Thomas de Vio in *cap. de specie* and Toletus in *ibid. q. 1* affirm that species as subiectible is predicable — which amounts to saying that species through its relation to genus is a second universal — although these two authors rest on different foundations, as Fuentes notes in *q. 8, difficulty 1, art. 2*. For Cajetan thinks that universality and predicability flow from subiectibility as two properties flow from one essence, so that just as this proposition is true, "man is risible," so likewise this one: "subiectible species is universal." Toletus, on the other hand, holds that universality is the essence from which subiectibility and predicability proceed as two passions, so that species as subiectible is a subiectible universal, and as predicable species is a predicable universal. The opposing view is defended by Scotus in *q. 21 of the universals, in the solution of the 4th argument*, Sarnanus, and others there commonly, asserting that species is the second universal through its relation to the individuals of which it is predicated.

It is to be noted and recalled from what was said in the preceding article that species regards two things: the genus immediately under which it falls, and the individuals of which it is completely predicated. According to this twofold respect, it is rightly investigated whether species constitutes the second universal through its relation to genus or through its relation to individuals.

First Assertion: Species as it is subjected to genus is not a universal, neither on the grounds that universality and predicability flow from subiectibility as two of its passions, nor on the grounds that predicability arises from universality as a passion from its essence. This assertion contains two parts and is gathered from Scotus in *q. 21 of the universals, in the solution of the arguments*. The first part, which conflicts with Cajetan, is proved: an opposite does not emanate from an opposite as its property — as could be shown by a long catalogue of the properties of things — but predicability is opposed to subiectibility, since predicability is the respect of a superior to its inferiors, while subiectibility is the respect of an inferior to its superior. Therefore, etc. The second part, which conflicts with Toletus, is proved: predicability is not a passion but the essence of the universal, as was shown in *q. 1 of this book, art. 9*. Therefore, etc.

Second Assertion: Species is not the second universal through its relation to genus, but through its relation to the individuals of which it is predicated. This assertion is likewise bipartite and is handed down by Scotus in the place just cited. The first part is proved: that to which the essence of the universal does not belong is not a universal; but to species as it is subjected to genus the essence of the universal does not belong. Therefore as such it is not a universal. The major is clear. The minor is proved: the essence of the universal is to be predicated of many, from what was said in the place cited; but species as it is referred to genus is not predicated of many, since to be predicated and to be subjected are opposed, as I explained above. Therefore, etc. Furthermore, and this seems to come to the same thing: two formally opposite things cannot belong to the same thing with respect to the same other thing, otherwise two contradictories would be true or false of the same thing. But if species, insofar as it is subject to genus, were a universal, two opposites would formally belong to it simultaneously — namely, predicability and subiectibility — which have been shown to be opposed in the antecedent assertion. Again, according to Scotus, from the distinction of terms the distinction of relations is derived; but genus and individuals are distinct terms to which species is terminated. Therefore there are distinct relations with respect to genus and individuals; but predicability regards individuals as its term. Therefore it is distinguished from subiectibility, which regards genus as its term; and consequently species through that relation to genus is in no way a universal. The second part is proved: that through which something is defined is that through which it is constituted, since a definition explains the thing defined and its parts or essential principles; but species is defined through its relation to individuals. Therefore it is constituted through that relation. The major is known; the minor likewise shines forth from the

definition of species, which is "to be predicated of many differing in number in what." I add that genus is a universal through its relation to the species of which it is predicated; therefore in like manner species is a universal through its relation to the individuals of which it is predicated.

Objection I. Species as it stands under genus is either a universal or a singular; but it is not a singular, because species itself mediates between genus and singular, and as such is not contracted by an individual difference. Therefore it is a universal through its relation to genus. The major is known, because no medium is given between universal and singular. Confirmation: species as it is subjected to genus is predicated of this and that subjectible species. Therefore species as it regards genus is a universal. The major is to be distinguished with respect to that character of subjectibility: I deny it; with respect to the character of predicability: I grant it. Others express this by saying that as such it is a universal materially and specifically, but not formally and reduplicatively. In response to the confirmation, I say that such predication is not essential but denominative — like the predication of an individual of this and that individual — which is excluded from the true character of a universal. Or as others say, such species is subjectible as a what and predicable as a mode.

Objection II. Inferiors are subjected to superiors and participate in their nature; but the five universals are inferiors with respect to the universal in common and participate in its nature, since the universal in common is a genus with respect to those five, as I proved in *q. 1 of this book, art. 11*. Therefore just as those five are universals insofar as they regard their genus, the same must be affirmed of any species. Granting the major, in response to the minor I say that even if those five participate in the nature of the universal, they are not formally constituted in being universal through the respect of subjectibility, but through their relation of predicability concerning their inferiors.

Objection III. The supreme genus in its being is constituted by the fact that it has no other genus above itself, and not through its relation to the inferiors of which it is predicated. Therefore species immediately, as it stands under genus, is a universal. The antecedent is proved from the Doctor in *1 d. 8, q. 3, before §. Alii probant*, where he says it is not of the character of the supreme genus to have many species under it, but rather to have no supervening genus above it — as is clear in the case of "when," which, although it is a most general genus, has few or no species under it. Reply: the supreme genus is considered in two ways: one, as it is supreme, and thus it is said to be supreme by the fact that it has no other genus above itself; and another, as it is a genus, and thus formally it is a genus through its relation and disposition toward the species of which it is predicated.

Article III. Whether Species is the Adequate Correlative of Genus

Among the various opinions of the Dialecticians on this article, one is that of the Lovanienses here affirming that species is the immediate and adequate

correlative of genus. Another belongs to those whom the aforesaid authors report, who suspect that the first and total correlative of genus is something common prescinding from both species and individual, which they call the "subiectible in what incompletely." The third, which is almost common among both ancient and modern Dialecticians, teaches that species is indeed the immediate correlative of genus, but that the total and adequate correlative of genus is species together with individuals.

It is to be noted and recalled from what was said in the Epitome in *1. 3, q. 4, art. 8*, that a relation is a respect toward another; what regards another is called a relative, and that to which the relation is directed is called its term. If from the side of the term itself there also arises a relation that regards that other, it is called the correlative, which can be twofold: immediate, which occurs when between the relative and its correlative nothing is interposed — an example is the act which is the immediate correlative of potency, since potency and its act regard each other immediately and proximately; and adequate and total, which so terminates the relation that it is in no way directed toward anything else — as a son is the adequate correlative of a father.

First Assertion: Species is the immediate correlative of genus. This is elicited from the Doctor in *q. 17 of the universals*, §. *Ad quaestionem*, where he says that genus is predicated immediately of species, and of individuals mediately. And in *q. 21*, §. *Dicendum* he adds that species is the correlative of genus and that genus must necessarily be placed in its definition, which runs: "species is that which is placed under an assigned genus." Proof I: in the direct predicamental line, between genus and species nothing mediates that could terminate the relation of genus, as is evident in the Porphyrian tree. Therefore the immediate correlative of genus is species, as is clearly established from the remark set forth above. Proof II: that which is included in the definition of something is immediate to it, because it is either of its essence or added to it; but species is included in the definition of genus as something added to it, as is clear from the particles of that definition. Therefore it is its immediate correlative. Moreover, Aristotle in *6 Top. cap. 2* writes that a relative must necessarily be defined through its immediate term; but genus is a relative and its term is species, which it regards immediately. Therefore, etc.

Second Assertion: The subiectible is not something common to species and individual; but species and individuals together are the total and adequate correlative of genus. This is deduced from the Doctor in the place cited above. The first part is proved: no predicable common to species and individual is given — otherwise there would be six universals, the opposite of which we established in *q. 1 of this book, art. 10*. Therefore neither is there a common subiectible; the consequence holds because when one relative is removed the other is also removed. Furthermore, the relative of genus is the infima species, as is gathered from *1 Top. cap. 13* and is clear from the definition of species.

Therefore if such a common subiectible were admitted, species and individuals would agree in that subiectible, and so would be one per accidens composed of subiectible and predicable — which is absurd. The second part is proved I: genus is terminated not only to species but also to individuals, and extends to nothing else beyond these. Therefore its adequate correlative is species and individuals; the consequence is clear from the remark set forth above. The antecedent is at hand: genus is subjected to both species and individuals, of whom genus itself is predicated. Proof II: species and individuals participate in the nature of genus — for "man is an animal" and "Peter is certainly an animal." Therefore genus taken formally is adequately terminated to species and individuals; and consequently the total and adequate term of genus is not species alone, but species and individuals together.

Objection. Porphyry brought forward the definition of genus including species alone. Therefore the individual does not belong to the first and adequate term of genus — otherwise he would have improperly omitted the individual, which would be included in its total term. Reply: it was sufficient for Porphyry to mention species, which is proximately and immediately subjected to genus, from which the individual could be understood to follow, since it is contained under genus remotely and under species proximately.

Article IV. Whether Species Requires Many Possible Singular Individuals

With ease we dispatch this difficulty, since with Scotus in *2 dist. 3, q. 6* we deny that the principle of individuation is matter, and assert that every specific nature both corporeal and incorporeal that is created is numerically multipliable — as we pursue at length in the Treatise on Angels, *disp. 1, q. 6* — against the Thomists cited by more recent authors, who hold that spiritual species are immultipliable, and specifically that one angelic species contains only one individual, so that it can in no way have several individuals. But granted that this Thomist opinion is true, the question arises whether that is a true species which has or can have only one individual. On the affirmative side stand Cajetan in *1 p. q. 3, art. 9* and a few others. On the negative side stand all disciples of Scotist doctrine in *2 dist. 3, q. 7* — and this is now the common opinion among more recent authors, so much so that some of them think the opposing view ought to be banished from the schools.

It is noted that Cajetan in the place cited above, for defending his opinion, premisses this foundation: that something can have the character of species in two ways — on the side of the thing and the intellect together, and on the side of the intellect alone. On the side of the thing and the intellect, it occurs when a common nature is abstracted by the work of the intellect from individuals, compared to them, and predicated of them. On the side of the intellect alone, it occurs when the intellect conceives a nature prescinding from individuals, even though that nature exists in one individual in such a way that it can in no way

obtain other individuals. Now all admit the character of species taken in the first way, to which the proper definition of species belongs; but they reject the character of species taken in the second way, which some devise with Cajetan, while other Dialecticians rightly reject it as invented and chimerical.

Assertion: Supposing that there were only one possible individual of some species, such that a multiplicity of individuals would be incompatible with it, it would not be a true species. This is deduced from Scotus in the places cited, and is proved I: the definition of species given by Porphyry does not fit Cajetan's species. Therefore that is not properly a species. The antecedent is proved I: species is one thing apt to be predicated of many differing in number in what. Therefore if a multiplicity of individuals is incompatible with it, it is not a true species, and consequently the proper definition of species does not apply to it. But if you respond that plurality of individuals is incompatible with angelic species on the part of the thing, though not on the part of the intellect and its mode of conceiving — since the intellect can conceive the angelic nature as indifferent and undetermined with respect to several individual differences, and thus the aforesaid definition of species can aptly be accommodated to it — against this it is argued from Scotus in *2 dist. 3*, cited above: if the angelic nature from the side of the thing and of itself is singular and incapable of plurification, it cannot be understood under the character of species and universal, because species and every universal is plurifiable, as is clear from its definition; otherwise the intellect would be deceived in understanding that nature otherwise than it is on the side of the thing. Furthermore, the divine nature, which cannot be plurified of itself since it is of itself singular, cannot be understood under the character of species or any other universal — for the mode of understanding it under the character of species is incompatible with it, because individual multiplicity is incompatible with it. Finally, either the angelic nature has the aptitude to be predicated of many differing in number in what, or it does not. If the first, it is a true species. If the second, it is in no way a species. To invent another species than the one handed down by Porphyry and other Dialecticians is entirely vain and chimerical. Proof II: the universal is one thing apt to be predicated of many, from *1 Perih. s.* and *1 Post. 8*. Therefore a species to which being predicated of many differing in number is incompatible is not a universal. But Cajetan's species is of this kind, as is clear from the remark set forth above. Therefore it is not a universal. Furthermore, a nature to which communicability is incompatible is not common nor universal, as is established from the first question of this book. But the species fashioned by Cajetan has communicability incompatible with it, as is clearly established from his statements. Therefore the said Cajetan rightly endeavors to introduce it into the schools.

Objection I. Angels are placed in the predicament of substance and immediately under the subaltern genus of incorporeal substance. Therefore angels have predicable species, each of which obtains only one individual on account of lack

of matter. Granting the antecedent, the consequence is denied as to that part which asserts that one species has and can have only one individual on account of lack of matter — for that principle we have shown to be false both in *Metaphysics* and in the *Treatise on Angels*.

Objection II. The nature of Michael, for example, can be conceived stripped of singularity as indifferent toward many individuals; but the nature thus conceived and abstracted is not singular. Therefore it is universal, and thus universality according to reason can be adapted to a species that cannot have several individuals. Reply: given the hypothesis that the nature of Michael is conceived in this way, it would be falsely conceived, since indifference and indetermination are incompatible with it, as it is singular and universality is incompatible with it. Wherefore properties compatible with and not incompatible with that nature are to be attributed to it.

Objection III. Formal universality is a relation of reason, as is clear from what preceded; and for its term it suffices that there be something of reason. Therefore for species taken formally, several individuals devised by the intellect are sufficient, even if they are impossible. Confirmation: according to Aristotle in the work on the Heavens, celestial bodies can be universals, even though they are incapable of plurification, because the same Philosopher holds that each of them coalesces from the whole matter, not only actual but also potential and possible within its species, as is clear in *1 Caeli cap. 8*. Reply: formal universality is indeed a relation of reason, but not one that is invented and chimerical — it has a foundation in the thing, for it is a second intention which is founded in first intentions, according to the common opinion of the Dialecticians. Therefore species requires several individuals, if not actual at least possible. In response to the confirmation, I say that those bodies according to Aristotle are incapable of plurification not from within but from without — that is, because there is no other matter that could receive such a form, according to the same Philosopher cited. We, however, assert that a multiplicity of individuals is not incompatible with species from within.

Question IV. On the Individual

Immediately beneath species stands the individual, of which species is immediately and completely predicated in what as of a subjective part of it. Therefore after the discussion of species we speak of the individual, especially because the individual is the correlative of species, and Aristotle in *lib. praedicamentorum cap. de ad aliquid* teaches that correlatives are known simultaneously.

Article I. What and How Many Kinds the Individual Is

The individual is distinguished by Porphyry in *c. de specie*, or rather the individual is taken in two ways: first, intentionally, which has being on the part

of the thing, and is described by the same author as that whose collection of properties is found in no other — as is clear in the following two verses:

Form, figure, place, together with name and blood, Country — these seven no one shares with another.

The individual taken in the second intentional sense, which has being from the intellect, is defined as that which is predicated of only one; it is also described by the same Porphyry as that which is contained under species, and is explained in roughly the same manner as that definition of species which reads: "that which is immediately contained under genus." Furthermore, there is individual substance, which as is clear from Aristotle in the Antepredicaments, *cap.* 2, is neither in a subject nor said of a subject — and this is also called suppositum, hypostasis, and person if it is of an intellectual nature, as Pelbartus notes in *Tom. 1 of his Rosary, verb. persona*, §. 3, following Vorrilong in *1 d. 23* and Mayronius there. Whence Scotus in *1 d. 23, q. un., §. Ad 9, ex Rich. 4 de Trin. cap. 22*, defines person as "the incommunicable existence of an intellectual nature." And there is the individual of accident, which according to the same Philosopher is in a subject but said of no subject — such as this color, this whiteness. Further, the individual is divided into the vague, the determinate, and the suppositional — on which see the Epitome, *art. 8, l. 1, q. 1, 3*.

First Assertion: The prior definition of the individual is not incongruous. So hold all Dialecticians together with Porphyry in the place cited. Proof I: accidents lead us to knowledge of substance, according to the statement of the Philosopher in *1 de anima cap. 1*, "accidents contribute greatly to knowing substance"; but the properties of the individual enumerated above are accidents. Therefore through those properties the definition of the individual is well assigned. The minor is shown: form, temperature of qualities, figure of members, their disposition, and the rest read in the verses cited are clearly accidents. Proof II: in this state substance is not knowable by us in itself, but only through its sensible and material accidents, as the Doctor teaches in *2 d. 3, q. 6*. Therefore the substantial individual is rightly described through properties and extrinsic entities.

Second Assertion: The second definition of the individual is by no means illegitimate. This too is accepted by all philosophers, and is proved: through that definition the nature of the individual is made known and declared — a nature which is indivisible into several subjective parts, as the Doctor notes in *Quol. 19, §. De tertio ante V*. Likewise, in it too the genus-character is assigned, which is "to be predicated," and the difference-character, which is "to be predicated of only one." Therefore, etc.

Objection I. Of singulars there is no definition nor demonstration, from *7 Met. cap. 15*. But the individual is singular — for individual and singular signify exactly the same thing among philosophers. Therefore the individual is

improperly defined. Reply: the major is to be understood of proper and quiditative definition, not of descriptive definition such as the definition of the individual, as Scotus agrees in *2 d. 3, q. 6, §. Ad arg. sub O.*

Objection II. The individual is predicated of nothing, as is held in the Antepredicaments, *cap. 2*. Therefore it is badly asserted that the individual is that which is predicated of only one. Reply through a distinction of the antecedent: by essential and quiditative predication, I grant; by identical and accidental predication, I deny. The locus of Aristotle cited above is to be understood in this way.

Objection III. Some individuals are distributed into parts from which they are composed, as this tree into its many branches. Therefore the individual is not indivisible and impartible. Reply: the individual is said to be indivisible into subjective parts, which are adequately identical with the individual itself — not into integral and entitative parts, as the argument proves.

Objection IV. Some individuals are very similar — such as two eggs, two solar rays, and the like. Therefore the first definition of the individual is not suitable, insofar as it does not fit every individual. Reply: that definition is most fitting to the individual of the human species, and then to the individual of any animated species, and in some manner to the individual of any other species, as Scotus indicates in *2 d. 3, q. 1, §. Contra istud arguitur G.*, saying that those individuals can be discerned at least by diversity of place or position.

Article II. Whether There is Some Common Character among Individuals

That there is no common character among individuals is held by Albertus, Soto, Cajetan, and the Lovanienses in *c. de specie*; opposed to them are Scotus in *1 d. 23, q. un. in fine* and *d. 26, q. un., §. Ad primum tertia via Y*, Lychetus there, Fuentes in *q. 8, difficulty 3*, and very many other more recent authors, teaching that there is a common character among individuals.

It is noted from Scotus in the place cited and more clearly in *2 d. 3, q. 6* that two things are contained in the individual from which the individual itself is composed — namely the specific nature and the haecceity or individual difference through which it is constituted in the being of an individual. Thus in this man there is humanity through which he is man, and there is haecceity through which he is this man. The question now is whether, just as from this man and that man, for example, humanity is abstracted as something common to them, so also a haecceity or individual character is prescinded from them that is common to them. Now something can be common to many either as a what or as a mode or as something quasi-proper, as the Doctor notes in *1 d. 23 of the first book, q. un. in fine*, and as Mastrius and Bellutus explain in *disp. 5, q. 2, art. 4*.

Assertion: There is one individual character common to individuals. So Scotus both in the places cited and in *q. 12 of the universals*. Proof I: things that enjoy the same definition participate in the same common character; but individuals possess the same definition. Therefore they obtain the same common character. The major is clear, because in a definition there is a common character in which certain things agree and a differential character by which they differ from others. The minor is known from the remark in which we explained the common character of the individual. Proof II: whenever from the formal constitutive principles of some things something real and common can be abstracted, something common can certainly also be abstracted from what is constituted through those principles; but individuals are constituted through individual differences, as will be shown in *Metaphysics*, and from their constitutive principles or haecceities, "haecceity in common" is abstracted — which is predicated of this and that haecceity, for Petrinity is haecceity, Paulinity is haecceity, and so forth. Therefore an individual character common to all individuals is conceded. Proof III: that which is formally predicated of many is common to many, for there cannot be predication of many unless something common is participated by many; but the individual is formally predicated of many — for "Peter is an individual," "John is an individual," and "Andrew is an individual." Therefore a common individual character is to be admitted for them.

Objection I. Aristotle and Porphyry as cited above, in defining the individual, say "the individual is that which is not predicated of many." But if there were a common individual character among many individuals, the individual would be predicated of many — for just as through a common nature predication of many comes about (as "Peter is a man," "Paul is a man"), so likewise through an individual character common to many individuals, predication of many individuals would come about ("Francis is an individual," "Anthony is an individual"). Reply: the authors cited are to be understood thus, namely that the individual is not predicated of many quiditatively, but not that it is not predicated denominatively and as something quasi-proper, as is deduced from Scotus in the first place cited above.

Objection II. From the ultimate distinctive and constitutive principles of some things, nothing common to them can be abstracted; but individual differences are the first distinctive and constitutive principles. Therefore no common concept can be prescinded from them. The major is Scotus's from *1 d. 26, q. un., §. Quantum ad tertiam viam G.*, and the reason is that if there were something common to them, they would not be primarily distinguished by that common element but by something contracting it — and so they would not be primarily diverse and primarily distinctive. The minor is clear because they are the ultimate differences constituting individuals in the being of the individual. Reply: I concede indeed that from ultimate distinctive and constitutive principles nothing common predicated of them in what can be abstracted,

because those are primarily diverse; yet another concept distinct from the quiditative can be abstracted, as I said above, and as the Doctor cited above edits, shortly before G. in the solution of the first, and as Faber proves in *Theor.* 95, O. 3.

Objection III. What is the principle of differing is not the principle of agreeing, for by the same thing something cannot both agree and differ; but the individual character is the principle of differing — for through it the individual is distinguished from everything that is not that individual. Therefore, etc. Confirmation: if a common individual character were given, it would be contracted to this and that individuation — which is contradictory, for the contracting character is not contracted, just as place is not placed, nor action acted. Therefore, etc. Reply: I distinguish the major — with respect to the same thing, I grant; with respect to diverse things, I deny — as is clear in the case of rationality, which is the principle by which man is distinguished from brute, yet is also the principle of agreement, since every man agrees in it and participates in it. Likewise, the individual character is the principle by which the individual differs from everything else that is not that individual, yet it is also the principle of their agreement, since all individuals participate in the individual character. In response to the confirmation: the consequence is denied; for the individual character is not contracted but is the principle of contracting, since it is not the individual difference but the common nature that is contracted and determined by the individual difference.

Article III. On the Predication of the Individual

The things said in the Epitome in the general treatment of predication, *q. 2, art. 2 of l. 1*, and its divisions are to be recalled, as well as what I brought forward there in *art. 8* on the individual and its division. Here only, with Lychetus in *1 d. 2, q. 3, §. Ad illa*, I observe that the singular or individual can be taken in three ways: first, as a second intention which is predicability of only one; second, as the foundation of this second intention, e.g., as Peter; third, as the individual difference determining and contracting the nature to singular being. In the first way, the individual can be conceived in itself, and through conception it is an object conceived; likewise it can be conceived under a universal mode — as when it is said that "the singular is a universal" — since to be predicated of only one is common to this and that, as is clear from the preceding article. Thus the object conceived is the singular, but the mode of conceiving is universal, because it is conceived under a universal mode.

First Assertion: The determinate individual is formally predicated of this and that individual. This is gathered from the Doctor in *1 d. 2, q. 3, §. Ad illa C.*, and is proved: what is common to many is formally predicated of those many, as is clear of man, who is formally predicated of the individual members of human nature; but the individual as conceived by the intellect as indifferent toward this and that individual is common to many. Therefore the individual is formally

predicated of those many. Moreover, Scotus in *q. 11 of the universals, in the solution of the 3rd argument*, says that the individual is a species of intention; but a species is formally predicated of those whose species it is. Therefore, etc. And further: just as this is a formal proposition — "animal is a genus" — so likewise this is a formal proposition — "Peter is an individual."

Second Assertion: The vague individual is formally predicated of determinate individuals. This is deduced from Scotus in *q. 12 of the predicamentals*. Proof I: from Aristotle in *c. de substantia*, who in presenting the division of substance into first and second, gives the example of first substance as "some man" and "some horse." Therefore just as the determinate individual is formally predicated, so likewise the vague individual, since both are individuals, even though the vague individual designates a singular thing indeterminately and obscurely, as the Doctor notes in the place cited. Proof II: the formal character of the individual is common both to the vague and to the determinate, since each presents something singular and individual, though one does so determinately and the other indeterminately. Therefore the predication of both is the same. Accordingly, these are formal predications: "Peter is some man" and "Bucephalus is some horse." See Scotus in the place cited above and Fuentes in *q. 8, difficulty 4, art. 2*.

Objection I. What is formally predicated of many is a universal. Therefore if the individual is predicated of many, it follows that it is a universal, and hence there would be posited more than five universals — contrary to Porphyry and our assertion made in *art. 10, q. 1 of this book*. Reply: the object conceived is singular, but the mode of conceiving is universal, as I made plain in the remark set out above. Since the singular is conceived under a universal mode, the individual therefore does not constitute another universal beyond those five handed down by Porphyry. And so in response to the form of the argument, I distinguish the major: if it is a common object, I grant; if it is a singular object, I deny.

Objection II. Scotus in *q. 12 of the universals, in the solution of the third*, writes that the individual is a species of second intention; and in *1 Sentences* in the place cited he admits this proposition: "the singular is a universal." Therefore according to Scotus the individual constitutes another species of universal distinct from those five commonly accepted. Reply: Scotus indeed concedes that the individual is a species of second intention, but not a species of the universal which is distributed into the five common species. For this reason the proposition "the individual is a universal" is not quiditative and essential but modal and denominative, as Cardinal Sarnanus rightly notes in that place. The response to the other point from *1 Sentences* is clear from what was said: the individual is a universal not of itself but from the mode of conceiving, insofar as it is conceived as indifferent toward this and that individual, as was sufficiently explained above. You will insist: the universal is a second intention; therefore if the singular is a species of second intention, as the Doctor teaches, it is certainly

a species of universal. Granting the antecedent, the consequence is to be denied. The reason is that although the individual has the mode of the universal, it does not have the quiddity of the universal, as has been said more than once above.

Question V. On Difference

Just as a substantive precedes an adjective and matter precedes form, so predication in what precedes predication in what sort. Therefore after the universals that are predicated in what, we now approach the universals predicated in what sort — and first of all difference, which is predicated in what sort of thing, or in essential what sort, which precedes predication in accidental what sort, which belongs to the remaining universals.

Article I. What Difference Is

That difference and distinction are taken indiscriminately is commonly found among philosophers; yet there is some distinction between them, which seems evident, even if there is not unanimous agreement on assigning it. For Hurtado in *disp.* 6, *sect.* 1 thinks the distinction consists in the fact that distinction designates plurality and difference designates inequality. Arriaga in *disp.* 8, *sect.* 1, *subsect.* 1 holds that the distinction consists in dissimilarity, whether there be equality or not. Others, like Mauritius Hibernus in the Epitome of formalities, place it in the otherness of the extremes. For the clarification of this matter:

It is noted from Gadius in *Quol.* 4 that these terms are related to one another such that one extends further than the other — that is, as more or less common — namely: divided, distinct, diverse, and not-identical. For everything divided is distinct, but not vice versa, since division, following upon matter and quantity, is found only in material things, as divisibility is a property of quantity, as will be clear in the following book on quantity. Distinction, on the other hand, is found both in material and in spiritual things. Diverse things are those that agree in nothing quiditatively and essentially, as Scotus seems to hold in *1 d.* 3, *q.* 3, *§. Ad q.*, whom the Formalists follow in the Tract. formalitatum. Again, everything distinct and everything diverse is not-identical, but not vice versa. For distinction and diversity, being positive relations, presuppose positive extremes which are their foundation and term. Hence Aristotle says in *7 Phys. T.* 31 that non-identity is more common than distinction, and consequently that between habit and privation, between affirmation and negation, there is not properly a distinction but a non-identity — or if there is any distinction, it is called negative distinction. To these may be added "different," which seems broader than "divided" and "diverse" but narrower than "distinct" and "not-identical." For everything different is distinct; yet not every distinct thing seems to be different, since the divine Persons are said to be rather distinct from one another than different. Accordingly, we order these as follows: non-identity, distinction, difference, division, diversity — the prior ones being broader and more common, the later ones narrower and less common.

First Assertion: The distinction between distinction and difference does not consist in the fact that distinction denotes plurality and difference adds inequality. This assertion conflicts with Hurtado cited above, and is presupposed by Scotus and his disciples. Proof I: among the divine Persons there intervenes distinction and difference, yet not inequality, as we showed in the Tract. de Trin., *disp. 5, q. 6*. Therefore that distinction is not properly handed down. Proof II: if two rational souls were equal, between them there would be distinction and difference, by which they would differ through their haecceities, but not inequality — by supposition that they were equal. Therefore Hurtado gratuitously asserts the aforesaid distinction between distinction and difference.

Second Assertion: The distinction between distinction and difference does not consist in dissimilarity. This is opposed to Arriaga above named, which also all Scotists presuppose. Proof through Arriaga: the divine Persons truly differ and are distinguished from one another, yet they have no dissimilarity, since they have the same essence, perfections, and attributes. Therefore the reason for the distinction between difference and distinction is not derived from dissimilarity. The antecedent is clear from *Hebr. 1: "Who being the splendor of glory and the figure of his substance"* and *Coloss. 1: "The image of the invisible God."* And we showed this at length in the Tract. de Trin., *disp. 7, q. 2*. Again, two individuals of a species differ and are distinguished from one another with respect to individual differences, and are similar with respect to the specific nature. Furthermore, similarity and dissimilarity are founded in quality, while distinction and difference are founded in substance, quantity, and the remaining beings. Therefore the distinction between distinction and difference is not to be located in dissimilarity.

Third Assertion: Distinction and difference diverge in that distinction extends more broadly than difference. This follows from what was said in the remark and from the refutation of others' views, and nothing seems to need to be added for its explanation and proof beyond what has already been said.

Fourth Assertion: Distinction is the character and principle of distinguishing; difference is the character and principle of differentiating extremes. This is indicated by Porphyry in the present passage, saying "difference is that by which singulars differ from one another," and by Scotus cited above. Proof I: relation taken universally is a respect or principle of relating; but distinction and difference are relations, as Gadius writes in the remark cited above. Therefore distinction is the principle of distinguishing. Proof II: identity is the unity of extremes. Therefore, from the opposite, distinction is the otherness of extremes, or the character by which extremes are distinguished from one another. Hence St. Athanasius in the Symbol, signifying the distinction of the divine Persons, uses the word "another," saying: "Other is the person of the Father, another of the Son, another of the Holy Spirit" — and in signifying the

identity of the divine nature he uses the word "one": "But of the Father and of the Son and of the Holy Spirit the divinity is one."

Fifth Assertion: Difference as it is the third universal is aptly described as "that which is predicated of several in what sort of thing." So Scotus in *q. 17 of the universals*, §. *Dicendum ad q.* Proof I: the aforesaid definition consists of genus and difference; therefore it is an apt definition. The antecedent is clear: "to be predicated" serves as genus, in which it agrees with the other universals. "In what sort of thing" holds the place of difference, by reason of which it diverges from the remaining universals. Proof II: that definition embraces generic and specific difference, or subaltern and infima difference, and well explains the nature of logical difference, containing nothing superfluous or deficient. Therefore it is a correct definition.

Objection I. Porphyry in the present passage defines difference as "that which is predicated of several differing in species in what sort of thing." Therefore the definition of difference handed down by Scotus and received by us is bad. Granting the antecedent, I deny the consequence. For in this, Hurtado and Arriaga in the place cited note that Porphyry was truncated and deficient; for he was obliged to assign a definition of difference common to both generic and specific differences, or to embrace specific difference under the one he gave. And no one should find this surprising — for if Porphyry himself, when wishing to deviate from the truth of faith, likewise sometimes deviated unintentionally from the truth of philosophy. Or say as I said in the Epitome, in the article on difference.

Objection II. A proper definition is constituted from genus and difference, as I have repeatedly urged in the preceding pages; but difference does not consist of genus and difference — for that belongs to species alone. And if difference consisted of genus and difference, since there is no greater reason for one than for another, a process to infinity would not be avoided. Granting the major, I distinguish the minor: as it is a species of the universal, I deny it — for I said above in *q. 1 of this book, art. 11* that the universal is a genus of which difference is one of the species. As it is the third universal, I grant it. For difference, as Scotus says in *q. Ad 4*, is taken in one way insofar as it is a name of second intention applicable to that which is the principle of differencing — as it is a real relation — and in this sense we speak here, and it is the third universal. In another way it signifies a relation of reason whose species are difference of species and difference of number, from which something is denominatively said to differ in species and to differ in number.

Objection III. The same thing cannot be defined under opposite modes; but the definition of difference given above involves opposite modes — namely "in what" and "in what sort," for what-subsisting and what-sort-inhering signify, as the Doctor notes in *q. 19 of the universals, verf. Nota*. I distinguish the major: with respect to the same thing, I grant; with respect to diverse things, I deny. As to the

thing, difference is predicated in what, because it belongs to the essence of those of which it is predicated; as to the mode, it is predicated in what sort, because it is signified in the manner of something adjacent to and informing another.

Objection IV. Certain differences are not predicated in what sort of thing. Therefore the definition of difference is unsuitable. The antecedent is shown: "irrational" is not predicated of horse, lion, and other species in what sort of thing, because it is a genus with respect to them; but genus is not predicated of its species in what sort but absolutely in what. The major is to be denied. In response to its proof, I say that "irrational" is a generic difference which constitutes the brute, which has many species. Therefore I deny that "irrational" is a genus with respect to them, and assert that it is an intermediate difference, just as "sensitive" is with respect to man.

Article II. Through What Relation Difference is Constituted the Third Universal

This difficulty seems to be resolved from what we said in *q. on Species, art. 2*. For those authors who there assert that species is a universal insofar as it regards genus are bound to say plainly the same here about difference. But we, who in that place held that species is a universal through its relation to its inferiors of which it is predicated, must in this article think the same also about difference.

It is to be noted, first, that some things are perfect and others imperfect — I said some things are perfect, supply: according to the requirement of their own nature; for absolutely, God alone is perfect. But there are natures perfect in their own kind, which do not tend toward any further perfection, such as specific natures — that is, most special natures. Truly imperfect natures are those which are carried toward further perfection, such as generic natures, which comprehend the differences that are constitutive and perfective parts of specific natures. This doctrine is clearly taught by Scotus in *4 d. 49, q. 14, §. Ad 1 rationem principalem M*.

It is to be noted, second, that difference regards three things: genus, species, and its own inferiors. With respect to genus, difference is called dividing, containing, and perfecting — in which regard Aristotle in *5 Met. T. 16* says that difference is a certain diversity of genus, and Porphyry here writes that difference is "that which is apt to divide those which are under genus." This arises from the fact that difference is referred to genus as a potential and determinable whole contracted by its differences, just as matter is determined and contracted by its forms, as I explained at length in *q. on Genus, art. 3*. With respect to species, difference is called that by which the species exceeds genus, or that by which the species surpasses genus. Likewise difference is that by which the species diverges from another. With respect to its own inferiors, it is defined in the preceding article: "that which is predicated of several in what sort of thing."

Assertion: Difference is constituted the third universal through its relation to the inferiors of which it is predicated. This is defended by the Doctor in *q. 19 of the universals*, whom the greater part of more recent authors follows. Proof I: the character of the universal — which is to be predicated of many — belongs to difference insofar as it presents a relation to the inferiors of which it is predicated. Therefore according to its relation to inferiors, difference is established as the third universal. The antecedent is clear from the definition of the universal in *1 Perih. cap. 5*; the consequence is evident from the antecedent of *art. 2*: the universal in act and formally is generated through the comparative act of the intellect, from *q. of this book, art. 8*; but the comparative act involves a relation to the inferiors of which the universal itself is formally predicated. Therefore difference, to which the character of the universal is adapted, is formally determined to be the third universal through its relation to those of which it is predicated. Furthermore, the universal regards many, as its definition indicates; but difference through its relation to genus or to species regards only one. Therefore through such a relation it is in no way the third universal. The objections to this assertion are dissolved from what was said in the place cited at the beginning of this article, since with the mere change of the word "species" to "difference," the objections and responses are exactly the same there and here.

Article III. Whether the Superior Difference is Included in the Inferior of Which it is Predicated

The state of this article is whether, for example, "rational" includes "sensitive," which is the superior difference, and vice versa — and whether the predication of the superior difference of the inferior is true, so that, persisting in the same example, this is true: "rational is sensitive." On this matter there are two principal opinions. The prior belongs to Cantelius in his exposition of the chapter on difference, Jandun in *2 Met. q. 12*, Soncinates in *7 Met. q. 37*, and others affirming that the superior difference is included in the inferior and is formally predicated of it. The latter is the common view, defended by Scotus in *1 Post. q. 24*, §. *Ad q. dicitur*, and in *4 d. 11, q. 3*, §. *Ad rationes ergo*, and in *7 Met. q. 8*; Antonius Andreas in *ibid. q. 15*; Orbellus in *c. 6*; Joannes Anglicus in *q. 13 of the universals*; and others, denying that the superior difference is formally contained in the inferior, nor that it is essentially predicated of it.

It is noted, first, from the Doctor in *q. 24 of the first Post.* and from Maior in *c. de differentia, notable 4*, that difference is derived from form — not from the form which is one of the parts of the physical composite, but from the form which is the formal significate or formal grade of perfection of the thing. Now the superior and inferior difference — namely "sensitive" and "rational" — can be regarded in two ways. First, insofar as "rational" is taken from the ultimate grade of man's perfection and "sensitive" from another grade: in this way "sensitive" is not included in "rational," since they are formally distinct grades. Second, insofar as "rational" is derived from the total perfection of man, which perfects

substance as the most general genus: in this way "rational" includes "sensitive" and all its superior differences, because in that total perfection a part is included. For greater evidence of this:

It is noted, second, that the inferior or superior difference is formally comprehended in the species which it constitutes, whether that species is subaltern or infima — as "living" in "animate," "sensitive" in "animal," and "rational" in "man." The reason is that the whole includes the parts from which it is composed; therefore species, which is a certain whole of genus and difference, contains that difference which is its constitutive part. Again, notice that intermediate species are genera with respect to their inferiors — as "living" with respect to "tree" and "animal." Now since in the species genus and difference are contained as parts from which it is composed, it clearly follows that in any such species there is formally included the subaltern genus together with its comprehended subaltern difference, and vice versa. Again, observe that the inferior difference does not formally include genus, and therefore does not contain the difference of the genus itself through which the subaltern species is made — as "rational" does not formally include "animal," nor "sensitive," which is the constitutive difference of animal itself. The reason is that genus and difference are distinct realities from which the metaphysical whole is composed, as the Doctor writes in *7 Met. q. 19, 1 d. 8, q. 3*, and *2 d. 2, q. 6*.

First Assertion: The posterior difference does not formally contain the prior differences. This is commonly held by Scotus as cited above and by nearly all other philosophers, and is argued from Aristotle in *4 Top. cap. 2, locus 18, locus 22, 6 of the same work, cap. 3*, and *3 Met. cap. 10*. Proof II: if the inferior difference formally included the superior, in the definition of the inferior there would be tautology — which is to be avoided by all in all things. Therefore the inferior difference does not formally comprehend the superior. The antecedent is shown: every definition, from *2 Post. cap. 8* and *7 Met. cap. 14*, is made from genus and intermediate differences down to the infima, or from the proximate genus and ultimate difference. If the definition is made in the first way, a clear tautology appears: since the superior differences are placed in the definition, and the inferior difference contains all those intermediate differences — they are therefore repeated twice: once in themselves and once in the ultimate difference. If the definition is made in the second way, tautology likewise appears: since the proximate genus includes its constitutive difference, and the ultimate difference equally contains it — it is therefore uselessly repeated twice; as "animal" includes "sensitive," and likewise "rational" includes "sensitive," and so "sensitive" is placed twice in the definition of animal, and an evident tautology occurs.

You will say: tautology is not committed, because "sensitive" is not placed twice explicitly, but once implicitly and once explicitly. Against this it is argued from Aristotle in *6 Top. 1*, who teaches that tautology is to be sought by putting the

definition of the name in place of the name. Let therefore the definitions of those names be substituted for those names, and a certain and indubitable tautology will be had. Furthermore, if "rational" includes "sensitive" — since it does not include it adequately and convertibly — consequently it includes it and something more; therefore "rational" will be composed of "sensitive" and that other, and so will be a species and not a difference — which is false. Moreover, formally distinct grades do not formally include one another, as is clear of itself; but the inferior and superior differences are formally distinct grades, as I indicated in the first remark and will clearly show in *Metaphysics*. Therefore the superior difference is not formally included in the inferior. Finally, there would be a process to infinity in differences: for by the same reasoning that "rational," for example, formally includes "sensitive," by the same reasoning "irrational" formally includes "sensitive." Therefore they agree in the common character of "sensitive"; but they differ from one another, as is clear from Aristotle in *5 Met. T. 16* — "differences are whatever are beings for something." Therefore they differ by their own proper differences, and the question must be asked whether those differences include the superior difference, and so on to infinity — or one must stop at the ultimate difference, which does not include the preceding differences at all, and the intention is had.

Second Assertion: The superior difference is not predicated of the inferior formally and essentially, but only identically and materially. This second assertion follows from the first, and the Doctor indicates it in §. *Ad probationem dicitur, q. 24 of the first Post.* The first part is proved: the superior difference is neither the whole essence nor a part of the essence of the inferior difference, because the latter does not formally include the former, as was proved in the first assertion. Therefore the prior difference is not formally and essentially predicated of the posterior. The second part is shown: the ultimate difference is really identical with the preceding ones, as will be shown in *Metaphysics* universally concerning grades or inferior predicates with their superiors. Therefore the superior is predicated of the inferior only identically and materially. And this is what we asserted about genus with respect to its differences in *q. 2, art. 5, assertion 1*.

Objection I. Aristotle in *7 Met. T. 43* seems to want the superior difference to be predicated in the abstract of the inferior difference and in the first mode of saying per se, for he says: "fixedness of foot is a certain footedness." But predication in the abstract and in the first mode of saying per se is quidditative and essential. Therefore, etc. Confirmation: Aristotle in the same place adds that the ultimate difference is the whole substance of the thing, but it cannot be the whole substance of the thing unless it comprehends the intermediate differences, which also pertain to the substance of the thing. Confirmation II: in the same place the Philosopher writes that in substance there is no order; but there would be order if the superior difference were not contained in the ultimate difference according to him. Scotus responds in *4 of the place cited before*

DD. that the locus of the Philosopher is not to be interpreted as being about predication but about division; for he thinks that Aristotle there divides the superior difference into the inferior, saying that in definitions comprehending intermediate differences down to the ultimate, differences are to be taken per se and not per accidens — as when the division of "having feet" is made, one should not say "having feet is either winged or not winged," but "having fixed feet" and "having non-fixed feet," which are per se differences of feet. Therefore he adds: "fixedness of foot is a certain footedness" — that is, fixedness of foot per se particularizes footedness, and therefore per se divides "having feet." In response to the first confirmation: I say with the same Doctor that this is to be understood not totally but completely. For presupposing the genera and intermediate differences, the ultimate difference is the final term and complement of them all. For just as in Physics the whole essence of the possessor is completely from the ultimate form — as the being of man is from the rational soul — so likewise the whole metaphysical or logical thing is completely from the ultimate difference. In response to the second confirmation: I say also with Scotus that this is not to the point; for Aristotle had previously taught that if tautology occurs through the addition of the preceding difference to the following one, so on the other hand tautology would occur in the opposite way — for in substances, that is, in those things that pertain to the substantial or definitive character of something, there is no such order that one ordering rather than another removes tautology.

Objection II. "Rational" is the ultimate difference, which includes the character of corporeal, which is the superior constitutive difference of corporeal substance. Therefore it cannot be denied that the superior difference is formally included in the inferior. The antecedent is proved: "rational" is either corporeal or incorporeal substance; not the second, as is clear; therefore the first. But it cannot be corporeal substance without the character of corporeal, which is the constitutive difference of corporeal substance and divides the generic predicamental substance. Therefore "rational" formally includes the difference of corporeity, which is a difference superior to rationality itself. Confirmation: "rational" formally includes "sensitive." Therefore the ultimate difference formally includes the superior differences. The antecedent is proved: "rational" in this state is a certain sensation and vital operation, for it proceeds from an internal principle of life. Reply: I deny the antecedent. In response to its proof, I say that "rational" is not formally corporeal substance, but only identically, insofar as it is identified with "animal," which includes all the superior differences in the way I indicated in the first remark. In response to the confirmation, I deny the antecedent. In response to its proof, I say that it is true presuppositively: for "sensitive" is presupposed for "rational," but "rational" is not formally "sensitive."

You will insist: vision, for example, is formally a sensation. Therefore reasoning too is formally a sensation, proceeding from a rational animal having an

intrinsic principle of sensing — and is a vital action emanating from an internal principle of life. And thus just as vision cannot be conceived without being a vital and animal action, so neither can reasoning, roaring, or any other animal operation, of whatever kind it may be. It can be said, according to the distinction adduced above, that vision is a sensation not formally but presuppositively, because the particular presupposes the common, and the principle of sensing is common to external and internal senses; therefore sight is not formally the principle of sensing but of seeing, because the principle of sensing is determined to the principle of seeing, just as the principle of living and sensing is determined to the principle of reasoning.

Objection III. That definition is considered good by Aristotle in *2 Post. T. 18* and *7 Met. T. 43* which is made from the supreme genus and the infima difference; and Boethius approves this in *1 divisionum*. But it would not be a correct definition unless the inferior contains the superior differences, because according to Aristotle himself in *2 Post.* cited, the definition must explain all quidditative predicates and include them. Therefore, etc. Granting the major, I deny the minor, because it is not the ultimate difference but the proximate genus that comprehends the preceding differences — as "animal" contains "sensitive," "living corporeal," and the remaining superior essential predicates.

Objection IV. A proposition per se of the first mode requires that the formal of the subject include the formal of the predicate, and by parallel reasoning the material of one contains the material of the other; but this is a proposition per se of the first mode — "man is animal." Therefore "rational," which is the formal of "man," per se includes "sensitive," which is the formal of "animal," and consequently "rational," which is the ultimate difference, comprehends "sensitive," which is the superior difference. Reply: the major is not absolutely true. For that occurs when the whole concept of the predicate is contained in the concept of the subject — as "man is rational." But it can happen that a proposition is per se of the first mode even though the formal of the subject includes only the material of the predicate — as "man is animal," where "animal" is material and is contained in the concept of "man," and the formal of this predicate "animal" is likewise included — as the Doctor teaches at the end of the question of the first Post. cited.

Question VI. On the Proper

With the universals presenting the essence of a thing now resolved, it is now pleasing to investigate those which are outside the essence of a thing and proceed from it — such as the proper, which makes the fourth universal, discussed in the present question; while accident, which is the last universal, will be discussed in the following question.

Article I. Whether the Proper is a Universal

Scotus in *q. 30 of the universals*, Joannes Anglicus, Mauritius, Brasavola there, and the Coimbrans in *c. de specie, art. 3* examine this question and establish that the proper is a universal.

It is noted, first, that "proper" is sometimes used for that whose ownership belongs to someone, as Maior notes in *c. de proprio*; and we in the Epitome in *art. 6, q. 3, l. 1*. Sometimes it is used for what someone habitually does well or badly — thus it is proper to Cicero to speak well and proper to Alexander to wage war gloriously, as Tataretus notes in the present passage, *scibile 2*. Furthermore, notice that the proper, like any other universal, is taken in two ways: first, first-intentionally — that is, as a property flowing from the essence of the thing, which among philosophers is commonly called a passion — thus risibility is the proper or property of man. Of the proper so taken, discussion will be held in Metaphysics. Second, second-intentionally — that is, as the second intention applicable to the property itself that immediately proceeds from the essence, and which is predicable in what sort convertibly. Of the proper so taken we treat in the present passage — which is defined by Aristotle in *1 Top. cap. 4* as "a convertible predicate not predicating essence," and is received by the Doctor in *q. 31 in the body*, where the same Doctor notes that Porphyry does not disagree with the Philosopher, whatever Mastrius and Bellutus may say in *disp. 8, q. 4, art. 1*.

It is noted, second, from Maior in the place cited, that some proper things proceed from the species by reason of matter, and others that flow from the species by reason of the specific form. Examples of the former are being snub-nosed and aquiline, having smooth flesh and straight figure. These are not truly proper things, since they can be removed at least by divine power from those to which they belong, being reckoned among common accidents — and therefore it is not incompatible with their intrinsic principles to be without them, as Sarnanus also notes in his exposition of the question cited, near the beginning. Examples of the latter are being risible, being capable of union, and others of this kind, which are truly proper and inseparable from those to which they are adapted, as the Doctor notes in *q. 33* and *1 dist. 20, q. 5*, and elsewhere. The mode of laughing and weeping is explained thus: rationality is the cause of man's risibility and weptility. From the fact that man is rational and is filled with wonder at what he sees and hears, and through wonder his spirit is held in suspense and strives to have the cause clearly perceived, and when that investigation is completed, if he apprehends something as advantageous to himself, delight follows — and when he is affected with delight, the vital spirits and heat are raised to the face, from which arise the dilation of the heart, the opening of the mouth, and laughter. But if he apprehends something as harmful, sadness arises, through which the heat and vital spirits are drawn to the heart and the brain is compressed, whence flows the lachrymable humor and weeping results. Furthermore, Tataretus notes that according to the twofold generic and specific difference, a twofold proper is assigned: generic, which

converts with genus, and specific, which converts with species — and this Mauritius approves in *q. 29 of the universals*, §. *De tertio, columna secunda in initio*, whom our more recent authors cited follow. However, Aristotle and Porphyry seem to speak only of the specific proper, from which Scotus does not depart in *q. 17*, §. *Ad quaestionem dicendum in solutione secundi*, adding: "proper belongs to nothing insofar as it is genus, but insofar as it is species, and thus converts with it, insofar as it is predicated of many differing in number." The reason for this assumption is that proper belongs to something only insofar as it is naturally apt to be the subject of demonstration, and this only insofar as it is a species — since only insofar as it is a species is it defined, and one must presuppose of a subject both what it is and that it is, from *Arist. 1 Post. 1*. But insofar as it is defined it has genus and difference, and thus is a species. Yet from *5 Top. 2* the generic proper is not entirely to be denied, as the authors named above demonstrate.

First Assertion: The proper is a universal. So Scotus in *q. 20*, proved first from Aristotle in *1 Top. cap. 3*, affirming that the proper is a predicate which is a universal — with whom Porphyry and all his interpreters agree. Proof II: that to which the character of the universal belongs is a universal, by the locus from definition; but to the proper belongs the character of the universal, which is to be predicated of many, from what was said elsewhere — for the proper is predicated of many in accidental what sort convertibly, as "risible" of man; for every man is risible and everything risible is a man. Therefore the proper is a universal. Furthermore, from *1 Post. cap. 4*, demonstration is of universals; but demonstration can be made of that whose proper it is — as "every rational is sensitive; every man is rational; therefore every man is risible." And consequently the proper is a universal.

Second Assertion: The proper only in its fourth mode constitutes the fourth universal. This is deduced from Scotus in *q. 32*, §. *Ad q. in solutione quarti*, and in *q. 33*, §. *Ad quaestionem dicendum*, affirming that the predicable proper proceeds from the essential principles of the subject; but only the proper in the fourth mode proceeds from the essential principles of the subject. Therefore only this kind of proper constitutes the fourth universal. The assertion is proved from Aristotle in *1 Top. cap. 4*: proper is that which does not indicate the what-it-is of the thing, inheres in it alone, and is predicated convertibly. The same Porphyry holds in *the last chapter of his Isagoge*. Furthermore, only the proper taken in the fourth mode cannot without incompatibility and destruction of the subject be separated from the subject; whereas the other proper things taken in the three modes can exist without the corruption of the subject. For man can exist without bipedality, medical knowledge, and greyness. Therefore, etc. Again, the proper in the fourth mode is demonstrated of the subject whose proper it is, as is clear from the demonstration adduced in the first assertion. Finally, the proper proceeds from the essence of the subject, which the other proper things do not have, as is clear of itself.

Third Assertion: The proper is a universal not with respect to the species from which it proceeds, but with respect to the inferiors of which it is predicated. This the Doctor intimates in *q. 30, §. Ad q. in solutione primi*. Proved by the same reasons by which in *q. 3, art. 2* and *q. 5, art. 2* we showed that species and difference are universals through their relation to the inferiors of which they are predicated. Hence some rightly conclude that the proper is indeed a convertible predicate as it regards the species with which it converts, but not under that character of convertibility is it a universal — since the universal is predicable of its inferiors; but the proper as universal does not convert with its inferiors. For the universal is prior to the inferior by priority from which there is no reciprocal entailment of subsisting consequence, as is clear from *Postpred. c. de priori*. Although the Doctor and others commonly call the proper a convertible accident, they nevertheless distinguish it from the common accident in that it is necessarily and immutably predicated, but not that it is reciprocally predicated — as the Doctor perspicuously indicates in the place cited above.

Objection I against the First Assertion: An opposite is not predicated of an opposite; but "proper" and "common" are opposites, and "common" is a universal. Therefore the proper is not a universal. Granting the major, the minor is to be denied: for the opposition must be with respect to the same thing in the same respect. "Proper" is said with respect to the species, while "common" and "universal" are said insofar as it regards the individuals comprehended under the species, as Scotus eloquently edits in *1 Post. q. 33, in fine*.

Objection II. The universal is referred to another, since it is formally relative, and every universal, since it is predicable, regards a subiectible of which it is predicated; but the proper is not referred to another. Therefore the proper is not a universal. The minor is argued: first, because the proper is not referred to that whose proper it is — for no accident is referred to its own subject, otherwise every accident would be a relative, which is false; and second, because the subject whose proper it is naturally precedes the proper itself, so they would not be simultaneous in nature — which conflicts with Aristotle in *c. de Ad aliquid*, who affirms that relatives are simultaneous in nature. Granting the major, the minor is denied. In response to the first part of the proof, I say that this holds for the proper taken first-intentionally, but not for the proper taken second-intentionally. In response to the second part of the proof, I distinguish: if the subject of the proper is considered absolutely, I grant; if it is regarded insofar as it has its proper, I deny — for in that case the proper always inheres in the subject from whose intrinsic principles it proceeds, as the Doctor excellently teaches in *q. 33, §. Ad q. dicendum*.

Objection III. The universal is formally a being of reason, from *q. 1 of this book, art. 7*; but the proper exists without anyone's thinking of it — for with no intellect existing, neighing belongs to the horse and roaring to the lion. Therefore the proper is not a universal. Granting the major, the minor is to be

distinguished: concerning the proper taken first-intentionally, I grant; concerning the proper taken second-intentionally, I deny — as is clear from the first remark.

Objection IV against the Second Assertion. Porphyry here and nowhere else mentions the three modes of the proper. Therefore the three modes of the proper pertain to the fourth — which is the universal. Confirmation I: those three modes of the proper are referred to the subject with a special relation, which does not belong to the common accident, which regards the subject with a common relation. Therefore, etc. Confirmation II: the capacity for philosophizing, and the capacity or aptitude for healing, is a passion of man — for every man is intellectual and rational, and consequently capable of learning. Therefore, since to be a physician, for example, is one of those three modes of the proper, it follows that it pertains to the fourth predicable. Reply: Porphyry mentioned them not because they are true proper things, but because they have an affinity with the true proper — and what he had already done in the chapters on genus and difference, where he adduced and explained the various acceptations of genus and difference (especially because from their explanation the proper becomes clearer to us), he did also here. By the same token the first confirmation is answered. In response to the second confirmation, I distinguish the antecedent: if speech is made about the capacity and aptitude had from the essential principles of the species which man possesses, I grant that the capacity for philosophizing and the aptitude for healing is proper to man in the fourth mode; but if we speak of the aptitude and inclination particular to individuals, arising from individual principles and from the diverse temperament by which one man and not another is endowed — whether toward arms or toward acquiring knowledge — I deny. Accordingly, these inclinations and peculiar propensities of individuals are not proper things but common accidents of the second species of quality, as the Doctor seems to hold in *2 dist. 16, q. un., §. Ad primum argumentum sub q. Ad finem*, and Tataretus in *c. de accid. dub. 3*.

Article II. Whether the Proper is a Universal Distinct from Accident

The common opinion of philosophers holds that the proper is a universal distinct from accident. So that the distinction between the two aforesaid universals may become known to us, we are pleased to examine this difficulty which Scotus raises in *q. 32 of the universals*; and for its understanding:

It is noted, first, with the same Doctor in *q. cited, §. Ad q. dicendum*, that accidents are of two kinds: some proceed from the intrinsic, and others come from the extrinsic. Those that arise from the intrinsic are bipartite: either they flow by reason of the specific form and are true proper things — which proceed from the essential principles of the thing as a kind of natural offspring; or not by reason of the specific form, and this can happen in two ways: either by reason of matter — such as quantity — or by reason of the primary active qualities, and these are secondary and derivative qualities with respect to the primary — and

they are sensible qualities because they are perceived by sense, called such — for example colors, which either proceed from heat, as blackness, or from cold, as whiteness. Those however that come from the extrinsic are also twofold: some remain when the extrinsic principle from which they arise is removed — as blackness in the face or hand caused by the heat of the sun; or when the extrinsic is removed they are likewise removed — as the image of a face in a mirror or in water, which vanishes when the face is removed.

It is noted, second, that there is not one distinction between proper and accident; for Sarnanus in *q. pag. 436* observes ten differences between them, of which Fonseca selects some in *5 Met. cap. 28, q. 19, sect. 4*. But proper and accident differ chiefly with respect to the principles from which they proceed. For the proper proceeds from essential specific principles; accident comes from individual principles — as Porphyry teaches in these words in *c. de communitatibus*: "proper things are born within species, but accidents primarily inhere in individuals." Aristotle in *c. de substantia* and Scotus in *q. ult. of the universals* are in agreement: all accidents pertaining to the nine posterior predicaments primarily inhere in first substances and are primarily said of them. Furthermore, the proper necessarily belongs to the subject, so that it is incompatible for the subject to exist without the proper itself, and it cannot be conceived with its opposite — as Scotus holds in *q. 32 and 1 d. 2, q. 7, sub 1*. But the subject can perfectly well be understood without the accident, as will become clearer in the following question. Again, the proper is convertible with the subject of which it is proper — as "every horse is capable of neighing" and "everything capable of neighing is a horse." Accident, however, is by no means so — for it does not follow that "every man is colored; therefore everything colored is a man." Moreover, the proper conduces to demonstration: from the subject and its proper a proposition per se of the second mode is formed — as "man is visible." Accident, however, is excluded from nearly all demonstration, because it has no necessary connection with the subject in which it inheres.

Assertion: The proper is a universal distinct from accident. This is defended by Scotus in the place cited with Porphyry in the present chapter and Aristotle in *1 Top. cap. 3*. Proof: a distinct mode of predicating of many argues a distinct universal, because the character of the universal from what was said is to be predicated of many; but the proper has a distinct mode of predicating of many from accident — it is predicated of many necessarily in what sort, while accident is predicated contingently. Therefore the proper is a universal distinct from accident. Furthermore, those things are distinguished from one another that have distinct definitions, as our Formalists declare and prove; but proper and accident have distinct definitions, as is to be seen in Porphyry and Aristotle named above, and as is clear from the differences adduced in the second remark. Therefore, etc.

Objection I. Whatever exists is either substance or accident, since no medium seems to intervene between substance and accident; and from *5 Met. T. 14*, being is divided into substance and accident. But the proper is not substance. Therefore it is accident, and consequently does not constitute a universal distinct from accident. The minor is shown: the proper is either the same substance as the species from which it flows, or a different one — since "same" and "different" are immediate from *10 Met. T. 12*. Not the first, otherwise the proper would enter into the definition of the species, since the definition expresses the entire essence of the thing defined. And more: because the proper proceeds from the species itself — but the same thing cannot be at once cause and effect with respect to the same thing. Not the second either, otherwise it could not be predicated of the species — but it is predicated of the species, as "man is risible." Therefore, etc. Confirmation I: except for matter and form in the composite, no other substance is found; therefore the proper, which is in the composite but is neither matter nor form, must be an accident. Confirmation II: that which proceeds from a composite substance is an accident; but the proper proceeds from a composite substance with physical composition. Therefore it is an accident. Reply: the major can be glossed as concerning real identity, not formal. And so in response to the minor: the proper is really substance, but not formally — since formally it is a "somethingness" of substance or accident, as is shown in *Metaphysics*. Or say with the Doctor here, through a distinction: if "accident" is taken for what is extraneous, for what is the same as a predicate not predicating essence, it is granted that the proper is accident; but if accident is taken for what comes from the extrinsic to a subject, it is denied that the proper is accident. Through this distinction the first and second confirmations are answered — a distinction intimated by the same Doctor in *2 d. 37, q. un., §. Propter igitur Q.*, and in *Quol. 1, §. De altero D.*, which Sirectus in *fol. 6 of the Tract. formalitatum*, Trombeta, Brulifer, and others there embrace.

Objection II. What is placed in the definition of something is not distinct from that in whose definition it is placed, since a definition denotes those things which are intrinsic and essential to the thing; but accident is located in the definition of the proper, for the proper, since it is outside the substance of the thing, is an accident. Therefore the proper is not a universal distinct from accident. Confirmation: the divided is included in the dividing members, as "animal," which is divided into "rational" and "irrational," is included in them; but accident is divided into separable accident and inseparable accident. Therefore the proper does not make a distinct universal from accident. Reply: granting the major, the minor is to be distinguished. Accident taken for what is extraneous, I grant; accident taken for what, coming from the extrinsic, accidentally perfects the subject itself, I deny. Or say with Scotus in the question: the intentional accident is indeed placed in the definition of the proper, but not the real accident, about which the question here is. In response to the confirmation: the same is to be said, for that division of accident has its place in real accident, not

in intentional accident — or also in accident taken for a predicate not predicating essence, as is established from what has gone before. Let these things said by a poor usufructuary suffice about the proper; let whoever is the proprietor add more, if he wishes.

Question VII. On Accident

The last place is given to accident in the Porphyrian roster of universals, because accident is posterior to the other universals in origin and dignity. This is clearly evident in the physical composite: the composite is first constituted from matter and form — as man from body and the rational soul — and immediately from it flow its passions, which are called proper things, and afterwards common accidents come to it from outside. And more: because the proper things proceed chiefly from species and common accidents from individuals, as I noted above — and that the former ought to be preferred in order to the latter, no one ought to call into doubt.

Article I. Whether Accident is a Universal

This question is examined by Scotus in *q. 34* and he answers affirmatively with Porphyry and the other philosophers in the present chapter — opposed by most of our more recent authors cited in *disp. 4, q. 5* and *disp. 5, q. 5, art. 1*, with whom Suarez in *disp. 6 Met. sect. 4, n. 4* cited by those same authors seems to agree.

It is noted, first, from the same Doctor cited above in *§. Ad quaest. dicendum*, that accident is taken in many ways. For it is either accident first-intentionally or second-intentionally. Accident first-intentionally is the same as something inhering, as Tataretus notes in *this c. scibile 4*. This is either taken for what happens in fewer cases — and this is threefold: casual, fortuitous, and indifferent — on which the Philosopher speaks in *2 Phys. T. 48*. Or it is taken for what comes to a complete being — from which its denomination derives, for "accident" comes from "accido" because it presupposes a thing complete in its being to which it happens, and is distinguished from substance, which does not happen to a thing but subsists per se. In this sense accident is common to the nine predicaments of accidents and is the other member of the division of being into substance and accident, as is clear in *5 Met. T. 14*. Accident taken second-intentionally designates the second intention which is attributed to something that can without incompatibility be affirmed or denied of a subject. It can also be used for what is extraneous, of which there is speech in the fallacy of accident; or for what is effected by the intellect alone — in which sense all five universals are accidents; or for a non-essential predicate, which is participated by the two last universals — for both proper and accident are called non-essential predicates; or for a predicate that is neither essential nor necessary — and in this sense it is the fifth universal. This is regarded not insofar as it is predicated of its inferiors — as color of whiteness and blackness, since in that sense it does not differ from genus — but insofar as it regards subjects in which it inheres and

denominates them, as whiteness with respect to swan and milk, of which it is accidentally predicated.

It is noted, second, from Joannes Maior in *c. de accidente*, that some accidents are added to only one part of the subject — as flatness to the nose and curliness to the hair — while others regard the parts of the subject indifferently, as whiteness can inhere in the tooth, the hand, and other parts of the body. Again, some accidents reside in the exterior part — as vision in the eye — while others are effected and subjected in the interior part, as recollection. Again, some are uniformly or equally intensified in the subject — as light of equal intensity in a house — while others are non-uniformly so, which are intensified more in one part than in another, as if the light is greater in one part of the house than another.

Assertion: Accident is a universal. This Scotus proves in the place cited: first from Aristotle in *1 Top. cap. 4* and from Porphyry in this passage, both of whom place accident among the universals. Proof II: that to which the definition of the universal belongs is a universal, by the locus from definition to the thing defined; but to accident belongs the definition of the universal. Therefore accident is a universal. The major is conspicuous. The minor is at hand: the definition of the universal is to be predicated of many, as I have often noted above; but accident is predicated of many — "the crow is black," "the swan is white." Therefore it belongs to it the definition of the universal. Again, accident is predicated of many in accidental what sort contingently. Therefore it is a universal distinct from the others. The antecedent is shown from the peculiar character of each universal: the proper is predicated in what sort necessarily, difference in essential what sort, genus and species in what.

Objection I. What is in a singular is singular — for what is received in the recipient is according to the mode of the recipient; but accident is in a singular, from *5 Met. cap. de eodem*. Therefore accident, about which we here treat, since it is that same accident, is not a universal but a singular. It can be answered to the major that common natures and quiditative predicates are in a singular, yet they are not singulars — and this can be confirmed from Aristotle in *c. de substantia*, saying that second substances are in the first — and it is plain that second substances are not singulars. However, granting the major, Scotus responds to the minor: that this intention "accident" is in a common subject, as in "white" or some similar thing to which it is applied — just as species is in this common subject "man"; whereas what Aristotle asserted in *5 Met.* is understood also of that to which this intention "accident" is applied, because that primarily inheres in the singular, since it does not follow from the principle of the species according to itself.

Objection II. No real being is formally universal, as we showed in *q. 1, art. 6*; but accident is a real being, for it is comprehended under being, which from *5 Met. T. 14* is divided into substance and accident. Therefore accident is not a

universal. Confirmation: no second intention is per se predicated of a first intention, because what is not a true nature is not predicated of a true nature; but accident is predicated per se of a first intention, as "color is accident." Therefore since accident is real, it cannot be formally a universal, which is a being of reason. Granting the major, in response to the minor I say that the argument holds for real accident, but not for intentional accident, of which the discussion here is. The same answer applies to the confirmation.

Objection III. No species of the universal properly inheres in a singular; hence "this animal is a genus" is false, and "this man is a species" is false; but this is true: "this whiteness is accident" — since to it the definition of accident, to be adduced in the next article, is accommodated. Therefore accident is not a universal. Reply: granting the major and distinguishing the minor: if accident is taken first-intentionally, I grant; if taken second-intentionally, I deny — as is clearly established from the first remark.

Article II. What Accident Is

Three definitions of accident are adduced in this chapter by Porphyry. The first is this: "accident is that which is present and absent without the corruption of the subject." The second: "accident is that which may happen to be or not be in the same thing." The third: "accident is that which is neither genus nor species nor difference nor proper, but inheres in a subject." The two preceding definitions do not differ from one another except in words, as Sarnanus in the exposition of the question and Arriaga in *disp. 8, sect. 2*, and before them Maior in *notable 3*, rightly note — and they coincide with the definition of accident given by Aristotle in *1 Top. cap. 4*, whom Porphyry imitates in this his Isagoge. The philosophers, however, labor greatly over the examination of the prior definition; some reprove it as bad, such as Hurtado in *disp. 6, sect. 6, §. 38* and Arriaga in *disp. 8, sect. 3, n. 27*. Others approve it as good but disagree in its explanation. On one side, Ruuius in *q. 3* and Joannes de S. Thoma in *q. 12, art. 1* want it to be understood of real inherence in the subject and real separation likewise. On the other side, Scotus in *q. 35 of the universals* and his interpreters there — from whom the Thomists do not seem to dissent — teach that it is to be understood of intentional and intellectual separation.

It is noted, first, from the Doctor cited above, that these words "is present" and "is absent," which are placed in the definition of Porphyry, and "to be" and "not to be," which are found in the definition of Aristotle, can be taken in two ways — namely as terms of first and second intention. About them taken in the first way the Philosopher writes in *7 Met. T. 1*, saying that the being of accident is to inhere; with which accords what the same Philosopher had previously said in *8 Phys. T. 62*, namely: "it is impossible for the same thing simultaneously to inhere in and be absent from the same subject." In these places, therefore, Aristotle speaks of accident taken first-intentionally, or of real accident. If however they are taken in the second way, they denote accidental and denominative

predication of accident of the subject — just as "to be said of" designates the essential predication of a superior of an inferior in the same genus. This is mentioned by Aristotle in the Antepredicaments, where he adduces the famous fourfold division of "to be in a subject" and "to be said of a subject," about which in the following book. Taking therefore "to be present" or "to inhere" as a second intention, or logically, it is the same to say "accident is that which is present and absent without the corruption of the subject" as "accident is a non-essential predicate not necessarily belonging to the subject," as Scotus explains in the place cited and in *q. 32, toward the end*. Or more clearly: "accident is that which is affirmed and denied of a subject without any incompatibility on the part of the subject," as the same Doctor adds.

It is noted, second, that there is a twofold abstraction of the intellect: one is precise, and the other divisive. Precise abstraction is that by which the intellect understands one thing without the other, even though both are conjoined and inseparable. For there is the privilege of the intellect to conceive one without the other, even though they cannot be divided and torn apart from one another. Hence Aristotle says in *2 Phys. T. 18*: "of those who abstract, there is no lying." Divisive abstraction is that by which the intellect separates one thing from another — that is, negates one of another. The Doctor alludes to both abstractions in the question in responding to the last argument, and in *3 d. 14, q. 2*. The first is attributed to the simple intellect and the second to the compounding or dividing intellect. Although certain accidents cannot be removed from their subjects without the destruction and ruin of the subjects — as is commonly shown by the examples of the blackness of the raven and the whiteness of the swan — nonetheless the raven and the swan, which are their subjects, can be understood without them, and under their opposite the essence of those subjects remains intact and no incompatibility is involved in their formal and essential concept. It is indeed true that the subject can be conceived without the proper which flows from it, because it does not enter into its essence; yet it can by no means be conceived under its opposite, because the proper proceeds from its essential principles, as I made clear in the preceding question. The same Oviedo affirms this in *Contr. 6, p. 7, n. 4*, from Bellarmine cited by him.

First Assertion: Accident is properly defined by Porphyry as that which is present and absent without the corruption of the subject, if it is understood in the way Scotus in the place cited expounds it — and he proves it by this single reason: a definition is suitable which is composed of genus and difference, as all philosophers sanction; but the definition of accident adduced above consists of genus and difference — for through its words is signified a non-essential predicate, which is its genus, and one not necessarily belonging to the subject, which is its difference, as I explained in the remarks set out above. Therefore that definition is legitimate. Accident is more conveniently and easily defined as that which is predicated of many in accidental what sort not necessarily, where

genus and difference are clearly seen — the genus in which accident agrees with the other universals, and the difference by which it is distinguished from them.

Second Assertion: The separation which is involved in the definition of accident is not real but intentional and intellectual. This is commonly defended by Scotus as cited above and other interpreters of Porphyry, to whom the Thomists assent. Proof I: from Porphyry in the present passage, who expressly says: "for it can be understood both that the raven is white and that the Ethiopian shines with whiteness beyond the corruption of the subject." And Maior rightly notes in *notable 2* that this separation is to be understood in the definition of accident given by Porphyry, around which the Logician revolves — not as it pertains to another craftsman. For the Logician speculates about the intentional separation of accident from the subject. He is not a real craftsman, as we showed elsewhere. Therefore that separation of accident is intentional, which is placed in its definition. Proof II: judgment is to be made about the definition of accident in the same way as about the definitions of the other universals, since the reason is the same for all universals; but the definitions of the other universals include second intentions, since they are expressed through predication, which is a name of second intention. Therefore the separation of accident that is located in the definition of accident is intentional. Hence the opinion of Fuentes in *q. 11, diff. 1, art. 1, assertio 1* and our more recent authors cited at the end — saying that if the definition of accident is taken only of separable accident it can be expounded of real separation — is not to be heeded, since it is clearly demonstrated that the Dialectician in no way touches real separation of accident, but that it is the task of the real craftsman to investigate that real separation. Therefore neither absolutely nor conditionally is that real separation of accident to be introduced here. Again, a double definition of accident would have to be produced — one of separable and another of inseparable accident — while there would still remain to be desired a definition of accident common to both and prescinding from both. And further, it conflicts with Scotus in the place cited, *verf. Quod accidens*, near the beginning, who cites Porphyry as dividing accident into separable and inseparable. And it is plainly also had from the same author, both in the body of the question and in the solution of the arguments.

Objection I. Porphyry in *cap. 5* here, explaining that the first definition of accident does not conflict with its division, provides two modes of separating accident from the subject — real and intentional — which would not be necessary if the definition of accident were to be interpreted of intentional separation only. Confirmation: one must philosophize about the definition of accident in the same way as about its division, which Scotus in *collation 35, §. Ad 1* and Augustine cited by him admit; but the division of accident into separable and inseparable is understood of real accident. Therefore so too is its definition. Reply: Porphyry is explaining himself in that place. For after giving the definition and division of accident, in order to meet the objection adduced, he

adds these words: "for it can be understood that the raven is white and that the Ethiopian shines with whiteness beyond the corruption of the subject." And the Doctor indicates in *2 d. 1, q. 5, §. Contra istud L.* — where note the word "be understood," which pertains not to real but only to intentional separation.

You will insist: if the reply were correct, no accident would be inseparable, since any accident can be separated or denied of a subject and understood without it. Maior in the place cited in *notable 1* and Tataretus in *scibile 4* respond by denying the sequel. For accident is not called simply inseparable because it cannot be simply separated from the subject, but because naturally and according to the common course of nature it cannot be separated or denied of the subject. Hence by supernatural power every absolute accident can be segregated from the subject and exist without it, as orthodox faith holds concerning the Eucharistic accidents. Add that Albert reports that if the pinions of ravens are anointed with the fat of goose or cat, and with quicksilver, white ravens will be born in a cold place. And we experience Ethiopians and Indians living in the seventh and eighth climates becoming white, as St. Augustine observes in *5 de Trin.* In response to the confirmation: granting the major, the minor is to be denied. For as Scotus says in *q. 32, in the solution of the last*, inseparable accident has the general character of accident; why it is called inseparable, Maior and Tataretus just now explained.

Objection II. Some accidents are present only with prejudice and corruption to the subject, as is clear from the division of Porphyry and from experience. For fever, combustion, death, and others of this kind bring with them the overthrow of their subjects. Therefore the aforesaid definition of accident is to be reproved. Scotus responds that the definition of accident is to be interpreted as concerning the subject of information or inherence — that is, matter, which perseveres incorrupt as the accident comes to it or departs from it — but not as concerning the subject of denomination, such as the composite, which is generated and corrupted, from *7 Met. T. 27*. If this response is accepted, all difficulty of the argument is removed — especially according to those who hold matter to be the subject of accidents. But since according to the Doctor in *2 d. 3, q. 4* the subject of accidents is not matter but the composite, the same Doctor therefore adduces another response: according to what we noted above, namely that "is absent without the corruption of the subject," placed in the definition of accident, is to be expounded of intentional or intellectual absence or separation. Which is to say that the subject of accident can be understood under its opposite with its nature remaining intact, with no incompatibility existing in its formal and essential concept. For the essence of the subject, conceived precisely and objectively, is not harmed — whether it is regarded dressed or stripped in life or in death, in health or in sickness, or in any other accident.

You will insist: through combustion and death the subject of accident is overturned, as is clear. Therefore the subject cannot be conceived without its

own destruction — otherwise the intellect would be deceived in understanding the subject otherwise than it is. And more: because "living" in its essential concept includes life, and consequently cannot be conceived without life. Granting the antecedent, I distinguish the consequence: by the simple intellect, I deny; by the compounding or dividing intellect, I grant. This distinction is plain from the second remark and is further clarified by Sarnanus at the end of the question. In response to the other thing added: I say that life is designated in the living thing necessarily not in act but in aptitude alone.

Objection III. A definition is not assigned through opposites copulatively, from *Arist. 6 T. cap. 2*; but the definition of accident is given through opposites copulatively, as is clear from those words "is present and is absent." Therefore that definition of accident is not correct. Confirmation: if such a definition of accident were apt, the soul of an ox or of another living thing would be accident, because it is present and absent with the subject — namely matter — remaining intact. But that this is false and absurd is shown in the book on the soul. Therefore that definition of accident is not genuine. Fuentes responds that the definition of accident is to be taken not copulatively but disjunctively. For accident can successively and not simultaneously be present or absent from the subject. You however say with Scotus in the solution of the first: it is to be understood not copulatively but circumlocutively, as is clear from what was said — for through those words we circumlocute a non-convertible, non-necessary accidental predicate, as Tataretus indicates in the place cited. In response to the confirmation: the sequel of the major is to be denied, for the soul is not in matter as accident is in a subject, but as a part in its co-part, from what will be said in the place now cited.

Objection IV. If the adduced definition of accident is suitable, it inheres per se in the thing defined; and thus accident per se is present and absent. But if it is per se present, therefore per se it is not absent. Scotus responds by denying the last consequence; for he says it is a sophism from "according to something" to "simply." Just as this does not hold: "the contingent is necessarily contingent; therefore the contingent is necessarily so."

Book III. On the Predicaments

This book on the predicaments was held in such esteem by Herminus the Peripatetic that he always had the ten categories on his lips — which Demonax the Philosopher, addressing him, thus joked: "I think you, Herminus, are not unworthy of the ten categories." The play is on the ambiguity of the word "category," which signifies both predicament and accusation, as Erasmus in *1. 8 Apoph.*, Fonseca in *5 Met. cap. 7, q. 1, sect. 2*, and the Coimbrans in the prooemium to the Categories testify.

Question I. On the Preliminaries to the Predicaments

Article I. Who is the Author of This Book on the Predicaments

First Assertion: Aristotle is to be considered the maker of this work. This is presupposed by Scotus in the questions on the predicamentals and is the common opinion of the Peripatetics, against Iamblichus and certain others who follow him. Proof: from Aristotle, who sometimes refers to this book in his writings, as Fuentes notes in *q. 13, diff. art. 1* — and it is listed in the catalogue of Aristotle's works, as is evident in Laertius in the life of Aristotle himself, Julius Pacius, Franciscus Patricius, and others.

Aristotle perfected Logic, as is clear from *1. 1, q. 1, art. 4*; but had he not published the book on the categories, he would not have completed Logic, for he would have omitted the incomplex terms contained in this work, which are the remote matter or integral parts of the syllogism. Furthermore, the concise and subtle style, as well as the phrasing and order preserved in the present work, plainly savors of Aristotelian doctrine. Therefore he is rightly its author.

Second Assertion: The first author of the ten predicaments is Archytas of Tarentum, a disciple of Pythagoras, whom Aristotle and the other philosophers followed. This assertion is expressly held by Theodorus Zwinger in *vol. 1, l. 2*, where he reports that Archytas is considered the author of the categories, whom Aristotle greatly commends in various places in his writings. And Mirandulanus in *1. 4 de examine veritatis* testifies that the work of Archytas divided into ten categories still exists, written in the Doric tongue, which Aristotle subsequently wonderfully cultivated and enriched — and Scotus does not dissent.

Objection. Aristotle calls the ancient philosophers ignorant of Dialectic in *1 Met. cap. 8*, compares them to inexperienced boxers lacking in skill in *ibid. cap. 4*, and likens them to stuttering infants in *cap. 7 of the same book, T. 51*. Therefore since the book on the predicaments is one part of Logic, as is clear from what preceded, Aristotle is to be considered its author. Reply: everything that Aristotle says about the ancient philosophers is to be interpreted with respect to perfect Dialectic — especially the form of the syllogism, which he himself boasts of having discovered at the end of the Elenchi — but not with respect to all its parts, especially the remote and integral parts, such as the book on the predicaments. And that they were acquainted with the aforesaid parts is clear enough from *l. 1, q. 1, art. 4, objection 2*.

Article II. What is the Subject of This Work

The Nominalists make voices the subject of this book, with whom Fonseca seems to agree in *5 Met. cap. 7, q. 1, sect. 6*. Avicenna at the beginning of his Logic establishes things as the subject of this little work. Scotus however in *q. 1 and 2 of the predicamentals*, Tataretus in *ibid. q. 1, dub. 2*, and other disciples of the same

doctrine assert that the intentional univocal common to the ten predicaments is the subject of this work.

It is noted from Titelmanus in *l. 2 of the dialectical consideration, cap. 1* that the name "predicament" is used in three ways. First, for what is predicated of something — thus Augustine took it in *1 de decem categoriis, cap. 1*, calling "animal" the category of substance. In this regard Cicero in *4 Tusculanarum qq.* describes a predicament as that which is predicated of something or of some things. And this is the acceptation from the etymology of the name. Second, for the whole coordination from the supreme genus and those things contained under it — thus Porphyry used it in his *Isagoge in c. de specie*. The Doctor in *2 d. 3, q. 4, §. Contra istam conclusionem* and the other philosophers in general receive it in this sense. Third, for the supreme genus alone — in which sense we say that man, for example, is under the predicament of substance, and substance is the first predicament. The more frequent use of "predicament" is derived from the second and third signification, so that predicaments in the present context and in the most common usage are taken for the first ten genera and for the ten coordinations of which they are the heads — as Maior and Tataretus excellently observe in *c. de substantia*. Nor is the common acceptation of "predicament" to be omitted for the first intention — that is, for things both substantial and accidental which are placed in the predicaments — or for the second intention attributed to things suitably disposed and ordered under one supreme head, as the Doctor notes in *q. 2 of the predicamentals, §. Ad q. dicitur*.

First Assertion: Voices are not the object of this book. So Scotus in *q. 1 of the predicamentals, before §. Ad q. dici potest*. Proof I: Logic is about second intentions as about the subject of predication and about the syllogism or mode of knowing as about the subject of attribution, as I showed in *l. 1, q. 3, art. 7*. Therefore voices are not the subject of this work. The consequence holds: what is not the subject of the whole is not the subject of the part either, because the part is contained under the whole. But voices are not the subject of the whole of Dialectic, as I proved in the place just cited, *art. 4*. Therefore neither are they the subject of this part. Proof II: of the subject of a science its passions are shown, from *1 Post.*; but no property of a significant voice is demonstrated either in this or in the other books, as is clear to any reader — especially because with no voice existing or possible, there is science about the ten predicaments. Indeed, all the passions of the syllogism and all its parts can belong to it according to the being it has in the mind, even if not uttered, because that being precedes voices. Therefore voices are not to be established as the object of this work.

Second Assertion: Nor can things be the object of this book. This too is defended by Scotus in the place cited above, *post §. Ad q. verf. Ad aliud dito*, and by Antonius Andreas in *q. 1 in lib. sex principiorum*. And it is proved by the reasons adduced in *l. 1, q. 3, art. 2*, by which it is shown that all things are not the subject of the whole of Dialectic.

Third Assertion: The predicament — that is, the intentional univocal common to the ten supreme genera — is the subject of this book. The Doctor holds this in *q. 2 of the predicamentals*, §. *Ad q.* and more expressly in §. *Contra verf. Ideo dici potest*. And it follows from the refutation of the others. It can further be argued: the Logician considers that intentional common to the ten predicaments, just as in the Isagoge Porphyry speculates about the universal. Therefore just as there the universal is established as its subject, as is clear in *l. 2, q. 1, art. 12*, so here "predicament" taken in the aforesaid manner is determined as the object of this book. Hence the reasons brought forward in the place cited to prove that the universal is the subject of the Porphyrian introduction can be accommodated here, changing only the name "universal" to "predicament."

Objection I against the First Assertion: In the present book treatment is had of equivocal, univocal, and denominative, which are differences only of the significant voice — for equivocation is adapted neither to things nor to concepts but to voices. Therefore voices are the subject of this book. Confirmation I: those three things mentioned above are defined through "are called" — but "being called" pertains to voices. Therefore, etc. Confirmation II: according to Aristotle in this place each incomplex thing signifies substance or accident; but to signify pertains to significant voices. Therefore voices are the object of this book. Reply: first, univocal and denominative are differences of predicates which as such belong to concepts, not to significant voices. As for equivocal, Aristotle treats of them on account of their opposition to univocal; or by "equivocal" he understands equivocated equivocal, not equivocating equivocal — the explanation of this division being had in the Epitome, *l. 1, q. 1, art. 5*. In response to the first confirmation: I say that Aristotle places "are called" there, which is the same as "are conceived," as I also noted in *l. 1, q. 3, art. 4*, on the subject of the whole of Logic. In response to the second confirmation: I say that this primarily belongs to the simple concept and secondarily to the significant voice. Whence Scotus concludes that if the subject of this work is something incomplex, rather the concept than the voice is the subject of this work — supply: of predication, not of attribution.

Objection II against the Third Assertion: Of the subject of a science passions are demonstrated, as Aristotle teaches in *1 Post. 1*; but of the predicament taken universally no passion is shown. Therefore the predicament is not the subject of this work. Confirmation I: predicament does not belong to all that is considered in this work, for not everything contained here is a predicament. Therefore it is not its subject. Confirmation II: predicament is contained under the universal, which is the subject of the Porphyrian booklet. Therefore this science is subalternated to the Porphyrian science, because as subject is related to subject, so science to science — but this seems absurd. Therefore so too is that from which it follows. Granting the major, the minor is to be denied. For these passions are demonstrated of the predicament: to be divided into species, to have no genus above itself, and to be predicated universally. In response to the

first confirmation: I say it is not necessary that everything examined here be a predicament, but it suffices if in some way they are reduced to it — as I said about the subjects of other sciences in *l. 1, q. 3*. In response to the second confirmation: I say that besides that condition, another is required for true subalternation — namely that the subalternated science derive its principles from the subalternating one, which this science lacks. Therefore it does not follow that this science is subalternated to the science on universals handed down in the Isagoge of Porphyry.

Article III. Whether There is Science about the Predicaments

Assertion: There is science about the predicaments. This Scotus holds in *q. 2 of the predicamentals*, and it is clear from the preceding article — for of the knowable subject science is given, as is known of itself. But the subject of the predicaments is knowable — for knowable properties are shown of it, such as to be divided into species, to have no genus above itself, and the like. Therefore, etc.

Objection I. Everything knowable is knowable through definition and demonstration, from *1 and 2 Post.*; but of the predicaments there is no definition. Therefore neither is there science about them. The minor: a definition is constructed from genus and difference, as no one denies; but the predicaments, since they are supreme genera, have no genus and difference. Therefore, etc. Granting the major, I deny the minor — for even if there is no definition properly of them, there is nevertheless a certain description, which seems sufficient for the scientific character.

Objection II. The subject of a science is prior to the passions demonstrated of it, just as cause is prior to its effects; but nothing is prior to the ten predicaments, since they are the first and supreme genera. Therefore science about them is not had. Granting the major: I distinguish the minor. In themselves, I grant; with respect to their intentional passions, I deny. For although with respect to themselves no cause through which they are demonstrated is had, nevertheless with respect to their intentional passions which belong to them insofar as they are considered by reason, they are true causes — at least by emanation — as will be made plain elsewhere.

Article IV. Whether the Science about the Predicaments Pertains to the Logician

Some hold that the treatment of the predicaments belongs to no particular and determinate craftsman, as the Coimbrans report without naming them in the prooemium to the predicaments; Ruuius there and Fonseca in *5 Met. cap. 7, q. 1* also. And there are those who refer this discussion to the Metaphysician alone. But Scotus in *q. 2 of the predicamentals*, Fuentes in *q. 13, diff. 1, art. 3*, and the other

philosophers commonly affirm that the work on the predicaments pertains to both the Logician and the Metaphysician under different characters.

It is to be noted from Scotus now cited, §. *Ad q. dicitur*, and to be recalled from what was said in the second article toward the end of the remark, that the predicaments can be considered in two ways: one, insofar as they are real beings — since from 5 *Met. T. 14* the real finite being is divided into ten genera or predicaments; and another, insofar as they are intentional beings caused by the intellect and attributed to real things. With this distinction laid out, the present difficulty is dissolved. For something can be considered by diverse sciences under diverse formalities, as is evident of quantity, which is examined by Physics and by Mathematics, and of body, which Physics and Medicine examine.

Assertion: The treatment of the predicaments is first-intentionally the task of the Metaphysician, and second-intentionally is the office of the Logician. This assertion is divided into two parts and represents the mind of Scotus in the place cited. The first part is proved: the object of Metaphysics is real being, which from Aristotle in the chapter cited, *T. 14*, is divided into ten predicaments as into ten modes; and the Doctor adds there that since Metaphysics speculates about being as being, it speculates also about its modes into which being itself is divided. Likewise the Metaphysician is the common craftsman — for he contemplates common natures and the quiddities of universal things. Therefore it pertains to him to carry out the labor of speculating about the predicaments. Add that the first Philosopher treats of modes of being and the Logician of modes of predicating, as will be proved elsewhere. Therefore, etc. The second part is proved: Logic treats of second intentions applied to first ones, according to the common dictum of Dialecticians, which Scotus recalls in *q. 1, before §. Ad q. verf. Ad oppositum*. Therefore predicaments taken second-intentionally pertain to the Logician. Furthermore, the Logician treats of predicables and subiectibles, for he regards the order of superiors and inferiors in the propositions he elaborates. Therefore predicaments with respect to this ordering and disposition caused by reason pertain to the Logician.

Objection I. Of the predicaments there is real science. Therefore about them there is no Logic, which is a rational science. The antecedent is proved: Metaphysics treats of these, as is clear in 5 and 7 *Met. T. 14*, which is a real science. Reply: following the distinction given in the remark — if the predicaments are considered first-intentionally, I grant; if they are regarded second-intentionally, I deny. For of them so taken Logic exists, as the Doctor indicates in *q. 11 of the predicamentals, §. Ad quaestionem dicendum*.

Objection II. The predicaments are things of first intention; hence Scotus cited above says their distinction is derived from the essences of things, and their predications are of first-intention things — as "man is substance." Therefore the predicaments do not pertain to Logic, which is not a real science. I distinguish the antecedent: as they are considered by Metaphysics, I grant; as they are

considered by Logic, I deny. So Scotus is expounded in the place cited: the Metaphysician per se speculates about the substract of the second intention; but the Logic meditates upon the second intention itself attributed and applied to that substract.

Question II. On the Antepredicaments

Just as this work is in its first division divided three ways — into Antepredicaments, Predicaments, and Postpredicaments — so the Antepredicaments are comprehended under the number three: Equivocals, Univocals, and Denominatives. Aristotle perhaps uses this number not unaware of its celebrated praise among the ancients: "God delights in an odd number."

Article I. On Equivocals

In addition to what I said about equivocals in the Epitome, *l. 1, q. 1, art. 5*, these things are worth learning. For in ignorance of equivocals many fall into many errors; hence Scotus says in *3 dist. 22, q. un., §. Ad 1 arg. sub E.*: "the equivocation of names has many times deceived." First of all, the instruction of Aristotle in *6 Top. cap. 1, locus 5* and of Scotus in *Quol. 1, §. De primo A.* and *q. 9, 10 Elench.* is to be observed: equivocals are to be divided before being defined. The reason for this can be given: because distinction is the manifestation of the true and false sense, as the Doctor notes in the place recently cited at the end of the question. There is also distinguished by the same Doctor in *q. 5 of the predicamentals, §. Ad q. dicendum*, a twofold equivocation: active and passive. Active equivocation is the relation of the supposition of one voice to many significates. Passive equivocation is the relation of many significates to the equivocating voice. Hence arises the division of equivocals into the equivocating equivocal, which is the voice or equivocal name applied to many significates, and the equivocated equivocal, which are the things or objective concepts expressed through the equivocal name. Furthermore, the equivocated equivocal can be used in two ways: first-intentionally, which is the significate or significates of the equivocal name — such as the significates of the name "dog"; and second-intentionally, which is the relation of reason of the signified name or significates to the equivocating significant voice — in which sense equivocals are described as those whose name is common but the account of the substance according to that name is diverse. Again, the equivocating equivocal is twofold: the equivocal equivocating by chance, which equally and primarily signifies diverse things under the same name through diverse concepts — as was explained elsewhere about "dog" — and the equivocal equivocating by design, which under one name designates several things through diverse concepts, yet one of them by comparison to another — as Aristotle exemplifies in the Antepredicaments, *cap. 1*, about "man" with respect to the living and the painted. Furthermore, note from the Doctor in *1 dist. 25, q. un., §. Respondeo A.* that the equivocal is not to be numbered among the equivocated — for it is not rightly said that "the fish and

the star are two dogs"; from Ferch. in *vest. 2, cap. 4, n. 11* — since the enumeration of something among others requires a common character among them, whereas in equivocal the account is diverse, and only the name is common to them.

Objection I. Aristotle in *6 Top. cap. 2, locus 73*, Scotus in *Theor. 19, n. 10*, and Mauritius in his annotation deny that equivocal can be defined. The reason is that equivocal signify many things in the manner of many, and have no common character; whereas a definition signifies one common character which every thing defined participates. Reply: equivocal can be considered in two ways: one way, as they are many absolutely — and thus they are undefinable, as the argument well proves. Another way, as they have the common second intention of equivocation imposed and applied to them by the intellect — and in this way they are definable, as Scotus teaches in *q. 5 of the predicamentals, ad 6*.

Objection II. Equivocal "are called." Therefore equivocal are voices, and consequently equivocal are not those whose names are common but are those names themselves. Granting the antecedent, I deny the consequence. The reason is that although equivocal are formally defined through that common equivocal intention, nevertheless the definition given is accommodated not to equivocating equivocal but to equivocated equivocal — as Antonius Andreas, following Scotus, notes in the exposition of the Antepredicaments, and the other illustrators of Scotus there.

Article II. On Univocal

Univocal seem to be opposed to equivocal, since although both equivocal and univocal share the same name, they are distinguished with respect to the account or objective concept. For equivocal obtain a diverse account and objective concept under the same name; whereas univocal participate in the same name and the same objective concept, as the Doctor writes in *1 dist. 3, q. 2, B.* and *dist. 8, q. 3, §. Ad argumenta P.* Hence the Coimbrans note in *q. 2 of the Antepredicaments*, from Albert, *Tract. 1, cap. 3*, that one must speak of these in the opposite manner to equivocal. And rightly Pelbartus in *Tom. 1 of his Rosary, verb. Ens, §. 2*, from Vorrilong in *1 dist. 4, art. 1*, notes that "univocal" is said quasi "one calling" — that is, when under some voice and quiddity corresponding to the voice, many things are called. This is favored by Aristotle in the present passage, writing that univocal are those whose name is common and the account of the substance according to that name is the same. Presupposing the partitions of univocal given in the Epitome, I observe with the common opinion of the Dialecticians that the univocating univocal and the univocated univocal are taken in two ways — namely first-intentionally and second-intentionally. The univocating univocal taken first-intentionally is a voice signifying something common to many — as the voice "man" with respect to Peter and Paul. Peter and Paul are said to be univocated univocal first-intentionally. The univocating univocal taken second-intentionally is the relation of reason of the significant voice to something common to many — as the relation of reason of this name

"man" to Peter and Paul. The univocal first-intentionally is something common to many signified through one voice — as man, who is participated by many of his individuals under the same name and same account. The univocal second-intentionally is the relation of reason of many significates through one voice — as the relation of reason of the individuals Peter and Paul signified through the voice "man" as it is a species. Accordingly, the definition of univocals given by Aristotle is taken of univocals taken second-intentionally — as Tataretus observes in *ibid. q. 1, scibile 2*, following Scotus in *q. 6 of the predicamentals*. And this is deduced from Aristotle, who clarifies it with the example of animal, man, and ox — for both man and ox are called by the name "animal" and enjoy the same account of animal, which plainly accommodates to the univocal; and the same Philosopher adds: "if anyone assigns the account of both in what they are as animals, he will assign the same account of both" — which equally belongs to univocals.

Three things especially are required for a proper univocal: first, that the name be common to many, as its notion declared above indicates — as "animal" is a name common to man and lion. Second, that the account of the substance be the same — that is, that the quiddity or the same objective concept be the same; not however the formal concept, as the Doctor writes in *1 dist. 2, q. 3* and *dist. 8, q. 3*, and as Bonetus proves in *1 Met. cap. 2*. Third, that the same objective concept be signified through the same name. For if the same account of substance were designated through another name, it would be not a univocal but an equivocal — as the name "dog" is common and "animated sensitive substance" is likewise common to the aquatic fish and the barking dog; yet because the account is not the same for them according to the name "dog" but according to the name "animal," "dog" is not therefore a univocal name for them. Furthermore, these instructions are handed down about univocals: univocals are properly defined; univocals per se are placed in the predicaments; and univocals are the objects of sciences — all of which are explained abundantly in their proper places.

Objection I. All equivocals have the same name and the same account of equivocals. Therefore if the definition of univocals is true, equivocals would be univocals — which is false, since the opposite would be predicated of the opposite. Reply: nothing prevents equivocals from being univocals in a different respect, as is clear of the sea-dog and the barking dog, which are univocal in the account of "animal" and equivocated in the account of "dog." Or the consequence is to be denied — for a sophism is committed from "according to something" to "simply." To have the same account of equivocals is to have an account simply and essentially diverse, yet in a certain respect and accidentally the same — just as to agree in difference is to agree in a certain respect and to differ simply.

Objection II. Those whose essential account is the same are essentially identical; but univocals have the same essential account, as is clear from their definition. Therefore they are essentially identical. But this is false, since man and lion, for example, are indeed univocals but are not essentially identified — indeed they differ essentially through their specific differences. Reply: granting the major, to the minor it must be added that the same essential account has the same common name; for if it were another name they would by no means be univocals, as I noted above. And so in response to the secondary argument: man and lion, insofar as they participate in the same name and common account of animal, I grant are univocals; but insofar as they participate in other names and diverse accounts which are their specific accounts and differences, I deny they are univocals — as is clear enough from what was said.

Article III. On Denominatives

The division and definition of denominatives are to be sought from the Epitome, *art. 7 of the place cited*, in the preceding article. Now the conditions required for proper denominatives are numbered as three. The first is that they agree in formal significate and differ only in mode of signifying — as I said about every concrete and abstract in the place cited above, *art. 6*. For "white" and "whiteness," for example, which are denominatives, formally signify the same thing — namely the form of whiteness itself — but they present a diverse mode of signifying; for "whiteness" precisely designates the form of whiteness itself, while "white" beyond that concerns the subject in which it resides — such as paper or some other thing in which it inheres — as the Doctor clearly teaches at the end of *q. 8 of the predicamentals*. The second is that they agree in the beginning of the word, or that they begin with the same syllables — as the aforesaid denominatives "white" and "whiteness" sufficiently illustrate. The third is that they differ in the ending of the same word — as those particles of their definition, "differing in case," indicate — that is, according to Scotus's interpretation, in inflection; because they have a distinct termination, as can be seen in the example adduced. Or if you prefer another more sublime and subtle interpretation of Scotus in *2 dist. 12, q. 1, §. Ad argumentum primum I.* and *Quol. 18, §. De 1. sub C.*, say that case or inflection of denominatives is toward the form or nature. Now since form and nature are twofold, a twofold genus of denominatives arises: either it is the inflection of substantial nature toward the suppositum, and a substantial denominative is had — as "man"; or it is the inflection of accidental nature toward the subject, and an accidental denominative is had — as "white." The former exposition of denominatives is more common and easier; the latter is broader, and does not seem to be comprehended in the definition of denominatives elaborated by Aristotle — for the substantial concrete does not seem to be a denominative except in a broad signification, as many Scotists intimate following Mayronius in the predicaments, *passage 3*. And this is the express mind of Scotus in *q. 16 of the predicamentals, §. Per idem ad 2 argumentum*, in these words: "It is to be said that

the substantial concrete does not have that definition, because it does not differ only in case — that is, in the inclination of the form toward a subject, as case is taken there — but it differs only in the inclination of the form toward the suppositum." Aristotle is in favor, who in illustrating the aforesaid definition adduces only examples of accidental concretes. The reason can be given: because the denominative designates the form in the manner of something adjacent to another, as Mastrius and Bellutus note in *disp. 2, Qual. 6* — which is proper to accidental concretes, not to substantial ones, as is clear in the Epitome, *l. 1, q. 1, art. 6*. Likewise, denominative predication is properly accidental, as is clear there, *q. 1, art. 2*. Hence the Doctor rightly concludes in *3 dist. 7, q. 1, §. Quarto videndum C.*: "although the denominative is a univocal predicate, it is not predicated univocally" — as will be made plain in the following article. Tataretus in the Summules, *Tract. 3 de praedicamentis in expositione denominativorum, scibile 2*, gladly subscribes to this. And so our more recent authors cited above do not seem to cohere with themselves — for at the beginning of the question cited they say that the denominative signifies form in the manner of something adjacent to another, which belongs only to the accidental concrete, and then near the end of the same question they strive to adapt the aforesaid definition of denominatives to both — that is, to both accidental and substantial — pressed by this slight reason: that both fall toward another and concern a subject or suppositum — as Raconius also implies in *Tract. 2 de Categoria, q. 3*. This motive, I say, is plainly slight and vain, as is clearly shown by what we have adduced thus far for defending and strengthening our position.

Objection. Denominatives pertain to Grammar. Therefore in Logic they are to be presupposed rather than defined and treated. The antecedent is at hand from the conditions that denominatives require — especially from the last two, for to agree in the beginning of a word and to disagree in the ending of a word are matters of the grammatical faculty. Reply: denominatives are considered differently by Grammar and Dialectic, just as I noted about noun and verb in the Epitome, *l. 2, q. 1*. For Grammar regards them with respect to the congruence of speech, while Dialectic regards them with respect to the objective concept and its truth. And that denominatives begin with the same letters and end with different ones expresses their similarity and dissimilarity. Or say, following the second interpretation of them, that their case or inflection is referred not to the name but to the subject, as was explained above.

Article IV. Whether the Definition of Univocals Belongs to Denominatives

Some deny this, among whom is Ruuius in *q. un. of this c.*; the opposite, however, is maintained by Scotus in *1 dist. 8, q. 3, §. Ad argumenta opinionis oppositae*, Vallo in *Tract. Form. fol. 76*, and Fuentes in *q. 12, difficulty 1, art. 2*, asserting that denominatives are comprehended under the definition of univocals.

It is noted from Scotus in *3 dist. 7, q. 1, §. Quarto videndum C.* that it is one thing to be a univocal predicate and another to be predicated univocally. For a univocal predicate is one objective concept common to many, not entering into the essence or quiddity of those of which it is predicated — as "white," which is denominatively predicated of wood and milk, as "the wood is white" and "the milk is white." But to be predicated univocally is when the predicate is of the essence of the subject — thus "animal" is predicated univocally of man and brute, because it is of their essence. This distinction is clearly gathered from Aristotle in *1 de substantia*, when he says that second substances are predicated univocally of first substances, while accidents of the subjects in which they inhere are predicated denominatively. The same Doctor repeats and expresses this in *1 Sentences* in the place cited at the beginning of this article, *P.*, saying that a univocal predicate is twofold: one which is predicated essentially and in what of the subject, as "animal" of man; and another which is predicated according to the same name and the same account — not however essentially and quidditatively — as "white" is predicated of milk and snow. Hence if "univocal" is taken in the first way, between univocal and equivocal there mediates the denominative — because between a predicate which has the same essential account and a predicate which has a diverse essential account there mediates what has the same non-essential, accidental, and extrinsic account, as was confirmed above by examples. But if "univocal" is taken in the second way, between equivocal and univocal nothing is interposed — because between having the same common account and having a different diverse account there is no medium; and so in the last article of this question we will assert that equivocals and univocals are immediate, and that analogs and denominatives do not mediate between them. Although between those mentioned no medium intervenes, yet Mastrius and Bellutus in *disp. 2, q. 6, art. 1*, following Joannes de Magistris in *c. de Denominativis* and Delphinus in *c. de univocis*, think that between the mode of predicating of equivocals and univocals there falls the mode of predicating of denominatives — led by this reason: every predicate either has the same common account for those of which it is predicated, or not. If not, there is the mode of predicating of equivocals. If yes, either that common account is quidditative and essential for those of which it is predicated — and there is the mode of predicating of univocals; or it is extrinsic and accidental — and there is the mode of predicating of denominatives. However, the bipartite mode of predicating of equivocals and univocals seems to suffice for Dialecticians — especially Scotists, who acknowledge no medium between univocal and equivocal — as the Doctor explicitly asserts in the place cited above, saying that in another way "univocal" and "equivocal" are immediate for the Logician. And he adds the reason: because the univocal taken broadly is that whose account is in itself one — whether that account is the account of the subject, or denominates the subject, or is said of the subject per accidens; while the equivocal is that whose account is different or diverse. Since therefore between having the same common account for many and having a diverse

account there is no medium, it follows that there are only two general modes of predicating — of equivocals and of univocals. Again, in investigating the number of universals, only two modes of predicating are assigned — in what, and in what sort; then the mode of predicating in what sort is subdivided into essential what sort and accidental what sort. By parity of reasoning, two modes of predicating of univocals and equivocals are established; then the mode of predicating of univocals — under which denominatives are contained — is subdivided, and the mode of predicating of denominatives falls under it. Furthermore, the fourfold distinction that Porphyry establishes, Scotists reduce to a bipartite one, according to the law of good division handed down by Boethius in *l. de divisione*. Therefore a third mode of predicating of denominatives, distinct from the two modes of univocals and equivocals, does not seem to be introduced into the school of Scotus. Aristotle, however, treated of denominatives not because he thought them to be distinguished from univocals and equivocals — as Scotists must concede — nor because they have a mode of predicating of the subject different from these — as Mauritius holds, cited and received by our more recent authors — but because they are contained under univocals. For whoever treats of the divided whole is certainly bound to discuss its dividing members.

First Assertion: Denominatives are univocal predicates. This Scotus holds in the places cited above, which I prove thus: univocals are those whose name is common and according to that name the account of substance is the same, as the Philosopher writes in *cap. 1 of the predicaments*. But denominatives are of this kind — for "white," for example, which is a denominative, is predicated of the subjects in which whiteness inheres according to the same name and the same account of whiteness: for it is true to say "milk is white," "sugar is white," and so for the rest that participate in whiteness. Therefore denominatives are univocal predicates. Proof II: every universal is univocal, as I proved in *l. 2, q. 1*; but the fourth and fifth universal especially are denominatives — such as "capable of roaring" and "colored." Therefore denominatives are not to be exempted from univocal predicates.

Second Assertion: Denominatives can be comprehended under the definition of univocals. This is established by the Doctor in the place cited, is indicated by Fuentes in the place cited, and follows from the prior assertion. For to univocals there is the same name and same common account, as Scotus excellently notes in the first place cited; but the account taken universally prescindds from essential and accidental account, intrinsic and extrinsic — just as "animal" abstracts from man and brute. Therefore denominatives properly, which obtain the accidental account of subjects, are not to be expunged from the definition of univocals.

Objection I. Scotus in *q. 6 of the predicamentals*, §. *Dicendum verif. potest dici* expressly denies that denominatives are univocals — proving it from Aristotle,

who in assigning the definition of univocals in *cap. 1 of the predicaments* says "univocals are those whose account of substance in the univocated is the same." But the account of white or of another denominative is not the account of substance, since whiteness or another accident is outside the substance or essence of the subject. Therefore the definition of univocals is not fitting to denominatives. Reply: from those words Scotus only deduces that he considers the contrary opinion not improbable — which he signifies by saying "it can be said." But in the theological places cited he, having considered the matter more maturely, absolutely and clearly defends the aforesaid assertion. In response to the proof from Aristotle: I say he can be expounded as speaking not of the quidditative and essential account of substance but of the account prescinding from essential and accidental account, intrinsic and extrinsic — as I was saying above. Or say that according to the mind of the Philosopher he defined univocals taken strictly, as the Doctor indicates in the place of the Sentences cited, and as Bonetus in the place cited explains, saying: "by 'account of substance' is to be understood the definitive quiddity which is found in every predicament of both substance and accident."

Objection II. Aristotle in *c. de substantia* writes that denominatives are not predicated of their subjects by name and account. Therefore denominatives are not univocals. The consequence holds by the locus from the negation of the definition to the negation of the thing defined. Fuentes in the place named at the beginning of this article, *n. 3*, responds that the Philosopher only excludes denominatives from essential and quidditative predication — as second substances are predicated of first ones — not however from accidental predication, which is rightly accommodated to denominatives, as the words adduced by him clearly demonstrate. Or more briefly, and to the same effect: denominatives are indeed univocal predicates, but are not predicated univocally — as I explained in the remark set out above.

Article V. Whether the Denominative Signifies the Form or Its Subject

Franciscus Lychetus in *1 dist. 4, q. 1, at the end*, notes that this difficulty is raised by the Doctor not so much about the denominative or substantial concrete, called "concrete toward the suppositum" — whose form is said to be in the suppositum and not in the subject — but about the denominative or accidental concrete, called the "concrete toward the subject," which presents two things: namely the accidental form and the subject in which this form inheres — as "white" designates whiteness and the milk or wall in which whiteness itself inheres. Now the question is whether the accidental concrete chiefly signifies the accidental form, or its subject, or both simultaneously and equally primarily. Hence according to the threefold sense that can be had about such a concrete, a threefold opinion of the Dialecticians arises. The first belongs to certain authors whose assertion is indicated by the Doctor in *4 dist. 12, q. 1, §. Ad argumenta*

principalia T., in the solution of the fourth — to whom our more recent authors in the place cited, *art. 2*, incorrectly join Fonseca in *5 Met. cap. 7, q. 5, sect. 1* (as is clear to one reading him there) — who hold that the denominative or accidental concrete per se and directly signifies both the form and its subject. The second belongs to Avicenna in *1 of his Logic, c. de proprio*, who holds that denominative concretes formally signify the subject and materially the accidental form — and the Nominalists are cited in this view by Gadius in *Quol. 1, fol. 9*, from whom Maior in *c. de Accidente, not. 5* and certain modern authors from the Society of Jesus do not seem to dissent. The third belongs to Scotus in *q. 8 of the predicamentals, §. Ad q. and 1 dist. 4, q. 1, at the end*, and *dist. 26 and 27*, and also in *4 dist. 12, q. 1, §. Ad argumenta principalia T.*; to Aureolus in *1 dist. 4, propositio tertia*; to Lychetus in the same place; to Tataretus both in those places and also in *Log. q. 2 praedicam. dub. 2*; to Joannes de Magistris; and to others teaching that accidental concretes primarily and per se signify the accidental form, while connoting the subject.

It is noted from Scotus in the Logic in the place cited above, that although accident does not exist without a subject — since it is a being in another, that is, dependent on a subject — it nevertheless has its own proper entity and nature distinct in essence from the essence of the subject. For being is divided into substance and accident, from *5 Met. cap. 7* and *1 Top.*, in every genus there is a what; and since there are nine genera of accidents, it is clearly established that accident participates in its own essence distinct from the essence of the subject. Wherefore accident can be understood in two ways: either precisely and under its own proper character — and in this way it is understood in the abstract; or insofar as it inheres in a subject — and in this way it is understood in the concrete, and by reason of this concretion it is said to signify the subject, not as something intrinsic to it, but as something on which it is supported and without which it cannot be perfectly and completely understood.

First Assertion: The accidental concrete signifies the form and at the same time connotes its subject. So Scotus in *q. 16 of the universals, §. Dicendum ad q.* and in the fourth of the Sentences in the place cited. Proof I: from Aristotle in *7 Met. T. 3, 4* and Averroes in *1 Phys. com. 25* and *12 Met.*, affirming that the accidental concrete — such as "musical" and "white" — simultaneously presents two things: the form and its subject. Proof II: the concrete and the abstract are distinguished from one another in that the abstract signifies the form precisely or in isolation, while the concrete signifies the form and that in which the form inheres, as I said in the Epitome, *1, q. 1, art. 6*. Therefore the concrete signifies both simultaneously — which is the common and indubitable assertion of all Dialecticians.

Second Assertion: The denominative concrete primarily and formally signifies the form, and materially and less principally the subject. Scotus expressly holds this in the places cited above. The first part is proved. I: from Aristotle in the

present passage saying that denominatives differ only in case from their principals — that is, from their abstracts; but abstracts formally signify nothing except the form, as is clear from the definition of the abstract term. Therefore neither do the denominative concretes, which the Doctor asserts in *1 dist. 8, q. 3, §. Contra istam positionem*, and *dist. 27, q. 3, §. Ad 2 q. I.*, differ from them only in mode of signifying. And this is had more expressly in *c. de substantia*: "white signifies quality alone" (understand: principally); now "white" is an accidental concrete and quality is the accidental form — therefore according to Aristotle the denominative concrete signifies the form chiefly. Proof II: whatever more principally is in act than in potency, as is clear of itself. Therefore the concrete primarily signifies form. The consequence is argued from Averroes in *8 Met. com. 7*: "the name is principally said of form, which it signifies only in act; but act in the composite is form, as no one denies." And more: because voices were devised chiefly for signifying, making known, and distinguishing things, and making known and distinguishing derive chiefly from form. Proof III: if denominative concretes formally designated the subject, since there is one common subject of all accidents, there would be one predicament in which all those accidents would be placed or at least reduced — which conflicts with the Philosopher in *5 Met. T. 14*, who divides finite being into ten predicaments, of which nine are genera of accidents. Again, this proposition would be per se: "white is wood," because the subject with respect to its significate is naturally apt to suppose per se, and the predicate would be of the essence of the subject — which contradicts Aristotle in *1 Post. T. 35*. The second part is proved I: in the definition of the concrete the subject is placed as something added, from *7 Met. T. 14*, and such a definition is called a definition by addition, because in it, beyond the essential things of the thing defined, something is added. Therefore the accidental concrete connotes the subject. Proof II: the concrete signifies form in the manner of something adjacent, as is clear in the Epitome cited; therefore it connotes or concerns the subject in which the form inheres. Proof III: that which designates two things equally primarily under its proper character is equivocal, as is clear from *art. 1 of this q.*; but not every concrete is equivocal — otherwise the end of speech would perish, which is to declare distinctly the concept of the mind, and no proposition would be true, no contradiction, consequence, or demonstration would exist, since equivocal is in no way placed in demonstration, from *1 Post. T. 26*. Furthermore, this would be a per se proposition: "white is wood" — for the predicate would be of the essence of the subject, which Aristotle reprobates in the place now cited, *T. 35*. Therefore the accidental concrete signifies its subject only materially and secondarily.

Objection I. In the definition of the concrete the subject is placed first. Therefore the subject is principally signified by the concrete name. The antecedent is at hand: for the concrete is defined as "having form" — as "white" as "having whiteness"; but "having form" is the subject of the form. Therefore, etc. Confirmation: the concrete is predicated of the subject, not of the form —

for one says "the body is white," not "the quality is white." Therefore it primarily signifies the subject. Granting the antecedent, I deny the consequence — for that is only the explanation of the name, not of the significate. Wherefore the concrete designates the subject only from the mode of signifying, not from the significate. Hence it is rightly said that the concrete per se signifies form and concerns its subject, as Scotus clearly teaches in *1 dist. 4, q. 1, at the end*. In response to the confirmation: granting the antecedent, I deny the consequence. For it is one thing to be said of another, to be used for another, and to signify something — for the concrete is said of the subject, as the argument deduces, but it does not primarily signify the subject; rather it only connotes and connotates it, as Scotus says in *q. 16 of the universals*.

Objection II. What per se constitutes the intellect is what per se primarily signifies it, since to signify is to constitute the intellect, from *1 Perih. c. de verbo*; but the concrete name uttered constitutes the intellect of the subject. Therefore it primarily signifies it per se. The minor is proved: the concrete constitutes the intellect of accident, which cannot be understood without the subject, because it cannot exist without the subject; and from *2 Met. T. 4*: "each thing is such in knowing as it is in being." Granting the major, I distinguish the minor: primarily, I deny; secondarily, I grant — as I made plain at the end of the remark set out above.

Objection III. The same term supposes what it signifies; but the concrete supposes the subject. Therefore the concrete signifies the subject. The major is shown: a term, from the fact that it supposes, does not have a new significate on account of its suppositing. The minor is proved from *1 Post. T. 35*: "white is wood" is per accidens — for it designates that to which "white" happens; but that to which "white" happens is the subject. Therefore, etc. Reply: with Scotus in *q. 8 of the predicamentals, Ad 2 principale*, suppositing and signifying do not coincide; for although a term supposes what it signifies, sometimes it supposes for what it connotes — as in personal supposition, where the common term supposes indeed for the suppositum, yet does not signify the suppositum. Wherefore even if the concrete supposes for the subject, it does not however signify the subject but only connotes it.

Objection IV. Scotus in *Quol. 1, art. 3* concedes that inherence inheres, and in *2 dist. 1, q. 5, 4 dist. 52, q. 3, 1 dist. 3, q. 7* writes that this is false: "whiteness is white" — the reason for which he gives in *q. 16*, because the subject and predicate are taken under diverse modes of signifying: for the subject is abstract and the predicate is concrete. Reply: inherence inheres as a by-which, not as a which; thus whiteness is not white, but is that by which the subject is white. The abstract and the concrete, though they signify the same thing, nevertheless obtain a diverse mode of signifying, as I noted above from Scotus.

Article VI. On the Unity and Plurality of Concretes

This difficulty, which seems to be grammatical — as the Doctor notes in a similar matter in *1 dist. 12, q. 1, §. Iuxta quaestionem istam* — can be raised both about accidental and about substantial concretes, and is useful for deciding many difficult and hard things treated in sacred Theology, as Arriaga notes above all others in *disp. prima summularum, sect. 9*. Now the question is whether the unity or plurality of the concrete is to be derived from the unity or plurality of form, or of subject, or of both simultaneously.

Concerning accidental concretes or adjectives, according to the school of Scotus in *1 dist. 12, q. 1, sub T., at the end, §. Ad argumenta respondetur*, and *Quol. 11, §. De tertio, sub H.*, and *3 dist. 6, q. 1, §. Ad argumenta F.*, and *dict. 8, q. un., §. Ad argumenta F.*, it is firmly established and intrepidly asserted that their unity or plurality is to be drawn from the unity or plurality of those same subjects — so that even if there were one accident in number in many subjects, such as one whiteness in number in many walls, the concretes would be multiplied to the multiplication of those subjects, and there would be as many concretes as white walls through the whiteness received in them. But if in one subject in number there inhered many accidents, there would be only one concrete in number — as an artisan endowed with many arts is called one artisan, and a Doctor having many doctrines and sciences is called one Doctor and one knower. Thus, with accident multiplied but the subject not multiplied, the concrete is not plurified; but with the subject multiplied, even if the accident is not multiplied, the concrete is plurified. The reason for this can be adduced from the Doctor in the first place cited above: because accident affects the subject on which it depends and without which it cannot exist. Since therefore it determines what terminates its dependence, its unity or plurality is clearly drawn from the unity or plurality of the subject, which terminates the dependence of the accident. Now if there were two accidental concretes — or as Scotus says in the place cited, two adjectives — since one cannot terminate the dependence of the other (because each is dependent), the dependences of both must be terminated by the subsistence and independence of a third, which is the substantive, which adequately terminates their dependences. Hence Scotus named above concedes that the Father and Son are two spirating things, but not two spirators — for the reason just given. For the numeral term added to a substantive designates that its formal significate is being numbered; thus "two spirators" would denote that the power and principle of spirating is multiplied in the divine Persons — which is false. But "two spirating things" signifies two supposita or Persons who spirate the Holy Spirit — which is true, since both are adjectives and equally dependent, terminated by the independence of a third, which is the Person — as we abundantly showed in the Tract. de Deo trino, *disp. 8, q. 3*.

Concerning substantial concretes or substantives, all affirm that their unity is to be derived from the unity of form or nature, even if many supposita participate in it — thus "there is one God," although there are three Persons participating in the same deity. Likewise "one creator," although there are three supposita having

the same power of creating. The reason can be: because, from what was said in the Epitome, *l. 1, q. 1, art. 6*, the substantive is something subsisting in nature and independent; hence its unity is aptly derived from the unity of form. But from what the plurality of concretes is to be derived is disputed among ancient and modern Scotists. For Bassolius, Bargius, Lychetus, and other eminent theologians — whom Vasquez follows in *1 part, distinct. 115, cap. 4* — hold that for the multiplication of substantial concretes a plurality of natures suffices without any multiplication of supposita, so that if the divine Word assumed several human natures, it would be several men by the plurality of them, with the unity of the suppositum of the divine Word itself remaining. This assertion is indeed deduced from the Doctor, who in *3 dist. 1, q. 3, §. Ad 1 argumentum*, investigating, on a given hypothesis that one Person assumed several human natures, whether that person would be one man or several — rejects others' opinions and twice refers the decision and response to this difficulty to *1 dist. 12, q. 1*, where he says that the numeral term placed upon some determinable places its significate upon it; and since if one divine suppositum assumed several natures, there would be a manifold determinable and manifold formal significate in accordance with the multiplicity of nature — therefore according to Scotus one assuming several human natures could be said to be several men. And if he were to assume a human and an angelic nature, he would be a man and also an angel. Whence St. Anselm in *lib. de Incarnatione Divini Verbi, cap. 5* adds: "when 'man' is uttered in common, it is signified" — and the reason is that for the unity of a substantive the unity of form suffices. Wherefore, since the substantive signifies form in the manner of something per se standing, it is evidently concluded that the dependence of the numeral adjective is terminated by the form of that same substantive. This can be corroborated from the same Scotus in *1 dist. 4, q. 1, B.*: "to every quo there corresponds its own quod" — that is, to every abstract there corresponds its own concrete, as to deity God, and to humanity man. Therefore if a divine Person assumes several humanities, in accordance with their plurality that Person would be several men — especially according to Scotus in the same place, *q. 1 at the end*: "The concrete does not import, concerning its per se significate, what 'having' is, but nature." With natures therefore multiplied, their concretes are multiplied — as among others Gadius notes in *Quol. 11*, following Scotus in *1 dist. 12, q. 1, to the end, §. Iuxta quaestionem istam*. Furthermore, even if it is certain from faith that the Word assumed a singular human nature, it is nevertheless said to have assumed a man, as Augustine not rarely writes, cited by the Doctor in the Reportata, *dist. 6, q. 3*. And certain Councils cited by us in the Tract. de Incarnatione confess this. Hence the Church sings: "Thou, about to take on man for his liberation, didst not shrink from the Virgin's womb." And not incongruously Arriaga, cited near the beginning of this article, observes about Christ as man certain true forms of speech which are not true of the divine suppositum — as "man died," but "the divine Word did not die"; and "man ate," "man consists of soul and body," and so on.

You will say, with Mastrius and Bellutus in *disp. 2, q. 6, art. 2, before the solution of objections*, that the concrete of substantial nature is not numbered or multiplied when natures are numbered and multiplied — because it is not ultimately independent, since it concerns the suppositum, by which its dependence is ultimately terminated. Against this: if from the ultimate termination of the substantial concrete its unity or plurality is to be derived, as those recent authors hold, it follows that at the multiplication of such ultimate termination and supposital independence the concrete and nature must be multiplied — and thus several divine Persons would be several gods, as Scotus argues in *3 dist. 1, q. 3, §. Ad 1*, against St. Thomas in *3 part, q. 3, art. 7, ad 2*. Again, in the opinion of these authors there would be no substantial concrete without ultimate termination by a suppositum; but a little earlier we clearly showed that such a concrete exists without supposital independence, as was established and corroborated there both by reason and by authority. And it can also be confirmed from what Scotus has in *1 dist. 12* cited, around AA.

On the opposite side, the more recent Scotists willingly and firmly maintain, among whom are Philippus Faber in *disp. 42, at the end of cap. 4*, Franciscus de Perugianis in *3 dist. 1, q. 3, art. 2*, and the two younger ones cited above, asserting that for the plurality of substantial concretes a plurality both of natures and of supposita is required.

Objection I. All the places of Scotus adduced at the beginning of this article, in which it is plainly read that for the multiplication of substantial concretes the multiplication of supposita is required. Bargius in *1 d. 12, q. 1, ad 3* most satisfactorily answers by interpreting those places not about substantial concretes but about accidental concretes — of which the Doctor himself subjoins examples there: about one having several sciences, about a father having several sons, about an artisan skilled in several arts, about a principle, and others of this kind, which are accidental concretes. You will insist: if the Doctor were speaking only about accidental concretes in those places, according to the interpretation of Bargius, it could be said that the Father is two principles, two producers — because he has two principles of producing, namely intellect and will; and that Christ is two willing things — because he has two wills, human and divine; two beings — because he has human and divine being; and similar things which Scotus rejects in the places mentioned. Therefore such an interpretation neither agrees with truth nor with the mind of Scotus. The sequel of the antecedent can be denied: for although in the Father there are two aforesaid principles, the Father cannot nevertheless be called two principles — but rightly "having two principles," which were shown above. This truth can be induced in similar cases: as in Christ there are indeed two natures in number, yet Christ is not two in number. And although Christ is man, yet he is not human nature in the direct case but in the oblique — that is, "having human nature." Similarly, matter and form are in the composite, but they are not called the composite. Likewise, soul and body are in man, yet man is not soul nor

body, but "having soul and body," as Scotus carefully notes in the *Reportata*, 3 q. 2, d. 6. And all the more, because since those principles proceed from nature as its powers and virtues, they cannot be said in the direct case of that nature — for what arises from another is not that from which it arises, just as effect cannot be the cause from which it proceeds. More about these things in their proper place.

Objection II. If from the unity of the formal significate the unity of the substantial concrete is derived — as from one deity one God, from one humanity one man, and from one spirating power one spirator — then with supposita multiplied, as is clear from what was said above: therefore since in the Father there are two formal significates, namely the principles of generating and of spirating, without doubt the Father will be called two principles — contrary to the Doctor cited and to other scholastics. Reply: I deny the consequence. For as the Doctor cited writes in *solution* 2: one thing can include in itself many accounts or principles of acting — as is clear of the rational soul having many powers and principles of operating. Thus the Father, although he is one suppositum, has nevertheless two principles of producing, yet he himself is not called two principles, as I was showing a little before. Or better, and more adapted to our Scotistic doctrine: principle is reckoned among accidental concretes or extraneous ones, for it is outside the substantial nature since it proceeds from it. Hence, since the multiplication of accidental concretes requires the multiplication of subjects or supposita, it does not properly follow that the Father, who is only one suppositum, is two principles. But that this is the mind of Scotus is clear from his writings — for he exemplifies there about one having several sciences, who is said to be one and not several knowing persons, which is clearly an accidental concrete.

Objection III. Against the rule of Scotus handed down about numeral terms: if the numeral term falling upon a substantive affects it and multiplies its formal significate — therefore "person," which is a substantive concrete name, through the numeral term has its formal significate multiplied; and thus, just as three divine Persons are said, three gods could be said — because divinity is their formal significate, which the Doctor objects to in 3 *dist.* 1, q. 3, §. *Ad* 1. Reply: the formal significate of "person" is not divinity but personality, which is multiplied in accordance with the multiplication of persons. Wherefore the adjective "divine" does not fall upon divinity; hence three persons cannot be called three gods. But it affects personality — and therefore in accordance with the number of three Persons, three divine Persons are numbered.

Article VII. Whether There are Analogs Distinct from Equivocals and Univocals

We presuppose that there are analogs from the common opinion of the philosophers — namely Aristotle in 4 *Met.* T. 2, in 7 of the same work, T. 14 and 15, and elsewhere; Scotus in q. 16 *Elench.*, and in 2 *dist.* 12, q. 2, §. *Ad* 1 *rationem sub* G., and in *Quol.* 3, §. *de* 1. B.; Richard in 1 *dist.* 25, q. 2, art. 2; St. Thomas in 1 p. q. 3,

art. 5; and St. Augustine in *c. 2 Categ.* The reason is that certain things have among themselves order, proportion, and attribution; hence they enjoy analogy, by which they are called analogs. For the word "analogy" means the same as proportion, according to Augustine in *1 Mus. 12*, or agreement or comparison, as Fuentes in *difficulty 2, art. 1* and Ruuius in the *Tract. de analogia* observe from Cicero and Quintilian. A threefold analogy is established: of proportion, of attribution, and of inequality. The analogy of proportion, mentioned by the Philosopher in *1 Eth. cap. 6* and *8 Met. cap. 4*, and touched on by the Doctor in *4 dist. 1, q. 10, §. Hic dicitur D.*, falls on things that have some similarity and agreement among themselves. By this analogy laughter is said of man and of a meadow — for just as when a man laughs he appears to be in good health and to be filled with joy, so when a meadow flourishes and blooms well, it is said to laugh. The analogy of attribution is that by which a common and superior account belongs essentially and intrinsically to its inferiors, yet with some of them depending on another. This Aristotle in *4 Met. cap. 2* calls "from one and toward one," as Fonseca notes there in *q. 1, sect. 6*; it is referred to by the Doctor in *1 d. 3, q. 3, §. Contra istam univocationem*, and in *d. 8, q. 3, §. Contra istam positionem*. It is called "from one or toward one" because in one the account formally exists, and in others dependently from that one — thus being is said analogically of substance and accident, because accident has being dependently from substance, from which it arises and in which it inheres. Or for another reason — as health is analogically predicated of animal, urine, medicine, and others. For health formally and intrinsically inheres in the animal, but not so in the others enumerated. According to this analogy, there is that well-worn maxim: "an analog placed per se stands for its more famous significate," which Scotus examines and exemplifies in *q. 16 Elench.* The analogy of inequality is that which belongs to many participating in the same name and same common account unequally. And this fits species having the same genus — thus "animal" is said to be an analog with respect to man and brute. This is mentioned by Aristotle in *7 Phys. cap. 4* and *10 Met. T. 13*, and is touched on by the Doctor in *1 dist. 8, q. 3, §. Ad argumenta E.*, and by others it is called *equivocatio physica* — according to that statement of the Philosopher cited: "in genera equivocations lie hidden" — which are plainly logical univocations, as his interpreters note there. Given therefore that analogs exist, it is rightly investigated whether analogs mediate between equivocals and univocals — as St. Thomas thinks in *5 Met. lect. 12* and *1 p. q. 13, art. 5*, Cajetan, Capreolus, and the whole family of the Thomists — or whether they are reduced to equivocals or univocals, as the Subtle Doctor holds in *q. 15 and 16 Elench.*, and in *1 dist. 3 and 8*, as cited by Orbellus in *4 Met. q. 1*; Mauritius in *q. 7 of the universals*; Sarnanus in the same place, *pag. 238*; Sirectus; Vallo in *Tract. formalitatum*; and the whole subtle school.

It is noted, first, from Scotus in *Theorem 9*, that concept is twofold: one formal, which is the cognition by which the intellect understands something — as one says "this is my concept or knowledge," as Vorrilong notes in *1 d. 3*; and another

objective, which is the thing known or the quiddity understood insofar as it moves or at least terminates the cognition of the intellect. In this sense Algazel says in his *Metaphysics*: "when the intellect is certain about one thing and doubtful about another, it has another concept distinct from that about which it is certain and from that about which it is doubtful" — as the Doctor shows in *1 dist. 3, q. 3*, on the univocation of being, where he proves that being designates a univocal concept prescinded from God and creature, substance and accident. Wherefore if the quiddity conceived is one thing common to many in thing and in name, there is one univocal concept; but if there are many diverse quiddities participating only the same name, the concept will be multiple and equivocal.

It is noted, second, that according to the Scotists — namely Canon in *1 Phys. q. 3*, Vallo in *Tract. formalitatum, fol. 71, 72*, and Sarnanus cited above — there are four degrees of univocation. The first is when something common belongs to many according to the same name, same account, same mode of being, same order, and same essential perfection. This degree of univocation is the most perfect and proper only to the most special species. Hence the Philosopher says in *7 Phys.*: "in the most special species is the most perfect comparison." The second is when something common belongs to many according to the same name, same account, same mode of being, and same essential order — yet not according to the same essential perfection — as "animal" with respect to man and brute: for man enjoys a more perfect degree of animality than brute. Hence through this diversity of degrees it is said in *7 Phys.* that "equivocations lie hidden in genus" — since one departs from perfect univocation on account of inequality of perfection, and one approaches equivocation. The third is when something common is accommodated to many enjoying the same name, same account, and mode of being, without order and equality of essential perfection — thus number is univocal to its species: three is more perfect than two, and two precedes three. Hence Aristotle adds in *8 Met.*: "the species of things are like numbers" — that is, one is more perfect than another. The fourth is when something common is adapted to many possessing the same name and same account, but lacking the same mode of being, order, and essential perfection — and this is the minimum univocation, according to which being is said to be univocal to substance and accident, as will be clear in *Metaphysics*. Now the instruction of Scotus in *q. 4 of the Prologue, §. Ad rationes pro opinione opposita, sub EE.*, is not to be passed over in silence: "when there are two opposite extremes, the more something recedes from one of the opposites, the more it approaches the other." Since equivocal and univocal seem to be opposites, and the univocal of the last degree is further from the univocal of the first degree than the univocals of the other degrees, it is therefore said to approach more closely to the equivocal. For this reason perhaps Porphyry in the *Isagoge, c. de specie*, and Scotus in *q. 15 Elench., §. Ad 1 rationem dicendum*, say that if anyone calls all beings univocal, he will name them equivocally and not univocally — insofar as

substance and accident agree only in the common account, character, and name of being, but lack the other things that make for perfect univocation.

It is noted, third, that analogs — whether of proportion or of attribution — can be considered in two ways. One way, insofar as the common account and name formally and intrinsically belong to all the analogated — even if some of them express an attribution and dependence on another — as substance and accident are said to be analogs to which the intrinsic and formal account of being belongs, even though accident depends on substance. And these are univocal analogs, because the dependence and attribution of one on another does not remove their univocation, which consists in the same name and common account of being which they indeed participate — as the Doctor clearly demonstrates in *4 dist. 12, q. 1, §. Ad q. respondeo H.* Another way, insofar as one of the analogated has some formal and intrinsic account signified by one and the same name, while for the rest it belongs only extrinsically and metaphorically — as laughter is properly attributed to man and improperly to the flowering meadow, as Scotus notes in *q. 15 Elench., toward the end.* And health belongs formally and intrinsically to the animal; but to urine, diet, and medicine it is attributed extrinsically, as the same Doctor clearly edits in *2 dist. 12, q. 2, §. Ad 1 rationem infra G.* and in *4 dist. 12, q. 1, before I.* And these are equivocal analogs — because under the same name they participate a diverse account, as is clear in the examples adduced. From these things those are refuted who place analogy as a medium between univocation and equivocation — such as the two recent authors in *disp. 2, q. 5, art. 3*, and Faber in *Theor. 95, at the end of cap. 1* — who, however, having considered the matter more prudently and maturely, in *4 Met. q. 1* denies that analogy mediates between those two, as I will prove below in the second assertion.

First Assertion: There are no analogs distinct from equivocals and univocals. So Scotus and all the Scotists cited above. Proof I: from Aristotle, who in *cap. 1 of the predicaments*, defining equivocals and univocals, makes no mention of analogs — which he would nevertheless have been bound to do, if analogs mediated between them; otherwise he would have been truncated and deficient. For he was there arranging all things placed in the predicaments and in distinct classes of things, and those things excluded from them. Wherefore since he neither here nor elsewhere has brought forth a peculiar definition of analogs, it is an open indication, says Scotus in *q. 15 Elench. versic. Alia est proprietas*, that they do not diverge from univocals and equivocals. Boethius, cited by the Doctor, is in our favor, saying that analogs are comprehended under the definition of equivocals — and this is indicated by Aristotle, who in declaring the definition of equivocals adduces the example of "man," which is equivocally predicated of the living man and the painted one, even though the name "man" is, according to the opponents, an analog with respect to them. The Complutenses at the end of *cap. 1 of the Categ.*, from St. Thomas and Cajetan cited by them, are in favor.

You will say with Arriaga in *disp. 10, sect. 3* and other Dialecticians that analogs are defined by Aristotle in *1 Eth. cap. 6 and 7, 4 Met. cap. 2*, and in *5 of the same work, cap. 6*: "analogues are those whose name is common but the account of substance signified by the name is neither entirely the same nor entirely diverse." But such a definition is contained neither explicitly nor implicitly in those places, as is clear to one reading the text of the Philosopher. I only find in *5 Met. T. 12* these words: "analogues are one, which are such that one has the same relation toward another." Which is to say: those things are analogues that preserve attribution or proportion and comparison to one another. But this is not to have the account of substance partly the same and partly diverse, as Arriaga wants analogues to have — but only similarity, proportion, or attribution, which is not the account of substance in any way the same and in any way diverse, but is only a relation having one accidental account distinct from any other, as I will show in the question on relation. Proof II: same and diverse are immediate from *10 Met. T. 12*. But univocals are the same with respect to name and account, while equivocals under the same name are diverse with respect to a diverse account, as is clear from their definition. Therefore everything is either equivocal or univocal, and consequently analogues are not to be interposed between them. Proof III: between intrinsic and extrinsic, proper and improper, no medium falls, as is clear of itself. But univocals have one proper and intrinsic account — as is clear of laughter, which is equivocally said of the laughter of man and of a meadow. For it properly belongs to man and improperly to a flowering meadow, and it is placed in the second mode of equivocation, as the Doctor notes in the place cited above, *verf. sicut ridere*. Again, the essences of things consist in the indivisible. Therefore every essence is either the same for many or diverse, and consequently the essence of the analogue is not divided so as to be partly the same and partly diverse. Finally, proportion, which is adapted to analogues of proportionality, is a relation founded in the unity of quality — just as the relation of equality is founded in the unity of quantity, from *Arist. 5 Met. cap. de relatione*. Attribution, which is the disposition of one toward another, is accommodated to analogues of attribution, and is likewise founded in the unity of its foundation. If therefore analogues participate the same intrinsic and formal account, they are univocals; but if only an extrinsic and improper one, they are equivocals — and accordingly all analogues are to be reduced either to univocals or to equivocals.

Second Assertion: Analogues — whether taken materially or formally — do not mediate between equivocals and univocals. So Scotus and all the Scotists, except the two recent ones cited above who assert that analogues taken formally are media between equivocals and univocals. Proof I: if analogues taken formally and distinct from equivocals and univocals were admitted, of them there would be a proper definition distinct from those of equivocals and univocals — because a distinct definition belongs to a nature distinct from others, distinctly expressed through it. But there is no distinct nature of analogues from the natures of

equivocals and univocals, because all analogs either have the same or diverse, either intrinsic or extrinsic account, as I clearly induced above. Therefore all analogs are to be inscribed among equivocals or univocals.

You will say that this reason holds for analogs taken materially, but not for those taken formally, because the unity of analogy formally differs from the unity of equivocation and univocation. Against this: univocal and equivocal are immediate, as those recent authors concede. Therefore their formal characters are also immediate — otherwise, given a middle character, a middle predicate between equivocals and univocals would be constituted through such a middle character — just as between white and black a medium is had through a middle quality, such as redness, "red" — which they openly reject. Therefore in no way falls a medium between them. Proof II: every medium according to the consensus of all is either through the negation of the extremes or through participation in them. But in neither way can analogs be media between equivocals and univocals — not through the negation of the extremes, but rather through participation in them, as is clear from the definition of analogs adduced and rejected by the opponents; and clearly the opposite is argued from what I adduced to prove the prior assertion. Therefore analogs even taken formally do not mediate between them. But the foundation and motive of the young authors is of no force at all. For they are founded in the doctrine of Scotus in *1 dist. 8, q. 3, §. Ad argumenta opinionis oppositae, sub E.*, writing that the unity of attribution is less than the unity of univocation and formally differs from it. From these words those authors deduce their opinion, asserting that analogs formally mediate between equivocals and univocals — because the formal character of analogy is formally other than the formal character of univocation, as the Doctor clearly teaches in that place now cited. But Scotus in no way favors them, if his words are read attentively and carefully weighed. First, he there wants the unity of attribution — which is called the unity of analogy — to stand together with the unity of univocation, because greater unity includes lesser, as the unity of species includes the unity of genus; for those that are one in species are one in genus. Therefore according to Scotus the unity of attribution or analogy is included in the unity of univocation, and it stands together with it, because lesser unity can stand together simultaneously with greater unity. But what stands together with another is not a medium of it — for the medium recedes from the extremes of which it is a medium. Furthermore, the included is not the medium of the including — as the account of animal, which is included in man, is not the medium of man — otherwise all superiors would be media of inferiors. Therefore since Scotus asserts that the unity of analogy is included in the unity of univocation, he plainly thinks that it is not the medium of the latter. Furthermore, the unity of attribution is transcendental according to Scotus, which is included in the unity of predicamental univocation; but the transcendental is not called the medium with respect to the predicamental. Add that attribution is a relation, as I noted

above, and the Doctor indicates there — and a relation and its unity is by no means considered a medium with respect to nature or concept, from which univocation is derived. Wherefore every unity of attribution or of name or of thing or of both is best reduced to univocation or equivocation; and accordingly there is no analog formally mediating between equivocals and univocals.

Objection I. Aristotle in *1 Eth. cap. 6* writes that the eye is an analog — for as the eye of the body is to the body, so the eye of the mind is to the mind. And in *2 Post. T. 23*: as the bone is in land animals, so the spine is in marine animals — in which the bone is seen to be an analog. Therefore analogs distinct from univocals and equivocals are to be admitted. Reply: granting the antecedent and denying the consequence, we allow analogs not at all diverging from equivocals or univocals. Now those analogs recounted by Aristotle are univocals: the eye of the body and the eye of the mind are univocated in one account of the principle of seeing, although they differ in their proper differences — one being corporeal and the other spiritual — in roughly the same way that body and spirit are univocated in the common account of substance, but are discriminated from one another by their proper differences. Likewise bone and spine agree in the common account of support, although they are distinguished from one another by their differences — the latter belonging to land beasts and the former to fish of the sea.

Objection II. The Philosopher in *4 Met. cap. 2, T. 2* affirms that being is an analog by analogy of attribution — called "from one and toward one nature," not equivocally, as health is said of animal, urine, and diet. Therefore if being, according to Aristotle, is not equivocal and not univocal, it follows that it is an analog distinct from them — because health, which he adduces as an example, is not said univocally of those things enumerated, as the Doctor affirms in *2 dist. 12, q. 2, §. Ad 1 rationem sub G.* and in *4 dist. 12, q. 1, before I.* The reason is that health formally is in the animal, in urine as in a sign, in diet as in a cause. And the same formal concept of health — as equality of humors, as signifying health, and as causing it — is not the same. Therefore health is predicated equivocally of them. Reply: Aristotle indeed holds that being is not equivocal, but he does not deny that it is univocal. In response to the example of "healthy," I confess it is an equivocal analog — which does not harm us, unless it likewise harms the opponents who deny that being is equivocal. Wherefore that is only adduced to clarify the disposition of being toward substance and accident, just as there is the disposition of health toward animal, urine, and diet — even though the latter is predicated equivocally of them and the former univocally. Similarity, however, does not hold in all things — otherwise it would be not similarity but identity, as Scotus notes in *4 cited above*.

You will say that Scotus in *q. 16 Elench., §. Propter hoc dicendum*, asserts that what is said analogically of the aforesaid things is to be reduced to the univocal, because it is only primarily signified of them — whereas he holds the opposite

in 2 and 4 cited above. Therefore either Scotus contradicts himself, or it must be conceded that analogs mediate between equivocals and univocals. I say that in that question of the Elenchi the Doctor expounds that maxim: "an analog placed per se stands for its more famous significate." Health, however, insofar as it is the principal analog, is equality or proportion of humors, which formally belongs to the animal — in which alone it is formally, as the Doctor intimates there in these words: "and such analogs are to be reduced to univocation, since they primarily signify only one thing. Thus the healthy analog is reduced to the univocal." But if health is taken as it belongs to all the analogated and comprehends the diverse concepts of health as significative and causative, it is certainly reduced to the equivocal, as the Doctor observes in 4 cited above. In this way the apparent contradiction of the Doctor is dissolved; and perhaps Faber, reproved by those recent authors for asserting that "healthy" is a univocal predicate, can be excused in this same way.

Objection III. The account of the analog is distinguished from the accounts of the univocal and equivocal. Therefore the analog likewise diverges from both. The antecedent is proved: the account of the analog is to signify one thing through a prior and another through a posterior, or the account of the analog is to signify several things having attribution or proportion to one another; whereas the univocal under one name precisely signifies one account, and the equivocal through one name simply signifies several things. Reply: I deny the antecedent. In response to its proof, I say that the account of the analog is to be reduced to equivocation or univocation — because even if in analogs there is some disposition, proportion, or attribution of one toward another, as is clear of being with respect to substance and accident, God and creature, yet that proportion or attribution does not remove univocation, as the Doctor rightly notes in the second place cited. But it only signifies that it recedes from perfect univocation, as is clear from what was said in the second remark.

Objection IV. St. Augustine in *l. Categ. cap. 4* and St. Damascene in his Logic affirm that denominatives are media between equivocals and univocals — and Scotus seems to favor them in *q. 13 Elench., §. Ad 1 ergo quaestionem*, where he enumerates analogs as distinct from the aforesaid two. Nor is Aristotle far from them, who after defining equivocals and univocals defines denominatives. Reply: denominatives are chiefly accidental concretes and are univocal predicates, as I showed in *art. 4 of this q.* They can however in some way be called media, insofar as they recede from the first and ultimate degree of univocation and approach some mode of equivocation, as is clear from the second remark. In this way perhaps the Fathers and Scotus cited above, and also Aristotle, can be expounded. It can be added that Scotus in that place indeed asserts that there are names which primarily signify something common that is found diversely in diverse things — as is clear of the health of animal, urine, and medicine; yet he does not remove those that are analogs from univocals or equivocals altogether. For he exemplifies there about continuous and discrete quantity,

from which it is clear that quantity taken generically is univocal. Or perhaps he speaks there in the opinion of others, as sometimes he does in that work, as I noted elsewhere.

Question III. On the Predicaments

Article I. Whether There is Something Univocal to the Predicaments

Scotus in *q. 3 of the predicamentals* asserts that there is something univocal to the predicaments — whom Tataretus in *ibid. q. 1, scibile 2*, Joannes de Magistris, and other disciples of Scotist doctrine follow.

It is to be noted that the question here is not whether some real univocal belongs to the predicaments — since to speculate about the common quiddities of things and to contemplate transcendentals pertains to Metaphysics, as I noted in *q. 1 of this book, art. 4*. Rather the difficulty is only whether some intentional element is given in which the predicaments are univocated — which pertains to Logic.

Assertion: Some intentional univocal is among the predicaments: namely predicament taken in common. So Scotus in the place cited, *§. Ad q. dicendum*. Proof I: something intentional is predicated of the predicaments according to the same name and same account. Therefore something intentional is univocal to them. The consequence holds; the antecedent is proved by the definition of univocals — for the individual predicaments agree in the common name and account of predicament, for substance is a predicament, quantity is a predicament, and so for the other supreme genera. Proof II: diversity in first-intention things does not prevent them from being conceived by the intellect through a univocal concept common to them — as, although man and lion differ from one another, they can nevertheless be conceived under the univocal concept of animal. But second intentions are attributed to things insofar as they are conceived by the intellect. Therefore since the predicaments agree under the common intentional concept which is predicament, it follows that predicament taken universally — as it is intentional — is univocal to the ten first genera.

Objection I. The predicaments are first genera, as all admit; but if something univocal were common to them, they would not be first genera — for that univocal would be prior to and more common than them. Therefore nothing univocal is common to them. Confirmation: given the univocal common to the predicaments, they themselves would be species, for they would agree in that common element as in a genus and differ from one another through their proper differences — whereas it is certain that they are primarily diverse, as the Doctor holds in *2 d. 3, q. 4, sub D*. But it is false that the predicaments are species, since they are supreme genera. Therefore it is also false that they agree in a common univocal concept. Granting the major, I deny the minor. For as Scotus says, that common intentional element is predicated of them not essentially but

denominatively — in roughly the same way that the universal taken precisely is said of genus, as is clear from *l. 2, q. 1, art. 11*. In response to the confirmation: the same is to be said, namely that the predicaments are species denominatively, not essentially — as is made explicit in the place now cited.

Objection II. The second intention proceeds from the thing. Therefore the unity of the intention is effected from the unity of the thing; but no thing belongs univocally to the predicaments. Therefore the second intention does not belong to them. Confirmation: no univocal is denominative; but the aforesaid intentional element would be predicated denominatively of the predicaments, as the Doctor says in *q. cited in the solution of the first and second*. Therefore, etc. The major is argued: because the univocal differs from the denominative, as is clear in the present book. Reply: the major is true occasionaliter, not effectiuè — for every second intention is made by the intellect and is founded in the thing, from which the intellect takes occasion to fabricate it, as Scotus says in *q. 3 of the universals*. In response to the confirmation: I say that the denominative is a univocal predicate, but is not predicated univocally — as I extensively showed in *art. 4 of the preceding q.*

Article II. How Many Predicaments There Are

A fierce quarrel once flourished among philosophers about the number of the predicaments, as the Coimbrans in *q. 2, art. 3* and Fuentes in *q. 13, diff. 1, art. 5* report — and it does not seem to have been settled yet, as Ferch. very recently strives to show in *vestig. 7*, in the places from Aristotle he cites. The decimal number of categories is indeed celebrated among nearly all the ancients, so much so that from what was reported at the beginning of this book, Herminus the Peripatetic always had the ten categories of Aristotle on his lips. Yet this number is even now scorned and reproved by some — especially by Arriaga in *disp. 3 Met. sect. 1* and Raconius in *Tract. 2 de categoria, q. 2, art. 2*, from whom Hurtado in *disp. 9 Met. sect. 2* is not far distant. We, however, with Scotus in *Quol. 11, §. de 4. ante K.* and in other places to be cited below, not departing from the common opinion of the philosophers, observe and recall from what was said in *q. 1 of this book, art. 2* for the firmness and stability of the aforesaid number: predicaments taken first-intentionally pertain to Metaphysics; taken second-intentionally they pertain to Logic. Their distinction, as the Doctor notes in *q. 11 of the predicamentals, §. Ad q. dicendum*, is derived from the essences of things placed in these ten classes, to remove the confusion of things and introduce their distinction — as Ferch. also notes in the place cited. Furthermore, I presuppose from what will be said in Metaphysics that real being — which has or can have being, setting aside the operation of the intellect, precisely taken, from Scotus in *1 d. 8, q. 3, N.* — is divided in its first division as into its modes into being quantitative and non-quantitative, finite and infinite. Finite being in its immediate partition descends to the ten predicaments as to its ten distinct modes, of which each obtains a constitutive character of one supreme genus;

and to these correspond diverse modes of predicating. Therefore they are called predicaments, as Scotus infers in *q. 15 Elench.*, before *§. Ad q.* And since according to Scotus in *1 d. 3, q. 3, §. Contra istam univocationem O.* and *d. 8, q. 3, N.* — whom Sirectus in *Tract. formalitatum*, fol. 12, pag. 1, Trombeta, and others there follow — being is not a genus (the reason for which Aristotle adduces in *4 Top. cap. 6, locus 72* and *3 Met. T. 10*): because genus must be a nature so limited that it can be prescinded from the differences by which it is contracted — but infinite and finite are not differences of being but modes to which being is determined, as will be abundantly shown in the place just cited.

Assertion: There are ten predicaments or ten supreme genera. This is defended by Aristotle both in this *cap. 4* and in *5 Met. T. 14*; by Scotus in *q. 11 of the predicamentals, §. Ad q., Quol. 11, art. 4, before K.*, and *4 d. 13, q. 1, §. Ad huius autem difficultatis intellectum sub C.*, and *8 Met. q. 5, 6*, and elsewhere; and by the other philosophers in general — whom it seems better to adhere to rather than contradict, lest the authority of the ancient philosophers be despised, for which reason Avicenna in *3 Met.* cited by the Doctor in the place cited in *4* says we are compelled to admit that celebrated division of the predicaments and to observe it. For one must speak with the many, and it does not seem safe to oppose oneself to the torrent of Doctors. And Ezekiel implies as much: "Where the impulse of the spirit was, there they went." Hence Maior rightly adds in *q. de proprio §. Sed illum modum*: "the common usage is to be imitated where no reason or authority presses in the opposite direction." And the same author at the end of the predicaments adds: "the authority of the philosophers is the principal reason for the decimal number of the predicaments." Now the proposed assertion can be argued I: by the reason of St. Augustine in *1 Categ. cap. 8*, who presupposing the first predicament of substance as well known to us, gathers the remaining predicaments of accidents thus: some accidents are within substance — such as quantity, quality, and position; some are outside substance — such as where, when, and habit; and others are partly within and partly outside substance — such as relation, action, and passion. Yet this reason does not demonstrate the aforesaid number of categories, since all accidents are outside substance, since they proceed from substance itself. Proof II: the reason of the Scotists is adduced — especially that of Franciscus de Mayronis in the present passage, *passage 8*: whatever exists is either substance or accident. If the first, the predicament of substance is had. If the second, it is either an absolute or a relative accident. If absolute, it either follows matter and is quantity, or follows form and is quality. If relative, it either comes intrinsically and is the category of relation, or comes extrinsically — and this either pertains to causality, or to measure, or to order. If to causality, either actively or passively — and thus two predicaments of action and passion are had. If to measure, either of permanent quantity and is the category of where, or of successive quantity and is when. If to order, either of parts and is position, or of the whole and is habit. But that reason is not convincing either, for it is not received by all — especially by those

who reject extrinsically coming relations, as will be clear below. Proof III: the reason of the Nominalists is adduced — among whom is Aureolus in *1 d. 30, propositio 6* — derived especially from Ockham in *1 p. of his Logic, cap. 41 and Quol. 5, q. 22* — based on the number of questions that can be asked about a first substance. For either we ask of the first substance what it is — and it is the first predicament; or how great it is — and it is the second predicament of quantity; or of what sort it is — and it is the predicament of quality; or to what it is referred — and it is the predicament of relation; or what it does — and it is the predicament of action; or what it suffers — and it is the predicament of passion; or where it is — and the category of where is had; or how it is situated — and it is the category of position; or how long it endures — and it is when; or how it is clothed — and it is habit. But we do not inquire of a first substance ten questions, as the Nominalists do — rather we seek the reason why there are only ten categories, which they by no means provide. Aristotle's reason in *cap. 4 of this work*, derived from the ten significations of things, is added: there are as many categories as there are categorically incomplex signifying beings; but such signifying beings are numbered as ten. Therefore ten categories too. The major seems clear. The minor is shown: they either signify substance, or quantity, or quality, or relation, or action, or passion, or place, or time, or position, or finally habit — all of which are comprehended in the decimal number. But this reason is not convincing either; for if from the multiple signification of incomplex beings ten categories are gathered, then since there are more than ten significant incomplex terms of things — as is clear in the *Epitome, l. 1, q. 1* — more than ten categories too should be enumerated. Furthermore, to signify is to represent something to the intellect through a name imposed at will, as I said in the place now cited, *q. 2, art. 1*. Therefore just as ten categories are signified at will, so they are at will referred to ten — and not because of any reason necessarily confirming the aforesaid number. Wherefore the decimal of predicaments is not demonstrated but probably argued and defended, as the Doctor intimates in the place cited.

You will say that Scotus in *q. 11 of the predicamentals, §. Ad q.*, affirms that Metaphysics can know this division with its reason why; but to know with its reason why is to demonstrate. Therefore such a division of the predicaments is confirmed by demonstration. I say that the Doctor speaks there doubtfully — hence he inserted the particle of doubt "perhaps." But he speaks assertively in the books of the Sentences in the places cited, in which he clearly asserts that the decimal distribution of the predicaments is to be retained on account of the authority of the ancient philosophers, and that one ought not easily contradict this.

Objection I. Being is one supreme thing under which all other things are contained. Therefore there is only one predicament or supreme genus having no genus above itself — especially in the opinion of Scotus who affirms that being is univocal to God and creature, substance and accident. Confirmation I:

what is said by superabundance belongs to one alone, according to Priscian; but being is said by superabundance, for it is most general and transcends all things. Therefore only one predicament of being is to be admitted. Confirmation II: every plurality is to be reduced to one, from *5 Top. locus 5*, which is prior to that multitude. Therefore if there are many genera, they are to be reduced to one most general genus prior to them — which is being alone. Reply: being is indeed transcendental, but is not a genus — because it is not divided into differences but into modes, as I noted above. And so I grant the antecedent and deny the consequence. For being can be univocal even though it is not a genus; and accordingly nothing against Scotus is concluded. In response to the first confirmation: I say the major is true not positively but negatively — for there can be many things first negatively, as are the ten predicaments. In response to the second confirmation: I say the predicaments are reduced to one prior to them in entity, causality, and perfection — namely to God, the principle and end of all things, as is read in *Apoc. 1*.

Objection II. Every being is either substance or accident — because it is either a being through itself and is substance, or is a being in another and is accident; but substance constitutes only one predicament. Therefore accident too makes only one other predicament, and consequently there are only two predicamental series — one of substance and another of accident. I deny the parity. For substance has only one mode of existing through itself and subsisting through itself, and therefore there is only one predicament of substance. But accident participates nine modes of inhering; hence there are nine predicaments of accident — which Arriaga, not attending to this, absurdly criticizes the aforesaid partition of categories.

Objection III. Being is divided into absolute and relative. Therefore just as one predicament of relatives is given, so another predicament of absolutes alone is to be conceded; and thus since quantity and quality are absolute beings, they do not make two distinct predicaments — especially because accidents with respect to their subject do not regard matter or form, as the reason of the Scotists for the ten predicaments does not suppose: but the composite, as I will show in *Physics*. Also there is the division into abstract and concrete. Therefore, just as quantity, which is abstract, constitutes one predicament, so too quantum, which is its concrete, will constitute another predicament — and what is said of quantity and quantum applies to quality and quale, and to the other abstracts and concretes. As for the addition that quantity follows matter and quality follows form, this is not to be understood of matter and form of the part — as is deduced in the argument — but of matter and form of the whole, which are not essentially distinct from the composite. Or perhaps because quantity is adapted only to material composites and quality to spiritual things, which are commonly called forms — hence in the enumeration of the predicaments it was said that quantity follows matter and quality follows form, even though in reality both quantity and quality inhere in the composite. In response to the other point: I

say that the division into concrete and abstract is a division of terms, not of predicaments — it comprehends being and all the rest contained under it. Hence abstract and concrete do not make peculiar categories. And more: because abstract and concrete do not differ essentially but only in mode of signifying, as I noted in the Epitome, *l. 1, q. 1, art. 6*. Hence they do not pertain to distinct categorical series, as Aristotle implies, who in this book in *cap. 14* writes about quantity and quality, and in *5 Met. cap. 13* about quantum and quale. And the Doctor and Maior clearly teach this in the solution of the arguments in the place cited and in Maior's response to the first. In response to the final point: I deny that accident is opposed to substance — it is rather disparate than opposite, unless opposition is taken broadly, for accident is the effect of the substance from which it proceeds.

Objection IV. That division of the predicaments is not immediate — for being is first divided into substance and accident, and also into uncreated and created, before it is divided into the ten categories. Again, some category is to be assigned in which the predicates of God reside. Moreover, every good division is bipartite. Therefore the decimal partition of the predicaments violates the laws of good division — indeed Arriaga, named above, proclaims it to be nearly guilty of seven mortal sins. Reply: it is immediate with respect to finite and created being, not with respect to being taken precisely — hence neither God nor his predicates are enclosed in any predicament, as will be proved in the following question. Although division is most often bipartite — especially if it is a genus into its differences — it nevertheless sometimes necessarily consists of many members, as is clear from the tripartite distribution of figures and of principles, from the fourfold division of elements, and from the soul being distributed into three species of soul; and in Sacred Scripture the law of God is divided into the ten precepts of the Decalogue. Wherefore the decimal of categories is not to be abhorred, despised, taken ill, or scorned — but by all to be embraced and celebrated.

Objection V. Non-beings, fictions, beings of reason, privations, and negations obtain a proper account of superior and inferior; for the intellect apprehends them under the character of conceiving not as singular but as universal — not as belonging to any of the genera enumerated above. Therefore they belong to some particular supremely general genus — which would be one predicament distinct from the others. And more, if one opposite is said in many ways, so too is the other, from *1 Top. cap. 12*. Therefore if accident, which is opposed to substance, is multiplied into nine supreme genera, substance too is divided into nine supreme genera, and consequently eighteen predicaments are to be enumerated. But these and similar things seem absurd. Therefore they are to be reduced to two predicaments rather than multiplying so many predicaments without pressing necessity and without a reason proving it. Granting the antecedent, I absolutely deny that there is one predicament of all relations — for above we divided relation into intrinsically coming, which makes the

predicament of relation, and extrinsically coming, which through six distinct modes that it has, constitutes the six last predicaments. Wherefore it is not surprising if absolute accident is separated into two genera, since it has a twofold mode through which a twofold predicament is constituted. As for the addition that quantity follows matter and quality follows form, this is not to be understood of matter and form of the part — as is deduced in the argument — but of matter and form of the whole, which are not essentially distinct from the composite. Or perhaps because quantity is adapted only to material composites and quality to spiritual things, which are commonly called forms — hence in the enumeration of the predicaments it was said that quantity follows matter and quality follows form, even though in reality both quantity and quality inhere in the composite. In response to the other point: I say that the division into concrete and abstract is a division of terms, not of predicaments — it comprehends being and all the rest contained under it. Hence abstract and concrete do not make peculiar categories. And more: because abstract and concrete do not differ essentially but only in mode of signifying, as I noted in the Epitome, *l. 1, q. 1, art. 6*. Hence they do not pertain to distinct categorical series, as Aristotle implies, who in this book in *cap. 14* writes about quantity and quality, and in *5 Met. cap. 13* about quantum and quale. And the Doctor and Maior clearly teach this in the solution of the arguments in the place cited and in Maior's response to the first. In response to the final point: I deny that accident is opposed to substance — it is rather disparate than opposite, unless opposition is taken broadly, for accident is the effect of the substance from which it proceeds.

In response to the objection about non-beings and beings of reason: all those are reduced to the predicaments in which they are founded and whose privations and negations they are — as the Philosopher writes in *2 de anima, T. 96*, where he reduces the non-visible to the visible and the non-odorous to the odorous. For to the same predicament belong a habit and its privation, body and its shadow. Not attending to this, Arriaga in the place cited holds it as inconvenient that opposites are placed in the same predicament — as sin and grace under the category of quality — whereas the philosophers unanimously place heat and cold and other contrary qualities in the said predicament of quality. Add that the Scotists teach that grace and sin are opposed only demeritoriè. And more: because metaphysically speaking, finite being, which is determined to the ten categories, is real being, as is clear from *Arist. 5 Met. T. 14* and from Scotus cited in *§. Ad q. dicendum* and *q. 25, §. Dicendum*; in which latter place he seems to reduce all intentional things or beings of reason to the real genus in which they are founded — and Lychetus indicates this in *Quol. 13, at the end*. And we noted above that there are Scotists who devise an eleventh predicament of beings of reason — as can be seen in Vallo in *Tract. formalitatum, fol. 48*, Zerbius in *Met. q. 8*, and other more recent authors; whom Scotus favors in *q. 11 of the predicamentals*, who under a form of doubt leaves this difficulty

unresolved, not dissolving the reason he had adduced for the affirmative side. This can be satisfied by saying that in Logic Scotus seems to be vacillating about this; but in Metaphysics and Theology in the places cited he clearly opens his mind and freely sets forth his opinion — which does not diverge from the common view.

Article III: Whether the Categories Differ from One Another Really

Brulifer, in his *Epitome of the Formalities*, reports that philosophers are divided into three groups on this question. Some — among them Paul of Venice (*3 Met. cap. 3*) and Augustine Suiseth (*4 Met. quaest. 4*), with whom agree Tataretus (*quaest. 1 praedicam. dub. 2*), Mastrius and Bellutus (*disp. 6. quaest. 2*), and Faber (*Theor. 41. in fine cap. 2*) — hold that the categories differ from one another really. Others — such as Doctor Scotus (*cap. de quantitate quaest. 1*), Toledo (*quaest. 5*), Suárez (*disp. 39. Met. Sect. 2. numer. 21*), and all the Thomists — hold that a distinction of reason as reasoned (*distinctio rationis ratiocinatae*) suffices to distinguish the categories. Sirectus, however (*Tract. formalitatum fol. 20*), Trombetta, Orbellus (*5 Met. cap. 7*), and all the Formalists, with whom agree John of Ghent (*3 phys. quaest. 5. ad 6*) and Fonseca (*5 Met. cap. 7. quaest. 3. sect. 3*), hold that the categories must differ from one another at least formally.

As presuppositions, we must recall what I wrote in the preceding book (*quaest. 1. art. 16*) concerning distinction and its threefold number as taught by the Scotists, as well as the distinction between categories taken in first intention and categories taken in second intention. For the present question is not raised about categories taken in second intention — since, as Scotus teaches (*quaest. 11. praedicam. §. Ad q. dicendum*), these differ by reason, being formally beings of reason — but about categories taken in first intention, which are real beings, and whose study properly belongs to metaphysics.

Assertion: Some categories differ from one another really, others formally; none differ by reason alone. This assertion is threefold and conforms to the teaching of Scotus, as is clear from the passages of his to be cited below. The first part derives from the same Doctor (*2. dist. 12. quaest. 1. and dist. 16. q. un. and 4. dist. 12. quaest. 2*), who distinguishes quantity and quality really from substance, which is their subject: finite substance, in which accidents inhere, quantity, and quality are three categories. Again, from the same Doctor (*2. dist. 2. quaest. 6. §. Ad q. igitur. G. and Quol. 11*): a body can by divine power exist without any place — the same being said of time, situation, and habit. Add the predicamental relation, which really differs from its foundation according to the same Doctor (*2. d. 1. quaest. 4. §. Contra istam opinionem. 1. and 3. dist. 1. quaest. 1. art. 3. R.*). Thus, according to Scotus, nearly all the categories differ really. This is confirmed first by the following: between substance and accident there exists a real distinction, as between a cause and its effect a real distinction obtains, from (*2. dist. 12. quaest. 1. ante §. Est igitur videndum sub A.*); but the first category is substance, and the rest are accidents, which proceed from substance itself as effects from their

cause; therefore nearly all the categories are really separated from one another. Second: things that can be separated from one another really differ, for real separation of certain things is a clear sign of their real distinction; but some categories can be separated from one another — for instance, substance, which according to Aristotle (*7 Met. T. 4*) is prior to accident in nature, definition, cognition, and time, and which in the divine can subsist of itself without any accident. Therefore, and so on.

The second part is derived from Scotus (*2. d. 1. q. 5. §. Ad argumenta principalia P.*), whom Orbellus also cites (*5 Met. c. 7*). And more clearly in the *Reportata* (*2. d. 1. q. 6. in solutione argumentorum*), where these words are found: "As for the other point, where it is said that the categories are primarily diverse, one may say that this is true with respect to formal quidditative ratios, and then it could be maintained that diverse categories can be the same really but not formally." The Formalists cited above confirm this very point. I have adduced these texts because of certain of our younger contemporaries who, when appealing to them, say that Scotus does not accept that response but gives another. Yet even if the Doctor there resolves in another way the argument proposed concerning the relation of a creature to God — which is transcendental and thus placed in no category — he nonetheless genuinely approves the formal distinction among the categories, as is clear from his words just cited. Hence the Formalists in the passage cited, while expounding the Themistian dictum that "the categories are unmixed," say this is to be understood formally, that is, that the essences of the categories are formally distinct. This is confirmed first from Aristotle (*c. de qualitate, in fine*), who affirms that it is not absurd for the same thing, under distinct formal ratios, to be placed in diverse categories. If you respond, with the recent authors cited, that Aristotle is speaking not in his own opinion but in that of others: against this, because Aristotle satisfies the objection of others with a twofold response, and his second response is that the same thing, under diverse formal ratios, can pertain to diverse categories — which he had made clear in the case of science, which is placed in the category of quality insofar as it is a habit, and in the category of relation insofar as it regards its knowable object. For another, more explicit example, take figure: which, according to the formal ratio of quantity, resides in the category of quantity, and according to the formal ratio of quality, is placed in the category of quality, as will be more evident elsewhere. Furthermore, from (*3 phys. T. 19*), action and passion differ not really but formally. The recent authors respond to this, with Scotus (*4 D. 13. q. 1. §. Ad huius autem difficultatis K.*), that the Philosopher in that passage is speaking of action as enacted, that is, of the term produced by the action, and not of the action that pertains to the category of action. But although the Doctor responds in one way in that manner, he also satisfies it in another way in the same place by interpreting Aristotle under L, with these words: "In another way this is taken, not as determining something prior, and then it is the same as this respect from which — and in this way it can be conceded to pertain to the genus of action;

but in this way it is not motion, which is in the patient, except only terminatively — and this suffices to save Aristotle's words. For Aristotle wants action and passion to be the same, as the road from Athens to Thebes and conversely — understand, not that one road is there understood in terms of the magnitude over which the motion occurs, but in terms of the very motion from here to there and conversely; as is evident from the other example he gave of the distance from here to there and from there to here over the same space: where he maintains that these are materially the same on account of the identity of the space, but formally other. So here the motion is that by which the agent is said to act through a respect from this — understanding by 'from this' the respect from which. In the mobile there is likewise founded, conversely, a respect toward the agent. And these two respects have something the same materially, namely the motion; but formally they are other, and in other subjects." Hence Bonetus adds that it is difficult to demonstrate a real distinction between action and passion, because it seems to many that one reality suffices. Sirectus (*Tract. form. fol. 4*) and Vallo (*ibid. fol. 11*) say the same, which is supported by what the Doctor writes (*Quol. 13*), cited by Vallo in the same place: motion, which is flowing form, can be numerically the same as action and passion — as action insofar as it is from the agent, and as passion insofar as it is in the patient. Second, it is proven that things which are inseparable and have distinct formal definitions are formally distinguished, as is clear from the definition of formal distinction cited in the last article of question I of book II; but action and passion are inseparable, since from Aristotle already cited they are really identified, and yet they have distinct definitions, as is clear from Gilbert of Poitiers (*l. sex principiorum*). Therefore some categories differ formally. The third part is derived and proven from Scotus (*quaest. 11. praedicamentali §. Ad q.*), who says the distinction of the ten categories is derived from the essences of things; but the essences of things do not differ by reason, since they exist apart from any operation of the intellect; therefore the categories do not disagree with one another by reason alone. Third: between thing and thing, or between reality and reality, or quiddity and quiddity, no distinction of reason obtains, as our authors teach (*Tract. formalitatum*) from Scotus (*2. dist. 1. quaest. 5*); but some categories are things and things, such as substance, quantity, and quality; and some are realities and realities, or quiddities and formalities, such as action and passion. Therefore no distinction of reason intervenes among them. This same point is corroborated by all the authorities and arguments adduced in proof of the two preceding parts.

You will object first, with the recently named young authors, that Scotus (*2. dist. 3. quaest. 4. §. Contra istam conclusionem. D. and 5. Met. q. 6*) posits a real distinction among the categories, and this can be proven from the same passage: nothing can be under diverse disparate species, because nothing can have a double essence. Therefore something cannot be in a double category. Moreover, things that differ numerically differ really. But things of diverse categories differ

numerically, because according to the antepredicamental canon, of diverse genera there are diverse differences, species, and individuals. Therefore a real distinction obtains among the categories. I respond that Scotus in those places does not recall the real distinction of all the categories, as is evident to one reading his text. In response to the argument drawn from the same passage, I say that the same thing, under distinct formal ratios, can pertain to diverse categories, as is clear from what has been said above — to which may be added another passage of the Doctor in the fourth text cited, (§. *Ad huius autem C.*): "It is necessary to say that the respects have sufficient formal ratios — sufficient, I say, for the distinction of genera." Nor is it correctly inferred that one thing has several essences, but only several formalities. Hence in the divine there is but one essence, while in the school of the Subtle Doctor there are many things formally distinct — such as attributes, relations of origin, and the like — as I taught at length (*Tract. de Deo uno disp. 3. art. 2*). In response to the other argument, I distinguish: things that differ numerically and can be separated from one another are really distinct, I grant; but things that differ numerically and cannot be separated from one another are really distinct, I deny.

You will object second: being and thing are identified; for they are among the transcendentals, which are really the same and are convertible; but being is divided into ten categories as into real and distinct beings; therefore, so too are ten things — and among things and things, there is a real distinction according to Scotus. Therefore a real distinction obtains among the ten categories. Setting aside the threefold sense of "thing" that Scotus gives (*Quol. 3. §. De 1. A.*), I grant the major; I distinguish the minor: if it is understood as a real distinction with respect to all the categories, I deny it; with respect to some, I grant it, as I made plain above. In response to the subsumption, I say: if "thing" is taken for substance or for absolute being, I grant universally; if it is taken for a mode and circumstance of a thing, it is not always true — especially regarding action and passion, and many others to be named and explained in their proper place.

You will object third: the categories are the highest genera and primarily diverse, from Aristotle (*8 Met. c. ult. T. 16*) and Scotus (*2. dist. 3. quaest. 4. sub D. vers. Ex tertia via*); but things that are primarily diverse agree in nothing, and things that agree in nothing differ really. Therefore all the categories are really distinguished. I respond with Scotus (*in Reportatis 2. dist. 1. quaest. 6*) by distinguishing the major: the categories are primarily diverse in a predicamental ratio, I grant; in a transcendental ratio, I deny: for what is common to them univocally is being, which is transcendent; but they share no common genus, as the Doctor writes (*1. dist. 3. q. 3*).

Article IV: What Is Placed in or Excluded from the Categories

On many things doubt may arise — most especially concerning beings per se and beings per accidens, concerning equivocal and univocal beings, finite and

infinite beings, complex and incomplex beings, complete and incomplete beings, composed beings and their parts, and individuals.

The three predicamental orders — direct, indirect, and reductive — already introduced and explained in the *Epitome* (*lib. 1. quaest. 4. art. 2*) should be recalled.

First Assertion: Beings per se are placed in the categories; beings per accidens are not. This is taught by Scotus (*quaest. 2. primi peri §. Ad partem oppositam, and 3. dist. 22. q. un. §. Contra ista. B.*). Proven first from Aristotle (*5. Met. cap. 7. T. 14*), who includes only being per se in a category; and (*6 Met. T. 4*) he excludes beings per accidens from metaphysics. Second: the categories are natural coordinations of distinct things, by way of essential predications of superiors about inferiors — which is what beings per se are; but beings per accidens, since they signify several things on an equal footing, such as "the musical Coriscus" or "white Socrates," cannot be predicated essentially and subjected. Therefore beings per se are placed in the categories and beings per accidens are excluded from them, as Scotus also implies (*2. dist. 3. quaest. 4. ante F.*).

Second Assertion: Only univocal things have a place in the categories. Proven first from Aristotle and Scotus, who in the Antepredicaments separate univocals from equivocals — thus indicating to us that univocals are included in the categories and equivocals excluded from them, as their commentators note in that place. And (*5 Met. T. 14*) they divide real finite being into ten categories, which according to Scotus is univocal. Second: a category is the coordination of a highest genus, intermediate terms, and lowest terms essentially subordinated; but this belongs only to univocals, which share a common essence; equivocal things differ in essence. Therefore only univocal things are placed in the categories.

Third Assertion: Only finite beings have a place in the categories. Scotus holds this (*1. dist. 3. quaest. 3. §. Ad q. H. and dist. 8. quaest. 3. §. Teneo opinionem meam. N.*), asserting that finite being is distributed into ten genera, and there excluding God, who is infinite being. Proven: the categories, by common consent, are genera; but genera are potential, being contracted and actuated by their differences, as established in the question on genus in the preceding book; but infinite being is most actual and supremely necessary. Therefore only finite beings reside in the categories. More on this below.

Fourth Assertion: Not complex, but incomplex things occupy a place in the categories. This is derived from Scotus (*quaest. 12. universalium, and quaest. 21. ad finem*). Proven first from Aristotle in this place, who, in presenting the division of being into incomplex and complex, sets aside the complex and takes the incomplex, distributing it into ten categories. Second: things placed in categories are predicable and subjectable, as is clear from the description of a category; but only incomplex things are such — having the nature of a

universal, which is one thing predicable of many; whereas complex things have many ratios and many essences, and one cannot be essentially predicated of another, as is evident. Moreover, complex things are fashioned by the intellect, whose function is to compose or divide; but categories taken metaphysically are series of things that in no way depend on the intellect. Therefore only incomplex things are placed in the categories.

You will say: "rational animal" is complex, yet it is placed in the category of substance; and Porphyry (*c. de specie*) takes "animated body" as a genus of the living and "rational animal" as another genus, under which he considered both man and angel to be comprehended. Therefore complex things should not be rejected from the categories. This is supported from the Philosopher (*1 de anima cap. 1. T. 6*), who affirms that definitions of things are to be drawn from the categories. I reply: only those things that are complex according to reality are excluded from the categories; but "rational animal," "animated body," and other definitions are complex only in expression, and coincide with their defined terms or species, as the Doctor recently cited notes. Therefore they are not removed from the categories.

Fifth Assertion: Complete and composite things — whether simply, as individuals of atomic species that cannot enter into the per se composition of another being; or in a qualified sense, as genera and species that enter into the composition of another per se being although complete in themselves — are placed in the predicamental series. Proven first from Porphyry (*c. de specie*), who constructed the predicamental tree, placing genera and species in its direct line — a coordination from which Aristotle does not depart (*in this book, and 5 Met. cap. 7, and elsewhere frequently*); nor is Scotus averse to it (*2. dist. 3. quaest. 3. §. Contra illud sub A. and quaest. 4. §. Contra istam conclusionem D. and E. and 3. dist. 22. q. un. §. Contra ista. B.*). Second: in the direct categorical order, one proceeds from the highest genus as head and apex, through subaltern genera, intermediate and lowest species, all the way to the individuals of that same coordination as its base and foundation; but genera and species are natures complete in a qualified sense, and individuals are natures perfect and simply complete, as I noted above. Therefore, and so on. Third: the first genus is predicated per se and essentially of each predicate within its natural coordination, and the individual is the receptive subject of every predicable within the same coordination; but those of which the highest genus is so predicated are the intermediate genera and species and individuals, which are composed and perfect natures. Therefore, and so on. Hence from the direct predicamental line are removed the metaphysical parts — that is, the differences — which are admitted at the side of the category, as Aristotle implies (*6 Top. cap. 3. and 5 Met. T. 10*). For genus is not predicated formally of them, nor are they predicated formally and in the manner of a whole, since they are primarily diverse and therefore agree in no essential predicate, as is clear from (*lib. 2. quaest. 5. art. 3*). Porphyry makes this plain in the place cited, with the

example of the differences of the category of substance, which he placed at the side.

You will say, with Ammonius (*c. de substantia*), whom Hurtado follows (*disp. 9. Met. sect. 3. §. 30. 31*): genera are equally simple and incomplete as differences. But genera are directly in the category; therefore so too are differences. The major is proven because genera are incomplete beings and parts of species, just as differences are. The case for both is therefore the same. Also, species are placed per se and directly in the categories; therefore so too are differences, since the species is composed from the difference. Moreover, this is a direct predication: "Peter is rational," just as "Peter is animal" — therefore differences are not excluded from the direct order of the category.

I reply: it is not for this reason but for another, shown by us above, that differences are admitted only at the side of the category — namely, because differences do not formally contain superior predicates, nor are they predicated of inferiors in the manner of a whole; and therefore they are rightly excluded from the direct predicamental line. By this reasoning, the other arguments of Hurtado are also dissolved: for species formally includes superiors and is essentially predicated of inferiors in the manner of a whole. In response to the other point: I say both are direct predications, since they are in the first mode of saying per se, and "animal" and "rational" are essential parts of man and his individuals; but from this it is not well inferred that differences are directly in the category — otherwise passions would also be directly in the category, because "man is risible" is a per se and direct predication. I affirm the same, with Scotus (*quaest. 15. praedicam. and 3. dist. 22. q. un. §. Contra ista sub A.*), concerning physical essential parts such as matter and form — which Aristotle explicitly holds of the soul (*2 de anima cap. 1*) — and concerning integral parts such as head, hand, and others, which are called dissimilar and heterogeneous parts, which are not predicated in the direct order of the composites made from them: thus "Peter is matter" or "Peter is form" does not hold, nor "Peter is a head" or "Peter is a hand." Moreover, these are parts of a complete substance, and it is the settled doctrine of philosophers that parts are reduced to the whole of which they are parts. Therefore the said parts are said to be in a category only reductively — and this, beyond what others transmit, is held by Lychetus (*1. dist. 8. quaest. 2. propè finem. §. Ad argumenta pro 2. opinione*) after Aristotle (*7 Met. T. 56*). But concerning homogeneous or similar parts, it does not seem that the case is the same, as Fuentes says (*quaest. 13. diff. 2. art. 5. numer. 23*), against Rubius (*cap. 4. de complexis quaest. 1. num. 12*) and Suárez (*disp. 34. Met. sect. 8*): for, as the Doctor holds in the third passage cited under B, all those things are per se in a genus which include a quiddity or which are themselves the quiddity; but homogeneous parts include the quiddity — that is, the quidditative and essential predicates of superiors — as is evident of a part of water, which, separated from a whole quantity of water, is plainly complete water, and everything that belongs

essentially to water in general also belongs to it. Therefore homogeneous parts are not to be excluded from the direct predicamental order.

You will say: any parts whatever, being parts, have an incomplete being by reason of the whole, because they are ordered to constituting the whole, which is made up of incompletions. Therefore homogeneous parts are not placed per se in the category, but only in relation to the whole, like physical and metaphysical parts. I reply: such things are called parts not per se and subjectively — that is, by reason of some superior under which they fall, so that as such they would be something complete and their entire essence would be predicated of them, as I was just saying — but per accidens and by way of division.

Sixth Assertion: Individuals are per se and directly in the category. So Scotus in the passages cited above, and (2. d. 2. citato D. E.). And from the same passage this can be shown as follows: what does not include any quiddity within a genus, nor does any quiddity within the genus include it, is in the genus neither per se nor per accidens; but the individual includes all quiddities — that is, all superior predicates — and all of them are essentially predicated of it, as "a plant is a living thing, a body, and a substance." Therefore the individual is per se in the genus — indeed it is the base and foundation of the entire predicamental edifice. Again: just as the first predicate or first genus is not removed from the direct catalogue of the category, so the lowest subject of each predicable — which is the individual — is not to be expelled from the predicamental series.

You will say: in a category, predicables reside — as the very name "category" implies; but the individual is not a predicable, but a subjectable. Therefore the individual is not per se placed in the genus. All the more so because Porphyry, treating of predicables in his *Isagoge*, presents the category of substance but makes no mention of the individual. Therefore, and so on. In a genus, not only predicables but also subjectable things are placed per se. In response to Porphyry: I say that he treats of universals and essential predicates, not of particulars and material ones; and that is why he says nothing of individuals.

Article V: Whether Concreta or Abstracta Are Placed in the Categories

Since there is a twofold concrete, as Scotus explains (*quaest. 16. Ad 1. and quaest. 2. art. 5. of this book*) — one concrete by concretion to the supposit, which is the substantial concrete; and another concrete by concretion to the subject, which is the accidental concrete — and since to this twofold concrete there corresponds a twofold abstract, substantial and accidental, the question now arises: whether substances and accidents are placed per se in the categories under concrete names or rather under abstract names.

First Assertion: The concreta of substance, not its abstracta, are placed in the category. This is derived from Scotus (*quaest. 16. universalium, and quaest. 11. praedicam., and also 1. dist. 5. quaest. 1.*), Lychetus, and other Scotists in the same place. Proven first from Porphyry (*c. de specie*), who arranged the category of substance under concrete names, as is clear to one examining the text. Second: from Aristotle (*c. de substantia*), who, in affirming that second substances are predicated of firsts, gives examples of concreta, such as "man," "animal," "some man." Third: in the category of substance, genera and species are placed per se; but substantial abstracta cannot be genera and species, because they are not formally predicated of anything — since they prescind from inferiors; and hence the predication of one substantial abstract of another is not valid, as in "humanity is animality." Therefore only the concreta of substance are ascribed to the category.

Second Assertion: The abstracta of accidents, not their concreta, reside in the categories. Scotus holds this (*quaest. 15. univers. §. Vel aliter*), with whom agrees Sarnanus in the same place; Scotus proves it from (*3 Top. cap. 1*), where Aristotle writes that justice is in the genus, not the just — and justice is the abstract of the accident, while the just is its concrete. Therefore the abstracta of accidents are placed per se in the categories. The Doctor also teaches this (*quaest. 11. praedicamentali §. Ad q.*). Moreover: those things that are placed per se in the categories are so disposed that superiors are formally and essentially predicated of inferiors, as the description of a category indicates; but the predications of abstracta of accidents about non-ultimate abstracta are true and formal — as "whiteness is a quality." Therefore the abstracta of accidents are placed in the categories.

You will object first: Scotus, in the third text cited by us more than once under B, writes that man or humanity is per se in the genus; but "man" is a concrete name and "humanity" is its substantial abstract. Therefore both the concrete and the substantial abstract are per se in the category of substance. It follows from the same reasoning that since the accident is placed in the abstract, so too should substance be placed in the abstract in the same category. The major of this consequence is proven: just as the mode of inhering belongs to an accident, so the mode of subsisting per se belongs to a substance. Therefore the case for both is the same. I respond: concrete and abstract differ only in mode of signifying, a difference which, while it prevents predication of one of the other, does not suffice to distinguish genera or to place something in diverse categories. Wherefore the substantial concrete and abstract are in the same category — with this distinction, however, that the concrete is directly in the genus, and its abstract is there only reductively. This response is drawn from the Doctor (*quaest. 11. praedicam. in solutione tertii. verf. Ad aliud de concretis*). In response to the consequence, I deny the major; in response to its proof, I say there is a disparity: for substance signifies only one thing — that which subsists per se — while accident presents two: one formal, which is the accidental form, and another

material, which is the subject of that accidental form. The result is that substance is ordered in the category under a concrete name, and accident under an abstract name.

You will object second: Aristotle in the *Categories* names and places accidents in the concrete, such as "quantum," "quale," and the like, according to Boethius's translation, and this he explicitly affirms (*1 Top. cap. 7, and 4 of the same work cap. 1, and 5 Met. cap. 13. 14*) and elsewhere. Therefore in Aristotle's book accidents are subscribed to the categories under concrete names. It follows from the Doctor (*quaest. 15. universalium. §. Vel aliter, and quaest. 11. praedicam.*) — who acknowledges that the concreta of accidents are in the genus, because they do not constitute genera distinct from their abstracta, and they bear toward one another the relation of superiors and inferiors, just as their abstracta do — that therefore not the abstracta alone of accidents occupy places in the categories. I respond, passing over the responses of others: when Aristotle sometimes admits accidents under concrete names into the categories, he did so to indicate to us that accidental abstracta do not constitute categories diverse from their concreta, but that both reside in the same categories — with this difference, that abstracta are per se and concreta only reductively placed in those same categories. So Scotus responds (*quaest. 15. univers.*) with these words: "But speaking simply, they are not in the genus except by reduction, because they are not in a category except because the coordination of concreta is reduced to the coordination of abstracta." He says nearly the same in (*quaest. 11. praedicamentali*) in the passage cited. By this, the confirmation drawn from the same Doctor is also answered. I have deliberately adduced these texts because of Mastrius and Bellutus, who, following not Scotus but Rubius (*quaest. 2. de complexis*), assert that both accidental abstracta and their concreta are placed directly in the categories, as is clear from their (*disp. 6. quaest. 3. artic. 2*).

You will object third: parts are rejected from the direct predicamental line, as was established in the preceding article; but accidental abstracta are parts of accidental concreta, since accidental concreta are composed of accidental forms and the proper modes of natural inhering in subjects. Therefore accidental abstracta are not placed per se in the categories. Granting the major, the minor is to be denied: for accidental abstracta are natures perfect and complete in their essential being, and are generic, specific, or individual natures, of which — provided they are not ultimately abstracted — formal and essential propositions are formed, such as "whiteness is a quality," "surface is a quality," and the like; although by reason of their weakness they need subjects as their supports.

Article VI: Whether Something Can Be Placed in Diverse Categories

Many, among them Mastrius and Bellutus (*disp. 6. quaest. 2. q. 4*) and Poncius (*disp. 11. quaest. 2*), deny that the same thing can pertain to diverse categories even under diverse ratios. Against them stand Aversa, cited by them, Arriaga (*disp. 12. sect. 9. numer. 47*), and others who follow our Formalists cited in (*art. 3. of*

this q.) and Bacon (*1. dist. 28. quaest. 2. art. 2. and 4*), holding that the same thing, under distinct formal ratios, can reside in distinct categories. Add Boethius (*in c. de ad aliquid*), whose actual words Bacon cites in the place just referred to; and Simplicius, Albertus, and Orbellus (*5 Met. cap. 7*) are in agreement.

Note from Scotus (*quaest. 10. praedicam.*) after Aristotle (*5 Met. T. 7*): one thing is distributed as one per se and one per accidens. One per se is that which has one per se concept — and this is fourfold according to the same Philosopher in the same place, namely: one in genus, in species, in number, and in proportion. One per accidens is called that which has several concepts, either expressed under one name — as "science," which as designating an absolute is in the category of quality, while as denoting the relation of the measurable to the measure it is in the category of relation — or signified by several names equally and immediately, as "white musician"; or one thing is signified per se and another connoted, as "white," which formally signifies whiteness and materially the subject in which whiteness inheres. More on this: Orbellus (*in Met. loco praeallegato*), Perbaltus (*verbo modus intrinsecus §. 7*), and Tataretus (*ibid.*).

First Assertion: Something that is one per accidens is placed in distinct categories according to its distinct significations. So Scotus (*quaest. praedicam. allegata, verf. Ad 1. istorum potest dici, and 4. dist. 12. quaest. 1. §. Ad q. respondeo. D.*). Proven: categories, as established, are classes of distinct things; but something that is one per accidens signifies several concepts or several things or formalities, as is clear from the note just given. Therefore, in accordance with the distinction of things or objective concepts, distinct categories are to be assigned to them — categories in which such things are disposed and ordered. The same is to be asserted of something one and the same by proportion, as the Doctor holds in the same place (*§. Ad q.*). Proven: such unity and identity of proportion consists in being similarly related — as animal to color; for just as color is related to whiteness, so animal is related to man, that is, just as color is the genus with respect to whiteness, so animal is the genus with respect to man. But it is clear that color and animal belong to distinct categories: animal resides in the category of substance, color in the category of quality. Therefore things that are one and the same by proportion are placed in diverse categories.

Second Assertion: One and the same thing per se is not admitted into diverse categories; but nothing prevents the same thing, under diverse formal ratios, from being placed in distinct categories. This assertion is twofold. The first part is defended by the Doctor in that very passage cited, (*vers. Idem specie vel genere*), and (*quaest. 15. univers. §. Ad 1. arg. verf. Aliter licet*). Proven first from the Philosopher, cited by Scotus in the question cited: things that differ in a prior differ in a posterior; therefore things that differ in genus differ in species and number; and accordingly one and the same thing per se cannot be in diverse most general genera. Second: of diverse genera not placed in subordinate order, there are diverse differences, species, and individuals, as Aristotle teaches in this

place; therefore something one per se — which is one in genus, species, or number — cannot hold its place in distinct categories. For the genus belongs to the essence of the species; therefore if the same thing in species or lower genus were in diverse higher genera, both those genera would belong to its essence, and thus it would not be essentially the same, because two non-subordinate genera predicate a diverse essence. Again: difference and genus constitute one thing essentially; therefore a diverse genus and a diverse difference constitute another thing essentially — and accordingly one and the same thing cannot be ordered into distinct categories. The second part remains abundantly proven in (*art. 3. of this q.*) by the authorities and arguments to be reviewed there.

You will object first, against the first part of the second assertion: Porphyry (*in Isagoge c. de specie*) places body in the category of substance; and Aristotle (*c. de quantitate*) places body in the category of quantity. Therefore something one per se, such as body, can be placed in diverse categories. It follows that figure resides in the genus of quantity — for it is considered by the geometrician, who regards quantity per se — and Aristotle (*c. de qualitate*) enumerates it in the fourth species of quality. Nothing therefore prevents something one per se from being referred to diverse highest genera. I respond: body can be used in two ways. In one way, for the nature capable of three dimensions — namely length, breadth, and depth — which coincides with corporeal substance; and Porphyry cited rightly took it in this sense and places body in the category of substance. In another way, for the three dimensions themselves; in which sense Aristotle admits body into the category of quantity. In response to the consequence: similarly, I say that figure is taken in two ways — either for a surface bounded by lines, and then it is in the genus of quantity; or for the very termination of those lines, and then it is in the genus of quality.

You will object second: the double and the half are quanta per se, and are also numbered among relatives; and likewise the equal and unequal are placed in the genus of quantity and also ascribed among relatives. Therefore something one per se can be placed in distinct categories. It follows regarding motion, which is referred to the category of quantity and also to the genus of action or passion. I respond: the double and the half can be considered either insofar as they are quanta — and then they are in the genus of quantity — or insofar as they regard each other mutually — and in terms of such respects they are in the category of relation. The same is to be thought of the equal and unequal. In response to the consequence: I say that motion is equivocal, as is mentioned in the postpredicaments, and in accordance with its diverse termination it can be placed in diverse categories or reduced to them.

Question IV: On Substance

Article I: What Is the Highest Genus of the Category of Substance

The senses and divisions of substance are to be sought from the *Epitome* (*lib. 1. q. 4. art. 3*). Philosophers labor greatly at finding the proper ratio or quidditative concept of substance as it differs from accident and applies to every substance. On this, see Bonetus (*in praedicamentis, libello de substantia*), Suárez (*disp. 33. Met. sect. 1*), Hurtado (*in Met. disp. 10. sect. 2*), and Arriaga (*disp. 4. subsect. 2*) and following. I myself consider that the ratio common to every substance — both created and uncreated, total and partial, complete and incomplete — that prescribes from and abstracts from all these is designated by "not being in a subject," as is clear from Aristotle in the Antepredicaments, who, in giving the ratio of substance common to both the singular and universal, always posits in them "not being in a subject"; and in assigning the definition common to every accident, he writes that this is "being in a subject," which Avicenna (*2. Met. c. 1*) receives and expresses, saying that being in a subject is accident, and being not in a subject is substance. Scotus subscribes (*Quol. 3. §. Respondeo s. and Quol. 9. §. De 2. A.*). Nor should anyone be surprised if substance is described negatively, since God and prime matter are likewise described negatively from what will be said elsewhere — although they are true and real positive beings. Thus under that negation placed in the description of substance there is understood something positive — namely, being subsisting per se — which applies to every substance, so that "not being in a subject" and "being subsisting per se" coincide: substance so universally taken is transcendent, comprising any substance whatsoever whether complete or incomplete, whether partial or total, as the Doctor excellently pursues (*Quol. 9. praallegato*).

First Assertion: Substance taken transcendentally is well described as "being which is not in a subject," or "subsisting being." This is derived from Aristotle and Scotus in the passages cited, especially (*Quol. 3. P. ad 2.*), to whom adhere Gadius in the same place, Lychetus (*1. dist. 8. q. 2. in responsione ad argumenta pro 2. opinione*), and very many others. This can be proven first from the very notion of substance: substance is derived from subsisting, as I said in the *Epitome* in the cited place, and Suárez extensively shows in the cited section (*num. 3*). Therefore substance is being subsisting — just as man, who draws his origin from the earth, is called earthly, according to that saying of Saint Paul (*1 Cor. 15*): "The first man from the earth, earthly," and so on. Second: being is divided into substance and accident as into mutually opposed dividing members, by the common judgment of philosophers; but accident is defined as "that which is in a subject" or "inhering being"; therefore, by opposition, substance is "being which is not in a subject" or "subsisting being." Moreover, in the aforesaid description of substance, "being" is posited — which is also common to accident — and "subsisting" is added, by which it differs from accident. Therefore the aforesaid description of substance is fitting.

Second Assertion: The highest genus of categorical substance is being subsisting per se, finite, and complete. This is not obscurely indicated by Aristotle and Scotus recently cited, to whom Bonetus (*loco cit. and lib. 8. Met. and*

lib. 1. Theologiae naturalis cap. 1), Suárez in the place mentioned above (*n. 20*), and other philosophers agree — except the Nominalists and certain others to be adduced in (*art. 3. and 4. of this q.*). The assertion can be proven from another etymology of substance which the Philosopher indicates (*5 Met. cap. 8*): namely that substance is derived from "substare" (to underlie), because it underlies accidents; but substance of this kind is finite and complete, since infinite substance is far removed from the reception of any accident, while finite and composite substance is the fitting receptive subject of accidents, as will be shown in Physics. Therefore, and so on. Moreover, from (*7 Met. T. 4*) substance is prior to every accident in origin, nature, perfection, and time; but this is finite and complete substance, such as genera and species are. Therefore the highest genus of predicamental substance is finite and complete being. Again, through the assertion stated above, the common and particular reasons can be given in which all substances agree with and differ from one another. For "subsisting being" is transcendental substance, whose ratio the other substances participate. Through "finite" it is distinguished from God, who is infinite substance. And through "complete" it differs from incomplete and partial substances. Add the conditions previously assigned in (*the preceding q. art. 4*), from which and from all the other premises stated it is inferred that the highest genus of categorical substance is well described as "subsisting, finite, and complete being."

You will object first, against the first assertion: if the ratio and quiddity of substance taken precisely is "not being in a subject," then the form of a horse, and every other form that is educed from the potency of matter, would not be substance — since it is in matter, which is the common subject of all forms; but to deny that these forms are substantial contradicts Aristotle and reason, as will be shown in its proper place. Therefore the ratio of substance is by no means "not being in a subject." It follows that "not being in a subject" is the first property of substance, as is evident in the present chapter on substance. Therefore it is not its essence. I respond by denying the inference from the major: because form is in matter as a part in its co-part, not as an accident inheres in a subject. Wherefore matter is called the subject of forms not by inhesion but by information, as the Doctor writes (*Quol. 9. §. De 2. A.*). Hence from matter and form there arises one thing per se — not so from subject and accident — all the more because the subject of the accident is the composite, which is not so for the subject of forms, which is matter, as the Doctor implies (*q. 15. praedicamentali §. Ad q. potest dici*). Or say with the same Doctor: parts are in a whole, not in a subject; for the mode of being of parts in a whole is different from the mode of being in a subject. In response to the consequence: I say that we circumlocute the essence of substance through its first property — just as Aristotle defines quantity through its first property, which is divisibility (*5 Met. c. de quanto*), and elements similarly through their properties (*2 de generatione T. 7*). This happens when the essence of a thing is hidden from us, but its property is known to us. Hence Bonetus aptly adds in the aforesaid little book: we properly do not know

what substance is, and it becomes known to us in some way through its attributes and passions.

You will object second: the aforesaid description of substance does not apply to every substance. Therefore it is not fitting. The antecedent is proven: it does not apply to second substances, which are in firsts. Hence the Philosopher adds in this chapter on substance: "When first substances are destroyed, it is impossible that any of the others should survive." I respond by denying the antecedent; in response to its proof, I say that second substances are in firsts in the way genera and species are in their individuals, or as superiors are in inferiors — not in the way accidents inhere in their subjects. And the said assertion of Aristotle is to be explained in a secondary and mediate sense, not in a primary and immediate sense. This distinction was already explained (*1. 2. q. 1. art. 1. in responsione prima oppositionis*). Or, if you prefer, say with Scotus (*q. 13. praedicam. §. Dicendum*) that it is to be understood in terms of the being of existence, not in terms of the being of essence, or quidditative and intelligible being.

You will say: second substance is opposed to first substance, because division is through opposed members; but no opposite has being in another opposite. Therefore second substance has no being in first substance. One may say, Scotus adds in the same place, that second and first substance are relative suppositis; and since relatives are simultaneous by nature, from the chapter on relation, therefore when first substance is destroyed, second substance is likewise destroyed, since relatives posit and destroy one another. What the division of substance into first and second actually is will become clear in the next article.

You will object third: Scotus (*q. 15. praedicam. §. Ad q. potest dici*) writes that substance is an equivocal name with respect to the highest genus of the category of substance and the substantial parts. Therefore no common ratio of transcendental substance applicable to all substances — complete and incomplete and partial alike — is to be admitted. I respond that Scotus said this to show that substantial parts are not placed directly in the category of substance, but only reductively, as I said of the other parts in (*the preceding q. art. 3*); and therefore substantial parts do not participate in the generic ratio of substance, but in the common transcendental ratio.

You will object fourth, against the second assertion: that substance is complete which consists of genus and difference, because "complete" and "composite" substance mean nearly the same thing; but the highest genus of categorical substance is not composite substance, because above it there is no other genus — otherwise it would not be the first genus, nor would there be a difference presupposing a genus under which it is contained potentially; instead there would be only transcendentals. Therefore the highest genus of categorical substance is not complete substance. First consequence: for this reason difference is called incomplete substance — because it is a part of composite substance and is ordered to its composition. Therefore the same must be said of

the first genus of categorical substance, inasmuch as it is part of composite substance and is ordered to its completion. Second consequence: no substance considered purely in terms of the being of the first genus of substance is complete, since it is necessary that a difference be added to it, through which it is contracted. Therefore the first genus of predicamental substance is not complete substance. I respond: although every substance composed of genus and difference is complete, it is not necessary that every complete substance be composed of genus and difference. For God is complete substance, although he is not composed of genus and difference, as I will prove in (*art. 3. of this q.*). Therefore complete and perfect substance do not coincide. In response to the first consequence: I say the difference between genus and difference is that difference is a part and always bears itself as a part, and is predicated as a part of species and individuals; but genus is a potential whole and bears itself as a whole, and is always predicated of its inferiors in the manner of a whole, as I showed in (*lib. 2. quaest. 2. art. 3*). In response to the second consequence: I distinguish the antecedent — in terms of the being of an actual whole, I grant; in terms of the being of a potential whole, I deny — as was fully explained in the passage just cited.

Article II: What Is the Division of Substance into First and Second

It is no small labor for logicians to determine what the divided term and the dividing members of this division of substance are. For some — among whom Suárez (*disp. 33. Met. sect. 2*) and Faber (*7 Met. sect. 2*) are referred to by our younger contemporaries (*disp. 7. q. 1. 2*) — affirm that the divided term and the dividing members are real. Others, among whom are found Scotus and the Scotists shortly to be named, maintain that they are intentional. And what kind of division this is — whether univocal or analogical, or one of the other kinds presented in the *Epitome* (*lib. 2. quaest. 7. art. 1*) — philosophers also dispute. For Ammonius (*in c. de substantia*) considers it not a proper division but merely a kind of enumeration — as if one were to say: "Of those reclining at table, one is Christ the Lord, another is a Pharisee" (*Luke 7*), and "Of the Apostles, one is Peter, another is Andrew," and so on (*ibid. cap. 6*). Tataretus in this place (*quaest. 1. scibilis 3*) considers it to be univocal, that is, a division of genus into species. Many others — such as Albertus (*Tract. 1. praedicam. cap. 3*) and Cajetan — make it analogical. But Scotus (*quaest. 4. univers. in solutione 2. and quaest. 12. praedicam. in fine*), Sarnanus, Burleigh here, Gadius (*Quol. 3. fol. 42. columna 2*), and others — to whom the Conimbricenses (*q. 2. art. 1. in fine 3. conclusionis*) seem to agree — assert that it is a division of a subject into accidents, not indeed real but intentional.

Note first: first substance goes by various names. It is called, first, "singular" insofar as it is opposed to the common and universal, at least by relative opposition. Second, "individual," because it cannot be further divided into inferiors, having none below it. Third, "first subject," because it is per se

primarily suited to receive common accidents. Fourth, "hypostasis" and "supposit," insofar as it subsists per se incommunicably and independently. Fifth, "person" — and this name applies only to those endowed with an intellectual nature; thus a stone is not a person but a supposit, while Peter is called person, supposit, hypostasis, individual, and singular. The later names are broader than the earlier ones. Thus "singular" and "individual" are common to both substance and singular accident; "hypostasis" and "supposit" are applied to singular, incommunicable substantial natures, whether endowed with reason or not; while "person" is attributed only to intellectual nature. More on this in the Tract on the Incarnation of the Divine Word. Furthermore, second substance is denoted by the following words. It is called second substance, universal and common, insofar as it can be communicated to many. It is also called genus and species of firsts. Hence it is defined by Aristotle in the plural, to signify that among second substances some are genera and some are species. First substance, however, is described by the same Philosopher in the singular, to show that every first substance is singular and individual.

Note second: first substance can be taken in two ways. In one way, as a term of first intention — in which case it is nothing other than a singular and individual, substantial nature, incommunicable to many subjective parts, described by Aristotle as "that which is neither in a subject nor said of a subject." In another way, as a term of second intention — which is a relation of reason attributed to the singular substantial nature; and in this way it is called the substantial individual, to which belongs the definition of the individual, namely "that which is predicated of one thing alone." Similarly, second substance can be considered in two ways: first, as a term of first intention — and it is the common substantial nature, communicable to many subjective parts, such as "man"; second, as a term of second intention — which is a relation of reason attributed to the common substantial nature that is communicable to many subjective parts. And it is described by Aristotle as "that which is said of a subject, and is not in a subject." Second substance is likewise called genus and species of first substances. And Gadius, mentioned above, notes that first substance has two things: one is that first substance is "this here"; the other is that first substance is incommunicable. Similarly, second substance designates two things: first, that second substance is communicable; second, that it receives formal universality from the collative operation of the intellect, as I proved in (*lib. 2. quaest. 1. art. 8*).

First Assertion: The subject of the aforesaid division is substance in common, prescinding from the ratios of singularity and universality. This is derived from Scotus in the passages cited, which our two young contemporaries already named also indicate along with Tataretus, and which Fuentes (*q. 14. diff. 1. art. 5*) and other Scotists openly defend. Proven first: Logic treats of second intentions founded in firsts; therefore the subject of the said division is common substance abstracting from the ratios of singularity and universality. The antecedent is the common doctrine of logicians: for second intentions are founded in firsts, which

are real natures from the side of the thing. The consequence holds: for common substantial nature can be affected and determined to formal singular and individual being, and to formally universal being, as I showed (*1. 2. q. 1. art. 4. §. 6. 7.*). Second: exactly the same philosophical judgment is to be made of this division as of that division by which being is cut into universal and singular, as is plain by analogy from substance — which is said to be first and second in terms of second intentions, as we prefaced and explained in the second note; but the subject of that partition of being into universal and singular is the real common nature taken precisely, insofar as it abstracts from universality and singularity, as I discussed at length in the said place. Therefore, and so on. Third: the divided term of this division cannot be the substance that is the highest genus of the first category, because the divided term does not coincide with either dividing member but abstracts from both; but the highest genus of the category of substance coincides with second substance, which is one of the members of the given division — comprehending all genera and species of first substances, as is plainly clear from the first and second notes. Therefore, and so on.

Second Assertion: The dividing members of the said division are formally not real but intentional. This assertion is opposed to Faber and in part to the two recent Scotists cited above, who affirm that according to the mind of Aristotle and Scotus these members and their divided term can be maintained as real. Proven first from the Doctor (*q. 4. univers. Ad 2.*), where he has these words: "If therefore that division is valid, it will follow that the members, as he there understands them, are opposed — but what is second substance, apart from the operation of the intellect, is not opposed to first substance, but is the same. Therefore he does not understand it of second substance as regards that which is a being apart from the operation of the intellect." And a little later he adds: "Second substances, as he speaks of them there, are accidents — not indeed real accidents, but intentional ones, of which it per se belongs to be said of," and so on. And in (*quaest. 12. praedicamentali*) he adds that the division of substance into first and second is a partition into intentions that are accidents of substance — that is, intentional accidents. Second: Logic per se treats of second intentions, as was frequently impressed upon us; therefore since this is a logical division, it follows that its dividing members are intentional. Third: the second substances, which are placed under one of the members of the adduced division, are formally genera and species, as Aristotle declares in this place; but genera and species are formally intentional. Therefore the members of the same division are likewise intentional.

Third Assertion: The aforesaid division is of a subject into intentional accidents. So Scotus in the places cited, especially (*quaest. 12. praedicamentali*), where at the end of it there are found these words: "The division of substance into first and second is not a division of the most general genus into species, but of a subject into accidents — because substance (insofar as it is understood according to what ratio it pertains to the logician) is divided into intentions that

are accidents of it." Antonius Andreas agrees with this, and Fuentes in the same place; and our recently mentioned younger contemporaries press this point more forcefully. Proven first: second intentions, as Scotus teaches in the passages cited, are accidents of substance as the logician considers it — just as whiteness and blackness are accidents of man, by which he is divided into white and black. Therefore that division is of a subject into accidents. The antecedent is acknowledged, because Logic does not treat of substance except in terms of its intentional being. Second: a division of a subject into accidents is one by which the subject is divided into what is accidental to it, as I said in the *Epitome* (*lib. 2. quaest. 7. art. 1.*); but to the real common substance there are accidental the second intentions of first and second substance, as we showed above. Therefore the said division is of a subject into accidents. From these it is easily collected and concluded that such a partition of substance into first and second is not univocal, because its divided term is real — namely, the real common substance, as I proved in the first assertion — while the dividing members are intentional, as I showed in the second assertion. But that nothing is common univocally to a real being and a being of reason, our authors demonstrate (*Tract. Formalitatum*) and we demonstrated in Metaphysics. Moreover, the univocal is that which is participated by the univocates according to the same name and the same ratio of the substance; but the real common substance — which is the divided term of this division — is not participated according to the same ratio by first and second substance, because as they pertain to Logic they are beings of reason. Add that univocal division is for the most part a division of genus into species — which the aforesaid division cannot be, for no genus of substance is distributed through it, as was evidently shown above. Therefore that division is not univocal. Thus the division in question is to be called only by the name of a division of a subject into accidents, as was efficaciously proven in this third assertion. You will object first, against the first assertion: common substance is second substance, since it is a universal nature; therefore the given division is inappropriate if the divided term is the real common substance, because it coincides with one of the dividing members. I respond through a distinction of the antecedent: formally, I deny; fundamentally, I grant. This distinction was sufficiently explained in (*lib. 1. quaest. 1. art. 6*), where we rejected the universal formally from the side of the thing.

You will object second, against the second assertion: the members of the division of substance are to be taken as they are defined; but the members of the said division are defined in terms of real being; therefore they are also divided according to real being. The major is evident. The minor is shown: first substance is that which is properly and principally said to underlie. Likewise, first substance is more substance than second substance. And second substance is described as that which is not in a subject yet is said of a subject. Moreover, the properties of substance are real. Therefore the dividing members of the said division are real. I respond: granting the major, the minor is to be denied; in

response to its proof, I say that those things mentioned belong to substance taken in first intention and metaphysically, not to substance taken in second intention and logically. And Aristotle did this because substance taken in first intention and its properties are more evident to us than when substance is affected by second intentions. Hence Porphyry too in his *Isagoge* gives examples of things as more known to us, as I observed in (*quaest. 2. lib. 2. art. 1. in responsione 3. oppositionis*).

You will object third, against the third assertion: the ratio of common substance belongs to both first and second substance. Therefore that division is univocal. The antecedent is urged: the ratio of substance is "to be per se." But first and second substance are beings per se, as the Philosopher indicates here (*T. 1*), saying that it belongs to both substances "not to be in a subject" — which is the same as "to be per se." Therefore, and so on. I respond through the very distinction adduced in the response to the first objection. For I grant it of the fundamental ratio of substance, but deny it of the formal ratio that the logician considers: because both substances taken logically are beings of reason, as is clear from what was said.

Article III: Whether God Is in the Genus of Substance

There are three positions of the scholastics that we must examine. The first is followed by Ockham (*1. d. 8. q. 1. conclusionem 4*), Gabriel in the same place, Bacon (*dist. 9*), Gregory (*d. 8. quaest. 3*), and certain recent authors who posit God in the genus of substance and also in the categories of relation and action; and these are favored by Hurtado (*disp. 9. Met. sect. 4. §. 54*), Arriaga (*disp. 3. sect. 2*), and Vázquez (*1. p. disp. 22. cap. 3*). The second position is embraced by Raconius (*Tract. 2. de categoria art. 3. membro 2. propositionem 2*) and a few others, among whom Saint Thomas is numbered (*qq. de potentia q. 7. art. 3*) — although he holds the opposite (*1. p. q. 3. art. 5*) — and touched upon by Bonetus (*L. 2. Theologiae naturalis c. 1*), these placing God reductively in the category of substance. The third is the common position: Scotus (*1. dist. 8. quaest. 3. §. Teneo opinionem meam mediam F.*, and in *Reportatis eadem d. q. 5*, and *Tract. de 1. principio cap. 4*), Tataretus in the same place and in (*Log. q. de substantia dub. 3*), Auriolus in that place in the fourth part (*art. 2*), Pelbartus (*verbo simplex §. 5*), Bonetus (*9 Met. c. 2. and l. suae Theologiae naturalis c. 2*), Faber (*Theor. 96*), Vulpes (*Tomo 1. disp. 14. art. 3*), and others exclude God from the category of substance and all other genera.

Note first — and this should be recalled from what was said in (*q. 3. of this book. art. 1*) — that finite being is immediately divided into ten categories by ten modes of being, as Antonius Andreas (*5. Met. q. 7*) holds with Scotus. An intrinsic mode or intrinsic degree is that which, when added to a thing, does not alter the thing — as Scotists commonly teach following the Master of Formalities. And this is derived from the Doctor (*1. dist. 8. quaest. 2. paulo ante L.*), who illustrates it with the example of whiteness, which has its six or eight degrees, by the addition or subtraction of which it is not essentially changed. And here the difference

between a degree and a difference is manifest: for a difference, when added to or taken from a thing, changes that thing essentially — as is clear of rationality and irrationality, which constitute essentially diverse species — but degrees or intrinsic modes of a thing do not essentially change it, as was explained above of the degrees of whiteness. Furthermore, a thing can be divided into its modes — as being into infinite and finite — or into its differences — as animal into rational and irrational. By reason of the former division, there is no composition; for whiteness as six is no more composite than whiteness as five, although it is more perfect. By reason of the latter, however, there arises logical or metaphysical composition — which consists of genus and difference.

Note second, from Scotus (*in 1. allegato, 2. d. 3. q. 6. §. Ad q. ergo sub K.*): genus and difference are in some cases taken from thing and thing, and in other cases from reality and reality. For genus is contractible and is contracted by difference; it is potential, actuated by difference — just as matter is contracted, determined, and actuated by form, as we said in (*1. 2. q. 5. art. 2*). Genus is also perfectible, and difference is perfective, and from both as from two parts there is constituted a whole that is perfect. If genus and difference are derived from thing and thing, from them is made a physical whole — a composite of matter and form, such as man from body and rational soul. If genus and difference are taken from reality and reality, from them there is constituted a logical and metaphysical whole, such as an angel. Whatever whole it may be — whether compact from thing and thing, or from reality and reality — it is placed per se in the genus, as Lychetus clearly shows in (*1. cit. §. Teneo opinionem.*). What difference, however, is to be placed between thing and thing, reality and reality, and such composites, is fully and lucidly explained in (*Met. in Tract. de Angelis disp. 1. quaest. 3*).

Note third, from the Doctor (*2. dist. 3. quaest. 1. §. Sed contra I.*): the divine nature is said to be common to the three Persons by inexistence and real communication, because it is of itself singular and individual — and for this reason it cannot be contracted and determined by any individual difference. But a created nature, although it is common by inexistence, is yet contractible by this or that haecceity (*haecceitas*); nor is it more determined by one singularity than by another, and when it is determined by one individual difference, it really identifies it with itself and can be essentially predicated of all its inferiors and individuals. Wherefore a created and finite nature, together with its real community, acquires potentiality and divisibility — by reason of which it can be actuated and multiplied by its differences. But the divine and uncreated nature, together with its real community, enjoys maximal actuality and indivisibility; and therefore it cannot be contracted and actuated by any difference, as the Doctor not obscurely teaches (*1. dist. 5. quaest. 2. §. Tertio principaliter ante K.*).

First Assertion: God is not placed per se in the category of substance. So Scotus in the passage cited. Proven first from Saint Augustine (*5 de Trin. c. 2. and 2. Conf.*): one who seeks pardon from God is sorry for having sometimes thought

God was confined within categories. The same is implied by Saint Dionysius (*c. 4. de divinis nominibus*), Cyril (*1. Thesauri c. 4*), Lactantius, and many others. Add Aristotle, who in this chapter on substance affirms that every substance placed in the genus of substance underlies accidents; and (*5 Met. T. 14*) he divides only finite being into ten categories, as Lychetus notes in (*suprà §. In quo ad illud*). But that God is infinite and underlies no accident, the same Philosopher teaches (*12 Met. T. 15*) — which Scotus also deduces from Saint Augustine (*in Reportatis loco citato*). To these, add the articles of the University of Oxford, which sanctioned as erroneous the view that the first cause is in a genus and not outside a genus, as Bacon reports (*d. 8. primi.*). Second: if God were in a genus, there would be something common to God himself and to the creature, indifferent to finite and infinite — because a genus is participated by those of which it is the genus, and is essentially predicated of them; but there cannot be a genus with respect to God and the creature, to the finite and the infinite, since being — which is common to God and the creature, finite and infinite — is not a genus, as it descends to them not as to differences but as to its intrinsic modes, as I noted above. Therefore God is not enclosed in a genus. Third: that which is in a category is either composable — as the highest genus with its proximate difference to constitute a species, as in our case, substance — which is the highest genus — is composable with "corporeal," which is one of the differences into which it is divided, to compose body as its species; or it is composed of thing and thing, of which one is perfectible and the other perfecting; or from reality and reality, of which one is contractible and the other contracting — as is a species, which is constituted from genus and difference. But God is neither composable nor composed in any way, since he is supremely simple, as the scholastics commonly hold in the passage cited. Therefore God is banished from the category. Fourth: from (*8 Met. c. 5. T. 9. and 16*), genus is potential and as it were matter; difference is as it were form; and from these, as from two essential parts, species is constituted. But in God there is nothing potential, since he is infinite — lacking no being — and supremely perfect — lacking no perfection; but if God were in a genus, one part of him would be in potency to another, as the perfectible to its perfective, namely genus to difference, as animal to rational. God therefore is not to be reduced to a genus.

You will say: genus does not present a distinct entity from the entity of difference, but both amount to the very same entity; therefore the argument cited does not conclude, as Auriolus mentioned above says. Against this, first: this explicitly contradicts Aristotle just cited, who says that the definition is an extended discourse, and through it one thing is expressed as matter and another as form. But it is plain that matter and form are two distinct entities. If they were not two entities, genus would be the whole entity and quiddity of the specific thing, and thus genus alone would suffice for defining the species, and the difference — which according to Auriolus does not differ from genus — would be added uselessly; or the same entity would be posited twice in vain.

Fifth: that which is supremely necessary is not in a category; but God is supremely necessary being, as no one denies. Therefore God does not reside in a category. The major is proven: in a category there are placed per se genera, species, and individuals, as I showed above; but genera are potential in relation to the differences into which they are divided and by which they are completed and actuated; but God is the most actual being, awaiting no final act for his completion. Therefore God cannot be placed in the category as a genus. Nor as a species, which is constituted from genus and difference — especially because species is predicated of many differing in number, while God is one and alone, to whom a multitude in the same nature is incompatible, as I will show in (*Met. q. de Deo*). Nor as an individual, which presupposes species, genus, and the rest that are ascribed in the predicamental series. Therefore God is not placed in a genus per se.

You will say: God is not to be excluded from a genus if his imperfections are removed — that is, potentiality, limitation, and finitude — as the Nominalists mentioned above opine. Against this: there cannot be a genus without being finite and limited, because a genus is by its very nature potential and determinable by its differences, and accordingly finite and limited. Hence it is called a "total power" (*totum potestativum*) because it potentially contains the differences by which it is contracted and actuated, as is clear from the passage cited in the second note.

Second Assertion: Neither God nor any predicate of God is placed reductively in any category. This is derived from the Doctor in the passage cited under N. Proven: what is placed reductively in a category consists of parts and imperfect beings, as is clear from (*3. q. art. 3. of this book*); but God has no part nor any imperfect entity, since he is most simple and most perfect. Therefore God — nor anything of his — is placed in a genus reductively. Moreover: what is common to God and the creature is transcendent, for it belongs to being before being is divided into infinite and finite; as it belongs to God, it is infinite; as it is accommodated to the creature, it is finite. Therefore it belongs to being before it is distributed into ten genera — and thus such predicates are transcendentals.

You will say: transcendentals are common to all, but certain predicates fitting God and the creature are not common to all — such as wisdom, which does not apply to all. Therefore, and so on. The major is to be denied: for it is not necessary that transcendentals belong to all, unless they are convertible with being, as is evident of the distinct passions of being, which are "necessary or possible," "finite or infinite," "act or potency." For "necessary" and "infinite" belong to God alone; "finite" and "possible" belong only to creatures. Wherefore for the ratio of a transcendental it suffices that it not be a genus, nor have a genus above it — not that it belong to all or to one alone.

You will object first, against the first assertion: Saint John Damascene (*in Elementario c. 8*) writes that intellectual substance contains God, and that it is in a

genus. Therefore God, who is comprised under substance, is in the genus of substance. First consequence: from Boethius (*1. 3. de Trin.*), who seems to assert two genera in the divine — namely the genus of substance and the genus of relation. Second consequence: from Averroes (*10 Met. comento 7*), who expounds that saying of the Philosopher in that place, "In any genus there is one first, which is the measure and standard of others," to mean: in the genus of substance, through the first substance — which is the measure of other substances — he understands the first mover, who is God. Just as therefore in the other genera the first of them is something within those genera, so too in the genus of substance, God — who is the first substance — is something of the genus of substance itself and is thus not to be removed from it. I respond: Saint Damascene is to be explained of transcendental substance, not predicamental, as his own words cited by the Doctor indicate. And more clearly (*1. 1. de fide c. 8*), where we read that the divine essence is "supereminent to all substances and excepted from every substance." Wherefore what pertains to perfection in substance — namely "to be per se" — is attributed to God; but what pertains to imperfection — namely to underlie accidents and to be finite and limited — is removed from God himself. Even if Damascene does not allow this interpretation, he is to be set aside in this matter, since other Fathers of no lesser authority cited in the first assertion stand with us. In response to the first consequence: I deny that Boethius asserts two genera in the divine, but only recalls there two modes of predication — substantial and relative — which Saint Augustine calls "to itself" and "to another." Such predicates are transcendentals, as Boethius himself plainly shows (*1. 1. de Trin. c. 5. 6.*) with these words: "Substance in him (that is, in God) is not truly substance, but beyond substance." To this perhaps looking, Saint Augustine (*7 de Trin. c. 5*) says that substance is predicated of God in an improper sense. And Saint Dionysius (*de Divinis nominibus c. 2*) affirms that God is above substance — which Mayronis (*1. dist. 22. quaest. 2*) considers to be said anagogically, that is, by way of excess; while Lychetus (*Quol. 1*) interprets that passage as being about predicamental substance, not transcendental substance, which properly belongs to God. In response to the second consequence: I say that the saying of the Peripatetic is to be explained of an intrinsic measure that is contained within the genus as one of its measured terms — not of an extrinsic measure that is outside the genus, as God is.

You will object second: those that participate the same common ratio of substance are placed in the category of substance, since categories are natural series of unmixed things, as I noted (*q. 3. of this lib. art. 1.*); but God and the creature participate in the common ratio of substance, which is described as "being subsisting per se," as I showed (*q. 4. art. 1.*). And God is being existing and subsisting per se. Therefore, since created substance has its place in the category of substance, uncreated substance — that is, God — likewise does. First consequence: from (*3 Top. c. 1. locus 11*): God and man agree in common

predicates and differ in proper predicates; but among the predicates common to them, substance is numbered — from whose genus man is not excluded; therefore God is not to be expelled from it either. Likewise from (*4 Top. c. 2. locus 17*): if difference is assigned as genus, as "immortal" is the genus of God, then the difference is "immortal animal." Second consequence: incorporeal substance resides in the category of substance, as found in the tree of Porphyry; but God is incorporeal substance, according to (*John 4: "God is spirit"*). Therefore, and so on. I respond: if the major is understood of the common ratio of predicamental substance, it is granted; if taken of the common ratio of transcendental substance, it is denied. In response to the minor, I say that God and the creature indeed participate in the same ratio of transcendental substance, but not predicamental; and thus not God but the creature is placed in the category of substance. In response to the first consequence: I distinguish — God and man have the same transcendental predicates, not predicamental ones; hence God is not in a genus as man is. Or it can be said that Aristotle by "God" understands an angel, which I will show to be in a category in the next article — for as Porphyry rightly observes, it is Aristotle's custom to take "God" to mean "angel." In response to the second consequence: I distinguish the major — limited and finite incorporeal substance, I grant; unlimited and infinite, I deny. With this distinction of the major, the minor is also to be distinguished — and for that reason I deny that God is comprised under that member of predicamental incorporeal substance.

You will object third: if God were to be removed from a genus, it would be chiefly on account of his infinity; but his infinity does not prevent him from being placed in a genus: for if an infinite line were given, it would still be in the genus of quantity, because from (*6 Top. cap. 3. locus 78*), the definition — which cannot exist without genus and difference — would apply to an infinite line. It follows: finiteness or infinity belongs to quantity from (*3 Phys. T. 24*); therefore the infinity of God is not a reason for excluding God himself from a category. I respond: granting the major, the minor is to be denied. In response to its proof: given an infinite line, it would be infinite in a qualified sense and with respect to extension; but finite with respect to its essence. God, however, is simply infinite and with respect to essence. Hence he is not enclosed in a genus. By this the consequence is also answered, according to Scotus (*2. Met. quaest. 6*): for finiteness and infinity in a qualified sense is a property of quantity, as will be more evident in Physics in the treatise on quantity.

You will object fourth: Christ the Lord is placed in the category of substance; but Christ is God, according to orthodox faith. Therefore God is placed in the category of substance. The major is shown: the divine Word through the hypostatic union was made man, according to (*John 1: "And the Word was made flesh"*); but man without doubt is placed in the category of substance. Therefore Christ too is contained under the genus of substance. I distinguish the major: by reason of his human nature, I grant; by reason of his divine nature, I deny. For

Christ is God and man simultaneously — as man he is placed in a genus, but as God he is excluded from it.

You will object fifth: Scotus contradicts himself, for here he asserts that genus is to be taken from one potential reality and difference from another actuating reality, and from both as perfectible and perfecting there emerges the species, which is a metaphysical composite. But in the *Parisian Reportata* (1. dist. 33. quaest. 2) he denies that the ratio of genus is another reality from the reality of difference — otherwise, he says, whiteness would be really composite, which he adduces as an inconvenience. If therefore, according to Scotus, genus and difference do not present distinct realities, there is no reason to exclude God from a category. I respond: no contradiction is involved in the Doctor's statements. For in the *Reportata* cited, Scotus refuses whiteness to be composed of thing and thing — which is every composite with physical composition, made from matter and form. But he admits it to be composed of reality and reality, which is the kind of metaphysical composition made from genus and difference. The proximate genus of the said whiteness is color; its difference is "dispersive." But when Scotus says that in accidental forms there is the same entity from which genus and difference are drawn, understand that the entity is the same really, not formally. Thus whiteness is one thing having several formally distinct realities — namely the realities of its genus and difference.

Article IV: Whether Angels and the Heavens Are Placed in the Category of Substance

Those who posit the highest genus of the category of substance as "generable and corruptible substance" exempt angels and celestial bodies from the category of substance — so hold Averroes (10 Met. T. 26), Janduno (*ibid.* q. ult.), Niphus (q. 9), Zimara (*Theor.* 62), and Zabarella (*lib.* 2. *de materia* c. 15). Those, however, who consider the highest genus of predicamental substance to be "finite substance" — prescinding from corruptible and incorruptible, from corporeal and incorporeal — do not remove angels and the heavens from the genus of substance at all; so hold all those authors who exclude only God from the category, cited in the preceding article's third position.

First Assertion: Angels, whom philosophers call intelligences and abstract substances, are placed in the genus of substance. Scotus holds this (1. dist. 8. quaest. 2. §. *Alia est opinio*, and in *Reportatis eadem d. quaest.* 5. §. *Contra illam viam*), Alensis (5 Met. T. 33), Antonius Andreas in the same place, and Faber (*Theor.* 64). Proven first from Aristotle (5 Met. cap. 8. T. 15), where treating of those things placed in the category of substance, he numbers among them "daemons," who are angels. The same is gathered from (1 Eth. cap. 9). And this was the judgment of the Philosopher, as Themistius (*in initio* 3. *phys.*), Porphyry, Ammonius, and other ancient and recent Peripatetics maintain. Second: what is contained under a species of some category is contained under the genus, since species cannot exist without genus, genus being its essential part; but angels are comprised

under the species of incorporeal substance — for from Porphyry (*c. de specie*) and Scotus (4. *dist.* 6. *q.* 10. §. *Ad q. M.*), substance is divided into incorporeal and corporeal; but angels are incorporeal, as I showed (*in Tract. de Angelis disp.* 1. *q.* 2.); therefore they are in the category of substance. Third: what consists of genus and difference is placed in the category, which is a series of genera, species, and individuals; but angels are composed of genus and difference, being created and limited substances, as I proved abundantly in the place just cited (*q.* 3.). Moreover, the properties of categorical substance belong to angels — for they are capable of contraries, namely hatred and love, and the like, which I pursued at length in the said Tract. Therefore angels reside in the category of substance.

Second Assertion: The heavens surely have a place in the category of substance. This is derived from Scotus in the same place, especially the fourth passage cited, who comprises corporeal and incorporeal substance under the same logical genus. Proven first from Aristotle (5 *Met. T.* 15), who, in treating of what is placed in the category of substance, mentions celestial bodies. And in (12 *Met. c.* 2), subdividing substance into corruptible or elementary and incorruptible or celestial, he enumerates elements and heavens in the same genus of substance. The same is gathered from (7 *Met. T.* 1. and 8. of the same work *T.* 1.). Second: body is not disjoined from the category of substance, as is clear to one examining this coordination; but the celestial spheres are bodies composed of matter and form, as we will say in the book on the heavens and world. Therefore the heavens are not segregated from the category of substance. Moreover, the heavens receive corporeal accidents — quantity, quality, light, rarity, density, and others of this kind. Therefore, since they possess the property of categorical substance, they must also hold its place.

You will object first, against the first assertion: God, on account of his simplicity, does not obtain a place in the category, as Scotus concedes in the *Reportata* in the passages just cited; but angels are pure and simple acts from (8 *Met. T.* 6) and elsewhere. Therefore they are banished from the genus. Granting the major, I distinguish the minor: angels are simple with the simplicity opposed to physical composition, I grant; with the simplicity opposed to metaphysical composition, I deny. For this reason angels are relegated in the genus of substance, but not God — who has both simplicities, opposed to physical and to metaphysical composition. So Aristotle and Scotus are explained in the passages cited.

You will say: Aristotle, both in the passage cited and in (12 *Met. T.* 42) and elsewhere, seems to want angels to be subjects that do not receive accidents. This surely indicates that angels lack composition not only physical but also metaphysical — and thus are simple with an absolute simplicity. Supporting this is Scotus (*Quol.* 7. §. *Secundum. GG.*, and *Quol.* 15. §. *De primo. C.*), who says that, according to Aristotle, understanding is the same in the intelligences as their very substance. All the more so, the same Doctor (2. *dist.* 3. *quaest.* 7. §. *Ad 1. argumentum. C.*) affirms that, in the school of the Philosopher, each intelligence is

of itself "this" — due to the necessity of being which he supposed to belong to them from eternity. Therefore angels are free from both kinds of composition.

I say: Aristotle in those places only wants to say that the first intelligence — which is God — does not underlie accidents, and that it alone is uncaused and infinite; but the other intelligences are caused and finite, and accordingly capable of accidents, as I showed in the present and the preceding article; and Scotus demonstrated this in both the quoted passages from the *Quodlibeta*. As for what is added from the same Doctor — that understanding is the same as the substance of the intelligence — the Doctor is not speaking in his own opinion, but in the opinion of Henry (*Quol. 8. q. 9*) and others who supposed Aristotle held this, as is clear from his words at (*Quol. 7. cit. sub HH.*): "but that understanding, as these say, according to Aristotle, is the same as the substance of the intelligence." He implies the same in (*Quol. 15. ante C.*) with these words: "Against this, although perhaps the Philosopher, who posited the intellection of an angel to be the same as the substance of the angel" — for this is stated by Scotus in the opinion of Godfrey (*Quol. 6. q. 7*), as his margin cites, a little before — and which the same Doctor refutes there. As for the passage of Scotus from the second book of the Sentences: even if Aristotle suspects that the intelligences are necessary beings, eternal and incapable of numerical multiplication, it does not follow well that they are uncaused, infinite, free from metaphysical composition, and incapable of accidents. For Saint Thomas and his disciples, cited by us in (*Tract. de Angelis, disp. 1. quaest. 6. 7.*), although they believe that angels, due to the lack of matter, cannot be multiplied in number, nevertheless do not deny that they are caused, finite, composed of genus and difference, and receptive of accidents. Similarly, although the Philosopher mistakenly supposes angels to be eternal and incapable of numerical multiplication on account of their formal necessity, from this it is not to be deduced that they are alien to metaphysical composition, uncaused and infinite, and separated from all accident — as the Doctor excellently proves in the passages just mentioned.

You will object second, from (*10 Met. T. 25*): the corruptible and the incorruptible differ more than generically; but angels are incorruptible and immortal — being without matter; while other substances, apart from the rational soul, are corruptible and mortal. Therefore angels are not placed in the same genus of substance. I respond with Scotus (*in 4. d. 6. q. 10. §. Ad q. potest dici. M.*): the Aristotelian dictum is to be explained of physical genus, not of logical and metaphysical genus — as is clear of substance, under which corporeal and incorporeal substances are contained: although they differ in physical genus — since the former have matter, and the latter lack it — they nonetheless agree in logical and metaphysical genus. Likewise regarding corporeal and spiritual quality, which similarly participate in a metaphysical genus but not in a physical genus, which befits mutually transmutable things.

You will object third, against the second assertion, from (*1 Caeli c. ult.*): "In eternal things there is no potency." For in them being and being-able are the same. But according to Aristotle the heavens are eternal. Therefore the heavens have no potency; but those lacking potency also lack genus, since genus from what has been said is a potential whole. Therefore the heavens, lacking genus, are expelled from the predicamental seat. I respond by expounding the Philosopher's assertion: in eternal things there is no proximate physical potency to transmutation, I grant; there is no remote physical potency — in spiritual things I grant this, in corporeal things I deny it. This distinction will be more clearly illuminated in the book on the heavens.

Question V: On Quantity

Article I: Whether Quantity Is a Highest Genus Distinct from Others

The Subtle Doctor (*2. dist. 3. quaest. 4. propè initium*) affirms that the first accident proceeding from material substance is quantity. The reason for this can be given from the same Scotus (*4. dist. 12. quaest. 2. §. Hic sunt sub. F.*): just as substance underlies all accidents and is called their "material subject" (*subiectum quod*), so quantity receives the other material accidents and is called their "formal subject" (*subiectum quo*). Hence it is right that philosophers, after substance, turn to quantity. The same Doctor (*q. 16. praedicamentali*) first investigates, as his chief endeavor, whether quantity is one of the ten highest genera — and Antonius Andreas, Tataretus, John of the Masters, Bonetus (*libello de quantitate*), and others follow him in that place. I presuppose from Aristotle (*2. de generatione T. 37*) and Scotus (*Quol. 6. §. Ad primum*), Richard (*1. dist. 19*), and Bonetus in the same place: there is a twofold sense of quantity — virtual and dimensive. Virtual quantity is the perfection of any thing whatever, and it is transcendent, belonging to all things — except the divine relations, as I taught in (*Tract. de Deo Trino disp. 5. quaest. 5.*). In this sense we read (*Gen. 3*): "God saw all things he had made, and they were very good" — that is, perfect in their kind, as Gadius explains (*Quol. praeit.*). Dimensive quantity is the ratio of extension which follows corporeal and material things. Its divisions and properties were presented in the *Epitome* (*lib. 1. quaest. 4. art. 6.*). And it is of dimensive quantity alone that we will speak henceforth.

First Assertion: Quantity is one genus distinct from others. This is taught by Aristotle, Scotus, and other philosophers both in the *Logic* in the chapter on quantity and in (*5 Met. T. 18*). Proven first: what has one common ratio distinct from others, predicable of many differing in species "in what" (*in quid*), is one genus distinct from others, as is clear from the definition of genus; but quantity is such — for it is predicated of continuous and discrete as of its species: for to the question "what is continuous?" it is correctly answered "it is quantity"; and similarly of discrete and other intermediate and lowest species of quantity. Therefore quantity is a genus distinct from others. Second: diverse differences

and diverse species argue a genus diverse from others, as is clear from the antepredicamental rule; but quantity has diverse differences and species, as we presented in the *Epitome* in the place recalled. Therefore quantity is a genus distinct from others.

Second Assertion: Quantity is a highest genus. So Aristotle and Scotus in the passages cited. Proven: what has species under it and acknowledges no other genus above itself is a highest genus, as is clear from what was said in (1. 2. q. de genere); but quantity has species, as is clear from the first assertion; nor does it have another genus above it, since above it there are only transcendentals. Moreover, quantity is referred among the ten categories, as I said (q. 2. art. 2.); but all the categories are highest genera. Therefore quantity is a highest genus.

You will object first, against the first assertion: no genus is predicated denominatively of its species, from (4 Top. cap. 1. locus 2.); but quantity is predicated denominatively of continuous and discrete — for we say "a line is quantum," "a surface is quantum," and likewise "a number is quantum." Therefore quantity is not one genus distinct from the rest. I respond: quantity is excepted from the major by proportion; and the reason for this is given: because the principle of division or measure belongs first to quantity, and afterwards to the other things distinct from quantity. Likewise, it can be said that it is predicated denominatively in an essential manner, as I showed in the *Epitome* (1. 1. q. 2. art. 2).

You will object second: a genus is predicated equally of its species, nor is one species prior to another; but continuous is prior to discrete — for from (3 phys. Tract. 68) discrete quantity is made from continuous. Therefore quantity is not a genus. I respond through a distinction: one species of quantity is prior to another in being, I grant; in predication, I deny. For although continuous participates the ratio of quantity before discrete, the ratio of quantity itself is equally predicated of both. This is evident from affirmation, which, although prior to negation (1 Perib. 4), is nonetheless equally predicated of both.

You will object third: one genus is divided by one division, from Aristotle (6 Top. cap. 3. and 5. and 7 Met. Tract. 43) and Boethius (lib. de divisione); but quantity is divided by a twofold division — namely into continuous and discrete, and into that whose parts have position among themselves and that whose parts lack such mutual position. Therefore quantity is not one genus. I respond: the major is true of formal division; for quantity is formally distributed only into continuous and discrete; but materially into quantity whose parts have position toward one another and into that whose parts are deprived of such position. Just as body is formally divided into animate and inanimate, but materially into corruptible and incorruptible.

You will object fourth: one genus has one measure, from (10 Met. T. 3. and 7.); but to quantity two measures are given — namely one and a point. Therefore

quantity is not a genus. Granting the major, I deny the minor: for it is not the point but only one (*unum*) that is said to be the measure of quantity, as the Doctor implies (1. dist. 24. q. un. §. Circa illud. Sub E.) and in the present question from Aristotle already named.

Article II: What Is the Essence of Quantity

The first opinion is followed by Saint Thomas (*opuscul. 52. in fine, and 1. part. quaest. 29. art. 1*), Albertus (*Tract. de quantitate*), and Cajetan (*in isto c.*), who affirm that the essence of quantity is measure. Bonetus seems to favor them (*propè initium libelli de quantitate*). The second opinion is held by Capreolus (2. dist. 3. quaest. 1. art. 3), Soncinas (5 Met. quaest. 21), and Javelli (*quaest. 20*), who hold that the formal ratio of quantity is divisibility into parts of the same ratio. Into this opinion are cited Scotus (*quaest. 17. praedicamentali, and 5 Met. quaest. 9*) and virtually all of his school. The third is embraced by our Doctor (4. dist. 10. quaest. 1. art. 2. §. Dico ergo. Met. and 5 Met. quaest. 9), Antonius Andreas (*ibid. quaest. 10*), Fuentes (*in Log. quaest. 15. difficultate 1. art. 2*), Tataretus, Gadius, and many others, teaching that the nature of quantity is position or extension of parts outside of parts.

Note from Scotus (2. dist. 1. quaest. 3. ante §. Hoc ergo in solutione quinti. Sub G.) and Orbellus (5 Met. c. 6): sometimes the division of a genus is effected into proper and essential differences — as animal is divided into rational and irrational; but sometimes into passions of the genus that circumlocute its quidditative and essential differences, which are hidden from us — as being is distributed into potency and act as its disjunct passions; and number into even and odd, as Scotus indicates (4. dist. 10. quaest. 1. §. Dico ergo. Sub N.). And the Philosopher clearly teaches this (2 postth. cap. 8. T. 18): "When per se differences cannot be assigned because they are unknown to us, accidental differences are provided." Hence the same Philosopher (5 of the same work cap. de quanto, Tract. 18) says that "quantum" is divisible per se — thus circumlocuting the essence of quantity through its property, which is divisibility. And he had done the same (second de generatione T. 7), saying that the primary qualities are the constitutive differences of the elements — while it is clear they are only properties and accidental differences of those elements. The Doctor (2. dist. 2. quaest. 9. §. Ad argumenta quaest. D. and E.) says the same, and Bonetus in the same place is not far from him.

First Assertion: The quiddity of quantity does not consist in the ratio of measure. So Scotus (*quaest. 17. praedicamentali. §. Ad quaest. dicendum*). Proven first: the ratio of a genus is equally participated by its species, since it is univocal to them and is univocally applied to them; but the ratio of measure does not equally belong to discrete and continuous quantity — indeed it belongs prior to discrete than to continuous, as is clear from (10 Met. cap. 2. T. 3. inde): "Properly most characteristic of one is to be a measure" — and since one is per se the principle of number, from it first the ratio of measure is derived to number, and

from number to the continuous. And there it is read: "A measure is that by which we know a quantum; but we know a quantum as quantum either by one or by number; and all number by one." Therefore the essence of quantity is not placed in the ratio of measure. Second: quantity is an absolute accident, as no one denies; but the ratio of measure is relative, as is clear from (*1 Met. cap. 2. and from 10 of the same work T. 2.*), and is touched upon by the Doctor (*Quol. 13. §. Circa 2. N.*). Therefore, and so on. Third: that to which a property is repugnant is not the essence from which that property flows, as is self-evident; but the property of quantity is repugnant to measure: therefore measure is not the essential ratio of quantity. The minor is argued from (*3. physic. cap. 4. T. 24*): the proper attribute of quantity is to be finite or infinite; but what is infinite is not measurable. Therefore the ratio of measure does not belong to infinite quantity, if it is given or if an infinite quantity — such as an infinite line — can be given; and accordingly measure cannot be the quidditative ratio of the genus of quantity. Furthermore: every measure is either active or passive, or either actual or aptitudinal; but none of these can be the ratio of quantity — not active, because a thing must be quantum before it measures another; nor passive, because it is also presupposed that a thing is quantum in order to be measured by another; nor actual, because a thing is quantum even if it does not actually fall under a measure; nor aptitudinal — which means nothing other than the capacity or property of measuring — which likewise presupposes quantity constituted in its quidditative being. Therefore in no way does the essence of quantity consist in the ratio of measure.

Second Assertion: Divisibility is not the formal ratio of quantity. This is taught by Scotus, especially in (*the 4th passage cited, ante P., and 2. dist. 2. quaest. 9. §. Ad argumenta quaestae. Sub D.*). Proven first: no relation is the proper essence of an absolute, as Orbellus notes from Aristotle in the passage cited. And the reason is that what is "toward another" is formally not "toward itself"; but quantity is an absolute genus, as none of the adversaries hesitates, and divisibility is formally a relation — for it is a capacity or aptitude for being divided, which Scotus demonstrates elsewhere to be formally a relation. Therefore divisibility is not the nature of quantity. Suárez (*disp. 40. Met. sect. 4. num. 3*) makes little of this argument, saying that divisibility can be conceived in the manner of a capacity and passive potency, and at most can be understood as including a transcendental respect — which is not opposed to an absolute being, especially quantity. But the aforesaid argument is not to be despised: for capacity is formally a relation; and even if divisibility is taken together with a transcendental respect, it is either not quantity or it is something aggregated from two genera and something per accidens — which is alien to the nature of quantity, of which we are now treating. Second: what follows upon the essence of something is not its essence, because essence is presupposed to be constituted in its being before anything follows from it; but divisibility proceeds from the essence of quantity — for an integral whole is required to be prior, before it is

divisible into its parts; for in order to be divisible, it must consist of parts into which it is divisible. Therefore the essence of quantity does not reside in divisibility.

The same is to be asserted of impenetrability, which Hurtado (*disp. 13. sect. 4*), Arriaga (*disp. 5. Met.*), and others — whom the two inseparable companions of the Scotist school (*disp. 9. phys. quaest. 1. art. 1*) seem to favor — appear to consider the primary and essential ratio of quantity. Even though quantity renders a body impenetrable: nonetheless the body is first quantum before it is impenetrable, because it is impenetrable by reason of its quantitative parts. Moreover, a formal effect does not coincide with its formal cause — especially according to the Scotists, who hold that material and formal causes have effects distinct from themselves, as is clear from (*3. dist. 2. quaest. 2. art. 1*). And in our matter (*4. dist. 49. quaest. 16*) the Doctor proves that two bodies cannot be in the same place at the same time with respect to local fulfillment. Moreover, a body can be quantum without interpenetration, according to that saying of the Apostle (*Heb. 4*): "We have a high priest who has penetrated the heavens." And this is plain from other mysteries of our faith, which Arriaga mentions in the same place. Nor is it fitting to say that this holds of actual impenetration but not of aptitudinal: since aptitudinal impenetration or impenetrability is not the formal effect of quantity, as those authors would have it, but rather its passion — just as divisibility is; for from the fact that a body is quantum, it follows that it is impenetrable and impossible with another in the same place simultaneously, as Scotus plainly and clearly teaches (*4. dist. 1. quaest. 5. sub F., and dist. 49. quaest. ibid.*). Moreover, the effect of the gift of subtlety is to render bodies penetrable; and the cause impeding their penetration is the quantity of those same bodies as filling up place, as the Doctor writes in the same place. Hence Scotus does not support them. Add that they deny aptitudinal extension of parts to be the essence of quantity; why then do they not equally reject aptitudinal impenetration — since the reasoning is the same in both cases? Finally: the expulsion — whether actual or aptitudinal — of contrary qualities from the same subject is not the essence and formal ratio of those same qualities. Therefore neither expulsion nor impenetration — whether actual or aptitudinal — of two bodies from the same place, as they mutually expel each other, can be the essence of quantity.

Third Assertion: The essence of quantity is the position of parts in a whole, and the extension of parts toward the whole and toward one another. This is expressly defended by the Doctor in (*the 4th passage prealleged*) — so that it is surprising why those two bright lights of our Seraphic Order should most recently draw him into the opinion of the aforesaid recent authors, which is certainly opposed to the Doctor himself. Since his meaning is openly apparent, why should he be led into a contrary and novel opinion? The same in the *Reportata* of the same distinction. Our assertion is also implied by Auriolus (*1. dist. 19. parte 2. art. 1.*), and is nearly common at this time, evidently gathered

from the refutation of the other opinions: for since the ratio of quantity is neither measure, nor divisibility, nor impenetrability, as I proved in the two preceding assertions, it follows that it is the said extension. Proven first: that through which a thing is constituted in its essential being is its essence or of its essence, as is self-evident; but through the extension of parts, quantity is constituted in its essential being. Therefore the extension of parts is its essence. The minor is proven: that by which something is formally quantum, it is constituted in the essential being of quantity, as is clear from Aristotle (*cap. de quantitate.*); but by the extension of parts, material things are formally quanta — such as material substance, quantity, and the like. Hence in the passage cited he explains the nature of permanent quantity through the extension of parts, or the position of parts in the whole and in relation to one another. Second: that from which the properties of quantity arise is the essence of quantity itself — just as because the properties of man proceed from humanity, humanity is the essence of man itself; but from the said extension of parts, the properties of quantity proceed: for from the fact that something is extended, it follows that it is divisible into its parts, measurable, impenetrable, equal or unequal, finite or infinite, and occupying place. Therefore, and so on. But the extension in which we locate the nature of quantity is not actual — as Scotus proves in the passage just cited — nor external and local, as is clear in the Eucharist, where the body of Christ has its proper quantity without actual and external extension in relation to place; but it is internal, or the position of parts in the whole and in themselves.

You will object first, against the first assertion: the essential ratio of some genus, common to its species, is the essence of that same genus; but measure is the common ratio to the species of quantity: therefore measure is the essence of the genus of quantity. The major is evident because a genus is essentially predicated of its species, as animal of man and brute. The minor is shown from Aristotle in the present chapter, who defines speech through measure with these words: "Speech is that which is measured by long and short syllables." And from (*4 phys. T. 117*): "Time is the measure of motion according to prior and posterior." It follows: the species of quantity are varied according to diversity of measure — for something is measured by one dimension, that is, in terms of length, and it is a line; or by two dimensions, that is length and breadth, and it is a surface; or by three dimensions — namely length, breadth, and depth — and it is a body. Also, place is posited by the same Philosopher in Logic in the passage cited as a species of quantity, which differs from surface in that place is an extrinsic measure of the located body, while surface is the extrinsic measure of the same located body. Moreover, every quantity is measurable by access or recession, or by replication. Therefore the formal ratio of quantity is placed in measure. Granting the major, I deny the minor; in response to its proof, I say that Aristotle there only indicates measure to be a property of quantity, not its quiddity. And accordingly the aforesaid definitions are not quidditative but

descriptive. By this also the answer to the consequence is evident. As for what is added about place: I say with Scotus (*quaest. 23*) that place is not a species of quantity distinct from surface, as I will show in Physics — and Aristotle implies this (*5 Met. cap. 13*), who, in enumerating the species of quantity, makes no mention of place. Thus his commentators say that in the *Logic* Aristotle was speaking in the common and popular opinion of others.

You will object second, against the second assertion: what is manifested through the definition of something is its essence, because the definition clearly notifies the essence of the defined thing; but divisibility is placed in the definition of quantity, as is clear from Aristotle recently adduced, where he defines quantity in the concrete as follows: "A quantum is what is divisible into parts that are present in it" — that is, a quantum is divisible into integral parts of the same ratio, from which the quantitative whole is constituted. It follows: the species of quantity are distinguished by divisibility — as a line is divisible according to length, a surface according to breadth, and a body according to the triple dimension of length, breadth, and depth. But the distinction of species is essential and quidditative. Therefore divisibility is the essence of quantity. I respond: the major is true of a quidditative definition, not of a descriptive one — such as is a definition given through a property, which indicates the essence of a thing when the property itself is better known, as I observed in the note just given. By the same token, the answer to the consequence is evident: for through multiple divisibility, the species of quantity are multiplied and distinguished — because divisibility, which is a passion, is better known to us than its essence, which is the position of parts in the whole.

You will object third, against the third assertion: having parts outside of parts belongs to material and corporeal substance, as the Doctor writes (*2. dist. 12. quaest. 2. §. Respondeo*). And we will show this in Physics. Therefore the position of parts in the whole is not the formal ratio of quantity. I respond: the antecedent is true of entitative parts, not of integral and quantitative parts. So the Doctor is to be interpreted in the passage noted. You will press: Scotus (*5 Met. quaest. 9*) removes parts from substance; therefore the Doctor himself is not to be interpreted of entitative parts. Fuentes, cited at the beginning of this article, responds that Scotus there speaks only argumentatively, not assertively — since his clear meaning is had in (*quaest. 17. praedicam., 2. dist. 12. quaest. 2., and 4. dist. 44. quaest. 1.*) and elsewhere. Or say that Scotus removes integral parts from material substance — which are adapted to it through quantity — but not entitative parts, which he openly defends in the cited places.

You will object fourth: if the essential ratio is located in the extension of parts, quantity will never be without such extension of parts; but quantity can be found without such extension of parts, as is clear in the Eucharist, where the body of Christ is quantum without the position of parts, since it occupies no place and exists there only sacramentally. Therefore the essence of quantity is

not placed in the extension of parts. Granting the major, the minor is to be distinguished: without the extension of parts in the whole and among themselves — which is called internal extension — I deny; without the extension of parts in relation to place — which is called circumscriptive external extension, or position of site, as Scotus says (*dist. 10. quarti, quaest. 1. ante N.*) — I grant. These and similar matters are to be examined and illuminated abundantly and precisely in Physics, in the book on quantity.

Question VI: On Relation

Article I: Whether There Is One Genus of Relation Distinct from Others

That relation intrudes and mingles into nearly all the categories, so that there is no genus proper to relation — this is what Zeno and other ancient philosophers are reported to have suspected, according to Averroes (*5 Met. commento 20*), Albertus (*Tract. de relatione cap. 1*), and Rubius (*c. de ad aliquid quaest. 1.*). Against them stand Plato, Aristotle here, Scotus (*quaest. 25. praedicam., and 2. dist. 1. quaest. 4. §. Etsi dicas. E., and §. Ad 1. Sub G. in solutiones*), and all subsequent philosophers, who assert and admit one category of relation distinct from the rest — with the exception of a few recent authors whom Arriaga follows. For Arriaga (*disp. 12. sect. 7*) does not consider it inconvenient to deny a peculiar genus of relation, saying: "No sacrament of the Church is being removed, nor any precept of the Decalogue; for the category of relation is retained only as a manner of speaking." To which one may say: although no mystery of orthodox faith is removed from Philosophy by denying the genus of relation, yet the common doctrine and established assertion of philosophers and theologians is thereby removed from it — and it is rash to expose oneself to that, especially because it is opposed to reason and truth, and many absurdities follow therefrom, to be adduced below.

Note first: although Vorrilonius (*c. dist. 30*) establishes some distinction between respect, relation, and habitude, as Pelbartus reports (*Tomo 1. verba Relatio. §. Secundo*), nevertheless Scotus (*in 2. praecitatus E.*) considers those three to be synonyms, and that respect and relation are used promiscuously by philosophers, as Hurtado notes (*disp. 15. sect. 1. §. secundo*). By whatever name it may be called — whether "to something" (*ad aliquid*), as Plato named it; or "relation," as Aristotle called it; or "habitude," as our authors sometimes called it — it means nothing other than the principle of referring and the habitude of one thing toward another, as the Doctor teaches (*in praedicamentis q. allegata §. Dicendum*), and the Anglicus agrees (*quaest. 24. universalium fol. 94*). Moreover, a relation, from the same Doctor (*in 2. cit. Ante §. Hoc ergo*): by reason of its meager entity — which it has in its foundations — it is not known to us except through those very foundations, since it has more tenuous being in them, as the Doctor says (*12 Met. pag. 366. in Not.*). Hence from their cognition we arrive in some way

at knowledge of relation. This is also noted by Orbellus (*5 Met. c. de relatione*). Hence Aristotle deliberately in the present chapter describes relatives as "those whose entire being is to be toward another" — intending thereby to indicate the definition of relation. For if a relative is "toward another," consequently relation is the respect by which a relative is toward another, or by which it regards another, as Scotus rightly notes (*in praenominata quaest. praedicam. verf. Ad 1. istorum*).

Note second, from the common judgment of philosophers: just as being per se is substance, so being in another is accident. Since, however, accident has a manifold mode of being or inhering in another, there results a manifold accident and a manifold genus of accident. As concerns our matter chiefly, one accident is absolute — which is "toward itself"; and another is relative — which is "toward another." Although the ratio of accident, signified by "being in another," is common to both and is essentially predicated of both, nevertheless a distinction exists between them: for the absolute is "toward itself," while the relative is "toward another," without which it cannot be — since "being toward another" is the proper quiddity or difference of relation, by which it differs from the absolute. So with Augustine (*7 de Trin. cap. 1 or 6*) the Doctor diligently notes (*1. d. 11. q. 2. §. Ad rationes D., and Quol. 3. §. De tertio. and §. Respondeo., and q. 39. praedicamentali §. Notandum pro quaestione*), and Faber (*1. disp. 22. cap. 1.*). Thus two things are included in relation: one is "to be in," which is participated by every accident and by which it differs from substance; and the other is "to be toward another," which is the proper and formal ratio of relation, by which relation itself is distinguished from everything else that is not relation. This is noted, after Scotus (*1. dist. 26. quaest. un.*) and Vorrilonius in the same place, by Pelbartus in the place just cited. Whether "to be in" and "to be toward" belong to the essence of relation or not is disputed among the scholastics and must be scrutinized elsewhere by us.

First Assertion: Relation is a genus, and one of the ten highest genera. So Scotus in the passages cited, and Lychetus (*2. dist. 1. quaest. 4.*). Proven — first part: what is predicated of many differing in species "in what" is a genus; but relation is predicated of many differing in species "in what"; therefore relation is a genus. The major is known through the place from definition to defined. The minor is proven: relation is predicated of relations of equiparance and disquiparance and others which are its species, as I plainly showed in the *Epitome*, where I presented the series of the category of relation. And Scotus expressed this (*in 2. ut. Ad 2.*) with these words: "I say that relation has its distinction into its species, just as another genus has its distinction into its species." Moreover: what possesses a generic ratio is a genus; but relation possesses a generic ratio; therefore it is a genus. The major is evident; the minor is argued: the generic ratio is what essentially belongs to many differing in species; but relation — which is the habitude of one thing toward another — essentially belongs to many differing in species, namely to the relations of its

superposition and supposition. And likewise, all relations in the same manner denominate a substance in comparison to another; therefore relations participate in the same generic ratio, and accordingly there is a genus of relation. The second part is proven: the highest genera are those that acknowledge no other genus above themselves; but relation has no other genus above it; therefore it is a highest genus. The major is plain to all philosophers. The minor is evident: because above relation there are accident, being, and whatever else there may be — but these are not genera, but transcendentals. Moreover, the ten highest genera are derived according to the ten modes into which finite being descends, as I implied (*q. 3. of this lib.*); but relation is a genus through one of the nine modes of accident by which substance is affected. For just as substance is extended through quantity and qualified through quality, so likewise through relation it is compared to another. Therefore relation is a highest genus.

Second Assertion: Relation is a genus distinct from the other genera. The Doctor holds this in the passages cited, and (*Quol. 3. §. Respondeo sub P.*) with the common school; and it follows from what was said above, and can be argued thus: what acquires a generic ratio disjoined from others is a genus disjoined from others, as is clear from Aristotle (*12 Met. T. 21*), who says: "The ratio of one category is not an intrinsic principle of another category." Lychetus approves and explains this (*praecit. §. Respondeo ad omnes istas solutiones*). But relation acquires a generic ratio different from the other genera — which is the principle of referring to another. And likewise relation has distinct differences, species, and individuals, as can be seen in the catalogue of relation. Therefore relation is a genus distinct from the other genera.

You will object first, against the first assertion: if relation is a genus, it is either a genus of substance or of accident — since no genus is found to mediate between the two; but relation is neither. It is not a genus of substance, as all acknowledge; nor a genus of accident, since an accident is "in another," while relation is "toward another." Therefore relation is not a genus. Granting the major and the first part of the minor, the second part is to be denied; and in response to its proof I say that relation has "to be in," which is common to all accidents, and has "to be toward," which is the distinctive ratio of relation itself from everything else that is not relation.

You will say: relation has its entire being "toward another," as Aristotle and Scotus write in this place; therefore relation does not have "to be in," since "to be in" and "to be toward" differ from one another, and accordingly relation is not a genus of accident. I say that in the definition of the relative and of relation as presented, only its formal ratio is placed — presupposing the common ratio of accident, as not infrequently happens in other descriptions, as Bacon (*1. dist. 28. quaest. 2. art. 4*) and Suárez (*disp. 47. Sect. 5. num. 3*) note above all others. For it is

plain that relation is in some foundation or subject, as the Doctor clearly explains (*4. dist. 12. quaest. 1. §. Ad quaest. respondeo, conclusione secunda ante. E.*).

You will object second: a genus is common and univocal to its inferiors; but relation has nothing common and univocal; therefore relation is not a genus. The major is evident, because a genus is essentially included in its inferiors. The minor is shown: to being and non-being there is nothing common and univocal; but certain relations are beings, while certain are non-beings. Therefore there is nothing common and univocal to relation. The major is known: for between contradictories there is no middle term, from (*1 posth. T. 5*). The minor as regards the first part is clear — for instance paternity, and other relations both in the divine and in creatures are real relations; as regards the second part it is argued: between being and non-being there exists contradiction — which is a relation — and since between contradictories no middle is interposed, it follows that such a relation is a non-being, or a relation of reason. Granting the major, I deny the minor; in response to its proof, I also grant the major but deny the minor — because contradiction is not a species of relation. For as Scotus notes in the same place, from (*6 Met. cap. 2.*) real being of itself — that is, real finite being — is divided into ten highest genera, which from what was said are distinct coordinations of things. But a relation that is understood between contradictories, taken in second intention, is only a relation of reason, as the Doctor also notes (*ibid. ante vers. Ad 2. principale*).

You will object third, against the second assertion: what is turned and mingled in other genera is not a genus distinct from them; but relation is of this kind — for in the genus of substance there are relations of identity and diversity; in the category of quantity, relations of equality and inequality; and in the category of quality, relations of similarity and dissimilarity. Therefore relation does not constitute a genus distinct from others. I respond through a distinction of the major: what is mingled in other genera does not constitute a genus distinct from the rest — if we speak of essential mingling and inclusion, such that the thing, losing its proper essence, passes into the essence of those in which it is enclosed, I grant; but if we speak of accidental mingling and inclusion while retaining its proper essence, I deny. With this distinction of the major, the minor is also to be distinguished: for relation is involved in the other categories accidentally, not essentially. So Scotus responds in a similar case (*in 1. suprà allegato*) when he says that a divine relation is included in the essence really, and is not formally identified — since relation does not pass into the divine essence according to its quiddity, but always remains in it in its quidditative being, even though they are really the same.

Article II: What Is the Highest Genus of Relation

Since to every relative there corresponds its correlative, as Scotus indicates (*1. dist. 21. q. un. §. Ad 1. argumentum D.*) — for a relative taken universally is "toward another," and is said "at convertibility" (*ad convertentiam*), as is clear from its

definition: for a relative in the singular is that whose entire being is toward another; and relatives in the plural are those whose entire being is to be toward another, from Aristotle in the present chapter — hence Porphyry (*cap. de genere*) adds that in the definition of relatives there are placed the correlatives, on account of the mutual dependence which they acquire from one another. Bonetus recalls this dependence of the related in (*praedicamento libello 4.*) and reasons about it clearly there. For this reason it is not without point to inquire whether only the relative is the genus of this category, or its correlative, or both at once. Again, since in each highest genus there exist concreta and abstracta, it is not unreasonably investigated whether the highest genus of this category is relation or the related or relation and the related together. Setting aside other positions adduced and refuted by our two young contemporaries (*disp. 8. quaest. 9.*), I present only three: the first is that of Albertus (*in hoc Tract. cap. 2.*) and certain others who consider the highest genus of relation to be "the relative"; the second is that of those whom Rubius follows (*quaest. 3. of this c.*), who affirm that the highest genus of this category is "relation in common" in the abstract, and "the relative in common" in the concrete; the third is that of Scotus (*quaest. 25. praedicam. §. Dicendum in solutione 3. and verf. Ad tertiam igitur.*), Fuentes (*q. 16. diff. 5. art. 2.*), Orbellus (*5 Met. c. de relatione*), Fonseca (*5. Met. c. 15. q. 6. sect. 2. 3.*), and many others, who teach that the highest genus of this category is not properly the relative, but relation — which is the principle of referring.

The divisions of relation, its definitions, differences, and conditions, which I adduced and explained in the *Epitome* (*lib. 1. quaest. 2. art. 8.*), should be reviewed. Moreover, the relation of this category is not of reason but real: because real finite being is common to ten categories, as the Doctor notes (*1. dist. 8. quaest. 3. §. Teneo opinionem. N.*); and the categories are coordinations of things, from the same Doctor (*2. dist. 3. quaest. 4. §. Contra istam conclusionem.*). Nor is it a relation "according to being said" (*secundum dici*) — which belongs to those things that are denominatively only relative and essentially absolute; but it is a relation "according to being" (*secundum esse*) — which belongs to those things that are formally and essentially relative. Nor is it an extrinsically adventitious relation — which does not necessarily arise from the extremes once posited, unless some condition is added, and which pertains to the six last categories — as I will show against Adversaries in (*q. 8. art. 1. of this book*); but it is an intrinsically adventitious relation, which necessarily emerges from the nature of the extremes. Wherefore the predicamental relation is a real relation according to being, intrinsically adventitious, really distinct from its foundation. Nor should the difference be omitted that exists between a transcendental and a predicamental relation, which philosophers dispute. Leaving aside the quarrel of outsiders, I present only the contention among our own. For Tataretus, Lychetus (*2. disp. 1. quaest. 5. §. nunc solvenda*), and Faber (*5 Met. disp. 20. cap. 2.*) assert that a transcendental relation is one that wanders through several genera and belongs to no determinate genus, and belongs to being before it is

distributed into ten categories. A predicamental relation, however, is one that constitutes a peculiar category — which is commonly called the category of relation — or one that has its proper place in the category of relation. But the two new Scotists (*disp. 8. quaest. 1.*) try to show that this is not a certain and adequate distinction and precise cause of such relations, saying that many relations — such as aptitudinal ones — which are really identified with things placed in a determinate genus would be predicamental, since those very relations are in a certain genus — namely in the one in which the things are whose aptitudes and inclinations they are; but it is held by everyone as certain that only relations of the fourth genus, or those pertaining to the six last categories, are predicamental. Hence they add that their adequate distinction must be sought from elsewhere — which they think is placed in the fact that predicamental relations are accidental to their foundations and are separable from them; while by contrast, transcendental relations are those that are really identified with their foundations and are inseparable from them. That Mayronis (*1. dist. 19. quaest. 1. art. 3.*), John of the Masters (*in hoc cap. quaest. 1. dub. 3.*), and others hold this, the aforesaid authors report. I, however, to speak candidly: the earlier Scotists seem to me to approach the truth and the mind of Scotus more closely than the later ones. For the Doctor (*1. dist. 8. quaest. 3. ante §. Alii probant. N., and dist. 19. quaest. 1. §. de secundo C., and 2. dist. 1. quaest. 5. §. Ad argumenta principalia. P.*) openly sets forth his opinion — which is the very one we recited above. Nor does the argument advanced by the Recentiores against it have any force: because aptitudinal relations (which Scotus recalls in (*Report. 2. dist. 1. quaest. 7. ad finem, and Quol. 13. §. Circa secundum. O.*)) reside only reductively in the category of those things of which they are the aptitudes and inclinations, as Tataretus and other Scotists note in the same place; and the discussion in the present place is of a relation that is placed per se in the category — which is actual, and possesses all the conditions previously described.

Assertion: Not the relative in the concrete but relation in the abstract is the highest genus of the category of relation. This is thus derived from Scotus in the passages cited, especially (*quaest. 25. praedicamentali*), where he openly teaches that the most general genus of relation is relation itself, or "habitude toward another"; and it militates against our two recent authors (*disp. 8. quaest. 9.*) who argue against John of the Masters and Fonseca who maintain the assertion proposed. Proven first: in the categories of accidents, their abstracta are placed per se, as was proven above (*quaest. 3. art. 5.*); but the category of relation is one of the categories of accident, as is clear. Therefore relation in the abstract is its highest genus. Second: all the species of relation — whether subaltern or lowest — and their individuals agree univocally in the common ratio of relation, which I previously said to be the principle of referring, and is equally and essentially predicated of all of them: for all relations of equiparance, disquiparance, superposition, and supposition are principles of referring and habitudes toward another. Therefore relation in the abstract is the highest genus of this category.

The authorities and arguments that I adduced in the place cited pertain here, with the common words of those authorities changed only to the particulars of this. The reason for doubt proposed at the beginning of this article causes us no trouble: because relation is not referred toward another as the relative is referred; but it is only the form and principle of referring, by which, namely, the relative is referred to another. Hence the occasion for inquiring what the highest genus of this category is ceases — for in our opinion it is evidently relation in common, described above. And likewise no occasion for doubting remains as to whether one or two genera of relation are to be admitted: for it is certain, persisting in the same opinion, that there is only one genus of relation — just as there is one genus of quantity and one genus of quality.

For the sake of discussion, if you wish to constitute the relative in the concrete as the highest genus of the category of relation — as the genus of quantity has "quantum" and the genus of quality has "quale," as Aristotle seems to hold (*5 Met. c. de quanto, and c. de quali*), and which has some probability in the teaching of Scotus (*q. allegata ad finem §. Etsi forte, and ibid. paulo ante, verf. Contra hoc si relatio, and verf. Item concesso*) — you may argue thus: to every abstract there corresponds its concrete; if therefore there is given relation in common — which is an abstract name — it must be conceded that there is a relative in common — which is its concrete. But the difficulty does not seem to be resolved so easily. For since the relative is referred to another, or to a term, it must be investigated whether the term which the relative regards belongs to the same or to a diverse genus; whether the term is in common — as the relative is in common — or in particular. To this doubt I would think, following the mind of Scotus, that just as the relative is in common, so its term is in common; and since from the same Doctor (*1. dist. 30. quaest. 1.*), relation terminates at the absolute, it does not follow that the term itself belongs to the same genus of relation or constitutes another genus of relation — which is clear for non-mutual relatives, and for mutual relatives will be shown below. And in this opinion so explained, no scruple seems to remain to be further dissolved.

But if against this doctrine you object that Scotus (*quaest. praedicam. citata, propè finem, vers. Ad secundam prius positam, and 1. dist. 21. q. un. §. Ad 1. argumentum. C.*) teaches that the relative in common is not referred to the term in common but to some term among its inferiors — to make his sense clearer, I here append his express words: "I respond that in all relatives of equiparance, the common taken in itself, as it is common, is not referred — because insofar as it is common, it is abstracted from all relatives or terms of relations; for a real relation is only of what is distinct to what is distinct; but if as such it were referred, it would be necessary to give there a term related distinctly to it; and therefore it would not be referred to something of the same ratio as the related, but to something of another ratio. Therefore such a relative is referred only for its inferior: as 'similar' is not referred for 'similar in common' to 'similar,' but for some inferior that can be distinguished from the similar to which it is referred; and likewise it

is so of 'different.' For it is not referred to 'different in common' as if to a first correlative, as if there were two first extremes of the relation, each most common, to every different; but 'different' is different from this different. And if you object that a relative gives first understanding of its common correlative, I respond: such a correlative is its correlative as common only insofar as it is taken for some inferior for which it can be distinguished from the correlative. An example of this in things: if the entire nature of fire were in one individual, that individual could not generate — since if so, it would generate another fire in which there would be the entire nature of fire, and there would be as it were two species of fire, which is impossible. And yet now in one individual the nature of fire is the ratio of generating, because it has sufficient unity for an active principle and sufficient distinction. So this similarity is the ratio of referring, or of terminating the relation; but it neither refers nor terminates unless it is taken for a distinct thing in which it is — so that neither unity nor distinction is per accidens, but each is per se with respect to such a relation, as was said in the question on circumincession." These by no means hinder us, because Scotus in the place cited speaks only of relatives of equiparance, as is clear from his words prefaced; and he does not treat of the relative in common, which prescribes from both relatives of equiparance and disquiparance, as the Conimbricenses (*quaest. 2. art. 1.*) of this chapter, our recent authors cited above, and Suárez (*disp. 47. Met. sect. 17*) rightly observe.

You will press from the same Doctor (*q. praedicamentali adducta, and Gadius in principio Quol. 6.*): relation is the principle of referring to some relative according to the same form. Therefore every relation and all relatives are relatives of equiparance — and accordingly the distinction above is useless for resolving the doubt about relatives of equiparance and about the relative in common abstracting from relatives of equiparance and disquiparance. Scotus responds in the same place just cited that the relative of equiparance is equivocal: for taken properly it is a relative according to the same form in species, from which one name is imported — which is said of both extremes of such a relation, such as "similar," "equal," and the like, of which the Doctor gives an example in the passage cited; but in a transposed sense, that is called a relative of equiparance which denominates both extremes under the same name, even though that name is not imported from one form in species — and in this second sense I grant that the relation which is the most general genus is a relation of equiparance, and the relative denominated by it is similarly a relative of equiparance. For a relative is divided into a relative's relative; but relation taken in the first sense is a species of this fourth genus.

You will press: in whatever way a relation of equiparance is the most general genus, it follows that all inferior relations are in that way such — which seems inconvenient, since paternity, filiation, and all relations of superposition and supposition are in no way relations of equiparance, because they do not denominate both extremes under one and the same name. The same Doctor

satisfies this (*ibid.*), saying that every inferior relation is one of equiparance, or a principle of referring to something said according to the same form in genus — where also both extremes are named by the same generic name, even though not every relation is a principle of referring to another according to the same form in species; nor is it the case that each extreme is named by the name of the species. For a father is called "relative of a relative" according to the form of his genus, even if he is not called such according to the proper form of paternity — because according to the proper form of paternity he is called a father.

Against this Rubius presses (*praecit. q. 3. c. 7.*), taking this middle term which is Scotus's, at the end of the question cited, (*verf. Contra illud.*): in inferiors the essential ratio of a superior is included, as in man and brute the essential ratio of animal — which is the ratio of the sensitive — is included. But the common essential ratio of any relative is to be referred to another, that is, to be referred to a term. Therefore such a common ratio belongs to every relative; and accordingly the relative in common regards the term in common — just as the relative in particular regards the term in particular. It follows: just as this father is the father of this son, and this father regards this son, so too "a father" is a father of a son, and "a father" regards "a son." Therefore the relative in common has the term in common. One may say: granting the major, in response to the minor — the ratio of the most general relative is not properly "to be referred to another" (for this belongs to the relative), but is habitude or principle of referring, by which the relative is not referred but relation refers; as the Doctor writes in the question: just as action is not acted, but is that by which the thing is acted; and likewise place is not located, but is that by which a body is located. In response to the consequence: I say this holds of relatives, but not of relation — which is the most general genus.

You will press from Scotus (*sub fine q. 4. Top. c. 4. locus 48.*): if a species is "toward something," and the genus is "toward something" — therefore if the species is the principle of referring to another, likewise the genus is the principle of referring to another. Again, it is repugnant for the highest genus to be a habitude toward another and yet not to render its subject as one bearing itself toward another, or as regarding a term. One may say: the most general genus of relation is "toward another" not through a diverse but through the same form, because from what was said it terminates not to a relative but to an absolute. By this also the other argument adduced is answered.

Against this: no absolute term can be found toward which the relative in common is borne. Therefore the aforesaid objection is escaped rather than dissolved through the distinction alleged. The antecedent is proven: that term cannot be substance alone, nor quantity alone, nor quality alone (which three are shown below to be the distinct foundations of distinct relations) — otherwise every term of a relation would be one of those three, which is not consonant with truth. Moreover, if the relative in common is referred to an absolute term,

it follows that every inferior relative is referred to an absolute term — which is false; for a father is referred to a son, and a teacher to a pupil, as to his correlative. The antecedent is argued: the inferior relative essentially includes the superior relative; therefore if the superior regards an absolute term, likewise the inferior terminates at the absolute. The antecedent is to be denied; in response to its proof one may say that the term of relation abstracts from substance, quantity, and quality. For being is first divided into absolute and relative before the absolute is subdivided into substance, quantity, and quality. In response to the other argument: the inference from the antecedent is granted, and no inconvenience follows — as will be evident below in the proper article. All the more so because, as the Doctor notes (*1. dist. 21. q. un. ante §. Ad 1. argumentum*), the correlative is not of the understanding of the correlative as something of it, namely as an essential or integral part, but as something toward which the understanding of it terminates. And hence, according to the same Doctor (*d. 30. primi P. 2. §. Ad 1. q. M.*), a relation necessarily co-requires for its being the term which it regards.

Article III: Whether There Are Real Relations

Vorrilonius — in his time the head and prince of theologians, as the Tossignano History of the Seraphic Order testifies — (*1. dist. 30.*) and Pelbartus (*1. Rosary, verbo Relatio, §. 1.*) report that Zeno, Socrates, and other ancient philosophers denied all real relation; and certain theologians subsequently followed them, among whom Auriolus is counted (*1. dist. 31.*), where through three articles he disputes at length and acutely about divine and created relations; and John Bacon cites him (*1. d. 28. q. 1. art. 2.*). The opposite opinion is maintained by Plato, Aristotle (*in Log. c. de Ad aliquid, and 5 Met. c. 15.*), Saint Thomas (*ibid., and 1. p. q. 13. art. 7.*) and elsewhere, Scotus both there and (*2. d. 1. q. 4. §. Et quia posset, ante C.*), Bonetus (*libello 4.*), and nearly all subsequent philosophers and theologians — from whom Bacon was unwilling to depart in the passage cited — who admit real relations.

Note first: there are three kinds of things, of which two are mentioned by Tataretus in the present passage (*dub. 2.*). The first is that of things whose being is complete in itself and is not ordered to another — such as absolute beings, so called as though released from all respect and order, which are called most especially complete and perfect substances, such as man, lion, and the like. The second is that of things which, being essentially imperfect, are ordered to another outside themselves — to such an extent that they cannot be fully understood without such an order, even though they are not that order but something else beyond the said order — such as incomplete substances, namely matter and form: for matter is a kind of imperfect being which together with form is ordered to constituting a physical composite. The third is that of things much more imperfect, whose being not only is in order to another, but is nothing other than order and respect toward another — such as paternity,

filiation, and the like. This doctrine is explicitly transmitted by the Doctor (*12 Met. pag. 336. in notabili.*), and is plainly implied (*2. d. 1. q. 4. §. Secundum membrum ante O.*). The question is now raised: whether that order and habitude toward another — which is relation itself — is from the side of the thing or is made by the work of the intellect. Two opposing opinions on this have been recited at the beginning of this article; Suárez treats of them at length (*citatus sect. 1.*).

Note second, from the same Doctor (*1. d. 31. q. un. §. Ad q. videtur dicendum. A., Quodl. 6. §. De tertio. LL.*), Pelbartus (*praecit. §. 7.*), and Orbellus (*5 Met. pag. 699.*): a real relation requires three things. First: real extremes, so that in the ratio of founding and terminating it does not depend on the intellect. Second: extremes really distinct — for there is no real relation of the same to itself. Third: the relation must arise from the nature of the extremes, apart from any operation of the intellect and any comparison of an external power. For this reason Scotus had noted (*quaest. 25. praedicam. verf. Ad 2. princ., and Quol. 13. §. Circa secundum, ante O.*) that a relation is of reason when both extremes, or one of them, is a being of reason, or because two things are not its extremes except through the consideration of the intellect — as happens in the relation of identity of the same to itself.

Assertion: Real relations are to be conceded. Scotus openly defends this (*ubisupra, and in Report. 2. d. 1. q. 7. J. Teneo.*). Proven first: the categories are coordinations of real beings, from what was said (*q. 3. art. 1. of this book*); but relation is one of the ten categories, as I proved in (*art. 1. of this q.*). Therefore real relations are not to be denied. Second: every real being is either absolute or relative, as after Scotus (*quaest. 25. praedicam., and in Report. loc. cit.*) Sirectus notes (*Tract. formalitatum art. principali*); and this is declared in the first note; and Aristotle does not dissent (*in hoc lib.*) — who establishes a peculiar genus of relation distinct from substance, quantity, and quality, which are absolute; but these are real, therefore relation is real, whose catalogue is presented by Aristotle (*5 Met. c. 15. T. 20.*). Third: what is perceived by sense is real, since sense is neither a reflexive nor a comparative power, as is clear from (*2 de anima T. 152. and 156.*); but relation is perceived by sense — such as the equality or inequality of two walls, the similarity or dissimilarity of the same. Likewise, cacophony and symphony are relations perceived by hearing: the former injures the hearing, the latter delights it. Again, distance and approximation of bodies, and their simultaneous locality, are discerned by sight. Therefore real predicamental relations are to be conceded. Fourth: the unity of the universe consists in the order of parts among themselves and toward one single first principle, from (*12 Met. T. 52*) — just as the unity of an army consists in the order of soldiers toward one another and toward one commander; but that order is relation without anyone thinking it, as the Doctor writes (*1. d. 30. q. 2. q. Respondeo ergo. E.*). Hence those who reject the real predicamental relation make the substance of the universe incoherent, as from Aristotle cited the same Doctor objects to them. Fifth: a composite cannot be made without the union of its component parts;

for with the parts disjointed there is no composite whole; but the union of parts is a relation apart from any operation of the intellect, as will be more evident in Physics (*q. de toto.*). Again, no effect can come about without the proportion and approximation of causes, as experience shows; but proportion and approximation are relations not depending on the intellect; therefore they are real relations. Moreover, mathematics demonstrates many relations about its subjects — such as equality of two right angles, and inequality of the three angles of a triangle; and equality and inequality are relations founded upon the unity of quantity. Finally, the mystery of the adorable Trinity is constituted from real relations of origin, as I made clear in (*Tract. de Deo trino*); and the ineffable mystery of the Incarnation of the Divine Word is not without a relation or union of the assumed human nature to the very Word that assumes — as I similarly showed in (*Tract. de Deo Incarnato*). Therefore real relations are to be admitted — and these reasons are of great weight, whatever Suárez may contrive to the contrary in (*loc. praecit. n. 14.*).

You will object first: what presents a negation or privation is not something real and positive, as is clear from the terms themselves; but equality — which is numbered among relations — signifies a privation, as the Philosopher indicates (*10 Met. T. 17. and inde*), saying that "equal" is opposed to "great" as two privations — for equal is that which is neither greater nor lesser. Therefore no genus of relation is to be introduced into the schools as something real and positive. It follows: equality is unity in quantity; but unity formally signifies a negation — for it is the same as "indivision," from (*3 Met. T. 3.*). Therefore equality and any other relation is not something real. I respond: granting the major, I distinguish the minor — in terms of name, I grant; in terms of the thing, I deny — as I showed at length in (*Tract. de Deo trino disp. 5. quaest. 6.*). In response to the consequence: similarly granting the major, I deny the minor. For unity is a real positive property of a real being, as I demonstrated in (*Met. quaest. de ente*). So Aristotle is to be explained in the passages cited.

You will object second: what receives being only from the intellect is not real; but relation receives being only from the intellect. Therefore it is not real. The major is evident; the minor is proven: relation is a comparison of the intellect comparing one thing to another — as the similar to the similar or to the dissimilar, the equal to the equal or the unequal. First consequence: Aristotle (*6 Met. T. 8. cap. ult.*), distinguishing real being into ten categories, writes that real beings are either quality or quantity or whatever else "the mind couples or divides." From this it is clear that the Philosopher himself wants certain categories to be beings of reason — as those that depend on the operation of the soul — and among them relation is to be placed, since it is of minimal entity, as Scotus notes (*quaest. 25. praedicam.*) after Averroes (*12 Met. comm. 19.*). Second consequence: the relations of number are from the soul — otherwise there would be real actual positive infinity. Therefore relation is not real but of reason. The antecedent is proven: given some double, in it there is the relation of the

double to the half, and the relation of the triple to the third part, and the quadruple to the fourth part, and so to infinity. Add the relations of dominion and servitude and those that follow voluntary obligation — these seem to be relations of reason. Granting the major, the minor is to be denied; in response to its proof I say there is a twofold comparison: one that is drawn from the nature of things — which is the habitude of two things mutually regarding each other, and this is real, without the operation of the intellect; and another that is made only through the intellect constructing order and habitude between things that from the side of the thing have no such habitude — such as the relations of genus to its species and of species to their individuals. The Doctor recalls this twofold comparison (*Quol. 3. §. Respondeo sub P.*). In response to the first consequence: I say that Aristotle immediately disapproves of that, arguing against those of the opposite opinion, as Bacon rightly notes in the passage cited (*art. 2.*). In response to the second consequence: I distinguish the antecedent — relations of numbering number (*numeri numerantis*), I grant; relations of numbered number (*numeri numerati*), I deny — as will be plain in Physics. As for the other point added, I say that relations of dominion are founded in coercive power — which is real and positive; hence relations founded therein are real, as Scotus implies (*2. d. 1. q. 4. §. Contra istam opinionem arguo, ante A., and 4. d. 6. q. 10. §. Hic dicitur infra*).

You will object third: every real being (except God) has a real efficient cause — as Aristotle and nearly all other philosophers subscribe in one voice, and we demonstrated in (*Tract. de creat. disp. 1. q. 17.*); but relation has no real cause. For to something white existing in Avignon there comes the relation of similarity — even though nothing is effected in it — merely because at Aix another white thing is produced. Therefore no real relation is to be admitted. Granting the major, I distinguish the minor: relation has no cause through motion and change, I grant; through simple emanation and resultance, I deny. Thus when two quanta equal to each other are posited, the relation of equality results between them; and given two white things, the relation of similarity arises between them. The aforesaid distinction of causes is to be explained in Physics.

Article IV: Whether Relation Is Distinguished from Its Foundation

Two opinions prevail among philosophers and theologians on this article. The prior is earnestly defended by the Nominalists, who deny that relation is distinguished really or formally from the foundation upon which it rests — but only by reason. So Ockham (*1. dist. 30. quaest. 1.*), Gabriel, Gregory, and others — and from these Suárez (*Tomo 2. Met. disp. 47. sect. 2.*) and Hurtado (*disp. 15. sect. 2. §. 7.*) do not dissent. The latter opinion is firmly maintained by the Realists, who affirm that relation is distinguished from its foundation — some really, others formally. The chief patron of this opinion is the Subtle Doctor (*2. dist. 1. quaest. 4. §. Iuxta istam opinionem. I., and 3. dist. 1. quaest. art. 3. §. Ad illud in oppositum. R., and Quol. 3. §. Respondeo.*), whom follow Lychetus, Gadius in the same place,

Pelbartus (*praecit.* §. 3.), Bonetus (*libello* 4. §. *Amplius autem Dicamus.*), Tataretus here (*dub.* 2.), and all the Scotists — and many Thomists cited by Suárez and Rubius (*quaest.* 14.) do not seem to contradict them.

Note first: relation requires two extremes, of which one is called the foundation and the other the term. The foundation is the root or principle from which relation proceeds and in which it is grounded; while the term is that toward which or at which relation itself is borne. The foundation, moreover, from Scotus (1. *dist.* 19. *quaest.* un. A.), Lychetus (*ibid.* §. *Respondeo.*, and *Quol.* 12. §. *Respondeo* C.), and in (*Reportata* 2. *dist.* 1. *quaest.* 7.), is divided into remote or material and proximate or formal. The remote has already been described by us above — it is that very thing which founds the relation, namely substance or quantity or quality. The proximate is the ratio of founding, recalled by the Doctor in (*Quol. praecite. fin.*), without which from the remote foundation the relation would not arise — such as the generic or specific unity of substance, quantity, and quality. Now since the three principal remote foundations of relation are those already implied by us above — namely substance, quantity, and quality — three overall distinct relations can be enumerated, founded in the aforesaid foundations. In substance are founded the relations of identity and diversity; in quantity, the relations of equality and inequality; and in quality, the relations of similarity and dissimilarity. And the unity of substance, quantity, and quality is the proximate foundation of the relations of identity, equality, and similarity; while the diversity of substance, quantity, and quality is the proximate foundation of the relations of diversity, inequality, and dissimilarity. The Doctor further notes (4. *dist.* 6. *quaest.* 10. §. *Hic dicitur D.*) that although the said foundations are properly accommodated to the aforesaid relations, nevertheless all such relations can be metaphorically adapted to any genus of them taken precisely. For in every genus taken precisely there are found in their own way quiddity, quantity, and quality, and their unities — in which the relations just enumerated can be founded. For according to its substance or quiddity something can be said to be the same or diverse with respect to another; according to its quantity taken virtually, equal or unequal; and according to quality, similar or dissimilar.

Note second, from Scotus (2. *dist.* 1. *quaest.* 4. §. *Contra istam opinionem arguo*), after Aristotle (7 *Top. c.* 1. and 2.): some problem or proposition can be rejected or received through an invented and given contradiction — as if one were to assert: "Matter and form are the same." The opposite of this is established through the contradiction to be immediately introduced. "What exists while another does not exist is not the same as that other — otherwise it would be the same as it and not the same as it: the same by supposition; not the same, because it does not persist when the other persists — which are contradictories." But matter exists, or at least can exist, while form does not exist, as we will show in *Physics* (*q. de materia.*). Therefore matter and form are not the same. The Philosopher uses this mode of argumentation (1 *physic. T.* 60., and 2 of the same work *summa* 2. *cap.*

3., and also 4 of the same work cap. 2.), where he proves that place is distinct from what is placed in it — because, with the located body perishing, the place does not perish. Hence the Doctor adds in the same place and (*Quol. 3. sub P.*) the rule for knowing the identity or diversity of certain things: that which belongs to something in such a way that there would be an absolute contradiction for it to exist without that other — that is really the same as it; and by contrast, where there is not an absolute contradiction, it does not follow that they are in every way the same.

Note third — this must be presupposed from (*Met. q. de accidente*), and Gadius observes it (*Quol. 3. fol. 41. columna prima*), from Scotus (*ibid.*, and 4. *dist. 12. quaest. 1.*): there is a twofold inherence of an accident — actual and aptitudinal — and neither enters into the essence of the accident, as Scotus indicates (*Quol. allegato §. Ad argumentum principale 5.*). Moreover, an absolute accident can exist by divine power without actual inherence, as faith establishes from the accidents of the Eucharist separated from every subject; but not without aptitudinal inherence, which is its property really identified with it and inseparable from it. But a relative accident can in no way exist without actual inherence, because it is really the same as it — as Gadius observes in the same place, and proves through the rule of Scotus adduced by us in the second note. Thus a relation has actual being "toward another" which it regards — and while this lasts it endures, and when it is removed, the relation is removed. So while the son — whom the father regards — persists, the relation of paternity remains; but when the son is taken away and dies, the relation of paternity perishes. Hence that celebrated saying is celebrated: "Relatives mutually posit and mutually destroy one another." Hence the actual inherence of a relation is really the same as it, as Scotus and Gadius affirm (*Quol. citat.*). And a relation depends essentially on the foundation and the term, as Bonetus excellently teaches (*in initio libelli de relationibus*) — and his teacher does not disagree (4. *dist. 12. quaestione secunda §. Ad argumenta principalia M.*), and it is plain from the definition of relatives. Whether a relation depends more on the foundation than on the term or not will be clearly established below.

First Assertion: Relation is not the same as its foundation. So Scotus in the passages recalled. Proven first from Aristotle, who in his *Organon* (*cap. de ad Aliquid*, and 5 *Met. T. 20.*) posits a peculiar category of relation distinct from the rest — which he could not do if relation were wholly coinciding with its foundation. For since the foundation of relation is substance or quantity or quality, as is clear from the first note, relation would be placed in one of those categories. But in the same place the Philosopher says that similarity is founded upon one — and gives the example of quality, in which, from what was said, the relation of similarity is founded. But the same thing cannot be founded in itself; and hence there is no real relation of the same to itself. This the Philosopher also plainly implies (12 *Met. cap. 2. T. 19.*) and in other places. Hence Bacon at the end of the question cited adds that the opposite opinion conflicts with Aristotle.

And solidly in the same place (*quaest. 2.*) he shows it to be the express view of Aristotle and his commentator — which Bacon himself embraces there.

You will say with Suárez (*loco citato, numer. 22.*): relation is indeed an absolute form — but not an absolute form taken absolutely, but an absolute form that is regarding or connoting another form, which the relative denomination includes and connotes. But such a relative denomination is not purely extrinsic — and therefore the category of relation distinct from others is preserved, which the common opinion posits. And with this explanation and interpretation, the said author believes he does not depart from truth or from Aristotle. He illustrates this with the example of similarity — which is a real form existing in the thing called similar, but does not differ from whiteness as it is in the thing called similar, except in respect of the term which it connotes. Thus similarity means nothing other than the very whiteness regarding another whiteness of the same or similar ratio. Against this: if relation is an absolute form insofar as it regards the term, the definition of relatives would be bad — "those whose entire being is to be toward another." And relation itself, which likewise has its entire being "toward another" — as Suárez himself acknowledges (*ibid. sectione quinta, numero secundo*) — would be rightly said in Suárez's opinion to have, in addition to "to be toward another," also "to be toward itself," since by him it is an absolute entity that has being "toward itself" — as is clear from the very name "absolute." Therefore relation itself does not have its entire being "toward another"; since from the same author (*numero tertio*): "to be toward itself" and "to be toward another" are distinguished. For by this he excludes from the definition of relation created substances, because these have being "toward themselves," since they are absolute; but relation has "to be toward another," because it is a relative form whose entire being is "toward another." And in (*numero quarto*), he adds with Aristotle that other accidents of the other genera are distinguished from relation because those have "to be in another" — since they are absolute — while relation has "to be toward another," which is proper to relation itself. Hence there seems to be manifest implication in his assertions. For not without contradiction is one and the same thing altogether absolute and distinguished from the absolute. But Suárez grants that relation is the same as its absolute foundation, and yet is distinguished from that very absolute — which is an evident contradictory. Nor does it avail to say with him (*sectione Secunda, numer. 23. and 24.*) that relation is distinguished from the absolute by reason — and therefore no contradiction follows. Against this: apart from the operation of the intellect that establishes a distinction between relation and its foundation — which is in reality, according to him, none from the side of the thing — either relation is something distinct from the foundation or it is nothing. Not the second, as he admits. Therefore the first — which is not a being of reason, because from the same author (*sectione tertia*), a predicamental relation is real, and only a real relation constitutes the category of relation. Likewise in (*numero sexto, sectione quinta*): "when it is said that relation has being 'toward another' only, the exclusive particle excludes the

absolute, and indicates the being of relation." And at the beginning of (*section 1.*): relation is of minimal entity among all genera. Moreover, the same author wants the entire essence of relation to be in the foundation — which will be refuted below; but he speaks there of real being, not of rational being. Again, he asserts that similarity — which is a relation — is in the thing called similar. Then, that relation results from the extremes being posited, as he himself affirms (*sectione septima, numero primo.*). And its cause is the foundation. And in (*numero quinto*): two whitenesses are referred by the relation of similarity. And he adds other things there that truly demonstrate that relation differs from its foundation more than by reason. Moreover: either relation, for example, is whiteness, or it is something distinct from whiteness — for between the same and diverse no middle falls, from (*10 Met. T. 12.*). But it is not whiteness, which is a quality, as is plain; therefore it is something distinct from whiteness — which is the point in question. If you say with Suárez it is whiteness as it regards another whiteness. Against this: whiteness as it regards another whiteness either adds something above it or not; if not, the argument is eluded and not solved; if so, that addition is either a respect — which from what was said coincides with relation, and seems received by one who (*sectione 5. numer. 5.*) adds that the being of relation consists in a pure respect toward another — or it is the term toward which it is borne, and that cannot be — because the term is one of its extremes; or something in the term — which is a third thing distinct from both extremes, as he concedes (*sectione 2. numer. 23.*); hence it is rightly that the foundation and the term are called extremes — because between them there mediates relation, which is a third thing distinct from them, as he himself, convinced by the argument, acknowledges there. Finally, from (*8 Met. T. 16*): the categories are primarily diverse — that is, agreeing in nothing. Therefore since the formal ratio constitutive of the category of relation is primarily diverse — through which the proper and peculiar category of relation is constituted, distinct from the other categories, some of which are its foundations, as I declared above — it is clearly deduced that relation is not identified with its foundation.

Second: from Saint Augustine (*7 de Trinit. cap. 5.*): "Every relative is something besides the relation" — which is explained as follows: for example, "equal" includes two things — quantity and the relation of equality. Likewise "father" imports two things — the supposit denominated "father," and the relation of paternity by which it is called "father." And so every relative presents two things — the foundation and the relation founded in it. Therefore relation differs from the foundation.

Third: what is absolute is not relative, because being is sufficiently divided into absolute and relative, as is clear from (*Tract. formalitatum, and 2. dist. 1. quaest. 4.*). But the foundation of relation — whatever it may be from those recited in the first note — is absolute; and relation is not of the genus of absolutes, from (*1. dist. 2. quaest. 7. §. Tenendo. K.*). Therefore relation does not coincide with its foundation. Moreover, if relation and its foundation were identified, there would

be one definition for both — which manifests unity of essence; but the definition of the foundation differs from the definition of relation, because their genus and difference are diverse, according to that saying of the Philosopher (*In Antepredicam.*): of diverse genera there are diverse differences, species, and individuals. Therefore relation and its foundation are not the same. Finally: if relation means nothing other than the coexisting absolute extremes, the hypostatic union of human nature with the divine Word is undoubtedly removed — which from the Doctor (*Quol. 19., and 3. dist. 1. quaest. 2.*) is an extrinsically adventitious relation of humanity from the independently personal eternal Word, and which is really distinguished from those very extremes — as I showed in (*Tract. augustissimae Incarnationis disp. 6. quaest. 1.*). These and other objections related there weigh so heavily with Ockham that — as Gadius testifies (*in commento Quol. allegati*) — although in (*1. dist. 30.*) he refuses to distinguish relation from the extremes, nonetheless in the third book he is compelled to honestly admit the aforesaid union, which even according to him is really distinguished from its extremes — namely the Word and the assumed humanity.

Second Assertion: Predicamental relation really differs from its foundation.

Scotus holds this in the passages cited, and (*1 Met. quaest. 11.*). Proven first: that without which something can exist really differs from it — for this is a clear sign of real distinction, as I stated in (*lib. 2. quaest. 1. art. 16.*); but the foundation can exist without the predicamental relation — as when the son is extinct, the paternity of the supposit that was called a father perishes, yet the foundation of paternity persists in the very supposit — which is the generative power, as Scotus says (*4. dist. 6. quaest. 10. §. Hic dicitur., and dist. 12. quaest. 2. §. Ad argumenta. M.*). Likewise Peter, for example, through the arrival of a servant becomes a lord, and through the departure of the servant, Peter himself ceases to be a lord — and yet in that very same Peter there persists the foundation of the relation of lordship, which is coercive power. Therefore between the foundation and such a relation there exists a real distinction. Maius responds that the argument does not conclude: for if the major and minor were true, it would similarly be proved that God and the governor of the world really differ — since if God were to annihilate the world, God would indeed be, but would no longer be the governor of the annihilated world. But the aforesaid argument — which is that of Scotus cited — remains firm and unshaken. First of all, Aristotle uses the same argument (*1 physic. Tract. 79.*) to demonstrate that matter really differs from form — because with form departing, matter persists. And (*4 cap. 1. T. 3. and 17.*) of the same work, he shows that place really differs from what is placed in it — because with the located body perishing, the place does not perish. Moreover, to be governor of the universe places nothing real in God, from what will be said elsewhere — unless perhaps a relation of reason; but a predicamental relation is a real entity, as I proved in (*art. 3.*). And Lychetus clearly teaches (*2. dist. 1. quaest. 4. §. Ad argumenta principalia*), saying that relation

is another thing from the foundation. Hence Maius's response is worthless. Second: composition is a relation that in the opinion of many is founded in the parts united among themselves; but composition or union of parts can be dissolved by the destruction of the composite — as is clear in the death of man, in which soul and body, which are its parts, are separated from one another while still persisting. Therefore the foundation persists while the relation does not; and accordingly relation really differs from the foundation. And this can be corroborated from sacred Theology: the personal union of the Divine Word with human nature is a relation founded in humanity and terminating at the Word — in our opinion — and in the opinion of others who do not distinguish the whole from its parts simultaneously united, founded in the parts themselves united. But in the three-day death of Christ the Lord, such union persisted in the soul and body separated from one another; and just as the Word freely assumed humanity, so it can freely release it: which being given, the foundation would still exist while the relation does not — and therefore between them there shines a real distinction. Third: whatever exists in creatures is either substance or accident, as no one denies — and this can be supported by the testimony of Saint Augustine (*5 de Trinit. cap. 5.*): "What is not said according to substance is said according to accident"; but relation is an accident from what was said — and Suárez holds this (*sectione 6. numer. 2.*). And that accident is really distinguished from substance the Philosopher demonstrates (*7 Met. T. 4.*), saying that substance is temporally prior to every accident; and Scotus receives this (*4. dist. 1. quaest. 1. §. Ideo dici potest circa KK.*). Therefore at least relations founded in substance are really separated from it. Moreover, a relation can be increased while the foundation is not increased — indeed while diminished: for example, if a white wall at degree VI is diminished, which was imperfectly similar to a white wall at degree IV. Therefore a real distinction intervenes between a relation and its foundation — otherwise the same entity would simultaneously increase and decrease, which is impossible.

Third Assertion: Transcendental relation — such as is the relation of a creature to God the creator — is not really but formally distinct from the creature. The Doctor defends this (*2. dist. allegata, quaest. 1. §. Ad quaest. istam, and in Reportatis 2. dist. 1. quaestione sexta.*), whom follow Pelbartus (*Tomo secundo, verb. creatio §. 7.*), Vallo (*Tract. formalitatum*), and the other Scotists. The first part is proven: those are really the same whose one cannot be separated from the other; and that relation is really identified with its foundation — without whose term the foundation cannot exist — as Scotus (*praecitat.*) and Sirectus (*prafato Tractat. fol. 9. pagina prima*) write; but a creature cannot exist without God, on whom it depends in being and conservation — God alone is from himself and independent, and every creature is dependent. Therefore the relation of the dependent creature to the independent God is really identified with the creature itself. Moreover this can be argued from the difference cited in (*art. 2. of this q.*) between transcendental and predicamental relation — namely that

predicamental relation really, and transcendental formally, differs from its foundation. The second part is proven: things that are mutually inseparable and possess distinct definitions or descriptions formally differ, as I said elsewhere; but the relation of a creature to God the creator, and the creature itself, have distinct descriptions arising from distinct formal ratios: for the creature is an absolute entity, while the relation is a relative entity; the former is "toward itself," the latter is "toward another" — which are formally distinct formal ratios. More on this in (*Tract. de creatione disp. 2. quaest. 3.*), where this difficulty is formally examined and decided.

You will object first, against the first assertion: Aristotle (*5 physic. Tract. 10.*) says: "Toward relation there is no per se motion or change." And the Doctor approves this (*2. dist. 1. quaest. 5. §. Ad primum. G., and Quol. 11. §. De quarto K., and 3. dist. 1. quaest. 1. §. Ad illud ante L.*). But if relation were really distinguished from the foundation, there would be per se motion and change toward relation — because the foundation would be changed by the approach or recession of relation: as, for example, Peter from a non-father would become a father through the generation of a son, and from a father would cease to be a father at the death of that same son. It is therefore better to assert that relation wholly coincides with its foundation. I respond with Scotus (*citat., especially Quol. 11.*) by explaining the assertion of the Philosopher: there is no per se motion toward relation, but there is per accidens — for relation cannot be the term or effect immediately produced by an agent through motion, as whiteness is immediately produced in a subject successively, as the Doctor says (*2. dist. 2. quaest. 9.*). Nor through change, as an agent through prior dispositions induces or educes a substantial form from the potency of matter. But rather through resultance — through the positing of the foundation and the term. The authorities of the Fathers adduced by Suárez (*sect. 2. numer. 13.*) can also be explained in this way.

You will press: Scotus (*2. dist. 1. quaest. 4. §. Ad primum alterius opinionis*) indeed says that there is no per se motion toward relation; but he concedes that there is per se change toward relation. And this can be confirmed from the same Doctor (*3. dist. 1. quaest. 1. K.*), who affirms that toward the hypostatic relation there can be per se change. Therefore Scotus conflicts with Aristotle, who denies that there is per se motion and change toward relation — and we wrongly admitted above. I say that no contradiction is involved in the writings of our Doctor. For Scotus (*in 3. alleg.*) explains himself, saying that toward a relation intrinsically adventitious there is neither per se motion nor change; but toward a relation extrinsically adventitious there is per se motion — as he concedes concerning the hypostatic union; and the Philosopher teaches this of "where" (*ubi*) (*in the same 5 lib. T. 9.*), as the Doctor notes in the same place.

You will press: Scotus (*in 3. memorato*) interprets Aristotle as speaking of intrinsically adventitious relation; and he had premised in the second passage

cited that toward the very relation of which Aristotle speaks, change can be. Therefore the objection raised above is not solved. One may say: immediately toward the intrinsically adventitious relation there is no per se change — because such a relation cannot be the immediate term of some agent; but mediate, nothing prevents there being change toward it — insofar as from the acquisition of the foundation and the term it necessarily arises. And this is implied by the same Philosopher (*11 Met. c. 4.*), and by Simplicius and others who grant that the subject is changed by the advent of such a relation.

You will object second: beings are not to be multiplied without necessity, from (*1 physic. T. 52.*); but if relation were distinguished from the foundation, beings would be multiplied without necessity — for absolute beings viewed in diverse ways suffice without any entity newly added to them, to be called relative. For example: one whiteness received in one wall makes the wall white; while another whiteness inhering in another wall renders both walls similar — no new entity accruing to them. Therefore relation does not differ from the foundation. It is confirmed: God is called creator and lord of all things with no real relation whatsoever added to him, as Scotus writes (*1. dist. 30. quaest. 1. §. Ad 2. quaest. respondeo. M.*). Therefore without any distinction of relation from the foundation, absolute beings can be called relative — that is, equal or unequal, similar or dissimilar. Granting the major, the minor is denied; in response to its proof concerning two whitenesses constituting two white walls, I say that by them those walls are made formally white; but they are called similar through the similarity resulting from their positing. Thus "to be white walls" and "to be similar walls" do not coincide. For they are presupposed to be white before similar — since their similarity is founded in the unity of whiteness received in them, and results from the nature of the extremes. In response to the confirmation: granting the antecedent, the consequence is denied — on account of the perfect, supreme necessity, and infinity of God himself, which renders him free of any new real relation and of any other entity, as I showed at length in (*Tract. de creatione disp. 2. quaest. 2.*).

You will object third, against the second assertion: if relation were really distinguished from the foundation, it could be separated from it and exist really without it; but it is impossible — while both foundation and term remain — for the relation to be separated from them. Therefore relation does not really differ from the foundation. The major is that of Scotus (*2. dist. 1. quaest. 4. §. Contra istam opinionem*), which Sirectus (*Tract. formalitatum art. 4. partiali fol. 23. pagina secunda*) explains and patronizes: for real separation of certain things from one another is a manifest sign of real distinction between them — of things that are actually separated or that can be separated without contradiction. The minor is shown: both because relation cannot exist without actual inherence in its subject or foundation, as is clear from the third note; and also because there would be equality without quantity, and similarity without quality, if equality and similarity were disjoined from these. Likewise, there would be paternity without

a supposit, if the relation of paternity were separated from the supposit that is truly a father on account of the son begotten — and if such paternity were placed in another separated from the father, that one would be a father through paternity inhering in it, even though he had begotten no son. These and similar things manifestly imply contradiction, as the Parisian Fathers observe (*1 Physic. quaestione tertia, ante §. Ad rationes suae opinionis.*). I respond: moreover the argument can be retorted, as Suárez does (*sectione secunda, numer. 15.*): relation cannot be disjoined from the foundation while the foundation and the term themselves remain. Therefore relation does not really differ from the foundation. The consequence holds. The antecedent is clear from the reason of Scotus adduced; for if, according to him, separability of certain things is a sign of their real distinction — by contrast, the inseparability of relation from the foundation evidently indicates that it is in no way really separated from it. The inference from the major is to be denied. For this holds of an absolute accident; but not of a relative accident — on account of the essential dependence that relation has most especially on the foundation, as Scotus says (*4. dist. 12. quaest. 2. §. Ad argumenta principalia. M.*); or on account of the real identity with actual inherence, as from the same Doctor (*Quol. 2. §. Respondeo*), Gadius and Tataretus affirm (*ibid. in Log. cap. de accidente, dub. 1.*). And this can be illustrated from the physical whole, which is indeed really distinguished from its parts simultaneously united — yet on account of the essential dependence it has from them, it cannot exist without them. Similarly, a creature is really distinguished from God — yet it cannot exist without God, on account of the essential dependence it has from God himself.

By this also the other objection is answered: from the canon of Scotus previously proposed, those that acquire essential dependence from others are excepted — by reason of which, even if they really differ, they nonetheless cannot be separated from those on which they essentially depend. As was made plain above concerning the whole with respect to its parts, and concerning the creature with respect to God.

You will object fourth: what newly accrues to something does so through a new action — for nothing new is produced unless through some new production; but if relation is something really distinct from the foundation, when a new white thing is produced, innumerable and nearly infinite relations would be produced toward all the white things already produced — whether near or distant. Indeed, at the movement of a finger, infinite relations would be acquired toward the infinite parts of the world, in respect of the approach and recession of the finger to and from such parts of the world; and accordingly at the motion of one finger the whole orb would be filled with infinite things and changed — which is absurd and ridiculous, and also against Scotus, who denies the infinite in magnitude and multitude, as is clear from the book on quantity (*in q. de Infinito.*). Hence Auriolus (*supra citatus art. 2. in initio primae propositionum*) adds that such an infinity of things is irrational, and should come into the mind of no one. I

respond: granting the major, I distinguish the minor — through motion and change, I deny; through natural resultance and concomitance, I grant. Nor on that account is there actual infinity — but only infinity in potency, as will be shown in Physics concerning the continuum, which is not actually infinite even though it is always divisible into innumerable proportional parts. Nor does any absurdity follow from admitting such a multitude of relations, since they are tenuous and of modest entity — nor are they multiplied in vain, except when terms are multiplied, as will be shown below. Hence Mayronis (*1. dist. 39. quaest. 2.*) adds jokingly and wittily that positing so many and such great relations in one and the same being — even the smallest — is no burden to it, unless for a slow wit and crude intellect. Others add no less acutely that the aforesaid argument is "tribunitian" (*tribunitium*) — convincing only the ignorant populace and the unskilled multitude when they hear that at the movement of a finger the whole universe is changed.

You will say: Scotus (*in 3. dist. 14. quaest. 2. §. Tertio modo. L.*) concedes actual infinity in multitude; but if an infinite number of things is given, surely relations are actually infinite — since in numbers there is a mutual respect. I say with Lychetus (*in commento eius loci*) that Scotus does not speak assertively but dubiously and problematically. For in his view it does not seem improbable to admit actual infinity in numbers and other things of modest entity — such as relations are. But consistently (*2. dist. 1. quaest. 4. sub N., and 4. dist. 6. quaest. 10. sub D.*) he denies actually infinite real relations.

You will object fifth, against the third assertion: the relation of a creature to God the creator is its dependence on the creator himself; therefore if it is really identified with the creature, it is deduced that all created things are relative — which the Philosopher adduced as absurd (*4 Met. T. 26.*). I distinguish the consequence with the Master of Formalities (*art. 1. principali, fol. 8. pag. 2.*) and Vallo (*ibid. fol. 38. pag. 2.*): denominatively, I grant; quidditatively and essentially, I deny. Or: really, I grant; formally, I deny — as is sufficiently clear from what was said above.

Article V. Whether a Relation Can Be Separated from Its Existing Foundation and Term

Francis of Meyronnes (*1. dist. 14*), Bonetus (*Libellus de Relationibus*), the Canon cited by Gadius (*Quol. 3. fol. 41*), and others whose names Lychetus passes over in silence (*2. dist. 1. q. 4*), together with Ruvi us (*q. 14, on the separation of a relation from its foundation*), hold that a relation can be separated from existing and permanent extremes. The common teaching runs the other way: Scotus (*Quol. 3. §. Respondeo sub P*), Gadius, Lychetus in the same place, the Parisians (*1. phys. q. 3*), and, unwilling to depart from them, Suárez (*disp. 47. Met. Sect. 8. num. 13*), all affirm that it implies a contradiction for a relation to be sundered from its extremes in reality.

From Scotus just cited, it should be noted that there is a twofold inherence of an accident: actual and aptitudinal. Neither belongs to its essence. Aptitudinal inherence is a property really identified with the thing itself, as I also observed in Article IV of this Question, nota III. Actual inherence, on the other hand, is really distinct from an absolute accident, because such an accident can supernaturally exist without it — as I illustrated above with the example of the accidents of the Most Holy Eucharist — but it is not really distinct from a relative accident. Scotus assigns no other reason for this disparity, as Gadius notes in the place cited above, except that a relative accident is a being toward another, while an absolute accident is a being toward itself. For this reason it involves no repugnance for an absolute accident to exist in act without a subject, whereas it is maximally repugnant to a respective accident to exist in act without an actual subject. Moreover, a twofold bearing of a respective accident is noted: one as foundation, the other as term. The former is called actual inherence, which coincides really with the relation, as Scotus intimates (*Quol.cit.*); the latter is called the bearing toward another. Both depend essentially on each of the two extremes, though more on the term than on the foundation, because the former belongs to the relation in its capacity as a common ratio — that is, insofar as it is an accident — while the latter belongs to it insofar as it is the proper and quidditative ratio through which the relation is constituted in the being of a respective accident and distinguished from everything that is not a respective accident.

Assertion: A relation can in no way be separated from its actually existing extremes. This is taught by Scotus in the place cited above (*2.dist.1.q.4. §.Ad q.infra N; 3.dist.1.q.1. §.Ad illud in oppositum K*) and indicated in (*Log.q.25.praedicam.*). It is proved first from the definition of relatives given in the chapter *Ad aliquid*, in which a bearing toward another is included; for a relation taken universally is described as the bearing of one thing toward another, as the Doctor says in the cited *Logic* question (*verf.Ad tertium dicitur*). Since therefore the extremes of a relation enter into its definition, it follows plainly that the relation cannot exist without them. Hence Boethius rightly writes in his exposition of the *Categories* that it belongs to the essence of relatives to be toward another. Secondly, from the same Philosopher in the same place: when one relative is posited, the other is necessarily posited, and when one is removed, the other is removed. But in the opinion of Meyronnes and others this does not hold: for with the term removed, the relative would still be constituted in relative being by the relation separated from the term — and so the relation would not be toward another, namely toward the term it regards, which conflicts with the essence of a relation. Thirdly, the same thing would be father and son with respect to the same thing: if the relation of son were placed in the father, the father would be a son; and if the relation of father were placed in the son, the son would be a father — and so the same thing would simultaneously, and with respect to the same thing, both generate and be generated, which involves an open contradiction and

impossibility, as Suárez also admits (*sect.5.n.12*). Again, there would be union without the united parts, production without the produced, local motion without a term — and very many other absurdities and inconveniences would follow, given that a relation were separated from its extremes. For union, production, and motion are formally relations, as will be said below, and they would obtain in the manner I described above if the rejected opinion were admitted. Furthermore, nothing ought to be asserted unless reason persuades it, or it is known per se, or known by experience, or approved by the authority of Sacred Scripture or the holy Fathers. But no reasonable cause is offered for a relation being able really to subsist apart from its extremes, as will be evident from the solutions to the objections; nor does this stand in the terms themselves, nor does experience show it, nor does any authority compel it — indeed it runs counter to the great current of the Scholastics, as the abovesited Suárez observes. Therefore a relation cannot be severed from its extremes.

You will object first: things that differ essentially can be separated from one another, at least by divine power; but a relation and its extremes differ essentially. Therefore they can be sundered from one another. The minor is clear from the preceding article. The major is shown thus: things that are essentially identified are inseparable; conversely, therefore, things that are essentially distinct are separable from one another. Confirmation: what depends on one thing in such a way that it could depend on another can exist without the former; but a relation depends on its extremes in such a way that it could depend on another; therefore a relation can be sundered from its extremes. The major is evident: the whole difficulty of separating a relation arises precisely from dependence on its extremes; if the relation could depend on something other than the extremes, it could undoubtedly be detached from them. The minor is proved: God is the first independent being, who terminates the dependence of all things and can supply the place of whatever terminates a dependence. Therefore, if a relation were separated from its extremes, its dependence would be terminated by God.

The major must be distinguished: I concede it for absolute things; I deny it for relatives. This arises from the essential dependence that a relation has on its extremes, from whose positing it necessarily arises. Hence the Doctor writes excellently (*4.dist.12.q.2.§.Ad argumenta M*) that the dependence of a relation on its foundation is most essential — and he sets this out plainly for both extremes in the places just narrated. The reply to the confirmation is evident from the same distinction: the major holds for absolute things, but not for relatives, for the reason just given, which Bonetus treats solidly and acutely in the work cited above.

You will object secondly: if a relation cannot be sundered from its extremes, this is chiefly because of the dependence it has on them; but this reason does not compel — therefore it should not be denied that a relation can be separated

from its extremes by any power whatsoever. The major is clear; the minor is argued as follows: the dependence of a relation on its extremes is either in the genus of efficient cause, or of final cause — and no one denies that God can supply both, since it is a dependence on an extrinsic cause involving no imperfection — or it is in the genus of material cause *in which*, and this too is no obstacle, because an absolute accident has a material *in which*, yet it can be separated from the subject in which it exists and exist without it — or it is in the genus of material cause *from which*, and this also is no hindrance, since a relation has no such cause — or it is in the genus of formal cause, and this, besides the imperfection it includes, inheres in the thing of which it is the cause, whereas the foundation in which a relation exists does not by any means exist in the relation itself. Confirmation: whatever a first cause can do together with a second cause, it can effect without that second cause; but the first cause, together with the foundation and term, can conserve a relation; therefore the first cause can accomplish this without the extremes themselves — and therefore a relation can exist without its extremes.

Granting the major, I deny the minor. To its proof I make a distinction: God can supply the place of whatever dependence terminates upon an absolute thing — I concede; upon a relative thing — I deny. For the production of a relation does not occur through transmutation but through resultance, as Scotus teaches in the cited places. Therefore the dependence of a relation on its extremes is essential, and absolutely inseparable from them, as the Doctor teaches admirably in (*Report.4.dist.12.q.1.propè finem*). By this distinction it is clear what is to be said to the confirmation: the major holds for absolute things, but not for relative ones, for the reason assigned above. This can further be corroborated by risibility and other natural properties, which flow necessarily from humanity once it is posited, so that God cannot impede their resultance, because they come not from without but from within. And for this reason perhaps Scotus calls the predicamental relation intrinsically accruing — which belongs to the fourth predicament — while calling the rest, which belong to other genera, relations extrinsically accruing, as Suárez intimates from his other works (*sect.2.num.17 and sect.16.num.17*). Therefore the objections that Suárez himself and others pile up against us fall apart.

Article VI. Whether *Esse In* Belongs to the Essence of a Relation

While all Philosophers write with one voice and one pen that a relation is essentially constituted by *esse ad* (being-toward), they nonetheless dispute whether *esse in* (being-in) belongs to the quiddity of the relation itself. The Thomists, following St. Thomas (*1.p.q.28*), together with Suárez (*disp.47.Met.Sect.5.num.7*), admit that both *esse in* and *esse ad* enter into the nature of a relation, yet they say that *esse in* is its generic ratio, and *esse ad* is its specific ratio. Others, among whom are Mastrius and Bellutus (*disp.8.q.4*), hold that both belong to its specific ratio. The common view of the Scotists, named expressly

by Trombetta (*7.Met.q.1*), Anthony Andrée in the same place, and Meyronnes (*1.dist.39.q.5*; *4.dist.12.in fine q.7*), holds that the essence of a relation is placed in *esse ad*, while *esse in* belongs to it as a property.

From Scotus (*Report.4.dist.12.q.1. §.Ad quaest. dico*), it should be noted first that although one of the extremes of a relation is ordinarily its subject — because a relation is an accident, and every accident requires a subject in which it inheres — and from the same in the Oxford writings (*ibid. §.Ad quaest. respondeo, conclusione 2 sub B*) the foundation may be called the proximate subject of the respect; nevertheless a relation taken precisely can exist without a subject, as is clear from the divine relations, which, being substantial, have a foundation indeed but not a subject. Therefore a relation as relation requires a foundation, because it requires that of which it is and toward which it is, from the same place (*D. in probatione 2 conclusionis*); it does not, however, necessarily require a subject, unless it is an accidental relation. And because a relation is the bearing of one thing toward another, from (*Quol.3. §.Respondeo ante Q*) or from the same in (*Report.cit.*), a relation is a duality of extremes, because it cannot be understood without two extremes, of which one may happen to be its subject. But if neither extreme is the subject, the relation exists without a subject, though not without a foundation and term, from which it necessarily emerges. What, therefore, in accidental relations is called the subject and the foundation, is in substantial relations — or in relations as relations — called only the foundation. Consequently, in predicamental relations there is no multiplication of a twofold bearing, one toward a subject and another toward a foundation, as our individual fellow-travellers in the cited philosophical course opine. For what is purely the subject of predicamental relations is at the same time their foundation, as the Doctor clearly intimates (*q.2 loci cit. in solutione 4 sub M.N.*). For if the relation did not accrue to it, it would not be denominated a subject but only a foundation, and so the denomination of subject comes from that very accidental inherence of the relation — not from a twofold bearing, one regarding a subject and another a foundation, as Scotus plainly indicates in the place cited above, and as will be shown more fully below. Moreover, lest you think the extremes belong to the intrinsic ratio of a relation: in the next article it will be made plain that they belong only to its extrinsic ratio.

First Assertion: *Esse in* does not belong to the specific ratio of a relation, but is only, as it were, its property. This assertion is twofold and is directed against our more recent contemporaries cited above. The first part is proved first from Scotus (*Report.2.dist.1.q.7. §.Ad aliud cum dicitur*), in whose own words we read: "I say therefore that to-be-in does not belong to the quiddity of a relation." The same is deduced from (*4.dist.12.q.1*) and other places, in which he plainly shows that *esse in* does not essentially and specifically constitute a relation. Secondly, *esse in* absolutely speaking belongs no more to a predicamental relation than to other accidents — which no one denies — it is common to all accidents. Hence the celebrated maxim circulates among Philosophers from (*7.Met.T.2*): "An

accident's being is to be in." But for other accidents, it is not the specific and quidditative ratio, as the Doctor proves in (4.cit.) and we proved in the *Metaphysics* in the question on accident. Therefore etc. Secondly, *esse in* either designates actual inherence or aptitudinal inherence in a subject, but neither inherence belongs to the essence of an accident; therefore *esse in* does not pertain to the specific nature of a relation. The major is well known in the School of Scotus. The minor is shown by the Doctor in the place cited above, and is to be pursued at length by us in the *Metaphysics* in the cited place. The second part follows from the first: since *esse in* does not belong to the essence of a relation and is really identified with it — because it is impossible for a relation to be found without being in some subject or foundation — just as it is impossible for something to be an accident without at least possessing aptitudinal inherence, it clearly follows that *esse in* belongs to a relation in the manner of a property.

Second Assertion: Two bearings essentially and specifically belonging to a relation are not to be distinguished in it, one bearing toward the foundation insofar as it is its subject, and another toward the foundation insofar as it is a foundation. This assertion likewise is opposed to the aforementioned recent authors. It is proved first from Scotus, who most powerfully in (*Report.4.cit.*) asserts that a relation can exist without a subject, but not without a foundation. Therefore, given and not conceded that a bearing toward a subject belongs to a relation, it is not an essential and specific ratio of the relation itself, without which it could not exist — especially because, from the preceding notable point, in an accidental relation the foundation and the subject are taken as the same thing, as I indicated from Scotus there and as Suárez confirms (*disp.4.Sect.10.13*). Secondly, the said authors in the same place, in their solution of the third objection, say that a relation is one simple bearing founded in the foundation and terminated at the term. Therefore a relation does not have a twofold bearing of *esse in* — since bearing and relation are the same thing, from what was said in Article I of this Question; if there is one relation, there is also one bearing, and if there is a twofold bearing, there is likewise a twofold relation, for a bearing is the respect of one thing toward another. Therefore, according to the twofold bearing admitted by them, a twofold relation toward the foundation and toward the term must equally be conceded by them, as Bassolis seems to intimate (*1.dist.30.q.2.art.3*) — a view rejected by them and by Bargius (*1.dist.3.q.5*). And the same authors, under the name of twofold bearing in their conclusion and below, later, pressed by an argument, make it only one bearing, lest they concede that a relation is one thing per accidens if the twofold bearing just explained were of its essence, as they suppose. Thirdly, an essence is prior to a property flowing from it, just as a cause is prior to its effect; but *esse ad* is prior to *esse in*, because a being is first a being toward itself before it is in another — and so being is first divided into absolute and relative before it is divided into being-toward-itself and being-in-another, as Trombetta, Meyronnes, and others

rightly observe in the *Tract. de Formalitatibus*. Therefore *esse in* does not pertain to the essence of a relation — unless one proceeds in a roundabout way, taking a property for an essential ratio, as Aristotle does in (*5.Met.c.de quanto*) and other places I have noted.

Third Assertion: The specific ratio of a relation is *esse ad*. It is proved first from Aristotle, who in the chapter on *Ad aliquid* defines relatives by *esse ad*, saying: "Of relatives, their whole being is to be referred to something else." There he rebukes the ancient philosophers for not recognizing the true nature of relatives, since their whole being-toward did not become known to them, as is clear from the definition given by them and rejected by Aristotle. Scotus concurs, defending this truth in many places, principally in (*Log.q.25.praedicamentali*) and (*1.dist.26.q.vn.§.Quantum ad primam viam L*): "to a relation belongs the fact that it is toward another; even if it is not toward another, it is not a relation," and (*§.Quantum ad 3.viam I*): "a relation is essentially the bearing toward another." Secondly, that by which one thing is essentially distinguished from another is its essential, constitutive, and specific ratio, because the constitutive principle and the distinctive principle are the same, from (*1.dist.11.q.2.B*); but through *esse ad* per se, a relation is essentially distinguished from an absolute thing, whose being is toward itself — for being is adequately divided into absolute and relative, as our Formalists teach with Scotus. Therefore etc. Nor does it help to respond with those recent authors that *esse in*, which is the specific ratio of a relation, is not *being-in* a subject but *being-in* a foundation. For this, beyond being rejected above, means that a single simple thing can never have two specific and quidditative ratios; otherwise it would be one thing per accidents. But by those recent authors a relation is a simple bearing of a foundation toward a term, as is plain from the solution to the third objection. It follows plainly, therefore, that it is essentially constituted by *esse ad*, of which *esse in* appears to be a property, as I said above. All the more so because there must be given some common element in which an absolute and a relative accident agree, and some element in which they differ — something that cannot be assigned in their view, since they want both *esse in* and *esse ad* to be the generic and specific ratio of the relation itself. I add that in the doctrine of Scotus cited above, a relation as relation can exist without *esse in* a subject — a feature it shares with an absolute accident — but not without *being in* a foundation, which is proper to a relation. Since therefore they cannot state a ratio that is both common and proper to a relation, they appear to contradict both truth and Scotus.

You will object first: a relation as relation is an essential bearing between two extremes; therefore such a bearing depends essentially equally on both extremes; and therefore just as *esse ad* belongs to the essence of a relation, so too does *esse in* belong to its essence. Confirmation: it is no less repugnant for a relation to exist without a foundation than without a term; but it cannot exist without a term, by the common view of Philosophers; therefore neither without

a foundation — and so both *esse in* a foundation and *esse ad* a term are its specific and essential ratio. I respond that a relation indeed requires two extremes on which it essentially depends, but its specific ratio is derived not from *esse in* a foundation but from *esse ad* a term — just as motion requires both a term from which and a term toward which, yet the common School holds, and I shall show in (*Phys.1 de motu*), that motion is specified by the term toward which. By this the reply to the confirmation is also clear: I acknowledge that both extremes are required for a relation, since it results from them; nonetheless I deny that its specific ratio is derived from *esse in* a foundation.

You will object secondly: the constitutive and distinctive principle of a thing are the same, from Scotus (*cit.1.dist.11.q.2.§.Contra istam opinionem B*); but according to Aristotle (*5.Met.c.de relatione*), the distinction of relatives is drawn from their foundations. Therefore *esse in* a foundation is the specific and distinctive ratio of a relation. Confirmation from the same Doctor, who writes (*4.cit. conclusionem secunda D*): "a relation, as a relation, is necessarily in a foundation." And in the same place (*q.2.§.Ad argumenta principalia in solutione tertii M*) he openly asserts this very thing; therefore a relation is essentially constituted and distinguished by *esse in* a foundation from everything else that is not a relation. Granting the major, I distinguish the minor: generically, in a circumlocutory and extrinsic way — I concede; specifically and intrinsically — I deny. So Aristotle in the cited place is to be interpreted. And this is plainly taught by Scotus (*4.dist.12.q.1.§.Ad argumenta principalia S*), Meyronnes, Bassolis, Bargius, and other Scotists in the same place. This can be explained by the extrinsic distinction of powers and their acts and habits derived from the objects with which they are concerned, which I treat at length in (*lib. de Anima q.3.artic.3*).

You will press: what is placed in the definition of something, and without which it can neither be nor be conceived, belongs to its intrinsic ratio; but in the definition of a relation its extremes are involved, nor can it exist or be grasped without them, as Scotus affirms (*q.1 prologi and 1.dist.3.§*); for a relation, as stated, is defined as the bearing of one thing toward another, that is, of the foundation toward the term; therefore each extreme pertains to the intrinsic ratio of a relation. I distinguish the major: what is placed in a definition in the nominative case and as genus or difference — I concede; what is placed in the oblique case and as an addition — I deny. To the distinction of the major I distinguish the minor accordingly: the extremes are placed in an oblique, not a nominative, position in the definition of a relation, as is plain to one who inspects it — and this is a definition by addition, as the Doctor intimates in the place just cited, and as Meyronnes (*ibid.*) and Bargius (*1.dist.28.q.3*) expressly hold.

Article VII. Whether a Relation Is Multiplied by the Multiplication of Terms

Against St. Thomas (*3.p.q.25.art.5*), Cajetan in the same place, and others accumulated by Mastrius and Bellutus (*disp.8.q.6.art.2*), who deny that a relation

is multiplied by the multiplication of terms in one and the same numerical foundation — holding that the unity or plurality of a relation is to be derived from the unity or plurality of foundations by which they are specified extrinsically — there stand opposed Scotus (*3.dist.8.9.vn.§.Contra istam rationem secundam*), Lychetus in the same place, Fuentes (*q.16.difficultate 5.art.6.dub.3*), Raconius (*Tract.2.membro 3*), Suárez (*disp.47.Sect.17.num.17*), Hurtado (*disp.15.sect.10.§.140*), and very many others, even from the Thomistic school, all affirming that in one and the same numerical foundation the relation is multiplied through the multiplication of terms by which they are specified extrinsically — so that in one and the same numerical father there are as many numerically distinct paternities as there are sons begotten by him.

It should be noted first that this difficulty is raised about predicamental relation, which, as Tataretus notes in the present chapter, requires four conditions, nearly all of which I touched upon in (*Epitome q.4.art.8.lib.1*). The first is that it be real, on account of a relation of reason, which has no proper seat in a category, as I affirmed above of every being of reason. The second is that it be finite and limited, on account of transcendental relations, among which the divine personal relations are numbered — relations that are formally neither finite nor infinite, neither perfect nor imperfect, as I showed at length in (*Tract. de Deo Trino disp.5.q.5*). The third is that it be actual, really distinct from the foundation — unlike an aptitudinal relation, which is reduced to the predicament in which its foundation is placed, and unlike the relation of a creature to God the Creator, which is really identified with the creature, as the Doctor writes (*2.dist.1.q.5.§.Ad quaest.M*). The fourth is that it be a relation intrinsically accruing, so as to exclude relations extrinsically accruing, which Scotus mentions (*3.dist.1.q.1.§.Ad illud in oppositum K*; *4.dist.13.q.1.§.Ad huius autem C.D*). These four conditions are included in the three enumerated by Scotus (*1.dist.31; Quol.8*), which I mentioned above in Article III of this question.

It should be noted secondly that there are two rules given by Tataretus (*loco praecit.dub.3*) and taught by our Doctor in the places shortly to be cited, and also touched upon by me in (*Epitome lib.1.q.1.art.6*). The first is found in (*3.dist.8.9.vn.§.Ad argumenta F*): for the multiplication of concreta there is required a multiplication both of forms and of supposita. For this reason, for example, since Peter is one, although he has several paternities corresponding to the several sons begotten by him, he is therefore called not several fathers but only one father; just as one who possesses several sciences is called not several knowing persons but one knowing person, because of the unity of the suppositum. For the same reason, Christ, possessing two wills — the divine and the human — is called not several willing persons but only one, as Scotus infers from St. John Damascene in the cited place. The second rule is drawn from (*1.dist.12.q.1*): for the multiplication of concreta there is not required a multiplication of forms, but a multiplication of supposita suffices — so that if one numerical whiteness were in two really distinct subjects, those subjects

would be called two white things, as Lychetus explains (*1.dist.19.q.1.§.Respondeo*). Thus in the divine persons, the Father and the Son are called two spirating, although there is only one power of spirating in them; similarly the Father, Son, and Holy Spirit are called three creating, although there is only one power of creating in them. Why they cannot be called three creators and two spirators, see there and what I wrote in (*Tract. de Deo Trino disp.8.q.4*).

It should be noted thirdly that there is a twofold essential ratio, or difference, of a relation: one intrinsic and another extrinsic. The intrinsic and quidditative is that which constitutes the relation itself in its essential and quidditative being, and essentially distinguishes it from everything else that is not a relation — namely the ratio or principle of referring to another. The extrinsic is derived from what is extrinsic to the relation, such as the foundation and term, from which the relation necessarily goes forth; it co-requires extremes as things from which it arises by its very nature, just as an effect presupposes and pre-requires the causes by which it is produced. Whether only the foundation, or both extremes, is the cause of a relation, see Bonetus (*Libellus de Relationibus*) and Lychetus (*Quol.11.§.Respondeo ad instantias*), following Scotus (*3.dist.1.q.1.§.Ad illud in oppositum sub K*). This twofold difference of a relation is indicated by Aristotle, who here does not describe the relation but relatives, as the Doctor observes there (*q.15.praedicamentali*) and more clearly (*2.dist.1.q.antè §.Hoc ergo viso*) and (*3.dist.1.q.1.K*). Furthermore, an accident is not individuated through the subject in which it inheres, but through its own haecceity, as the Doctor states (*2.dist.3 and 4.dist.12.q.2.§.Hic sunt duae opiniones*). See what I have written in (*Tract. de Angelis disp.1.q.6.§.9*) against the Thomists named there, who think accidents are individuated through the subjects in which they are subjected.

Assertion: With the multiplication of terms, numerically distinct relations are multiplied in the same foundation. So Scotus in the place cited above. It is proved first from Aristotle, who says in this chapter: "Relatives are simultaneous by nature and by cognition." Scotus points to this passage (*in Report.d.allegata*) to persuade us of the aforesaid assertion, and after him Ruvius (*q.8.cap.7.de Ad aliquid*); but given the Thomistic opinion of numerical unity of relation in a foundation relative to several terms, relatives are not simultaneous by nature and by cognition. Therefore, in order that this well-known property of relatives transmitted by the Philosopher and conceded by all may hold true, a foundation with one numerical relation does not regard several terms — rather, there are to be counted in that same foundation as many numerically distinct relations as there are terms. The minor is shown: the terms are not all simultaneous by nature and cognition with the foundation, except for the first; therefore with respect to the other terms beyond the first, relatives are not simultaneous by nature and by cognition. The antecedent is well known from the case of many sons begotten by one parent at different intervals of time. The consequence is evident: those whose generation is not simultaneous are not simultaneous by nature or by time, as is clear from the *Postpredicaments*.

The Thomists, in order to meet this and other Scotist arguments, contort themselves wonderfully and move off into different responses, which both of the recent authors cited at the beginning of this article collect with no small diligence. I present only one or two of the chief ones, by which the rest are easily dissolved. The Thomists therefore respond — notably Ruvius in the place cited — through a distinction and explanation of the Philosopher's testimony, saying that the aforesaid property of relatives is true with respect to the substance of the relation, or with respect to an accidental extension to many terms; so that, for example, a father having several sons is simultaneous by nature and cognition with the first son only, with regard to the substance of the relation, while he is simultaneous by nature and cognition with all his other sons with regard to extension. Into the same thing seems to fall the response and distinction of others, particularly Arriaga (*sect.9.disp.12.num.49*), who affirms that a father having several sons has several paternities inadequately but not adequately — somewhat in the way that a genus is said to be in one species inadequately and in all species adequately. Against the first response I argue: a relation does not admit of extension, which is proper to quantity, nor of intension or remission, which belongs to quality — for a relation does not admit of more and less except through its foundations, as all interpreters of Aristotle hold in the chapter on *Ad aliquid*. For a subject is not simply perfected or extended through a relation accruing to it. Therefore that distinction between the substance of a relation and its extension to several terms seems irrelevant. Furthermore, a new extension to something else does not occur without a new relation to something else. Therefore if, as Ruvius concedes in the cited place, there is a new extension to something else, there must equally be admitted a new relation. The antecedent is proved: a new extension is had through a new action of an agent upon a patient; but a new action induces a new relation, as is clear from Aristotle (*5.Met.cap.23.T.20*), affirming that the second genus of relatives is founded on action and passion. All the more so because a new extension to something else is a new ordering toward something else, which is a relation, as Ruvius himself admits (*cit. in solutione 1.arg.*). And the reason is that an order, from what was said above, means nothing other than the respect of some things ordered toward one first thing, as is clear from the order of the things of the world toward one God from (*12.Met.T.55*). Moreover, there are new founding ratios in the father toward sons newly begotten by him; therefore there are also new relations in that very father toward sons newly procreated by him. The antecedent is proved: the founding ratios in the father are active generations, and their foundation is the power of generating; but there are many active generations with respect to the many sons begotten — therefore there are also many relations of paternity in one parent regarding many sons. Furthermore, motion is specified by the term toward which, as I indicated above, from what is to be proved in the *Physics*; and motion is formally a relation, as will be shown there in the book on motion. Again, Aristotle in the cited place says relatives are simultaneous by nature; but by the distinction

offered, a relative and a non-relative would be simultaneous by nature, because through the attainment of only the first term the whole relation — with regard to its substance — would be had; but this does not suit Aristotle, who adds that when one relative is posited the other is posited, and when one is removed the other is removed. But if the first son is removed, the relation of paternity is not destroyed in a father who has other sons; yet the whole substance of the relation ought to perish and the whole would be acquired through the first. But with the first son destroyed, the father is formally still a father through the relation to the second son who is living. Therefore by another paternity distinct from the first the father regards the second son.

But if you say that a father having several sons regards them all by a single paternity as its adequate terms, and regards one or another of them as an inadequate term — which is the second response and distinction of the Thomists recalled above — I argue against this: what can be neither exceeded nor exceeded by another is adequate to it; but this active generation by which this father is this father can neither exceed nor be exceeded by the passive generation by which this son is this son. Therefore the aforesaid distinction is vain and void for solving Scotus's argument. The major is clear from the terms. The minor is clear, because through this active generation the father cannot regard other sons, nor can this son be regarded by the father through another generation, because this act is total and adequate. Furthermore, a cause actually produces an effect in act, such that in act it does not extend to the production of another effect; but these extremes in act are the total cause in act of this relation in act — just as this whiteness in act is the total cause of this wall in act as white. Therefore each individual son is the adequate term of an individual paternity, and just as paternity is founded on having-begotten, so this paternity is founded on this having-begotten, and therefore begettings are multiplied in accordance with the multiplication of those begotten — which is Scotus's assertion.

The proposed assertion is proved secondly: a relation essentially regards another, and is essentially a respect toward another, as I have repeatedly stressed above. Therefore if that *other* which the relation regards is multiplied, the relation is likewise multiplied; but with the term multiplied, the *toward-another* is multiplied; therefore with the term multiplied, the relation too is multiplied. The first consequence is evident, because when the formal ratio of something is multiplied, its form and essence through which it is formally constituted in such being is equally multiplied. Thirdly, when the *quo* (that by which) is posited, what the *quo* is for (the *quod*) is posited — since to each *quo* corresponds its own *quod*, as is common in Scotus: when form and matter are united by an agent, the composite is posited; with the form removed, the composite is destroyed. Similarly when this *quo* is posited, this *quod* is posited, and when this *quo* is destroyed, this *quod* is also destroyed. Therefore just as with the destruction of this filiation this son is destroyed — the son who is formally denominated a son through it — so with the destruction of this paternity through the destruction of

this son, this father too in the aspect of this relation of paternity ought to perish, though not in the aspect of a suppositum. But with the second son remaining, this man is still called a father — not through the relation to the first son, who is supposed to have died — therefore through the relation to the second son who is alive, on account of whom this man is denominated a father. I add that the Thomistic foundation is ruinous, inasmuch as it individuates a relation and any other accident through the subject in which it inheres, as I noted in the third notable point. For there are many accidents distinct by number alone in one and the same numerical subject, such as several sensibles in the same sense organ and several lights in the same medium — as I shall show in the *Metaphysics* in the question on Accident.

You will object first: if with the multiplication of terms the relation is likewise multiplied in the same numerical foundation, it would follow, for example, that just as there are several sons, so there are several fathers; but one numerical father, despite the plurality of sons, is not several fathers, as all hold for certain; therefore in him there are not several numerical paternities corresponding to the plurality of sons. The consequent of the major is proved thus: as a son is constituted in the being of a son through filiation, so a father is constituted in the being of a father through paternity. Therefore just as through this filiation this is this son and through another filiation this is another son, so through this paternity this is this father and through another paternity this is another father — and according to the plurality of paternity it follows that there are several fathers, just as according to the plurality of filiation there are several sons.

The consequent of the major is to be denied; to its proof, the matter is clear from the second notable point: there are several sons according to the multiplication of filiation because not only the relation but also the suppositum is multiplied. But there are not several fathers, even though there are several paternities, because the suppositum is not multiplied — and so from the unity of the suppositum one father is denominated as having several sons, just as one is called one craftsman and one knowing person, although he has several arts and several sciences, as I explained in the second notable point, and as the Doctor sets out lucidly in (*Quol.11. §. De tertio sub H*).

You will object secondly: a genus by a single relation existing in it regards all its species subject to it, of which it is immediately predicated, as animal bears a single bearing to man and to beast. Therefore likewise a father regards all his sons begotten by him through a single paternity. Confirmation: one visual power tends toward all colors, one auditory power toward all sounds, one power of matter toward all forms, and one faculty of understanding toward all that is intelligible. Therefore one father is related to all sons procreated by him through a single paternity. Raconius in the place cited above responds to the first objection by denying the parity, saying that one species is not the total and adequate term of one genus; but one son is the adequate term of one active

generation — therefore a genus regards its species by a single relation, while this father is not related to all his sons by a single paternity. This response is consonant with Scotistic doctrine with regard to adequation of sufficiency — which suffices for the whole thing to exist — but not with regard to adequation of perfection, by which a thing exists in respect of every perfection owed to it, as was sufficiently explained elsewhere. But we can deny the antecedent, for no effective proof of it is offered by the Adversaries. To the confirmation I say that a power regards its common object adequately, but particular objects inadequately. Therefore each individual color is its partial and inadequate term — and the same is to be said of the objects of other powers. Nevertheless, the same cannot be said of the acts of those powers, because each act bears upon a term adequate to it: thus this or that active generation of the father has this or that son as its total and adequate term.

You will object thirdly: that from which a thing receives its being specifies it, as is clear from science, which is caused by its object and specified by the very same — as the Philosopher teaches (*3 de Anima Tex.33*); but a relation receives its being from the foundation, because it emanates and springs from it and then tends toward the term. Therefore a relation is specified by the foundation and is multiplied by its multiplication. I respond that although, as some recent author observes, the major admits of many instances — for a creature receives its being from God yet is not intrinsically specified by him, from (*4.dist.12.q.1. §.Ad quaest.F*); likewise an accident draws its being from the subject, though it is not individuated by it; again, intellection is caused by the intellect yet does not derive its specific distinction from it — nevertheless, granting the major, the minor is to be distinguished: from the foundation alone — I deny; from the foundation and the term — I concede, as Scotus clearly teaches (*3.dist.1.q.1. §.Ad illud in oppositum K*). For the relation is co-produced, or rather arises, upon the positing of both extremes. Indeed the dependence of a relation on the term appears more essential than on the foundation, as Bonetus notes (*libellus quarto de Relationibus §.Amplius autem de dependentia*) and Gadius of Bologna indicates after Scotus in the same place (*Quol.3*). The reason is that a relation essentially regards another, which is the term, and I demonstrated above that several relations exist in one foundation — which evidently shows that a relation depends more essentially on the term than on the foundation.

You will press: Scotus (*4.dist.12.q.2. §.Ad argumenta M*) expressly says that the dependence of a relation on the foundation is most essential. Therefore the dependence of the same on the term is not to be considered more essential. It can be said that both dependences are absolutely most essential, without either of which the relation can in no way exist; yet relatively speaking, dependence on the term is more essential than on the foundation, for the reason just presented. You will object fourthly: if someone procreates twins simultaneously, a single relation of paternity will accrue to him, because the generation of both is one; therefore even when he begets several sons successively, he acquires only one

paternity by which he regards them all — and so with the multiplication of terms, the relation is not multiplied in the same foundation. Confirmation I: one numerical son begotten by two parents — that is, father and mother — is related to both generators as to two terms by one numerical relation of filiation. Therefore one numerical relation existing in one foundation tends toward several terms. Confirmation II: the formal effect of paternity is to constitute the father in the being of a father, just as the formal effect of whiteness is to constitute the subject as white; but through the first relation of paternity to the first son the father is constituted in the being of a father, as no one denies. Therefore through the generation of a second son no new relation of paternity accrues to that father, since such a relation would be superfluous and would attain no formal effect.

I respond by denying the antecedent: just as the son is doubled and the relation of filiation is doubled, so a twofold relation of paternity arises in the same parent simultaneously procreating two children. For the parent has a twofold active generation and a twofold passive generation by which the two sons are denominated. To Confirmation I: I deny the antecedent. For as Scotus holds with Galen, the mother actively contributes to the generation of offspring — and the father and mother are two partial causes constituting one total cause. Therefore the son begotten by them regards them by a twofold relation of filiation — one toward the father and another toward the mother — and one is really distinguished from the other; and one can perish while the other remains, as Scotus (*3.dist.8.q.vii. §.Ad q*), Faber, and other Scotists in the same place teach. To Confirmation II: I say the major can be expounded in two ways. If it is understood that paternity is the ratio or accidental respective form through which a father is called a father and is referred to a son — just as whiteness is the absolute accident by reason of which a wall is denominated white — I concede this. If it is understood that a father having one numerical paternity through one numerical son begotten by him cannot have another paternity through another son begotten by the same, and as many as the sons he has begotten — I deny this, as has been effectively proved above. The unity of the former is compatible with the multiplicity of the latter, just as one God has several creatures, one sun has several effects, and one man has several properties. Especially so because just as a father through paternity is a father, so this father through this paternity is this father — yet it does not follow that through several paternities there are several fathers, because although paternity is multiplied, the suppositum is not multiplied, by reason of which one father is said to be one from what was said in the second notable point. Nor finally does it follow that through another paternity there is another father, for the same reason — since for the otherness of a father there is required not only the otherness of form but also the otherness of the suppositum having the form, as Scotus constantly and subtly teaches (*Quol.11.antè §.De quarto*).

Article VIII. Whether One Relation Can Found Another Relation

In this article there are precisely the same opinions as in the preceding one. The Thomists, with their leader Thomas (*1.p.q.42.art.1.ad 4*) and in other places cited by the recent authors, deny that one relation can be the foundation of another relation. On the other side, the Scotists with their Prince Scotus (*1.dist.19.q.1. §.Hic primo A; 2.dist.1.q.4. §.Ad quaest. istam sub N; Quol.3.P; Quol.6. §.De tertio X; 4.dist.6.q.10. §.Hic dicitur D*) affirm that one relation can be the foundation of another. With them agree Suárez (*disp.47.Met.sect.11.num.11*) and very many other recent authors.

It should be noted here that there is no doubt about the ultimate foundation, which is the substance — the support and sustaining basis of all absolute and relative accidents. Since a relation is an accident, it cannot be the ultimate foundation of a relation. The difficulty is therefore raised about the non-ultimate foundation in which a relation immediately inheres — so that the question is whether, just as a relation is founded in quantity or quality, another relation can be founded in one relation. And although a relation has a modest entity from what was said, this does not prevent one relation from being sustained by another; just as an absolute accident, which is weak — especially with respect to substance — can be supported by another absolute accident, such as whiteness, sweetness, and the like by quantity; and this is clearly evident in artificial things, in which we see with our own eyes some accidents existing in others. Suárez adds in the cited place that motion and time, although they are of diminished entity, can found a relation. Whether the relations of which one founds another are distinct can be raised as a dispute, which Lychetus settles with the Doctor (*§.Nunc solvenda sunt argumenta principalia*), saying that similarity is indeed really distinct from its foundation, while the otherness founded in that similarity is really identified with that very similarity. For it is repugnant for similarity to exist without the term of that otherness. Scotus intimates the same (*Quod.3. §.Respondeo P; Quol.6. §.De tertio X*), to whom Gadius, Tataretus, and their other expositors there adhere.

Assertion: One relation can be the foundation of another relation. Scotus expressly teaches this in the places just named, proving it first from Euclid (*5 Geometriae in initio*): proportionality is a similarity of two proportions; but proportion is a relation in which proportionality is founded, which is likewise a relation. Therefore one relation is founded upon another relation. Secondly, in an absolute accident an absolute accident is founded — as quality, for example whiteness, in surface. Therefore by equal right in a relative accident a relative accident is founded. The antecedent is clear from the preceding notable point. The consequence is proved: the unity of essence, according to Aristotle (*5.Met.cap.15*) and Scotus (*4.dist.6.q.10.antè §.Sed restat infra D*), is a sufficient reason for founding a relation of identity — whether generic or specific — between things of the same genus or species; but a relation brings with it a formal unity of essence, as we showed above. Therefore one relation can be supported by another relation. Thirdly, two paternities stand to each other as

two whitenesses, or two quantities, or two substances do; but between two whitenesses there is a relation of similarity, between two quantities a relation of equality or inequality, and between two substances a relation of identity or diversity — because they are of the same or different genus or species — therefore between two paternities there is likewise a relation of similarity. This argument seems to be a demonstration, to dissolve which no responses are adequate that the Thomists diligently employ, as can be seen in our younger members (*disp.8.q.5.art.2*) — especially those who deny the parity, claiming that between two paternities there is found only fundamental similarity, while between two whitenesses there is a formal similarity through the relative identity joined to them. Against this: two paternities are formally positive entities of the same species, formally positive — since they fall under the species of relation, which is a formally positive entity, as the same Thomists agree with us above. Therefore their conformity and similarity is formally real and positive, just as the similarity of two whitenesses is. Nor does it help to say with others that a relation is a weak and infirm being, unfit to sustain another — since this was already rejected above in the notable point. Furthermore, matter is considered by all Philosophers to be the most minimal being, almost nothing; yet it is constituted by them as the foundation of nature, the subject of all substantial and accidental forms. Therefore it is no obstacle that a relation — even though it is a weak being — can underlie another relation. Fourthly, things that are distinct found distinction: just as white things are white through whiteness and similar things are similar through similarity, so distinct things are distinguished through distinction; but relations are distinct — for even though they are of the same genus, they differ in species on account of the distinct differences into which the genus of relation itself is divided. Therefore they found distinction, and distinction is a relation. Finally, as Orbellus argues (*5.Met.cap.7*): identity and equality are relations between which there is an order, which is a relation. Therefore upon a relation another relation is founded. Add that to a relation belongs inherence — since, from what was said, a relation is an accident — and inherence, from Scotus cited above, is a relation. It is therefore rightly concluded that one relation exists in and is founded upon another.

You will object first: the Philosopher (*5.Met.cap.15*) mentions only three foundations of relation — namely substance, quantity, and quality. Therefore according to Peripatetic doctrine a relation does not found a relation. Confirmation from the same (*4.Met.T.4*): an accident does not accrue to an accident. Therefore a relation, which is an accident, does not accrue to a relation — that is, is not supported by a relation. I respond that Aristotle explicitly names those three foundations which are absolute; but implicitly he adds a fourth, which is the relation, as I intimated from Scotus above in the second proof. To the confirmation I say: explaining that passage of Aristotle thus — an accident does not accrue to an accident as to a subject and ultimate foundation — I

concede; as to a non-ultimate subject and foundation — I deny, as is sufficiently clear from the preceding notable point.

You will object secondly: St. Augustine (*7 de Trin.cap.5*) writes that everything that is said relatively is something, except the relative; but that something which is distinguished from the relative is absolute, since there is no medium between absolute and relative. Therefore a relation is founded only in an absolute thing. Confirmation: Scotus (*Quol.6.X*) adds: "perhaps one relation founds another relation." Therefore the teaching just set forth does not conform to the view of Scotus, who there speaks doubtfully and does not explain the testimony of Augustine in the opposite sense. I respond that St. Augustine speaks of the ultimate foundation, which is always something absolute — namely substance — or speaks of the foundation of the prior relations, but not of the posterior relations, which immediately have only something fixed and stable, as Lychetus excellently expounds (*ibid. sub fine §.Ibi ergo viso*). To the confirmation: I say that although there he speaks doubtfully, nonetheless in (*4.cit.*) and in (*Reportata 4.dist.6.q.9*) the Doctor speaks constantly and assertively, and there judges the opposite view to be false.

You will object thirdly: if one relation were to found another, a further relation would found another, and since there is no better reason for one than for another, there would be an infinite regress, which all Philosophers shun — especially in things ordered per se — with Aristotle (*2.Met.cap.2.T.5*). Therefore one relation does not appear to be the foundation of another. Confirmation I: a relation is the ratio of referring such that it is not itself referred; it is that *quo* in such a way that it is not the *quod* — just as whiteness is not white, place is not placed, and action is not acted upon. Therefore one relation is not founded in another. Confirmation II: Scotus (*4.d.6.q.10.sub E*) admits an infinite regress in relations of reason, which also seems to be conceded in real relations, since the Doctor himself (*2.dist.1.q.4.§.Contra istam opinionem B*) proves a real relation to be distinct from its foundation because a relation of reason is distinct from the foundation. From which the same Doctor infers (*Quol.1.§.De secundo art. infra P*): whatever real per se order would exist between things if they were really distinct, the same per se order exists between them correspondingly if they are distinguished by reason.

The consequent of the antecedent is denied, with Scotus (*2.4.cit.*). The terminus stands at second relations. For even though in two paternities the relation of similarity is founded, it does not then follow that another relation is also founded in that very relation of similarity. For just as in absolute accidents a certain terminus is given — as quality is founded in quantity and no further proceeding occurs — so in relative accidents a boundary is had that is not exceeded. To Confirmation I: I concede the antecedent and deny the consequence. For a relation is not referred but is the principle *quo* by which a relative is referred. And although in two paternities the relation of similarity is

founded, it does not then follow that another relation is founded in it and in those like it, because in any order of things one must arrive at an ultimate — as in differences, among which there are ultimate differences that differ through themselves, as Scotus teaches (*1.d.3.q.3. §.Ad q.igitur F*). Therefore all those things that Adversaries adduce as absurdities fall apart, and they can be examined in Lychetus (*praeallegatum §.Dicitur ab Henrico*). To Confirmation II: the parity is to be denied, with Scotus in (*4.cit.*). The reason is that any relation of reason can further found another relation of reason, since it depends on the intellect, which can carry out such a proceeding.

Article IX. Whether a Relation Terminates at an Absolute Thing

In this article Philosophers are divided into three groups. Some — such as Cajetan (*1.part.q.13.art.7*), Banez in the same place, and Augustine Niphus cited by Lychetus in (*Commentariis 1.dist.30.q.1*) — maintain that every relation, whether mutual or non-mutual, terminates at a relative. Joined to them are Fonseca (*5.Met.Sect.4.cap.15.q.4*) and the Complutenses (*in Log.q.6*). Others — such as Ferrariensis (*2.contra Gentes cap.11*), Ruvius (*in praesenti q.7*), and John of St. Thomas (*q.17.art.5*) — use a distinction to resolve this question, saying that a mutual relation regards a relative term, and a non-mutual relation regards an absolute term. Scotus (*1.dist.30.q.1. §.Respondeo igitur ad quaest. circa E and G; and in Reportata, same distinction and question*), Vigerius in the same place, Bonetus (*Libellus de Relationibus*), Fuentes (*q.16.difficultate 5.artic.4.dub.2*), Raconius (*Tract.2.de Categoria membro 2.art.4*), Suárez (*Tomo 2.Met.disp.47.Sect.16*), Hurtado (*disp.15.Met.sect.7*), and many others — even from among the Thomists, such as Capreolus (*1.dist.30.q.1.artic.2.ad 3*) and Socinus (*5.Met.q.30.ad 2 and 3*) — affirm that both kinds of relation, both mutual and non-mutual, tend toward an absolute term. Hence Fonseca in the place cited inadvisedly claimed that our view is rejected by all, when it is in fact more common and more probable than the opposite.

It should be noted first that in a relative — take for example a father — three things are considered: his substance, his power of generating, and his paternity. The first is called the subject of the relation, the second its foundation, and the third the relation itself. Similarly three things occur in a son — namely his substance, the passive power of generating, and his filiation. The question is now what among the last three items mentioned is the formal term in the son that terminates paternity: the substance of the son, or the passive power of generating, or the very relation of filiation itself? No one appears to make the substance of the son the formal and immediate term, since this can only be called the remote and mediate term and the ultimate subject of the said relation. The whole dispute among the aforementioned authors is about the other two — that is, whether paternity is immediately terminated at the passive power of generating, or at filiation. From this it is plainly evident that we are not speaking here of the material and radical term of the reason, as Ruvius and

some other Thomists suspect, but of the formal and immediate term toward which a relation formally and immediately bears. For the term of a non-mutual relation is not relative, since no relation arises from it — it is absolute, as Ruvius and the others cited above acknowledge along with us. Furthermore, relations are specified by the absolute formal term, and from it together with the foundation once posited, the relations themselves result. And if, per impossibile, in mutual relations no relation arose on the part of the term, that very relation, flowing from the foundation, would immediately and formally regard an absolute term. Again, the extreme and end that a relation regards is something absolute; for we shall show below that a relation bears from the foundation toward the term before a reciprocal relation proceeds from that term regarding the other extreme. Therefore the aforesaid distinction used by the Adversaries is of no use — except to evade, but not to eliminate, Scotus's arguments.

It should be noted secondly, from Aristotle (*5.Met.cap.15.T.20*), Scotus in the same place in the text and (*q.12 of the same work*), (*1.dist.3.q.5.§.Quantum ad hoc C and D*), (*Quol.13.§.Circa secundum*), and other places, that there are three modes of relatives, brought forward and carefully discussed by Bonetus in the present place and by Pelbartus cited above (§.10). The first is founded on one and many, such as the relations of identity and diversity, equality and inequality, similarity and dissimilarity. The second is founded on active and passive power, such as the relations of producer and produced, cause and effect, mover and movable. The third is founded on measure and measurable, such as the relations of intellect to intelligible, science to knowable. The relations of the first and second modes are called mutual, because from each extreme a relation arises; while the relations of the third mode are called non-mutual, because from one extreme indeed a real relation arises, but not from the other extreme — as from the side of science there plainly emanates a relation to the knowable, whereas from the side of the knowable there corresponds no real relation to science, as Lychetus observes with Vorrillone (*1.dist.30*) against Ockham, cited by Pelbartus in the place cited.

It should be noted thirdly that Scotus's doctrine about the absolute term of a relation is to be understood only of prior relations, and not of posterior relations, of which we made mention above in the notable point. For example, similarity, which stands between two white things, is founded in an absolute thing and terminates at an absolute thing; but the distinction between two similarities, or the similarity between two paternities — which is itself a relation — is founded in a relation and likewise terminates at a relation. Although this happens per accidens, insofar as its proximate foundation is a relation, as Raconius in the cited place rightly notes, after Suárez (*cit.num.14*). Furthermore, when a relation is said to be between two extremes, it should be understood that it is in one foundationally and subjectively, and in the other terminatively — not that one and the same numerical relation is in both extremes, as Henry thinks (*Quol.9.q.tertia*), somewhat in the manner in which Aristotle (*3.phys.T.21*) writes

that the road from Thebes to Athens and from Athens to Thebes is the same. For this cannot be maintained, since one and the same accident cannot exist in two really distinct and separated subjects, such as the extremes of a relation are. And the testimony of the Philosopher just adduced does not support Henry. For it is excellently explained by the Doctor (*4.dist.13.q.prima §.Ad huius autem infra L*) not of formal but of material unity and identity, which is compatible with formal plurality. Thus in motion the respect of the mover toward the moved and conversely of the moved toward the mover are formally distinct; similarly, the relation of the foundation toward the term is different from the relation of the term toward the foundation.

First Assertion: A non-mutual relation terminates at an absolute thing. So Scotus in the place cited above (*post E.G.*). It is proved first from Aristotle (*5.Met.c and T cit.*), who establishes the difference between relatives of the first and second modes, and those of the third mode, in that one of the relatives of the third genus is referred to another, but the other is not referred to it in return. But what is not referred to another is absolute; therefore since a relation of the third genus bears toward a term from which thereafter no relation arises toward what bears to it, it is clear through Aristotle that a relation of the third mode terminates at an absolute thing. Secondly, the relation of a creature to God is non-mutual, because there is no real relation of God to a creature, from Scotus recently cited. But God, whom such a relation of the creature regards as its term, is an absolute being. For as the Doctor says in the *Reportata*: if God were the sun, as some have suspected, there would still be a real dependence of created things upon him — which is a relation regarding him under an absolute ratio, since all confess that the sun is an absolute being. Therefore the term of a non-mutual relation is absolute. Thirdly, the relation of science to the knowable is of the third mode, from (*5.Met.loco allegato*). But the knowable, which is its term, is an absolute being, as is clear from natural body, which is the object and term of physics; from quantity, which is the term of mathematics; and from the objects of other disciplines, which are absolute entities. St. Thomas adds (*q.7 de potentia, artic.10.ad 4*), speaking of the relation of servitude of a creature to God himself, who is called Lord, that in God there is no orderly arrangement of lordship, even though he terminates the relation of that servitude. Therefore God is its term with respect to the real absolute being he has, not with respect to the respective being of lordship that he does not have. And so through St. Thomas a non-mutual relation regards an absolute term.

Banez (*1.part.q.13.artic.8*) meets these arguments in two ways. First, from Cajetan in the same place, who says that the relation of the knowable to science — which is also to be understood of the relation of God to a creature — is real solely from the fact that the relation of science to the knowable bears toward it. But this escape — and no true response to the preceding arguments — is rightly judged by Suárez, Hurtado, and other recent authors to be worthless. For either the relation is in the knowable, or it is not. If the first, then the knowable regards

science through its own proper relation existing in it, which Cajetan, along with other Philosophers, denies. If the second, then science does not tend toward a relative term, since there is no relation in it, as Cajetan himself concedes. Again, either the knowable is referred to science through the same relation by which science is referred to it — and this Banez holds to be false, thinking that in this way he lapses into the Scotist view, which he considers improbable — or through a different one, and this seems less acceptable, since the knowable has no real relation in itself to science, and such a relation of science would be non-mutual. Next, a relative through a relation inherent in itself is relative, just as a white thing through whiteness inherent in it is white; but no real relation exists in the knowable through which it terminates a relation as a relative term — therefore it terminates it as an absolute term. Furthermore, a relation presupposes extremes from whose positing it arises, and the knowable is conceived as terminating the relation of science before it receives a denomination from it. And so it terminates it not as a relative thing but as an absolute thing. All the more because even according to the Thomists, a relation has *esse in* and *esse ad*; but in the knowable the relation does not have *esse in*, because all its real being is in science, as they concede; therefore it does not have *esse ad* — and accordingly the knowable is not relative, and if it is not relative, as it truly is not, it can by no means be a relative term of science.

Banez responds secondly in the same place that the relation of the knowable to science is founded in the very same foundation in which is founded the relation of science to the knowable, so that science is the proximate foundation of two relations, of which one is real and the other rational. And he thinks this is what Aristotle intended in the cited place, intimating that the whole reason for founding both relations is really in science and not in the knowable. Against this: it is sufficient that there be in science its real relation by which it tends toward the knowable, as the Philosopher cited plainly teaches and Scotus expounds (*Quol.13.ad finem articulo secundo sub V*). This is supported by the argument that in one relative only one relation is found by which it regards its correlative, as is clear from father and son and the like. Therefore whichever of the two relations posited by Banez in science to escape the force of the argument is superfluous — not the one that is science's toward the knowable, which everyone admits; therefore the other, which is the knowable's toward science. Furthermore, a form intrinsically affecting a subject denominates the subject with an intrinsic denomination, as paper is denominated white through whiteness inhering in it. Therefore if the relation of the knowable were truly in science, science would be the knowable through the relation of the knowable existing in science — which is false. Again, science would be referred twice to the knowable — once through a real relation and once through a relation of reason — because since a relation has *esse in* and *esse ad*, if there is a twofold relation in science in which it has *esse in*, it has *esse ad*, which is proper to a relation. Again, the knowable would not be the correlative of science, as the same Doctor holds with Cajetan, because a

correlative is so through a relation adhering to it by which it corresponds to the other correlative, as the name itself indicates; but through Banez the knowable has no relation in itself by which it regards science, since both relations are in science. Add that the same Author, in responding to the authority of St. Thomas cited above, acknowledges that the relation of lordship is in God — a relation of reason belonging to him through the operation of the intellect. By parity he must concede that a relation of reason is in the knowable, just as shortly before he had conceded it to be the relative form through which the knowable is referred to science. But if he admits this relation of reason — as he truly does admit it along with others of the same school — it is then attacked from Scotus (*1.dist.30.q.2.sub G*): the relation of reason of the knowable to science is not the ratio for terminating the relation of science to the very knowable; for a relation is not in the knowable except when it is actually considered by the intellect, whereas science is really referred to the knowable even if not considered by the intellect. Therefore that rational relation in the knowable is not the ratio for terminating the relation of science. This is also clear from the relation of lordship, which is a relation of reason attributed to God in correspondence with the relation of servitude of a creature to God — which belongs to God independently of any operation of the intellect; whereas a relation of reason requires the operation of the intellect. A relation of reason, therefore, is not the ratio for terminating a real relation of the third mode. Nor does it help Banez to say that certain beings of reason have being before and outside the operation of the intellect. For this is impossible, since a being of reason — such as a relation of reason — depends on the work of the intellect both in its being and in its becoming, as I shall say elsewhere.

Second Assertion: A mutual relation likewise terminates at an absolute thing. Scotus holds this in the places mentioned. It is proved first from Aristotle (*9.Met.cap.7.T.13*): a potency, which is opposed to act, is defined through act; and every relative is defined through its term, from (*6.Top.cap.2.loco 45*). Therefore either potency terminates at act under an absolute ratio — and the intended conclusion is had — or under a relative ratio: in which case act and potency would be simultaneously defined — potency through act and act through potency — and the same thing would be both prior and posterior to itself, and a circle would be committed in the definition of each, as the Doctor infers with Averroes in the (*Quol.nuper.cit.*). Therefore every relation bears toward a term as an absolute thing. Suárez (*ibid.num.34*) makes little of this argument, saying that the inconveniences can easily be avoided in transcendental relatives, and that concomitantly, just as relatives are simultaneous in cognition, so they are simultaneous in definition. However, Scotus uses such an argument to show that his view is consonant with the doctrine of Aristotle, as he does in other matters. And the Doctor asserts this not only to avoid the said inconveniences, but for the thing itself — that is, because a relative bears toward its term precisely under an absolute ratio — as he himself subtly proves in the first place cited (*F*), from

whom much of what Suárez says is borrowed. Secondly, the extremes are presupposed to the bearing and relation that arises from them, just as causes are presupposed to their effect which is produced by them. But a mutual relation is the bearing of the extremes — that is, of the foundation and term from which it results; for when these are posited it is posited, and when these are removed it perishes. Therefore a relation of the foundation presupposes and pre-requires the term no less than the foundation, since it arises from the positing of both; therefore a mutual relation does not terminate at a relative thing but at an absolute thing — especially because mutual relations are simultaneous by nature, and so one cannot be the term of the other, since the term must necessarily be presupposed to it so that the relation arises from its positing and accrues to the term as term, and conversely the term is referred, as Scotus teaches in the cited place (§. *Respondeo sub G*). Thirdly, paternity and filiation are mutual relations of the second mode, founded on active and passive power; but the effect of the generating power or cause is the substance of the son begotten — which is why it is called substantial generation, because its term is the substance produced by it. Therefore a relation regards an absolute term. Even if per impossibile in these relatives God were to prevent the term from being referred to the other extreme, with the term remaining, the relation would undoubtedly have the term itself as absolute. This hypothetical can be confirmed from St. Thomas (3.part.q.25.art.quinto), Cajetan, and others in the same place, who affirm that the Blessed Virgin is referred to Christ the Lord by a real relation of maternity, while Christ himself is not referred to his Mother by a real relation. All the more so because the ratio of terminating is not the ratio of referring, as Bassolis and Bargius note above others (*dist.30 of the first*), and this is clear in non-mutual relations, in which there is a ratio of terminating on the part of one extreme, but no ratio of referring. Therefore the term of a relation is not relative.

You will object first: Aristotle in this chapter expressly seems to assert that the term of a relation is relative; for he says there that relatives are said to convert, as a slave is a slave of a master and a master is a master of a slave. And he adds that they are not said to convert if, instead of that to which they stand, something accidental to them is assigned — as if instead of the term of slave one assigns "man" or "biped." Therefore according to Aristotle a relation terminates at a relative thing. Confirmation: relatives are simultaneous by nature, as the same Philosopher states in the same place; but if one relative did not terminate at another relative, they would not be simultaneous by nature — for the relation of paternity in the father would be prior to the relation of filiation in the son, since being a father is prior to having a son, as every cause is prior to its effect. Therefore a relation does not tend toward an absolute thing.

I respond that Aristotle there only wants relatives to reciprocate by reason of the mutual relations that arise from their extremes, and that with those relations removed, whatever else may remain, there is no further reciprocation between

the said relatives. For just as with whiteness removed from a wall, the wall is no longer white and no longer similar to another white wall, so with the relation of slave to master removed, the one who through that relation was a slave is no longer a slave — and conversely, whatever else may endure in him. Therefore the Philosopher by no means holds that a relation terminates at a relation; for it is one thing for relatives to mutually regard each other, and another for them to terminate — as Lychetus (*cit. §. Respondeo*) and Tataretus here (*scibili quarto*) rightly observe, and as I showed above that the ratio of referring is distinct from the ratio of terminating. To the confirmation: granting the major, I deny the minor. To its proof I distinguish with Scotus (*q. 27. praedicam. propè finem, and primo praecit. F and G*): if relatives are taken fundamentally — that is, with respect to their absolute entities in which a relation is founded — I concede, for in this way the suppositum of the father is prior to the suppositum of the son. But if they are taken formally — that is, with respect to their relative forms — I deny. Just as a genus materially taken is prior to a species, while formally speaking it is simultaneous by nature with the species, as the Englishman (*9. 21. universalium, fol. 91. colum. 3*) observes among others.

You will object secondly: if a mutual relation terminated at an absolute thing, there would be no difference between a mutual relation and a non-mutual one, since both would tend toward an absolute term; but there is a difference between the said relations, as is established from the preceding assertions. Therefore a relation does not regard an absolute term. The consequent of the major is to be denied; for these relations differ in that in non-mutual relations, from the part of one extreme no real relation arises, while in mutual ones, from each extreme a real relation results.

You will press: in all relatives there is a mutual relation if they are conveniently assigned. Therefore the response just given is of no weight. The antecedent is proved: all relatives are said to convert — as science is the science of the knowable, and the knowable is the knowable of science. Likewise the sense is the sense of the sensed, and the sensed is the sensed of the sense, as the Philosopher indicates in the cited place. I deny the antecedent. To its proof I admit that all relatives are said to convert; but I deny that in relatives of the third mode there are mutual relations. For although science bears a real relation toward the knowable, the knowable does not in return bear a real relation toward science. Hence it is denominated the correlative of science not by an intrinsic but by an extrinsic denomination, because there is no real relation in the knowable by which it regards science — as Lychetus recently cited (*§. Respondeo ad rationes Ocham.*) hands down from Aristotle (*5. Met. praecit.*).

You will object thirdly: correlatives are simultaneous in cognition by the common consensus of Philosophers — one who definitively knows one relative knows definitively the other too, as the Philosopher just recounted states; as one who knows a father also knows a son. Therefore a relation terminates at a

relative. The consequence is proved I: if it terminated at an absolute thing, one would necessarily have to know the absolute thing at which it terminates, which conflicts with Aristotle in the place mentioned. Confirmation: one relative is defined through another relative, as Porphyry adds after Aristotle in (*cap. de specie*), where he defines genus through species and species through genus, which the Doctor observes in (*primo allegato sub E*). Therefore one relative is the term of another relative.

Granted and explained, the antecedent — that is, that knowing one relative, the other is easily reached — I deny the consequence, in the interpretation of Tataretus, and I admit its proof. For since the cognition of a relation depends on its extremes, it is therefore necessary that its extremes be known beforehand, as Scotus says (*Quol.14.*). Nor does this contradict Aristotle, as will shortly be made plain. To the confirmation: I say this comes about not through correlation but through the foundation — especially because the definition of relatives is given not through essential elements but through an addition; for just as in the definitions of accidents their subject is placed, so in the definitions of relatives their correlatives are placed, as the Doctor rightly notes (*q.18.praedicam.§.Hoc potest concedi*).

It will be pressed: the Doctor in the place just cited says that the essence of a relative is to bear toward another; but that toward which a relative bears is its correlative; therefore a relative terminates at a correlative. I say that this instance indeed concludes that a relative refers to its correlative, but not that it terminates at its correlative — since, from what was said, to be referred is one thing and to be terminated is another. It will be urged: relatives are opposites and one of them regards the other, as is clear from the chapter on opposites; but this mutual regard is derived from the ratios of referring and terminating that relatives have with respect to each other; therefore the term of a relation is relative. Granting the major, the minor is denied. The mutual and opposite regard comes from the fact that from each extreme a real relation arises; even if from the part of one extreme no real relation arose, the relation of the other extreme would tend toward it — but it would not in turn be referred. Therefore the mutuality and opposition of respect is derived only from the opposing ratio of referring, not from the ratio of terminating.

It is argued again: the divine relations of origin are borne toward relative terms; therefore the same is to be said of created relations. The consequence holds because the same reason runs through both. The antecedent is clear: paternity terminates at the Son, who is a suppositum formally relative — and the same is to be maintained of the other personal relations. I say this instance is of no force in the view of those who affirm that the divine persons are constituted by absolutes — a view that Scotus shows to be not improbable and not heretical (*1.dist.16.q.vn.*), on behalf of John of Ripa who defended it. In the common opinion, however, affirming that the divine persons are formally constituted by

such relations, the antecedent is conceded and the consequence is denied. The reason for the disparity is that a created person is absolute, while an uncreated person is formally relative — therefore it is no wonder that its term is relative. And this also occurs in created things when the foundation of a relation is itself a relation, as I noted above.

You will object fourthly: if a relation tends toward an absolute thing, a substance — which is an absolute being — would be a relative being, because what a relation terminates at is considered relative, as is clear from the knowable, the sensible, and the like; but it is impossible for substance to be relative, as Aristotle asserts in the present place. And even if substance were conceded to be relative, all things too would have to be conceded to be relative — which absurdity is adjudged by Aristotle and later Philosophers alike. I respond by distinguishing the major: formally and quidditatively — I deny; accidentally and denominatively — I concede. The minor is to be distinguished correspondingly to the distinction of the major, and so Aristotle and the rest of the Philosophers are explained when they deny that substance is relative.

Article X. Whether the Same Thing Can Be Referred to Several Things

This difficulty is extensively treated by Scotus (*q.29.praedicam.*), Bonetus (*lib.4.de Relationibus*), Orbellus, Anthony Andrée, and others, (*5.Met.*) — a question that the Philosopher touches upon there (*T.20.6.15*) — for whose explanation and resolution it should be noted from Scotus (*cit. §.Ad istud dici potest*): something can belong to something else in two ways: in one way, per se primarily; in another way, per se not primarily. What belongs to something with respect to its formal and specific ratio is said to belong to it per se primarily — that is, adequately; so having three angles belongs per se primarily to a triangle. What belongs to another in respect of some formal ratio, though not a specific one, is said to belong to it per se not primarily — as having three angles belongs per se not primarily to an isosceles triangle. It should further be noted with Bonetus in the cited place that this doubt can be understood of a relation of the same or of a different mode. Moreover, recall from what was said in Article VI of this question that something can be referred to several things through several relations contained in it — as a father is referred by as many paternities as there are sons begotten by him.

Assertion: The same thing can be referred to several mutually distinct things by several relations contained in it; but by a single relation it is referred to only one thing adequately with respect to its proper ratio. This is handed down by Scotus in the passage recalled, for both parts. The first part is proved first from Aristotle (*4.Top.cap.1 and 2*) and Porphyry (*c.de specie*), who affirm that a species is referred to the genus under which it is comprehended and to the individuals of which it is predicated. Therefore the same thing can be referred to several things by several relations existing in it. Secondly, one whiteness is

referred to another whiteness by similarity and to blackness by dissimilarity; the same science is referred to the same knowable insofar as it is distinguished from it and caused by it, by a relation of the first and second mode, and insofar as it is measured by the same knowable, by a relation of the third mode; and a father is compared to the several sons he has begotten. Therefore the same thing can regard several things according to the several relations it has in itself. The second part is proved first from Aristotle (*5.Met.Tex.cit.*), who considers it absurd for one thing to be said twice — that is, for one thing per se primarily, as Scotus expounds it, to be referred to two altogether different things. Secondly, producing by one production is referred to the produced, as one father by one paternity regards one son. Therefore the same thing, with respect to the same mode, per se primarily is not referred to several things. Furthermore, one and the same thing has one essential and quidditative definition, as we observed in (*lib.2.q.de genere*); and the reason is that the definition of a thing makes known its nature — and there is only one nature and quiddity of one thing. Finally, a relation is specified by its term. Therefore one relation regards one term only. The antecedent is shown in Article VI of this question. I add that a relative is defined through its correlative. Therefore the same thing cannot be referred to several things by a single relation existing in itself.

You will object first: Aristotle in the passage recently cited writes that intellection is not referred to the intellect, but is referred to the object understood. Therefore according to Aristotle the same thing cannot be referred to several things — otherwise intellection would be referred to the intellect as its efficient cause and also to the object as its measure. Since therefore Aristotle denies that intellection is referred to the intellect, he by all means denies that one thing can be compared to several things. I respond: if intellect is taken for the intellective power, it is true that intellection is not referred to the intellect itself by a relation of the third mode — that of the measurable to the measure; but it is referred by a relation of the second mode to the intellect, as to its effective cause. But if intellect is taken for the object understood, then intellection is referred to the object understood as measurable to the measure. So intellection regards both — not by one and the same but by a distinct and different relation. In this sense Scotus seems to interpret Aristotle (*Quol.13.antè §.De tertio art.X*).

You will object secondly: if the same thing could be referred to two things, the same thing would be defined by a twofold definition with respect to those two things it regards; but the same thing cannot be defined by a twofold definition — otherwise the same thing could be both known and unknown, known through one definition and unknown if the other definition were not had. Granting the major, I deny the minor. To its proof I say that with respect to the same thing no two descriptions can be given; but with respect to different things there is no obstacle, as is clear from (*lib.2.q.2.art.1*). I add that there is only one definition through the proper essence of a thing; another, through a property of the thing or some accident of it, is called a description.

Article XI. Whether a Relation Requires an Existing Term

Some — such as Paul Soncinas, it seems, and Gregory of Rimini (*1.dist.28.q.3 and 5.Met.q.7*), to whom Arriaga (*disp.12.sect.10*) and two Scotist fellow-travellers (*disp.8.q.6.art.1*) seem to favor — think that a relation does not necessarily require a term existing in act. The opposite view is defended by Scotus (*1.d.21.q.vn. §.Ad q videtur dicendum; Quol.6. §.de 3.art; 3.dist.1.q.1. §.Ad illud in oppositum*), Lychetus in the same place, and nearly all the other Scotists and Thomists, asserting that a relation necessarily requires an existing term.

It should be noted that this difficulty is raised chiefly about both transcendental and predicamental relations, and about aptitudinal and actual relations, of which the Doctor makes mention (*Quol.13. §.Circa secundum sub O*). An aptitudinal relation coincides with the property or propensity of a thing, which is really identified with the thing of which it is a property. An actual relation is a tendency or respect actually existing, which actually bears toward an actual term — as paternity, by which someone is actually a father, regards the son begotten by him as actually existing. This is intimated by the Doctor (*1.dist.30.q.2. §.Contra istam opinionem antè A; 2.dist.1.q.4.in fine §.Et quia antè D; in Reportat.2.dist.1.q.6; 1.dist.17.q.2.sub O*).

First Assertion: Aptitudinal relations do not require a real term actually existing. So Scotus in the cited place and Orbellus (*5.Met.in fine c.*). It is proved first: aptitudes and properties of things are, from Scotus in the cited place, real aptitudinal and fundamental relations, which are really identified with the things of which they are properties, from the same (*ibid.dist.16.q.vn. §.Ideò dico*); but such aptitudinal respects can exist without their acts and terms — as risibility, or the power of laughing, without laughter, or the act of laughing. Therefore aptitudinal relations do not require real terms actually existing. Secondly, supposing that there were no color toward which sight could bear, there would still be in man the power and aptitude for seeing — but there would be no actual vision, nor its actual term, by the given hypothesis; but the aptitude for seeing is an aptitudinal relation, as I noted above. Furthermore, the Eucharistic accidents have an aptitudinal inherence toward their subjects — namely the substances of bread and wine — in which, thus divinely separated, they do not actually inhere, yet they have the aptitude for inhering in them, as the Doctor writes (*4.dist.12.q.1. §.Ad q. and §.Ad argumenta principalia*). Therefore aptitudinal relations can exist without their equal terms. It is not unknown to me that the two Scotist fellow-travellers in the cited place think these relations to be formally real and actual, because all properties that consist in such aptitudinal respects toward their conforming acts are real. And the potency of matter, insofar as it regards possible forms to be introduced and drawn out, is real, formal, and actual. But their opinion is not to be followed or approved, since it conflicts with Scotus, the chief Scotists, and reason. For Scotus (*Quol.13.sub O*) calls the said relations real potential and aptitudinal, and adds (*sub*

P): "a relation cannot more truly have being than the term toward which it is." But the terms of those relations are potential, aptitudinal, and possible — therefore those same relations are equally potential, aptitudinal, and possible. And shortly after he intimates that they are real on the part of the foundation and rational on the part of the term. The same is nearly the same as what he holds (*4.dist.12.q.1. §.Ad q.respondeo B and §.Ad argumenta principalia A*), saying that the inherence of an accident — both actual and aptitudinal — is a relation, but with this difference: the former is in act, the latter in aptitude. Whence Vallo rightly adds (*Tract. formalitatum fol.106*) that an aptitudinal relation has an aptitudinal term proportionally corresponding to it. And the constant doctrine of Scotus (*Quol.6. §.De tertio sub L.L. and elsewhere*) is that a real actual relation arises from real actual extremes. Since then the terms of aptitudinal relations are not real and actual, it clearly follows that those relations are not real and actual — as their very name also indicates, and as does their difference from actual respects. Again (*4.d.6.q.10. §.Sed restant H*): "a non-being cannot be the foundation or reason for founding any real relation, nor the term — for on this account it is held to be a contradiction, and a relation of reason, because it has a foundation or term that is a negation." And the same mind is openly expressed in (*Quol.6. §.De tertio sub LL. and elsewhere*) that a real actual relation results from extremes actually posited and actually existing. This is openly defended by Bassolis (*3.d.8.q.1.art.1*), Bonetus in the cited place, Faber (*5.Met.disp.22*), and other more distinguished Scotists, whose chief argument is that a relation is essentially toward another as toward a term; but what is not a being, or is a being only in potency, is not properly another, as the Doctor clearly shows (*dist.6.quarti q.10. §.cit.H*) and also (*Quol.13*). Again (*dist.12.q.1 of the same Sentences*), the same Doctor adds that a relation is essentially the bearing between two extremes; therefore if the term toward which the relation is directed is removed, that relation too is removed — it being a relation that emanates from the said extremes. And it is plain there, and in (*1.dist.5.q.1*), that Scotus speaks of the bearing toward an actual term, in the existence of which the relation exists, and in the non-existence of which the relation does not exist. The foundation of the aforementioned recent authors is groundless, because the properties of things, the potency of matter, and the like are called potential and fundamental relations — that is, as the Doctor teaches (*Quol.cit.*), from the part of one extreme or of the foundation, which is real, they are called real; but not from the part of the non-existing term, by reason of which they are called rational — as Lychetus, Gadius, and the rest of his interpreters affirm there, and as those authors also acknowledge at the beginning of (*q.1*).

Second Assertion: Mutual predicamental relations require a real actual term.

The Doctor holds this in the places cited above. It is proved first: a predicamental relation has its whole being toward another, as is clear from its definition delivered by Aristotle in the chapter *Ad aliquid* — he there rejecting the definition of relatives given by the ancient Philosophers. Therefore a mutual

predicamental relation requires that other toward which it actually bears; but that other, which it actually regards, is its term, as is plain. Therefore it is not to be denied that a predicamental relation requires an actual term. Secondly, a predicamental relation pre-requires and presupposes co-existing extremes from whose simultaneous positing it arises — as an effect from its cause. Relatives mutually posit and regard one another, mutually destroy and eliminate one another; they are simultaneous by nature and cognition, and are said to convert. But these things cannot obtain without the actual existence of the term. Thirdly, if a predicamental relation were to tend toward a possible term, as the authors of the first view assert, a man who has never procreated sons would be a father through relations to as many sons as he could generate — since a father is constituted in the being of a father through a relation to a son. But this bears open falsity and absurdity — as, for example, that Christ the Lord would be a father through respects to the sons he was able to generate. Likewise the Blessed Virgin would be a mother through relations to other sons she was able to bear besides Christ, whom she truly brought forth as her only-begotten. Similarly, a maiden not yet married would be married through a relation to a possible man she could take as her husband — absurdities and the like, which no one of sound mind fails to see.

Arriaga in the place cited (*n.50*) tries to reconcile both views with a distinction, saying that Gregory is wrong in the matter but right in manner of speaking. For it is customary to say "this is the son of Francis," even though Francis may have died. Likewise "this evil man is an image of Antichrist," even though Antichrist has not yet come. But Philosophers consider not only the manner of speaking but chiefly the thing itself and its truth — for in this way the serious difficulties proposed for resolution in Philosophy would easily be evaded, if they were deflected into a manner of speaking, especially since manner of speaking pertains more to the grammarian than to the philosopher. And if Arriaga admits this, he should also confess that the view of Suárez — rejected by Arriaga himself — is true, namely that a relation is wholly in the foundation, which is to be refuted at length in the next article.

You will object first: Aristotle in this chapter writes that the heating thing is referred to the heatable, and the acting thing in act to the patient in potency. But such relations are predicamental, mutual, and of the second mode of relatives. Aristotle therefore holds that a predicamental relation terminates at a term not existing in act. Confirmation: some real predicamental relations exist that lack real terms actually existing — as Scotus notes with Tataretus (*in praesenti c.*) in (*Quod.lib.13.*); and this may be argued from the relation of distinction, by which a form differs from its privation, and from the relation of creation, which creation itself bears toward the non-being of the thing immediately preceding it, as the Doctor teaches (*Quod.cit.N*). Likewise from the relation of information toward the non-information immediately preceding it, from (*2.dist.1.q.5.antè T*; *4.dist.11.q.1.F*) and other places, in which the same Doctor

seems to concede that some real and predicamental relations do not tend toward actually existing terms. I respond: if those extremes are actually existing, their relation indeed is real; but if one or both is in potency and a non-being, their relation is not real — and so Aristotle in the cited place is to be interpreted, and he intended no more there, as some recent author asserts. And it is the express view of Scotus (*Quol.12.¶.De 2.art sub E*): "The first respect, which is that of being itself toward the preceding non-being, is not real, because it is not toward a positive term." And in (*Reportata of the first, dist.30.q.2*). By this the reply to the confirmation is also clear: for in the places cited from Scotus the opposite is evident — especially (*Quol.praeallegato sub P*): "when the term does not have real being but only being in the intellect, then toward it there can be only a relation of reason; for a relation cannot more truly have being than the term toward which it is." And this is deduced from (*4.dist.13.q.1.sub V*).

You will object secondly: that from which a thing draws its entity draws its reality from the same, as is clear; but a relation draws its entity from the foundation, because it is caused by it; therefore also its reality — and accordingly, with no real term existing, a relation is real, its reality derived from its foundation. Confirmation: Logic is a real science, even though its term, which is its object — namely the syllogism — is a being of reason. Furthermore, there is real science about a non-existing rose; but science has a real relation of the third mode toward the knowable object. Therefore it is not necessary for the term to be a real actual one in order for a relation to be real. Granting the major, I distinguish the minor: a relation has being from the foundation, to the exclusion of the term — I deny; from the foundation, with the term posited — I concede. This response is Scotus's (*in Reportat.4.dist.6.q.9.¶.Dico igitur*): "There can be no intrinsically accruing respect that can arise from the foundation alone without the term being posited, because nothing is referred to itself." And (*dist.12.q.1.¶.Ad quaest.dico and ¶.Ad aliud dicitur*) and (*Quol.12.art.2*). And this is openly clear from the conditions for a real relation set out as necessary by the Doctor in (*1.dist.31.q.3.Reportata and Quol.6.¶.De tertio; 1.dist.31.q.vn.¶.Ad q.*). And this perhaps, forgetting what they had said earlier, the aforementioned recent authors accept a little later, providing the difference between a predicamental and a transcendental relation — that the latter requires a possible term while the former requires a real term actually existing. To the confirmation: a response was given in (*lib.1.q.2.artic.2*).

You will object thirdly: an aptitudinal and transcendental relation does not necessarily require a real term really existing, as has been proved in the first conclusion. Therefore neither does a predicamental relation, since in both cases the reason appears to be the same, as Suárez labors to show with many arguments (*cit.num.5.6*). Confirmation: one thing can terminate another even if it does not exist, as is clear from a final cause, which terminates toward its effect even if the effect does not yet exist. Granting the antecedent, I deny the consequence: the reason for the disparity is that a transcendental and potential

relation is really identified with the foundations in which they are founded; whereas a predicamental relation really differs from the foundation that sustains it, and therefore unless a really existing term is present the relation does not accrue to the foundation. Furthermore, a transcendental relation regards even a possible term; but a predicamental relation — since it necessarily arises from the positing of the foundation and term — necessarily presupposes a positive term actually existing, as Scotus writes (*in Report.primi dist.30.ad finem q.2*). To the confirmation: I deny that a relation is properly real unless its term really exists; the Doctor gives this reason in (*Reportat.4.dist.6.q.9.§.Dico igitur*): because nothing is referred to itself, but to another, which is a positive term. The same had been expressed in the same work (*primi dist.31.q.2.§.Supponendo*), and Suárez defends it (*ibid.num.18*), following Bassolis (*1.dist.30.q.1.art.1*), Meyronnes, Tataretus, and other students of Scotist doctrine, to whom our recent authors seem to consent (*q.3.art.1 of the same disputation*).

It will be pressed: the relations of images, which lack actual terms — as the relation of an image to Caesar who has now died is a relation of similarity to a non-existing term — and such relations are enumerated by Aristotle (*5.Met.cap.de relatione*). Therefore a predicamental relation does not require a term actually existing. I respond: Aristotle there did not teach that the said relations are predicamental, as Fuentes observes (*q.16.diff.5.art.2*); Lychetus adds that they are not real; and this is deduced from the Doctor (*ibid.§.Ad quaest.2.N*) in these words: "to the second, in a similar manner, since the being of an exemplated thing is only being in a qualified sense (*esse secundum quid*), and therefore the bearing toward such a term is not real, just as the term is not real."

You will ask whether a relation is a thing or a mode. The Doctor responds (*in 2.cit.§.Quod si adhuc proterviaur D*): such a question is almost entirely about a name. For a relation absolutely speaking is a being and a thing — it is contained under that division of being into absolute and relative, as is clear from (*5.Met.T.14*), and likewise under the other distribution of being into substance and accident, and similarly of accident into absolute and respective, speaking of a created relation, which is comprehended under finite being. Comparatively, however, a relation can be called a mode, insofar as a relation is an accident more imperfect than an absolute accident. Thus quality is called a mode with respect to substance, which is nobler than it, even though quality absolutely speaking is a thing. That the same thing can be named in different ways — as thing and as mode — is clear from St. Augustine (*lib.1.de doctrina Christiana cap.1*), who writes that a sign as sign is something, but is also a mode of the signified. From these things one may gather the distinction that exists between a relation and its extremes, and what distinction exists between two real predicamental relations — namely a real distinction, because it exists between thing and thing; and it could be called modal, if a relation is conceded to be a mode, as was explained above. I note, however, that this manner of speaking is not in use in the School of the Subtle Doctor. For modal distinction is used in one sense by

our party, and is taken in another sense by Doctors outside the school of Scotus, as the undivided Scotists also note (*disp.8.q.3.art.1*).

Article XII. Whether the Essence of a Relation Is Wholly in the Foundation

Suárez (*disp.47.Met.Sect.2.num.25*) cites certain recent authors commonly called Connotators as holding that the whole essence of a relation is in the foundation, and that the term is required for it not as something formal and essential to its being but only as something connotated and oblique. They appear to have been preceded by Alensis (*5.Met.ad Tex.20*), Henry (*Quol.9.q.2*), and Baccus (*1.dist.28.q.1.dub.3*). This opinion is fully and well refuted by the abovementioned authors following Scotus in the places adduced in the previous article, and by other Doctors both ancient and recent, who commonly affirm that a relation essentially depends on the term and arises together with the positing of the foundation when the term is also posited. Vitadus (*disp.15.Met.sect.3*), Arriaga (*disp.12.Log.sect.8*), and Fuentes (*q.16.diff.3.art.1*).

What I said in (*Epitome lib.1.q.1.art.6*) about the concrete and connotative name — which has a twofold signification, one primary and another secondary, treated at length in (*lib.3.nostra Logica q.2.art.5*) — should be recalled. Since, however, the significations of terms cannot be proved, as Gadius warns from Scotus (*1.dist.1.q.3.¶.Quod autem, Quol.12.fol.125.pag.3*), but must be drawn from the usage of approved authors, it should not be omitted — from what was said in the cited place — that a concrete accidental name does not differ from an adjective, nor much or at all from a connotative name, as Tataretus touches upon (*Tract.7.summularum comm.1.scibili 2*). Nor is the Doctor far from this (*4.dist.12.q.1.¶.Ad argumenta principalia*). For since to connote means nothing other than to note one thing together with another, it follows from the force of the word that a connotative term is one that notes one thing together with another — one material, which is the subject, and another formal, which is the form inhering in the subject, as was explained in the cited place. But connotation can occur in two ways: in one way, by reason of the object, when a form is signified as attaining the object toward which it bears — so vision, intellection, and the like are called connotative because they signify qualities or cognitions and connote the known objects, of which Scotus makes mention (*Quol.12.13*). In another way, by reason of the term, when one thing is signified dependently on another because one cannot perfectly exist or be understood without the other — so principally the form is signified, and less principally the subject of the form that it connotes, or something else — as "lunch" signifies per se the eating and connotes midday time. Therefore, since a relative per se regards its term, it clearly follows that it is not a connotative name, as Suárez mentioned above wrongly thinks with certain others. And this is noted by our younger members at the end of the cited article, yet in (*1.p.suarum Inst.Tract.1.cap.3*) they take as an example a father who is said to connote a son in

the aspect of a term — which does not seem to have been said consistently. This is also intimated by Gadius with Scotus (*Quol.8 and 12.art.2 and antè q.8.praedicam.*). Furthermore, note the common Scotist assertion that relations are specified by their terms, which is derived from the definition of relatives given by the Philosopher in the chapter *Ad aliquid*. For the whole being of relatives is toward another — that is, toward the term — and a relation is the bearing or respect toward another. Therefore relations are specified by their terms, somewhat in the way motion is specified by the term toward which, and powers by their acts, and acts by their objects, as is clear from (*2 de Anima T.33*). All the more so because in one foundation several specifically distinct relations can exist — as in the same whiteness the relations of similarity with another whiteness and of dissimilarity with blackness. Although the foundation is the cause of the relation, the distinction of the relation is nevertheless not derived from it, as the undivided companions of the Scotist philosophical course think (*dist.8.q.10.art.1*); for just as from God and the sun, as efficient causes, the essential differences of the things they produce are not derived, so too. But such a distinction of a relation from the term is not an intrinsic essential distinction but an extrinsic one, as was noted in Article VII of this question, nota III, with Scotus there cited and (*5.Met.q.12*).

Assertion: A relation does not have its whole being in the foundation, such that with the term perishing, the whole relation would still persist in the foundation itself. This is taught without doubt by Scotus and his disciples in the places cited above, and more expressly in both works (*quarti dist.12.q.1. conclusione prima circa D*): "A respect is essentially the bearing between two extremes, and therefore just as to remove the term toward which the respect is, is to remove or destroy the respect; so to remove that of which the respect is, is to remove the respect and destroy the ratio of a respect." And in the same place (*sub N*) he adds: "for if only the foundation were posited without the term, there would follow no respect." It is proved first: relatives are simultaneous by nature and by cognition, and when one is destroyed the other too is destroyed, from Aristotle in this chapter. But if the whole relation were to persist in its essential and quidditative being in the foundation after its term is destroyed, one relative would exist while the other does not. Therefore the aforesaid assertion of the Peripatetics would be false. The minor is easy to prove: just as what has whiteness is white, so what has a relation is relative; but with the term non-existing, the foundation has the whole relation, as Suárez concedes in the cited place. Therefore the foundation is relative — and so correlatives would not be simultaneous by nature and cognition, which contradicts the common view of Dialecticians. Moreover, a relation arises upon the positing of extremes, as Suárez himself admits in the same place; and yet according to him, with the term not posited, the whole relation exists in the foundation — which openly implies a contradiction.

You will say with Suárez in the cited place that upon the positing of the term no new relation is posited but only a new connotation. Against this, in the first place, the common philosophical maxim endorsed by all is wrested from him — namely that from the positing of extremes there results a new relation, not a new connotation. For that new connotation is either a new relation or something absolute. If the first, the intended conclusion is had — for Suárez merely changes the name of relation into connotation, and unwillingly departs from the common opinion not in reality but in word, which is not his intention — for he plainly intends more, as is clear from his writings. If the second, then it is either substance, quantity, or quality; but it is also plain, even by Suárez, that it is none of these absolutes. Therefore such a connotation is vain. Again, such a connotation is either something or nothing — not the latter, because it belongs to the foundation connotating the term, which is clearly outside of nothing; nor the former, for a respect is something either intrinsic or extrinsic. If intrinsic, then through something newly accruing to the foundation it connotes the term, not through something already pre-existing — that is, through a relation already presupposed in the foundation itself. If extrinsic, it pre-requires a change made in something through a relation received in it — not indeed in the foundation, because the ratio connotating was already pre-required; nor in the term, because the term is something extrinsic and connotated. Therefore that connotation is fruitless and vain for dissolving this difficulty. Secondly, what is formally constituted in being through a form is denominated through that very form through which it is constituted, with everything else excluded. But a relative is constituted in relative being through a relation; therefore it is denominated relative through it. The major, although it seems sufficiently proved from the preceding argument, is further corroborated: what is animated is constituted in the being of an animated thing through a soul, and is denominated animated through a soul; and what is black is constituted in the being of a black thing through blackness, and is denominated black through blackness. The major is evident from similar cases of other accidental concreta, which are constituted in being through the forms they have in themselves, among which number is the relative, as Scotus plainly teaches (*5.Met.q.11*). Since therefore the foundation through the relation inherent in it is relative, it is perspicuously deduced that with the term removed, that very foundation is denominated relative — which the Connotators deny.

You will say that the relation remains in the foundation, with the term not existing, in the aspect of entity, but not in the aspect of denomination. Against this: for something to be intrinsically denominated such, it must have in itself such an entity — for example, for someone to be denominated a knowing person, he must have in himself the science through which he is denominated a knowing person, since intrinsic denomination presupposes the entity existing in that which it formally denominates. But according to the said Connotators, the relation is in the foundation in the aspect of entity; therefore also in the aspect

of denomination. For a manifest implication is seen in Peter — for example, that paternity is actually and formally present according to its whole entity, and that Peter through it is not denominated a father; and in Paul that filiation is actually and formally present according to its whole entity, and that Paul through it is not denominated a son. For it cannot be that in something there is a formal cause without its formal effect. Therefore, since a relation without a term formally affects the foundation, it must render it formally relative and formally denominate it relative.

You will say this holds in an absolute form, not in a relative form, which connotes the term. Against this: the whole relative form is in the foundation, just as the whole absolute accidental form is in the subject. And if there is any disparity, it is the connotation of the term, which a relative form and not an absolute form bears. But such a connotation — besides being rejected above as vain for our purpose — is of no help to the Adversaries for solving the argument. For even an absolute accidental form connotes the subject in which it inheres or has the aptitude for inhering; and a relative concrete is properly denominated even when its object or term does not exist — as "understanding" is a relative concrete, and a man is truly called "understanding," even though the object or term toward which the intellection tends does not co-exist. Therefore the cited authors have recourse gratuitously and without foundation to the distinction between an absolute and relative form. Whether the relation of the "understanding" to the understood object is transcendental and real is clear from what was said above; and this argument seems almost entirely *ad hominem*. A third argument: a new real and intrinsic denomination does not accrue to a thing without a new entity, according to the Connotators, as Arriaga (*cit.*) and Oviedo (*Controversia 9.Met.n.18*) note. Therefore if through the arrival and existence of the term a new real and intrinsic denomination accrues, a new entity is likewise joined to it. But I ask whether that new entity is absolute or relative. Not the first, as is plain; therefore the second must be given — and thus there will be a twofold relation in the foundation: one old, before the term exists; another new, after the existence of the term. But one of the two is superfluous — not the later one, because it arises from the positing of the term together with the foundation; therefore the earlier one, which is imagined to be in the foundation before the term. Again, since a relation is co-produced upon the production of extremes by the common view of Philosophers, I ask: what agent produces or co-produces the relation pre-existing in the foundation before the arrival of the term? If you say it results from the nature of the foundation — as a property flows from the subject of which it is a property — it follows that in a child there are all the future and possible paternities; that in one white thing there are already all the similarities of future and possible white things; and likewise that relations of the second mode are not founded on action and passion — since they were already in the foundation even though no action and passion accrued to it. Hence without active generation there would be

paternity and without passive generation filiation — absurdities and the like, which are plainly false and ridiculous in themselves, clearly demonstrating the absurdity and vanity of the view just recounted.

You will object first: Aristotle (*5.Met.cap.15*) distributes relation into mutual and non-mutual, and this latter is said to be the relation of measure and measurable placed in the third mode of relatives. But if a relation included its term, the aforesaid division would be vain, because a non-mutual relation does not require a term for its being — since a relation does not arise from the term but only from the foundation, and hence its whole ratio is in the foundation independently of the term. Granting the major, I deny the minor — for above in Article IX of this question the difference was presented and explained that I do not repeat here again unnecessarily. But the Doctor writes that a relation essentially depends on the term (*3.d.1.q.1.K and dist.15.q.vn.§.Ad 1.antè X*), and Gadius and Lychetus explain this excellently (*Quol.11*). The reason is that a relation is essentially the bearing toward another — that is, toward the term.

You will object secondly: what is outside the essence of something is not a part of its essence, since nothing is more intrinsic to a thing than its essence; but the term is outside the essence of a relation — since the relation bears toward it and pre-requires it, as is clear from what was said. Therefore the whole essence of a relation consists in the foundation. Confirmation: if a relation included the term, when it is said "Francis is similar to Charles," it would be the same as saying "Francis is similar to himself," which is false — since similarity exists between distinct things having the same quality in species. Granting the major, to the minor I say that neither the term nor the foundation enters into the formal and intrinsic ratio of a relation, yet the relation essentially depends on both as on extrinsic things, as the Doctor clearly asserts in the places just cited and also (*2.dist.1.q.5.antè §.Hoc ergo G and 4.dist.12.q.1.§.Ad argumenta principalia S in solutione tertii*). And this is clear from the relation of a creature to God the Creator, on whom as term it essentially depends; and also from any other relation, which essentially depends on the foundation, even though the foundation is extrinsic to it. Add that, as Lychetus notes in the recent citation, the term is required for the formal and essential being of a relation, because it is a pure order and bearing toward the term, as Suárez frequently acknowledges (*cit.sect.5. and elsewhere*).

You will object thirdly: a divine relation is wholly preserved in the foundation; therefore the same should be affirmed of a created relation, since the reason appears equal for both. The antecedent is proved: the relation of paternity constitutes the Father in the being of a father and regards the Son only as its term, not as a part of it. Let the antecedent pass; the consequence is denied. The reason for the disparity is that the divine relation is transcendental and constitutive, while the created one is predicamental and adventitious — as can

be seen in Scotus (*1.dist.26.q.vn*; *2.d.1.q.5.§.secundum membrum* and *§.Ad auctoritatem sub P*).

Article XIII. On the Threefold Division of Relation

Aristotle (*5.Met.cap.15*) and Scotus (*ibid*; *1.dist.30.q.2.§.Respondeo sub E*; *Quol.13.§.NuncV*) make a threefold partition of relation, which we are now to examine — of which I made mention in Article IX of this question, second notable point. At the outset this well-known distribution of relation is derived from its proximate foundations, from which it sufficiently remains proved and insisted upon from the foregoing that relations draw their distinctions as merely material and extrinsic from the foundations, and as formal and extrinsic from the terms. The first member of a relation is founded on unity and multitude. The second on active and passive power. And the third on measure and measurable.

Concerning the first, it should be asked what unity is and what multitude is, in which relations of this first mode are founded. To understand these more conveniently, it should be recalled from what was said above in Article IV, first notable point: the three main foundations of such relations are substance, quantity, and quality; and the three unities of these are the proximate foundations or founding ratios of those same relations. I said the chief foundations of these relations are three, because five can be counted, in accordance with the five unities related by Aristotle (*5.Met.T.12*) — which are numerical, specific, generic, proportional, and transcendental unity. In these are founded the relations of identity, equality, similarity, proportion, and the like. For as Aristotle (*cit.*) teaches, those whose substance is one are formally the same through the relation of identity; those whose quantity is one are formally equal through the relation of quality; and likewise those whose quality is one are formally similar through the relation of similarity. The Doctor observes (*1.dist.19.q.1.§.De secundo B*; *2.dist.3.q.1.§.Contra istud antè C*; *4.dist.6.q.10.§.Hic D*) that the aforesaid relations are found not only in the three first predicaments but also in all others, and indeed in the transcendentals. The reason is that every being has its own essence and quiddity, in whose unity the relation of identity is founded; likewise it has its own quantity of perfection, in whose unity the relation of equality is founded; and it participates in quality or difference, in whose unity the relation of similarity is founded — as the same Doctor proves from Aristotle in the places cited. And while nearly all concede that the said relations are founded in the four latter unities: St. Thomas (*3.part.q.42.artic.primo*) and his disciples in the same place hold that no real relation is founded in the first unity, which is numerical. But Scotus (*1.dist.31.q.vn*; *2.dist.3.q.1*; *Quol.6*), his interpreters and followers, defend that numerical unity can be the proximate foundation and founding and terminating ratio of the said relations — so that if one numerical whiteness were in two subjects, there would be real similarity between them, just as there is

between the divine persons participating in one numerical divine nature. The reason is at hand: given the hypothesis, all the other conditions adduced and explained for a real relation would be present — for there would be real extremes, really distinct, such as two white things, and independently of any operation of the intellect, from their nature a relation would arise.

You will say that a real relation requires extremes not only really distinct but also a founding ratio distinct from the terminating ratio. But given the hypothesis, there is only the founding ratio — namely the unity of one numerical whiteness — in which the relation is proximately founded; in the term, however, there is no terminating ratio since another whiteness is not found in it. Hence Scotus (*2.dist.3.q.1.¶.Contra sub B*) infers that the unity required in the foundation of a real similarity is not numerical, because nothing that is one and the same is similar and equal to itself. The major is to be denied. For even if this is true in created things as a matter of fact, it is not true of the possible. For a real relation requires only a unity of founding ratio from (*5.Met.cap.15.T.20*), and not the distinction of that unity in the extremes. It suffices that the extremes be really distinct from each other and have one founding ratio, even a numerical one — as is clear from the divine relations of origin, which are founded in one numerical essence, as the Doctor well observes (*3.dist.8.q.vn.in fine 1 and Quol.6.¶.Istarum DD.*). Nor does it follow that the same thing is similar and equal to itself, because with that unity existing, the extremes really differ — which suffices for a real relation.

Relations of this first mode that are founded on multitude — or the distinction and division of the same nature or form — are opposed to the prior relations and are equally numerous: namely the relations of diversity, inequality, and dissimilarity. For those things are diverse whose nature is diverse, such as man and beast; those are unequal whose quantity is not one, such as a palm and a half-palm; and those are dissimilar whose quality is not one, such as white and black. Therefore what I have affirmed about the prior relations is likewise to be said by contrast about the latter.

Regarding the second member of relations, which are founded on active and passive power, the Doctor discusses this in (*5.Met.q.13; Quol.12.¶.Hic sunt C; 4.dist.6.q.10.¶.Sed restat 1; dist.13.q.1.¶.Ad argumenta V; 1.Reportat.dist.27.q.1.Ad 1.principale*). To this mode belong the relations of producer and produced, cause and caused, mover and movable, and others that Scotus mentions in (*dist.13 quarti q.cit. infra V*). Scholastics investigate whether such relations are founded on action and passion — as St. Thomas (*1.part.q.28.art.4*), Cajetan, and others of the same class think — or rather on active and passive power, as Scotus teaches in the cited places, Lychetus, Bargius, and others of the same family, to whom Suárez (*disp.47.Met.sect.12*), Hurtado (*disp.15.section.10.Subsection.2*), and Ruvius (*in Log.capit.7.pedicament.q.12*) agree.

The aforementioned authors note that they are speaking of power not formally — that is, of the respect of potentiality that power formally includes — but of the absolute or the substrate of such a respect: as paternity is founded in the generative power — that is, in the form that is absolute — Scotus expounding this in the (*Reportat. alleg.*). Aristotle in the cited place (*T.20*) seems to expressly hold the same, as Ruvius above others among the recent authors observes.

Although the Philosopher there asserts that power reduced to act is the foundation of such relations, he does not therefore hold that they are proximately and immediately founded in action and passion — because when action and passion do not remain, the relation remains, which cannot exist without a foundation. For someone can generate and die before the formation of the fetus and never be a father, though his action or generation preceded; and when paternity is present, there is no actual generation, because it has already passed. Therefore action stands with respect to the said relation as a prior disposition toward the relation itself. So Aristotle's assertion in the cited place is explained: relations of the second mode are said to be according to active and passive power according to their foundations, and they are said to be according to the actions of powers as prior dispositions toward those relations — in the interpretation of Scotus in the cited place. This argument, which Scotus forms plainly effectively against the Thomists, Suárez and Hurtado in the cited place turn against Scotus himself, as follows: a relation of the second mode can remain while power does not, as if someone after begetting a living son is castrated or the power of generating is divinely removed from him — then indeed he will be a father because he begot a son, yet he will lack the active power of generating, the removal of which eliminates the seminal workshop. But the relation of paternity would not therefore exist, because with the foundation removed the relation is removed, as Scotus asserts (*4.dist.12.q.1. §.Ad quaest. conclusionem prima D and ibid.q.2. §.Ad argumenta M*). Therefore the relation of the second mode is not founded proximately in power.

In dissolving this argument different authors labor greatly and apply various responses that are plainly futile and rejectable. First, Ruvius in the cited place with some modern authors steps forward, saying that a relation of the second mode depends on the foundation and the founding ratio in the aspect of being and becoming, but not in the aspect of being conserved. Therefore if the power of generating is removed from the father while his son lives, the relation of paternity will remain without a foundation and will immediately inhere in the subject, which is his substance. Against this: when the proximate foundation of something is removed, what proximately resides in such a proximate foundation is also removed — as when the surface in which whiteness is proximately subjected is removed, the very whiteness that adheres in that surface is removed. But power is the proximate foundation of the relation of the second mode, as Ruvius holds with Aristotle and Scotus in the cited place.

Therefore if the power of generating is removed, the relation founded in it is equally removed.

You will say that power is the foundation of this kind of relation in becoming, but not in being conserved; and in this respect this relation differs from a relation of the first mode, whose foundation is in being and being conserved, while the foundation of the latter is only in becoming. But this does not help Ruvijs; for besides the fact that he himself refutes those who assert that the relation of the second mode is founded in the radical power — which is the substance of the generator and which coincides with its subject — he, unwilling, falls into the view that he expressly attacks; and what undertakes to attack him overturns his whole edifice. The foundation of a relation, from the very meaning of the name, is universally considered by all to be that by which the entity of the relation — however modest its mass — is sustained; otherwise it does not merit the name of foundation, and to use that name is to abuse it, as is clear from the foundation of a visible thing — such as a house — from which the name is transferred to designate the foundation of any thing. Furthermore, this relation either always remains in the power or it does not; but first in power and afterwards in the substance of the generator. If the first, then power is never its foundation — since it never stands in it, as this relation never inheres in it. If the second, then power is not its proper and permanent foundation, but only its condition and medium — just as action or active generation, which the same author denies to be the foundation of the same relation because it swiftly passes while the relation persists in the foundation, as Orbellus excellently asserts (5.*Met.c.7*) following Scotus (*in Report.4.dist.13.q.1. §.Dicuntur*). Again, the relation of the second mode is not a relation of identity or diversity, whose foundation is the same or diverse substance pertaining to the relation of the first mode. Add that a relation essentially depends on the foundation — as Scotus clearly teaches (4.*dist.12.q.2.M*); nor is a relation real unless it has a real foundation and a real proximate founding ratio, as the same Doctor had premised (2.*dist.3.q.1. §.Contra sub B*). Therefore with the foundation of a relation removed, it must necessarily be removed too; and accordingly not only in becoming but also in being conserved does a relation depend on the foundation, as Scotus affirms (4.*dist.6.q.10.antè I*).

Secondly, Suárez (*disp.47.Met.sect.12*) and Hurtado (*ibid.disp.15.sect.10*), pressed by the preceding argument, step forward and say that the relation of the second mode is founded not in formal but in radical power — that is, immediately and proximately in the substance of the generator, which is commonly called the subject and remote foundation of the same. Therefore, even if the father lacks formal power, he still possesses radical power — and he is truly a father through the relation of paternity existing in that radical power itself. Against this: these authors openly contradict Aristotle, who (*T.20 loci praecit.*) expressly speaks of formal active or passive power and their actions or passions, by which such powers are reduced to act. Furthermore, the powers and virtues of things,

according to Suárez (*disp.18.Met.sect.3*) imitating the Thomists, are accidents that are really distinct from the substance of which they are powers. Therefore the foundation of relations of this second genus is not radical power, which is substance — especially because one substance has many and diverse powers in which many and diverse relations of this second mode are founded. Furthermore, these are relations of producer and produced, which pre-require and presuppose their effective principles and formal powers — from which immediately and proximately actions proceed, as intellection from the intellect and volition from the will. Therefore since radical power cannot be the immediate principle of these actions, it is plainly deduced that it is not the foundation of the said relations. Most recently there come the unseparated Scotists (*disp.8.q.10.art.2*), who, overcome by the preceding argument, distinguishing power of generating as really distinct from the father whose power it is, candidly confess that such relations are real only as long as actions last — and with these past, they are not real but only real denominations. So paternity and filiation would not be real relations but only denominations of father and son — of the one who begot and of the one who was begotten. But these authors are in no way to be tolerated, who evidently conflict with Scotus (*4.dist.6.q.10.¶.Sed restat; dist.13.q.1.sub V; ibid.in Report.antè S.Dicuntur; 3.dist.8.q.vn; 1.dist.27.¶.Ad 2.q.I*). And more clearly in (*Report.terti dist.8.q.vn.*) in these words: "Filiation is the bearing inhering in the produced nature, and it remains as long as the produced nature remains." And this is clearly shown by the reasons that the Doctor presents to prove that a relation is multiplied in the foundation with the multiplication of terms — especially the one found in the Oxford writing (*¶.Contra sub B*) in these words: "When something is ultimately such in something through a thing, it cannot remain in it unless what has it is such through it — just as whiteness cannot remain in a surface unless the surface itself is white, and especially if the surface is ultimately white through the whiteness; but a relation is that by which what has it is ultimately toward another. Therefore it cannot remain the same in something unless what it remains in is through it toward another. Therefore the same paternity does not remain with that term destroyed, toward which the one having it is formally called such by that relation." This also seems to be sensed by the said recent authors (*disp.allegata q.5.art.2*) who admit that two paternities are similar, whose similarity cannot persist unless the paternities themselves remain. They likewise in (*art.1.q.cit.*) state that denomination must necessarily occur either through real reception of a relation or through real termination, from (*5.Met.cap.15*). And in (*q.3.art.1 of the same disp.*) that denomination is intrinsic, and certainly since it is real and not rational, something real is had in the foundation. Again, a relation from the genus of relation, with extremes posited, necessarily arises, and when those are removed is destroyed — as Scotus along with the common body of Philosophers everywhere teaches. With those therefore persisting, this too persists — as no one denies of the relation of the first mode. To say that such extremes are not commensurate to such a relation evades the argument and

wrests the maxim of Philosophers — and it is gratuitously added that something else is required for the permanence of a relation beyond what Philosophers have commonly assigned; otherwise the relation would be extrinsically accruing. Nor does it follow from this that if the relation remains, action or generation also persists with it — since, as Scotus explains in the place cited, Aristotle's said statement means that action is pre-required as a prior disposition toward the relation that afterwards results. Therefore the Doctor denies that action is the foundation of a relation, because action swiftly passes while the relation persists in the foundation, as Orbellus (*5.Met.c.7*) admirably asserts following Scotus (*in Report.4.dist.13.q.1.§.Dicuntur*). And the Philosopher indicates this in the cited place when he says one is called a father because he begot, and a son because he was begotten. Finally, the relations of paternity and filiation are real and constitutive of the persons of father and son, and they always remain. Hence Scotus (*1.dist.9.q.vn.in fine*) approves the assertion of Gregory the Great expressing divine generation in the past, "because in this way a completed nativity is signified." Nor is the reasoning of those who say that the son begotten by the father no longer depends on the father of any weight — therefore he regards the father by no real relation. For although after the completed generation the son in his suppositional and absolute being does not depend on the father, yet in the being of a son — which is a relative being — he plainly depends on the being of the father, according to the condition of relatives: relatives mutually posit one another, mutually destroy one another, between which there is mutual dependence and co-requirement — as the aforementioned younger members hold with Scotus and Bonetus (*disp.8.q.3.art.2 and q.10.art.2.in explanatione 3*).

I myself, however, think that the presented instance is fully answered by denying that the power of generating can be really separated from the father. For although such a power is really separated from the soul, as the Doctor writes (*4.dist.44.q.2.§.Ad quaest.dico A*), nonetheless it differs only formally from the whole composite, as the same Doctor intimates (*2.dist.16.q.vn.§.Ideo sub H*), affirming that powers universally differ formally from the essence of which they are powers — just as the properties of being formally differ from being. And before (*§.dico igitur*) he had noted that substance is generated from substance, both in univocal and equivocal generation. He therefore wants there that the principle or power of generating is a substance not really differing from the essence of which it is a power — therefore formally. Hence he adds (*§.Ad primum P*) that power absolutely speaking is not from the genus of quality — such as the power of removing a stick, of boxing, of running, and the like — which belong not to the soul but to the whole composite, as he explicitly asserts in (*quarti cit.*), where he gives the example of visual power, and teaches in (*Reportat.2.dist.16.q.vn.§.Ad Authoritates*) that it is not really different from the essence of which it is a power, in these words: "From (*2 de Anima T.9*): if the eye were an animal, sight would be its form. Therefore he implies that power is not

really different from essence, since it is its form." More in the (*Tract. de Anima disp.3.q.2*), where I examined this difficulty at length concerning the distinction of the generative, nutritive, and augmentative power. Therefore, although the power of generating can be impeded in many ways, as the Doctor writes (*4.dist.34.q.vn.*), it nevertheless cannot be entirely removed from a man, as I proved abundantly in the place just cited.

Concerning the third genus of relations, which are founded on measure and measurable, what remains to be treated — in which are placed the relations of science to the knowable, intellect to the intelligible, sight to the visible, and the like, which are called non-mutual relations. By the name of measure and measured, Aristotle understands rule and regulated, exemplar and exemplated — as after Scotus (*1.dist.3.q.5. §. Quantum ad hoc C*) and Bonetus in this place, the Conimbricenses interpret (*cap.7.praedicament.q.2.art.2*). Whether those relations exist in the measure and measurable as in a foundation, some doubt — among whom I find Suárez (*cit.sect.13*) and the undivided Scotists cited above, who defend the negative part against the common affirmative, and cite Aristotle (*5.Met.T.memorato*) and Scotus both in the place cited and elsewhere for themselves. But Aristotle seems nearly as expressly to establish the foundations of these relations as of those of the first and second mode, if he is read attentively. For since relations cannot exist without their foundations — as is clear from what was said — and the Philosopher distinguishes these three modes of relatives through the three foundations just recalled, as even the said authors do not deny; and since he lays no other foundations for the relations of the third mode, the foundations commonly received by the consensus of his interpreters are plainly proven. And although he does not express this third foundation there as explicitly as the first and second, he neither ignores it nor denies it; rather from his words there it can be conveniently deduced and explained, as all his commentators unanimously and consistently show. Furthermore, in the *Logic* chapter *Ad aliquid* he presents examples of relations of all the said modes, but passes over measure and measurable and the rest of the foundations. In the same place he defines relatives, but not the relation. And in the *Postpredicaments* he recounts the modes of the former, but not the modes of the latter, which can be easily gathered from those and which Scotus notes — as I cited in (*Epitome lib.1.q.4.art.14*). Nor should weight be given to the words and their position in the text, since the matter is settled and what the name of the thing amounts to is known: thus since Aristotle's commentators plainly show what they understand by the names of measure and measurable, faith is to be given to them and the mind should acquiesce — especially since no reason urges the opposite. What they object there is slight and is easily dissolved from what was said. Why does he in the *Metaphysics* put the knowable before science? In the *Logic* chapter cited he seems to give the reason: because the knowable is absolutely prior to science — for the knowable can exist without science, but not science without the knowable. Furthermore, these would not differ from those if

the interpretation of Suárez were correct: for they would be reduced to the first or second mode, as Suárez himself concedes (*ibid.num.4*) regarding the relation of science to the knowable — which openly conflicts with the cited text in which the Philosopher narrates three modes of relatives and expressly places the relation of science to the knowable in the last one. I add that once such a relation is admitted in the first or second mode, it follows that it is mutual — as are all relations of the first and second mode. And so there would be no distinction that Aristotle establishes between mutually referring and not mutually referring — which that same author and all the rest acknowledge. Furthermore, although science, insofar as it is caused by the knowable, is referred to it as effect to its cause — and that is a relation of the second mode — there still remains the relation of science as measured by the knowable, which is its measure; and that this is a relation of the third mode, Philosophers and Theologians affirm with one voice along with Aristotle — expressly Alensis (*5.Met.*), Scotus in the same place, St. Thomas, and others. Therefore the recent inseparable authors are remarkable for attributing the opposite view to Scotus, who evidently in the place just cited (*q.13*) embraces the common doctrine — which he indicates not obscurely in (*1.dist.3.q.5. §. Quantum ad hoc; dist.36.q.2.Report. §. Secondly I argue; Quol.13.art.2.infra V*); and other places of the Doctor can be adduced for us that the said recent authors falsely adduce for the opposite. Although the Doctor there asserts that relations of the third mode differ from those of the other modes — because the latter are mutual while the former are called non-mutual — nevertheless this difference does not eliminate the distinction that relations derive from their foundations, which those Doctors acknowledge (*art.1.q.allegata*). Hence Bargius (*1.d.30*) admirably adds that the said relations draw their distinctions effectively and extrinsically through foundations, but intrinsically and formally through mutually and non-mutually referring. Nor does it help to say with the cited authors that mutual and non-mutual dependence belongs to relations of the third mode not by reason of the foundation but from the dissimilar assignment of extremes, of which one is assigned in act and the other in potency — while it would be different if both were assigned in act or in potency — and so non-mutual or mutual dependence argues for not an essential but an accidental difference. Against this: Aristotle and Scotus not once but repeatedly bring forward the said difference among the said relations; and neither there nor elsewhere do they mention another proper and essential difference from this one. Therefore this is to be considered intrinsic and essential to them, since it always belongs to them, even if their extremes are handled uniformly or dissimilarly. And the relations of the third genus are always non-mutual, because from the part of one extreme no real relation arises. Hence Scotus (*4.dist.1.q.1. §. Ita sub R*) writes from (*5.Met.T.20*): the measured depends on the measure, not conversely. And Orbellus in the cited place adds that the relation of the actual knowable to science is rational; and the said recent authors do not deny this; and the relation of God to a creature is always rational, as Scholastics hold (*1.dist.30*). Therefore, although all relatives

are said to convert and their extremes can be uniformly assigned — as Aristotle strenuously urges in the *Logic* chapter cited — nevertheless this does not eliminate the fact that relations of the third mode are always non-mutual, for the reason now given.

Article XIV. On Action.

In examining each of the six principles in turn, following the Peripatetic order, the first matter I encounter for inquiry is the category of action, whose proper differentia Bonetus (*libello 5, de actione*) candidly confesses he does not know; nor have the other philosophers left us a sufficiently clear account of it. Therefore, so that action, its divisions, and its properties — insofar as they pertain to the logician — may in some measure become known to us, it is useful to set before us the various senses in which the term is used, as found in (*Scot. 4.d.12.q.1. §. Ad huius autem*), H. Antonius Andreas (*q.7. super sex principia*), Gadius (*in exposit. Quol.13.fol. 139*), and Aureolus (*1.d.27*). For action is an equivocal name, taken in five ways.

First, it is taken for an immanent operation, such as intellection, which is properly a quality, not action except equivocally. It is nonetheless called action on account of two features noted by the Doctor (*Quol.13. §. Ad ista, DD.*) and explained by Vallone (*fol.45 sua lectura*). The first is that it is in continual dependence upon the cause by which it is produced. The second is that the operation passes into the object as into its terminus — though the object does not receive its being through the operation, since it is presupposed to it as its partial efficient cause. The Philosopher mentions this (*1.6.Eth.c.4; 9.Met.c.16*).

Second, action is taken for the relation of the producer to what is produced, in which sense a father is called the active cause of his son. Third, for the relation of what induces to what is induced, or of what educes to what is educed — in this way heat is the cause of heat in wood. These relations are clearly distinct, since they respect distinct termini; and since they are intrinsically advening, they belong to the category of relation, as I noted in the preceding article. Fourth, for the thing done, including within itself a reference to the agent by which it is done or produced — a sense recorded by Aristotle (*3.phys.c.3.7.14*), who says that action is the act of the agent as agent, as a perfection, as the Coimbrans also observe (*q.1 de actione et passione, art.1*). Action taken in this way, insofar as it designates something absolute, belongs to one of the absolute categories; but insofar as it includes a relation, if that relation is intrinsically advening, it belongs to the category of relation; if it is extrinsically advening, it has its seat in this category. Fifth, for the relation of what transmutes to what is transmuted — action taken in this sense is described by the Porretanus as that by which we are said to act upon what is subjected to us. This coincides with Scotus's definition (*Quol.3. §. de 3. circa AA.A.*, cited under G): action is the relation of the agent to the patient that is transmuted. I have explained this at length and illustrated it with examples (*in Epit.l.1.q.4.a.2*).

Action is divided into immanent and transient. Transient action is true action, of the genus of action, which has just been described. Immanent action is not true action but a quality, placed in the genus of quality, as I have noted above. Therefore the division just given is not a division of a genus into its species, but of a word into its significations, as the Doctor rightly notes (*Quol. alleg.q. Ad ista, DD.*).

Again, action is distributed into instantaneous action, which occurs in an instant — as generation and illumination — and successive action, which occurs over some interval of time — as alteration and local motion. Further, into substantial action, whose terminus is a substance — as the generation of a physical composite — and accidental action, whose terminus is an accident — as the whitening of a wall. All of these are held to belong to this category by the companions of the individual Scotistic philosophical courses (*disp.8.q.12.art.2*).

Two properties are enumerated by Aristotle in this category (*Scot.q.36.praedicam. Notandum*): the first is to receive contraries; the second is to receive more and less. These, as Scotus notes in the same place, belong to action itself with respect to the termini toward which and from which it proceeds (*ex 5.phys.T.4*), and are specified accordingly. They are further explained in the Epitome at the cited place.

Assertion I. Action is not something absolute. This is the view of Scotus in the places cited above, to which I add (*Quol.11.§. De 4. sub K*). It is proved as follows. First: if action were something absolute, there would be an action of action; for an absolute that is produced, since it is not from itself nor from nothing, is produced through action. Therefore, if action were something absolute, it would be produced through an action, and so on to infinity — as the Stagirite argues (*5.phys.T.10*), proving that there cannot be motion per se of an action. Second: if action were something absolute, it would be either in the agent or in the patient. Not in the agent: for the agent would be changed, and would be not an agent but a patient, receiving this absolute form — which involves a contradiction in terms, since the same thing with respect to the same thing would be simultaneously agent and patient, as Aureolus (*art.2.§. Restat ergo*) also subtly demonstrates. Nor in the patient: for the patient could not receive any other absolute form — say, quantity or quality — unless it first or simultaneously received action, which is posited as an absolute form distinct from the others. But this is inconvenient: that a subject cannot receive a prior form unless it receives a subsequent form that does not depend on the prior one, since it can persist without it — as is clear from the whiteness remaining in the wall after the whitening, which is a transient action. The reasons adduced in the preceding article, proving that the last six categories (among which action is numbered) are not absolute, likewise support this assertion.

Assertion II. Action of the genus of action is the extrinsically advening relation of what transmutes to what is transmuted. This is Scotus's position in the places

cited above. It is proved from Aristotle (*5.Met.7.17*), who defines active potency as the principle of transmuting another as other. Therefore, just as active potency according to Aristotle is the principle of transmuting, so action — which is the act of active potency — is transmutation, namely, the relation of what transmutes to what is transmuted. The Author of the Six Principles holds the same view when he describes action by saying: action is that by which we are said to act upon what is subjected to us.

Every being is either absolute or relative, as I have established more than once above. But action is not something absolute, as I showed in the preceding assertion. Therefore action is something relative — and not an intrinsically advening relation, because when an active and passive thing are posited, action does not follow necessarily: it can be impeded, whether by an interval or by an opposing agent, even when the two are approximated, as was fully explained in the preceding article. Therefore action is clearly deduced to be an extrinsically advening relation. The same is also shown by what was established in the preceding article, proving that the last six categories, among which action is contained, are relative.

Objection I. No relation is a principle of acting — just as quantity is not, according to Averroes (*4.phys.comm.84*). But action is formally a relation, as is evident from Assertion II. Therefore action is not a principle of acting, which is contrary to its definition given above. I reply that the major premiss must be distinguished. No relation is a principle of acting as the *quod* — as fire is the principle of producing heat in wood: granted. No relation is a principle of acting as the *quo* — that is, as the formal productive principle, as heat is the formal principle of producing heat: granted likewise. No relation is a principle of acting as the *quo* in the sense of a productive act: denied. For by heating — which is a relation of the genus of action — as a productive act, wood is heated; and by cutting — which is likewise of the genus of action — as a productive act, wood is cut. Action is thus called productive because through it, as a productive act, the effect is reached. This solution is drawn from the Doctor (*4.cit. §. Ad argumenta* sub P, and in the *Reportata* there, and *Quol.13.* sub BB).

Objection II. A relation of the second mode is founded upon action and passion (*ex 5.Met.T.20*). But a relation is not founded except upon something absolute. Therefore action, upon which the relation is founded, is something absolute. I reply with Scotus (*in 4.alleg.* sub V) that the Philosopher's statement is to be interpreted as follows: a relation of the second mode is founded upon action and passion as prior dispositions necessarily presupposed to it; whereas it is founded upon active and passive potency as its proper foundation — concerning which see (*q.6.huius lib.art.8 & 13*).

Objection III. To create is properly to act. Therefore creation is properly action. But to create is not to be related, because through creation God is not related to creatures. Therefore creation is not a relation, and thus action taken generally is

not a relation — since the consequence from an inferior to a superior affirmatively holds. Corollary: the act belongs to the same thing as the potency (*ex Arist. libello de somno et vigilia in initio*). But active potency properly belongs to God. Therefore action equally belongs to him. I reply by denying the antecedent and equally the corollary, for the reason given by Scotus in the cited passage (N): where there is total production without any presupposed subject, there is not properly action of the genus of action, because such action always presupposes a subject (*ex 5.Met.comm.17; ex lib.sex principiorum c. de actione*). Therefore, since God creates from nothing, it follows that to create is not properly to act, nor is creation properly action in the sense understood by philosophers — as is clear from its definition given above.

To the corollary I reply with the same Doctor in the same place (X): just as action is an equivocal name — being taken broadly for any production, and narrowly for transmutative production alone, which is the only kind that belongs to the genus of action — so active potency is taken for simply productive potency, and for transmutative potency, from which transmutative action arises, just as simply productive action proceeds from simply productive potency. Therefore the proposed objection carries no weight.

You may say that Scotus in the cited passage attributes to God both productive and transmutative potency, and likewise both simply productive and transmutative action. Now since transmutative action belongs to the genus of action, it follows that God's action itself is placed in a category — which the same Doctor does not seem to concede (*1.d.8.q.3*). I say that God's action *ad extra*, of whatever kind it may be, since it is a being of reason — as Scotus states (*in Report.cit. §. Dico igitur*) — does not reside *per se* in this category, since as has been said, every category is a series of real beings. This is also evident from the analogous case of the relation of lordship, by which God is called Lord in time: this is not formally real but only a being of reason, as the same Doctor explains in this passage before (§. *De 2.art.*, citing *dist.30.primi*, in fine solutionis principalis q.5).

Article XV. On Passion.

The various senses of passion, drawn from diverse authors, are collected in the theological lexicon. Four are found in (*5.Met.c.21.7.26*); but with Vorreillon (*1.d.14*) and Pelbartus (*Tomo 1.Rosarij verbo passio*), we bring forward three that are most relevant to our subject, leaving the others to be weighed in their proper places. First, passion is used for the property of a thing that is convertible with the thing itself and flows from its essential principles — in this way risibility is a passion of man, neighing a passion of the horse. I treated of passion so taken (*l.2.q.6*). Second, for a sensible quality, which is a quality of the third mode — Aristotle took passion in this sense (*2.Rhet.*) when he said that joy, sadness, hope, fear, and the like are passions. Third, for the reception of any form whatever in pre-existing matter. It is described by the Porretanus in these words: passion is the

infliction and effect of action; or, as Titelmans says (*cit.cap.53*): passion is that by which what is subjected to it is said to undergo. And Scotus (*4.dist.13.q.1* & *dist.43.q.5.¶. De tertio* infra H): passion is the extrinsically advening relation of what is transmuted to what transmutes. For since action and passion are opposed relations (*Doct.cit. & Antonio Andrea ubi supra q.8*), they mutually regard each other, and each makes the other known — one is implicitly or explicitly placed in the description of the other, as anyone who examines both definitions can see. Therefore, since from the knowledge of one relative the other is definitively known — as Aristotle writes (*c. de Ad aliquid*) — and since action and passion are correlatives, it follows that from the prior knowledge of action obtained in the preceding article, passion, which is its correlative, is rightly known. And what has been said of the divisions, species, and properties of action applies equally to passion, with only the name of action changed to the name of passion, as I noted (*in Epitome lib.1.q.4.art.9*).

Assertion. Passion is the extrinsically advening relation of what is transmuted to what transmutes. This is Scotus's position (*ubi supra*). It is proved by the same means by which the second assertion of the preceding article was proved, with the proportionate adjustment I have just indicated. For opposite things have the same account and discipline (*8.Top.1*). But action and passion are opposed relations, as I noted above. Therefore, just as action is the extrinsically advening relation of what transmutes to what is transmuted, so passion is the extrinsically advening relation of what is transmuted to what transmutes.

Objection I. Entities are not to be multiplied without necessity — as the common philosophical maxim holds (*1.phys.T.41*). But there is no necessity compelling us to admit passion as distinct from action: for action and passion are one and the same thing signified by two different names. It is called action insofar as it is in the agent and is said to be a relation *from* this; and it is called passion insofar as it is in the patient and is said to be a relation *in* this — as Aristotle seems to hold (*3.phys.T.218*), saying that just as the road from Athens to Thebes and from Thebes to Athens is the same road, the ascent is nonetheless not the same. Therefore action and passion are entirely the same and hence do not constitute distinct categories. Granting the major, I deny the minor. To its proof I reply with Scotus (*4.dist.13.q.1. ante §. Ad propositum* sub L) that they are materially the same on account of the identity of the space, but formally distinct, since they take on distinct definitions as is evident from what has been said; they have different ways of being predicated of their inferiors; and they are in distinct subjects — for action is in the agent and passion is in the patient. Bonetus's reply (*libello de passione*), saying that the space is the same but the ascent and descent — which signify action and passion — are distinct because they are distinct termini, seems to come to the same thing.

Objection II. The definition of passion assigned by the Porretanus is not convertible with passion itself. Therefore it has not been correctly given. The

antecedent is proved: every form terminating a motion is the infliction and effect of action — since the agent produces the form toward which motion tends, through the action itself as a productive act. But it is not to be held that every form terminated by motion is action of the genus of action. I reply with Antonius Andreas (*q.8. of the aforesaid place*) that passion is called the effect of action not because action produces passion as its *quod* principle or as a formal *quo* principle, but as a productive act by which the agent, through transmutation, transmutes the patient. This passive transmutation is called passion and the infliction or effect of action, because it is the relation following upon the form toward which the patient is transmuted.

Objection III. A principle has no principle — just as place has no place, action has no action, and production has no production. But the principle of passion is action, as is clear from the description of passion cited above. Therefore, etc. I reply that the major is not true absolutely, since substance is the principle of accidents, of which there are nine principles or categories. So the major can be distinguished thus: in the same genus, granted; in a different genus, denied. This is supported by the example of form and matter, which are principles of natural things in different genera — not in the same genus, since form is drawn from matter, being educed from it, as will be evident in physics. It can also be confirmed by (*2.phys.7.30*): causes are mutually causes of each other — understand, in different genera of cause, as will be explained there.

Objection IV (a further instance). Active and passive belong to the same genus (*ex 1. de generatione T.50*). Therefore action and passion belong to the same genus or category; the consequence holds by the locus from conjugates. Again, contraries share the same genus (*ex 10.Met.T.42*). But action and passion are contraries. Therefore, etc. I respond that the antecedent derived from Aristotle is to be interpreted of the physical genus, not of the logical genus of which we are here speaking. As for what is added in support of this, I say the major holds for contrary opposites, not for relative opposites, which is what action and passion are.

Article XVI. On *Ubi* (Where).

Bonetus (*libello 9. de ubi*), following Scotus (*4.d.10.q.1. §. Quol.11. sub O*), notes that the description of *ubi* given by the Author of the Six Principles is not common to every kind of *ubi* — for example, active and passive, definitive and circumscriptive. That description is adapted only to passive circumscriptive *ubi*, which is acknowledged by all to be accommodated only to corporeal things. For this kind of *ubi* is the circumscription of a body arising from the circumscription of place. Or, as the Doctor says (*Quol.cit.art.4. ante L*): *ubi* is the extrinsically advening relation of a contained body to the containing place.

A most general account of *ubi* can also be given, which is the presence of a thing in a place, as the Doctor indicates (*nunc alleg. ante and post O*, and also in *4*).

praec. KQ and R). Gadius (*fol.117*) plainly affirms this, and Lychetus (*ibid.* §. *In ista q.*) does not dissent. *Ubi* taken absolutely and precisely in this way is divided into definitive *ubi* — which is the presence of a thing in a place in such a way that it is there and nowhere else, as an Angel is in heaven and not on earth — and circumscriptive *ubi*, which is the formal circumscription of a body in place. Circumscriptive *ubi* is twofold: active and passive. Active *ubi* is active circumscription, or the extrinsically advening relation of the circumscribing place to the circumscribed body. Passive *ubi* is passive circumscription, or the extrinsically advening relation of the circumscribed body to the circumscribing place, which is formally place — as will be evident in physics, where the nature of *ubi*, its unity, plurality, immobility, and other such matters pertaining to it are to be treated fully and accurately.

Objection I. *Ubi* and place, taken formally, coincide — as Gadius (*fol.119*) notes, though the Porretanus seems to mark some distinction between them. But place is the surface of the containing body (*ex 4.phys.T.39* and following), and it is read in the work on the heavens that abstract substances — or Intelligences, whom we call Angels — are not circumscribed by time or place. Therefore the division of *ubi* into definitive and circumscriptive is inappropriate, since only circumscriptive *ubi* is recognized and received by Aristotle and other philosophers, as Scotus himself (*in Report.4.d.10.q.1.vers. Ad quod genus*) acknowledges before the others. Granting the major, to the minor I say that Aristotle's definition and those of the other philosophers concerning *ubi* and place taken universally are too narrow — though, as Lychetus (*in fine 1.art.Quol.11*) notes, Aristotle does not explicitly assert that only passive *ubi* is placed in the category of *ubi* — since they comprehend only circumscriptive *ubi* and place. But I have just noted at the beginning of this article that there is a broader and freer definition of *ubi*.

Objection II. Action and passion constitute two supreme genera because they are two opposed relations having two distinct general accounts predicable of their inferiors. Therefore, equally, active and passive *ubi* constitute two categories, since in both cases the reasoning is the same — otherwise the division into active and passive *ubi* must be judged entirely empty and useless, as Toletus objects (*in hoc c.*). The same can be deduced about certain other categories, as is evident with respect to the series of the *quando* and *habitus* categories (*in Epitome q.4.lib.1.art.12 & 13*).

Antonius Andreas (*q.15. in sex principia*) and Gadius (*fol.119*) raise this difficulty and leave it unresolved. Orbellus, cited here by our two Juniors (*disp.6.q.1.*), in his second solution denies the parity: action and passion take on real and general accounts of acting and being acted upon that are distinct from each other; but active and passive *ubi* denote action and passion only grammatically, because they are expressed through an active and passive verb — they do not signify true and real action and passion — in roughly the same way that the divine Word is

said to become incarnate vocally and grammatically, as Scotus (3.d.1.q.1.art.3.§. *Ad argumenta* sub L) and Orbellus (*ibid.q.1. ad tertium*) note. A not inconsiderable reason for this can be given: for *ubi* is taken either materially — and in that sense it is the surface of the containing body, which is quantity and incapable of action — or formally — and in that sense it is a relation, which likewise does not belong to the genus of actives.

Objection III (further instance). You will say: action is formally a relation, from what was said above, and yet it is a productive *quo* principle. Therefore the reason given is of no moment. I say that action is a productive act through which an effect is produced; but not so the relation that is formally place, since through it nothing is produced. Therefore that argument is not incongruous.

Objection IV. Definitive *ubi* is placed only reductively in the category of *ubi*, as Antonius Andreas (q.12. of the cited place) and other Doctors admit — from whom Scotus (4.cit. sub K) does not seem to be far. Therefore definitive *ubi* is not a species of *ubi* taken generally, since a species is placed per se in the category of which it is a species, as is evident (q.3.art.3. of this book). I respond that the aforementioned authors are speaking according to the common position of Aristotle, the Porretanus, and others, who assign only circumscriptive *ubi* to this category. But speaking absolutely and composing a general catalogue comprehending all *ubi*, we rightly place definitive and circumscriptive *ubi*, active and passive, in it — as is shown (*in Additione Quol.11. ante D*, and in 4. proximately cited), and as received by Lychetus (*in expositione Quol.cit.artic.1*), Gadius, and other Scotists, from whom most of the more recent authors outside the Scotist school do not depart.

Objection V. If two bodies were by divine power to exist in the same place, either they would be in the same *ubi*, or in two *ubi*, or in no *ubi*. Not the third, for they are supposed to be in some *ubi*. Not the second, since that is outside the supposition — we suppose them to be in the same place and *ubi*. Not the third, because since there are two passive circumscriptions by which both bodies are circumscribed, there would consequently be two *ubi* and two formal places — and they would therefore not exist in the same place and *ubi* as the argument supposes. I reply that given the hypothesis, the two bodies would be in the same material place but not in the same formal place, as Scotus writes (*Quol.cit.art.3*), which is to be extensively examined in physics. In the meantime see Lychetus and Gadius there.

Article XVII. On Situs (Position).

What is commonly called position (*situs*) by other philosophers is what the Author of the Six Principles calls disposition by arrangement. Setting aside the popular sense of *situs* for the place or space in which something is said to be situated — in which sense this category is taken by Aristotle (5.Met.c.19.7.14) — for example, when a tree is said to be in this or that spot of a garden, in order

that the nature of *situs* may be fully known to us, we note with the Doctor (*praecit.* §. *Dico ergo* M) that position is twofold.

The first is the one that is a difference of quantity, described as the order of parts in the whole, for which, as the commentators write (*in c. de quantitate*), three things are required: a subject in which these parts exist, which subject must be continuous and have permanent parts — some of which are extreme, some intermediate — and one after another must exist, as is evident in a worm and other creatures. These are treated luminously by Titelmans (*l.2.c.16*).

The second is the one through which the category of *situs* is constituted, which is the order of the parts of a whole with respect to the parts of its place. This presupposes and presupposes the first: it is necessary that the parts first be disposed and ordered among themselves before they are commensurated and coextended with the parts of place. Hence by divine power the first can be separated from the second in two ways. In one way, by negation of the terminus: if God were to create some body outside the heavens, it would have positional quantity, since its parts would be disposed in relation to each other, but it would not have positional *situs*, because with no place and no parts of place in existence, there would be no coextension and commensuration of its parts to the parts of place. In another way, by the positing and existence of the terminus: God can preserve a body with its parts, even though these parts are not contained and circumscribed by place. For what is prior can exist without what is posterior, what is intrinsic without what is extrinsic, and what is contingently conjoined with another can by divine power be separated from it — as is positional quantity in relation to positional *situs*, as Scotus divinely proves (*loco memorato* N and O).

There is, however, a greater doubt as to what the difference is between *ubi* and *situs*. For some — such as Fonseca (*5.Met.q.2.Sect.4.ad 5*), supported by Suárez (*disp.2.Met.sect.1.1.7*), Arriaga (*disp.5.sect.3.n.42*), and two recent Scotists (*disp.8.Log.q.12.art.2*) — hold that philosophically *ubi* and *situs* coincide, differing only popularly. But in agreement with Aristotle and other philosophers, they posit *situs* as a distinct category from the others and attempt to assign the difference by which *situs* is truly distinct from *ubi*.

Bonetus the ingenious Scotist (*lib. de situ*) devotes himself entirely to explaining this accurately and demonstrating it evidently. And certainly — as is clear from the Doctor (*in 4.alleg. M*) — philosophers generally separate *ubi* from *situs* in that *ubi* is the circumscription of the whole located thing with respect to the whole place, while *situs* is the relation of the parts of the located thing to the parts of the locating place. That these two relations are distinct from each other is plainly shown by the fact that while the *ubi* of some body remains the same, the *situs* of its parts can change — as when a vessel full of water remains in the same place while its parts move here and there: then the *ubi* remains the same, but the parts of the water, differently disposed by motion, have a different *situs*.

But if this reasoning does not satisfy you — because whether the whole is in the whole place or the parts of the whole are in the parts of the place, this entirely pertains to the category of *ubi*, since the total *ubi* is constituted from the partial *ubi* — then say with Bonetus and most of the more recent authors that the difference between *ubi* and *situs* consists in this: *ubi* is the presence of a thing in place, prescind from every mode of being present in that place; while *situs* is the determinative mode of *ubical* presence, or the modification of coexistence, not only of part with part but also of the coexistence of the whole located thing with the whole place — such as sitting, standing, lying. This the Doctor hints at (*in 4.cit.* a little before N) when he says: *positio* as a category presupposes positional quantity and specifies *ubi*. The Porretanus also hints at this when he says: position is a kind of ordering of parts and generation, according to which we speak of standing or sitting.

Furthermore, *ubi* can be separated from all *situs*, as is evident in the case of the body of Christ the Lord in the Eucharist, which is stripped of all *situs*. Moreover, *ubi* is the foundation of *situs*, since *situs* modifies and determines *ubi* — and it is plain that a foundation differs from that of which it is the foundation, and a subject from its accident, as is clear from relation and its foundation, and from an accident and its subject. Again, the decadic number of categories is not to be denied, as the Doctor teaches (*ubi supra* in fine *1.art.* and more plainly *d.13.q.1. §. Ad huius C*; and we note *q.3.art.1.* of this book). But if *ubi* and *situs* do not differ, there would be not ten but nine categories — contrary to the whole Peripatetic school, both here and in (*5.Met.*), as Ruuius (*cap.10. de praedicamento situs*) notes, against Mastrius and Bellutus who, lest they agree with Bonetus, deny the aforesaid number of categories on slight grounds, contradicting Aristotle and Scotus — as will be evident in the objections to be adduced shortly.

Nor is Suárez (*praecit.q.9*) satisfactory when, to dissolve the difficulties mentioned, he posits a distinction of reason between *ubi* and *situs*. He is not satisfactory, I say, because from what has been asserted elsewhere, the categories are a series of things or realities, into which a distinction of reason does not fall — only a real or formal distinction. Furthermore, more than a distinction of reason obtains between a mode and the thing modified, between what determines and what is determined, as was sufficiently shown above. Therefore a distinction of reason — which is produced by the intellect alone — is not to be invoked for the resolution of these matters.

Objection I. Scotus (*praenominatus §. Dico aliter M*) acknowledges no other difference between *ubi* and *situs* than the one I have adduced above, which is clear from their descriptions: *ubi* is the extrinsically advening relation of a circumscribed whole to the whole that circumscribes it; *situs* is the extrinsically advening relation of the parts of the circumscribed thing to the parts of what circumscribes. And in (*Report.4.d.10.q.1. §. De 2. difficultate*), he says nothing of *positio* other than that it is a kind of *ubi*. The Stagirite hints at this same

difference (5.*Met.c.19.7.24*): disposition is said to be the order of what has parts — with respect to place, potency, or form. Therefore no other difference between these two categories need be sought beyond the one assigned. I grant that the difference between *ubi* and *situs* given and expressed by these authors is the common and widely known one; but the proper and quidditative one is what we have just shown, and I signified above that it is not unknown or unrecognized by the same authors. All the more because in the *Reportata* just cited, Scotus affirms that position is a category — which, unless the aforesaid essential difference is maintained, does not appear to differ from *ubi*. This Scotus presupposes in many places, defending the division into ten genera as to be maintained, and consequently that the category of *ubi* is to be distinguished from the category of *situs* by the difference just named.

Objection II. Beings and modes are not to be multiplied without necessity — as philosophers and theologians often insist. But if *situs* is a mode of *ubi* superadded to it, as we have explained above, then modes are multiplied with no pressing necessity. For we rightly understand how a thing is disposed according to the order of its parts with respect to the parts of place — whether sitting, standing, or lying — without fashioning any additional mode of existing in place. Therefore it is better to deny that *situs* is distinct from *ubi* than to introduce this new mode of presence. Granted the major, I deny the minor and its proof, as the arguments adduced above appear evidently to compel — and their great weight is not denied by the two younger Scotists named above.

Objection III. In article I of this question it was rejected as the opinion of those who hold that the last six categories are constituted by modes. But now it is affirmed that *situs* — which is one of those six genera — is a mode. Therefore there is a contradiction in what has been said above. I reply that there is no inconsistency in our assertions: for in the cited place we rejected the view that those categories are constituted by absolute modes, or by absolute and relative modes together. We do not, however, deny that these same categories are constituted by relative modes. For a relation can be called a mode, as the Doctor writes (2.*dist.1.q.4.¶. Quod si adhuc D*), with whom Lychetus (*ibidem*) and Fuentes (*in Log.q.16.diff.5.art.1.petitione 2*) concur.

Article XVIII. On *Quando* (When).

It is plainly difficult to conceive the quidditative accounts of the categories, and more difficult still to explain them — as Aureolus (1.*d.30.art.3.propositione 5. in fine*) and Antonius Andreas (q.15. *in sex principalia* §. *Respondeo*) testify. This difficulty seems especially great for us, who strive to reach a distinct and clear knowledge of these last categories. For since they are reckoned among relations — which, as has been said, are of slight and meager entity — they must equally be of thin and slender knowability.

Among these is numbered *quando*, which some — such as Aureolus (*cit. propositione 6*) — think to be a being of reason, or, to use his words, something that the intellect conceives as left behind from time in things that are in time. Others, whom Ruuius (*hoc loco*) and the Coimbrans cite under suppressed names and attribute to St. Thomas (*opuscolo 48*) and to Scotus (*2.d.2.q.2*) — and whom two of our members recently follow (*disp.8.q.12.art.2*) — hold *quando* to be an extrinsic denomination derived from the time with which things coexist and in which they are said to be. Scotus, however (*praecit.*), Antonius Andreas, Tataret, John of Metz, and other Scotists in the present place affirm that *quando* is the extrinsically advening relation of a thing contained in time. For the comprehension of this:

Note I, from Bruliferus (*1.d.8.q.2*), that these three differ: to be *with* time, to be *from* time, and to be *in* time — which I must now explain. To be *with* time is the same as to coexist with time, which belongs to God and to Angels. For since to coexist is the same as to exist simultaneously, and God and time now exist simultaneously, it follows that God and every other created thing possessing its own existence rightly coexist with time. But since from eternity time did not exist — as faith teaches — nor after the universal judgment will it exist (*Apoc.10*: "time shall be no more"), neither did God from eternity coexist with time, nor after the day of judgment will God himself or any creature coexist with time. To be *from* time seems to mean the same as to begin to be, or to newly come into being — and therefore nothing eternal is from time, since nothing eternal began to be, as an eternal thing is free from beginning and end (*Quol.6.ubi Gadius et Lych.*, and I myself in the *Tract. de Deo uno disp.1.q.8*, and *Tract.de Angelis disp.3.q.1*). To be *in* time is to be measured by time, as generable and corruptible things are measured — as I showed (*in phys.l.de tempore*). From the fact that something is in time, or measured by time, there results a certain extrinsically advening relation of the temporal thing to time — which is called *quando*, in roughly the same way as from a located body's relation to its place there arises the extrinsically advening relation of the located thing to the place, which is called *ubi*, as Titelmans (*l.2.c.55*) rightly observes. Hence the Porretanus (*c.4.sui libel.*) describes *quando* as what is left behind in a temporal thing from the adjacency of time. That this description may be better understood:

Note II, with Bonetus (*libello 8*), that *quando* is to be distinguished from time, because it is something left behind by time itself — as expressed in its description cited above. For what is left behind by another is posterior to it, and prior and posterior are evidently distinct from each other. Furthermore, a relation arising from extremes is distinct from those extremes themselves, just as an effect is distinct from its cause. Since therefore *quando* is a relation arising from a temporal thing toward time, it should not be doubted that *quando* is separate from time itself — whatever Fonseca may adduce to the contrary (*5.Met.cap.15.q.10.sect.2*).

The account of this category is drawn from the coexistence of generable and corruptible things with the motion of the first mobile, which — being most orderly and most uniform — is said to measure all things subject to it. Thus a reading is said to last for an hour, a rose for a day. From the coexistence of sublunary things with the motion of the first mobile, two relations emerge: the first is that of time to the temporal thing, as of measure to measured — called active *quando*; the second is that of the temporal thing to time, as of measured to measure — called passive *quando*, which alone is defined by Gilbert (*cit.*), perhaps — as some say — because passions are easier to know and more familiar to us; or more aptly, because that Author failed in this regard, not assigning the most general account of the category of *quando*, comprehending everything contained under it, as I also noted (*art.4.huius q.* with the Doctor (*4.dist.10.q.1.art.1.* sub K)) concerning the category of *ubi*. *Quando* can however be described in universal terms thus: *quando* is a limited being by which something is said to be, to have been, or to be going to be in time or in a moment. It can also be described thus: *quando* is the duration of a created thing, which is divided into aevum and time.

Assertion. *Quando* is not a mere extrinsic denomination derived from time, with which things coexist; rather, it is the extrinsically advening relation just explained. The first part of this is contrary to the two recent Scotists who in (*1.part.Inst.Tract.1.cap.7*) approve the common explanation of this category, yet in (*disp.8.q.2.art.2*) seem to refute it. Moreover, at the end of the cited article they add that *habitus* is an extrinsic denomination. Again, the same authors (*art.1*), inconsistently with themselves, deny that the last categories — among which *quando* is numbered — consist only in an extrinsic denomination. Finally, with the common Scotist position, they hold that the aforesaid categories are extrinsically advening relations — but extrinsically advening relations are not extrinsic denominations, as is evident from action and passion. Therefore *quando* is not the extrinsic denomination set forth and defended by those more recent authors.

I add further: if that denomination signified by *quando* constituted one category, then more categories than those given would have to be posited, corresponding to the plurality of extrinsic denominations — for there are denominations from acts, from objects, from effects, and others of this kind. Moreover, the categories are a series of genera, species, and individuals, not a series of extrinsic denominations. All the more because time is not an extrinsic denomination — as I will show in physics. Therefore neither is *quando*, which is to be in time. For if the thing is not an extrinsic denomination, neither is that which follows from the thing. But *quando* is something left behind from time, as I made clear in the first note. Therefore *quando* is not an extrinsic denomination.

The second part is Scotus's (*4.dist.13.q.1.* C, and elsewhere), and it is sufficiently proved from the first article of the cited place.

Objection. If *quando* formally denotes some real form, that form is either absolute or relative. But it is not absolute, as I proved (*art.1.assert.3*). Nor is it relative: for whatever relation it may be, it is the relation of measured to measure, which is a relation of reason — as the Doctor observes (*Quol.13. N*). The reason is that its extremes do not have real being but only known being, which is a being of reason. Confirmation: time, in the aspect of measure, is not something real. Therefore neither is the relation signified by *quando* real. Granting the major and the first part of the minor, I deny the second part of the same minor. To its proof I say that this is true of the relation of what is actually measured to an actual measure — but not of the relation of what is measurable to a measure, as Lychetus (*ibi*) rightly explains, through whose interpretation there is also explained what the Doctor has (*2.dist.2.q.3.¶. Ad 1. sub C*). This relation is moreover of the third mode of relatives, as is evident (*5.Met.T.20*).

You will say: this does not belong to it by reason of time but from outside — even if there were no time, *quando* would still be measurable through its extrinsic account. I say that this indeed results from time, since it is left behind by time itself; yet that relation itself is the formal and quidditative account of *quando*, as is clear from its definition — and it cannot exist without time, because a relation cannot exist without its terminus. Therefore Bonetus (*cit.*) adds that *quando* has as its foundation the thing that is in time or in an instant, and as its terminus time or the now. And just as past time is not, nor is future time, but only present: so *quando* with respect to the past is past, with respect to the future is future, and with respect to the present is present. To the confirmation the antecedent is denied. The reason for the denial is clear from what has just been said, and will be clearer in physics, where it will be shown that time is a real being independent of the intellect's operation. And even granted that *quando* were a relation of reason, this would not give our cited Recentiores what they intend — for they hold that *quando* is constituted by an extrinsic denomination, which they themselves claim (*disp.3.q.6.art.1*) is not a being of reason, though they seem to acknowledge this later.

Article XIX. On *Habitus* (Having).

The Archbishop of Aquis (*dist.30.art.3.propositione 3*) thought the same of *habitus* as he had of *situs* and *quando*, holding *habitus* to be formally a being of reason. For he says that although armor, clothing, and the body to which they are applied are something real, and the shapes of garments and armor arising from a clothed and armed body are real, nonetheless the intellect fashions from these a certain residual being — namely, being adorned, being safe in battle, or something else — which has no being apart from the operation of the intellect. This view is rejected by nearly all philosophers, both here and in (*5.Met.*) — notably by Antonius Andreas (*q.15. in sex principia*), who teaches that *habitus* and the remaining categories are real beings, as has been abundantly established

from what has been said, and I judge nothing further need be added on this point.

Although philosophers commonly teach that *habitus* is something real, there is nonetheless considerable disagreement among them in assigning what that real thing is. As many different opinions on *habitus* are reported as on *quando* and certain other categories — as Suárez (*disp.53.Met.sect.1*) indicates. Setting aside these and the ones refuted above, I note that some — including two of our younger members (*cit.art.2*), following Bonetus (*in praedicamentis libello ult.*) and Bassolis (*4.dist.12.q.1.art.1*) — make this category too broad, including within it the union or connection of two extremes taken universally, whether it be the union of matter with form, of accident with subject, of relation with its foundation, or of parts with the whole — as will be clear from the definition of *habitus* to be adduced below. Others, however, make it too narrow, judging that under *habitus* only defensive armor is included, not offensive weapons — a view favored by Suárez (*ubi supra sect.2.n.4*). These will be refuted from what follows.

The opinion of Scotus and the common Scotists pleases me: they hold *habitus* to be the extrinsically advening relation of a garment or ornament to what is clothed or adorned — which properly belongs to animate things, not inanimate ones, as the Doctor observes (*1.dist.32.q.2.¶. Contra post Arist.6.Eth.cap.13* and other places). Although, as the same Doctor adds, inanimate things can be denominated from something adjacent to them which, insofar as it is in some way their ornament or covering, can be reduced to the genus of *habitus*. And this can also be said of animals clothed or adorned by human art, and by a certain analogy of trees, flowers, leaves, roofs, houses, tapestries, temples, and other such things said to be clothed or adorned by art or nature. The only difference that perhaps intervenes is that man acquires the former by his own industry for himself or others; the latter receive theirs by their own nature — as Aristotle writes and expresses (*3. de partibus animalium cap.1*).

In one word, the common and general account of this category can be assigned: it is *habitus* in the concrete and *habutio* in the abstract, as Bonetus and after him Suárez (*supra alleg.*) note. It is described by Gilbert (*capite 7.sui libel.*) thus: *habitus* is the adjacency of bodies and of what is around bodies, according to which the one is said to have and the others to be had. Titelmans (*l.2.capite 170*) explains this as follows: by *habitus* is understood a relation — namely, extrinsically advening — arising in a body from the adjacency or application of a garment or ornament to that very body. That such a relation arises from this is clear from the fact that in a body that is clothed in a garment, bound with a belt, or otherwise adorned, it cannot exist without some reference to the garment, belt, or ornament — as Titelmans (*loco cit.*) infers. Aristotle concurs (*1.praedicam.c.10*), saying that to have signifies to be shod, to be armed — that is, as Bonetus (*cit.*) explains, insofar as armor is applied to the body and footwear to the feet, a certain relation of the extremes to each other arises, by which a man is formally

said to be armed, or to have armor. Similarly, a man is formally said to be shod or to have footwear; and such relations are called by their proper names — arming, shoeing. The Philosopher hints at this more explicitly (5.*Met.c.20*), saying that *habitus* is the intermediate act between what has and what is had — just as action mediates between agent and effect, so between the man having the garment and the garment that is had, *habitus* is the intermediary. *Habitus*, therefore, is the same as *habitus*, or the relation we have explained.

Furthermore, in any concrete accident — such as *habitus* — three things are principally to be considered: subject, form, and the relation arising from them when united to each other. Likewise, in *habitus* three things are to be weighed: the body on which the garment is placed, the garment itself, and the placing around. *Habitus* formally is neither the body nor the garment, since each is a substance, and *habitus* — being one of the nine genera of accidents — is an accident. Therefore it is the placing around, which is the said extrinsically advening relation of the garment to the clothed person — called active *habitus* — or of the clothed person to the garment — called passive *habitus*, as is clear from the final words of Gilbert's definition. The divisions of this category and its properties are rightly and clearly expressed by Titelmans (*praecit.*) and by me (*in Epitome 1.1.q.4.art.13*).

Objection. Union must be placed in one of the categories. But it does not seem to be placed in any other category than *habitus*. Therefore *habitus* comprehends union taken generally — whether of corporeal things or of spiritual things — and hence the category of *habitus* is not to be limited or narrowed to the aforesaid unions of garment or ornament, which are accommodated only to bodies. The major should be evident to everyone, since the categories are a series of all created things. The minor is supported by induction through the individual categories. For union does not reside in the categories of substance, quantity, or quality, since these are absolute beings, while union — as was said above — is a relative being. Nor in the category of relation, since it does not follow necessarily from the extremes, as a relation of the genus of relation does. Nor in the category of action — for it is evident that union is not action: once the action is over, union still remains, just as after the generation of a composite, the union of matter and form remains in the composite itself. Nor in the category of passion, for the same reason just given, with only the name of action changed to the name of passion. Nor in the genus of *ubi*, since union — besides the presence of a thing in place that *ubi* expresses — denotes something additional, as is clear from the case of an Angel who is indeed present to a stone, yet is not said to be united to it — because union seems to designate some information of form in a subject, between which the union itself subsists. Nor in the syllabus of *situs*, for the same reason given for the genus of *ubi*. It therefore remains that it be placed in the catalogue of *habitus*, since the union of form with subject seems to be the adjacency left behind from accident and subject when they are simultaneously united. I reply: granting the major and denying

the minor, to its proof it can be said with Scotus (*4.dist.12.q.1.§. Ad quaest. respondeo C*) that union is reducible to the genus of passion — so that passion names not only the relation to the agent but also to the form — or to the genus of action — so that action names not only the relation of the agent to the patient but also that of the informing form to what it informs. Or say that union is reduced to the category of the form it unites, just as a passion that is a property of a thing is reduced to the category in which the thing whose property it is resides — as I have said elsewhere with Scotus. And it is not implausible that union belongs to this category, as I noted from Bassolis (*in Epitome l.1.q.4.art.13*).

Question IX. On the Post-Predicaments.

Article I. What Opposition Is.

That God created opposites is attested by Holy Scripture (*Eccles.42*): "God made all things in pairs, one against another." That they exist in the nature of things is confirmed by experience. For heat is contrary to cold, the moist to the dry, and other things are in turn opposed — as we will discuss in particular in physics. And given that there are opposites, opposition must be conceded: for through opposites things are opposed, just as walls are whitened through whiteness. What opposition is taken universally, however, is not so evident. To make it plain, I first note with Aristotle (*10.Met.T.12*) that the same and the different are immediate — and every being compared with another is either the same as it or different from it. Or, to speak more abstractly: every being is either the same as or distinct from another. And this proposition is very well accommodated to created and uncreated beings alike. For we say that the divine Persons are distinct, but not that they are diverse — for the name of diversity removes the unity of the divine nature, as I noted (*Tract. de Deo trino q.6.disp...*). But we use the name of distinction without any danger, both on account of the relations and on account of the divine attributes, as I proved at length (*Tract.de Deo uno disp.3.q.2 & Tract.praecit.q.8.disp.4*). The Doctor writes (*1.dist.11.q.2.§. Contra istam. B.C.*) that each thing is distinguished from every other that is not itself, by that through which it is formally constituted in being — as man is constituted and distinguished from a brute and from everything else that is not man, by rationality.

Besides opposites there are also disparates, which — as noted (*in Epitome l.1.q.1.art.9*) — have no affinity or community with each other. Among these Scotus (*citato*) numbers certain divine relations, such as filiation and active spiration — whereas passive and active spiration are opposed relations. Thus opposites and disparates are not excluded from divine things.

Nor is opposition taken in the broadest sense to be thought coincident with distinction and diversity, as two recent Scotists (*disp.9.q.1. in initio*) hold, imitating Suárez (*disp.45.Met.sect.1*) — and perhaps the Doctor hints at this (*q.37.praedicam. in initio*). For among disparates there is found distinction but not

opposition and diversity; and distinction extends further than opposition and diversity.

Opposition is twofold: one complex, the other incomplex. I dealt with the former (*in Epitome lib.2.q.4.artic.1 & 2*). I now take up the latter, which is commonly described according to its name as the incompatibility of things that cannot coexist simultaneously and with respect to the same thing in the same subject. Thus the relations of producer and produced, of cause and caused, and the like are opposed. This description can be illustrated by examples and proved by induction through the individual opposites, the knowledge of which will become clear in the following articles, in which I will treat each of them separately. I note only here that in the said definition — as is customary in every definition — something common is posited in which disparates and opposites agree, namely incompatibility; and something peculiar is posited by reason of which opposition is distinguished from everything that is not opposition, as is evident from an examination of each of the words given above.

Objection I. Where there is supreme unity, there is no incompatibility and opposition, since opposition obtains between two extremes of which one is not the same as the other. But in God there is supreme unity and simplicity, as all theologians teach. Therefore in God there is no opposition and no opposites. I reply by distinguishing the major: where there is supreme unity without any formal or real distinction, granted; where there is supreme unity with a formal distinction of attributes and divine perfections, and a real distinction of supposits together with an identity of essence, denied. Or say that this holds for contrary opposition, not for relative opposition — which I have noted above is found in God.

Objection II. Opposition is a species of difference, and difference of diversity, and diversity is a passion of being — as Scotus argues (*q.37.praedicam.*) and as follows from Aristotle (*10.Met.T.24.25*). But in God there is no diversity, as I was saying above. Therefore neither is there any opposition. I reply that the major holds for finite and limited being, among which diverse genera of natures exist — and thus Aristotle and Scotus are to be interpreted in this way — but not for infinite and unlimited being, which participates in only one nature. Therefore there is no diversity in God, which designates multiplicity of nature and contrariety.

Article II. Whether Opposition Is a Real Being.

Scotus (*proximè cit.*) raises this doubt there, and seems to hold that opposition is a being of reason, adducing arguments for both sides that render it probable. In (*q.38.§. Ad 1.quaest.*), however, the same Doctor seems to resolve the present difficulty by this distinction: saying that opposition is an equivocal name. Taken in one way it applies to the opposition that belongs only to contrary and relative oppositions, and in that sense he concedes that opposition is a real being that

belongs univocally to them. Taken in another way, it applies to the opposition belonging only to privative and contradictory oppositions, and in that sense he seems to conclude that opposition is a being of reason — since even if one extreme is real, the other is not, being a privation or negation, as Scotus (*ibid. Quol.1. & Tataret (dub.2)*) notes.

But in this place the Doctor does not seem to be speaking assertively — as is clear from the words he uses, namely "it can be said," and "perhaps," which he repeats several times — the sign of one who doubts. Or else he is speaking not in his own view but in that of others, as frequently happens in that work, as Bargius and other interpreters of his note. For in (*1.dist.23.q.un. §. Item arguo. G; 2.dist.12.q.2. §. Ad 1.rationem ante F*) and other of his writings — which carry greater weight and authority — he plainly asserts that negation and privation exist on the part of the thing independently of any thinking. The same is expressly taught by Trombetta (*12.Metaphys.q.6*), John Canonicus (*1.phys.q.10.artic.2*), and it will be evident in physics in the question on privation.

Others attempt to satisfy this difficulty by this distinction: that opposition taken logically is a being of reason, but opposition taken physically is a real being. It can also be added, as relevant to our purpose, that opposition taken metaphysically is certainly a real being — whose consideration is had (*5.Met.c.10*). For metaphysics studies real being, being a science that is formally and objectively real, as I will show (*1.1.Met.*). The arguments adduced by Scotus at the beginning of the cited question powerfully persuade of this. I adduce only one, which is more evident than the others, being an induction through the individual members of opposites. Contrary opposition clearly shines forth on the part of the thing: there is mutual action between hot and cold, moist and dry, with no intellect thinking about it. Likewise, relative opposition is seen in the nature of things, as is clear from father and son, who regard each other through a mutual relation. Likewise, privative opposition: there exist the seeing and the blind, with no intellect excluded — as from (*4.Met.T.4 & 10* of the same work *T.12*) and following the Doctor confirms (*in 2.cit.*). As for contradictory opposition, it is easy to prove — since it follows upon any other opposition. Therefore, since the others exist outside the intellect, contradictory opposition likewise does not borrow its existence from the intellect.

Objection I. An accident does not enjoy a more real and better being than the subject in which it is subject. But the subject of opposition is intentional, or a being of reason. Therefore opposition is also a being of reason. The major is evident; the minor is proved by induction: for species and genus are relative opposites, from what was said (*1.2.q.3.a.3*), and these are beings of reason. Likewise, genus and non-genus, species and non-species are contradictory opposites, which are likewise numbered among intentional beings — and the same is to be maintained of the other two opposites. Granting the major, I

distinguish the minor: concerning logical opposition, granted; concerning metaphysical or physical opposition, denied — as was declared above.

Objection II. To be predicated and to be subject belong to intentional being, from Scotus (*q.17.Universalium*, ante §. *Ad quaest.*). But opposition is predicated of the four aforesaid oppositions, which are subject to it as dividing members to their divided, or as inferiors to their superior. Therefore opposition is a being of reason. Granting the major, to the minor I say — following the distinction already given — that this is true of opposition taken logically, not of opposition taken physically or metaphysically.

Article III. How Many Kinds of Opposition There Are.

Aristotle makes opposition fourfold, both here and in (*5.Met.c.10.T.16*). Scotus (*q.38.praedicament. §. Ad 2.quaest.*) gives a not incongruous account of this, and Orbellus (*4.Met.cap.4*) aptly explains it: every opposition is either of a real being to a real being, or of a real being to a non-real being. If the first, either one regards the other — as father and son — and we have relative opposition; or one expels the other from the same subject — as heat and cold — and we have contrary opposition. If the second, either one designates the privation of the other in the same subject — as seeing and blind — and we have privative opposition; or one denotes the negation of the other — as seeing and non-seeing — and we have contradictory opposition.

Another cause of this fourfold division — which does not seem to differ greatly from the first — is given by the same Doctor (*5.Met. in comm.T.15*): opposites either mutually posit each other and mutually destroy each other, and are relatives; or they alternately expel each other from the same subject, and are contraries; or one designates the lack of a form existing in the same subject, and they are privatives; or one asserts the negation of the other, and they are contradictories.

Whether opposition is equivocal or univocal with respect to those four oppositions is not a matter of one mind among all. Raconius (*Tract.2.disp.3.sect.1.q.1*) holds it to be univocal. But Scotus and many others make it equivocal. The principal reason is that real positive being has nothing univocal in common with the privative and negative: but some oppositions are real positive — namely relative and contrary — while the other two are negative oppositions, as is clear from what has been said. Therefore opposition is not univocal with them. Furthermore, there is nothing univocal between being and non-being, as is self-evident. But the first two oppositions are properly beings; the other two are not properly beings, as is clear from what was said above. Again, opposition is a relation — as Scotus (*citatus*) hints and Bonetus (*4.Met.c.2*) proves. The two preceding oppositions are real, since their extremes are real positive beings; the two following, though one extreme is positive, the other is

not — as I illustrated with examples above. Therefore those four oppositions are not univocated in the common account of opposition.

Objection I. Every good division must be binary, as Boethius (*1.Divisionum*) notes. But the aforesaid division of opposition is fourfold. Therefore it is not good. Granting the major, to the minor I say that it is made binary by the first account I gave: for I said that every opposition is either of being to being, or of being to non-being — making opposition's division bipartite. Or say it is binary if divided into positive and negative — then positive into contrary and relative, and subsequently negative into privative and contradictory. And I add that elsewhere I will show that a division need not always be binary.

Objection II. Every division is made through opposites, according to Boethius (*ubi supra*). But the said division is not made through opposites, since this partition is among oppositions — and opposition is not opposed, just as action is not acted upon, nor place located — otherwise one would regress to infinity, since there would be no stronger reason why one would be opposed rather than another. The major can be denied with Scotus (*nuper alleg. in solutione primi*): for a division of the genus of substance into its species, properly speaking, is not between opposites but between disparates. Or, if the major be granted — as it seems truly to be — to the minor I say that while opposition is indeed not opposed, it is nonetheless that by which an opposite is formally opposed — whether by relative or any other of the aforesaid oppositions — just as whiteness is not whitened but is that by which a subject is whitened.

Article IV. On Relative Opposites.

Aristotle, in enumerating the opposites (*c.ult. de postpraedicamentis*), begins with relative opposites — and this he also does in treating them. Perhaps the reason is that relatives are the least opposed of all, as the Coimbrans (*in praesenti Comm.*) observe. And this seems to have its foundation in the doctrine of the same Philosopher, who writes (*10.Met.T.15*) that contradictory opposition — which is placed last — is the greatest of all, such that opposition proceeds in grades from relative, contrary, and privative, to contradictory. Hence the Stagirite adds (*ibid.*) that privation is a kind of contradiction, because departing from relative and contrary, it approaches contradictory opposition.

Relative opposites are described by the same Aristotle (*c. de oppositis*): they are those that are said to be *of* the opposites, or in some other way in reference to them — that is, relative opposites are those that mutually regard each other, through some case: genitive — as a father is the father of a son — or ablative — as the disciplined is disciplined by discipline, and a father is a father by paternity — as Titelmans (*l.2.c.60*) rightly notes. And the Doctor touches on this (*q.39.praedicam. §. Notandum pro differentia 24*).

Whether the aforesaid description of relative opposites is legitimate, see what I wrote (*q.6.huius lib.*). For beyond the case of opposites, the very same description

that was given by the Ancients — which was not received there — is here accepted, perhaps because it is more apt for expressing this kind of relative opposition, as the Coimbrans (*cit.*) hint. The Philosopher also hints at this when he says "are said to be *of* the opposites." Or perhaps the same Philosopher is not speaking in his own view but in that of Plato and others — which was then common and celebrated — as he also does in the chapter on quantity, where he records certain species of quantity there according to popular opinion, which he does not admit elsewhere, as is evident (*5.Met.c.de quanto*).

Such relative opposition seems to exist between extremes through the relative forms by which they regard each other, as the Doctor (*proximè cit.*) plainly sets forth, saying that relative opposites reciprocate, while other things that are indeed relatives but not opposites do not reciprocate. Whether such a relative form is directed toward its terminus as absolute or relative — and likewise whether it can be founded on a relation or requires an absolute foundation — these difficulties have already been resolved in the cited place.

Objection I. Things that exist simultaneously are not opposites, since opposition is the incompatibility of two extremes of which one does not tolerate the other. But correlatives exist simultaneously — indeed, one cannot exist without the other, and if one perishes, the other must perish as well, as is clear from what has been said. Therefore relatives are not opposites. The major is to be denied: for opposition is required not with respect to coexistence but with respect to the impossibility of opposed forms, which cannot be simultaneously in the same subject or foundation with respect to the same thing. Father and son are relatively opposed because the filiation that is in the son can in no way be in the father — just as the paternity that is in the father cannot be in the son, whom the father regards.

Objection II. Relative opposites can be simultaneously predicated of the same thing — for the same person can be named father and son, as experience shows. Therefore relative opposites are not opposed according to the incompatibility of relative forms in the same subject. I distinguish the antecedent: with respect to the same thing, denied; with respect to different things, granted. For the same man is called father with respect to the son he begot, and is called son with respect to the father from whom he was begotten.

Article V. On Contrary Opposites.

In order that the proper nature of contrary opposites may be clear to us, we think it opportune to adduce the twofold sense of "contrary" noted by the Doctor (*q.14.praedicam. § Ad 1. in solutione 3*), Orbellus (*4.Met.c. de oppositionibus*), and Tataret (*in q.postpraedicam.scibili 2*). Nor did Aristotle omit this, as will become clear in the explanation of each.

The first and broad use of "contrary" is for any opposite and impossible with another — as Aristotle mentions (*1.Phys.T.142*) when he calls the natural

principles — matter and form — contraries. In this sense, two forms impossible simultaneously in the same matter are called contrary; and such contrariety is found in every genus, as the same Philosopher indicates (*10.Met.T.13.24*), whom the Doctor cites in the place cited. Even among transcendentals such contrariety is found, as Scotus notes (*q.42.praedicam.¶. Quarta propria.*).

The second and narrow sense of contraries is for those that alternately expel each other from the same subject. These are properly contraries distinct from the other opposites — mentioned here and elsewhere by Aristotle — whose description is read (*10.Met.T.14*) in these words: "Contraries are those that, placed under the same genus, are most distant from each other and mutually expel each other from the same subject." The Stagirite himself adds (*c. de oppositis*): unless one of them is present by nature — meaning that some contraries are innate in certain subjects, as heat in fire and cold in water.

This definition is explained through its parts. First, the word "opposed" or "incompatible" is suppressed as a kind of genus. Then "under the same proximate genus" is posited — as whiteness and blackness share the same proximate genus, which is color; or the same remote genus — as virtue and vice, which reside in the genus of *habitus*. Hence contraries are in the same category and differ specifically from each other, as is clear from the examples just given.

Moreover, the difference of contraries from privative and contradictory opposites is indicated: these latter are not placed per se in any genus, since one of their extremes is a privation or negation, which belongs per se to no genus. And perhaps also their difference from disparates is hinted at — which need not share the same genus, as is clear from quantity, quality, and other disparates.

"Most distant" is to be understood not of local or temporal distance but of entitative distance, as Bonetus (*4.Met.cap.2*) interprets it — or of formal repugnance of nature, as the Doctor signals (*3.dist.1.q.1.¶. Ad argument. sub L, in solutione 3*). The remaining words signify that contraries possess the same subject, in which they cannot simultaneously be, but can successively be. For in a subject that now has cold, after some days heat will be received; and in what now has moisture, after a short time there will be dryness — as daily experience teaches.

But this expulsion of contraries does not always seem to occur by violent action, as happens with qualities that are absolutely called active qualities. Sometimes, perhaps, it happens without violent action, by simple cession — as Titelmans (*loco cit.*) exemplifies with colors, odors, tastes, and sounds. Scotus (*supra cit.*) touches on this and Suárez (*disp.45.Met.Sect.2.num.14.15*) does not dissent. Whether such expulsion or cession of contraries is to be understood with respect to number or species, see Scotus (*4.dist.49.q.13.¶. Respondeo B*), where he establishes that it is to be understood of contraries taken according to species,

and of the same thing according to species — and if the same according to number, not of every, but some. Otherwise an accident would migrate from subject to subject, as the Doctor rightly infers there.

Contraries are divided by Aristotle (*hoc loco*) and Scotus (*q.38.praedicament. §. Ad aliud dico*) into immediate and mediate. Immediate are those of which one or the other must necessarily be in any subject capable of them — so that the subject of these can never exist deprived of either of them. As health and sickness are immediate contraries, whose subject is an animal, which is always either healthy or sick. This example of health and sickness that Aristotle gives is subject to criticism, since between those two there is an intermediate state of convalescence, as Galen teaches (*l.de spermate*); and as one who is more experienced in this he is to be given more credence, as Scotus (*3.dist.4.q.un.*) forewarns. Another example can be given of number, which is either even or odd, and no number can be found that is not either even or odd — therefore evenness and oddness are immediate contraries with respect to number.

Mediate contraries are those of which neither is necessarily found in the same subject — indeed, the subject of either can be deprived of both. As heat and cold are mediate contraries whose subject, for example, is water, which sometimes has neither heat nor cold but only tepidity, and is on that account called tepid. Likewise, whiteness and blackness are mediate contraries whose subject, for example, is a surface, which sometimes is neither white nor black but red or furnished with some other intermediate color.

Mediate contraries are subdivided into those mediate through participation of extremes, and those mediate through negation of extremes. The former are those that participate in something of both extremes — which can occur in two ways: either through formal participation in both extremes, as between cold and hot water there is tepid water; or through natural agreement of the middle with the extremes — not that the middle is really composed of the extremes as of its parts, since the middle is as simple as the extremes, but because the middle agrees more with the extremes than the extremes agree with each other — as redness, which is a quality intermediate between whiteness and blackness, agrees more with whiteness and blackness than whiteness and blackness agree with each other. This is deduced from Scotus (*1.dist.7.q.un. §. Ad argument. infra X; 2.dist.15.q.un. §. Dico ergo. B; Tatarum (cit. in fine scibilis 2)*) and other Scotists.

The Doctor further adds (*q.praedicament. nuper alleg.*) that some mediate contraries have several media — as is clear with white and black, between which red, yellow, pale, and others intervene; while others have only one medium — as between hot and cold, tepid is interposed as their sole medium. Moreover, some media have names assigned to them — as those I just mentioned — while others are unnamed and are described by circumlocution: as between friend and enemy there is non-friend; between just and unjust there is the non-just; and between good and evil there intervenes the non-good, etc. — which

Boethius, Scotus, and other authors call neutral and indifferent, and which Aristotle touches on (*c. de oppositis*). Nor is it to be passed over that Scotus notes there that the medium through participation of extremes is properly a medium — since the medium through negation of extremes is found in all opposites except immediate contraries, though a medium through participation is not found between contradictories, as will be plain when I treat of contradictories.

Objection I against the definition of contraries: Some contraries exist that are not subject to the same genus. Therefore it is inappropriately said that contraries are placed under the same genus. The antecedent is proved from Aristotle (*in fine cap.cit.*): "It is necessary that contraries be in the same genus — as whiteness and blackness are in the genus of color — or in different genera — as justice and injustice — or be the genera themselves — as good and evil." I respond by denying the antecedent. To its proof I say it suffices that they be of the same supreme genus: thus justice and injustice, and good and evil taken positively, reside under the genus or category of quality. So contraries are of the same proximate or remote genus, as I was noting above in the explanation of their definition — and in this way Aristotle is well interpreted in the cited place.

Objection II. Many contraries exist that are not greatly distant from each other. Therefore it is not rightly asserted that contraries are most distant from each other. The antecedent is proved: mediate contraries are not as distant from each other as immediate ones — as I was inducing above from intermediate colors. And Suárez (*disp.45.Met.Sect.2.num.9*) and the Coimbrans (*hic cap.10.q.un.art.4*) demonstrate concerning certain virtues and vices, asserting that avarice is contrary to liberality. But avarice is not most distant from liberality — it is more opposed to prodigality than to liberality, since extremes fight more than middles: avarice and prodigality are extremes, while liberality mediates between them. Again, error is contrary to true opinion, but differs more from science than from opinion — since from opinion it differs in truth, while from science it is separated in certainty and evidence. Furthermore, singular contraries fight more against each other than common contraries, since beyond common contrariety they acquire particular contrarieties with respect to individual differences. Therefore it is not certain and firm that contraries are most distant. I deny the antecedent. To the proof I concede this of mediate contraries, but not of immediate and extreme ones — as follows from Aristotle (*10.Met.c.6* and following), who, explaining the statement that "to one there is only one contrary," says it is to be interpreted of extreme contraries, not of mediate ones. Therefore, when it is said that between contraries there is maximum distance, it is to be taken not absolutely but relatively — that is, with respect to the media — as Bonetus (*supra cit.*) observes. In this way the instances of the more recent authors cease. For I admit that avarice does not maximally differ from liberality, because liberality — being a virtue — consists in the middle; and the contrary extreme most opposed to avarice is prodigality, as I also declared in the proposed instance. Likewise, error and opinion are not extreme contraries — as

the instance proves — and so it is not surprising if they do not greatly conflict with each other.

Further instance: The divided is common to all its dividing members, and a definition is adequately suited to all that is defined — from what is asserted elsewhere. Therefore, since contraries are adequately distributed into immediate and mediate, and the definition given of them is equally adequately suited to them, and in that definition it is established that contraries are most distant — which Aristotle's exposition has shown must be adapted only to immediate ones — the response given is evidently shown to be of no moment. It can be said that Aristotle sometimes attributes to a genus what does not belong to all its species: as in the chapter on quality he says that quality receives more and less — which I showed above does not suit certain qualities of the fourth species. Likewise, (*1.phys.T.41* and following) he asserts that the principles of natural things are contrary — though it is plainly established that matter is contrary to nothing. Or it can also be said that the same Philosopher sometimes gives the definition of a genus that is more adapted to its principal species than to the genus itself — as in (*1.Post.cap.2*) he defines science as the knowledge of a thing through its proper cause, which definition applies to science *propter quid*; and in (*2.de anima cap.2*) he defines soul as the principle of vegetating, sensing, moving locally, and understanding — which definition, according to Simplicius, is accommodated to the rational soul alone. Aristotle seems to be imitated by Gilbert, who defines only passive *ubi*, as he did equally for some other of the six principles — as I noted with Scotus above. The reason can be given that the species is better known than the genus; hence philosophers sometimes assigned the definition of the species rather than of the genus. To the final instance I say with Bonetus (*cit.*) that contrariety is principally founded on specific nature, not individual nature. The reason is that contrariety is formally a relation whose proximate foundation is unity or multitude — if it is of the first mode — as I noted above.

Objection III. Contraries in remiss degrees retain their proper specific nature in which they are founded — as I was just saying. But in remiss degrees they do not mutually expel each other from the same subject, as Aristotle (*5.phys.cap.ult.*) writes and Scotus (*1.dist.17*) concedes. Therefore the description of contraries has not been rightly given. The same can be urged about the acts of willing and not willing, of loving and hating, which with respect to objects of the same kind can coexist in the same subject or in the same will. Granting the antecedent, the consequence is to be denied. The reason is that even if they fight each other in remiss degrees too, yet because of their weak and feeble forces, one cannot altogether vanquish the other and thus drive it from the same subject. But these matters are to be treated exactly and accurately (*l.de elementis q.4*). In the meantime see Scotus (*1.dist.17.q.3.¶. Contra istam opinionem*), and in the *Reportata ibid.*, Lychetus, and Bonetus (*citat. in examine definitionis contrariorum*).

Article VI. On Privative Opposites.

Privatively opposed things cannot be fully known unless privation and negation are made perspicuous and visible. Therefore the nature of privation and negation must be investigated before privative opposites are examined. Setting aside the various senses of negation and privation noted by Scotus (*1.d.23.q.un.¶. Item arguo* H.O; *d.28.q.2.¶. Quantum ad 1. B*; Mayr (*ibid.*); Pelbartus (*Tomo 1.Rosarij.Verbo privatio*); and Orbellus (*4.Met.c.4*)), I observe that negation has a wider extension than privation. For every privation is indeed a negation, but not every negation is a privation properly taken — in roughly the same way that every man is an animal but not every animal is a man, since animal extends further than man. Aristotle signals this (*5.Met.cap.22.7.27*) and the Doctor expresses it (*cit.dist.28*) by distinguishing negation into negation outside a genus and negation within a genus.

Negation outside a genus is that which denies every entity and posits nothing positive whatsoever — and can be predicated both of being and of non-being. Hence it is rightly called negation outside a genus, and is expressed in the first principle: "Of any thing whatsoever, either affirmation or negation holds, and of nothing both simultaneously." Negation within a genus is that which posits something in what it underlies, and is called negation within a genus because it denies something within the limits of some genus — as blindness denies sight within the limits of animal, and darkness denies light within the genus of light. Therefore the difference between negation outside a genus and negation within a genus consists in this: negation outside a genus posits no subject of which it is asserted — as non-being, non-man — whereas negation within a genus requires a subject of which it is stated — as negation of sight in a mole.

Privation, however — which is distinguished from both kinds of negation — requires a fitting subject, and is hence described strictly by Aristotle (*cit.*) as "the negation of a form in a fitting subject." Or as Scotus says (*1.dist.9.q.2.¶. Teneo. sub P*; and earlier *q.41.praedicam.¶. Ad istud dici potest*; and *q.39.¶. Notandum quod specialis*): privation is the lack of a form in a subject that is by nature apt for it — as blindness is the lack of sight in a man fit for seeing. Suárez (*disput.14.Met.sect.5.num.7*) and the common run of more recent philosophers are of the same view.

Having explained these matters, which in a certain way contribute to a full knowledge of privative opposites, let us bring forward their definition. As Titelmans (*l.2.cap.63*) notes, it is gathered from Aristotle (*c. de oppositis*) and expressly established by Titelmans himself (*cit.*) and Orbellus (*ubi supra, ad finem cap.alleg.*), and is as follows: Privative opposites are those that have to do with the same subject in an irreversible order and at a time determined by nature.

The definition is explained: first, in this definition the word "opposed" is suppressed — by which their quasi-generic commonality with other opposites is

denoted, as I noted above in the definition of contraries. Then is posited "having to do with the same subject" — noted by Scotus (*citat.q.praedicament.*) to show the agreement of these with contrary opposites, which successively share the same subject — as sight and blindness regard the eye as their proper subject. "In an irreversible order" is added to signify the distinction of privatives from contraries. For when one contrary approaches the same subject, the other recedes and vice versa — as when heat departs from a body, cold arrives in the same body, and conversely, when cold migrates, heat returns to that same body. But in privative opposites, although a transition from habit to privation can be made — from sight to blindness, from hearing to deafness — nonetheless from privation there is no return to habit: from blindness to sight, from deafness to hearing — according to the common saying of Aristotle and others: "From privation to habit there is no return."

"At a time determined by nature" is added to identify another difference between privative opposites and contraries. For the subject of contraries is at all times both capable of them and always receives one or the other of them; but the subject of privative opposites requires a fixed time determined by nature, so that one of them is lodged in it and it is said to have or lack one or the other. Thus a puppy before the ninth day, if it does not see, is not called blind; likewise an infant who before one year has no teeth is not called toothless. But if after the ninth day the puppy does not see, it is called blind; and if after one year the infant is not furnished with teeth, it is called toothless — because the time fixed by nature has passed, at which it should have been adorned with that habit and is not; on that account it is rightly said to be deprived of it, as the Doctor teaches (*in Report.2.d.41.q.un.*). Finally, by reason of the fitting subject, privative opposites are distinguished from contradictories.

Objection I. From darkness to light and from sleep to waking, a daily return occurs. But these are privative opposites, as is evident. Therefore privative opposites are not rightly described as having to do with the same subject in an irreversible order. I reply that the major is true when privations are privations that deprive only in act and not in potency; but we are speaking with Aristotle of privations that deprive in potency — in which sense from death to life and from blindness to sight no return is found by the forces of nature. And the common Philosophers' saying "From privation to habit there is no return" is to be interpreted in this way — as we show more fully (*in phys.q.de privatione*). This is also Scotus's meaning (*q.41.praedicam.§. Ad istud potest*), and Tatarct (*scibili 3*) holds this.

Objection II. Between privation and habit there is no medium — just as there is none between contradictory opposites (*ex 10.Met.7.15*). Therefore a puppy before the ninth day is either blind or seeing. But it is not seeing. Therefore it is blind. And consequently the phrase "at a time determined by nature" is pointlessly posited in the definition of privative opposites. I reply with Scotus (*in*

Report.alleg. §. Ad 1.principale) by distinguishing the antecedent: between habit and privation absolutely there is no intermediate, granted; relatively, denied — that is, having respect to time and other circumstances. For since the time fixed by nature at which the habit should be in the subject has not yet come, there is not its lack, but only negation. Therefore a puppy before the ninth day is neither blind nor seeing, but non-seeing. Scotus likewise adds (*ibid.*) that there is an act of will that is neither good nor bad but indifferent and neutral; and just as there can be indifferent acts, so indifferent acts can generate an indifferent habit — as I showed at length in the moral treatise.

Article VII. On Contradictory Opposites.

From the knowledge of privation and negation obtained in the preceding article, it does not seem very difficult to investigate what contradiction is and what contradictory opposites are. For privation strictly taken is accommodated to privative opposites, and negation to contradictories — as the Philosopher touches on (*1.Post.6.26* and following; *4.Met.cap.7.T.17*) where, signifying contradictory opposites, he mentions negation. Nor does the Doctor dissent (*ibid.*). And Tataré (*q.ult.praedicam.scibili 3*) plainly teaches this, distinguishing negation into infinitating negation — which belongs to contradictories — and depriving negation — which is adapted to privatives.

Hence the Cardinal of Cambrai describes contradiction thus: "Contradiction is the affirmation of one and the negation of the same." And Bonetus (*4.Met.cap.2*): "Contradiction is the opposition by which formally something and nothing are opposed — that is, of which two terms, one is positive, the other negative." For all this to be more easily grasped, a twofold contradiction is to be distinguished from Scotus (*q.41.praedicam. §. Hic assignat; 1.d.4.q.1. §. Ad 1. E; 2.d.2.q.9. R*): one is incomplex, which regards terms — as man, non-man; the other is complex, which regards propositions — as "Peter is learned," "Peter is not learned" — and this requires the same subject, the same time, and other conditions and qualifications of a true refutation. The former is examined here; the latter has its place in the book on *Perihermeneias*.

From these it is clearly gathered what contradictory opposites are. They are described by Aristotle (*1.Post.c.2.T.5* & *4.Met.T.27*) and by the Doctor (*ibid.* & *q.39.praedicam.* & *4.d.1.q.1. §. Ratio 2. sub F*): contradictories are those between which, of themselves, no middle falls — as is clear from the example cited: man, non-man; being, non-being.

The parts of the definition are explained: the word "opposed" is understood, denoting their genus shared with the other opposites — as I noted above. "Between which no middle falls" is added, by reason of which contradictories are distinguished from the remaining opposites. "Of themselves" is added on account of immediate contraries, to which it belongs not per se but per accidens

to have no medium — as Orbellus (*4.Met.q.4*) and Zabarellas (*in comment.1.Post.contex.13*) well explain.

Thus contradictories taken absolutely lack a middle, as the Doctor asserts (*1.d.2.q.7.§. Ad 1. infra KK*). The reason that can be adduced is: that which belongs to something per se and essentially — its opposite can belong to it neither per se nor per accidens, as is clear of rationality, which belongs to man so per se that its opposite, irrationality, is repugnant to him. This can be induced about the others. But lacking a middle belongs per se to contradictories, since it is posited in the definition of contradiction given by the Philosopher in the cited place. Furthermore, in the remaining opposites it is easy to find a medium: for in contraries between white and black there mediates red; in privatives between blind and seeing there mediates the non-seeing. Therefore it is only contradictories that per se are deprived of a medium — understanding a medium of truth and falsity, accommodated to complex contradictories, or a medium of predication, adapted to incomplex contradictories — as Titelmans (*l.2.cap.64*) notes.

Furthermore, contradictories cannot have a middle through participation of extremes — which others call a middle according to form — nor a middle through negation of extremes — which others note as a middle according to subject — as can be observed in Orbellus and Zabarellas as cited. The antecedent is supported: first concerning the middle through participation, because no positive is properly composed of being and non-being; but whatever exists is either being or non-being, and it is impossible for the same thing to simultaneously be and not be (*Arist.4.Met.cap.9; 1.Post.c.8.T.26* and following). But one extreme of contradictory opposites is positive and a being, the other negative and non-being — as is sufficiently clear from the above. Again, one contradictory destroys the other — as Suárez (*disp.3.Met.Sect.3.n.1*) notes. Therefore if one of them is denied of some subject, it cannot be in that same subject, and hence contradictories do not acquire a middle through participation. Then, concerning the middle through negation of extremes: contradictory opposition embraces all things, since everything is either being or non-being. Therefore each thing is comprehended under one or the other contradictory, and there is no medium through negation between contradictories.

Scotus, however, left it written (*nuper cit. & d.5.q.1.§. Ad argumenta logica infra L, in solutione ult.*), with whom Lychetus and Orbellus agree (*in fine q.4.prealleg.*), that complex contradictories taken with a syncategorematic term can claim a middle for themselves — which he confirms with an example: "Man as man is neither white, nor is man as man non-white." For if man as man were white, the sense would be that man is the precise and formal cause by which whiteness would belong to him; and if man as man were non-white, the sense would be that man is the adequate cause by which whiteness would be repugnant to him. Therefore

both proposed propositions are false; and this proposition is true — "man as man is neither white nor non-white" — and mediates between both the aforesaid statements. Likewise, contradictories are not predicated per se: for man is not per se white, nor is man per se non-white. For if man were per se white in the first or second mode of saying per se, he could not be non-white — because what belongs to something in the first or second mode, its opposite can belong to the same neither per se nor per accidens, as is clear from rationality and risibility, which belong to man per se in such a way that their opposite can in no way belong to him. Furthermore, in complex contradictories the term is not to be taken distributively and for something common in contingent matter — otherwise both could be true, as "man is white; man is not white" — which Tataret (*cit.scibili 3*) and Orbellus (*ubi supra in solutione ult.*) diligently note. Finally, Scotus (*1.dist.4.q.1.Ad 3*) notes that contradiction does not follow in the aforesaid composites — for example: "A stone is not a white piece of wood; therefore a stone is a non-white piece of wood" — because "wood" is affirmed in the second, which is not affirmed in the first.

It remains to be examined whether contradictory opposition is the greatest of all oppositions, and what the distance is between contradictory extremes. Scotus (*4.Met.q.4; 2.dist.1.q.2.§. Ostensis, Z; 4.dist.1.q.1.§. ratio secunda, F*) resolves these two difficulties — the second clearly, and the first it only indicates in the two last cited places.

On the former, the common opinion holds that contradiction is the greatest of all oppositions — and the Coimbrans report and receive this (*cap. de oppositis, q.un.art.6*). It is proved as follows.

First: the greatest incompatibility and impossibility of extremes makes for the greatest opposition, since opposition is the incompatibility of things that cannot be simultaneously — as is clear from (*art.1.huius q.*). For just as those things are said to be minimally opposed that have minimal incompatibility, so those that undergo maximal incompatibility are maximally opposed. But contradictories obtain maximal incompatibility, since they cannot be made simultaneously in the same time and subject nor by any power — even divine absolute power — as theologians commonly teach, especially Scotus (*4.d.10.q.2.§. Dico ergo. F*). Since therefore contradictories are maximally opposed, the greatest opposition is consequently contradiction — according to Scotus's rule, from concrete to abstract. And this is had (*10.Met.T.15*).

Second: things that admit of absolutely no medium are opposed with the greatest opposition — for the more some things are immediate, the more they are opposed, since they agree in no middle — whether it is a middle of form or a middle of subject. Therefore the more one extreme departs from the other, the more it is opposed and repugnant to it. But contradictories admit of no middle whatsoever between them, as is clear from their definition given above and from induction through the individual cases. Therefore among opposites

they are opposed with the greatest opposition, and hence among oppositions, contradiction holds first place.

Third: the greatest opposition is that which is found in all things — in supreme and lowest alike, and in middle ones. For the broader and wider an opposition, the greater and more excellent it is. But contradiction can be made in all things: whether superiors — as God, non-God; or inferiors — as earth, non-earth; or middles — as air, non-air, and so on for the rest. But privative and contrary oppositions do not fall upon God nor upon many other things. Therefore contradiction is to be preferred to the remaining oppositions.

Contradictories follow upon privatives, because privation includes negation in a fitting subject — as the Doctor notes (*in 4.praecit.* a little before G). For affirmation and negation — which privatives display — are more repugnant than the two affirmations and positions that contraries and relatives designate. After privatives come contraries — against two of our younger members (*artic.2.q.1.disputat.9*) who think that relatives follow immediately upon privatives as more opposed than contraries.

First, Aristotle seems to agree with us, who in enumerating the individual opposed members, begins from relatives as the minimal opposites. The reason that can be adduced is that relative opposites can be simultaneously in the same supposit with respect to different things — as the same man is called son insofar as he is begotten by another, and is named father on account of the son he begot. But contraries — with respect neither to the same nor to different things — can be simultaneously in the same subject; indeed they alternately expel each other from the same subject by formal expulsion, and not rarely by effective expulsion. I add that among beings, relations have the least entity — as has been seen elsewhere. Therefore they also have the least incompatibility, and consequently hold the least place among opposites.

On the second difficulty: it is celebrated among philosophers — that common assertion that between contradictories there is infinite distance — which Scotus mentions and explains (*locis praenarratis*), noting a twofold distance (*in 4.citat. & 1.Reportat.dist.2.q.3.¶. secundo arguitur*): dimensional and perfective. The former is properly called distance, and belongs to the genus of quantity, having a medium between the extremes — a space lying between them. Where, however, no medium or lying space intervenes, there is no quantitative distance. The latter is a metaphor, attributed to things that lack quantity, and — according to Scotus — is nothing other than the excess of one above the other. Since, then, one extreme of contradictories is positive and the other negative — between which there is no interval — those extremes are said to be precisely distant from each other: and the distance between them is judged to be as great as the greater positive extreme is. This is argued by analogy: the distance of God from a creature — even the supreme possible creature — is as great as God is. Therefore if the supreme possible creature were given, still God would be

infinitely distant from it, because God is infinite. Bonetus the most perspicacious Doctor (*4. Metaphys. capite secundo*) expresses this doctrine luminously, saying that between all contradictories the distance is not equal — since between some there is established infinite distance, and between others finite distance. For the distance of contradictories is drawn from the infinity or finitude of the positive extremes. Therefore if their terms are infinite — as God — the distance will be infinite; but if they are finite — as any created thing — the distance will equally be finite.

From these things the response to the proposed difficulty is clear: between contradictories there is infinite distance — that is, according to Scotus's interpretation, on both sides indeterminate distance. For just as there is no distance so small that it would not suffice for contradictories, so there is no distance so great — even were it greater than the greatest possible — that contradictory opposition would not extend to it and its extremes. Therefore their distance is infinite, that is, indeterminate, toward however great or small an interval. And although all contradictories are equally impossible with each other, they are not all equally distant — for God is more distant from non-God than white is from non-white, because the positive extreme is greater. This the Doctor subtly infers (*4. alleg. H*; and in *Reportat. ibid. §. Ad rationem Sequentis*).

Objection I. Being and non-being are contradictories. But between being and non-being, generation mediates (*ex Arist. 2. Met. T. 7*). Therefore between contradictories there is a medium. Granting the major, I distinguish the minor: between being and non-being simply, no medium falls, denied; between being and non-being in a qualified sense — that is, imperfect being, which is called non-being with respect to perfect being — such as generation, granted. Aristotle (*citatus*) is to be interpreted in this way.

Objection II. The more the extremes are distant from each other, the more media are interposed between them — as experience makes clear. But between contradictory extremes there is the greatest — indeed infinite — distance, as is clear from what has been said. Therefore between contradictories a medium falls. I reply that the major is to be glossed: if understood of dimensional distance, it is granted; if of perfective distance in the way I explained above, it is denied.

Objection III. White and non-white are contradictories. But a shield, for example, of which one half is white and the other half is black, is white and non-white. Therefore between contradictories a medium intervenes. Granting the major, I distinguish the minor: the aforesaid shield is white and non-white simply, denied; in a qualified sense, granted — meaning that the shield is white and non-white with respect to different parts. But contradiction is the incompatibility of what is so with respect to the same thing, as I hinted above — and Major (*in Postpraedicam.*) especially notes this.

Objection IV. What includes is greater than what is included — as induction and daily experience teach. But the remaining oppositions — especially contraries — include contradictory opposition. For if two things exist, one white and the other black, they are contraries — and within them is included contradiction: namely, white and non-white, black and non-black. Therefore contradiction is not the greatest of all oppositions. I distinguish the major: what includes is greater than what is included, if the included is adequately contained in the including, granted — and this alone is what the cited experiences show. But if the included is contained in the including only inadequately, denied — as is clear of superiors, which are included in inferiors, yet superiors are broader and wider than inferiors. So: contradiction is contained in opposites, and moreover in all the others — as is sufficiently established from what has been said.

The remaining post-predicaments are touched upon by me (*in Epitome artic.14.q.4.lib.1*) and treated extensively by Titelmans (*cap.65* and following *lib.2*). On priority and posteriority, see Scotus (*q.43.pradicament.*), Orbellus (*5.Met.cap.5*), Bonetus (*6.Metaph.cap.2*), and most recently Mastrius and Bellutus (*disputat.9.q.2 & 3*).

Book IV. On the Proposition.

We make logic tripartite, as is evident from the beginning of the Epitome and its arrangement. For one part of logic is concerned with simples — of which we have been treating up to now. Another contemplates composites — which we have presently at hand. And a third surveys discourse, which embraces all the remaining matters to be treated in the following book. Thus in the present work we discuss composites or complex things — which by one name are called propositions (*enuntiationes*), by which truth or falsity is designated.

Although this work was inscribed by the Stagirite *peri hermeneias* — that is, "on interpretation" — as Titelmans (*l.3. in praefatione*) notes, and the Doctor (*1.perih.q.1*) hints, nonetheless the common usage of philosophers has taken root so that interpretation and proposition are indiscriminately received in this place — as Titelmans (*cit.*), Tataret (*q.1.dub.1*), the Coimbrans (*in proaemio huius operis*), and before these, Alexander and Ammonius — noble Peripatetics — in their Commentaries rightly observe.

Question I. On the Object of the Books on *Perihermeneias*.

Article I. Whether the Proposition Is the Adequate Object.

Although all of Aristotle's commentators acknowledge that the proposition is the total object of the books of *Perihermeneias*, they are not in agreement and

harmony in determining what it is. For some — such as Ammonius and Boethius — think the simple proposition is the adequate object of this work. Others, however — among whom seem to be Scotus (*hic q.prima*) and his disciples, to whom Toletus and Ruuius subscribe (*in proaemio*) — hold that the total subject of these books is the proposition abstracting from simple and composite propositions.

Note I, that interpretation — whose inscription distinguishes these books of Aristotle — admits of many senses, some of which Tataret (*Tractat.5.Summularum fol.37.scibili 2 & 1.Perihermen.q.1.dub.1*) and James of Valencia (*Tractat.2.artic.quarto.prologi in Spalt.*) adduce. Setting aside those that are grammatical and scriptural, and of little relevance to our subject — since the present discussion concerns philosophical interpretation — I note only from the Doctor (*cit. in principio articul.*) that interpretation is described in two ways.

In one way it is described as an articulate utterance expressed with the imagination of signifying — and this applies both to incomplexes and to complexes, and does not pertain to this place, which deals only with complexes. In another way it is described as an articulate utterance expressed with the imagination of signifying something to be or not to be. Interpretation taken in this sense does not differ from the vocal proposition. But just as I excluded voices from the object of logic (*libro primo, questione tertia, articulo quarto*), so this kind of interpretation — which coincides with the vocal proposition — is to be excluded from the object of this part of logic. The Doctor himself not obscurely teaches this (*ubi supra*).

Note II, that proposition is commonly distributed into mental, vocal, and written. This division, in certain respects, is to be explained in roughly the same way as the division of the term into mental, vocal, and written, explained (*in Epitome l.1.q.1.art.5*). A mental proposition is that by which the intellect apprehends and judges that something agrees or does not agree with another — as "man is an animal," "a stone is not an animal." A vocal proposition is the utterance of one thing of another spoken aloud. And a written proposition is the utterance of one thing of another expressed in letters. As for what and how many kinds of judgment there are, see Scotus (*4.d.47.q.1.¶. Respondeo sub A*) and Gadius (*Quol.15.fol.183*), who define judgment thus: judgment is the certain apprehension of something through another — for every true complex is apprehended as true through another; even if it is immediate, it is still judged true through the grounds of the terms, because from Aristotle (*1.Post.T.6*) we know principles insofar as we know the terms, as is plainly evident from the preface of the Epitome.

Assertion. Not the simple proposition, but the proposition prescinding from simple and composite, is the total object of the books of *Perihermeneias*. This follows from Scotus almost immediately at the beginning of the cited article, and is proved as follows. First, from Aristotle (*cap.4. of the first periher.*), who,

defining the proposition, divides it into simple and conjoined. Therefore according to Aristotle, the proposition taken absolutely is determined to be the adequate object of these books. Second: a conjoined proposition is a true proposition, since it appears to be contained under a proposition as a species under a genus. Therefore it is to be treated in some part of logic, and it does not appear to be considered in any other part than this — as is clear to anyone reviewing the individual parts of dialectic. Third: everything treated here is treated for the sake of the proposition, since we discuss its integral parts, then its genus which is discourse, and likewise its subjective parts, and then its properties themselves. Therefore the proposition taken generally is established as the primary and adequate object of these books.

Objection I. The subject of a science must be common to all that is considered in that science — as is clear from the conditions of a subject given elsewhere by me. But the proposition is not such: for it is not predicated of the noun and the verb — since these are not true propositions: "a noun is a proposition," "a verb is a proposition." Therefore the proposition is not the object of this work. I distinguish the major with Scotus (*praecit.*): concerning the subject of attribution, denied; concerning the subject of predication, granted — as I explained (*1.1.q.3*). And this alone is inferred by the other instance.

Objection II. If the proposition were the subject of this work, it would be either the mental, vocal, or written proposition. But none of these appears to be so. Not the vocal or written, says the Doctor — since, no voice or writing existing, logic and its parts — among which this is numbered — would still be. Nor the mental, because noun and verb are parts of the vocal proposition, since they are voices — as is clear from their descriptions adduced and explained (*in Epitome l.2*). I respond with Scotus: just as vocal noun and verb are parts of the vocal proposition, so the same things mental are parts of the mental proposition — for what is apprehended in the first operation of the intellect is composed in the second, even if not expressed through voices. Therefore in the form of the argument: granting the major and denying the minor, to its proof — admitting the first two parts of it — to the third I say that vocal noun and verb are indeed parts of the vocal proposition, but not of the mental; and this is made manifest through that.

Question II. On the Parts of the Proposition.

The parts of a proposition are of a twofold kind, as the Doctor (*1.Periher.q...*) mentions: some are integral parts — from which the proposition itself is constituted — which are noun and verb; others are subjective parts — into which the proposition is distributed — which are affirmation and negation. Concerning the former I will touch here on a few things more worthy of note; the rest are to be seen (*in Epitome l.2.q.1.art.1 & 2*). Concerning the latter, however, in the following question there will be discussion.

Article I. Whether Voices Signify Conventionally.

There were among the ancient philosophers some — notably the Pythagoreans (as Dexius, cited by Ruuius (*1.1.periher.cap.2.q.3*) testifies) and Heraclitus and Cratylus (as the Coimbrans (*in praesenti q.4.art.2*) and Arriaga (*disp.13.Sect.1.subselt.3*) report) — who held that voices naturally signify things, or that names are natural signs of things. The common position, however, of the remaining philosophers — especially Aristotle (*1.Periher.cap.1 & 2*), Scotus (*ibid.q.4 & 1.d.22.q.uni* sub C; and in *Report.eodem l. & D; & 2.d.11.q.vn.§. De secundo*), Titelmans (*l.3.cap.1*), Tatarct (*q.1*), John of Metz (*ibid.*), and others — is that voices are conventional signs of things, significant by the will and discretion of the imposers.

Note I from Pelbartus (*Tomo 1.verbo nomen*), following Vorreillon (*1.d.22*): that "noun" (*nomen*) is derived from *notamen*, because through it we note the substance and quality of something. Hence among the ancient grammarians, as the Author of the *Grammatica speculativa* testifies, a noun designates the substance and proper or common quality of something. Hence Aristotle, at the beginning of the first *periherm.*, adds that nouns are notes or signs of concepts that reside in the mind. Since therefore a noun is a note or sign of a concept hidden in the soul — and a sign is multiple — it must be investigated what kind of sign it is. And for all this to be better and more distinctly perceived, the descriptions and divisions of signs are to be recalled, which I brought forward and explained (*in Epitome l.1.q.1.art.1*).

Note II from Titelmans (*nuper alleg.*): that among voices, some signify nothing determinately — such as the voices of children, of fools, or of drunkards, uttered by them without articulation, from which nothing is understood by hearers. Others signify something determinately, and these are of two kinds: some naturally signify something even if no imposition had been made by any human being — as laughter signifies joy and groaning signifies sadness. Others signify something from the institution and will of the imposers — as *homo* among Latins and *anthropos* among Greeks signifies a rational animal.

Although a voice that signifies conventionally cannot signify other than what the imposer intends to represent in some way — since a vocal name is as it were the offspring of the mind, and it is pointless to impose a name to signify what in no way is known or at least conceived to exist, since voice was invented to lay open our concept — yet it can signify more than the one who uses or institutes or hears that name can conceive with clear knowledge. For if someone had never seen Rome but used this name with respect to another who had seen that city, it would represent it to the latter more clearly and plainly than the one who used the name could conceive it. Furthermore, Scotus says: if some wayfarer were to address a Blessed soul and name God to it, although the wayfarer did not know God distinctly and quidditatively, nonetheless by that name he would represent God distinctly and clearly to the Blessed soul, which intuitus God evidently.

Again, it can happen that the hearer understands the thing designated by name better and more perfectly than the one who imposes or uses such a name — if the hearer is of keener intellect, of greater learning and practice.

Note III from Gabriel (*3.dist.22* & *35.q.un.artic.2*): although in matters of fact there is no doubt, nonetheless sometimes there is a not inconsiderable dispute among authors about different impositions and the different voluntary use of names — which use takes on the force of imposition. For it sometimes happens that a name is truly and falsely asserted of the same thing simultaneously, according to different senses; and the same vocal and written proposition may be simultaneously true and false, on account of the equivocation of names — as I explained (*in Epitome libro tertio, q.4.artic.3*). Hence the Gloss (§. *De Suppellectili legata, leg.Labeo*) and Gadius (*post Scotum. Quol.20.artic.3. sub R*) rightly add: "Names are not to be taken from the opinions of individuals, but from common use." Likewise (*Extra. de sponsali, ex litteris*): it is read that if one party did not understand what the other proposed, recourse is to be had to the common understanding of the words, and both parties are to be compelled to retain the words uttered in the sense that those who understand correctly usually generate from them. Augustine agrees (*3.Mus.2*).

Assertion I. The concepts of things are the same for all. This is what Aristotle (*1.perih.c.1*) holds, together with Scotus (*ibid.q.4.§. Ad quest.; Quol.3. sub B*), Mayr (*lib.2.Terminorum fol.24*), Bonetus (*2.Met.cap.2*), and the rest of the philosophers. It is proved as follows. First: things are everywhere the same — as the nature of a lion is the same whether the lion exists in Rome or in Paris, whether it is presented before the Supreme Pontiff or before a king. Therefore the concepts of things are the same. The consequence is at hand: because concepts are natural images of things, naturally expressing the very things of which they are images and natural likenesses — and everywhere retain their natural representation, as is seen at the eye in images of objects presented by mirrors. Second: what is from nature is the same for all — as is clear from plants, trees, and other things that nature produces everywhere on earth. But the concepts of things are from nature, being born from the objects of which they are natural likenesses — as I will show in the book on the soul. For just as the sensible likeness of an object in the sense is always representative of that very object, so the spiritual likeness in the mind is always representative of that very object. Therefore the concepts are the same, and the same things exist for all peoples — though not all peoples use the same voices to express things and manifest concepts.

Assertion II. Voices are voluntary signs of things significant by the discretion of the imposers. Aristotle and Scotus maintain this (*ubi supra*, and *2.dist.42.§. Ad 2.quest. N*, and *Quol.3.art.1.§. De 1. sub B*). It is proved as follows. First: what depends on the will of man is conventional. But the signification of voices depends on the will of the imposing man. Therefore voices are significative

conventionally. The major is known; the minor is evident from any language (*idioma*) that men use in conversing with each other — for Hebrews use different voices, Greeks others, and Latins yet others, to express their concepts and declare their things. Second: what is not from nature but from art and human discretion is conventional. But voices are not naturally significative — otherwise they would be the same for all insofar as they signify, since a natural cause, unimpeded and duly approximated, wherever it may be, produces its effect. Likewise, there would be no difference between the voices of men and those of brutes — which is plainly false and absurd. Therefore voices must be conceded to be conventional and dependent on the discretion of the imposers.

Objection I against Assertion I: Every man has his own concept of a thing he knows — as Paul has a concept of a lion distinct from the concept Francis has of the same lion. Therefore the concepts of all are not the same. Confirmation I: if concepts were the same for all, since concepts lead to the knowledge of the things of which they are concepts, every individual would know things in the same way through the concepts representing them, and hence all would be equally knowledgeable — which is absurd. Confirmation II: different things exist among one nation, different things among another — as is clear from clothing, customs, words, letters, characters, and the like. Therefore neither are the same concepts, nor the same things, found among all. I respond that Aristotle's statement is to be understood of specific identity of concept, not numerical — as the argument proves. Or say with Scotus that the concepts of all peoples are the same with respect to representation — since they represent the same thing everywhere — but not in themselves and with respect to their entity. For in this way concepts are distinct according to the distinction of the conceivers. To Confirmation I: the sequel is denied. For although there is one specific and representative concept of the same thing, yet the numerical and entitative concept is not the same, since one person has a confused and obscure concept, another a distinct and clear concept, of the same thing — and hence it does not follow that all have equal knowledge and science. To Confirmation II: I say that this holds not for natural things but for artificial things, which vary according to the variation of craftsmen. Hence Scotus adds (*prope finem q.citat.*) that letters and voices are changed among different imposers, because they are signs from imposition, which is different among different peoples.

Objection II against Assertion II: It is narrated (*Gen.2.*, cited by *Scot.1.dist.22.q.un.¶. de secundo. sub C*) that Adam imposed names on all living creatures according to their natures. For these words say: "Whatever Adam called every living soul, that is its name. And Adam called all the animals by their names, and all the fowls of the air, and all the beasts of the field." Therefore voices are natural signs and not voluntary. I reply that Adam did indeed impose names on all living creatures voluntarily and by his own discretion, guided by God — names that can in some way be called natural signs, not simply, but insofar as appropriate names were imposed upon each according to their

natures, drawn from their specific differences or certain of their natural properties. Thus *lapis* (stone) was named from *laedendo pedem* (harming the foot) — as Scotus (*loco citato* §. *Potest dici*) notes — and *petra* from *terendo pedem* (*ibid.* §. *His praemissis*) by the Latins. Or from motion, shape, operation, or some singular and proper accident. But other names were imposed upon other things by those endowed with life and art and ingenuity, and have been received in common use, with no account taken of their natures, properties, or any of the above — as frequent experience teaches us.

Further instance: The imposition of names upon the stars is ascribed to God (*Psalms 146*): "Who numbers the multitude of stars and calls them all by their names." But God most perfectly knows the natures of things and assigns proper names to them; and proper names are those that signify things under their proper account — as the Doctor teaches (*ubi supra* §. *Ad quaest. prae-mitto*). All the more because voices are signs of concepts, which are natural signs of things, as the Doctor affirms (*4.d.10.q.4. §. Haec duo ante B*). Furthermore, the names that our first parents used and spoke were not instituted at their discretion — for either Adam alone, or both of them, imposed names on things. But neither of these can be said, since it is not apparent when they would have indicated the imposition of so many voices, or with what voices they would have signified mutual consent in the invention of voices. Therefore voices signify naturally. I reply: although God assigned names to things that suit their natures, yet they are not natural in the sense explained above — for God acts *ad extra* not naturally and necessarily, but freely, as is read (*Psalms 134*): "He has done all things whatsoever he wished." And St. Hilary hints at this (*1.de synodis*): "The will of God brought substance to all creatures." To the other objection added: I say that concepts are indeed natural signs, while voices are voluntary signs — as I showed above. To the last: I say that sacred pages only report that Adam gave names to the animals. I believe, however, that the rest was accomplished by God's authorship — who infused the species of things into the mind of both parents.

Objection III. The essence of a thing is everywhere the same — as is clear from Assertion I. But a significative voice is essentially significative. Therefore a voice is everywhere the same, and consequently naturally significative. The minor is proved: a voice receives its signification through imposition, and signification is its form. But every form existing in a subject necessarily causes its formal effect. Therefore having received its signification from the imposer, the voice necessarily and naturally carries its significate. Granting the major, I distinguish the minor: essentially naturally, denied; essentially from institution and the will of the imposer, granted. For where the imposition of a voice and its signification are known, it signifies the same for all — not otherwise, since voices are different among different nations, and according to the diversity of voices there is likewise diversity of significations. This can be confirmed from Scotus (*4.d.1.q.2*) affirming that the sacraments are significative and causative signs of grace — not

natural and physical but voluntary and moral, from God's institution and covenant — as can be seen in the cited place.

Objection IV. Man by his own nature is a discursive being endowed with a natural power of speaking. For, as Aristotle acknowledges (*1.Polit.cap.2*), man is a social animal, and one communicates and expresses his concepts to another. But the instrument of the natural discursive power must be natural. Therefore since a significative voice is the instrument of the aforesaid discursive power, a significative voice is certainly a natural instrument or natural sign.

Confirmation: man is not of a viler and worse condition than a brute — being among animals the most noble. But natural voices are conceded to brutes, as is evident. Therefore natural voices are not to be denied to man.

I reply: granting the major, to the minor I say indeed that the instrument of the discursive power is natural — and manifold: tongue, teeth, palate, throat, lungs, and the like, which concur in forming articulate voice (about which in the book on the soul). But I deny that the articulate voice itself is naturally significative. For man by his art and ingenuity can invent names and impose signification on them at his discretion, to declare his concepts and signify his things. For just as to avoid what is harmful we use instruments — some of which are natural (as hands) and some artificial and voluntary (as weapons) — so in our matter, man, having available the natural instruments for forming voice, then by his own industry and institution has conventional signs for laying open his internal affections and signifying his things. To the confirmation: I say that man has, beyond the natural and inarticulate voices that are common to him and to a brute for designating natural affections — as Aristotle hints (*7.pol.cap.2*) — articulate and conventional voices, by which and by very many other things man surpasses a brute.

Article II. Whether Voices Primarily Signify Things or Concepts.

That voices are signs of concepts, and writing is a sign of voices, is a common saying that later philosophers draw from Aristotle (*1.periher.cap.10*). But whether voices primarily signify things or concepts is not a slight dispute among them. Boethius — in his commentary, cited by Scotus (*q.2.primi periher.*) — teaches that voices signify only concepts, citing Aristotle and Porphyry in this place in his favor. Priscianus seems to go in the same direction — whom the Doctor (*citatus*) mentions, saying that every part of a sentence signifies a concept of the mind. St. Thomas agrees (*1.p.q.13.art.1*). On the other side, Scotus (*praealleg.1.d.22.q.un.¶. de ratione huius; & d.27.q.un.¶. Ad argumenta* infra H), whom Gabriel (*ibid.*) and not a few recent thinkers follow, hold that voices signify principally things — though our Doctor (*in Log. in fine loc.cit.*) teaches a way of defending each position as probable. For he says there that the first is more probable according to authorities, while the second is more plausible with respect to reasons. The Coimbrans (*q.3.art.1*) seem to agree with this, taking a middle path and holding that voices signify both concepts and things.

Note from the Doctor (*proximè cit.*), whom Arriaga (*disp.13.sect.2*) follows: the dispute here is not about names imposed to signify likenesses or species existing in the intellect — which our two new Scotist interpreters (*disp.2.q.1. in solutione 2. obiectionis*) do not consider — nor about voices applied to denote concepts of the mind — such as the intellections residing in the mind itself. For it is quite certain that voices primarily signify concepts in that case. But the entire difficulty bears on other voices imposed upon things outside the intellect — for example, whether the name "man" signifies human nature or the species, or the concept had of human nature itself? Here pertains the distinction of concept into formal and objective — which was adduced and explained (*1.3.q.2.art.7*), to which reference is made, lest I repeat the same things frequently and uselessly.

Assertion I. Voices signify things. It is proved as follows. First: from many places cited by the Doctor (*praecit.*), not far from the beginning of the question. From (*3.c.huius lib.*): the verb signifies something — as "I read," reading; "I write," writing — and constitutes and determines the intellect of the hearer so that he perceives the thing that the speaker represents to him through voice. Therefore, voice according to Aristotle is significative of a thing. Then (*1.Elench.c.1*) the same Philosopher adds: we use names in place of things because we cannot bring things themselves into disputation. And a few lines later: since things are infinite and names finite, one name and one expression must signify several things. Again (*4.Met.T.28*) he adds that the expression (*oratio*) which a name signifies is the definition; but the definition designates the true essence of the thing. Therefore voices are significative signs of things.

This is corroborated from sacred scripture, especially (*Gen.2*) where Adam is read to have imposed names on the animals — as I weighed in the preceding article, Objection II. Again (*Luke 1*): the Angel says to Zechariah: "You shall call his name John." (*Mark 3*): Christ the Lord imposed on Simon the name Peter, and on the two sons of Zebedee, Boanerges — that is, sons of thunder. From these and similar authorities it is clearly shown that names signify things. St. Augustine adds (*7.Trinit.cap.3*) that a voice makes manifest, beyond itself, the thing of which we speak. But we speak of things — plants, flowers, and the like — which are true things. Therefore voices signify things.

Second: voices signify that for the signifying of which they were imposed — namely, that the speaker manifests the thing about which he reasons to the hearer. Voices were devised to make things manifest, so that the name "man" signifies one having humanity, not one having the concept of humanity. Therefore voices signify things.

Third: names either signify concepts of the mind, or things, or both. But they do not per se appear to signify concepts. Therefore they signify things. The major is known since nothing else remains for voices to signify. The minor is shown: names signify either the formal concept or the objective concept. Not the first — since the formal concept is nothing other than knowledge or intellection, which

I gave warning is not in doubt (*in not.*). Therefore the second — and I have what I intend; for the objective concept is nothing other than the thing known and understood. But if it be said that voices signify both, this is to be examined below — how voices make both things and concepts evident. For now it suffices to prove that voices denote things; whether they signify things or concepts first is to be argued (*in 3.assertione*).

Assertion II. Voices in some way signify concepts. This also Scotus proves (*ubi supra*). First from Aristotle (*cit.cap.1*): "Voices are signs of affections of the soul" — that is, of concepts, according to Scotus's interpretation (*1.dist.22.q.un.*). And a little later: "The affections of the soul are the same for all, of which voices are notes, as also for all the things of which these affections are likenesses are the same." Augustine agrees (*15.Trinit.cap.11*): "the word that sounds outwardly is the sign of the word that lies within." And (*lib.2.de ordine cap.12*) he adds that reason introduced speech, since men could not perceive each other's minds or concepts.

Second: voices denote that for the signifying of which they were invented by men — namely, that the speaker lays open his internal concepts through voices, so that men may converse with each other and mutually reveal the sentiments of their minds. Therefore voices signify concepts. The major is evident since voices from human discretion are conventional significative signs, as I said in the preceding article. The minor is acknowledged, since human will is directed toward declaring internal concepts through voices and names — so that what is useful for human society, friendship, and the conduct of life may be understood, undertaken, and carried out — as Plato (*in Timaeo*, cited by the Doctor (*3.dist.28.q.un.¶. In ista quest.*)) writes before Aristotle (*in 1.Pol.c.2*) with these words: "For this reason an ordered discourse is a common sharing, so that mutual indications of will may be at hand."

Third: the truth or falsity of a vocal proposition signifies the truth or falsity of a mental proposition, as Aristotle asserts in this place. Therefore a vocal proposition designates a mental proposition, and the parts of the latter designate the parts of the former. But the parts of a vocal proposition are voices. Therefore voices signify concepts of the intellect.

Furthermore, the intellect joined to knowledge of things is bound to the senses, which are fixed only to corporeal things — as will be evident in the book on the soul — and one person cannot, without voices, reach the counsels and sentiments of another. Therefore to lay open mutual concepts, voices were invented, which are their signs from human institution. Again: we experience teachers teaching their students arts and sciences by manifesting their concepts through voices. But Angels — because they are entirely separated from matter — speak differently with each other and notify their concepts in a different way, as I showed at length (*Tract.de Angelis disp.7*).

Assertion III. Voices signify things by means of concepts. This the Doctor (*praenominatus*) seems to hold as more probable, and (*1.dist.8.q.3.¶. Contra*); and it is expressly defended by Tataret (*q.1.scibili 4*), Toletus (*4.concl.*), and very many others.

It is proved as follows. First: that which a voice primarily signifies is that for the signifying of which it is primarily imposed. But a voice is primarily imposed to signify a thing. Therefore it primarily signifies the thing, and only subsequently the concept of the mind. The major is known since the entire signification of a name depends on the will of the imposer. The minor is proved: for example, the name John — which was imposed on the son of Zechariah — beyond doubt immediately signifies that very son of Zechariah, not the concept had of him. Likewise, the names ascribed to the animals by Adam designate not the concepts of the animals formed by the first parent, but the natures of those same animals — as is evidently clear from the words of the sacred text. Therefore voices signify things by means of concepts.

Second: what is primarily perceived by the hearer is primarily signified by the voice of the speaker. But what is primarily perceived by the hearer is the thing rather than the concept of the speaker. Therefore the thing is primarily signified by the voice of the speaker rather than his concept. The major is evident, since voices are instituted principally so that the hearer may conceive what the speaker intends to signify to him. The minor is supported: a direct act is prior to a reflexive act. But a thing is understood by a direct act and its concept by a reflexive act — as the Doctor diligently notes (*in praesenti*). Therefore in that priority in which the thing is understood, without the understanding of its concept, a name can be imposed upon it — and thus a name primarily signifies the thing.

Third: if voices primarily signified concepts and not things, propositions that are otherwise true would be false. For example, this proposition — "God is just" — which is true, would be false, since the concept of justice that we have is not an attribute of divine justice, as is self-evident. Again, a voice does not primarily signify the formal concept, as I noted above; but it does signify the objective concept, which is the thing itself as known. Finally, what a voice primarily signifies is that for which it is primarily substituted and stands in place of. But a voice is substituted for the thing — as "man" for one having humanity — as I showed abundantly (*lib.1.Epit.q.2.art.3*). Therefore it is concluded that voices signify things by means of concepts.

Objection I. Aristotle (*1.perih. in principio primi c.*) says that voices are signs of affections that lie in the soul — and what resides in the soul are concepts and species, natural likenesses of things. Therefore voices primarily signify concepts. Confirmation: certain names designate the operations of our intellect — such as the name "intellection." But the operations of our intellect are concepts, as is evident. Therefore names signify concepts immediately and primarily.

I reply from Scotus (*1.dist.27.q.3. §. Ad argumenta huius quaest. sub H*) that the Philosopher there only intends that voices are signs of concepts not properly, directly, and ultimately, but mediately and as a presupposition: for it is necessarily presupposed that a thing is first conceived before it is expressed orally by name. Thus for example the name "stone" — with the concept of it being presupposed — properly signifies such a thing as is called a stone, so that the voice is subordinated to the concept. For the concept of a thing comes first, before the thing itself is named and signified by voice — and thus voices signify things by means of concepts. To the confirmation: I say that those names are to be excepted that were invented to signify likenesses and species that have their seat in the mind — as I noted from Scotus above.

Objection II. Names imposed to signify fictions — such as chimera, hircocervus (*goat-stag*), and the like — designate only concepts of the mind. Therefore voices primarily signify concepts. Confirmation: voices designate only the agreement or disagreement of the mind; but agreement and disagreement are concepts of the mind. Therefore voices primarily signify concepts of the mind.

I reply that the aforesaid fictitious names primarily signify impossibilia, or beings of reason, which have no foundation on the part of the thing. Therefore I deny the antecedent — for as Scotus notes (*in q. §. Ad partem oppositam*), fictions and singulars, although they form species in the imaginative faculty, do not do so in the intellect, which is only capable of receiving the species of its object — which for the present state is the quiddity of a sensible thing, as I showed at length (*in Tract. de cognoscibilitate Dei disput.1*). To the confirmation: the antecedent is denied. For we experience a thing being indicated primarily by a nod, since the thing is the primary and immediate significate of the nod — as Scotus states (*loco cit. § Ad q. dicitur*).

Objection III. Voices are substituted in place of concepts, as I showed above from Aristotle. Therefore voices primarily signify concepts. Confirmation: if voices primarily signify things, there would be no lying — for as Scotus says (*2.dist.42. §. Ad 2. quaest. N*): "speech must make known what is in the mind — otherwise it is a lie." Therefore voices properly carry concepts. The consequence of the antecedent is proved: lying in common parlance is going against the mind (*ex 3. Report. dist.38.q.1.*), and lying is the abuse of a voice — since voices were invented to denote the indications of the will. Those who lie do not use voices as indications of the will but the opposite. Furthermore, from St. Augustine (*l. de mendacio*), lying is described as "false signification of a voice with the intention of deceiving." Therefore if voices primarily do not designate a concept, it is rightly concluded that there would be no lying, since no one would speak against the mind or concept that one has in mind — though Scripture says (*Psalms 61*): "the sons of men are liars," and (*Psalms 115*): "every man is a liar."

I reply by distinguishing the antecedent: voices are substituted in place of formal concepts, denied; in place of objective concepts, granted — as was

explained above. Or say that names signify things by means of concepts, as is clear from the response to the first objection. To the confirmation: the sequel of the antecedent is to be denied. To its proof I say that lying consists in the external affirmation of what the mind holds as negation, or conversely in the external negation of what the mind holds as affirmation. But affirmation and negation, truth and falsity, concern things by means of concepts — as the Doctor touches on (*in q.praesenti* §. *Ad quaest. dicitur*) — and can be explained by examples adduced by the same Doctor (*in 3.Report.praecit.*), especially (*Gen.27*) where Jacob says he is the firstborn, the opposite of which he knew very well. And (*ibid.cap.42*) Joseph says to his brothers, by the life of Pharaoh, "you are spies" — the contrary of which was not unknown to him. One can also cite (*Acts 5*) about Ananias and his wife, who defrauding the price of a field lied to God — as St. Peter reproves them (*ibid.*).

Article III. What the Signification of Voices Represents.

This article is discussed and decided by the Doctor chiefly in two places: (*2.dist.42.q.4. §. Ad 1.argum.* O) and (*4.dist.1.q.5. §. Contra opinionem* B). In these I find two chief opinions. The first is of those who assert that the signification of voices is something real — and these seem to dispute among themselves. For some — such as St. Thomas (cited by Lychetus, and refuted by the Doctor (*in 2.praecensito*)) — write that the signification of a voice is something real and intrinsic to the voice, namely a certain power to cause a concept in the mind of the hearer. Others — whose names Arriaga (*disp.13.sect.4*) withholds — think it is a real relation in the names themselves, arising from the free imposition of men. The second opinion is of certain others who think that the significations of names denote nothing real — and these are divided in two: some hold that names are significative through a relation of reason, among whom Scotus seems to be (*in 4.cit.*), and more expressly (*in Report.2.dist.42.q.4. §. Ad aliud dico*). Others — to whom the Doctor in the Oxford writing (*2.dict.alleg.*) seems to be inclined — hold that the signification of voices is constituted by an extrinsic denomination.

What I said (*in Epit.1.1.q.2.art.1*) on sign and signification is to be recalled. Now I only note that this difficulty is not raised about inarticulate and naturally significative voices — whose signification is certainly something real, as weeping signifies sorrow and laughter joy — but about articulate and conventional voices, whose significations are derived from the discretion and will of the imposing men, who by their discretion affix such significations to these names.

Furthermore, as gathered from Scotus (*in 2.cit. infra* O), a voice can be considered in two ways: in one way in itself — as a quality or sound emitted by some cause — and in this sense a voice is a natural sign of its cause, as other effects signify their causes. In another way as significative — and in this sense it is a commemorative sign, the knowledge of which is had by those to whom the imposition of this significative voice is known.

A voice formed by the natural instruments noted elsewhere imprints its species in the hearing, and from the species in hearing it passes through common sense, imagination, and memory to the intellect — in roughly the same way as was said of the universal formally (1.2.q.1.a.8) — which perceives its nature and the imposition to signify, and has its formal and objective concept, relating the voice to the thing signified by it as sign to signate. From this a relation of reason arises. I further observe that we are not led to knowledge of the thing upon which a voice is imposed unless we previously know through its species that thing which is affected by the voice. But when we have habitual knowledge of it, hearing the voice, we acquire through that same voice, as a commemorative sign, its actual knowledge — as Scotus (*ubi supra*) well continues.

Assertion I. Signification adds nothing real — whether absolute or relative — to the voice. This is Scotus's position in both the cited places, and is proved as follows. A non-significative voice undergoes no entity superadded to it beyond its own proper entity — which is a quality, as I noted above. Therefore the same is to be affirmed of a significative voice. The antecedent is open to everyone. The consequence is proved: the voluntary imposition given to a voice to signify cannot be something real absolute or relative. For men at their discretion use the same voice and the same sign for different things to be signified — sometimes they note, sometimes they obliterate; now they innovate, now they abrogate — so that the comparison of voices to leaves on trees, now growing, now falling, is not incongruous. But the same real thing cannot undergo so many opposed real entities — absolute or relative — dependent on human will. All the more because it is not plausible that the will should cause something real and physical in voices by means of free imposition. For such a caused being would be either a free or a natural effect. Not the latter: because anyone, without knowledge of the free imposition, could naturally arrive at knowledge of all significative voices — and thus voices would not be conventional. Nor the former: because from a free principle a natural effect does not issue — just as a natural effect does not proceed from a natural potency freely — as I showed elsewhere with Scotus.

Assertion II. No intrinsic power is contained in a significative voice that causes a concept in the mind of the hearer. This is Scotus's position (*ibid.*) and follows from what was said in the preceding assertion. The same Doctor argues for it thus: the same principal and instrumental causes, remaining the same, natural, sufficient, and unimpeded, always produce the same effect — according to the common saying: "the same remaining the same always does the same." But if a Latin speaker utters Latin words before a Greek who is ignorant of the Latin language, the principal and instrumental cause is the same as if he were speaking to a Latin speaker or to a Greek who knows Latin. Therefore the same effect would be produced — which is the perception of the Latin speech. And hence the Greek ignorant of Latin would perceive the Latin discourse just as the

Latin or the Latinate Greek does; and any individual would be accomplished in all languages — which is false and absurd.

Furthermore, that power inherent in the voice and causative of the hearer's concept is natural, since it emanates from a natural cause and resides in it. But natural things are the same for all, as I asserted (*art.1.huius q.*). Therefore if that power were admitted as contained in a voice, the voice would not be a conventional significative — which conflicts with the cited place. The Doctor exemplifies this with the circle of laurel or some other thing hung before a house to signify wine for sale — in which, on account of that signification, no quality is posited as newly produced. So likewise, in a voice, no real entity is to be placed on account of the signification in act first imposed upon it. The same, he says, is to be held about the price of a coin and other signs significant from human institution — as Scotus says (*in fine q.5. §. Ad 1. L*).

Assertion III. The signification of a voice is a being of reason caused or left behind in it by the institution of the imposer. This is expressly taught by Scotus (*2.Reportat.dist.42.q.4. §. Ad aliud dico*; and *4.dist.1.q.2. §. De 2. a little after H*). It is proved as follows. First: voices are considered by logic as second intentions — from Tataret (*Tract.1.summularum & 1.perih.q.2.scibili 1*) who affirms that the name formally taken is a second intention attributed to a significative voice conventionally. But second intentions are beings of reason according to common consensus. Therefore the signification of a voice is a being of reason. The major can be corroborated: for logic per se scrutinizes nothing real, since it is a rational science — as I said (*lib.1.q.2.art.6*). Second: what has being only through the intellect is a being of reason. But the signification of a voice has being only through the intellect. Therefore it is a being of reason. The major is evident from the definition of a being of reason hinted at (*lib.1.q.3.art.5*). The minor is evident: for actual signification does not belong to the voice itself except through the act of the institutor — as the Doctor teaches (*4.praealleg.*) with these words: "signification is a sign from institution." Such a relation does not arise naturally from a foundation: for even if in the thing there is an aptitude for signifying the signified effect, yet actual signification does not belong to it except through the act of the imposer. Third: the comparison of one to another through the intellect's operation is a being of reason — from the same Scotus (*cit.*). But the signification of a voice is a collation of one to another — namely, the comparison of sign to signate — as the Doctor adds (*q.5. of the proximately cited place, ante §. Ad 1.*). Therefore the B and C follow. Add that things not existing are signified by voices — whether past, as Adam, or future, as Antichrist. But a relation is not real when the terminus does not actually exist, as is clear from what was said in the question on relation. Therefore nothing real exists through the signification of a voice. Hence our two Juniors certainly decline from Scotus (*disp.2.q.2*) when they assert that the signification of a voice is only a real extrinsic denomination derived in the voice itself from the will of the first institutor; then they add that absolutely this extrinsic denomination is not to be

explained as a being of reason. But as is clear from the cited passages, Scotus openly teaches that the signification of a voice is a being of reason — which they seem to sniff afterward (*disp.3.q.6.artic.1*) though there they deny that an extrinsic denomination is a being of reason.

Furthermore, when the mind of an Author is known through the words of that same Author, it is not to be drawn toward an alien position — as Scotus warns about Aristotle's positions (*1.dist.8.q.vlt.& quol.7*). But Scotus plainly teaches that the signification of a name is a being of reason, as the cited passages show. Therefore this other position is not to be attributed to him, as the cited recent authors do.

You will say: Scotus (*in 4.cit.q.5*) speaks doubtfully, adding that little word "perhaps" — which is not the word of one asserting but of one in some doubt. And so the cited Doctors do not expressly contradict Scotus. I say: even if in that place Scotus adds that doubtful particle, nonetheless a few lines later he adds that such signification of a voice is the collation of sign to signate — which, it is evident to students of Scotus, is a being of reason (*in fine eius q. & q.2.eiusdem operis*). And in the *Reportata* just cited he plainly affirms this with these words: "Therefore nothing new arises from imposition except a certain order, which is a relation of reason."

Objection I. A voice is significative of a thing without the operation of the intellect. Therefore the signification of a voice is not a being of reason. The antecedent is proved: the voice "lion," for example, uttered by anyone, signifies a lion — even if the intellect does nothing concerning it. Therefore signification of a voice is not a being of reason. I deny the antecedent. To its proof I say with Scotus (*4.dist.1.q.2* sub H) that something is included in the voice that designates a being of reason — namely, "sign from institution." For this relation does not follow the foundation from the nature of the thing. Even though the aptitude for signifying the signified effect is on the part of the thing, yet actual signification belongs to it through the act of the institutor. From these it follows that, although not all who utter a significative voice form a being of reason — as is clear from (*1.dist.22.q.un.§. Ad quaest.premitto*) regarding a parrot producing human voices — yet the institutor and his author, in imprinting signification upon the voice, forms a being of reason.

Objection II. If the signification of a voice — which is required from the imposer — is a being of reason, then when the imposer and his imposition have passed away, no signification of the name will any longer remain. But this is plainly false. Therefore the signification of a name is something real that persists after the death of the imposer. I respond by denying the sequel of the major. The reason for the denial is that a voice is a commemorative sign — which is of a past thing. Hence, though the institutor has departed from life, the name and its signification are nonetheless not abolished — as long as its use

persists — just as is also clear from the price of a coin and many other things that retain their same value and force even after their authors have died.

Objection III. To know something, its formal account — by which it is formally constituted in being — must be known. But signification is the formal account of a significative voice. Therefore to know it, its signification must be known. But we hold the signification of a voice to be a being of reason. Therefore, to know a significative voice, it is necessary to know a being of reason — which is known to few. Yet the signification of a voice is known to all by whom it is in use.

Confirmation: children learning grammar know names and their significations, but perceive no being of reason whatsoever, since it is a most difficult thing to know. Therefore the signification of a name is not a being of reason.

I respond that the major is true of quidditative, perfect, and evident knowledge — not of knowledge acquired through use and the custom of a common sign invented by some author and received by the community, as is the knowledge had of a significative voice, which both the learned and the unlearned acquire for themselves. Therefore to acquire this knowledge, knowledge of a being of reason is not necessary — just as to know a man in some way, a clear and evident knowledge of him is not required; it suffices that a rational animal is signified by the common custom of the name "man." By the same token the confirmation is answered — which can in some way be illustrated from the case of trainable animals, especially the dog: if a dog is accustomed, when it hears and the word "bread" is repeated, to have bread offered to it several times, it approaches the one who says such a word; and sometimes, when the word "bread" is merely heard and bread is not offered, it still comes to whoever utters this word. And when it hears the word "stick," it retreats. But the dog neither recognizes nor does any being of reason — as will be shown in the book on the soul.

Objection IV. There are some who at times, from the doctrine of others, learn things that had never occurred to them — as experience testifies. Therefore it is not required in the hearer, as the Doctor (*in utroque loco cit.*) holds, that there be habitual knowledge of the things about which the speaker is speaking. I respond: granting the antecedent, to the consequence I say that Scotus is to be interpreted of those things that are understood by a direct act — not those that are by a reflexive act, as the Doctor lucidly expounds (*q.3.univers.*). Or say it is to be interpreted of incomplexes, for which a species is necessarily required in the hearer, so that the hearer may perceive what the speaker says. But the argument proceeds about complexes, for whose knowledge in the hearer is not required, so that what the speaker says may be received. For the intellect has such power that from perceived incomplexes it forms complexes, and from these draws good or bad discourses. And although not every intelligible object moves the intellect to knowledge of itself per se or through its own species, it suffices if the intellect is occasionally excited by a thing outside to acquire for itself knowledge of any object whatsoever — as the same Doctor writes (*in fine q.4.univers.*).

Question III. On the Essence of the Proposition and Its Species.

Article I. Whether the Proposition Is a Being of Reason.

What and how many kinds of proposition there are is clear from (*Epitome lib.2.q.2.art.1* & 2) and from (*1.q.huius lib.art.un.*). There remain in the present question these things principally to be investigated: whether the proposition is among beings of reason — which is to be discussed in this article. Then, whether the proposition is a simple quality. Again, whether the apprehensive proposition differs from the judicative. Then, what the division of the proposition into affirmative and negative is. We set about examining and establishing these in the following articles.

On this article, according to the threefold number of propositions — mental, vocal, and written — three particular opinions are reported by recent philosophers. One is of those who think that every proposition — whether mental, vocal, or written — is a real being, which Blancanus (*disp.1.de enunt.sect.1*) expressly defends. And perhaps those who assert that the object of logic is a real being — whom I rejected (*lib.1.q.3*) — do not differ from these. Another is of others — among whom is Malius (*disp.de oratione q.2*) — who suspect that the mental proposition is indeed a real being, but not the vocal and written. The third is the common one of the others, who teach that any of the aforesaid propositions is a being of reason. Scotus hints at this (*q.3.univers.* a little before §. *Ad rationem*, and §. *Vel potest dici*; and *q.8.praedicam.* §. *Ad quaest. dici potest*). And it is entirely consonant with the principles of the same Doctor. For the comprehension of this difficulty, what I wrote (*lib.1.q.3.art.3*) on active and passive acts of the intellect — the former being the object of the science of the soul, the latter of dialectic, as I noted in the cited place — is relevant.

Assertion. The proposition — whether mental, vocal, or written — is a being of reason. This is clearly deduced from Scotus (*ubi supra*). It is proved as follows. First: such as are the parts of which a whole is constituted, such are those parts — that is, if the whole is real, its parts are real; if the whole is substantial, its parts are substantial. But the logical whole is a being of reason — namely the syllogism or mode of knowing, as is evident from what was asserted (*lib.1.q.3*). And one of the parts of a syllogism is the proposition, since a syllogism is composed of three propositions, among which the proposition exists — as I explained (*lib.3.Epitomes q.1.art.1*). Therefore the proposition is a being of reason.

Second: every passive collation of one known object to another known object is a being of reason (*ex 4.dist.1.q.2*). But the proposition is a passive comparison of predicate to subject and conversely — as is clear from (*1.dist.23.q.un.* ante B). For the extremes of a proposition are compared to each other — whether they agree

or disagree. From this arise affirmative or negative, true or false propositions — as I showed (*lib.2.Epit.q.2.art.3*).

Third: what has real species and properties is a real being; and what has species and properties that are beings of reason is a being of reason. But the species and properties of a proposition are beings of reason. Therefore the proposition is a being of reason. The major is known. The minor is at hand: for the species of a proposition are affirmation and negation, and its properties are truth and falsity, and also opposition, equipollence, and conversion — which, being second intentions, are evidently beings of reason. Furthermore, of the vocal and written proposition it can be specifically urged that voices and writings are conventional signs — from what was said in the preceding question. And the Doctor asserts (*in 4.proximè cit.*) that a sign from institution is a being of reason. Therefore, since the vocal and written proposition is composed of names that are beings of reason, it is clearly inferred that the vocal and written propositions are beings of reason.

Objection I. An act of the intellect is a real being, since it proceeds from a real potency and cause. But the proposition is an act of the intellect, since it is the second operation of the intellect. Therefore the proposition is a real being. I distinguish the major: an active act of the intellect is a real being, granted; a passive act, denied — in the way I made clear (*lib.1.q.art.praealleg.*).

Objection II. What is composed of real parts is a real being. But the proposition is composed of real parts. Therefore it is a real being. The major is evident. The minor is proved by induction: the mental proposition is composed of real concepts; the vocal proposition of voices, which exist on the part of the thing and are really uttered; and the written proposition of written terms, which are also real beings. Again, signification and truth — which belong to the proposition — are real. Therefore the proposition is not to be removed from the list of real beings.

Granting the major, I deny the minor. To its proof I say that the mental proposition is constituted from concepts — not indeed active ones, but passive ones, which from what has been said are beings of reason. As for the vocal proposition being constituted from real voices, and likewise the written from real writings taken materially — granted. Taken formally, denied — as is clearly established from the preceding question. To what is added about signification — natural signification is admitted; free signification is rejected. Likewise, truth of the thing is granted; truth of the intellect and sign is denied — as will be plain in the following question. See Orbellus (*6.Met.cap.2*).

Article II. Whether the Proposition Is a Simple Quality.

That the vocal and written propositions are composite is held for certain by all: for the vocal proposition is composed of spoken voices or names, and the written of letters and characters. The entire difficulty is raised about the mental

proposition — whether, just as those aforesaid are composite from voices and writings, so this one coalesces from partial notions of subject, predicate, and copula.

On this matter, I read two extreme positions of philosophers. The first is that of Soto (*lib.2.summularum*), Hurt. (*disp.7.sect.2*), and Arriaga (*ibid.disp.6.sect.4.concl.*), who affirm that the mental proposition — whether categorical or hypothetical — is a simple quality. Ponce (*disp.19.q.4*) concurs. The latter is defended by John of Metz (*1.perih.q.3.dub.3*), Mayr (*1.Post.cap.1.fol.62*), Ruuius (*q.4*), and most others there, asserting that the mental proposition is a composite quality. And the Coimbrans (*q.4.art.3*) confess that this is more conformable to the common sense of the Ancients — which Scotus (*q.1.primi Perib. in solutione 3*) and Tataret (*ibid.q.1.dub.1*) plainly indicate.

Note I, that the first operation of the intellect is called simple — not only with respect to its entity and principle, but also with respect to the objects apprehended. This is because the terms apprehended through it are simple and incomplex, in the way explained elsewhere. To each simple term apprehended by the intellect there correspond simple concepts of the intellect itself — these are called objective concepts, while the formal concepts are those of the intellect itself. But the second operation of the intellect is called composition and division: composition, because the apprehended terms are united to each other and composed — for one known object is posited with another known object; division, because these terms are divided and separated from each other. Concerning these simultaneously united or divided things, the intellect renders its judgment and pronounces its sentence like a judge, in one direction or the other — seeing these to agree and those to disagree. If, then, the terms agree with each other, the judgment the intellect renders concerning them is called affirmative judgment; if they are mutually repugnant, the judgment of them is called negative — and the former is commonly named affirmation and assent, the latter negation and dissent. Scotus plainly teaches all of this (*1.dist.3.q.4.¶. Quantum ad 2. C and D*).

Note II, that our intellect cannot understand many things simultaneously. The reason is that through one species it can only understand one object; and because of its finitude and weakness it cannot simultaneously attend to several objects represented through several distinct species. Hence arises the necessity of composition and division: for since we cannot apprehend the essence of a thing and simultaneously all its properties and powers, it is necessary that we have distinct apprehensions corresponding to the distinction of things to be apprehended. Therefore what agrees with a thing must be conjoined, and what is repugnant to it separated — and in this task consists the second operation of the intellect, which is founded in the unity or distinction of things. Hence I observed above that composition and division are so called.

Assertion. The mental proposition is not a simple but a composite quality. This is gathered from Scotus (*praealleg.*). It is proved as follows. First, from Aristotle (*1.Perib.cap.1*), who calls the second operation of the intellect composition; and (*c. de verbo*) adds that the verb composes the subject with the predicate, and that a proposition is produced by composition and division of the intellect. Furthermore (*3.de anima cap.6.T.21*) he declares that the second operation of the intellect is composition of concepts. Hence it has taken root among later philosophers to call the second operation of the intellect, composition absolutely. But Vorreillon (*1.dist.8*) especially notes that composition is opposed to simplicity. Therefore, since composition of concepts belongs to the mental proposition according to Aristotle, it undoubtedly follows — in Aristotle's view — that the mental proposition itself is a composite quality.

You will say, with Toletus (*q.19.tertii de anima*) and the Coimbrans (*praecit.*), following St. Thomas and others cited by them, that Aristotle is to be explained of composition and objective concepts — and hence the passages cited from him neither attack nor refute the first position, which removes composition and formal concepts from the mental proposition. On the contrary: to objective composition and objective concepts correspond formal composition and formal concepts — since these arise from those, just as knowledge partially proceeds from the object according to the common position of philosophers. Therefore if objective composition is conceded to the mental proposition, formal composition is equally not to be taken away from it. And this seems especially to have a place in the doctrine of Thomists, who distinguish the knowledge of Angels from the knowledge of men on the ground that the former is simple while the latter is composite. But this difference is not to be understood of objective composition — since both are directed at composite objects. Nor of formal apprehensive concepts, as the Coimbrans interpret (*artic.3. in fine solutionis primae*) — since through the same (*q.4.art.1*) the apprehensive proposition does not differ from the judicative. Therefore our assertion is true both of apprehensive and of judicative concepts.

Second: what consists of parts is composite. But the mental proposition consists of parts. Therefore it is composite. The major is evident. The minor is shown: just as vocal noun and verb are parts of the vocal proposition, so mental noun and verb are parts of the mental proposition. For the vocal proposition is a sign of the mental proposition, and voices are signs of concepts — from the beginning of the first *Periher.* Third: from those things something is composed into which it is resolved — as is clear from a mixed body, which is composed of four elements into which it is resolved according to common opinion. But the mental proposition is resolved into predicate and subject as its parts, and the verb as the bond and copula of both — as I explained at length with Aristotle (*1.Priorum, 1*) (*in Epitome lib.1.q.1.art.2*). Therefore the proposition is a composite quality.

Fourth: the intellect cannot judge that one thing agrees with another unless it apprehends those two things. For apprehension precedes judgment, which is not rendered about unknown things. Therefore judgment includes two apprehensions of two things. And the proposition — which coincides with judgment — coalesces from those two apprehensions as from parts. The consequence is proved: because the intellect either perceives or does not perceive — in the judgment that presupposes apprehensions — the things about which it judges. Not the latter, since it could not judge about them. Therefore the former — and hence judgment is composed of two apprehensions. Since this is identified with the mental proposition, it is clearly deduced that the mental proposition is not a simple quality.

Objection I. The proposition is a judgment by which the intellect directs itself to judge the entire proposition, without tending toward its parts. For the force of judgment is such that it can reach the whole, even if it does not reach its parts — especially in the school of Scotus, who affirms that the whole is really distinct from its simultaneously united parts. Therefore the proposition is a simple quality. I deny the antecedent. For it cannot be that the intellect perceives the whole while its parts are not perceived — otherwise its intellection would be false, understanding as simple what is in reality composite, especially since the whole essentially depends on its parts — as will be said in physics. Therefore, since the proposition is — from what has been proved — composite, consequently the intellect is directed toward it as composite.

Objection II. If from an objective composite proposition a composite formal proposition is argued — as I inferred above — then every objective proposition would be composite, since it is produced from two objects that are really, formally, or rationally distinct — of which one gets the name subject and the other predicate. And thus "God is immortal," "God is infinite," and other propositions formed about God would be composite — and God himself would not be free from composition, the opposite of which I asserted (*Tract. de Deo uno disp. 1*). Therefore it must not be denied that the proposition is a simple quality. I respond that the sequel holds only for those things that undergo composition — that is, objects that in some way are composite or compossible with each other — but not for God or for things that are said of him, since God is immune from all composition and compossibility. And although in propositions about God and his attributes there are extremes — subject, predicate, and verbal copula — nonetheless, because one of them does not stand in the mode of act and another in the mode of potency — which is required for true composition — therefore no objective composition is inferred in the aforesaid propositions; but only that their extremes are distinguished by some one of the three distinctions mentioned above.

Whether God forms true propositions of himself is disputed by some: Hurt. (*adductus in initio art.*), following the Nominalists, affirms; others deny — and

rightly, since God, by reason of his supreme simplicity and infinity, is free from the composition required to form propositions, which in a created intellect involves imperfection.

Objection III. Aristotle (*3.de anima T.23*) speaks these words: "When the intellect that has parts, both as a whole and as something one, contemplates it, it then understands that whole in one and the same time." Therefore the intellect reaches by a single act the whole proposition at the same moment.

Confirmation I: the will by a single volitive act tends toward many things simultaneously united and composed, themselves willed by the will itself.

Therefore the same is to be affirmed of the act of the intellect with respect to the proposition. Confirmation II: what an inferior potency can do, a superior potency can also do — as will be evident in the book on the soul. But the imagination has a simple act of imagining about different and composite things — as is proved in dreams. Therefore this is not to be denied to the intellect, which is a superior and more eminent potency.

I reply that Aristotle there is speaking of a divisible whole — namely a continuum — which can be called divisible in two ways: actually and potentially. If it is conceived by the intellect as potentially divisible into these and those parts, it is understood successively. But if it is conceived as actually divided into parts, it is understood and apprehended simultaneously by the intellect by an apprehension pertaining to the first operation of the intellect — which the same Philosopher calls the distinction of something from something, after he has dealt with the first operation of the mind. To Confirmation I: granting the antecedent, the consequence is denied. The reason of disparity is that — quite apart from the fact that the intellect has three distinct operations not adapted to the will — knowledge is partially caused by the object, but volition is not, being elicited only by the will. Therefore from a complex object there arises complex, or composite, knowledge; just as from an incomplex object, incomplex knowledge arises. Or say, admitting the parity: since the will according to Scotus is a collative potency, it can have concerning the things willed a complex act of willing a complex. To Confirmation II: the major can be granted and the minor denied, with certain Scotists who assert that the imagination has a certain power of conjoining one object with another — which is to be examined elsewhere.

Objection IV. If the proposition were composed of several partial notions, two numerically distinct accidents would simultaneously inhere in the same subject — which Aristotle (*4.Met.T.14*) denies. Therefore the proposition does not appear to be a composite quality. Granting the antecedent, the consequence is denied.

To Aristotle I say that he is speaking of augmentable and remissible accidents, whose termini are simultaneously impossible — not of intentional accidents and others of this kind, which — from what will be proved in the metaphysical question on accident — can be simultaneously in the same subject.

A further instance: Scotus (*4.dist.1.q.2.* O, at the end) says that second intentions are formally one most simple act. Therefore, since the proposition, syllogism, and the like are second intentions, they are not composite qualities. To this it can be answered by saying that the Doctor is speaking of second intentions pertaining to the first operation of the intellect, not of the others about which we are now speaking — though Tataret, pressed by this instance, remains undecided.

Article III. Whether the Apprehensive Proposition Differs from the Judicative Proposition.

Gregory (*q.1.prologi*) and the Coimbrans (*q.4.art.1.huius operis*) — acknowledging no difference between the apprehensive and the judicative proposition — hold that every mental proposition is judicative. The opposite is commonly held by the Scotists from Scotus (*2.dist.1.q.3.¶. Tenentes, circa D*) and by the Nominalists with Ockham (*q.1.prol.*), who teach that the enunciative proposition really differs from the judicative.

Note that apprehension of the intellect is twofold: one of simple terms, pertaining to the first operation of the intellect and commonly called simple apprehension — about which there is no doubt in the present question, since in it there is neither truth nor falsity, nor affirmation, nor negation, nor any judgment. The other is of complex terms, which are indeed perceived by the intellect but not judged — though in these there is truth or falsity — as when we apprehend that stars are even in number or that a circle is a square, without pronouncing our verdict on these. This is called the enunciative apprehension.

Assertion. The apprehensive proposition is plainly distinct from the judicative. This, as coming from Scotus (*praecit.*), is taught by the most learned Bargius (*1.dist.1.q.3*) and followed by Mayr (*1.Post.fol.61*). It is proved as follows. First: everything prior is distinguished from its posterior. But the apprehensive proposition precedes the judicative. Therefore the latter is separated from the former. The major is a common saying of philosophers and theologians. The minor is supported: we first mentally compose extremes with each other before we render judgment on them — for judgment concerns united and complex things, by which we judge that their extremes agree or do not agree with each other. Therefore, since composition — which is the second mental action — precedes judgment, and composition and proposition coincide, it is clearly deduced that apprehensive apprehension is distinguished from judicative.

Second: contradictory propositions are simultaneously apprehended by us, as are indifferent and ambiguous propositions — as "whether the heavens are incorruptible," "whether a mixture is composed of four elements or not." But two contradictory judgments about the same subject simultaneously and in the same intellect are incompatible. Therefore complex apprehension is truly separated from judgment. The major is confirmed by the authority of the Philosopher

(2.*de anima* T.145 and following; and 3. of the same T.28) who says that no sense and no intellect compares extremes unless it apprehends them — and such an apprehension is without judgment, since to the extremes thus apprehended we do not assent. In roughly the same way, the Doctor adds, as we speak of understanding what we believe to be true and not understanding what we believe to be false — though we apprehend the latter.

The Coimbrans reply, with certain authors whom they cite and whom Suárez (*disp.8.Met.sect.4*) imitates, that the aforesaid are not true propositions but simple apprehensions of a voice, of which one is conceived not together with another but one after the other. On the contrary: what possesses truth of the thing or falsity are true or false propositions — as is clear from the definition of the proposition, of which truth or falsity, if not the essence, is at least the property, as I made plain (*in Epitome lib.2.q.2.art.2*) and Tatarct (1.*Perib.q.3.Scibili* 3) defends. But apprehensive propositions possess truth or falsity of the thing about which they make a proposition — as two contradictory ones apprehended together: "stars are even in number; stars are not even in number." Likewise: "a circle is a square; a circle is not a square," and similar ones — which are indeed apprehended by us, but not judged. Therefore they are not simple apprehensions of a voice but true and genuine propositions of things.

Then: doubtful and ambiguous propositions are proper propositions — since although they are known as doubtful by us, yet they are in themselves true or false. Such propositions are only apprehensive, since we render no judgment about them — as the Coimbrans themselves not infrequently leave both sides of a proposed question under doubt. Add that it sometimes happens that a proposition is in itself true while the judgment about it is false. Therefore apprehensive proposition is to be distinguished from judicative.

Finally: it often happens that we form apprehensive concepts about things to be done, yet we are not willing to judge about them — either from their difficulty or from fear of offending someone. Nor is it to be passed over that a vocal proposition is a sign of a mental proposition, and we sometimes express a vocal judgment opposed to the mental proposition — which is express lying. Or, with no mental judgment had, a judgment is uttered in words about certain matters. Therefore if a judgment is uttered in voice, while in mind there is only apprehensive proposition about the same things, it is plainly conceded that an apprehensive proposition distinct from a judicative one exists.

Objection I. The words Aristotle uses to name the second operation of the mind signify that every proposition is judicative. Therefore there is no apprehensive proposition distinct from the judicative. The antecedent is proved: in the book of the categories (*c. de substantia*) the same Philosopher calls the proposition *opinion*, and opinion — since it concerns probable things — includes judgment. And (6.*Eth.cap.3*) he calls it an act of science, which likewise is not distant from judgment. And (3.*de anima* in the cited text, and in this place) he calls it

composition and division, and divides it into affirmative and negative, true and false. Therefore according to Aristotle, the distinction of proposition into apprehensive and judicative is not to be introduced into the schools.

I respond from the cited places that the Philosopher teaches the judicative proposition as more known and more frequent, and distinguished by more names — without denying the apprehensive proposition, even if he did not so expressly state it, just as he did not state the judicative one. This Aristotle does also in many other matters — as Vallone (*Tract. Formal.*) notes. And (*3. de anima T.26*) he defines the proposition prescinding from the apprehensive and judicative.

Objection II. Judgment is nothing other than the affirmation of one thing of another or the negation of one from another — according to St. Thomas (*q.1. de veritate art.1*); or according to Scotus (*4. dist.47. q.1. §. Respondeo infra A*): "judgment is the certain apprehension of something through another." But one who unites and connects predicate with subject affirms one of another; and one who removes or disjoins predicate from subject negates something of another. For to affirm or to negate is to judge, and affirmation or negation is judgment. Therefore only the judicative proposition is the genuine proposition. Granting the major, I distinguish the minor: if a proposition is perceived by the intellect as something complex, without determining anything about it, denied; but if it is perceived by the intellect as a complex thing, determining something about it, granted — which is sufficiently proved and confirmed above.

Objection III. Where there is a passion, there is the essence from which that passion flows — since they are really identified. But truth or falsity is the passion only of the judicative proposition. Therefore beyond the judicative, no other is to be reckoned a proper proposition. The major is evident. The minor is proved: one who judges says something true or false; not so one who apprehends. Otherwise God — who apprehends all propositions — could say something false, which savors of enormous falsehood.

Granting the major, I deny the minor. To its proof, I do indeed grant that one who judges says something true or false; but I deny that without judgment one cannot apprehend something true or false. For one who only apprehends is not said to know or to err, because he does not determine himself toward either side of holding or rejecting. Thus if God apprehends something false, yet his apprehension is not false. For there is not an insignificant difference between apprehending something false — which is in itself false — and being stained with a false apprehension. The first belongs to God; the second is contrary to God.

Article IV. Whether the Division of the Proposition into Affirmative and Negative Is a Division of a Genus into Species.

John Mayr — most acute philosopher and theologian, auditor of the Subtle Doctor — (*Tract.1.summularum*, at the end, on the affirmative and negative proposition) recounts from Boethius (*1.Perth.*) two opposed positions on this article. The first is that of Alexander (*1.priorum cap.1*), the Philosopher (*1.Post.c.21*), and others, who think the aforesaid division is an analogical division into its analogates. The second — which the same Mayr testifies was common in his time — is defended by Porphyry (*1.priorum cap.1*), Simplicius (*cap. de quantitate*), St. Thomas (*cap.4.primi Perih.*), John of Metz (*q.3.dub.1*), and is hinted at by Scotus (*1.post-ante et post. §. Ad quaest. dicitur*) and others from the Ancients and Moderns, who with one voice affirm that such a division is of a univocal into its univocates, or of a genus into its species.

Note I, that Scotus (*mox alleg.*) reports from Averroes three arguments of Alexander to prove that the affirmative proposition is prior to the negative. The first is drawn from the side of the word (*vocis*) and is called priority of simplicity of expression. For the affirmative word is simpler than the negative: negation is produced from affirmation with something added to it. The second is from the side of the thing: even if in particular things non-being precedes being — as is evident in the generation of sublunary things — yet absolutely, being precedes non-being, as the being of the first cause precedes the non-being of a second cause. The being of the first cause precedes the non-being of a second cause — perhaps keeping this in view, Aristotle says "act is prior to potency" (*9.Met.13*). Since affirmation signifies being and negation non-being, the former must precede the latter. The third is from the side of the intellect: because the intellect composes before it divides — which is to say, the intellect affirms before it negates. Others add a fourth: priority of reason — for through affirmation we know negation, and through habit privation, as is evident (*1.Post.cap.21*; *1.dist.41.q.un.*; *dist.47*; and the *Tract.de scientia Dei disp.2.q.5*).

Note II from Tataret (*in praedicam.cap. de quantitate q.un.scibili 1*) that the species of a genus can be compared in two ways. In one way among themselves — and in this way one is prior and more perfect than the other, as man than lion. In another way with respect to the genus, which is predicated of its species — and in this way the account of genus is univocal to them, and is predicated of them immediately and equally. This doctrine Scotus brings forward (*q.4.praedicam. §. Propter hoc*) with these words: "In every genus there is one first, which is the measure of the posterior ones (*ex 10.Met.T.22*); perhaps however the case of analogical voices and of genus with respect to species is not altogether similar — because although the species of a genus have an order among themselves according to more perfect and less perfect in being, yet in participating in the account of genus they have no order, since they participate equally primarily." For genus is predicated equally immediately of the first species dividing it — and then there is no difference in primacy between those predications: "whiteness is a color," "blackness is a color" — even though comparing whiteness and blackness with each other, whiteness is more perfect than blackness.

Assertion. The division of the proposition into affirmative and negative is univocal. This is touched on by the Doctor (*loco cit.*) and (*1.Priorum q.3*). It is proved: that is univocal which is equally participated by its inferiors. But the name and account of proposition are equally participated by the affirmative and the negative. Therefore the aforesaid division is univocal. The major is clear from the definition of univocals. The minor is shown: the account of proposition precisely taken is "the utterance of one of another" — as I explained (*in Epitome lib.2.q.2.art.2*). But this univocally belongs to the affirmative: for each is an utterance of one of another, though they are distinguished according to their proper differences — one being affirmative, the other negative. Furthermore, proposition abstracts from truth and falsity — as Scotus (*4.dist.5.q.2.¶. Aliter sub V*) elegantly teaches — and equally from affirmation and negation; for the divided abstracts from the dividing members into which it is divided. But what is common, abstracted from its inferiors, that agrees with them according to the same name and same account, is univocal. But proposition is this with respect to the affirmative and negative: for each proposition enjoys the same name and common account of proposition. Therefore that partition of proposition into affirmative and negative is univocal.

Objection I. Aristotle (*lib.1.huius operis cap.4*) makes the affirmative prior to the negative. And the reason is that affirmation carries composition and negation carries division; but composition precedes division. But what is prior to another is not univocated with it — since univocals participate equally primarily in the common account by which they are called univocal. Therefore the aforesaid division is not to be reckoned univocal. I reply by explaining Aristotle: the affirmative is prior in the common account of proposition — denied; in the peculiar and specific account of negation — as I made clear in (*Note II*): granted.

Objection II. A division of some essential whole into accidentals is not univocal — as is clear from the division of a subject into accidents. But the aforesaid division is of an essential whole into its accidents — namely of proposition into its qualities, since affirmation and negation are its qualities, as the Philosopher hints in this book. And they seem to differ as a white man and a black man, who do not essentially differ (*ex 10.Met.cap.25*). Granting the major, to the minor I say that affirmation and negation are essential qualities of a proposition — as the divisive differences of a genus and the constitutive differences of species are essential differences, which are sometimes called qualities — as I touched on (*in Epit.lib.1.q.4.art.7 & lib.2.Log.q.5.art.1*) from Scotus (*3.dist.1.q.1.art.3. D*). The interpreters of Aristotle explain him in this way.

Objection III. One of the laws of good division is that the divided not exceed the dividing members — as I explained (*in Epit.lib.2.q.7.art.1*). But the proposition — the divided in this partition — surpasses the dividing members. For some proposition is found that is neither affirmative nor negative — as "no lion is not an animal" — which is not negative, on account of the double negation added to

it; nor affirmative. For if one negation can make a proposition negative, with even more reason two negations can do so. For if one man can carry a weight of ten pounds, more easily can two men carry that same weight. Granting the major, I deny the minor. To its proof I say that the proposition is affirmative, because two negations affirm. To the disproof of this, a distinction is to be applied: if they mutually assist each other, granted; if one impedes the other, denied. And this happens with two negations: the first negation impedes the second; for since negation is of a malignant nature, it destroys whatever it finds after itself and posits the opposite. Hence it follows that an even number of negations before the verbal copula produces an affirmative, and an odd number a negative — as Mayr (*cit.*) and Titelmans (*lib.3. de enuntiatione cap.10*) diligently note.

Objection IV. Affirmation and negation belong to the first principle (*ex 4.Met.T.15*): "Of everything whatsoever, affirmation or negation is true." But this first principle is a common transcendent, to which neither the account of genus nor of species can belong. Therefore the aforesaid division is not a genus into its species. I respond that affirmation and negation are taken in two ways: in one way, with first intention — that is, for being and non-being — and in this sense they belong to the first principle and pertain to metaphysics. In another way, with second intention — that is, for the formal account of an affirmative and negative proposition — and in this way proposition, with respect to them, has the account of genus, and they pertain to logic — as Tataret (*1.Perih.q.1.dub.1*) rightly notes.

Question IV. On the Properties of the Proposition.

Article I. What Truth Is.

That truth exists is clearer than light. For it is attested frequently in sacred scripture — notably (*Deut.13*): "the thing investigated with truth"; (*Judic.16*): "revealing the truth of the thing"; (*Esdras 3*): "truth conquers all." Of which Christ the Lord provides great testimony (*John 18*) with these words: "For this I was born, and for this I came into the world, that I should give testimony to the truth." And (*John 16*): "When the Spirit of truth comes, he will teach you all truth." To acquire this truth — as worthy of all honor and love — philosophers spare no labor or sweat throughout the whole course of their lives, directing all their study and care to its investigation. Indeed, setting aside all other things, they embrace this one thing and love it above the rest. Hence that celebrated saying: "Socrates is a friend, Plato is a friend, but truth is a greater friend" — which is hinted at (*1.Eth.6*). Though — as one who has stripped herself of all advantage and looking with clear eyes at all things — many do not acquiesce to it, as the Apostle witnesses (*Roman.2*) and truth is hated, according to that common saying: "Truth begets hatred."

Since truth, from Bonetus (5.*Met.c.2*), is an equivocal name, and equivocals are to be distinguished — from Scotus (*Quol.1.¶. De primo A*) — a distinction must be used in examining it. First: Scotus (6.*Met.q.3*; 1.*d.2.q.2.¶. Ad arg. F*), Lychetus (*ibid.*), and Bonetus (*cit.*) affirm that truth is distributed into truth of the thing and truth of the intellect. Truth of the thing — also called truth in being and transcendental truth — is a passion of being, pertaining to metaphysics, of which the Doctor mentions (1.*d.3.q.4.5. Circa 4. sub N*). Truth of the intellect, or truth in knowing — which from (1.*dist.48.q.un.¶. Quamvis*) is the conformity of the act of understanding to the understood object — is divided into incomplex truth and complex truth (*ex 1.q.prologi.¶. Antequam sub M*). Incomplex truth is the conformity of the simple act of the intellect to a simple and incomplex object — when, namely, an incomplex object is understood just as it is on the part of the thing. Complex truth is the conformity of the intellect composing one thing with another, or dividing one from another, as it is on the part of the thing. The former pertains to the first operation, the latter to the second operation of the intellect. To the first is opposed ignorance; to the second, falsity is opposed. It is primarily this latter that we must examine in the present work — the former we relegate to metaphysics for examination. According to the multiple acceptance of truth, multiple descriptions of it are also given — as can be seen in the Archbishop of Aquis (1.*dist.19.propositione 2*) and Altenstaig (*in Lexico Theologico, verbo veritas*).

One is the philosophical definition of truth, given by Boethius: "truth is the adequation of the thing to the intellect." Another is that of Avicenna (1.*Met.cap.1*): "The truth of each thing is the property of being that is established for it." The third: "truth is quiddity purified and separated from all that is foreign." The fourth is elicited from the Doctor (*quad.18.art.3.¶. Contra ante T*): "truth is the conformity of what is affirmed to the existence of the thing." The second and third descriptions are adapted to incomplex and transcendental truth. The first and fourth apply to complex and logical truth. Correspondingly, falsity — insofar as it is contrary to logical truth — is described as the disconformity of what is enunciated to what is in the thing. Hence Scotus adds (4.*d.8.q.2.¶. Aliter ante V*; and *dist.50.q.6.¶. Ad argumenta K*) following Aristotle (*in praedicam.cap. de substantia & cap. de modis prioris*): from the fact that a thing is or is not, an utterance is said to be true or false.

Furthermore, from the same Doctor (*Quol. alleg.*) two kinds of truth are drawn: one immediate and indemonstrable — belonging to the principle; the other mediate and demonstrable — suited to the conclusion. And this is indicated by the same Scotus (1.*dist.2.q.3.¶. Quantum A*) with these words: "There are two acts of the intellect assenting to some true complex: the act by which it assents to some true complex on account of itself, as to a principle; and another by which it assents to some true complex on account of another, as to a conclusion on account of the principle."

You will say that Scotus elsewhere teaches that the truth of a conclusion does not differ from the truth of the principle — as Gadius (*fol.188*) notes and Lychetus (*1.1.8.q.4.q.*) explains with these reasons. Therefore there is no aforesaid distinction of truth, or Scotus is not self-consistent. I say that the Doctor only intends in the first sentence that the truth of a conclusion is not absolute and independent, as is the truth of a principle. As Lychetus (*nunc alleg.*) illustrates with the example of a whole — which, though according to Scotus it is something really distinct from the parts of which it coalesces, nonetheless essentially depends on them, as an effect on its intrinsic cause. So the truth of a conclusion is indeed distinct from the truth of the principle — upon which it depends — as will be clearer in the last book of this work.

Objection I. Truth is accommodated not only to things and the intellect, but also to sense — therefore the division into truth of the thing and truth of the intellect is insufficient. The antecedent is supported by the authority of Aristotle (*2.de anima T.63*), saying that sense of proper sensibles is always true. Granting the antecedent, I deny the consequence. To its proof I say that truth of sense is not distinct from truth of the thing and transcendental truth — since a sense is called true because it has a true representative species of a sensible object. Perhaps for this reason Bonetus (*nuper alleg.*) distributes truth into truth in the soul and truth outside the soul — such as the truth of sense. And the truth in signifying — which is accommodated to a name and a vocal proposition — can be reduced to this. The same is hinted at by St. Anselm (*opusc.de veritate*), who investigates truth in speech, action, will, intellect, sense, and in the essences of things.

Objection II. God is called truth (*John 14*): "I am the way, the truth, and the life." Orthodox faith is also called truth. Likewise, moral truth — of which Bonetus (*4.de Consolatione, prosa 3*) mentions, and the Doctor (*Quol.18*) nods — is not to be omitted. Again, other descriptions of truth are assigned — such as those found in Aureolus and Bonetus (*praecensiti*) — as when it is said that "truth is the conformity of the produced to the producing," or of the ideated to the idea, or of the exemplated to the exemplar. I reply: God is called truth in the abstract because he is the purest act, separated from all that is foreign — which can belong to no created thing, which always undergoes some composition. We are called truth, partly because it proceeds from God who is the supreme truth, and partly because it shows the way of truth and points to the true end. The other things that are added show that the aforesaid divisions of truth are not entirely exact and do not comprehend all truth — which I do not deny: I adduced them as more celebrated and worn, and as certain enumerations.

Article II. Whether Truth Is a Real Being or a Being of Reason.

There is no doubt among the Scotists whether truth of the thing — or transcendental truth — is something real positive. For since it is a passion of being, which according to the same Doctors formally differs from being itself —

as I showed extensively (*in Met.lib.2.q.2.art.2*) from Scotus (*1.dist.3.q.3* & *2.d.16.q.vn.* & *3.d.8.q.vn.* ante §. *Ad argumenta* sub E) — it consequently follows that it is numbered among positive real beings, or rather among the entities of being.

But the entire difficulty in this place concerns truth of the intellect. On this matter, various positions of the philosophers and their differences are recounted and refuted by recent authors, and most recently by the paired Scotists (*disp.10.art.3.q.2*). From these I select two principal ones to set forth and examine.

The first is the one that Mayr (*Tract.2.de propositione dub.6*) follows, and testifies to be common to the Nominalists — holding that truth does not differ from the proposition of which it is the truth, and universally that any truth of knowledge is not distinct from the act of the intellect. Hurtado (*disp.9.de anima, sect.3.subsect.4*) approves and champions this. The second is of others who — though by unanimous consent they teach that complex truth is something distinct from the proposition and from the entity of the act of the intellect, and that what formally constitutes truth is not something absolute but relative — nonetheless differ in that some, including our two recent members (*alleg.*), hold that truth of knowledge is formally a real relative being; while others hold it to be a relation of reason — thus Bonetus (*5.Met.cap.2*), Orbellus (*6.Met.cap.3*), and Dar. (*1.dist.19.q.5*), with whom Vasquez (*1.p.Tom.1.disp.75.cap.2*) and Blancanus (*disp.1.de enuntiatione sect.4*) agree.

What was said above is to be recalled — that truth is twofold: one incomplex, the other complex. The former concerns simple terms apprehended by the intellect; the latter concerns complexes composed or divided by the intellect with each other. About each the present doubt can be raised, which will be decided through the assertions to be set forth shortly.

Assertion I. Truth — whether incomplex or complex — is formally neither an act of the intellect nor a proposition. This is gathered from the Doctor (*4.dist.8.q.2.* post V). The first part is proved as follows. First: an act of the intellect is not considered by logic, but by the science of the soul — whose function it is to examine the faculties of the soul and their acts. The antecedent is proved abundantly (*1.1.q.2.art.3* & 6). Second: an act of the intellect is an absolute quality, as Scotus (*Quol.13*) shows copiously. But in the next assertion it will be proved that truth is formally a relative entity. Therefore truth is not essentially an act of the intellect.

Furthermore, what is essential to something cannot be removed while it remains — otherwise its essence would be removed, and yet it would not be removed since it would still persist, which involves an obvious contradiction. But the same act can change from true to false, as Scotus (*nunc allegato*) writes. Therefore truth is not formally an act of the intellect. All the more because this

is true: "the act is true" — but this is not: "the act is truth" — just as "man is risible" is conceded but not "man is risibility." The second part — concerning incomplex truth — is doubted by no one, since the simple terms concerning which incomplex truth exists are not, nor do they make, a proposition, unless they are united and composed by the intellect.

As for complex truth — there is a dispute against the Nominalists. The negative part is shown thus: no passion is formally that of which it is a passion — just as no effect is the cause by which it is produced. But truth is a passion of the proposition — as the Doctor affirms (*q.1.praedicam.*) and Hurt.

(*disp.4.Summularum, sect.1; disp.9.de anima sect.3.subsect.4*) does not dissent.

Likewise: what is in the foundation is not the foundation itself — as Scotus argues (*ubi supra*). But truth is in the proposition as in a foundation — as the same Doctor (*ibid.*) states. Therefore complex truth is not the proposition itself. Furthermore, the prior is not the posterior in the same order and series, as is evident. But the proposition is prior to truth, since truth arises from it — which Hurtado himself does not deny at the end of the cited subsection. Finally, this is not valid: "the proposition is truth" — but this is valid: "the proposition is true" — which equally I was arguing above concerning incomplex truth.

The Doctor (*praecit.*) adds that God could institute some expression that is not significative, at whose utterance by the minister God himself would assist, to cause an effect at the end of the utterance — in which case the expression would be stripped of truth or falsity. Therefore truth is not part of the quidditative concept of the proposition.

Assertion II. Neither of the aforesaid truths is an absolute entity — but each is a relative entity. This is Scotus's position (*1.dist.3.q.4.¶. Quantum ad 2. C; and 4.cit. infra V; and dist.49.q.4.¶. Iuxta I; and 6.Met.q.3.*), whom Tataret (*1.Perih.q.1.dub.3*) and Fonseca (*4.Met.cap.2.q.6.sect.2*) imitate.

It is proved as follows. First: every absolute is "toward itself," and every relative is "toward another." But truth is not "toward itself" but "toward another." Therefore truth is not an absolute entity but a respective one. The major is evident from the explanation of terms (*1.1.Epit.q.1.art.6 & lib.3.Log.q. de relatione*). The minor is proved from the definition of truth received by all: truth universally taken is the conformity of one to another. For if it is truth of the thing, it is the conformity of the thing to its principles; if truth of the intellect, it is the conformity of the intellect to the thing understood. But this conformity to another is formally a relation — as is clear from the description of relation. Therefore truth does not carry an absolute but a relative entity.

Second: every absolute is either substance, quantity, or quality. But truth is none of these. Therefore it is a relation. The major is clear from what was said (*lib.3.q.3.de praedicamentis*). The minor is evident by induction: for truth is not substance — divided into incorporeal and corporeal; nor quantity — which is

continuous or discrete; nor quality — whether spiritual or material (*ex q.de qualitate art.6*).

Assertion III. Incomplex truth — if it regards an actually existing object — is a real relation; but if its object does not actually exist, it is a relation of reason. This is expressly held by Bonetus and Orbellus (*ubi supra*), and deduced from the Doctor (*Quol.13.art.2*). The first part is proved: a real relation requires real extremes, really distinct, from which the relation itself naturally arises — as Scotus (*citat. sub L*) notes. But incomplex truth regarding an actually existing object has actually existing and really distinct extremes: the knowledge and its object — from which the relation of conformity arises — are really distinct. Therefore such truth — which is this conformity — is a real relation. The second part is proved: toward a terminus that does not have real being but only being in the intellect, there is a relation of reason — as Scotus (*ibid.*) argues, because a relation cannot have more true being than the terminus it regards; but a non-existing terminus has only being in the intellect, which is a being of reason. Therefore a relation terminated at it is a relation of reason.

Assertion IV. Complex truth is formally a relation of reason. This also the aforesaid authors teach — with whom Fonseca (*ubi supra*) is joined — and it is drawn from the Doctor (*1.dist.3.q.4.¶. Quantum ad 2. C*; and other places) against our two younger members (*disp.10.q.2.art.3*).

It is proved as follows. First: what has a being of reason as its foundation is itself a being of reason — for a real being cannot be founded on a being of reason, which is of the least entity. But the foundation of complex truth is a being of reason — namely the proposition or enunciation, as Scotus hints (*4.dist.8.q.2.¶. Aliter ante X*), and I clearly showed (*q.3.artic.1.huius lib.*). Therefore complex truth is formally a being of reason. Hence I am surprised at the cited recent authors, who in (*q.1.disp.10*) maintained that the enunciation is a being of reason — but now in (*q.2.art.3. of the same disp.*) affirm that the truth of the proposition — which is founded on it — is a real relation independent of any operation of the intellect. For why is truth posited as a real relation while the proposition — which coincides with the enunciation and from which truth proceeds — is a being of reason? For a being of reason producing a real being is the height of absurdity. Nor does it help them to say that the proposition is true before the operation of the intellect — since the proposition is a work of the intellect. Therefore complex and formal truth — which follows from it — is not had without the intellect's operation.

Second: a relation between rational extremes is a relation of reason, and conversely a relation between real extremes is a real relation. But the extremes of complex truth are beings of reason — namely subject and predicate. Therefore complex truth — which arises from them — is a relation of reason. Third: logic contemplates complex truth — as all confess. But it is established from what was said (*lib.1.q.3*) that logic contemplates second intentions, which

are relations of reason — since they are formed by the intellect comparing one to another object. Therefore the aforesaid truth is a relation of reason.

Objection I against Assertion I: an act of the intellect is the formal representation of an object as it is — for example, I form this proposition: "a lion is an animal," and through this act, the lion is represented as it is. Therefore such an act is conformed to the object; and since truth consists in the conformity of the intellect to the object, it follows that truth is formally the act of the intellect. Confirmation: either the act is essentially similar to the object or not. If the former, it is essentially true. If the latter, it is essentially false, since it is disconformed and dissimilar to the object. Therefore it seems that truth does not differ from the act of the intellect.

I reply: I concede that the act of the intellect is representative and expressive of the known object; but I deny that it is essentially the representation of that very object. For a man who has whiteness is indeed white, but is not whiteness. Similarly, I grant that the act is true — provided it is conformed to the object — but I deny that the act is truth, since it is not such conformity. To the confirmation I say that the act is true or false accidentally, on account of the truth or falsity of it — which is an accidental relation, as the Doctor (*in 4.cit.* a little before X) asserts.

Objection II against Assertion II: a perfection simply speaking is an absolute being — for it is better than it is not, itself — as St. Anselm states (*in Monologion cap.15*) and Scotus explains (*1.dist.8.q.1. §. Ad 1.1.*). But truth is a perfection simply speaking — for it belongs to God, who is not once named by the Holy Fathers — notably Hilary (*6.Trin.*) — "subsisting truth, first and supreme truth," as Fonseca (*4.Met.q.6.sect.2*) notes. All the more because Anselm (*cit.*) separates relative relations from perfections simply speaking; and in anything, it is better to be true than false — for a true stone is better than a false stone. Therefore truth is something absolute.

Confirmation I: truth does not depend on some real existing terminus — as real relation requires. For there are propositions of perpetual truth that prescind from all actual existence — from what will be said below. Confirmation II: this is a true proposition — "a chimera is a fictitious being" — which denotes no relative entity, since it undergoes no conformity. For comparison of measured to measure cannot be made in it (*ex 4.dist.1.q.1. G; and q.13. M*). The reason is that measure is prior to what is measured, but a being of reason is posterior to cognition. Therefore truth is not a respective being. Granting the major, I distinguish the minor: concerning divine truth, granted; concerning created truth, denied. As for what divine truth is, see Vulpes (*To.1.summa disp.10.a.vlt.*) and what I wrote (*Tract.de Deo uno disp.2*). To Confirmation I: I distinguish the antecedent — concerning formal and actual truth, denied; concerning fundamental and objective truth, granted — as will be evident (*a.5.huius q.*). To Confirmation II: I say that the proposition is true with a truth suited to it — for

just as a chimera is a fictitious being, so its truth is fictitious and a chimerical relation.

Objection III against Assertion IV: what precedes the operation of the intellect is not a being of reason. But truth precedes the operation of the intellect. Therefore truth is not a relation of reason. The major is evident, since a being of reason either is or follows the operation of the intellect — as I observed (1.1.q.3.a.5). The minor is supported: the knowledge of God, directed toward himself or toward created things, possesses truth with no intervening operation of the intellect. Especially because for an act to be true means nothing other than to affirm that the thing is as it is on the part of the thing — as when "man is an animal" is said, animal is enunciated of man just as it is truly found in the nature of things and the essence of man demands. But with all operation of the intellect excluded, man is an animal on the part of the thing. Therefore truth also exists on the part of the thing, independently of any fiction of the mind.

Granting the major, I deny the minor. To its proof I say that all of what is adduced applies to objective and fundamental truth of the thing — not to truth of knowledge and formal truth, which is produced by the created intellect alone. But the divine intellect — since it neither divides nor composes — is free of this kind of complex truth, since it involves imperfection.

Objection IV. If complex truth is a relation of reason — since it is founded on the proposition, which is likewise from what has been said a being of reason as a second intention — truth would not be drawn from the thing outside. But this contradicts Aristotle (*c. de substantia*), who says: "from the fact that a thing is or is not, an utterance is said to be true or false." Therefore complex truth is not to be held to be a relation of reason. I reply that the aforesaid truth is proximately founded on the proposition — but remotely on the thing outside. Nor is it inconvenient that one relation be founded on another — as I proved (1.3.q. de relatione a.7). Or say with Bonetus and other authors that truth is formally in the proposition, but causally or terminatively in the thing — which is well perceived as follows.

Article III. In What Subject Truth Subsists.

Five opinions on this article are recounted by Aureolus (1.d.19.p.3). Two being omitted, three are adduced by Aquila (1.d.8.q.1) and Pelbartus (*Tomo 1. Rosarij, verbo veritas*): two extreme ones and a third middle one. The first is that of Durandus (1.d.19.q.5), Henry (*Quol. 3.q.1.4.2.6.3*), Vasquez (1.p.q.67.c.1), and others, who hold that truth is formally in the objective concept of the intellect insofar as it is conformed to the thing as it is in the nature of things. The second is that of Cajetan (2.p.q.16.a.2), Ferrariensis (1.contra Gentes c.59 & 60), Fonseca (4.Met.c.2.q.6), and Suárez (*disp.8.Met.sect.1*), who affirm that truth is formally in the formal concept of the intellect insofar as it is conformed to the thing as it is in itself. The third is the one followed by Aquila and Pelbartus (*praecit.*), who

reconcile both aforesaid discrepant positions, teaching that complex truth is formally in the intellect — namely in the formal concept — but fundamentally in the thing, or in the objective concept.

What was said above is to be recalled: that truth is taken in two ways, as Bonetus (*cit.*) especially notes. In one way, fundamentally — and in this sense, according to some, it is the thing or quiddity insofar as it is conformable to the intellect's knowledge. More correctly it can be said that truth taken fundamentally is the conformability of the thing to the intellect — insofar, namely, as the thing is fitted to be conformed to the knowledge of the intellect. This is perhaps what Aristotle keeps in view (*2.Met.c.1.T.4*) when he pronounces that saying: "as the thing is in being, so it is in truth." In another way, formally — in which sense Pelbartus (*alleg.*) asserts that Isaac (*1.definitionum*) described truth as "the adequation of the thing to the intellect."

Note, moreover, not incongruously, from the philosophers, that conformity or adequation is twofold: one active, the other passive. The former is on the side of the intellect, the latter on the side of the thing. When the conformity of the intellect to the thing and the thing to the intellect is equal, all-round truth is had — which can hold both of incomplexes and of complexes. Therefore, following what I established in the preceding article about incomplex and complex truth, these matters are to be decided in the present in nearly the same way.

Furthermore, since from what was asserted there, truth is formally a relation — which requires a foundation and a terminus from which it arises — it is not unreasonable to investigate whether truth is subject in one or the other of these. Moreover, since the object partially concurs to produce its knowledge, and knowledge is terminated at it, it is rightly asked whether the truth of knowledge is causally in the object — as Godfrey (*Quol.2.q.6*) thinks — or terminatively, as some hold, or in both ways, as not a few think. Bonetus (*ubi supra*) defends both those modes as probable; though the first is judged more frequent and more plausible by the philosophers. Hence the most eminent Sarnanus (*q.15.univers.pag.45*) rightly notes that truth is in three things: in the thing as in the efficient, in the proposition as in the representing sign, in the intellect as in what receives. He illustrates this with the example of the light of the sun, which exists in the sun as in the efficient, in a transparent body and air as in the transmitting medium, and in the earth as in the receiver.

Assertion. Transcendental truth — also called truth of the thing — resides in the very thing of which it is the truth; but truth of knowledge holds its place in the intellect. This assertion contains two parts. The first part is undoubtedly Scotus's (*1.d.8.q.4.¶. Ista tamen, M*), where he teaches that a passion follows its subject (*¶ 2.d.16.q.un.* and elsewhere), and maintains that truth is a passion of real being. From this doctrine a twofold argument is formed to support our assertion. First: a passion is in the thing of which it is the passion — as risibility is in man, neighing in a horse. But transcendental truth is a passion of real being — as is

clear from Aristotle (2.*Met.cap.1* & 4. of the same work, *T.10*), and the common run of philosophers holds it — as Bonetus (*ibid. in initio cap.2*) notes. Therefore transcendental truth has its seat in real being. Second: what follows from some subject resides in that very subject from which it arises — as is clear from accidents, which proceed from substance and are received in it as in their subject. But truth of the thing proceeds from real being, as do its other passions — as I showed (*in Met.lib.2.q.2.art.2*). Therefore transcendental truth inheres in real being.

The second part is drawn from the Doctor (6.*Met.q.3* & 1.*d.1.q.3.D. Quantum ad 1.* sub A; and *d.3.q.3. C*). It is proved as follows. First, from Aristotle (1.*perihier.cap.1*; 3.*de anima c.26*; 6.*Met.cap.2.7.8. summ.2*), who affirms that truth and falsity consist in composition and division. Add Plato (*in Symposio*), Nicaeus (*lib. de vita Moysis*), and Anselm (*lib.de veritate cap.2*), who expressly seem to assert that truth is in the proposition.

Second: in what there is the proximate foundation or subject of something, there the passion of it resides — since subject and its passion formally differ only, as I wrote (*in Met.loco proximè cit.*). But the foundation of complex truth is the proposition, which is in the intellect subjectively. Therefore truth — which is its property — is likewise subject in the intellect.

Third: a being of reason has being only in the intellect — as is plainly clear from the metaphysical question (*q.ult.*). But complex truth is a being of reason — as I proved (*in superiori a.conclusionè 4*). Add that a vocal proposition is subordinated to a true or false mental proposition — as after Tatarè (*hoc loco q.1.dub.2*) the Coimbrans (*q.5.art.1*) note from the Philosopher (*c.1.huius operis*). Therefore, since truth is said to be in a vocal proposition as in a sign — because it denotes the formal truth of the mental proposition — it is clearly deduced that complex truth is in the intellect as in its subject.

Objection I. What belongs to two things, one as cause and the other as caused, belongs primarily to the cause rather than to the caused. Hence, since fire is the cause of heat in all hot things, it is especially called hot (*ex 2.Met.7.4*). But truth of the thing is the cause of truth in the intellect and in the enunciation — as the Philosopher (*c.de substantia*) writes. Therefore truth is primarily and formally in the thing. Confirmation: a proposition is true on account of truth existing in the thing — as Aristotle (*praealleg.*) declares. Therefore if a proposition is true because of truth of the thing, it follows that truth is prior and more formal in the thing than in the enunciation — according to Aristotle (1.*Post.*): "that on account of which a thing is such, and that thing more so." I reply by distinguishing the major: if it belongs to both formally, granted; if it belongs to one formally and to the other causally, denied — as is clear from the sun and the earth, both of which are called hot, but differently: the sun is hot causally and eminently, while the earth is hot formally through heat caused in it formally by the sun itself. Much the same seems to happen in our case: truth is in the

enunciation formally, but in the thing only causally — as I expressed at the end of the preceding note. To the confirmation the same distinction holds, through which the cited Aristotle passage is explained.

Objection II. Just as good is the object of the will, so true is the object of the intellect — which indeed is of truths (*ex 1.Post.T.44*). But things outside are the primary objects of the intellect — not species, acts, or second intentions. Otherwise all knowledge would be reflexive. Therefore truth is primarily in the thing and secondarily in the intellect. Confirmation I: what is adapted to one as a sign and to another as the signified, through such a sign — belongs to the latter intrinsically and formally, and to the former extrinsically and materially — as is clear from health, which formally belongs to an animal and to urine as its sign. Therefore since truth is attributed to the intellect and to speech as a sign, and to conformity with the thing outside, it follows that truth is formally in the thing. Confirmation II: from St. Augustine (*9.Trin.c.11*): "greatness is the same as truth; greater and truer being coincide." But greatness is in the thing. Therefore so is truth.

I reply with the Doctor (*6.Met. in fine, q.3*) by denying the major — whom Orbellus (*ibid. in fine c.3*) follows. For the intellect not only understands the true under the account of truth, but also the good under the account of good, and distinguishes between them. Therefore it studies both — as the Stagirite asserts (*2.de anima T.146*). When it is said that the intellect is "of truths," it is understood of the habit of first principles, which are always true. Hence the same Philosopher adds (*1.Met. at the threshold*): "who will go astray in these?" — especially since on their truth depend the truths of all conclusions — as Scotus (*1.d.2.q.3.1.*) agrees. To Confirmation I: granting the antecedent, I deny the consequence. For that conformity of the intellect to the thing formally resides in the intellect and is terminated at the thing, or caused by the thing. Therefore truth — which expresses that conformity — is formally subject in the intellect. To Confirmation II: I say Augustine is to be interpreted of fundamental truth — but the discussion here is of formal truth, whose subject we make the intellect.

Objection III. Scotus (*1.d.9.48.q.un. §. Ad arg. B*) commits these words: "Truth of the intellect depends only on the object, which, if it is as it is understood, the intellect is true." The same is hinted at (*Quol.18.art.3. §. Contra 5*) and confirmed (*in Report.1.d.48.q.vlt. R*). I say Scotus there is speaking of truth causally and as depending from outside — for only the object from outside partially causes truth, and from it alone as from outside truth itself depends. That this is his meaning is evident from that text: for he compares truth with goodness, saying that truth depends on the object alone, but goodness depends not only on the object but also on due circumstances — which he expresses (*in Report.cit.q.5*). Lychetus and Gadius in (*in expositione Quol. & §. cit.*) are of the same view.

Objection IV. The intellect is not said to be conformed to the object because it is conformed to formal knowledge in being — since the intellect and its formal

knowledge are always spiritual, while the object considered by the intellect is most often material. But because the object is perceived by the intellect as it is on the part of the thing. Therefore the whole comparison is made between the thing in known being and the thing in real being — and consequently the primary truth has its seat in the objective concept. I reply that such conformity of the intellect with the thing is not entitative and real, but intentional — insofar as the object is represented through knowledge in the way it is in the nature of things, as Aristotle (*3.de anima c.8.T.37*) writes. Hence such conformity and representation is not directed toward the known object and itself, as Durandus thinks, but toward the representative concept and the represented object — as Suárez (*praenominatus n.6*) explains at length, where he gives the example of an image, which is called true not by comparison of the represented thing to itself but by comparison of the image to the imagined thing.

A further instance: The object is said to be represented through a true cognition of the intellect. Therefore the object is formally true; and hence formal truth inheres in it. The antecedent is conceded in the response to the preceding objection. The consequence is proved: what is such through representation, the thing represented through it is formally such — as if an image of a lion is fierce, the lion is formally fierce. Therefore if cognition is true representatively, the thing represented through it is formally true through truth inhering in it. Granting the antecedent, I deny the consequence. To its proof I say: this holds in real representation — but not in intentional representation. The reason adduced is that in the former there are two objects, while in the latter only one — at which it is terminated, and which is called true extrinsically through formal truth remaining in the intellect — just as through vision the eyes are intrinsically and the wall extrinsically called seen, as Lychetus (*quol.praememor.*) aptly continues.

Objection V. Truth is in what the vocal enunciation designates. But a vocal enunciation designates the objective concept. Therefore formal truth is in the objective concept. The major seems evident: since just as voices are signs of things, so a vocal enunciation is the sign of an objective enunciation. The minor remains proved (*q.2.huius l.art.2.assert.3*). All the more because a mental enunciation is likewise a sign of an objective concept. Likewise, when the intellect renders a formal judgment, it does not reflect upon its own act but compares the known object to what it itself is on the part of the thing. Therefore formal truth is to be placed in the objective concept.

I reply that the argument concludes concerning truth of the thing and fundamental truth — not the truth of knowledge and formal truth, about which we are now discussing. Especially because voices signify not only things but also formal concepts — as Aristotle says at the beginning of the first *perih.*, and I proved extensively in the cited place. To what is added: I say that since truth is a relation, it designates indeed the object at which it is terminated and which is its

cause; nonetheless the enunciation primarily and formally contains truth. To the other that is added: I say that the truth of cognition can probably be taught to reside in the known thing, or in the objective concept, in roughly the same way as I said concerning the universal formally and the remaining second intentions in the proximately cited place. Vulpes agrees (*1.p.Tom. 2.disp.32.art. 4.*), and Faber does not entirely dissent (*disp.9. de pænitentia cap. 2. num 33.*) — though he displeases in this respect, that he holds the two positions set forth above to coincide, and that the objective and formal concept are not distinguished from each other; whereas it is clearly and plainly established, in the cited authors, what difference intervenes between their senses and their doctrine. But of this more fully elsewhere.

Article IV. Whether Truth Is Found in Every Operation of the Intellect?

Since there are three operations of the intellect, which I introduced and described in Book I, Question III, Article VI, logicians — especially the moderns — carefully inquire whether truth resides in each of these operations. That truth or falsity is to be located in the second operation is confessed by all with one voice; in the third, all likewise presuppose this as certain. The entire difficulty therefore rests in the first. For Cajetan (*1.p.q.16.art.2.*) and others cited by Suárez (*disp.8.Met.sect.3.*), the Coimbrans (*1.de Interp.q.5.art.2.*), and Fonseca (*4.Met.cap.2.q.6.sect.3.*), with whom Faber from our own school agrees (*disp.9.de pænit.cap.3.*), hold that truth in cognition is found only in the second operation of the intellect. The opposite is maintained by Scotus (*6.Met.q.2.*), Orbellis (*ibid.cap.3.*), and others cited by the aforementioned moderns, affirming that the first operation of the intellect is not without truth.

For the resolution of this question, the familiar distinction of truth into incomplex and complex must be recalled, as I introduced and explained in the present question, Article I. Incomplex truth is attributed to the first operation of the intellect, and complex truth to the second. This explanation seems sufficiently apt and adequate for understanding the difference between the two kinds of truth, as well as for discerning the proper truth that befits each operation, as remains evident from the descriptions of those operations given above. The objections that Suárez raises (*num.9.loci cit.*) against this mode of explanation are of no force. For Suárez says there that by the same reasoning one might say that truth resides in a special mode in simple cognition, since only incomplex truth is found in it. But this does not follow correctly, because simple cognition and incomplex cognition mean the same thing; not so simple cognition and incomplex truth, since the latter arises from the former as a property arises from the thing of which it is a property. Unless therefore an equivocation is made on the word "simple," Suárez's objection has no force; and given the equivocation, that term must be distinguished according to the rule about distinguishing equivocal terms, and so his argument is dissolved.

Nor does it help him to add there that from this distinction of truth it does not follow that truth is not more properly and formally adapted to the second operation than to the first — since in man there is composite truth, and in an angel there is simple truth; and likewise in man there is material truth and in an angel spiritual truth, and so on according to the fitness of things. This, I say, profits him nothing. For by the same reasoning composite or complex truth is formally adapted to both man and angel alike. For although the angel possesses a more excellent nature and intellect than man, nonetheless the intellect of each is compositive, divisive, and discursive; and their object and end are the same, as I showed at length with Scotus in the *Treatise on the Angels*. Wherefore the aforementioned division of truth is excellent, and is used by nearly all to resolve this question — notably Bonet (*5.Met.cap.2.*), Hurtado (*disp.9.de anima sect.2.*), and the Coimbrans (*art.3.*) from Aegidius (*quol.4.q.9.*). They add that through this distinction the two conflicting opinions may be reconciled. Why truth is attributed more to the second than to the first will be made plain from what follows. I add that the same Suárez (*disp.8.sect.8.num.37.*) seems to admit this.

The assertion is: in the first operation of the intellect, incomplex truth is found; in the second and third, complex truth. This assertion is threefold. The first part is Scotus's (*cit.in Met.*), which the same Doctor hints at (*q.1.prol.§.Antequam post M.*). It is proved first from Aristotle (*3.de anima cap.6.T.26.*), who likens the intellect to sense in the cognition of simples, since in the second book on the soul (*cap.6.*) he noted that sense with respect to its proper sensible is always true. And in (*9.Met.cap.7.T.21.22.*) he adduces that twofold genus of truth, one of which belongs to the first operation and the other to the second. This is why Fonseca (*sect.4.loci recens.*) marvels that philosophers of the opposing view think they are treading in Aristotle's footsteps. Second, truth is the conformity of a thing to the intellect; but in the first operation such conformity is found; therefore, truth is also found there. The major is evident from what was said above. The minor is proved: the intellect through the first operation apprehends simple and incomplex things as they are in reality — as when it apprehends gold, silver, and things of that kind as they exist in the nature of things. Third, where an entity is apprehended, there truth is found, if it is apprehended in the mode in which it exists; but in the first operation an entity is apprehended as it is in reality; therefore truth is also found there. The major is clear, because truth is a property of entity. The minor is at hand, because the first operation is described as the apprehension of simple terms. Wherefore incomplex truth is to be located in the first operation, just as its entity is incomplex. I add that in the divine intellect there is the most perfect truth, even though in it there is simple apprehension.

The second part is the common view of Aristotle (*in this work cap.1. and cap.1 of the Categories, and 6.Met.T.8. and elsewhere*), of Scotus (*ubi supra*), and of others, among whom is Vázquez (*disp.55.1.p.*). It is proved from the definition of truth, thus: truth is the adequation or conformity between a thing and the intellect;

but such conformity exists in the second operation of the intellect; therefore truth flourishes in that operation. The major is clear. The minor is at hand. For he is said to speak truly and to hold a true proposition when he knows things in the mode in which they exist in themselves — as when he knows and affirms that man is rational, and denies that man is irrational. That affirming something of another or denying something from another belongs to the second operation of the intellect, no one doubts. Second, truth is found where falsity also abides: but falsity inheres in the second operation; therefore truth does also. The major is supported by that pronouncement, "contraries have the same subject," which is drawn from the description of contraries. The minor is clear, because falsity is not opposed to the truth of the first operation, as after Bonet (*5.Met.cap.2.*) Orbellis (*6.Met.cap.3.*) asserts, explaining (*3.de anima T.26. and 9.Met.cap.12.*), in the testimony of the Coimbrans (*art.3.q.5.*): "the intellect concerning that which it is is always true." Third, complex truth or falsity occurs in the agreement of one thing with another or the disagreement of one from another, as is well known; but in the second operation there is effected the agreement or composition of one thing with another, or the discrepancy of one from another, as is clear from its definition. Therefore in the second operation complex truth or falsity is located.

The third part is presupposed as true by all, and was expressed by the Doctor (*quol.18.¶.Contrà 5.*). It is proved: first, where there is conformity, there is truth, as is evident through the argument from definition to the thing defined; but in the third operation there is conformity of the intellect with the thing understood, when a true conclusion is deduced from true premises; therefore in the same operation there is proper truth, distinct from the others. Second, in every proposition there is truth or falsity, for the reason given more than once — namely, that truth is attributed to the proposition as its property; but the third operation involves a proposition, since the syllogism (*q.IV.art.V.*) is constructed, as noted above, from three propositions, one of which is the conclusion, as is clear in the Epitome (*lib.3.q.1.art.1.*) and in the Logic (*lib.5.q.1.art.5.*). It is therefore perspicuous that truth befits the third operation of the intellect.

You will object first: Aristotle (*here cap.1. and 3.de anima cap.5. and 6.Met.cap.2.7.8.*) plainly asserts that truth lies solely in composition and falsity in division — which, it is established, is expressly the second operation. Therefore truth is not ascribed to the first operation. Scotus is added, who (*2.dist.6.q.1.¶.Respondeo.G.*) states these words: "It does not belong to the intellect of simple things to err or to speak truly, for these are conditions of the intellect composing and dividing." I respond that Aristotle and Scotus were speaking of complex truth, which is indeed proper to the second operation; but not of incomplex truth, which befits the first operation, as I declared in the present note. Now the custom of philosophers has grown so settled that whenever discourse is undertaken about truth absolutely, complex truth is understood. For as Fonseca (*4.Met.q.6.cap.2.sect.9.*) well observes, whatever complex statement is presented to

us — "man is an animal," "man is a stone" — we simply say the former is true and the latter false. The reason that can be given is that the composing and dividing intellect is the judge of truth and falsity. Hence truth and falsity simply are attributed to its composition and division.

You will object second: truth advances in words at the same pace as in concepts, because words are substituted in place of concepts; but in simple words there is no truth — for when one utters the simple word "animal," one states no truth. Therefore in the first operation, which is the cognition of simple terms, no truth exists. Confirmation: where there is no falsity, there truth is not found, because contraries have the same subject, as I indicated above; but in the first operation no falsity is found, as the Philosopher plainly teaches (*3.de anima T.21.*). Therefore truth is excluded from the first operation. Granting the major, I distinguish the minor: in simple words there is no complex truth, I concede; no incomplex truth, I deny — in nearly the same way as I said above, namely that truth is in the concept formally and in the word as in a sign. To the confirmation, I say that falsity is used in two ways: in one way for the ignorance of simple intelligence, or nescience, to which incomplex truth is opposed; in another way for error, or ignorance by way of disordered disposition, to which complex truth is opposed — and this is called falsity absolutely, which philosophers generally remove from the first operation and locate in the second, especially Bonet and Orbellis as cited. According to this distinction the argument is solved: for if the major is admitted, the minor is to be distinguished thus — in the first operation falsity taken in the second sense is not found, I concede; taken in the first sense, I deny. Or it could be said, and I would not find it inconvenient, if falsity is distinguished into incomplete and complex falsity. With this distinction in place the argument is easily dissolved: the major is conceded, and the minor is distinguished — of incomplex falsity, it is rejected; of complex falsity, it is accepted. I do not raise particular difficulties about falsity, because since falsity is opposed to truth, as Pelbart observes (*Tom.2.§.1.verbo falsitas*), and the discipline of opposites is the same, what has been said about truth can conveniently serve to dissolve what is said about falsity.

Article V. Whether Propositions of Eternal Truth Exist.

The Nominalists cited by Tataretus (*q.ult.praedicabilium dub.3.*) and certain theologians mentioned by Suárez (*disp.31.Met.sect.12.num.58.*) admit no proposition of sempiternal truth, asserting that of things that exist there are indeed true or false enunciations, but of things that do not exist there are neither true nor false ones. The common opinion of the remaining philosophers and theologians opposes them: Scotus (*1.dist.3.q.4.§.Ad q.igitur*), Lychetus (*ibid.*), Antonius Andreas — both there and in his commentary on the first Perihermeneias — Johannes de Magistris (*q.ult.praedicam.*), the first Meteorologics (*q.1.in fine dub.3.*), and others who teach that there are

propositions of eternal truth. For a more convenient grasp and fuller elucidation of this:

Note first, from Lychetus in his commentary, as Scotus touches upon (*in the passage cited*) and as I already indicated (*lib.1.q.2.art.2.not.4.*), that a thing can be considered in two ways: either in real being, or actual being, and the being of existence, which a thing possesses when it has been produced by its causes — as is clear from Genesis I concerning heaven and earth and the other things created by God, which still persevere in the actual being they received from God; or in objective and possible being, which is called intelligible, quidditative, and essential being, prescinding from all existence and from every circumstance of time, place, and the like — or, as the Doctor (*cit.5.*) speaks in particular of sincere truths, abstracting from everything accidentally conjoined with them. The first being is called temporal, because created things were made in time and participate in that temporal being, as the divine chronicler testifies with the words: "In the beginning God created heaven and earth." The second being is called eternal and perpetual, both because things were producible from eternity — that is, there is no repugnance on the part of things preventing them from having been produced from eternity and persisting in being throughout all time, as I showed abundantly in the Treatise on Creation (*disp.3.*) — and because creatures received known and understood being from God from eternity, as Scotus writes (*ubi supra*), which is diminished and qualified being; hence they are called eternal in a qualified sense and receive existence in a qualified sense, as after the Doctor, Lychetus and Vigerius note in that place. Now a property of a thing in its real and existing being presupposes the real existing being of that thing; and a property of objective being presupposes objective being, as Lychetus (*cit.*) carefully notes. Since, however, each thing possesses its own truth as its property, according to the twofold being assigned above, a twofold truth arises — namely, the truth of real being and the truth of objective being — or rather one truth that follows upon both objective being and real positive being, since what is objective and in objective potency is the same thing, and then what is in act and placed outside its causes.

Note second: that propositions of perpetual truth can be understood in two ways, as Scotus touches upon (*1.d.29.¶.Contra istud, infra B.*): either according to the existing being of the things about which they are formed, or according to the objective being of the things about which they are made. This difficulty is not ventilated with respect to being taken in the first way: for either things are generable and corruptible — and of these, since they do not always exist, there cannot be perpetual truth according to the being of their actual existence; or things are ingenerable and incorruptible — and of these, although there can be perpetual truth from the future direction, yet not from the past direction, since they were not created from eternity, and especially because God by his absolute power can destroy and annihilate them; and if their entities were to perish, their truths would likewise perish. And accordingly from this account one cannot say

that propositions formed about those very things are of eternal truth, in the sense in which philosophers commonly understand this. Nor does it help to say with some that the things themselves are not eternal, but that the connections of their essential and quidditative predicates are eternal. For if things are not eternal — as indeed they are not, as is clear from the Treatise on Creation (*disp.3.*) — neither do their connections enjoy eternity. For a connection is nothing other than a union, and a union is a relation, and a relation requires the extremes from which it arises; but the things and their essential predicates, which are the extremes of the relation, are not eternal, as those authors concede; therefore neither are the connections found between those predicates eternal. Furthermore, what emanates from something presupposes that from which it emanates, as is clear concerning an effect which presupposes the cause by which it is produced; but a union results from the approximated and united extremes, as I wrote concerning every extrinsically accruing relation (*1.3.q.de relatione.*). Since, therefore, the extremes of these connections are the essential predicates of things, which do not exist from eternity, it is perspicuously proved that the connections of those predicates are by no means eternal — on the basis of which connections enunciations might be deemed to be of sempiternal truth. The whole difficulty therefore revolves around being taken in the second way — namely, whether propositions about the objective being of things are necessary and of eternal truth. This seems to require that one say: propositions whose subjects include predicates essentially — as "man is an animal" — or identically — as "man is risible" — are of perpetual truth, whether their extremes exist or not; but other propositions, whose subjects include their predicates neither essentially nor identically, do not enjoy eternal truth. This is deduced from Scotus (*3.d.22.q.un. §.sed quid logicè, sub M. and 1.d.3.q.4. §.Quantum ad 3. and 1.quol.7. §.Ad argumenta, infra X.*), and is handed down by Bassolius (*ibid.*) and Sarnanus (*q.11.univers.pag.178.*).

Note third, from the Doctor (*in 1.alleg.ante §.De ente a.circa 5.*) and Bonet (*cit.not far from the beginning of cap.2.*): a sensible object actually existing in the external and internal senses — especially in the phantasy — produces a confused species representing the accidental whole, that is, the object clothed in quantity, color, and other material accidents. Since the species or phantasm represents the object confusedly and merely accidentally, many people perceive only the accidental being. But those who through the intellect abstract the essence and quiddity of an object from all its accidents, and survey its essential predicates and those that flow from the same essential principles, compose subjects with predicates and form enunciations of eternal truth. This is illustrated by the example of the proposition "every whole is greater than its part," which is first true not insofar as the whole is in wood or stone, but insofar as it prescind from everything to which it is accidentally connected. Hence the intellect that never understands totality except in an accidental concept — namely, in the totality of

stone or wood — never understands the pure and sincere truth of that principle, because it never understands the precise notion of the term by which it is true.

The assertion is: propositions of eternal truth exist. Scotus maintains this (*ubi supra*), and it was indicated by him in the Logic (*1.perih.q.8. §.Ad 2.q. and §.Ad aliam q.*). It is proved first from Aristotle, who (*1.post.T.21.*) shows that demonstration has a conclusion that is perpetually true, because it is from what is per se — that is, from what is necessary and eternal. The same he writes (*1.perih.c.6. and 9.Met.c.6.*), and from there Scotus (*ibid.pag.280 according to the Cauellus edition*). The same seems to be the view of Porphyry (*in Isag.c.6.*) in comparing the difference with the property. Second, from the holy Fathers: Augustine (*6.retract.c.4. and 2.de lib.arbitrio cap.5.*) states these words: "As long as they are future, 'heaven is' and 'earth is,' I do not know; but 'seven and three are ten' is true not only now but always, nor in any way were seven and three not ten, or will seven and three at any time not be ten." And he adds that nothing is more eternal than that two and three are five. And Anselm (*in Dialogo de veritate cap.14.*) expressly maintains the foregoing assertion. Third: those propositions are deemed to be of eternal truth which are about eternal and necessary objects; but some enunciations are of this kind; therefore such are of perpetual truth. The major is Aristotle's (*1.Post.cap.6.*), where he proves that demonstration is from what is necessary and always true. That demonstration is composed of three necessary propositions is certain and beyond doubt to all. Therefore the propositions of a demonstrative syllogism are of perpetual truth. The minor is at hand from what was just said about the propositions of demonstration, which are always true — as "every animal is sensitive," "every man is an animal," "therefore every man is sensitive." Fourth: what is perpetually connected by a bond is perpetually true; but the subjects and predicates of necessary propositions are joined by a perpetual bond; therefore the enunciations formed from these are of eternal truth. The major is the steadfast doctrine of the Philosopher (*2.Met.T.4.*), writing that "as a thing stands with respect to being, so it stands with respect to truth." The minor can be induced through individual necessary propositions; I content myself with one for now — namely "animal is sensitive" — where "animal," which is the subject, and "sensitive," which is the predicate, so stand to each other that neither can ever be separated from the other, which is a clear sign of the indissoluble bond between them. Fifth: where there is perpetual conformity of the intellect with the thing understood, there is perpetual truth; but in necessary propositions there is perpetual conformity of the intellect with the thing understood; therefore in these there is perpetual truth. The major is known from the foregoing description of truth. The minor shines forth — for when the intellect perceiving the proposition "every whole is greater than its part" always understands it exactly as it is in reality, given that the terms have been previously explained. Hence the Archbishop of Aachen (*1.d.39.*) adds that the truth of a proposition is received according to the truth of the thing, because the truth of the sign is taken from the condition of what is

signified. The same author adds that truth cannot be immutable in a proposition unless the signified is immutable in its being.

You will object first: the truth of a proposition is taken from the truth of the thing about which it is made, as is clear from the chapter on substance; but no truth of a thing is eternal, since nothing except God is eternal, as orthodox Faith teaches and as I made plain in the second note. Therefore no proposition is always true. I distinguish the major: the truth of a proposition is obtained about a thing in the being of its actual existence, I deny; in its objective and aptitudinal possible being, I concede. To the distinction of the major, the minor must be distinguished correspondingly. This distinction and solution is drawn from the Doctor (*6.Met.q.1. in the solution of the third principal argument*), who says that the conclusions of demonstration are to be understood of aptitude, not of actual existence. The same is handed down by Mauritius (*q.30.univers.fol.56.col.2.*), and I explained it sufficiently in the first and second notes.

You will object second: necessary enunciations are therefore said to be of eternal truth either because the things about which they are formed always exist, or because there is a necessary and indissoluble connection between their extremes. But neither can be said; therefore no enunciations are to be granted as being of eternal truth. I accept the major for the double cause assigned in it by way of distinction. The minor is shown — and indeed as regards its first part, this is already clear from the first objection: for only God has the attribute of always existing, as David attests (*Ps.101.*): "But you are the same, and your years shall not fail." And the Philosopher agrees in the recently cited passage: "When primary substances are corrupted, secondary substances are also corrupted." As regards the second part, it is shown: first, because a union presupposes existing extremes through which things are united with one another, as is clear from the union of matter and form and other natural and artificial things. The reason is that nothing can be united with anything unless it pre-exists. Second, because what are mutually united are united by some efficient cause; but no efficient cause is found that would always have united the extremes of such propositions. Therefore such propositions of eternal truth are to be denied. Granting the major, the minor is to be denied; and to its proof I say that things always exist — not indeed in the being of actual existence, but (*q.IV.art.VI.*) in objective being, and likewise their necessary connections are in said objective being, which suffices for propositions about them to be deemed of eternal truth, as Mauritius (*shortly after the cited passage*) and Vulpes (*Tom.1.disp.28.art.1.*) correctly note, and as Bassolius expressed excellently in these words: "This is not verified in act, as is the case in reality; but of potency, or aptitude, or non-repugnance — because the thing signified, for example by 'man,' whenever it is posited in reality, is not repugnant to being an animal; indeed, once posited, it is necessarily an animal — so that there is actual verification of aptitude, or actual potential verification."

You will object third: Scotus (*1.dist.3.q.4.Ad q.infra P.*) asserts that eternity is a condition of what exists; but things in objective being receive no existence, as is clear from what was said above; therefore propositions about things in such objective being enjoy no eternal truth. Confirmation: the same Doctor (*3.dist.22.q.un.§.Sed quid logicè M.*) denies that this proposition was true — "Christ during the three days was a man"; therefore neither is this true — "Adam is a man, with no man existing." The consequence is deduced because the reasoning seems to be the same for both, since Christ was truly a man through the humanity assumed by the Word, just as Adam existed. I respond that Scotus explains himself: for he is speaking there of things as they have intelligible being, or known being, as Tataretus (*praecit.*) notes — to which being, since it is diminished and qualified, existence and eternity also belong in a qualified sense, just as to being simply and actually, divine existence and eternity belong simply. To the confirmation, the same Doctor (*ibid.*) meets the objection by adducing a difference between the falsity of the one and the truth of the other. For in the proposition "Christ is a man," one of the extremes — namely "Christ" — does not have a single concept, as Saint John Damascene testifies according to the Doctor (*cit.*): "Christ is a name signifying two natures, human and divine," and thus designates two concepts, namely God and man; but in the proposition "Adam is a man" it denotes only one concept. Wherefore, since for the truth of a proposition it is required that the subject present only one concept, that proposition whose subject includes multiple concepts is false, while that whose subject signifies a single concept is true. See Lychetus (*cit.*).

Article VI. Whether a True Enunciation Can Be Changed into a False One.

Some, such as Hurtado (*disp.9.de anima sect.4.*) and Arriaga (*disp...2.de anima*), deny that a true proposition can be transferred into a false one, or conversely a false one into a true one, following certain authors whom Bonet (*5.Met.c.2.§.Amplius autem habet dubitationem*) favors. But the common position is that of Scotus (*4.d.8.q.2.§.Aliter sub V.*), the Coimbrans and Toletus (*in fine comment.c.de Substantia*), and also Suárez (*disp.8.Met.sect.2.1.q.*) and others, who affirm that an enunciation can be changed from true to false and conversely.

Note first: all confess that necessary propositions, which I treated in the preceding article, undergo no change of truth or falsity; but it is called into question whether contingent propositions, signifying a certain or uncertain part of time, can pass from true to false.

Note second: that something can change in two ways — through itself and by reason of itself; or accidentally and by reason of another. In the first way an enunciation does not admit change; because since it is formally a being of reason, a second intention, and a relation of reason, as is clear from what was said, there can be no per se motion toward it, according to Aristotle's pronouncement that there is no per se motion toward a relation, as is clear from

the fifth book of the Physics. But an enunciation can indeed change in the second way — namely, by reason of the change of the object about which it is made. Just as, when a per se change occurs in what is signified, there occurs an accidental change in the name; for when the terminus is destroyed, the relation to the terminus is also destroyed. The conformity, for example, of this proposition "Peter is writing" — which is its truth — has the writing of Peter as its term, and when Peter is not writing, that conformity ceases to be. Therefore, a per se change having first occurred in Peter's writing, an accidental change is effected in the aforementioned enunciation. Moreover, recall from the Doctor (*cit.*) that a proposition is by nature prior to truth and falsity, and the Doctor adds perhaps also in the property of time; and accordingly the proposition in its formal and quidditative concept does not include truth and falsity but prescinds from them, just as a subject abstracts from every accident received in it, and a foundation from every relation founded in it.

The assertion is: contingent propositions — that is, those formed about contingent objects, signifying a certain or uncertain difference of time — when their objects are changed, can pass from true to false and conversely. The Doctor defends this (*praecit.*) and indicates it (*1.dist.3.q.4. §.De tertiis and §.De sexto ante Y.*). It is proved first from Aristotle (*cap.de substantia and 1.Perih.c.8. and 9.Met.cap.22.*), who plainly teaches it. Second, formal truth depends on fundamental truth, just as cognition depends on the thing of which it is the cognition; but when the object changes, the fundamental truth changes, just as a property changes when its subject changes; therefore a proposition can be transferred from true to false according to the change of the subject about which it is made. Third, a subject changes through the approach or withdrawal of the accidents that are received in it — as is clear with a wall, which changes through the coming or going of whiteness or blackness — and likewise the cognition that is had of it; therefore through the change of the subject about which a proposition is enunciated, there occurs in it a change of its truth into falsity or conversely falsity into truth. Add that if contingent propositions were immutable, there would be no difference between necessary and contingent propositions, since both would be immune from change — which is plainly false. All the more because when the terminus changes, the relation changes; and since truth, as stated, is a relation, it is evidently deduced that the aforementioned propositions undergo change.

You will object first: the proper fourth-mode attribute of substance is to admit contraries, as Aristotle teaches (*c.praalleg.*); but if an enunciation could pass from true to false, the reception of contraries — namely truth and falsity — would be attributed to it as well, as the same Philosopher argues (*ibid.*). Therefore such a property does not seem to be ascribable to a proposition. I respond by distinguishing the major: substance alone admits contraries as the ultimate and primary subject, I concede; as a non-primary mediating subject, I deny. For a surface, which is a quantity as a non-primary and immediate subject, receives

whiteness or blackness or other contraries, as experience makes clear; thus Aristotle (*praecit.*) can be explained in this way. Or say that substance is the subject of contraries per se and by reason of itself, while a proposition is receptive of contraries accidentally and by reason of another — that is, of the object about which it is said — as I made plain in the second note; especially because truth or falsity is not formally placed among contraries but among relations, as was decided in Article II of this question.

You will object second: a property of a thing, according to Scotus (*2.d.16.q.un.*), cannot be separated from the thing of which it is a property, since between them there is only a formal distinction, which holds of those things that are inseparable from each other; but truth or falsity is the property of an enunciation; therefore if a proposition could pass from true to false, it would be found without its property — that is, without truth or falsity — which seems absurd. Granting the major, regarding the minor I say that truth or falsity is a disjunctive property of the proposition, and hence one or the other always inheres in it — just as contingency or necessity is a disjunctive property of being according to Scotus (*1.dist.39.¶.Vifo*) and Lychetus (*ibid.¶.Quantum ad 1.*), and every being is either necessary or contingent, though no being is both necessary and contingent simultaneously. Or it can be said that the aforementioned is not a property of the enunciation in the fourth mode, as the argument proves, and as the Doctor hints (*4.dist.8.q.2.ante X.*), when inquiring what kind of proposition a converted proposition is — whether true or false — he answers that it is then neither, and is prior naturally and perhaps also in time to its truth. You will object third: what signifies that something is or will be according to some certain or uncertain difference of time cannot be changed; but propositions about a contingent object signify that something is or will be at some determined or indefinite time interval. Therefore propositions of this kind cannot undergo the aforementioned change. The major is proved, because according to the common maxim of philosophers, "everything that is, when it is, must necessarily be"; therefore a proposition about the present is so true that it cannot be false; likewise, what is future as future is necessarily future; therefore a proposition about the future cannot be altered either; and about a proposition about the past no one is in doubt, because the past is necessary. Hence the Philosopher (*6.Eth.cap.2.*) writes that "God alone is deprived of this: to make undone what has been done." The minor can be induced through some propositions of a certain moment of time — as "Peter is writing" and "Peter will read tomorrow morning in instant A or B for half an hour" — or of uncertain time and instant, as "Francis at the third afternoon hour will hear a lecture, without the particular moment of that hour being observed when he will apply himself to the lecture." I deny the major. To its proof I distinguish: in the composite sense and the necessity of the consequence, I concede; in the divided sense and the necessity of the consequent, I deny. This distinction is drawn from Scotus (*1.dist.40.q.un.¶.Ad istam q.B. and dist.39.¶.Ad 1.Z.*). In this way nearly

everything that opponents urge is solved — and especially about future contingents with respect to divine foreknowledge, about which Scotus (*in the proximate dist.*) discourses at length over five questions.

You will object fourth: when the object is changed, its cognition is changed; therefore it is not the same proposition if the object about which it is enunciated changes. The antecedent is clear, because the object or species, which is its deputy, concurs in generating knowledge; therefore when the same object is varied, its cognition is also varied. I deny the antecedent. To its proof I distinguish: per se, I deny; accidentally, I concede — as is clear from the second note. Thus at the change of the object, the same cognition remains according to its substance, though not according to its accidents — that is, according to truth or falsity.

Article VII. Whether Enunciations about a Conjoined Extreme Can Be Necessary.

I read in the present article two conflicting opinions of great men: the first affirms that enunciations about a conjoined extreme are necessary and essential — such as Alexander of Hales, Bonaventure, Richard, and Thomas (*3.dist.7.q.1.art.1.*) and others cited by the Coimbrans (*q.6.c.4.art.6.*). The other denies that the aforementioned propositions are necessary and essential — which is maintained by Scotus (*3.dist.11.q.3.§.Hic sunt B. and more clearly dist.22.q.1.§.Sed quid logicè*), Bassolius, Mair (*ibid.*), and from the Thomistic school Capreolus (*same dist.*) and Soncinas (*9.Met.q.5.*), with whom the Nominalists with Ockham and many others agree.

Note first: the title of the present article can be understood in two ways — either of propositions that receive subjects connected with two accidentally united items, as "the black horse is capable of neighing" and "the russet lion is capable of roaring"; or of enunciations that have predicates joined with two accidentally conjoined items, as "Peter is a large man" and "Paul is a small man." About the latter there is scarcely any difficulty, since all hold those propositions to be contingent, because those predicates are connected contingently with such subjects. The whole dispute among logicians concerns the former — whether propositions taken in this way are necessary or contingent.

Note second, from the Report (*3.d.22.§.Sed quid*): for a proposition to be true of something, it must first be true in itself, as is clear from (*5.Met.T.29.34. and c.de falso*), where it is held that a false proposition is true of nothing — as this proposition is false and impossible: "man is irrational," because irrationality is the opposite differentia by which a brute is constituted in the being of a brute and distinguished from man, who is constituted in his being by rationality which is opposite to irrationality, and by the same rationality is distinguished from the brute and from everything that is not man. A proposition can be false in two ways: either when the things of which it is enunciated involve repugnance

with each other — as is clear in the proposition "man is irrational" just cited; or when the things of which it is made are not actually conjoined, though they can exist conjoined — as "Peter is writing," if Peter is not actually writing, the proposition is false, though it can be true. Scotus adds there that if no man were white, "a white man is a man" would be false, though it could be true. That it is false is clear; for it is inferred: "a white man is a man; therefore man is a white man"; if therefore "a white man is a man," then "man is white"; but with no man existing white, "man is white" is false, because it can be said of none in the a-priori sense. Wherefore of a proposition false in itself nothing is truly said. But a proposition is necessarily true when the predicate belongs to the essence of the subject — as "man is rational" — or is its property — as "man is risible" — or is really identified with it — as "risible is rational." It is contingently true when the predicate is actually conjoined with the subject, though it can exist without it — as "man is white" when whiteness actually exists in man.

Note third, from the Doctor (*nuper alleg.*) and Pelbart (*Tom.3.verbo communicatio idiomatum §.8.*): a predicate respecting a conjoined subject can be attributed to it either by reason of the whole subject — as "a rational animal is risible," where "risible" is said not of the animal alone (for then it would be predicated of a brute), nor of the rational alone (for then a rational soul separated from the body would be risible), but is accommodated to the whole subject — namely "rational animal"; or by reason of a part — as "a white wall disperses sight," where "to disperse" is attributed to the wall by reason of the whiteness inhering in it alone. Furthermore, observe that Scotus (*d.22.loci cit.*) inclines strongly to the view that a per se proposition requires a subject that is per se one in order that something be predicated per se of it. The reason is that of what is not per se one, nothing can be predicated per se. In this way "a white man is a man" is not per se, because the subject of this proposition includes two concepts — namely the concept of humanity and the concept of whiteness. Likewise, according to Scotus, "Christ is a man" is not per se, because Christ includes two concepts; for Christ is the same as the Word-man. Since, therefore, propositions about a conjoined subject are not per se for the reason assigned above, it is perspicuously inferred that they are neither essential nor necessary.

The assertion is: enunciations about a conjoined subject are contingent. So Scotus (*in the passages narrated above and 1.d.39.ante S.Sed contra sub H.*). It is proved first from Aristotle (*7.Met.cit. by the Doctor in the Report already cited §.Ad rationes principales*), where it is read: "What the being of a white man is, is not identical with a white man" — because if "white man" were essentially identical with "white man," a "white man" would be essentially identical with "man," which is false, since whiteness does not enter the essence of man. The sequence is clear from the second and third notes. Otherwise no difference would be seen between a per se composite and an accidental composite. Second, a necessary and essential proposition does not involve a contingent copula or union; but in the aforementioned propositions there is a contingent union on the part of the

conjoined subject; therefore they are contingent. The major is known from the preceding article and is supported by that dialectical canon handed down by me in the Epitome (*1.2.q.3.art.2.*): for the falsity of a copulative enunciation it suffices if either of its parts is false. The minor is clear, because whiteness accidentally and contingently adheres in man, and the conjoined subject "white man" is contingent; and "a white man is a man" is equivalent to a copulative — that is, "man is white and is a man." Third, in order that something be essentially and necessarily predicated of some subject, it is required that the formal account of the subject first be essential, necessary, and true for it, as I made plain in the second note; therefore in order that the predicate of an enunciation about a conjoined subject be predicated of that very subject, the account of such a predicate must be included essentially and necessarily in that subject; but the account of the predicate is not essentially and necessarily included in the conjoined subject — as in the cited proposition "a white man is rational" is clear. For "rational" is not necessarily and essentially included in whiteness, because it is accidental for whiteness to be in man, by which man is accidentally and contingently denominated white. And even if "rational" is essential to man, it is nonetheless accidental to him to be white, by reason of which the proposition is called contingent and accidental. Furthermore, the proposition whose subject's parts involve repugnance and impossibility toward each other is false and impossible — as "an irrational man is risible"; and the proposition whose subject's parts are necessarily conjoined is necessary — as "a risible man is rational"; therefore the proposition whose subject's parts are accidentally and contingently connected is accidental and contingent. And thus the Carthusian (*3.d.22.q.2.*) unjustly thinks that Scotus's view is supported by neither authority nor reason.

You will object second, from Aristotle (*7.Met.c.10.T.33.*): a bronze statue is an accidental composite, and it is added there that bronze belongs to the account of that very statue; therefore according to Aristotle a proposition about a subject composed of two accidentally conjoined items is essential. Confirmation I: the same Aristotle places propositions of this kind among simple and categorical enunciations (*1.2.perih.*). Confirmation II: it is doubted by no one that they are necessary. Confirmation III, from (*6.Top.c.1.locus 25.*): accidental being is essentially defined. Therefore nothing prevents propositions composed from accidental being, such as the aforementioned enunciations, from being necessary and essential. I respond that Aristotle in that passage by no means intends that bronze is of the intrinsic account of the statue, because he expressly teaches that a bronze statue is an accidental being, and accordingly bronze is its accidental account; but given that the statue is made of bronze, the proposition "the statue is of bronze" is true — just as, given that man is white, "man is white" is true — though it is accidental and contingent, as the former is. And Aristotle expressed this in the same work cited by me to prove the foregoing assertion, saying: "Whatever the being of a white man is, is not identical with a white man."

To Confirmation I: I say these propositions are simple on the part of the predicate, not on the part of the subject — thus Aristotle is explained. To Confirmation II: I say that he speaks there of definition taken broadly, which coincides with notification or description; for Orbellis (*7.Met.c.2.*) rightly observes that accidental being has no quiddity, since it is an aggregate of things of diverse genera, and therefore it cannot enjoy an essential and quidditative definition.

You will object second: nothing is more essential to any whole than the parts from which it is composed; but "white man" is some whole composed from humanity and whiteness as its parts. Therefore this proposition is essential: "a white man is a man." I respond that the major holds in a whole and its essential parts, but not in an accidental whole and accidental parts — which are integral natures, each perfect in its own genus, so that one is joined to the other accidentally, and the proposition formed from them is accidental. Furthermore, even if the said proposition is true by reason of man, it is not true by reason of white, as the Doctor asserts (*in Rep.cit. §.Ad 1.*).

You will object third: when something absolute can neither exist nor be understood without another, it necessarily and essentially includes that other, as is self-evident; but "white man" can neither exist nor be understood without whiteness; therefore whiteness is necessarily and essentially included in it, and accordingly when it is said "a white man is a man," it is a necessary enunciation. I respond that the major can have two senses: if it is understood absolutely, so that it includes repugnance for the one to exist without the other, it is conceded; if it is understood conditionally, it is denied. To the distinction of the major, the minor must be distinguished correspondingly: absolutely it is conceded; conditionally it is denied. For man can exist without whiteness and whiteness without man absolutely; but once whiteness is posited in him as such, the white man necessarily is white with the necessity of a condition, and this necessity is compatible with contingency — just as when it is said "Peter sits," insofar as he sits, he necessarily sits, because according to Scotus (*1.d.30. §.sed contra*), after Aristotle (*1.perih.c.ult.*): "everything that is, when it is, must be"; but simply Peter sits contingently, so that he can not sit, since the act of sitting inheres in him accidentally and contingently.

You will say, with the Coimbrans mentioned above, that such an enunciation can be considered in two ways: either in the being of existence, and thus it is a contingent and accidental proposition; or in objective and possible being, and in this way it is necessary and essential. Against this: the necessity and truth of a proposition is taken from the necessity and truth of the things about which it is enunciated, as is clear from the preceding article, where I was saying with Aristotle that "from the fact that a thing is or is not, a proposition is true or false"; but "white man," unless he exists, has no necessity or truth — because between these things signified by these terms there is no necessary nexus; for

man is a substance and whiteness is an accident that really differs from the substance, as is established in the Metaphysics in the question on accident; therefore there is neither necessity nor truth in objective being. For this reason a proposition is true in objective being only because it is about things that are essential or at least inseparable; but to be a man and to be white are neither essential nor indissoluble, since they are accidentally conjoined. Therefore such enunciations are contingent. This seems to be scented by the Coimbrans (*c.8.q.un.a.2. in the solution of the first and a.5. in the response to the first of the second objection, and near the end of that article in the fourth rejoinder*).

You will object fourth: an identical proposition is necessary and essential; but a proposition about a subject composed of two accidentally united items is identical; therefore it is necessary and essential. If the major is conceded, the minor is to be denied. For as the Doctor writes (*cit. §.Ad 1.principale*), with no man existing, "a white man is a man" is a false proposition, because the account of the subject is in itself false — namely "white man"; for it is inferred by conversion: "a white man is a man; therefore man is a white man," and further "man is a white man; therefore man is a man and thus," as in Article I (*ad ultimum*), "with no man existing, this is true: some man exists" — which no logician accepts.

Article VIII. Whether, of Two Singular Contradictory Propositions about a Future Contingent, One Is Determinately True and the Other Determinately False.

Approaching this most arduous and obscure difficulty, I find two extreme and diametrically opposed positions. The former is defended by the most eminent Cardinal Archbishop of Aachen (*1.d.38.art.3.prop.1.*), the Cordovan (*q.1.questionary q.55.dub.2.*), Catherinus (*opusc.de veritate enuntiationum*), and Raconius (*2.p.de enuntiatione sect.4.q.1.prop.1.*), who say that of two singular contradictory enunciations about a future contingent, neither is determinately true or false. These are favored by Fonseca (*4.Met. in the explanation of c.7.*), Bonet (*5.Met.c.2.*), and others cited by recent authors. The latter position is embraced by the Subtle Doctor (*1.d.39.§.Viso N. and §.Ad argumenta principalia and in Rep.eadem d.q.2. and Quol.14.§.Hic 5.*), T. Gadius (*ibid.fol.149.col.4.*), Tataretus (*1.perih.q.ult.*), Alexander of Hales (*1.p.q.15.m.7.*), Bonaventure (*1.d.38.q.1.art.3.*), Ockham (*q.1.Ad principale*), Richard (*q.5.art.1.*), Trombeta (*Opusc.de praescientia contingentium*), and many moderns — teaching that of two singular contradictory propositions about a future contingent, one is determinately true and the other determinately false.

Note first, from Scotus (*1.d.3.q.4.§.De tertiis G. and 2.d.7.q.un.§.contra d.*) and Mair (*1.Post.fol.61.§.Quarto arguitur*): there is a twofold agent — natural and free. A natural agent is one that, once all requisites for acting are in place, cannot not act — as fire, properly approximated to combustible material and unimpeded, cannot not burn that combustible material near it. A free agent, however, given all that is necessary for acting, so dominates its own act and mode of acting that

it is in its power to act or not to act — likewise to act intensely or remissly, that is, with greater or lesser effort. Thus acts the will, which is mistress of its own acts, free toward opposite acts, objects, and effects, as Scotus subtly pursues (*1.d.39.¶.Quantum ad 1.E.*). A contingent in the twofold sense, which is now under discussion, regards a free cause; and what is necessary or natural regards a necessary or natural cause. Thus since a free cause is indifferent and undetermined to either part, and can decline toward either one, determining itself to one part, it elicits its act freely and contingently and through it tends freely to its object, and likewise freely produces the effect it wills to produce. It stands, moreover, that the will determines itself to one thing while being able to will the opposite of it in the same instant — and in this the liberty chiefly shines forth; for when, for example, someone is writing, he has the power of not writing at the same time and moment in which he is writing. See what I said in the Physics (*l.de causis q.3.*), in the Treatise on the Knowledge of God (*disp.3.*), and in the Treatise on the Will of God (*disp.3.*).

Note second, from the same Doctor (*proxime alleg.¶.Ad argumenta principalia P.*): there is a difference between the determinate truth of enunciations about the past and present, and the determinate truth of enunciations about the future. For from (*4.d.45.q.3.¶.Circa istam sub B.*), the past has more of truth than the future, because the truth of future things is contingent while the truth of past things is necessary, as Aristotle testifies (*6.Eth.c.2.*). And from (*2.d.5.q.2.¶.Respondeo primo C.*), a proposition about the present is more determined than an enunciation about the future; hence the Philosopher (*1.perih.c.7.*) admits determinate truth in propositions about the present but not in propositions about the future. And in the Report (*1.d.38.q.2.¶.Ad 1.principale*): "The truth in future things is not like the truth in past and present things, because what is present or past is so determined that its opposite is not in the power of the agent." For that truth is certain and determinate in past and present things, such that falsity cannot underlie it — as "Christ was born." The reason is that what has once been posited outside its causes is no longer in the power of the agent to posit or not posit. It is indeed true that a free cause is by nature prior to its effect, and as such can produce its effect or not produce it; but once the effect is posited in being and produced, it cannot have not produced it. But in enunciations about the future, there is such determinate truth on one side that falsity can be there, because it is in the power of the cause, at that instant, to posit and effect the opposite; and this indifference and indetermination of the free cause is sufficient for deliberating and negotiating. Wherefore Trombeta and Tataretus, with the other named Scotists, rightly note that a proposition about the future can be said to be determinately true in two ways — namely, with determination of inherence and with determination of possibility. A proposition about the future is determinately true with determination of inherence that designates the thing as going to be as it is future; and a proposition is determinately true with determination of possibility that denotes

a thing as going to be in such a way that its opposite cannot occur — such is not a proposition about a future contingent, because the latter is so true that it can be false at the very instant at which it is true. Hence determination of possibility is adapted only to necessary and essential propositions. So that this may be perceived more distinctly and profoundly, and the arguments of opponents may be more easily dissolved:

Note third, from the same authors cited above: the indetermination of a free agent is twofold, corresponding to a twofold determination — namely, indetermination of inherence and indetermination of possibility, each of which is likewise doubled on the part of the cause and the effect. Indetermination of inherence on the part of the cause is that by which the cause is undetermined to acting or not acting; indetermination of possibility is that by which the cause is undetermined to being able to act or not being able to act. Indetermination of inherence on the part of the effect is that by which the effect is undetermined to being produced or not produced; while indetermination of possibility on the part of the effect is that by which the effect is undetermined to being capable of being produced. One of the aforementioned indeterminations and determinations is called "of inherence" because the extremes are of inherence, and the other is called "of possibility" because the extremes are of possibility. Just as indetermination can arise from two sources — namely from the indetermination of the cause and of the effect — so too determination can come from a twofold source, from the part of the cause and from the part of the effect. It is quite compatible, moreover, that indetermination of possibility coexist with determination of inherence, as I noted at the end of the second note.

Note fourth: something occurs necessarily in two ways — either by simple and absolute necessity, or the necessity of the consequent, by which it cannot occur otherwise: thus stars necessarily shine, the moon shines, and the sun illuminates; or by qualified necessity and by supposition, or the necessity of the consequence, by which something is, but can nonetheless be otherwise; but supposing that it is, it is necessary with this necessity of the consequence — as Peter sitting can not sit, but given the hypothesis that he is sitting, he necessarily sits with necessity by supposition. The first necessity destroys freedom and the contingency of things; the second, however, is quite compatible with freedom and the contingent occurrence of things. Thus future contingents stand with the immutability and infallibility of divine knowledge, as I pursued at length in the Treatise on the Knowledge of God (*disp. 3. q. 5.*). For God foreknows future contingents in the mode in which they are future; since they are contingently future, because they can occur otherwise, he foreknows them accordingly; and since they will be as he foreknows, and he foreknows as they will be, his knowledge is therefore called infallible and immutable, and they occur necessarily with the necessity of the consequence — as Scotus states (*cit. §. sed contra I. and §. Ad 1. pro 3. opinione Z. and quol. 16. §. De primo sub H.*) — which does

not destroy the contingency and freedom of the free cause. Wherefore, although God foresees all future contingents, according to that of Hebrews IV: "all things are naked and open to his eyes," nevertheless his prevision imposes no force on free will, because it is extrinsic to it; but rather the excellence and eminence of God's knowledge is indicated, which scrutinizes all things whatever they be, even the depths of the abyss. This is illustrated by an example: just as a most skilled physician who foresees that a patient sick with a malignant fever will die is not the cause of his death and imposes no force on him, so God foreseeing, for example, that the Antichrist will die finally in mortal sin — his foreknowledge is not the cause of the latter's eternal death; but his final mortal sin is the cause, just as the physician's prognosis does not compel the feverish man to depart this life, but the malignant fever brings death to him.

The assertion is: of two singular contradictory enunciations about a future contingent, one is determinately true and the other determinately false. So Scotus (*in the places previously mentioned*), with whom the greater part of philosophers and theologians agree. It is proved first: the propositions of the Prophets and the articles of orthodox Faith are so true that falsity cannot underlie them; but propositions of this kind are about a future contingent; therefore of a future contingent there is given determinate truth or falsity. The major is the chief foundation of the Christian Religion. The minor is induced through certain propositions, especially the following. Isaiah VII: "Behold, a virgin will conceive and bear a son." When this was uttered by Isaiah, it was about a future contingent determinately true, such that its opposite — "Behold, a virgin will not conceive" — was determinately false. Likewise those of Christ the Lord, Matthew XXVI: "Before the cock crows, you will deny me three times." And *ibid.*: "He who dips his hand with me in the dish, he will betray me." Luke XIX: the future destruction of the city of Jerusalem. Matthew XXIV: the resurrection of the flesh and the future day of judgment. Such and similar propositions are about a future contingent, determinately true, and their opposites are determinately false. All the more so because if the foregoing propositions were not determinately true, there would be no difference between true prophets and false prophets, since none of them would be a liar or a truth-teller; but in sacred scripture false prophets are convicted and true prophets are elevated with praises, as Ezekiel XIII reads of the false prophets: "They see vanity and divine lies saying: the Lord says — when the Lord has not sent them — and they have persevered in confirming the word." Deuteronomy XVIII: "This you will have as a sign: that the prophet who predicted in the name of the Lord, and it did not happen." And Matthew XXIV: "If therefore they say to you: behold he is in the desert, do not go out; behold he is in the inner rooms, do not believe." Therefore singular contradictory enunciations about a future contingent are determinately true or determinately false. Second, all things known by God are determinately true: for knowledge is of true things, from the first Posterior Analytics (*c.24.T.44.*). But future contingents are known by God,

according to Psalm CXXXVIII: "You have understood all my thoughts from afar, and you have foreseen all my ways." Wisdom VIII: "Who knows past things and estimates future things, knows the subtleties of speeches, the solutions of arguments," etc. Ecclesiasticus XXIII: "Before they were created all things were known, and after they were made he looks back on all things." Citing and weighing this passage, Saint Augustine (*15.Trin.cap.13.*) says: "God knows what is necessary for us before we ask him, nor did he come to know these things from any point in time, but all future temporal things — before the ages in which we were going to ask him for something and when, and those whom he was going to hear or not hear — he foreknew without beginning beforehand." Third, that proposition is true which conforms to its object — that is, which enunciates that to be which is, and that will be which will be; and conversely that is a false proposition which enunciates that to be which is not, and that will be which will not be. But one of the singular contradictory propositions about a future contingent enunciates that will be which will be, if it is affirmative; or that will not be which will not be, if it is negative. Therefore of the aforementioned propositions one is determinately true and the other determinately false. The major is Aristotle's (*1.Perih.cap.4.*) and can be corroborated by the definition of truth, which is the conformity of the intellect with the object. The minor is proved: this proposition which I stated three days ago is determinately true — "I will be writing the day after tomorrow" — because it enunciated that which now is, since I am truly now writing. All the more so because the truth or falsity of a proposition is not taken from the actual existence of the thing; otherwise a proposition about the past would not be true, since it is not about an existing object; nor would God truly and determinately know things unless they existed — which conflicts with the passages of Scripture cited in the first argument. And rightly almost all theologians remove from consideration the eternal coexistence of things with God's eternity, which Cajetan (*1.part.q.14.art.13.*), according to the testimony of Lychetus, and a few others try to introduce into the schools. Fourth: where there is a true contradiction, there is no middle term, as Aristotle (*4.Met.cap.5.T.27.*) and Scotus (*1.dist.2.q.2.ante §.ostenso sub Y.*) hold, and I made plain in the preceding book (*q.9.art.7.*). But between singular propositions about a future contingent there is a true contradiction — as "Francis will write or will not write." Therefore just as by reason of the contradiction, in a proposition about the present there is determinate truth or falsity — "Peter sits or Peter does not sit" — and in a proposition about the past — "Peter wrote or Peter did not write" — so the same is to be affirmed for propositions about future contingents. Finally, between "is" and "is not" no middle intervenes according to the first principle — "whatever is, either is or is not"; therefore between "will be" and "will not be" no middle is interposed.

You will object first: a future contingent is by its very nature indifferent and undetermined to being or not being; therefore an enunciation formed about a future contingent is not determinately true or false. The consequence holds

because the truth of a proposition presupposes the truth of the thing, as Aristotle writes (*at the end of the chapter on substance and 10.Met.T.5.*). The antecedent is easy to prove — both from the description of a future contingent, and also from its cause, which is undetermined to producing it or not producing it. Since therefore a future contingent is not determined in itself, because it does not yet exist, nor in its cause, because it has not yet determined itself and does not determine itself to acting, it is clearly deduced that of it there is no certain knowledge and truth. I respond by distinguishing the antecedent: a future contingent is undetermined with the indetermination of possibility, I concede; it is undetermined with the indetermination of inherence, I deny. This distinction needs no further explanation beyond what I provided in the third note.

You will object second: as a thing stands with respect to entity, so it stands with respect to truth, from (*2.Met.cap.1.T.4.*) and Scotus (*ibid. in the exposition of the text*); but a future contingent has no entity, since it has not yet been produced by its cause but is only future, that is, about to be produced by it. Therefore a future contingent receives no determinate truth. Granting the major, the minor is to be distinguished: in the being of actual existence, I concede; in objective being, I deny. Thus responds the enlightened Doctor Francis of Meyronnes, and before him the Subtle Doctor (*q.8. primi Perih.§.Ad aliam q.vers.Ad 3.*), where he interprets the maxim of Aristotle cited in the major — namely, "as a thing stands with respect to being, so with respect to truth" — saying: "for the truth of such a proposition there must be in the thing a union of the kind that is signified in speech. But the nature signified by what Caesar is, is a being through the intellect; otherwise the intellect would not make a composition about it; and so there is a composition of what exists in the intellect with itself, and such composition suffices for truth where the thing does not exist — as is clear in these: 'a chimera is a chimera,' 'a non-being is a non-being.'" Especially because God certainly foreknows future contingents in objective being from the determination of his will, as Scotus (*1.dist.39.§.Vifo O.*), Lychetus, Vigerius, and others (*ibid.*) hand down.

You will object third: if future contingents were determinately true or false, they would be known by some intellect; but they are known by no intellect; therefore they are not determinately true. The major is Scotus (*4.dist.10.q.8.ante §.Ad argumenta sub N.*), saying that what has determinate truth has determinate knowability in any intellect surveying the whole of being. The minor is shown: for it is not known by the created intellect, which cannot fathom what free will is going to do or not do, except perhaps conjecturally, as the Doctor touches upon (*4.dist.45.q.3.§.Circa istam ante B.*). Nor by the uncreated intellect: Isaiah XXVIII — God predicted the death of Hezekiah and in Jonah III the ruin of Nineveh, and yet these did not come to pass; therefore he did not know them determinately. Confirmation: if God foreknew these things with certainty, he would have foreknown them from eternity, since his knowledge is eternal, immutable, and

incapable of increase; but what is from eternity is necessary and infallible, and accordingly there would be no future contingent — as the Stoics believed. Granting the major and the first part of the minor — namely that a created intellect cannot determinately know a future contingent while it is in its cause, as the Doctor notes (*in 4.cit.*) — if the created intellect does not know this, it is to be attributed to its weakness and infirmity; the second part of the minor is to be denied. To its proof I say that that manner of speaking was minatory or conditional — that is, those things were going to occur unless they amended themselves through penitence; but since they did penance, and he by weeping toward the wall (*2 Kings XX*) and these by fasting and humbling themselves at the preaching of Jonah, as Christ the Lord testifies (*Matt.XII*), they obtained pardon from God, and none of those things that had been foretold to them occurred — just as in Acts VIII, Simon Magus was beseeching the Apostles that through their prayers none of those things they themselves had said would come upon him. To the confirmation I say that this only proves that a future contingent related to divine foreknowledge is necessary with the necessity of the consequence, which is quite compatible with the contingency of things and free will; but not with the necessity of the consequent, which removes created freedom and abolishes contingent effects, as I observed in the fourth note.

You will object fourth: if there were determinate truth about a future contingent, then since it can not be and its opposite can occur — as its name and its description (*1.Prior.cap.4.*) indicate — there could be determinate falsity underlying it; but "from a possible posited in being, no impossible follows." Therefore if its opposite were posited — that which had been foreknown by God — God himself would be deceived, because the thing would occur otherwise than had been foreknown by him. But that God cannot be deceived is a steadfast truth that no one can rightly deny. I respond that the indetermination of possibility stands with determination of inherence; and so we grant that the opposite can indeed occur, but will not occur; and if it had occurred, it would have been foreknown by God. Therefore God cannot be deceived, because to be deceived is to think a thing will be otherwise than it is going to be, for the time when it is believed to be. But God foreknows a future thing as it will be, and likewise foreknows that the thing can occur otherwise, but will not occur otherwise — for example, God foresaw that I would be writing today, and for this time, as I am truly now writing, and that I can not be writing now, but that this would not occur now — namely that I would not be applying myself to writing now — as the Doctor explains and pursues admirably (*in primo alleg.§.Ad 1.2.q.sub Q. and dist.40.q.un. in the solution of the second infra D. and in the Report eadem dist.q.2.near the end*), where he adds that it is a fallacy of the consequent; the same views the resolved Doctor Johannes Baconius (*ibid.*). To what is added — "from a possible posited in being no impossible follows" — Scotus (*ubi supra*) meets the objection: from the positing in being absolutely, no impossible follows; but from the positing together with another proposition of

inherence that stands, an impossible does follow, because it supposes the opposite to be conserved in being — for example, I can write tomorrow; given that I write tomorrow, no impossible is had; but if this is joined to another — namely, I can not write — an impossible follows, because in the same instant it cannot be both that I write and that I do not write. Thus, given the hypothesis that God foreknew that I would be writing, at this very instant I am indeed writing, and I can nonetheless not write; but given that I am now writing, in the composite sense I cannot not write, though I can in the divided sense. Wherefore, although something simply does not conflict with itself, it can nonetheless conflict by reason of the positing of another. In this sense the future contingent can not occur; but given the foreknowledge of God by which he foreknew it as future as it is future, it is a contradiction for it not to be future — because God foresees things in objective being from the determination of his will, in that mode and at that time in which they are future; and if they are not future, he does not foresee them as future but as possible, nor are they determined by the divine will, which is the root of all future things, as Lychetus writes with the Doctor and the Scotists in the passages already cited.

You will object fifth: if a future contingent were determinately true, there would be no need to deliberate and negotiate, as Aristotle argues (*at the end of the first Perihermeneias*); but with deliberations and negotiations removed, human liberty, merit and demerit, praise and blame are also removed — which is heretical and absurd. Therefore a future contingent is not determined. The sequence of the major is proved: for if things are already determined to being or not being, there is no human solicitude; for whether man deliberates and negotiates or not, such things will be or will not be, since they are already determined from all eternity to being or not being, and were foreseen from eternity by God — who cannot be deceived — as going to be in that mode at that time. I deny the sequence of the major. To its proof I say that even if future things are determined with determination of inherence, they are nonetheless undetermined with indetermination of possibility, and thus human freedom is preserved and the indifference of contingent things remains, and deliberations and negotiations are valid; since even though free agents are determined to acting, they nonetheless possess the power of not acting or of doing the opposite — just as one who is actually writing has the power of not writing. Hence he remains free to elicit his acts and to carry out his works, as Scotus (*praecit. §. Ad argum. principalia P.*), Tataretus — both there and also in the Logic (*Perih.q.ult.*) — teach excellently. What Aristotle thought about these things the scholastics dispute among themselves; omitting their quarrels, perhaps it can be said that when Aristotle (*in the cited passage*) asserts that future contingents are undetermined to either, he is speaking of indetermination of possibility, and not of indetermination of inherence. This interpretation seems to the Doctor (*cit.*) when he says: "This indetermination — namely of possibility — suffices for deliberating and negotiating. But if neither part were going to be, there would

be no need to deliberate or negotiate; therefore the fact that one part is going to be, while the other can nonetheless occur, does not prohibit deliberation and negotiation." But if the Philosopher does not accept this meaning and wishes future contingents to be altogether undetermined — as he plainly seems to think in that passage, and as Antonius Andreas explains him there, and as Scotus had already indicated in the Reports cited (§*Ad rationem Philosophi*) — then in this matter, and in certain others, especially about the world being set up from eternity, as can be seen (*5.Phys.cap.1. and 1.Caeli T.102.*), he is not to be followed, but rather the authors of the opposing view, which is common in our time.

Book V. On the Syllogism.

There remains in this last book to treat the syllogism, which I prefaced as the scope of Aristotle and the object of his Logic in the Preface to the Epitome and asserted in (*lib.1.q.3.art.7.*). For having prefaced the books of the Predicables and the Categories — in which I taught simple and incomplex terms, which are the remote parts of the syllogism — and having surveyed the enunciation in the preceding book, which is its proximate part, as the Doctor decides (*1.Priorum q.2.§.Quantum ad 3.not.*) — I now not inopportunately proceed to examine the syllogism composed from the foregoing. The order of nature requires that, once the parts have been investigated, the whole from which they coalesce be subsequently sought — which the Stagirite performed diligently, as I observed (*1.Phys. and in other passages in the prelude to the first book of the Epitome*).

Question I. On the Syllogism in General.

Article I. Whether the Syllogism Is the Subject of Aristotle's Prior Analytics.

This doubt seems to have been nearly decided by me in (*lib.1.q.3.art.7.*); yet I judged that it ought to be expounded here in the proper course — both because this is its proper place, and because logicians are not in agreement about it, as can be seen from the Coimbrans and Ruuvius in the proem. For Marsilius makes argumentation the subject, Averroes with Alexander makes demonstration the subject, while Scotus (*1.Priorum q.2.*), Tataretus (*ibid.q.1.dub.1.*), and others commonly make the syllogism the subject of attribution of this work.

Note first, from the interpreters of Aristotle: these four books, which we have in hand for discussion and about which we propose the five questions mentioned above for decision, are called in Latin "resolutories" and in Greek "analytics." And indeed the first two are entitled by Aristotle and his expositors "analyticōn proterōn" or Prior Analytics; but the last two "analyticōn hystērōn" or Posterior Analytics, as Zabarella (*in comm.1.post.*), Mair (*ibid.*), and the Coimbrans note after Galen, cited by them. Why these books are entitled analytic — that is, resolatory

— the reason given is that in them the norm and mode of resolving conclusions into their principles is handed down. Since, however, as Scotus (*praecit.*) and Mair (*Tract.de syllog.*) say, a conclusion can be resolved into its principles in two ways — namely according to form and according to matter — Aristotle therefore provides the rules and precepts of each mode of resolving: the first mode of resolving in the book of the Prior Analytics; the second in the book of the Posterior Analytics. Since the resolution of a conclusion into its principles according to form consists in the premises properly disposed in mode and figure, as I explained in the Epitome (*lib.3.art.5.q.1.*) — those books are from this resolution called the Prior Resolutories. And since the resolution of the conclusion into its principles according to its matter is sought from the necessary connection of the extremes with the middle term in order to infer the conclusion, the remaining books are for this reason called the Posterior Resolutories. Why the former are called Prior and the latter Posterior: a reason not to be despised is given — because discussion of the syllogism taken generally must precede discussion of the syllogism taken particularly, just as the treatise on genus precedes the treatise on species, and universally more common things are to be prefaced to less common ones, as I noted not once above, and Mair noted in his explanation of the first book of the Posterior Analytics. Hence, because in those books the syllogism in general is treated, and in these the syllogism in species — which is demonstration — I determined to dispute first about the syllogism and subsequently about the rest.

Note second, from the Doctor (*1.Priorum q.6.¶.Respondetur*) and Tataretus (*cit.dub.1.*): two things are found in the syllogism, some of which are called the formal principles of the syllogism — namely, mode and figure — from which the syllogism is constituted as in its formal being, as it were as form. Just as the soul is the form of an animated body, so these seem to be the form of the syllogism; or if you prefer, the essential differentia of it, just as rationality is the essential and quidditative differentia of man. Certain others are called material principles — such as the propositions from which the syllogism is composed, as it were from its matter. And from these as from matter and form the whole syllogism is constituted.

The assertion is: the syllogism, considered according to its generic formal account, or as Scotus says, insofar as the properties common to itself pertain to the necessity of inference, is determined to be the object of Aristotle's Prior Analytics. So Scotus (*cit.¶.Quantum ad 3.vers.si autem fiat consideratio.*). It is proved first from Aristotle (*this locus cap.4.*), where he proposes to treat first of reasoning and then of demonstration, the reason for which he gives as that reasoning is more common and wider than demonstration. For demonstration is indeed reasoning, but not every reasoning is demonstration; for a topical syllogism is clearly reasoning but not demonstration, as all confess; and reasoning coincides with the syllogism, as is clear from (*cap.1 of this book.*). Therefore since according to Aristotle these books treat of reasoning as their subject matter, consequently

reasoning is their object. Second: that whose definition, parts, and properties are examined is the object of a given work, as is clear from the conditions required for a subject, as I handed down and explained in (*lib.1.q.3.*). But the definition, parts, and properties of the syllogism pertaining to the necessity of inference are considered in this work, as is evident to the reader. Therefore the syllogism, in its generic form, is aptly located as the subject of these books.

You will object first: it is Aristotle's intention at the beginning of the first Prior Analytics to treat of demonstration and the science of demonstrating; therefore according to Aristotle's intention, the object of these books is demonstration. I respond that Aristotle's purpose there is to treat of demonstration — not indeed in this work, but in the next following, that is, in the Posterior Analytics — as the same Philosopher plainly indicates (*cap.4 of this book*), where he explicitly ordains that he will discuss first reasoning and then demonstration, which holds the first place among the other argumentations; and he hints at the reason there — because knowledge of the superior serves for knowledge of the inferior.

You will object second: the subject of a science does not exceed the limits of the science of which it is the object, as is clear from what was said in (*lib.1.q.3.art.1.*). But the syllogism exceeds the scope of this prior analytic work; it is established by the Doctor as the primary and adequate subject of the whole of Logic, as is clear from his third question on universals. Therefore the syllogism is not the subject of these books. I concede the major; I distinguish the minor: in all its parts and properties, I concede; in its form or the necessity of inferring, I deny. For it is considered in this way alone as the subject of the present work. I satisfied this from Scotus in the now cited passage (*lib.1.art.7.objection 3.*).

You will object third: Scotus (*cit.*) removes argumentation from the subject of Dialectic, and there establishes the syllogism — in whose footsteps I also followed as I showed above in assertion I. But in (*1.Priorum q.2.*), in the account of all the parts of Logic and its total object, the same Doctor asserts that the object of the Prior Analytic work is argumentation insofar as its general properties pertain to necessary inference. Therefore either Scotus contradicts himself, or the syllogism is not the subject of these books. I respond that Scotus in the said Prior Analytics takes argumentation as coinciding with the syllogism — as the Scotists observe, who hold the subject of that work to be the syllogism, though the Doctor there stated it to be argumentation: which is clearly gathered from the same author, who (*ibid. ante §.Ad 1.not.*) says that "the opposite is argued by those who commonly explain this book, who hold that the syllogism is the subject of this one." But in (*q.3.univers.*) he takes argumentation broadly, insofar as it is distinguished from the syllogism, and thus did not intend to assert there that argumentation is the object of the Logic handed down by Aristotle, for the reasons adduced by him in that place and accepted by me.

Article II. What the Syllogism Is.

Although the definition of the syllogism, which I introduced and explained in all its parts in the Epitome (*lib.3.q.art.3.*), is now nearly clear, it is nonetheless my pleasure to examine carefully and with diligent inquiry the said definition and its principal objections principally with Scotus (*lib.1.Priorum q.5.*). For a more convenient grasp of this, recall what I taught in the Epitome (*lib.2.q.7.art.2.*) about definition and its necessary conditions, as well as what Scotus (*q.alleg.*) notes — especially (§.Quantum ad 1.not.) — namely that definition is of two kinds: the one quidditative simply, which is adapted to composite substance alone, according to Aristotle (*7.Met.T.15.*); the other by addition — such as the definition of an accident, which expresses not only the essence of the accident itself but also the subject in which it inheres. A third can be added — namely the descriptive definition, which the Doctor (*ibid.*) seems to call the definition of the name, and I showed that it is produced in various ways in the cited passage in the Epitome. Furthermore, for clarifying this the distinction introduced in the second note of the preceding article is helpful — into formal and material parts of the syllogism, both proximate and remote, from which the whole syllogism is constructed. Hence it is clear that the syllogism is not something simple and incomplex, but something complex and composed from multiple properly disposed parts. Although the syllogism materially speaking includes many things, it nonetheless receives its proper essence and unity formally — which every logical being of reason or logical second intention possesses as well. For as Scotus most acutely observes (*4.dist.1.q.2.§.Ad 1.arg.O.*), however many diverse things can concur in the foundation of one relation of reason — it is necessary that many things be conceived as one in relation to some signified. And this is clear because this one relation, which is to signify good new wine, can very well have as its foundation the whole of this — a circle covered with ivy leaves set up on a cross, etc. Nor should the difference be omitted that Scotus (*cit.*) and more clearly (*1.Priorum q.16.§.Secundo not.*), and which I touched on in the Epitome (*lib.3.q.1.art.2.*), and others commonly assert between formal and material consequence. For if the conclusion is inferred from the premises by reason of the syllogistic form, which consists in mode and figure, it is called a formal consequence; but if the conclusion is deduced only according to the extremes necessarily connected with the middle term, it is called a material consequence. And according to this twofold consequence a twofold resolution is likewise noted — the prior analytic and the posterior analytic — which is clear from what was said in the preceding article, note I.

The assertion is: the syllogism taken materially is not defined essentially and quidditatively; but this is otherwise if it is used formally. This is indicated by the Doctor (*q.alleg.§.Quantum ad 2. and q.4.cit.*). The first part, which seems to be located by the Doctor (*cit.*) in the present book in conclusion I and II, is proved by him because only substance constituted from genus and differentia is defined essentially and quidditatively, from the seventh book of the Metaphysics, as I noted above. But the syllogism is an intentional accident; therefore its definition

thus accepted is not essential. If you say that an accident is defined essentially, provided it consists of genus and differentia, as every good definition must. Against this: the definition of an accident expresses the subject as something added; but in the adduced definition of the syllogism no subject is explained; therefore it is not to be considered quidditative, if accepted in the way I said. Furthermore, the syllogism is composed of multiple propositions explained in the cited Epitome, which are distinguished from each other. But one definition is declarative of one thing only. Therefore the definition of the syllogism taken materially is not to be numbered among essential definitions. The second part is touched upon there (*concl.3.vers.His igitur praemissis*), where genus and differentia are assigned — which are the chief conditions of an essential definition, by everyone's judgment — and it is the explicit doctrine of the Doctor (*in q.4 just mentioned*); and it is explicitly maintained by the Coimbrans (*q.2.cap.1.art.2.*). And it can be urged thus: that is an essential definition which enjoys genus and differentia, as none denies; but the aforesaid definition of the syllogism possesses genus and differentia, as is clear from its parts explained in the Epitome; therefore, etc. Again, and it seems to come to the same thing: what coalesces from material and formal parts is defined essentially, whether those parts be physical or metaphysical; but the syllogism is composed of material and formal parts, as I declared in the preceding article, note II. Therefore its definition is essential. Add that the definition of genus and other second logical intentions is in its own mode quidditative, as I proved in (*lib.2.q.2.art.2.*); and of all logical second intentions the Doctor writes (*in q.4.cit.§.De 2.1. and §.Ex his K.*). But the syllogism is one logical second intention comprising the rest of the second intentions, as Sarnanus hints (*Tract.de primis et secundis intentionibus art.1.2.*). Furthermore, the operations of the intellect are in their own mode quidditatively defined, as is clear in the preceding book from the definition of the enunciation, which is the second operation of the intellect passively taken. Nothing therefore prevents the definition of the syllogism from being essential and quidditative.

You will object first: definition is given of incomplex things only, since there is one definition of one thing — and especially for clearly declaring its parts; but the syllogism is something complex, for it is a discourse composed from multiple discourses joined to each other, as is clear from what was said; therefore the syllogism cannot be defined essentially. I distinguish the minor: definition is of incomplex things formally taken, I concede; materially or fundamentally accepted, I deny. For multiple things can be disposed and ordered toward one, and of it as such — with the others presupposed — a definition can be given, as I made clear with Scotus (*cit.*) and in the Report (*ibid.*) before the foregoing assertion. Sarnanus (*praenominatus*) declares this same thing lucidly, saying: the intellect cognizes two propositions aptly disposed according to the syllogistic rules, and compares them to another proposition that is properly inferred from those premises; and this comparison of both premises

to the conclusion is a logical second intention called a syllogism. Especially because the syllogism is called one discourse on account of one connection of the extremes and one illative judgment.

You will object second: a good definition belongs to the whole of the thing defined, as is clear from the laws of an apt definition given by the Doctor in the present question. But the aforementioned definition of the syllogism does not apply to every syllogism — namely, to the enthymeme, which from the first Posterior Analytics is a syllogism, though it consists of only two propositions; but a syllogism requires three propositions. Therefore that is not the genuine definition of the syllogism. I concede the major. To the minor I say that the enthymeme is a truncated and imperfect syllogism, in which one proposition is silently understood, which is virtually contained in it, and a perfect syllogism can be made if that proposition which is suppressed is added to it.

You will object third: a definition is vitiated in which a remote genus is placed, from (*4.dist.11.q.3.sub CC.*). But in the aforementioned definition of the syllogism a remote genus is placed — namely "discourse," whereas the proximate genus, which is argumentation, should be placed in it. Therefore that is not an apt definition of the syllogism. Because of this argument some, such as Burana, substitute in place of "discourse" the term "reasoning" or "ratiocination," which they consider to be the proximate genus of the syllogism. But I, approving the common version, can respond by denying that "discourse" is the remote genus of the syllogism, since ratiocination, argumentation, discursus, and the like are used interchangeably, as Hurtado (*disp.9.sect.10.*) notes, and Mastrius and Bellucius (*disp.11.q.1.*) indicate, and Arriaga does not dissent (*disp.15.sect.2.*) — though he thinks in (*sect.1 of the same disp.*) that demonstration is the genus of the syllogism. And this will be more manifest below in Article IV. Therefore to the form of the argument I concede the major and deny the minor, which is proved by no logician I have seen. Add that in the following article it will be shown that the syllogism is not a genus with respect to the demonstrative, topical, etc.

You will ask whether the aforesaid definition of the syllogism is aptly adapted to both the illative syllogism — in which only the illative form is found, and which Aristotle sometimes uses in this work with initial letters, as "every A is B; but C is A; therefore C is B" — and to the probative syllogism, which is formed from some proper material, or a certain and particular thing, as "every virtue is praiseworthy; modesty is a virtue; therefore modesty is praiseworthy." I respond that it applies to each: for each is a discourse consisting of three propositions. Nevertheless it fits the probative more, both because it is useful to the sciences, and because the chief purpose of the syllogism is the investigation of truth.

Article III. Whether the Division of the Syllogism into Dialectical and Demonstrative Is a Division of Genus into Species.

The common opinion of logicians holds that the syllogism is distributed into dialectical and demonstrative as a genus into its species. The opposite position is maintained by Scotus (*1.Priorum q.6.*), Tataretus (*ibid.q.1.dub.1.*), Mair (*Tract.de syllog.ante c.2.*), and others who deny that the aforementioned division of the syllogism is a division of genus into species.

For the elucidation and resolution of this question, the twofold differentia of the syllogism given and explained in Article I of this question, note II, contributes greatly — namely, the formal and material: the formal is the figure with the mode of inferring, or the concluding inference from the premises; the material, however, are the propositions from which the syllogism is constituted as from its matter. For the necessity of the demonstrative and the probability of the topical syllogism — on account of which the aforesaid division is made — are taken from the propositions, which are its matter. If those propositions were necessary, the syllogism composed from them is demonstrative; if they were contingent and probable, a topical syllogism is composed from them.

Wherefore those parts of the syllogism are not essential and formal to it, but accidental and material; and the syllogism is called not a genus but a whole in mode — because it is determined by accidental and material determination — by the Doctor (*ubi supra.*). And thus Aristotle (*1.Top.c.1.*) is to be explained, who enumerating the syllogisms — dialectical and demonstrative — plainly declares them to be species of the syllogism.

The assertion is: the division of the syllogism into dialectical and demonstrative is not a division of genus into species. So Scotus (*cit.§.Respondetur, conclusione I.*). It is proved first: the division of a genus into species is effected through formal and essential differentiae, from (*1.Met.T.43.*). But the distribution of the syllogism into topical and analytic is made through material and accidental differentiae, as I noted before the assertion. Therefore such a division is not one of genus into species. Second: the thing of which things are not species has no genus with respect to those of which it cannot be a genus; but the topical and analytic syllogisms are not species of the syllogism taken generically; therefore the syllogism is not their genus, and accordingly its partition into them is not essential. The major is clear from the definition of genus. The minor is proved: complex entities are excluded from the categories, as is clear from the book of the Predicaments, where incomplex being is divided into ten categories; but the dialectical and demonstrative syllogisms are complex entities, for they are composed of multiple discourses, as is clear from the definition of the syllogism in general. Therefore the syllogism with respect to the topical and analytic is not a genus.

You will object first: what is predicated of many things differing in species in "what is it," is a true genus of those of which it is so predicated, and its division into them is essential; but the syllogism taken precisely is predicated in "what is it" of the topical and analytic syllogisms; therefore it is their genus, and the said

division is formal and essential. The major is conspicuous from the definition of genus. The minor is proved: the definition of the syllogism is correctly adapted to those syllogisms that differ among themselves not in number, therefore in species. I concede the major; I distinguish the minor: if such definition is taken according to material parts, I concede; if it is taken according to formal parts, I deny. All of this requires no other clearer explanation than that which I provided in the second article; see it there.

You will object second, from (*1.Post.T.43.*): the subject of a science is one in genus; but the syllogism is the subject of Aristotle's Logic, from what was asserted in (*lib.1.q.3.art.7.*); therefore the syllogism is one in genus; but it does not appear to be a genus unless it comprises species under itself, which seem to be none other than the dialectical and analytic syllogisms; therefore the syllogism is the proper genus of each. I respond: I deny indeed that the syllogism is a genus having species under it, but deny that those species are the topical and analytic syllogism. For the syllogism insofar as it is a genus can be distributed into four species, which are named by the terms Barbara, Celarent, Darii, Ferio — as Tataretus and Mair probatively defend in the present context. Or it can be said that the common run of philosophers uses material and accidental differentiae in place of essential and formal differentiae, as I noted elsewhere from Aristotle and Scotus in a similar case. In this sense perhaps the Doctor (*3.dist.23.q.un.R.*) calls induction a species of argumentation.

Article IV. Whether Discursus, Syllogism, and Argumentation Are the Same Thing.

Most think that discursus is a genus with respect to argumentation or the syllogism, enthymeme, induction, and example — favored by the Coimbrans (*c.1.primi prio.q.2.art.1.*) and Arriaga (*disp.15.sect.1.*). Others think that discursus, ratiocination, and the rest narrated above — from Saint Bonaventure (*3.d.2.q.5.*) — though differing in word, agree in reality; such seem to be the view of Lychetus (*q.3.prol.4.lat.§.Iuxta hoc*), Bargesius, Vigerius, and the other Scotists (*ibid.*), with whom Raconius (*Tract.de argumentatione sect.1.*) agrees, and Scotus does not differ far from this, as will be cited below.

Note first: that three modes of discoursing can occur. First, insofar as it is the same as understanding one thing after another — and in this way only God, who simultaneously understands everything in a single act, is immune from discursus. Second, insofar as it is the same as understanding one thing through another — thus Saint Augustine (*lib.de divinatione*) says that a demon from the affection and disorder of the air known to itself foresees future storms. Third, insofar as it comprises both — or to know one thing after another and through another, which is to say, from the knowledge of one known thing to arrive at the knowledge of another unknown thing — and for this reason one is said to discourse, a metaphor taken from the running and motion of an animal, as the Coimbrans (*praalleg.*) observe with Albert. For just as an animal when it passes

from one place to another is said to run, so the created intellect, when it knows one thing after another or through another, is said to discourse — from the knowledge of what is prior and known to it to the cognition of what is posterior and unknown to it. Hence discursus is described as the progression of the intellect from the cognition of a known thing to having the cognition of an unknown thing — as when from premises known to it it makes its way to the conclusion inferred from them, which was sought and subsequently becomes evident to it. This description of discursus does not differ from that which the Doctor (*2.d.3.q.9. §. Contrà 2.A. and q.10. ante N.*) gives, saying: discursus is a cognition from the known to the unknown. Nor is it dissimilar to what Lychetus (*cit.*) has and I accept in the Treatise on the Prologue (*disp.3.de scientia Dei disp.1.q.4. and de Angelis disp.6.q.1. §.5.*): discursus is the inference of the consequent from the antecedent, fundamentally including two premises disposed with the proper mode and figure, and terminatively including the conclusion drawn from them — and this same is hinted at by Scotus (*Quol.15. §. De 2. sub V.*).

Note second, from Mauritius (*q.26.univers.*) and Bargesius (*q.4.prol.*): discursus requires three conditions. The first is that one thing be cognized by the intellect after another — that is, once the cognition of the premises is had, the knowledge of the conclusion is acquired. The reason for this is given: because since discursus is a transit or procection from one thing to another, and accordingly a spiritual motion, it necessarily includes two terms — the terminus from which and the terminus to which. The terminus from which are the principles, and the terminus to which is the conclusion. The second is that one thing be understood through another — because since the extremes are conjoined with the middle, so too with respect to being known, the dependence is such that one is not fully perceived without the other, especially because the cognition of one is the cause of the cognition of the other. The third is that the premises be known and the conclusion be cognized by another knowledge. For distinct cognitions generated through acquired species are produced about distinct objects, as is shown in the book on the soul. For the premises differ from the conclusion as cause from effect; and that distinct pieces of knowledge are had of cause and effect no one is ignorant of — and this will be made more manifest from the articles to be examined below. Scotus hands this down clearly (*q.1. primi Post.*), and it is his explicit view in the Prologue (*q.alleg.*), where he plainly teaches that science is caused through syllogistic discursus and is the equivocal effect of the premises. The same he writes in (*3.dist.14.q.2. ante §. Ad 2.q.*), and Gadius (*Quol.15.fol.163.*) and other Scotists follow him. I note this on account of the Coimbrans (*praenominati*), who from Cajetan (*1.p.q.58.art.3.*) argue against Scotus because they think (*q.4.Prol. and 2.d.27.q.1.*) that he asserts that multiple cognitions are not necessary for discursus — but they attribute this to him wrongly, since the opposite is plainly read there, as Pelbart (*Tom.1.verbo scientia §.7.*), Vulpes

(*Tom.1.prima p.disp.24.art.1. and disp.2.art.7.*), the Two Juniors (*disp.11.q.1.*), and the other Scotists both ancient and recent defend.

You will say: Scotus (*3.dist.14.q.2. and Quol.15.*) asserts that the Blessed can in a single vision see the divine essence and the created objects that eminently shine in that essence. Therefore in the view of the Doctor one act suffices for discursus, by which both the premises and the conclusion are attained. I must meet this objection: given the hypothesis, that vision is caused by the divine will in the intellect of the Blessed, but it is not properly discursive, because the Blessed see it in the divine essence as in the most lucid mirror, and not through the divine essence — as Gadius (*fol.163.*) well notes. See the Quodlibet (*cit.*).

Note third, from the same Scotus (*in prol.alleg.*): discursus can be effected in two ways — successively or in an instant. It occurs in time when the cognition of one thing is had prior in time to the cognition of another, which happens to us on account of the weakness and imperfection of our intellect, which — when an effect is cognized — does not immediately come to the cognition of the cause, as is clear from Aristotle (*1.Met.2.*) narrating that men began to philosophize from the effects known to them and their ignorance of causes. But discursus can be effected in an instant, when the premises are cognized prior by nature to the conclusion — and in this way the Parisians (*1.Phys. in fine*) confess that angels discourse, following Scotus (*2.dist.1.q.6. and dist.7.q.un.*) and citing Saint Augustine (*supra Gen.*) saying that the Blessed by knowing God consequently know creatures. And I treat this at length in the Treatise on the Angels (*disp.6.q.1.§.5.*). Wherefore no interval of time is required for discursus, but only an order of nature — that is, as Scotus (*cit.*) affirms, that the principle of discursus be naturally prior in knowledge and as such be causative of the other extreme of the discursus.

The assertion is: discursus and syllogism, argumentation and syllogism, as well as ratiocination, do not differ essentially from each other. The first part is deduced from Scotus (*quol.15.art.2.sub V.*) and is proved: discursus formally or virtually comprehends three propositions, as is clear from its description adduced in note I; but a discursus composed from two propositions is an imperfect syllogism, which is called an enthymeme; and a discursus composed from three propositions is a perfect syllogism, as its definition makes clear. Again, Logic is called a discursive science precisely because it is occupied with the syllogism as its subject. All the more because all discursuses that by virtue of the disposition of the terms evidently infer something, accomplish this only insofar as they virtually contain a syllogism within themselves — which alone is properly a formal and perfect discursus. The second part is likewise gathered from the Doctor (*who at the end of q.2. primi Priorum uses "argumentation" for "syllogism"*), enumerating its parts and properties; and that ratiocination coincides with the syllogism the Philosopher holds (*1.Priorum c.1.*), where he proposes to discourse about ratiocination — that is, the syllogism — as he makes

clear a little later, when he asserts its definition, where according to the common version "syllogism" is placed; others, as the Coimbrans, translate "ratiocination" — and they do the same at (*cap.4 of the same work.*). The reason is that Logic is called rational and ratiocinative (*q.I.art.V.*) because it is occupied with the work of reason or the syllogism; therefore ratiocination and syllogism signify the same thing. And if any difference intervenes, it is accidental. Add that words are to be used according to the common usage of authors, as Scotus (*1.d.14. and 15.q.un.sub E.*) notes. And nearly all logicians use the aforementioned names interchangeably, as appears to anyone reading them anywhere; therefore no essential difference is to be placed between them, as the Philosopher hints (*2.Priorum c.29.*).

You will object first: things of which distinct definitions are given are essentially distinct, as the major shows clearly. But of discursus, the syllogism, and ratiocination, distinct definitions are handed down; therefore discursus, syllogism, and ratiocination are essentially different. The major is perspicuous. The minor is clear from what was said: for discursus is defined as the procession from the known to the unknown, while the syllogism and ratiocination are described as discourses consisting of three propositions disposed in mode and figure; and to be a progression from one to another, and to be a complex discourse, and things of this kind indicate distinct definitions. I admit the major; I reject the minor. To its proof I say that these are not distinct descriptions as regards reality, but as regards word — as is clearly established from what was adduced and explained above.

You will object second: for a perfectly complete syllogism and ratiocination, two pieces of knowledge are required — one of the premises and another of the conclusion, as I said above, and Gadius (*cit.*) noted. But discursus can be effected by a single act or cognition, as Scotus and his interpreters cited above seem to hold. Therefore the foregoing items differ among themselves by more than an accidental difference. Granting the major, the minor has been answered at the end of the second note. Or it can be said that there is indeed one act, but there are distinct terminations and attainments; or, if you prefer, it is one act comprehensively, because it is the third operation of the intellect or the formal illative judgment; but initiatively it is the knowledge of the premises, which the conclusion presupposes. Thus discursus formally presents one cognition, in which it formally consists, and materially denotes and presupposes another, which arises from the principles or premises.

Article V. Whether the Conclusion Is of the Essence of the Syllogism.

On account of differing citation of Aristotle about both the premises and the conclusion, and on account of a divergent mode of speaking and discordant texts, conflicting and diverse opinions of logicians arise. For Averroes and Albert (*1.Priorum T.1.c.5.*) hold that the premises alone are the essential parts of the syllogism, excluding the conclusion from its essence. Conversely, some, with

whom Zabarella (*1.Post.ad tex.4.*) subscribes, think that the whole essence of the syllogism is located in the conclusion. The common position, however, is that of the Subtle Doctor (*q.45.Elench. §.Ad q.*), Orbellis (*1.Priorum c.1.*), Raconius (*Tract.de argum.sect.3.*), and others who hold that both the premises and the conclusion enter the essence of the syllogism.

Note first, from Mair (*Tract.de syllog.not.2.*): Aristotle sometimes takes the syllogism for the premises alone when well disposed — as in (*2.Priorum and 1.post.c.2.*); sometimes for the conclusion alone — as (*1.Priorum in initio 1.figurae and 1.de anima T.48.*); sometimes for the premises and conclusion with the illative particle — as (*1.Priorum c.1. and 2.Phys.T.31.*) and frequently elsewhere. The syllogism taken in this last way can be considered in two ways: first intentionally, and thus it is a discourse composed of two premises and one conclusion with the particle of inference; and second intentionally, and thus it is a relation of reason founded in the premises and terminated toward the conclusion, as Scotus (*Quol.15.art.2.infra V.*), Gadius, and Lychetus hint — both there and in the Prologue (*cit.in ant.art.*).

Note second, from the Doctor (*1.Post.q.10. §.Ad rationem*): the conclusion can be considered in two ways: in one way insofar as it is a certain proposition consisting of subject, predicate, and verbal copula, with no other account being had — and thus it is called the conclusion materially. Although the conclusion is gathered from the premises and depends on them in being, nonetheless since it is one proposition distinct from others, it can be immediately cognized by the intellect in the account of an object, as Gadius (*quol.cit.*) excellently notes, following Scotus (*ibid.*). In another way, insofar as it is a certain proposition deduced and collected from two premises — and thus it is called the conclusion formally, because it concludes and terminates the syllogistic discursus, as the same authors note from Aristotle (*1.Post.2.*), and this is gathered from the same author (*ibid.c.16.*), calling the conclusion "the terminus of the demonstrative syllogism." To these Zabarella (*praecit.*) adds that the conclusion is the form of the syllogism: for since form is drawn out from the potency of matter and is its act and formal terminus, and the premises are its matter, the conclusion is rightly called the terminus of the syllogism. Furthermore, since motion requires two terms — the terminus from which and the terminus to which — and discursus is a kind of spiritual motion of the created intellect, to it accordingly are to be assigned terms: from which, which are the premises, and to which, which is the conclusion, as I noted above.

Assertion I: the syllogism taken first intentionally or materially includes the conclusion as its essential part. This is Scotus (*ubi supra*). It is proved first from Aristotle (*1.Priorum c.4. and lib.2 of the same work*), who among the parts of the syllogism numbers the conclusion. Second, a perfect syllogism is essentially composed of three propositions aptly ordered to each other, as is clear from its definition; but what enters the definition of something is of its essence; since the

conclusion is one of the propositions of the syllogism, it is inferred that it is of its essence. Third, matter and form are the essential parts of a composite, as is clear in the Physics; but the premises are as it were the matter and the conclusion as it were the form of the whole syllogism, or the inference that is in the conclusion — which the Doctor (*q.6.1.Priorum §.Resp.*) asserts to be the form of the syllogism. The illative judgment, moreover, by which the third operation of the intellect is distinguished from both preceding ones, exists most fully in the conclusion formally taken; for the particle "therefore," by which the illative judgment is expressed, is accommodated only to the conclusion. Therefore it is evidently concluded that the conclusion is not separated from the essence of the syllogism.

Assertion II: the syllogism taken second intentionally or formally does not include in its intrinsic and formal account either the premises or the conclusion. This is gathered and simultaneously proved from the Doctor (*2.d.3.q.9.§.Contra 2.A. and Quol.cit.§. and letters alleg.*), where it is indicated that discursus or the syllogism is a kind of spiritual motion of the soul, which begins from the premises and ends in the conclusion; but the intrinsic account of motion does not include its terms from which and to which, as I proved in the Physics (*l.de motu*); therefore neither the premises nor the conclusion, which are the terms of the syllogism, are of its essence. Furthermore, in the essence of a relation its foundation and terminus are not included, since they are prerequired and presupposed to it, and sometimes are substantial — as I stated in (*lib.3.q.de relatione*); but the syllogism formally taken is a relation of reason founded in the premises and terminated toward the conclusion, and is a logical second intention, just like the others that are considered per se by Logic — as Sarnanus writes (*Tract.de 1.et 2.intentionibus c.2.*). Again, the passive comparison of one known object to another known object is a being of reason and a logical second intention, from Scotus (*4.d.1.q.2.§.Hic primo B.*). But the syllogism is a comparison of the premises to each other and to the conclusion, as Sarnanus (*cit.*), Tataretus (*1.Priorum q.1.*), and the Scotists generally excellently affirm. Therefore the premises and conclusion do not enter the essence of the syllogism formally taken.

You will object first, against Assertion I: Aristotle (*1.Prior.*) in defining the syllogism calls the conclusion something different from the premises, as is clear to one examining the said passage; but to be something different from another denotes a diversity of essence, as I noted in (*lib.2.q.de differentia*); therefore since by Aristotle the conclusion is different from the premises, it follows that it is not an essential part of the syllogism. I respond that the Philosopher indeed wishes the conclusion to be different from the premises, because it is their effect — as will be shown below — but he does not assert that it is different from the syllogism, as Scotus (*near the end of q.45.Elench.*) carefully observes; indeed he locates it in the syllogism's definition, which is a clear sign that he does not separate it from the essence of the syllogism. Nor does it obstruct that

something is the effect of something and also its co-part with respect to a third: for flesh is produced from blood, and both are parts of an animal, as will be clear in (*lib.2.de anima.*). Therefore there is no repugnance in the conclusion being the effect of the premises and also being a part together with them for constituting the syllogism, as Scotus writes (*2.Prio.q.2.in fine.*).

You will object second, from (*1.Prio.c.21. and 1.Post.c.19.*): a syllogism has three terms and two propositions; but without the conclusion there are three terms and two propositions; therefore the conclusion does not pertain to the essence of the syllogism. I respond that Aristotle is speaking of the propositions necessary for inferring the conclusion, not of all the propositions necessary for obtaining a perfect syllogism. For in this way the conclusion is necessarily required for its completion as its chief part. Or say that, according to the first note, Aristotle there took the syllogism for the premises alone — using the part for the whole — just as he sometimes used the conclusion alone for the whole syllogism, as I noted there from the same Philosopher.

You will object third: with the same conclusion remaining, the syllogism can be varied; therefore the conclusion does not pertain to the essence of the syllogism. The antecedent is proved: there can be one conclusion of two syllogisms, as Aristotle (*2.Prio.c.1.*) asserts, and Zabarella (*1.de 4.figura cap.10.*) expresses with this example: if an argument is made in Darisi, which pertains to the first figure, and in Datisi, which pertains to the third figure, two syllogisms are preserved with one conclusion — namely "some man is risible" — which remains the same in both aforementioned modes, as can be seen at a glance in these: first in Darii — "every rational animal is risible; some man is rational; therefore some man is risible"; second in Datisi — "every rational animal is risible; some rational animal is a man; therefore some man is risible." I respond: given the hypothesis, there is one conclusion materially but two formally, just as there are two formal syllogisms. Let it therefore stand that the premises alone are not the essential parts of the syllogism, nor the conclusion alone, but the premises in order to the conclusion, and likewise the conclusion in order to the premises.

You will object fourth, against Assertion II: what is per se placed in the definition of something is of its intrinsic account, as I repeatedly insisted; the premises and conclusion are per se established in the definition of the syllogism, since from what was said in Assertion I they are its essential parts; therefore they are of its intrinsic and formal account. I respond that this argument concludes about the syllogism taken materially, about which I spoke in Assertion I, but not about the syllogism taken formally, about which I discoursed in Assertion II.

You will press: Aristotle in his Organon and his other works acknowledged no other nature or definition of the syllogism than the one he adduced; therefore if the premises and conclusion are the essential parts of the syllogism invented by the same Philosopher — as Alexander (*1.Prior.Sect.2.and 3.*) testifies — they are

certainly of its intrinsic and formal account, which is denied in the posterior assertion. I must meet this by saying that Aristotle from his plan treated the syllogism only materially taken, because it is more convenient and easier to know. Hence the same Philosopher, though he discourses about second intentions, which the logician studies per se, nonetheless sometimes provides examples from things in order to declare those intentions — especially in the book of the Categories (*c.3.*), as Scotus (*q.9.¶.Ad q.*) notes there. And I noted that Porphyry does the same (*lib.2.q.1.art.1. in the response to the third objection.*). That Aristotle did the same (*4.Phys.T.39.*), defining place materially only, I observed there with our men.

Article VI. Whether a Fourth Figure of the Syllogism Is to Be Admitted.

The celebrated Medical Academy zealously defends a fourth figure of the syllogism, which Averroes (*1.Prior.c.8.*) testifies that their leader Galen introduced into the schools of logicians against Aristotle — though in the works of Galen that have come down to us nothing about a fourth figure is found, as after Zabarella (*praecit.c.1.*) the Coimbrans (*c.7.q.1.art.1.*) note; or as Mair (*Tract.de syllog.c.2.dub.2.¶.Ad 2.*) says, perhaps Galen differs from Aristotle in word but not in reality. Whatever be the mind of Galen, without doubt distinguished men armed with valid reasons and sustained by robust arguments seek to maintain that fourth figure. But the Peripatetic Lyceum — all of them, and especially Scotus (*1.Prio.q.34.*), Titelmannus (*1.4.c.3.*), Raconius (*3.p.de arg.q.2.sect.ult.*), and Hurtado (*disp.10.sect.20.*) — attacks and overthrows the Galenist figure as useless and unnatural. For a greater grasp of this:

Note first, from Averroes (*cit. and in Epit.c.1.*): for the construction of an apt and true syllogism, before the premises are composed it is necessary that a determinate theme or some problem be proposed, toward which the discursus is directed — or which is to be the future terminus of the syllogism to be made, or the conclusion that is to be deduced from the premises. When the theme is proposed — which consists of the major and minor extremes, as "every man is sensitive" — a middle term must be assumed, as "animal," from which, joined to the said extremes, the premises are formed with the proper quality and quantity, from which is drawn such a conclusion as the premises are fitted to cause. For if the middle is connected to the predicate of the problem, it generates the major proposition; if it is joined to the subject of the problem, it makes the minor proposition; and from both is caused the conclusion, which is the theme proposed in the beginning. Thus a perfect syllogism is had: "every animal is sensitive; every man is an animal; therefore every man is sensitive." Hence Aristotle, from only the threefold complication of the middle term with the extremes in the premises, discovered only three figures, the explanation, definition, sufficiency, and examples of which are to be sought from the Epitome (*lib.3.q.1.art.5.*). The fourth figure is added by Galen from the fourth

complication of the middle, which occurs when the middle is predicated in the major and subjected in the minor — as is seen at a glance in this syllogism: "every animal is sensitive; every sensitive thing is a body; therefore some body is an animal." This illegitimate form of arguing did not escape Aristotle (*1.Prior. and 2 of the same work*), as Zabarella (*cap.8.loc.cit.*) testifies; yet he neglected and despised it as oblique and unnatural — whatever the Two Junior Scotists (*1.p.Tract.3.cap.5.*) may say.

Note second, from Zabarella (*mox cit.cap.5.*): Aristotle, according to the norm of natural Logic, invented artificial Logic — that is, imitating nature and preserving the natural order; for this same reason Aristotle himself contemplated no other syllogism than one that proceeds by the natural way. Those syllogisms that he discerned to deviate from the natural way, he prescribed a mode and rule for reducing to natural syllogisms and to their force, necessity, and evidence — though they can be called artificial, because they have been reduced to art. Hence, in order that their naturalness might be established and become clear (*lib.1.Prior.C.1.*), he adduced the "said of all" and "said of none" — which I already explained in the cited passage (*art.4.*) — on which as most certain and firm foundations is built the whole edifice of perfect syllogisms, and on which all natural and perfect affirmative and negative syllogisms rest. But the naturalness or unnaturalness of a syllogism is not taken from the unnaturalness of predication — such as species of genus and subject of accident; otherwise unnaturalness would befall the modes of the first figure concluding indirectly — as in the conclusion in Baralipon: "some body is sensitive," and in the conversions of propositions such as "every risible thing is a man"; but rather from the illative form, which is had when what is predicated in the premises is likewise predicated in the conclusion, and what is subjected in the premises is likewise subjected in the conclusion — which is known to us through the "said of all" and "said of none"; the opposite of this is effected in the fourth figure. For what is superior in the premises becomes inferior in the conclusion. Hence the said figure as never illegitimate Aristotle does not receive, nor does he judge it worthy of treatment in terms of its modes of arguing.

The assertion is: only three natural figures of the syllogism are to be admitted; the fourth, as oblique and unnatural, is to be rejected. This, with Aristotle (*1.Prior.c.22.23.*), Scotus (*ubi supra*) maintains. The first part is proved: there are as many distinct natural figures as there are distinct natural combinations of the middle term in the premises; but only three distinct natural combinations of the middle term in the premises exist; therefore only three distinct natural figures. The major is evident from the first note. For the number of figures was collected by Aristotle from the number of natural combinations of the middle in the premises. The minor is clear to those following the natural way in constructing syllogisms. For the middle is either subjected in the major and predicated in the minor, or predicated in both, or subjected in both. Hence from this threefold natural disposition of the middle, a threefold figure arises. But if the middle is

disposed in a fourth way — so that it is predicate of the major and subject of the minor, which is desired to be arranged last, so that the middle is involved in the premises in every way and in every place it can be — there arises the fourth figure: the argument is oblique and departs from the natural course of reasoning, which Aristotle has not attended to, as I noted in the second note. Or say with Scotus (*1.Prio.q.34.*): the fourth figure is not to be given, because the disposition of the middle cannot be essentially diversified except in the three modes stated; for the fourth figure introduces the first combination of the middle. Hence it only accidentally differs from the first. For by transposing the premises, the first figure is obtained: as, "every animal is a substance; every man is an animal; therefore every man is a substance." And in the fourth figure: "every man is an animal; every animal is a substance; therefore every man is a substance."

The physicians of no small repute respond that the fourth figure is not to be rejected nor is it illegitimate; for they concede that three diverse dispositions of the middle in the premises cause three figures, so the fourth combination distinct from those three of the middle in the same premises ought to cause a fourth figure distinct from the three already shown. Nor is this to be considered unnatural. For only the composition of the premises varies the mode of the figure, as is clear in Cesare and Camestres, which are two modes of the second figure; and the conclusion in them is natural, as Aristotle does not deny. Likewise, transposing the premises of the first figure, with the position of the middle changed, the fourth natural figure plainly results, as is clear in this example: "every animal is sensitive; every man is an animal; therefore every man is sensitive." This syllogism is of the first figure in Barbara. But if its premises are transposed and the middle holds another seat — that is, the minor becomes the major and the major becomes the minor, and the middle is superior in the major and inferior in the minor — the fourth figure emerges: as "every man is an animal; every animal is sensitive; therefore some sensitive thing is a man." The inference of this is natural, as in the modes of the first figure concluding indirectly — notably Baralipon, etc. But this response does not weaken the force of the foregoing argument, since both the inference of that figure conflicts with the natural order and the seat of its middle is adverse to nature; and hence by such transposition of propositions and the inverted disposition of the middle in the said premises, no figure distinct from the three figures is constituted. For those three figures observe the natural way, as I described above, even if the last two do not obtain the evidence that the first has. Furthermore, although in act they do not have the "said of all" or the "said of none," they nonetheless contain one or the other in potency. But this invented by Galen declines from the natural order; for what is predicated in the premises is not predicated in the conclusion; likewise what is subjected in those is not subjected in this; but in this the natural order of predication and subjection of

the terms is inverted; hence it is rightly judged oblique, unnatural, and monstrous by the Peripatetics.

The assertion is proved second: what is accidental is not numbered among what is per se, as is clear of the accidental cause, which Aristotle (*2.Phys.T.33.*) does not place among the per se causes; but the fourth figure is accidental, because it is not intended per se by nature; indeed it conflicts with the natural and right order of syllogistic discursus, as was confirmed above by example. Therefore it is not to be received. Again, art imitates and perfects nature, from (*2.Phys.T.79.*), but does not invert nature and work against it; but syllogisms elaborated by artificial law are artificial or constructed by art, in the way I said above; therefore they must proceed by a natural process, which the syllogisms of the fourth figure do not do. Hence Averroes most fittingly adds: "in the conclusion of the syllogism and the figure, natural thinking does not fall." Furthermore, the modes concluding obliquely and indirectly of the first figure are of the same figure and are reverted to the directly concluding ones, as all teach; therefore the same is to be judged of the invented modes of the fourth figure, which Hurtado (*cit. §.152.*) recounts. For that transposition of propositions and the inverted disposition of the middle in the said premises does not constitute a different figure from the first; but what is disordered and imperfect in it must be ordered and reduced to the first figure.

You will object first: to that which the proper definition of a figure belongs, belongs a proper figure; but to the Galenist figure belongs the proper definition of a figure; therefore it is a true figure, number four. The major is evident through the argument from definition to the thing defined. The minor is shown: a figure is commonly described as the combination of the middle term with the extremes in the premises according to proper predication and subjection; but the fourth figure receives such a combination of the middle term in the premises, different from the remaining figures — for in it the middle is predicated in the major and subjected in the minor. Therefore the fourth place among syllogistic figures is to be attributed to it. Granting the major, I deny the minor. To its proof I say that it lacks a natural conclusion, as I explained abundantly in the second note; and for that reason, it is not established as another figure distinct from those previously named, but is to be reduced to the first, as Scotus (*cit. at the beginning of this article concl.4.*) approves.

You will object second: those are deemed suitable syllogisms and in a good figure to which the definition of the syllogism given by Aristotle (*1.Prior.cap.1.*) is adapted; but the definition of the syllogism taken generally applies to syllogisms constructed in Galen's figure; therefore the fourth figure devised by Galen and championed by the physicians is legitimate. The major is denied by no one. The minor is shown: from two affirmative premises in that figure an affirmative conclusion follows — as "every man is an animal; every animal is a body; therefore some body is a man." Likewise, in the same figure, from two negative

premises a negative conclusion is inferred — as "no man is a stone; every stone is a body; therefore some body is not a man." I concede the major; I deny the minor. To its proof I say that the inference of those syllogisms is oblique and illegitimate; hence the definition of the syllogism, which is given only for natural syllogisms, is in no way accommodated to them.

You will object third: there can be made many legitimate and suitable syllogisms of none of the three enumerated figures; therefore the ternary number of figures is deficient and insufficient. The antecedent is proved at length by the Doctor (*1.Prior.q.34.*), Tataretus (*ibid.*), and the Coimbrans (*cap.7.q.1.art.2.*) about hypothetical syllogisms — as "every man is rational or irrational; no man is irrational; therefore every man is rational." Likewise about the syllogism adduced by Aristotle (*2.Prior.*). And also about the syllogism from obliques and from opposites, examples of which see with the cited authors. I respond with Scotus (*ibid.*) that the foregoing assertion is to be understood of every categorical syllogism with straight and finite terms, but not of every hypothetical syllogism — as the adduced instances prove. The reason is that only in the categorical syllogism is there proper ordering of the middle with the extremes, according to predication and subjection in the premises, for inferring the conclusion.

Article VII. Whether the Assent to the Conclusion Differs from the Assent to the Premises.

Some Nominalists (*q.8.prol. as cited by Mastrius and Bellucius disp.11.q.2.*) opine that the act and assent by which we assent to the premises and to the conclusion is the same, and Lychetus (*q.3.prol.*) and Aureolus hint the same. And certain recent authors cite Scotus for this same view, but wrongly — as is clearly established from his passages to be adduced below. Nor are there lacking those who, though distinguishing the assent of the premises from the assent of the conclusion, nonetheless hold that once both assents are had, by a repeated assent of the conclusion the premises are cognized — so that the assent to the principles is formally comprehended in that assent to the conclusion. Ruuvius (*1.Post.cap.1.q.6.*) testifies that Saint Thomas (*1.2.q.8.art.3.*), Durand (*2.d.38.q.3.ad 3.*), and others tend toward this opinion. But Scotus (*1.Post.q.1.§.Ad aliud and q.8.9. and also q.3.Prol. and q.4.lat.A.*), Vigerius, and others (*ibid.*) assert that the assent to the conclusion differs from the assent to the principles, and that the latter is not formally included in the former.

Note first: the authors of the second position take it as established that the act of the intellect by which we assent to the premises is distinguished from the act by which we give assent to the conclusion, because each is directed toward distinct objects; and we adhere to principles on account of themselves — that is, on account of the mere explication of the terms; but to the conclusion we adhere on account of the principles, which are said to be prior, more known, and the cause of the conclusion. Taking this as an established supposition, it is inquired

whether the intellect, in having the assents of the principles and the conclusion, rests, or whether it is necessary for it to return and look back at those same principles as the account through which the assent to the conclusion is made.

Note second: the principles and the conclusion and their assents can be considered in two ways: in one way as they are objective propositions or certain objects distinct from each other, with no account of their connection and dependence had — as happens when someone gives assent to some conclusion, resting solely on the authority of a trustworthy man; thus Aureolus thinks (*in Prol. about theological matters.*). In another way, insofar as between them there exists a connection and dependence — such that assent is given to the conclusion on account of the premises as its causes. The defenders of the second opinion say that such dependence is essentially and formally included in the assent to the conclusion as its formal objective account. But although their first assertion is true, their second is not: since the conclusion, besides the essential dependence it has from the premises as effect from its cause, is itself also considered as an objective proposition in the account of an object, as Scotus (*quod.15. §. De z. infra.*) teaches. Nor are the premises the formal accounts of its assent, but its efficient causes, as will be shown in the following article. Furthermore, such assent is an act of the intellect, which as the Doctor proves (*13. quod.*) is of the genus of quality; but dependence is a relation; and no absolute thing essentially and formally includes a relation. Therefore the dependence of the conclusion on the principles, which is formally a relation, does not intrinsically enter the assent to the conclusion.

Assertion I: the assent to the conclusion does not coincide with the assent to the premises. This is Scotus (*1. Prior. q. 8. 9. and quod. 4. lat. prol. and quod. 15. and 3. d. 28. q. un. §. Ad 1. sub G.*). It is proved first from Aristotle (*1. Prior. cap. 1.*), where in defining the syllogism he calls the conclusion "something different from the premises": but the distinction of assents is taken from the distinction of the object by which they are partially caused; therefore since by Aristotle the conclusion is a distinct object from the premises, it is plainly deduced that its assent must differ from the assent of those. Furthermore, the Philosopher there (*ibid.*) when prescribing the syllogistic form notes that the middle must be placed twice in the premises, never in the conclusion. And in (*1. Post. cap. 1.*) he adds that all teaching and all learning arise from pre-existing cognition; therefore since according to Aristotle the assent to the premises precedes the assent to the conclusion, in no way is the former essentially included in the latter. Second, as a thing stands with respect to being, so with respect to being known, from (*2. Met. T. 4.*); but the premises are distinct from the conclusion in the objective account; for both are objectively considered propositions pertaining to the second operation of the intellect, and the conclusion is the third proposition collected from them pertaining to the third operation of the intellect. Therefore the assent to the premises is separated from the assent to the conclusion. Third, cause and effect receive distinct assents, as no one is

ignorant; but the premises are the causes of the conclusion and the conclusion is their effect, from what will be proved in the next article. Wherefore the assents had of each differ from each other.

Assertion II: the assent to the premises does not formally enter the assent to the conclusion, such that there is no return of the conclusion to its principles. This is openly hinted by the Doctor (*and mol.cit. and 1.d.19.q.3. §. Quantum a primum A.*). It is proved first from the common adage of philosophers: "once the terminus is acquired, motion ceases"; but the syllogism from what was said above is a kind of spiritual motion whose terminus is the conclusion, as I stated there from the cited Scotus; therefore once the conclusion is had, the intellect is at rest in its immediate cognition, and accordingly no repetition of the intellect of the conclusion to the premises is required. Second, what is prior as prior is not included in the being of what is posterior, because although the posterior depends on the prior, the prior does not in its being depend on the posterior; therefore the assent to the principles, which is prior to the assent to the conclusion, is not formally included in the assent itself to the conclusion; otherwise the conclusion would be more known and more evident than its principles, and in one and the same act the intellect would simultaneously attain the premises and the conclusion — and things of this kind and similar ones that I introduced in the second note are plainly false and absurd.

You will object first, against Assertion I: the divine intellect surveys all things in a single simple act, as Scotus writes (*in Prol.cit.*); therefore the created intellect, which is assimilated to it, if not all things, at least many things reaches in one act — both because the intellect of the Blessed knows all things in a single act in the divine essence, from (*3.d.14. and quol.15.*), and because wisdom, which is one of the five habits of the intellect and is generated from a single act by species, speculates not only the principles but also the conclusion caused from them, from (*6.Eth.cap.8.*); wherefore the created intellect can terminate at the premises and their conclusion. Granting the antecedent, the consequence is denied. The reason is that God is alien from all discursus, as I proved in the Treatise on the Knowledge of God (*disp.1.*). But the created mind knows one thing through another and from another, and its cognition is caused by things; hence, according to the diversity of objects and things, through diverse species it compares to itself diverse pieces of knowledge. And I satisfied the passages of Scotus in (*art.4 of this question note II.*). To the other thing adduced about wisdom, for its decision I observe that it can be used in two ways: either as the philosophers described it — as Augustine (*14.de Trin.*) says in these words: "wisdom is the knowledge of human and divine things," and thus it is not distinguished from science; or as Aristotle defines it (*1.Met.1.*): "wisdom is knowledge of first and highest causes," and thus it constitutes one peculiar habit of the intellect distinct from science and the others. But in whatever way it is taken, if it respects premises and conclusions inferred and collected from those,

I deny that it can be effected in one and the same simple act — as what I adduced above clearly demonstrates.

You will object second, against Assertion II: every cognitive power tends in one act toward the object and the formal account of cognizing it, as is clear concerning the visual power, which by the same act of seeing is directed toward color — which is the object of vision — and light, which is its formal account of seeing; but the assent to the principles is the formal objective account of the assent to the conclusion, because through the knowledge of the premises we assent to the conclusion. Therefore the assent to the premises is formally included in the assent to the conclusion. Certain recent authors respond that the major is true of the account of cognizing "in which" — as they correctly exemplify with light and color — but not of the account of cognizing "from which," such as are the principles with respect to the conclusion. Or if the major is admitted, it can be said regarding the minor that the premises are not the formal and objective accounts of cognizing the conclusion, but its effecting accounts — as I pledged to show in the following article.

You will object third: the manner of philosophizing about acts of the intellect should be roughly the same as that in which we philosophize about the acts of the will with respect to their means and attainment of ends; but by the same act the will tends toward the means, toward the end through the means, and toward the end itself; therefore likewise the intellect in one act attains the principles and their conclusion. Scotus (*3.d.28.q.un. §.Ad 1.sub G.*) responds — and the Coimbrans (*1.Post.q.4.c.1.art.5.ad 2.*) follow — denying the parity. For with respect to the end and means there is only one goodness that the act of the will respects, by reason of which the will is moved through means to the attainment of the end. But in the premises and conclusion there are two objective accounts moving the intellect to their attainment — namely, the truth of the principles, which is had from the terms and is called immediate truth; and the truth of the conclusion obtained through the premises, which is called mediate truth. For this reason there are two acts of the intellect: one by which it tends toward the principles, the other by which it tends toward the conclusion drawn from them.

You will press: Scotus (*1.d.8.q.4.*) says that the truth of the conclusion is nothing other than a certain participation of the truth of the principles or premises; therefore no other assent of the conclusion than the assent to the premises is to be distinguished in his doctrine. I respond that Scotus intends there that the truth of the conclusion is virtually contained in the truth of the premises, just as an effect is virtually contained in its cause; hence he asserts that the truth of the conclusion is a participation of the truth of the principles. But formally the conclusion enjoys its own truth, distinct from the truth of the premises — as the Doctor (*6.Met.q.1. and 1.d.1.q.3. §.Quantum ad 1.A.*) clearly declares, besides the passages cited above.

Article VIII. Whether the Premises Are the Cause of the Conclusion.

All logicians with unanimous consent affirm that the principles are the cause of the conclusion; but in what genus of cause they are to be located, there is among them no small dispute. For some — such as Rubionius (*in Prol.q.8.art.4.*) — think the premises are causes of the conclusion in the genus of material cause only. Others — such as Hurtado (*disp.7.de anima sect.8.*) and Arriaga (*in Log.disp.15.sect.5.*) — refer the causality of the principles with respect to the conclusion to the genus of formal cause. But Scotus (*1.Post.q.2.§.Ad 1. and q.8.§.Ad 1. and q.9.§.Ad q. and q.1.Prol.§.Ad 2.ante 5.*), Mair (*1.Post.cap.2.dub.1.*), Tataretus (*ibid.q.1.dub.3. and 2.Prio.in fine q.*), and Ruuvius (*1.Post.q.5.*) teach that the premises cause the conclusion in the genus of efficient cause and material cause. The Thomists think the same, with Saint Thomas (*2.Post.lect.3.*).

Note, from Scotus (*1.Post. especially q.1.§.Quantum ad 3.*): the principles being the cause of the conclusion can be considered in two ways — either according to themselves, or as they are applied to the conclusion. In the first way the principles are called the cause of the conclusion virtually and potentially only. In the second way the principles are called the cause of the conclusion virtually and under their proper account. Other modes of causality of the principles in relation to the conclusion Mair (*ubi supra*) adds and weighs, which can be seen with him, since these two modes that I assigned suffice us for untying this difficulty. Furthermore, I observe with the Doctor (*1.d.5.q.2.G.*) that the preposition "ex" sometimes denotes the subject or material cause from which something is made — in which way natural forms are drawn out from the potency of matter, and artificial forms from natural composites, as a figure of Caesar from wood: thus Genesis VI, God commanded Noah to preserve the ark from planed planks. Sometimes it signifies the efficient or originating principle — as Ecclesiasticus XXIV: "I came forth from the mouth of the most High, the firstborn." And Psalm CIX: "From the womb before the morning star I begot you." Sometimes both simultaneously — as from the father supplying the seed the son is said to be produced and generated, where the material and efficient principle is designated; likewise in our matter from the principles as material and efficient causes the conclusion is produced.

The assertion is: the principles can be called material and efficient causes of the conclusion. This assertion in both parts is handed down by the Doctor (*in the cited places*), most explicitly in (*1.Post.q.8.vers.Ad aliud.*). The first part is proved first from Aristotle, who (*2.Post. at the beginning of cap.1.*) leaves in writing this pronouncement: "All teaching and all learning come from pre-existing cognition" — where the greater part of interpreters understand by teaching and learning the discursive knowledge that is had about the conclusion and is caused from the premises; but what is a presupposed subject for effecting something is a material cause, as is clear from the definition of matter (*2.Phys.T.28.*).

Therefore since the major and minor extremes with the verbal copula joining them to each other precede the premises in producing the conclusion — the major and minor being linked to the conclusion — it is most clearly deduced

that the premises exercise material causality in producing the conclusion. Second, the particle "ex" sometimes denotes the material cause from which something is made, as I noted; but all concede that the conclusion is deduced from the premises as its principles, and that besides the middle the remaining terms are placed in the conclusion. The second part is proved first from the same Philosopher (*ibid.cap.2. of the first Post.*), plainly conceding that the premises of demonstration are the causes of the conclusion; hence, using "syllogism" for the premises alone, he adds that demonstration is a syllogism making one know or generating science; but science is cognition through a cause; therefore since the name of cause and effect is there posited absolutely — and by Aristotle (*2.Phys.T.21.*) concerning an efficient cause and the effect of that same efficient cause — the Philosopher himself is to be explained accordingly. Second, the certainty and evidence of the conclusion depends on the certainty and evidence of the premises, as the Stagirite expressly teaches in the same passage, adducing that axiom: "on account of which a thing is such and such, it is so even more"; therefore there seems to be no doubt that the premises contribute effectively to producing the conclusion. Again, in the most powerful demonstration, the middle and the definition of the subject — as will be shown in the proper question — and the predicate of the conclusion is the proper property of the said subject, caused by the subject itself; and the quidditative definition always has an essential part of the thing, which presents the cause of such a property, as is evidently seen in this demonstration: "every rational being is risible; every man is rational; therefore every man is risible." Again, the conclusion in some way assimilates the premises; and we assent to the conclusion on account of the premises; wherefore the premises are rightly deemed efficient causes of the conclusion.

You will object first: what can exist without another is not caused by it, because an effect necessarily presupposes its cause, from which it receives being — if not in actual being, at least in the process of coming to be; but the conclusion can exist without the premises, as is clear in one who proposes logical conclusions for discussion — such as "Logic is a science," "Logic is speculative," and the like — in which the majors and minors of them are not present; therefore the conclusion is not caused by the premises. Granting the major, the minor is to be distinguished: the conclusion can exist without the preceding efficiency of the premises being exerted, I deny. For just as an effect cannot be produced or have been produced without its producing cause, so the conclusion cannot have being without the principles; after the efficiency of the premises has been exerted, I concede: for any effect that does not depend in being and in the process of coming to be on its cause, remains in being when the cause is absent or has perished — as is clear of a house constructed by a builder, which, when he is absent or dead, perseveres in being. Or it can be said that these are conclusions not formally but materially taken, as I declared in (*art.5 of this question note II.*). Or say that propositions of this kind are in reality not

conclusions but claim for themselves the name of conclusions — because the premises are supposed to have been applied to the syllogistic form in the writings of those defending them, or at least are retained in memory by the same persons, if not in act then at least in habit.

You will object second: science can be had without an adhesive cognition of the premises; but science is the habit of the conclusion, from (*1.Post.cap.2.*). Therefore if science can exist without the cognition of the premises, the conclusion can likewise exist without the premises. The major is proved: whatever God can effect together with a secondary cause, he can effect by himself alone, as theologians commonly hold; but God together with the created intellect produces the science of the conclusion; therefore without the created intellect he can produce it; but such science would lack premises, because it would not proceed from a discursive intellect — since God, from whom all discursus is far removed, would produce it immediately; therefore the conclusion can be had without the premises being had first. I respond that the argument holds of supernatural power, but not of natural power. Or, what seems to come to the same thing, the objection proceeds about infused science, not about acquired science, of which logicians speak.

You will object fifth: if the third operation of the intellect, which is expressed by the name of conclusion, is produced by the principles, then likewise the second operation would be effected by the first operation, since the reasoning seems equal for both; but the second operation is not produced by the first. For the apprehension of simples and the cognition of incomplex things is not the cause of the composition of those same terms; therefore neither is the third produced by the two first, which are called premises. Granting the major, I distinguish the minor: about terms that are self-evidently evident by their own nature, I deny; about non-evident terms, I concede. This solution is drawn from the Doctor (*3.d.23.q.un. §. Aliter E.*). For every evident term generates knowledge of itself in the intellect through its own species; then the intellect composes or divides such terms, and such composition or division is called the second operation — flowing from those same incomplex terms that actively and partially concur in eliciting it.

You will object fourth: what determines and actualizes an undetermined and indifferent subject to receiving something pertains to the genus of formal cause, as is self-evident; but the assent to the premises actualizes and determines the intellect toward this or that conclusion, because from these or those premises, this or that conclusion is deduced; therefore the concurrence of the premises for inferring the conclusion is reverted to the genus of formal cause. Granting the major, the minor is to be distinguished: the premises only determine the intellect, I deny; the premises determine and simultaneously concur to effect the conclusion, I concede. The example is at hand regarding the intelligible species of the object, which not only determines the intellect toward the

intellection of the object of which it is the species, but also together with the intellect actively concurs to cause the very knowledge of that same object.

Article IX. In What Way the Premises Precede the Conclusion.

It is taken as established by Aristotle and all his interpreters in this work that the premises are prior to the conclusion; but there is dispute among them about what sort of priority this should be understood as — whether priority of time, as Capreolus (*2.d.3.q.2.*) thinks, or priority of nature, as the more common opinion of logicians holds — notably Scotus (*1.Post.q.8. and q.9. and q.3.prol.principale and q.4.lat.shortly after A.*), Lychetus, Vigerius, and Tataretus — both there and in (*1.Post.q.1.dub.3.*) — as well as Mair (*1.Post.cap.1.dub.3.*), who affirm that the premises precede the conclusion in priority of nature.

Note first: in this article it is not called into question whether the cognition of the premises can be acquired prior in time to the cognition of the conclusion; for since from what was said the assents are distinct, one can consequently be compared after another with some temporal delay. Nor is it disputed whether the premises, insofar as they are certain propositions taken separately in mode and figure without being disposed, can be cognized prior in time to the conclusion — for that is certain and can occur, as the Doctor does not deny (*1.Post.q.8. §.Ad primam.*). But the difficulty is whether the premises aptly disposed according to form and figure, with no obstacle interposed, are cognized prior in time or in nature — whether in apprehensive or adhesive cognition — to the conclusion.

Note second, from the Doctor (*praecit.*): cause and caused can be considered in two ways — formally, that is, insofar as they regard each other mutually and are correlatives; or materially, that is, for the foundation and terminus of cause and caused. This distinction is sufficiently clear from what was said in the question on relation; hence I do not explain it further here. Observe also from the same author (*ibid.q.1.8.*) after Aristotle (*2.Prior.cap.26.*) that the conclusion can be known in universal and in particular, whether in habit or in act. The conclusion is known in universal when the major is cognized, without the minor and conclusion being cognized in themselves; for if "every mule is sterile" is cognized, it is known in universal that this mule is sterile. The conclusion is known in particular and in habit, when the major and minor are cognized, but it is not yet adverted that the minor actually falls under the major — and in this twofold way the premises are cognized prior in nature and in time to the conclusion in act. Finally, the conclusion is cognized in act when the premises are actually aptly disposed and applied to producing the conclusion; and thus, once the premises are cognized, the conclusion is cognized simultaneously in time.

The assertion is: the premises and conclusion taken formally are simultaneous in nature; taken materially, they are simultaneous in time with the conclusion,

yet prior in nature to the conclusion itself. The assertion is threefold and is handed down by the Doctor (*ubi supra.*). The first part is proved: relatives are simultaneous in nature, from the chapter on "ad aliquid"; but the premises and conclusion are relatives — for they are cause and effect, from what was asserted above, and that these are to be numbered among relatives is clear from (*5.Met.cap.de relatione*); therefore they enjoy simultaneity of nature. The second part is proved from (*1.Post.cap.7.*): once the major is cognized, the conclusion is simultaneously cognized in time, as Mair notes in the said passage — provided the intellect is not indisposed and the will does not divert it from the consideration of that same object. Third, a sufficient natural cause, unimpeded, with all requisites for acting in place, has its fitting effect — as is clear concerning the sun with respect to light and fire with respect to heat, as the Doctor pursues at length (*2.d.1.q.3.*). But the premises together with the intellect are natural efficient causes and unimpeded, if they are ordered in mode and figure; therefore in the same moment of time they produce the conclusion; and thus, once the premises are cognized, the conclusion is simultaneously cognized in time. Hence Scotus (*cit.1.Post.q.8.¶.Ad 2.*) rightly adds: "the premises thus applied contain the conclusion in power, just as an efficient thing disposed contains its effect; but an efficient thing posits its effect in act in every disposed matter," etc. The third part is proved: the cause at least in nature precedes its effect, as I said in the treatise on causes; but the premises are the causes of the conclusion, as I proved in the preceding article. Again, that on which something essentially depends is prior in nature to that which depends on it, as is clear from the Postpredicaments; but the conclusion essentially depends on the premises; therefore the premises precede the conclusion in nature.

You will object first: the material cause antecedes in time the effect proceeding from it and inhering in it, as Aristotle proves (*7.Met.T.4.*) of substance, which precedes every accident in cognition, definition, and time; but the premises are material causes of the conclusion, as I asserted with Scotus in the preceding article; therefore the premises are prior in time to the conclusion. Confirmation, from (*1.Prior.cap.26.*): it can happen to know every mule to be sterile and to doubt whether it has something in the womb; therefore, with the premises examined, the conclusion can be unknown — and so the premises and the conclusion are not simultaneously known in time. I respond with Scotus (*cit.*) that the premises receive the account not only of material cause but also of efficient cause with respect to the conclusion; hence nothing prevents the conclusion from being cognized simultaneously in time with them. The passage of Aristotle adduced I explain in the Metaphysics and in (*lib.2.q.6.*) shortly to be published. In the meantime see Scotus (*in that text.*). To the confirmation I say, with the same Doctor, that the objection holds for premises not applied according to the syllogistic form, but not for premises suitably disposed in mode and figure and rightly applied to inferring the conclusion. This response is approved and confirmed by Mair (*alleg.objection 5.*).

You will object second: motion occurs successively and in time, as all philosophers teach with Aristotle (*5.Phys.cap.1.T.10.*); but discursus is a kind of motion, as is clear from what was said in (*art.5 of this question*) — for the intellect, by discoursing from the premises as the terminus from which, passes to the conclusion as the terminus to which; and so it first knows the principles and subsequently the conclusion, which cannot be done without some interval of time. Granting the major, regarding the minor I say that discursus is called motion not properly but by analogy. Although motion is required in constructing, disposing, and cognizing the premises, as the argument proves, yet once the cognition of the well-disposed premises is had and all impediments removed, the cognition of the conclusion is simultaneously acquired in time — and this is what Aristotle affirms near the beginning of this book and what Scotus accepts at the end of the cited (*q.8.*).

You will object third: our intellect, being of finite and limited power, cannot attain by its cognition multiple things as multiple, from (*2.Top.cap.9.locus 33.*), where it is read: "it can happen to know many things, but not to think of them simultaneously"; but the premises and conclusion are multiple intelligibles; therefore they cannot simultaneously be cognized by the intellect. I respond that the maxim of the Stagirite by which the major is firm is to be interpreted about many things that share no order and mutual relation; in this sense, though many things are known in habit, not in act; and given that many things are actually perceived, not equally perfectly and clearly — just as if one were attained by actual cognition, according to that common saying, "for him who attends to many things, the sense for each is less," as the Doctor says (*2.d.42.q.1.§.Respondeo G.*). But about many things that have no connection between them, it can be conceded that the intellect does not direct its cognition as intensely and perfectly as if it were to terminate at one object alone, as is clear of an intellect detained and occupied about many things. Especially because it is probable that the intellect understands many disparate things in act, as is clear of the sense of sight, which in a sheet simultaneously perceives blackness and whiteness — which is to be asserted with all the more right of the intellect, which is a superior and more eminent power, as after Scotus (*cit.*) Mair and Tataretus note (*ubi supra.*). And these authors confirm this concerning the comparative act of the intellect, by which many things are understood, when one known object is compared through it to another known object. Therefore the intellect can simultaneously understand many things ordered and disordered, in the way now set forth.

You will object fourth: if the premises together with the conclusion were cognized in the same instant of time, then no sophism and no error would occur, because in every paralogism the conclusion would immediately be inferred once the premises were pre-cognized. The consequence is to be denied: for a sophism is committed when no right application of the premises in mode and figure is made for inferring the conclusion. But once their fitting

application is had, a good logician simultaneously in time well knows what conclusion is to be deduced from such premises, and what is not to be deduced — as the Doctor carefully notes (*1.Post. at the end of q.8.*).

Article X. Whether, Once the Assents to the Premises Are Had, the Intellect Is Necessitated to the Assent to the Conclusion.

The question of the present article is whether, once the assents to evident premises aptly disposed and properly ordered in mode and syllogistic figure are had, the intellect necessarily assents to the conclusion; or whether it can dissent from it, be impeded or restrained by the command of the will. On this, two opposing views are recounted and celebrated by recent logicians. The one, maintained by Ruuvius (*1.Post.cap.1.q.8.*) and Aversa (*q.25.sect.3.*), affirms that once the assents to the premises are admitted, the will can suspend the assent to the conclusion and divert the intellect to the consideration of other objects. The other is that of Scotus — both in (*1.Post.q.8.§.Ad q. and §.Ad primam and q.9.§.Ad primam*) and also in (*1.d.1.q.4.§.Ad argumenta and 2.d.6.q.1.§.Respondeo H. and d.41.q.4.§.Quantum ad 1.E. and Quol.16.§.de 1.circa C.and D.*) — of Mair (*1.Post.dub.3.§.Quarto arguitur.*), Lychetus, Gadius in his commentaries on the cited Scotus, Fonseca (*1.Met.cap.2.q.3.sect.7.*), and others, who hold that the intellect, once the assents to the principles are had, cannot be restrained from the assent to the conclusion by the will's command, and diverted to other objects.

Note first: although from Saint Augustine (*2.de lib.arb.*) as cited by Scotus (*2.d.42.q.4.§.Ad qq.istas B.*), the will is the mover in the whole kingdom of the soul and all things obey it — that is, all its powers both organic and non-organic comply with the very will — nonetheless in certain of their operations they seem in no way to be subject to the will's command. First, just as the will in being presupposes the intellect, so the operation of the will presupposes the operation of the intellect, according to that common saying: "nothing is willed unless foreknown." Likewise, all the first movements of the other powers are not under the power of the will; in this sense the Doctor (*cit.§.Ad 1.sub R.*) explains that passage of the Apostle (*Rom.VII.*): "the good that I will, I do not do." The same Augustine (*alleg.cap.15.*) asserts: "it is not in our power that we are not affected and influenced by what is seen" — and the Doctor accepts this (*in the memorated passage §.Quantum ad 1.circa D.*), proving it thus: some thought necessarily precedes every act of willing, at least in nature; but what precedes every act of willing and is prior in nature is at least not in our power; the will can however be pleased with it, confirm the intellect in its consideration, avert it from it, and convert it to another and to many others indistinctly and imperfectly — as the Doctor explicitly hands down (*ibid.§.Respondeo F.G.*). Furthermore, the other powers of the soul — or even of the whole composite — such as the generative, nutritive, vegetative, and sensitive, obey the will insofar as they depend on the motive power; so the nutritive requires the application of

nutriment and the approximation of active to passive, and with respect to this and similar operations can be said to be under the yoke of the will. But once all that is necessary for acting is in place, with no obstacle intervening, since they are natural and necessary powers, they cannot be restrained — as open eyes rightly disposed, with the visible object present at the proper distance, the will cannot make them not see such an object. Similarly, unwilling the will, the ear properly disposed cannot not hear, at the proper distance, a vehement sound; and every sense is struck by a most powerful sensible object acting with great force and cannot not feel pain if it is harmful and adverse to it, or not feel pleasure if it is delightful, as the Doctor hints (*3.dist.15.q.un.*). Say the same of the intellect: which, being a natural power, with an evident object proposed to it and the remaining requisites in place, cannot restrain itself from emitting the act of understanding, even with the will opposing it. But after the emission of the act, the will can call the intellect away, so that it desists from its contemplation, or persists in it, or turns to the cognition of another — as Scotus writes (*1.d.1.q.4. §.si tenendo.*)

Note second, from the received doctrine of all theologians, especially Scotus (*1.d.10.q.un. and also Quol.16.art.2.*), Gadius (*ibid.fol.168. and in the Report of the first d.40.q.un.*): there is a twofold freedom of the will — namely freedom of contradiction and freedom of contrariety. Freedom of contradiction, which is also called freedom of exercise, is that by which, with all requisites for acting in place, the will can will or not will, unwill or not unwill this or that; and it is called freedom of contradiction because the acts of willing and not willing, likewise the acts of unwilling and not unwilling, are contradictory. Freedom of contrariety, which is also called freedom of specification, is that by which the will can elicit opposite acts — which are willing and unwilling, loving and hating. The will, moreover, determines itself with the determination of specification in eliciting an act of the same kind concerning the object presented to it — namely the act of willing and not simultaneously the contrary act, namely the act of unwilling. So in its own way the intellect is determined with the determination of specification toward assent to the object presented to it, and not toward dissent from it. Furthermore, the will determines itself with the determination of exercise toward one act alone — as some say that the will is necessitated in loving good in common. Likewise the intellect is determined with the determination of exercise, when it assents to an object in such a way that it cannot dissent from it; and in this the whole difficulty consists — whether the intellect, evidently assenting to the premises, is necessitated to assent to the conclusion, or whether by the will's command it can be drawn away from that assent or attracted to other objects for examination.

The assertion is: once the assent to the premises about necessary and evident things is had, the intellect is so necessitated to providing assent to the conclusion that the will cannot tear it from the said assent and lead it to the contrary. So Scotus (*cit.*). It is proved first from Aristotle (*2.Phys.T. and*

9.*Eth.cap.3.*), affirming that once the assents to the premises are given, the intellect simply tends toward the conclusion. Second, the conclusion necessarily follows from the conceded premises, as is plainly clear from the definition of the syllogism that the Philosopher gives (1.*Prior.c.1.*). Therefore once the premises are posited, the intellect is compelled to assent to the conclusion even against the will's wishes, for a natural power — as the intellect is — with all that is necessary for acting prepared, acts at once, as I made clear in the first note. Especially because the object and the intellect alone are causes of knowledge, not the will; and an evident object has greater efficacy, force, and weight than the will's command. Third, what is essentially or really the same as another is inseparable from it, as our Formalists commonly teach with Scotus in the Tract on Formalitates; but the conclusion is really or essentially the same as the premises in a demonstrative syllogism — as will be made plain in the question on demonstration — and the reason is that through the middle term placed in the premises, the two extremes are necessarily united in the conclusion. Therefore just as necessary assent is provided to the premises through the assumed middle, so to the conclusion — in which such extremes are demonstrated as united — assent is necessarily provided by the intellect, such that whether the will wills or wills not, the intellect cannot retreat from it. This the Doctor lucidly explains (2.*d.6.q.1.ante §.Ad 1.principale sub H.*).

You will say that all of this is true when the will is not opposing; but if the will wills, it can impede the intellect from providing assent to the conclusion. Against this: just as the will cannot restrain the sensitive appetite from an object vehemently delightful or distressing to it, properly approximated; nor the vegetative, generative, and sensitive faculty, with all that is pre-required for their operations in place, from those very operations — as we verify in ourselves by daily experience; otherwise the will could impede man from being cold in winter and hot in summer, and a woman from bringing forth in that pain, and from being afflicted by inconveniences, persistent hardships, and labors — so the intellect, with the assents to the premises had, cannot be torn from assent to the conclusion by the will in the least.

You will object first: as the will stands with respect to its object, which is the good, so the intellect stands with respect to its object, which is the true. For every power seems to regard in roughly the same way the object with which it is occupied, and to require the same conditions in its own way; but the will does not necessarily tend toward the good, even if it were the supreme good, as Scotus (1.*d.1.q.4. §.Quartum and quol.16.*) asserts. Therefore neither does the intellect necessarily tend toward the evident and apparent true. I deny the major. The reason is that although the object of each power is the same and common — not contracted and narrowed by truth or goodness, as I proved with Scotus in the Treatise on the Knowability of God (*disp.1.*) — nonetheless there exists a not insignificant difference between these powers. For the intellect is a natural power and the will is a free power, which receive an opposite mode of

initiating, from the Doctor (*in 1.cit. §.Ista q.*). Hence the former necessarily and naturally, the latter freely, labors about its object.

You will object second: the will dominates all the powers of the soul, both material and spiritual, just as a king absolutely commands all his subjects, great and small — as I was saying with Augustine above; therefore the will, after the assent to the principles, can impede the intellect from providing assent to the conclusion. The consequence is proved: he who can the greater can the lesser, as is clear from the Epitome (*lib.3.q.3.art.4.num.11.*); but the will by its command can prohibit the intellect from giving assent to the premises, in which there is greater evidence; therefore it can also effect that the intellect does not assent to the conclusion deduced from them, in which there is lesser evidence — as Aristotle admits (*1.Post.cap.3.*). The major is known: for he who can bear a weight of fifteen pounds can certainly bear a weight of ten pounds, as is clear from experience. The minor is urged — both because no one experiences being compelled in assenting to first principles, and because there seems to be a certain contention about them, as Orbellis (*4.Met.q.5.*) shows. It can be responded that the antecedent is true in obscure matters, but not in evident matters. Or, given the antecedent, I distinguish the consequence: directly, I deny; indirectly, I concede. This the Doctor expressed (*nuper alleg. §.Si tenendo.*) and I explained above in the first note. To its proof I say that the major holds in things that are of the same account, as the example of weight plainly shows; but not of things that are of another account. For it does not follow that if a man can generate a man, he can also generate a mosquito or a plant, which is a lesser work. Or if that perhaps can hold for assenting to the premises, not so once the assents to the premises about things clearly and distinctly cognized are had, as the Doctor hints (*3.d.23.q.un. §.Aliter post F.*).

You will object third: the same is the account of necessarily operating and necessarily persisting in operating — "if simply, then simply; if when it can, then when it can" — as the Doctor argues (*in 1.alleg.q.4.vers.Item ad principale.*). But the intellect can be withdrawn by the will, so that it does not persist in the cognition of certain things, as Scotus admits — both there and also in (*Quol.16.*) and (*4.d.49.q.0.*). Therefore, with the premises conceded, the will can restrain it from being drawn into assent to the conclusion. Granting the major, I distinguish the minor: directly, I deny; indirectly, I concede — the Doctor in the cited places is to be explained in this way.

You will press, from (*2.Phys.T.89. and 7.Eth.cap.32.*): "as principle is in speculative matters, so is end in practical matters"; but the intellect necessarily assents to principles; therefore the will also assents necessarily to the end — and accordingly with the practical dictate posited, the will necessarily assents to it, as the Stagirite acknowledges (*1.Eth.cap.2.*); and accordingly neither directly nor indirectly can the will suspend and restrain the operation of the intellect. All the more so because in things that are natural and necessary, no habit is to be

admitted, as is clear from the Doctor (*2.d.2.q.10.*). Therefore if the intellect necessarily provides assent to the conclusion, no habit about the conclusion is to be given — which is absurd. I respond that the maxim of Aristotle is explained by the Doctor (*in 4.cit. §. Ad primum M.*): namely that the parallel is placed in this — that as the truth of the conclusion is ordered to the truth of the premises, so the goodness of the means is ordered to the end; and this holds in comparing principles to objects and ends, but not with respect to powers. For the intellect is a natural power and the will is a free power; hence the former acts necessarily and the latter freely. To what is added from the same Aristotle, I say that is not true absolutely but conditionally — that is, if the will is right and follows natural inclination; just as man is said to necessarily will beatitude — that is, by Scotus's interpretation, with natural appetite, but not with the elicited act of the free appetite. To the other thing I say that the antecedent is true of things that are not knowing; such things are indeed capable of habits; but false of knowing things, in which inheres a habit for operating easily, delightfully, intensely, and promptly — as Scotus writes (*3.d.33.q.un.B. and in the Report of the same d. and q.alleg.*). You will object fourth: what is indifferent to doing or receiving something must be determined by something (except the will, which determines itself), as is clear of matter — which, being indifferent and undetermined, is determined and limited by the supervening form; but the intellect is sometimes undetermined toward eliciting two conclusions — namely the direct and the indirect — as is clear when the premises are disposed in the modes of the first figure, of which some conclude directly and others indirectly, and by which it is not determined more toward one than toward the other conclusion. Therefore it is determined by the will toward one or the other; and accordingly once the premises are given, the will can suspend and divert the intellect itself, so that it does not provide assent to the conclusion. Granting the major, to the minor I say that the intellect is determined by the premises to assenting to the direct conclusion necessarily, primarily, and immediately; to the indirect conclusion, secondarily and mediately. And this can be explained concerning light, which is directed directly toward a mirror and indirectly toward us looking at such a mirror.

Question II. On Precognitions and Precognita.

Article I. What is the Subject of This Work.

In this and the following questions we must examine the Posterior Analytics fully and completely. These works shine with such dignity and nobility that they illuminate all the other parts of Logic, and they are of such weight and importance that, when neglected and unknown, philosophical and theological doctrines seem likewise to be unknown, as Maior affirms in the Proem of this work, Zabarella at the end of his dedicatory epistle to his commentary on the Posterior Books, and Sarnanus (*9.1. universalium pag. 15*). In this work the genius of Aristotle shone so brightly that Alexander the Peripatetic publicly declares

that Aristotle taught the art of demonstrating. For this reason, perhaps, lest so great a work should be accessible to everyone, Themistius the distinguished Peripatetic believed in the beginning of his Paraphrase that the philosopher deliberately concealed and obscured it — or rather, what is more pleasing, he did so because of its excellence and eminence, for not all are capable of reaching sublime things, according to the well-known saying: not everyone is given to go to Corinth, to which is accommodated that text of Matthew XIX: not all receive that word, although it was spoken to intimate something else. And so a certain Doctor says that all must view the cottages of Vitriacus. The meaning is that each person, according to the capacity of his own intellect, can acquire for himself knowledge, if not of the sublime things of this present work, at least of its humbler contents. And this, concerning sincere truths, together with Augustine (9. *de Trin.* c.6), Scotus openly sets forth (1.d.3.q.4. §. *Ad q. ante V*): for it belongs to few, as the same Augustine teaches (12. *Trin.* c. 14), to arrive by the eye of the mind at intelligible reasons, and only pure souls attain them. Wherefore, together with Aristotle and Scotus, we here diligently and carefully examine the demonstrative knowledge of the Posterior Books, beginning from its elements and principles, from which its essence is composed, and we shall investigate it and its properties as far as the weakness of our modest intellect permits — provided we first determine the object of these books.

Article I. What is the Subject of This Work.

Some, such as Averroes and Theophrastus in this place, hold that demonstration together with definition is the proper and adequate object of these books. The common opinion, however, is that of Scotus (1. *Prior.* near the end, q.2. and 1. *Post.* at the close of q.2), Maior (*ibid.*), Zabarella, in his commentary, Faber (*Theor.* 19), and others who teach that demonstration is the subject of attribution and the total subject of this work, and with these we take our stand.

Assertion. Demonstration alone is the primary and adequate object of these Posterior Books. Scotus holds this in the place cited above, and I prove it, first, from Aristotle (1. *Prior.* c.4), where in the Prior Books he proposes to treat of the syllogism in general, and in the Posterior Books of the demonstrative syllogism; and he gives his reason, namely that the syllogism taken in general is more universal than the demonstrative syllogism, which is particular, dealing with necessary matter, and falls under that common form as a particular and inferior falls under the common and superior. Moreover, in these books the philosopher provides the method of resolving the syllogism into necessary matter, and is entirely occupied with setting forth the nature of demonstration, its properties, the conditions necessary for it, and its effect which is science, as is clear to the reader. Since, therefore, from what was said in the Prolegomena (q.3), the object of a science is that with which the whole science is occupied, together with the other conditions assigned there — which are rightly applied to demonstration — it is plainly deduced that the subject of these books is demonstration.

Furthermore, there is an equal reason for the object of the whole science as for the object of a part: a single total science has a single total object, as all philosophers and theologians unanimously and in common proclaim. Therefore, since a single total subject has been established for all of Logic, in like manner a single partial object must be established for this demonstrative part, which is demonstration alone, as will appear more clearly from the solution of the arguments of the composite opinion.

You will object, first, that Aristotle (*1. Post. c.7*) and elsewhere in the same work (*c.3*) treats of certain matters concerning definition, and there separates it from demonstration as a distinct instrument of knowing: therefore in these books not only demonstration but also definition is established as the adequate object. I reply that Aristotle in those places treats of definition insofar as it serves demonstration, as Faber observes above all others (*Theor.6.c.3*): for definition is its middle term, or its conclusion, or the entire demonstration differing from it only in the arrangement of terms, as is stated in the passage just cited (*1. Post*).

You will object, second, that three modes of knowing, distinct from one another, are enumerated by common consent of the dialecticians: therefore, according to their distinction, a distinct treatment and proper place must be assigned to each of them for examination. No other proper place seems available than in these Posterior Analytics. For in the sixth book of the Topics, where definition is mentioned, it is rather exercised than taught, as the Conimbricenses note with Alexander at the beginning of their commentary. And in the Metaphysics the common quiddities of things are considered, while definition as a mode of knowing is left to Logic itself to discuss. Therefore the subject of these books is definition together with demonstration. It may be added that definition surpasses demonstration in nobility, because the former investigates what a thing is, while the latter investigates what kind of thing it is; and the quiddity of a thing is more noble than its quality, from the first book of the Metaphysics (*T.4*). Therefore, it is not definition that is ordered to demonstration, but rather demonstration that is ordered to definition, as regarded by Logic. I reply that Aristotle, while he does indeed treat promiscuously of demonstration and definition in this work, nevertheless does not treat of definition through itself and immediately, but only insofar as definition serves demonstration, as I was saying just above. A proper and special place for definition must indeed be conceded, in which definition itself is considered; and that Aristotle provided this through five books is stated in the catalogue of his works — although those books have not come down to us, just as certain others listed in the same index have not, notably the book on Division, which Boethius afterward composed as a complement to Logic. To the additional point, I deny the major premise: for demonstration includes definition either as a part, or as a principle, or as a conclusion, or finally because it differs from it only in the syllogistic form, as Scotus notes (*q. proxime alleg.*). Aristotle moreover wishes it to be more excellent

to contemplate only the quiddity of a thing than its quality; yet demonstration encompasses both, and for that reason surpasses definition.

Article II. Whether All Teaching and Learning Arises from Pre-existing Knowledge.

Zabarella (*1. Post. at the very beginning of c.1*) sets in print that the proposed difficulty, viewed through the various interpretations of commentators — which may be seen among the more recent dialecticians — is extremely obscure; but that, viewed in the text itself as it stands, it is most clear. I shall dispose of it quickly, once I have first premised certain matters that make for its understanding.

Note first, from Maior (*1. Post. propositione 2*), Tataretus (*ibid. q.1. scibili 1*), and others, that teaching and learning coincide in nearly the same thing, though they differ from one another in concept or by reason of diverse respect: for one and the same science is denoted by these two names, namely teaching and learning, but in different ways — it is called teaching insofar as it proceeds from the teacher by voice or writing, and learning insofar as it is received in the learner. Aristotle himself asserts the same thing (*3. Phys. summ. 2. c.6. T.19*), saying that teaching and learning are the same science, just as action and passion are the same motion; although no small difference intervenes between these, for teaching and learning belong to the same genus and are identified really and formally, while action and passion, though really the same, as will be shown in its proper place, are formally distinct from one another.

Note second that cognition taken universally is twofold: sensitive and intellective. Sensitive cognition is subdivided into external, which arises from the external sense with its object present — as sight arises from the sense of sight regarding a color presented to it — and internal, which arises from an internal sense subsequent to cognition by the external sense, regarding a sensible object, as in the sensation of the common sense or of the imagination. Intellective cognition is likewise twofold: incomplex and complex. Incomplex cognition is that which is had of some simple and incomplex thing, by means of a sensible and intelligible species subsequent to the cognitions of the external and internal senses. Complex cognition, on the other hand, is that which, all the foregoing having been posited, is had of some complex or composite thing through the intellect, whether from the side of the thing it is capable of composition or not.

Note third, from the aforementioned Maior after Scotus (*here, q.1. §. Ad quaest.*), that Aristotle established the proposition, all teaching and all learning arises from pre-existing knowledge, against the ancient Academics, especially Heraclitus, Cratylus, and Socrates, who held that all things are unknowable — as Aristotle expressly recounts about Socrates (*4. Eth. c.7*) — and also against the more recent Academics, namely the Platonists, who held that while we do know

some things, nothing is known anew but only through recollection. And by the particles all teaching and all learning, Aristotle refutes the former; by the remaining particles, he refutes the latter philosophers.

First Assertion. Every cognition that is intellective arises from a preceding sensitive internal cognition; sensitive internal cognition arises from sensitive external cognition; and at the level of external sensation we stop. So Scotus in the place just cited, and this is attested by experience, and shines forth most clearly in the manner I showed how the universal formally comes to be and is known, in the second chapter, question I, article VIII. For the cognitive powers of the soul are so disposed and bound together by nature that the higher and more noble ones, in the present state, require and presuppose in their operation the operation of the lower and less noble ones. Hence is celebrated that well-known saying of the philosopher from the book on sense and the sensible (*c.1*), adduced and explained by the Doctor (*q.2. Universalium*): Nothing is in the intellect that was not first in the sense.

Second Assertion. Complex intellective cognition presupposes incomplex knowledge of terms; and complex cognition of a conclusion requires prior cognition of the premises. This assertion is delivered by the Doctor in both its parts in the place cited. As to the first part: it is an acknowledged matter that a composite is not distinctly known unless its parts are known, on which it essentially depends. Now complex cognition is a certain logical whole and composite, as I showed particularly concerning the proposition in the fourth book, for it is composed of subject and predicate joined by a verbal copula. Therefore complex intellective cognition presupposes incomplex cognition. Furthermore, from Aristotle (*1. Post. T.21*) and from Scotus (*ibid. q.2*), we know principles insofar as we know their terms. Now the principles that serve as the premises of a demonstrative syllogism are complex items of knowledge. Therefore complex cognition of propositions that are called principles of a demonstrated conclusion requires prior incomplex cognition of the terms. The second part is evident from what has been said. For an effect presupposes its cause, from which it receives its being. Therefore, since premises are the causes of the conclusion, it is plain that they must precede it.

Third Assertion. The teaching and learning that Aristotle mentions in the cited proposition must be taken to mean only discursive knowledge or science of the conclusion. This is drawn from the Doctor in the place recently cited, and is proved, first, from Aristotle himself, who, as found in the Greek codex, calls teaching and learning *dianoetiken*, that is, discursive and rational, as Zabarella and the Conimbricenses rightly note there; or as Themistius and Simplicius read, *logiken*, that is, rational and syllogistic, which signifies nothing other than the teaching of the conclusion, as the same philosopher's words in the same place (*T.3*), in the second book of the same work toward the end, and in (*6. Eth. c.3*) and (*1. Met. T.48*) — where he repeats this same proposition — clearly

confirm; and this is the more common interpretation of both Greek and Latin commentators. Secondly, Aristotle employs the resolutive method, as is clear from the title of these and the preceding books. He therefore begins from knowledge of the conclusion, which is first in the analytic order and last in the compositive order. The examples adduced by Aristotle in this place, or rather — as others prefer — the induction in the sciences and arts, wonderfully confirm this: first in the mathematical disciplines, which are caused by prior cognition of their principles; second in Logic, which is produced by means of a syllogism that presupposes cognition of the major and minor and knowledge of the terms; third in Rhetoric, which principally uses the enthymeme and example, which, being imperfect syllogisms, are in any case formed from prior cognitions of other things. And some attribute this likewise to the productive arts, which proceed from certain prior cognitions of things, as Themistius illustrates by examples — though this is not to the mind of the philosopher, whose aim and purpose was to teach the instrument of knowing, which is demonstration, and its effect, which is science, as one may observe in his text.

You will object, first, that angels, Adam, and others who possess science divinely bestowed did not receive it from antecedent cognition, as is evident. Therefore Aristotle's proposition cited above is not universally true, even when teaching and learning are taken to mean science of the conclusion. I reply, with Scotus (*q. secunda*, §. *Ad oppositum*), that what the philosopher asserts is to be interpreted of science humanly acquired, not of infused science, as the argument proves.

You will object, second, that as the sense stands to sensibles, so the intellect stands to intelligibles; but the sense can perceive something with no prior sensation. For when a newborn infant, before any cognition or perception whatsoever, has honey applied to its tongue, it immediately perceives sweetness; and the same must be said of sight and the other senses. Therefore the intellect also can know some things without pre-existing cognition. I deny the major premise, because, as the Doctor writes (*q.1. §. Ad 1*), a sensible object has a native proportion with the external sense, such that it is apt to be attained by the sense without any prior disposition or cognition. But the same sensible object, clothed in individual and material conditions, has no proportion with the immaterial and spiritual intellect; and for this reason it needs some prior cognition in order to understand what is presented to it by the senses. All the more so because the intellect is a discursive power that moves from principles to conclusion; and therefore, in order to attain cognition of the conclusion, it must possess cognition of the premises.

You will object, third, that Aristotle (*1. Met. T.48*) adduces and extends this same proposition to the teaching of definition: therefore it ought not to be restricted to the teaching of the conclusion alone, as is written in the third assertion. I reply that in that place of the Metaphysics it does indeed admit a broader sense, extending to cognition of definition as well as of the conclusion. But at the

beginning of the first Posterior Book it takes only discursive teaching, on account of the word opposed to it there, which in Greek is *dianoetiké*, and in Latin discursive, as Zabarella notes above all others in that place.

Article III. How Many Precognitions and Precognita There Are.

A precognition, as Maior (*1. Post. dub.7*) notes from the meaning of the name, is nothing other than cognition prior to others, or cognition had before another; properly speaking, however, as it pertains to our subject and this place, it is the knowledge required as a prerequisite for having science of the conclusion. A precognitum, from the meaning of the name, is what is cognized before another thing; but as it is taken in the present context, it can be described as that which is cognized in advance and required as a prerequisite for producing science of the conclusion, as is clear from Scotus (*4. dist. 1. q.2. §. Ex his*). Aristotle, wishing to furnish a rule of demonstrating and to open the way of knowing, teaches how many precognitions there are and what the precognita are, that is, what must be premised and foreknown. Now there are two precognitions: whether it is, and what it is. Whether it is is twofold, namely whether a thing exists or can exist, and whether it is, that is, whether it is true. What it is is likewise twofold: what the name signifies, and what the thing is — that is, what the thing is, or the nature and essence signified by the name. There are, moreover, three precognita enumerated by Aristotle: the subject, the property, and the principles or premises. Regarding the property, what the name signifies is foreknown; regarding the principles, that they are true; and regarding the subject, both: whether it is and what it is.

Assertion. There are only two precognitions, while there are three precognita as enumerated. So Scotus (*1. Post. q.4. §. Ad quaest.*) together with Aristotle in this place (*c.1. T.2*), whom the Doctor cites (*3. dist. 14. q.2. §. Contra rationem, sub H.*) and (*collation 13. §. Ad quaest.*). The first part is proved as follows: regarding any matter to be known through demonstration, we must foreknow whether it is and what it is. Therefore there are two precognitions as recounted. The antecedent is at hand. For, in order that something be known demonstratively, it must be foreknown whether it exists or can exist, and also what its quiddity and nature is; otherwise it cannot be known. The second part is proved thus: in acquiring demonstrative science, three things must necessarily be foreknown; therefore there are three precognita required for demonstration. The antecedent is shown as follows: a property must be demonstrated of a subject through principles or premises, which are the causes of the scientific conclusion. Hence it is evident that there are three precognita for demonstration, namely the subject about which the demonstration is made, the property that is demonstrated as inhering in the subject, and the principles that produce the conclusion. Since, therefore, nothing else is required to be foreknown for generating science of the conclusion, it is most aptly deduced that there are no more than three precognita, as Zabarella lucidly expresses (*1. de trib. praecognitis c.1*). I add that,

since demonstration is divided into principles and conclusion, and the conclusion into subject and property, these three must be the only precognita.

You will object, first, that regarding the subject what is foreknown is what the thing is, or what the thing is simply, and regarding the property what the name is, or what it is in a qualified sense; but what the thing is and what the name is are distinct precognitions. Therefore there are three precognitions, because to those two just cited there is joined another, namely whether it is. I reply with the Doctor near the end of the cited question that both precognitions, what the name is and what the thing is, are comprised under one general precognition, what it is; and for that reason, at the beginning of this article, I divided the precognition what it is into what the name is and what the thing is.

You will object, second, that there are as many precognitions as there are questions; but there are four questions from the second book of the Posterior (*c.1*): whether it is, what it is, what kind it is, and why it is so. Therefore there are also four precognitions. The major seems evident, because questions require precognitions, since every question presupposes one thing and seeks another. The Doctor replies (*alleg. §. Ad primam obiect.*) that there are two principal questions, namely whether it is and what it is, and the others are reduced to these: why it is so is reduced to what it is, and what kind it is to whether it is — as Zabarella clearly perceives (*suprà cit. c.2*). Or one may say there are two general ones and four special ones; and this reply does not seem to differ from the preceding. Or, if you prefer, there are two necessary ones and the others are by no means so.

You will object, third, that there are three precognita — subject, property, and axiom — and therefore three precognitions. The antecedent is our own assertion. The consequence holds because precognitions must be enumerated according to the number of precognita, for they are relative and are said convertibly. Granting the antecedent, I deny the consequence. For it is not necessary that the subject be multiplied according to the multiplication of forms existing in it, just as a father who has several sons is related to them through several numerically distinct paternities existing in him, and yet he is their one father.

You will object, fourth, that besides those three things enumerated, the middle term and the soundness of the consequence must be foreknown. Therefore there are more than three precognita. I deny the consequence: for the middle term does not constitute a distinct precognitum apart from subject and predicate, but is always one or the other in the first figure, and in the other figures is always either the predicate, as in the second figure, or always the subject, as in the third figure. The syllogistic or inferential form, moreover, belongs to the Prior Analytics, not the Posterior; and therefore it is not counted here as a special precognitum distinct from those three. Or one may say, with

Maior in the present place, that the soundness of the consequence is included in the foreknowledge of the principles.

You will add that subject and property are referred to in the principles as parts in a whole: therefore, if the middle term does not constitute a distinct precognitum because it is placed in the premises and is their subject or predicate, the same thing must be asserted about the subject and property, which are likewise included in those same premises. I say the disparity is this: that subject and property are foreknown by precognitions distinct from the precognition of the principles, but the middle term is not. For this reason the middle term is not a precognitum distinct from those three; but subject and property most certainly are, as will appear more clearly in the following articles.

Article IV. What Must Be Foreknown Concerning Principles.

Aristotle (*1. Post. c.1*), assigning a distinct precognition to each, writes that concerning principles it must be foreknown that they are true; concerning the property, what the name signifies; and concerning the subject, both: whether it is and what it is. These matters must be examined by us one by one, with Scotus (*1. Post. q.5. 6. 7*).

Note first that these three — subject, property, and principles — though necessary for generating demonstrative science, are nevertheless considered in different ways. The subject, to be sure, is regarded insofar as all others are placed beneath it and subjected to it; the property, insofar as it is in the subject, proceeds from it, and essentially depends on it; the principles, insofar as they are the causes from which knowledge of the others derives. Now, since the property is demonstrated of its subject through the principles, in order to acquire science, those three must be foreknown — not, to be sure, by the same foreknowledge, since they regard different things, but by distinct foreknowledges, as will be more fully established by what we shall set forth below.

Note second that a principle taken universally is divided into simple and complex. The simple or incomplex is that which is expressed in a single term (concerning which some remarks were made in the Epitome (*l.1. q.1. art.4*)); it is subdivided into a principle of being and a principle of knowing, treated in the Physics in the book on principles. The complex is that which is signified by several terms, as is clear from the Epitome cited; it is an axiom or universal proposition, which is called indemonstrable, self-evident, a common conception of the mind, and an axiom or dignity; it is subdivided in this book (*c.2*) into common and particular. A common principle is a principle of Metaphysics, which is called the common science, as is established from (*3. Met. T.3*) and (*4. eiusdem T.5*). Furthermore, according to Aristotle (*1. Post. c.8*), the common is twofold: most common, and less common. The former extends to all things, as every being either is or is not; the latter does not extend to all

things, as contraries cannot exist simultaneously in the same subject — which is considered by Physics and Medicine. A proper principle is one that belongs to one conclusion or one science alone, as nature is the principle of motion and rest, which applies to Physics alone. Furthermore, observe from the Doctor (*q.5 loci allegat.*) that a complex item, under the concept of the complex, does not have a what — and consequently, according to Aristotle (*7. Met. T.12*), has no definition.

Assertion. Concerning principles it is foreknown that they are true. So Scotus (*q. nunc allegat. §. Ad quaest.*) together with Aristotle (*ibid. c.1*). Proof: principles are the causes of the conclusion, as I showed above. Therefore concerning them it must be foreknown that they are; for what is nothing cannot be the cause of anything. Again, if something else were to be foreknown about principles, it would above all be what they are; since no other precognition is given, as is clear from the preceding article. But what they are cannot be foreknown about the principles themselves, because they have no what, since they are complex and aggregated from several whats, and I noted from Aristotle that things aggregated in this way have no what simply speaking, at the close of the second note. Moreover, assent to premises, which are the principles of the conclusion, is required before assent to the conclusion. Therefore concerning principles it is foreknown that they are true.

You will object, first, that Aristotle (*c.8 of this book*) states that concerning all principles what the name signifies must be foreknown. Therefore concerning principles it is foreknown both that they are and what they are; and the Conimbricenses (*q.3. art.4*) and Raconius (*art.5. disput.1. parte 3. sect.1*) think so as well. I reply that this must be explained as referring not to the principles precisely as such — since, being complex, they have no what — but to their parts, namely subject and property; otherwise the philosopher would contradict himself, who expressly delivers in (*c.1 of the same book*) that concerning principles it is to be foreknown only that they are. The Doctor indicates this interpretation (*ubisupra in fine*).

You will object, second, that the syllogism and the proposition are complex and have a what, because they are defined, as is clear in (*1. Prior. c.1*). Therefore, even though principles are complex, one cannot deny that they have a what, and that the what of them is foreknown. Scotus replies (*citat. §. Ad 1. rationem*), and signifies (*4. dist. 1. q.2*), that the syllogism is considered in two ways: either under the concept of the complex, and so it is denied that the syllogism has a what; or under the concept of the incomplex, and as it is the second intention signified by the name "syllogism," in which case it is conceded that the syllogism has a what and a definition. The same must be asserted about the proposition, which can also be taken under the concept of the complex or of the incomplex; and likewise about principles.

You will object, third, that existence presupposes and requires essence, just as a mode presupposes the thing of which it is a mode; but principles have existence, since it is universally conceded that it is presupposed about them that they are — especially because, being causes of the conclusion, they must pre-exist, since nothing causes unless it pre-exists. Therefore they also have essence; and what has essence has a what, because essence and quiddity either do not differ or, if they do differ, at least cannot be separated from each other. Therefore, if concerning principles it is foreknown that they are, it is equally to be foreknown what they are. The same Doctor cited replies that what properly belongs only to the incomplex, and it is only of the incomplex that there is a definition that explains what the thing is. For this reason Aristotle rightly denies that beings per accidens and aggregates have a what. Thus, to the argument in form: the whole is conceded; but Scotus denies the minor, because essence belongs both to complex and incomplex things. Or one may say that this is true of simple essence, but not of essence aggregated from many things, as happens in our case.

Article V. What Must Be Foreknown Concerning the Property.

Some, among whom is Raconius (*disp.1. de demonstratione*), place two precognitions of the property: whether it is and what it is; and Mastrius and Bellutus (*2. parte Introd. Tract.1. c.1*) favor them. But the common opinion is that of Aristotle (*1. Post. c.1*), Scotus (*q.6. §. Ad quaest.*), Fuentes (*q.19. diff.1. n.18*), Conimbricenses (*art.4*), and others in the same place, affirming that concerning the property only what the name signifies is foreknown.
